ABOUT US

It all started in a coffee shop in 2006: Max said to Anatoli, “Someday we’ll be able to run these AI models on a cell phone.” Anatoli promptly spit out his coffee. Just a few short years later, we created L-DNN, our award-winning and patented AI technology that can run on the edge and on the lightest of devices. It’s based on advanced research work cofounders Versace, Gorchet and Ames conducted for NASA, DARPA and the Air Force Research Labs. Between them, our three founders have four PhDs, 19 patents, and decades of experience working together to create groundbreaking AI.

In 2013, Neurala emerged from stealth mode and joined the Techstars program to deploy AI at a commercial scale. By working with some of the most innovative companies in the world to bring intelligence to products and devices, and find solutions to problems that change the world in meaningful ways.

Neurala launched Brain Builder in 2019 - a cloud-based solution that enables rapid AI prototyping, allowing users to annotate and train at the same time. By giving organizations an easy to use tool for data tagging, training, deployment, and analysis, Brain Builder makes vision AI creation more efficient.

In 2020 (yes, during the pandemic), Neurala launched its flagship Visual Inspection Automation (VIA) software, an integrated solution to help manufacturers ensure quality inspection on the production line. With VIA, Neurala continues its mission to make AI more accessible with software that is affordable, flexible, and easy to implement.

Our groundbreaking technology and leadership have been hailed one of the most innovative in the world by several organizations, including Draper Ventures, CB Insights, the Edison Awards, Netexplo / UNESCO, Softech INTL, AUVSI, BostInno, MassTLC, and EY's Entrepreneur of the Year.
