ONSITE REFUELLING

AFD Onsite Refuelling System

AFD's innovative refuelling system will increase worker safety by minimizing exposure time around the hot zones and high pressure lines through controlled fuelling. The self-contained unit has been built to meet and exceed fire code and hazardous location standards as well as include secondary systems to ensure that fuelling continues uninterrupted.

Huge Capacity

10,000 L fuel tank allows for seamless mobilization and demobilization as well as reducing start times. The main fuel tank has an internal pump to attach to an alternative fuel source in addition to connections to the 24 fuel reels.

Greater Flexibility

The main body of the trailer contains 24 fuel reels, each with 300 - 450' of 1" hose allowing for greater flexibility in tight locations. Each hose includes sensors and transmitters that generate real time data to the control room. The unit is also equipped with perimeter lighting for night operations and fuel spill protection.

Intuitive Control Panel

The Control Room contains two touch screen display monitors that control and provide fuel status for each reel and the main tank. The color coded monitoring system allows for easy recognition of each individual reel, as well as a visual of all 24 reels at one time.
