What is Zapier? ↓

What is a Zap?

A **zap** is a combination of a **trigger** and an **action**. Our dashboard lets you pause, unpause and test your zaps.

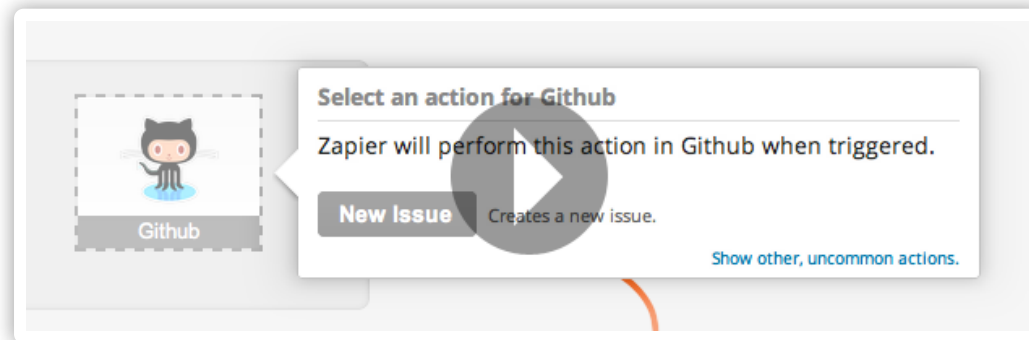

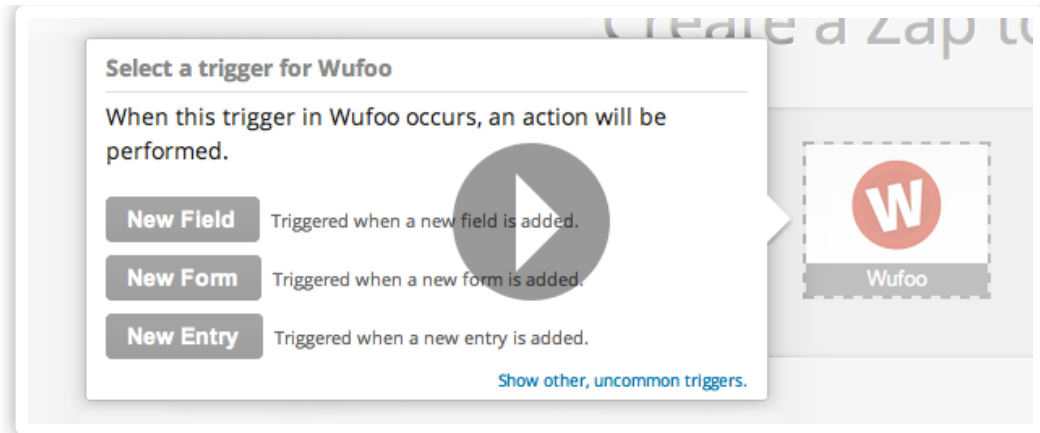

Pop up video to watch how!

Select Your Trigger

A trigger is the left side of an integration. We watch for the trigger to happen before performing an action.

Some examples might be *when there's a new ticket in Zendesk* or *when there's a new contact in Highrise*.

Select Your Action

An action is the right side of an integration. An action happens automatically when a trigger is tripped.

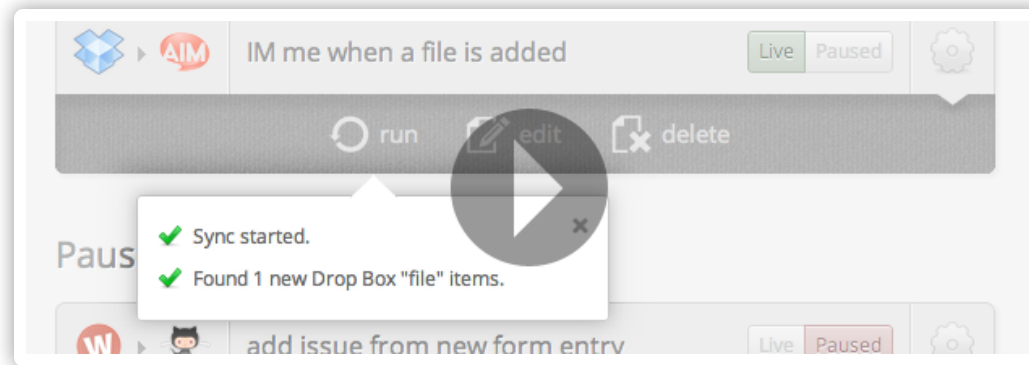

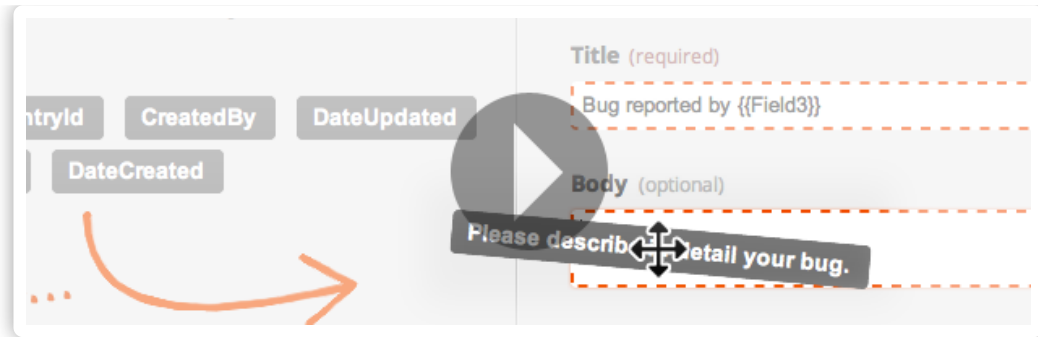

Some examples are *create an issue in GitHub* or *add a new contact to Google Contacts*.

Pop up video to watch how!

Build Your Zap

Drag and drop data available from your trigger to create your action. This lets you customize how your action is performed.

Run Your Zaps

Zapier will periodically run your zaps for you in the background, but you can manually run them from your dashboard.
