Only thing you proved is what everyone already knows, you need to drill a pilot hole with normal bits and not the hyperstep

So drilling a pilot hole and swapping bits is more time efficient and enjoyable then one and done ?

Most people don't drill pilot holes on 1/2 drill bits. 1" and up sure.

@The506Garage I'm not arguing against the hyperstep bits. I'm arguing against your test. Nobody that knows anything about using a drill is going to try and drill a 1/2 inch hole without a pilot hole. Drilling a 1/2 inch hole by itself takes a lot of downward pressure which is why you struggled and didn't get it through. Again hyperstep bits are great your test wasn't

@MoparMadness93 if you drill a pilot hole for a 1/2 drill bit in a machine shop you will be laughed at..

Used rotor is hardened by the heat of the brake pads and this is part of the reason the 1/2 ...

Reply

MoparMadness93 1 year ago

@The506Garage machine shops uses drill presses and mills not hand drills. You get a lot more leverage in a drill press than a hand drill. If you drilled that rotor in a drill press the regular 1/2 bits would have gone through because you could use more downward pressure. The bigger the diameter the more pressure needed to drill. I'm not pulling this out of my ass...

So once again I come back to the hyper step is a better bit for ease of drilling and faster when not using a drill press ? as soon in the video. Not sure why you are commenting about pilot holes as that wouldn't be comparing the bits across equal playing field.

@TheSubGarage

I think it'd be a fair test assuming you counted that in your time, like yea standard bits take 2 minutes to drill including the pilot hole. kinda unfair to just say you cant drill 1/2 inch holes with standard drill bits, like its the hyperstep tech that makes it actually possible
