Subject: Shujun getting started
Date: Monday, June 18, 2012 9:07:58 AM

Mark, Christian,

With Shujun starting, I wonder if she can begin coming up to speed on our accuracy analysis but also, in parallel, help set up the infrastructure needed to use the MiSeq (it might be delivered and (self?) installed quite soon) and HiSeq (maybe not installable until our permanent labs are ready, but that's only about 6 weeks from now). Setting up a lab from scratch will require ordering misc lab supplies & reagents, equipment for sample prep (e.g. For running gels, PCR, etc - Christian may already have some of this coming) but also procedures & documentation (e.g. Lab safety training and documentation).

Christian also has another potential hire he mentioned to me Friday, a woman who used to run his HiSeq production lab in Hayward. If we hire her near term (she has left Illumina) she could also help with this.

To get started, we should establish a baseline, e.g. demonstrating to ourselves that we can sequence (e.g. Amy) to the quality we expect. This will validate the equipment we receive. Then we can work on experiments which advance from that base.

I'm on a departing plane. More later.

John West
