General Chairman's Message

Welcome to the IEEE 53rd Vehicular Technology Conference. This conference has been organized by the VTS Israeli Chapter. Unfortunately, we could not host you in Israel, as we had originally planned. However, we trust that the facilities at Rodos Palace in the Island of Rhodes will prove to be an excellent replacement, adding the promise that we will invite you to a meeting in Israel for one of the near future VTCs.

As usual we are publishing both a CD-ROM and a hard copy book as conference proceedings. However, we have thought that time is ripe to deviate a little from the normal form. In the past the book was designed to follow the conference. As a result it was organized by the chronological order of the presentations. However, as the number of papers grew, the book became multi-volumes and heavy, with diminishing value as a companion to the flow of the conference. Also, as the book became optional, not every participant purchased the book. The conclusion from these observations is that the book makes more sense as a post-conference tool. This led to a new ordering of our book and CD-ROM. i.e., rather than by sessions, they are organized by topics.

In order to help the participant in the course of the conference we have extended the program by including short abstracts of the presentations. Naturally, these are organized by sessions. We hope you find these arrangements more beneficial.

I would like to take this opportunity and to thank all our volunteers, members of the Organizing committee, members of the Technical Program Committee and all others for their help and dedication. Without them there would be no conference.

As a plenary talk we have thought you might be interested in a new and novel idea, with interesting features, which is being considered for local wireless applications, with all its promises and perils. I am referring to UWB, which stands for Ultra Wide Band.

Reuven Meidan, Fellow, IEEE

General Chair, VTC 2001- Spring

LINDA HALL LIBRARY
Kansas City, Mo.

SUPELEC Service Radioelectricite et Electronique, France
Protection Against Cochannel Interference from Neighboring Cells using Down-Tilting of Antenna Beams 1553
H. Cho 1, Y. Kim 2, D.Sung 3
1 Hankuk Aviation University, Korea
2 ETRI, Korea
3 KAIST, Korea
Performance Analysis of a Blind Adaptive Linear Minimum Mean Squared Error Receiver for Use in UMTS TDD-CDMA Basestations 1558
Y. Bian, A. Nix, J. McGeehan
University of Bristol, UK
The Projection Matrix Method for Interference Cancellation 1563
S. Shim 1, S. Jung 2, C. Lee 1
1 Yonsei University, Korea
2 Samsung Thales Ltd., Korea
Intercell Interference Cancelation at a SCDMA Mobile Terminal by Exploiting Excess Codes 1568
M. Lenardi, A. Medles, D. Slock
EURECOM Institute, France

Interference Factor Evaluation for CDMA System Capacity Analysis 1573
S. Ammari, A. Wautier
SUPELEC Service Radioelectricite et Electronique, France
Derivation of a New Analysis Tool to Compute the Performance of Non-Linear Multistage Interference Cancellation Detectors 1578
A. Wellig
Morphics Technology Inc., USA
Interference Cancellation for Multirate Multiuser Systems 1584
D. Yoo, W. Stark
University of Michigan, USA
Implementation Issues on the Interference Cancellation over Asynchronous Multi-path Channels 1589
Y. Kim 1, S. Kim 1, I. Choi 1, S. Cho 2
1 ETRI, Korea
2 Hanyang University, Korea
CDMA Downlink Equalization with Imperfect Channel Estimation 1593
L. Mailaender
Lucent Technologies, USA
Iterative (Soft) Interference Cancellation and Decoding for the Uplink IS-95 CDMA System 1598
S. Waxman, S. Shamai
Technion-Israel Institute of Technology, Israel

34 Equalization 1603

Iterative Soft Cholesky Block Decision Feedback Equalizer - a Promising Approach to Combat Interference 1604
J. Egle, C. Sgraja, J. Lindner
University of Ulm, Germany
Adaptive Equalization for Mobile Communication Systems Based on Constant Modulus Algorithm 1609
M. Hajian 1, j. Fernandes 2, P. Cunha 2, L. Ligthart 1
1 IRCR/TU Delft, The Netherlands
2 Technical University of Lisbon, Portugal
Maximum Likelihood Channel Estimation with Noise of Unknown Power Spectrum 1614
D. Hui, K. Zangi
Ericsson Research, USA
Off-line Frequency Correction for Equalization in the EDGE System 1619
A. Kuzminskiy, C. Luschi, P. Strauch
Lucent Technologies Optimus, USA
Performance Analysis of DS-CDMA Indoor Infrared Wireless Systems using Equalizer on Diffuse Channels 1624
M. Matsuo 1, T. Ohtsuki 2, I. Sasase 1
1 Keio University, Japan
2 Keio University, Japan
Turbo Equalization and Incremental Redundancy for Advanced TDMA Systems 1629
R. Visoz 1, A. Berthet 2, A. Saadani 1, B. Penther 3
1 France Telecom R&D, France
2 Alcatel Space Industries, France
3 Mitsubishi Electric ITE, France
Iterative Turbo Decoder with Decision Feedback Equalizer for Signals Transmitted Over Multipath Channels 1634
X. Yu
Motorola Inc., USA
QML-MC Algorithm for Frequency Estimation on Multipath Channels 1639
M. Terre 1, V. Cueff 2
1 Conservatoire National des Arts et Metiers, France
2 Alcatel CIT, France

Adaptive MLSE Space-Diversity Reception Technique in Mobile Radio Channels 1644
L. Rubio, N. Cardona, J. Reig, A. Gonzales
Universidad Politecnica de Valencia, Spain
Unconditionally Convergent pre-Distortion of non-Linear High Power Amplifiers 1649
J. Sala, H. Durney
Universitat Politecnica de Catalunya, Spain
A New Reduced Complexity Turbo-Detector for Highly Selective Long Delay Spread ISI Channels: A Solution for 4G Mobile Systems? 1654
A. Berthet 1, B. Penther 2, R. Visoz 3, J. Boutros 4
1 Alcatel Space Industries, France
2 Mitsubishi Electric ITE, France
3 France Telecom R&D, France
4 ENST Paris, France
Fast Blind and Semi-Blind Channel Identification of Mobile Radio Fading Channels Using A-Priori Information 1659
A. Schmidbauer
Munich University of Technology, Germany
A Code-Aided Adaptive Equalizer using Soft Decision-Directed Algorithm and Convolutional Coding for Fading Channels 1664
Y. Lee, M. Wang
Hong Kong University, Hong Kong
An Efficient Equalizer for 8-PSK EDGE Cellular Radio Systems 1668
J. Olivier 1, C. Xiao 2, K. Mann 3
1 Nokia Research Center, USA
2 University of Missouri-Columbia, USA
3 Wireless Solutions, Canada
Transmit Diversity and Equalization for Frequency Selective Fading Channels 1673
L. Li, H. Li, Y. Yao
Stevens Institute of Technology, USA
A Effective Scheme of Combining Turbo-Codes and Transmitting Diversity 1678
Z. Li, Y. Xu, W. Song, H. Luo

35 - Synchronization 1683

Shanghai Jiatong University, P.R. China
NBI Suppression for Code Acquisition in a DS/CDMA Overlay Environment 1684
J. Kim
Kwangwoon University, Korea
A Carrier Frequency Offset Correction Scheme for MC-CDMA 1689
A. McCormick, P. Grant, J. Thompson, E. Al-Susa
The University of Edinburgh, UK
Comparison of Downlink and Uplink MC-DS-CDMA Sensitivity to Carrier Frequency Offsets 1693
H. Steendam, M. Moeneclaey
Ghent University, Belgium
Algorithms of Reduced Power Consumption and Reduced Complexity for Code Tracking Loops 1698
J. Scheim, B. Bobrovsky
Tel Aviv University, Israel
Performance of Iterative DS-CDMA M-ARY Demodulation in the Presence of Synchronization Errors 1703
P. Xiao, E. Strom
Chalmers University of Technology, Sweden
An Improved Automatic Frequency Correction Scheme for Discontinuous Pilot Mobile Communication System 1708
Y. Zhang, X. Yu
Southeast University, P.R. China
An Iterative Frequency Estimator for Feedforward Frequency Synchronization 1713
T. Brown, M. Wang
Motorola Inc., USA

Coherent Slot Detection under Frequency Offset for W-CDMA 1719
T. Chulajata 1, H. Kwon 1, K. Min 2
1 Wichita State University, USA
2 Neoreach Inc., USA
Least Squares Approach to Data-Aided Frequency Estimation in Frequency-Selective Fading Channels 1724
E. Jeong 1, S. Jo 2, Y. Kim 1, Y. Lee 1
1 Korea Advanced Inst. of Sci. and Technology, Korea
2 Samsung Electronics Co., LTD., Korea
Optimized Timing-Error-Detector for DS-CDMA Applications in Multipath Scenarios 1729
G. Fock, P.Schulz-Rittich, J. Baltersee
Aachen University of Technology, Germany

36 Multi-user Detection 1734

Maximum Likelihood Semiblind Linear Multiuser Interference Suppression for CDMA Systems 1735
M. Bugallo, J. Miguez, L. Castedo
University of Corunia, Spain
A Semi-Blind Multiuser Projection Receiver Based on Conjugate Gradient and Subspace Tracking 1740
Q. Wu, C. Li
Modern Communication Research Inst., P.R. China
Enhancing the Cellular Downlink Capacity via Co-processing at the Transmitting End 1745
S. Shamai, B. Zaidel
Technion-Israel Institute of Technology, Israel
Blind Signal Recovery for High Rate CDMA Systems 1750
J. Zhang, W. Ser, J. Zhu
Nanyang Technological University, Singapore
Synchronisation Error Resistant Multiuser Detection for Asychronous CDMA 1755
F. Zheng
Victoria University of Technology, Australia
Minimum Variance Decorrelating Receiver in Time Variant Frequency Selective Rayleigh CDMA Channel 1760
X. Tang, Y. Bar-Ness
New Jersey Inst. of Technology, USA
Robust Joint Channel Estimation and Multiuser Detection with Differential Modulation in DS/CDMA Systems 1765
Z. Guo, K. Letaief
Hong Kong University, Hong Kong
An Adaptive Decision-Feedback Multiuser Detector Using Parallel Interference Cancellation for CDMA Systems 1770
Y. Huang 1, J. Wen 1, H.T Wu 2
1 National Chung Cheng University, P.R. China
2 Southern Taiwan University, R.O.C
A New CMA-based Blind Adaptive Multiuser Detction 1775
Q. Xue 1, X. Jiang 2, W. Wu 1
1 Beijing University of Posts & Telecomm, P.R. China
2 Northern Jiao Tong University, P.R. China
Hybrid MMSE and SIC for Multiuser Detection 1779
C. Tsai 1, W. Fang 1, J. Chen 2
1 National Taiwan University, P.R. China
2 National Tsing Hua University, P.R. China
A Computationally Efficient Hybrid of Joint Detection and Successive Interference Cancellation 1784
R. Misra, J. Pan, A. Zeira
InterDigital Communication Corp., USA

Group-Blind Multiuser Detection for UTRA-TDD 1789
J. Yu 1, A. Host-Madsen 2, X. Wang 3, G. Messier 4
1 Ericsson Wireless Communications Inc., USA
2 University of Hawaii, USA
3 A&M University, USA
4 TRLabs, Canada

Genetic Algorithm Based Antenna Diversity Assisted Multiuser Detection for Synchronous CDMA Systems 1794
K. Yen, L. Hanzo
University of Southampton, UK

Space-Time Iterative and Multistage Receiver Structures for CDMA Mobile Communication Systems 1799
S. Marinkovic 1, B. Vucetic 1, N. Ishii 2, S. Yoshida 2, A. Ushirokawa 2
1 University of Sydney, Australia
2 NEC Corporation, Australia

Multiple Access Interference Cancellation in Fading Multipath Channels: Progress and Limitations 1804
J. Andrews, T. Meng
Stanford University, USA

Partial Interference Subspace Rejection in CDMA Systems 1809
H. Hansen 1, S. Affes 2, P. Mermelstein 2
1 University of Denmark, Denmark
2 University of Quebec, Canada

Sensitivity of Blind Adaptive LMMSE Single-User Receivers to Path Delay and Phase Estimation Errors in Multipath Fading Channel 1814
L. Mucchi 1,2, M. Latva-aho 1, E. Del Re 2, R. Fantacci 2
1 University of Oulu, Finland
2 University of Firenze, Italy

Performance Analysis of MAI Canceller Combined with Adaptive Array Antenna for DS-CDMA 1819
K. Yano, S. Hirose, H. Murata, S. Yoshida
Kyoto University, Japan

On the fading channel Performance of Temporal-Spatial Filters for CDMA 1824
A. Yener 1, S. Ulukus 2
1 Lehigh University, USA
2 AT&T Labs Research, USA

On the Performance of Multisensor Reception in CDMA by Fast Independent Component Analysis 1829
T. Ristaniemi, R. Wu
University of Jyvaskyla, Finland

A Channel-Shortening Multiuser Detector for DS-CDMA Systems 1834
I. Medvedev, V. Tarokh
Massachusetts Institute of Technology, USA

Double-Threshold Selective PIC Receiver for CDMA Communications in Multipath Fading Channel 1839
R. Fantacci, S. Morosi, S. Villano
University of Firenze, Italy

Adaptive Blind Multiuser Detection in Asynchronous CDMA 1844
J. Murillo-Feuntes, M. Sanchez-Fernandez, F. Gonzalez-Serrano
Universidad Carlos III de Madrid, Spain

A Code Acquisition Scheme with Interference Cancellation for DS-CDMA Systems 1849
J. Lee, S. Oh
Ajou University, Korea

Projection Multiuser Detectors for Hierarchical Cell Structures in CDMA Cellular Systems 1853
A. Catovic, S. Tekinay
New Jersey Inst.of Technology, USA

Blind PSP-Based Turbo Equalization 1858
S. Vlahoyiannatos, L. Hanzo
Univ. of Southampton, USA

Reduced Complexity Multiuser Receiver for Asynchronous Trellis Coded DS-CDMA Systems 1863
G. Corral-Briones, M. Hueda, C. Rodriguez
Universidad Nacional de Cordoba, Argentina
Blind Adaptive Stochastic Neural Network for Multiuser Detection 1868
G. Jeney, J. Levendovszky, L. Kovacs
Budapest University of Technology and Economics, Hungary

37 Software Radio 1873

A 'Low Cost' Software Radio Test Bed 1874
J. Dixon, J. Wilkes
Telcordia Technologies, USA
Channel Diversity in a Software Autoradio 1879
H. Schnepp, T. Muller, J. Luy
DaimlerChrysler AG, Germany
Iterative Decoding Algorithms for Real Time Software Implementation in Wireless Communication Systems 1884
Y. Or, G. Kutz, A. Chass, A. Gubeskys, E. Pollak
Motorola Semiconductor Israel Ltd, Israel
A Schedule Algorithm for Multiprocessor System used in WCDMA Software Radio Base Station 1889
Z. Tiejun
Beijing University of Posts & Telecomm, P.R. China
A Feasibility of an Adaptive Sampling Processing Method for Software Defined Radio 1892
R. Sawai 1, H. Harada 2, H. Shirai 1, M. Fujise 2
1 Chuo University, Japan
2 Communicatons Research Lab, Japan
IM2 Removal in Direct Conversion Receivers 1897
M. Faulkner
Victoria University of Technology, Australia
Digital Filter Implementation for Software Radio 1902
Z. Wu, C. Luo, X. Su, X. Xu
Tsinghua University, P.R. China
A Flexible Waveform Synthesis Method for Software Radio 1907
S. Zhao, C. Luo, X. Su, M. Zhao
Tsinghua University, P.R. China
Software Radio Platform Based on General PC and Network 1912
C. Luo, X. Su, S. Zhao, M. Zhao
Tsinghua University, P.R. China
Towards the Implementation of a WCDMA AAA Receiver on an FPGA Software Radio Platform 1917
S. Korah, S. McDonald
University of Natal, South Africa
Intelligent Reconfiguration of Large Mobile Networks using Complex Organic Distributed Architecture 1922
T. Karran, G. Justo, K. Madani
Westminster University, UK
A Novel Generic Distributed Intelligent Re-configurable Mobile Network Architecture 1927
R. Ramos, K. Madani
Westminster University, UK

38 Transceiver Design 1932

Throughput Analysis of a Class of Selective Repeat ARQ with Multi-copy Retransmissions 1933
M. Choi, Y. Yao, H. Heffes
Stevens Inst. of Technology, USA
Downlink Capacity of CDMA/HDR 1937
W. Chung, H. Lee, J. Moon
Shinsegi Telecomm Inc., Korea

A Programmable Transceiver Structure of Multi-rate OFDM-CDMA for Wireless Multimedia Communications 1942
P. Fu, K. Chen
National Taiwan University, Taiwan
An Improved Averaged Stochastic Gradient Algorithms for Blind Multiuser Detection in DS/CDMA Systems 1947
Y. Hu 1,2, H. Zhu 1, J. Zhu 2
1 Anhui University, P.R. China
2 University of China, P.R.China
The Peak Limiting of a Baseband Code-Division Multiplexed Signal Applied to a Predistorted Power Amplifier 1953
S. Mizuta, H. Kawaguchi, Y. Akaiwa
Kyushu University, Japan
Further Results on diagonal-Layered Space-time Architecture 1958
M. Sellathurai, S. Haykin
McMaster University, Canada
Closed Loop Transmit Diversity Enhancements for UMTS Narrow Band and Wide Band TD-CDMA 1963
M. Da silva, A. Taffin, S. Lasaulce, S. Buljore
Motorola Labs, France
A Broadband Polynomial Predistorter for Reconfigurable Radio 1968
T. Nesimoglu, C. Canagarajah, J. McGeehan
University of Bristol, UK
Channel Estimation for DS-CDMA with Transmit Diversity over Frequency Selective Fading Channels 1973
P. Schulz-Rittich, J. Baltersee, G. Fock
Aachen University of Technology, Germany
Optimization of CDMA Signature Sequences in Multipath Channels 1978
J. Concha 1, S. Ulukus 2
1 Princeton University, USA
2 AT&T Labs, USA
A Flexible Test-Bed for Developing Hybrid Linear Transmitter Architecture 1983
S. Mann 1,2, M. Beach 1, P. Warr 1, J. McGeehan 1
1 University of Bristol, UK
2 Tait Electronics Ltd., NZ
Duoquaternary FSK Receivers in Mobile Communications 1987
I. Barbounakis 1, P. Stavroulakis 1, J. Gardiner 2

Abstract

Cellular location methods based on angle of arrival (AOA) or time difference (e.g. E-OTD) measurements assume line-of-sight propagation between base stations and the mobile station. This assumption is not valid in urban microcellular environments. We present a Database Correlation Method (DCM) that can utilize any location-dependent signals available in cellular systems. This method works best in densely built urban areas. An application of DCM to GSM, using signal strength measurements, is described and trial results from urban and suburban environments are given. Comparison with AOA and E-OTD trials shows that DCM is a competitive alternative for GSM location in urban and suburban environments.

1. Introduction

Cellular location techniques have received a lot of attention recently. This is due to the great number of new value-added services that can be realized using location technology. Also, the requirement set by the United States Federal Communications Commission (FCC) to locate emergency calls according to certain accuracy criteria by October 2001 has been a driver for the development of location methods. Several techniques have been tested in trials and also in commercial networks. However, it is difficult to estimate which of the competing techniques is the best in terms of accuracy, or which of them fulfil the FCC requirement. This is due to the fact that the accuracy of each location method can not be presented by a single number but by a statistical error distribution, and a large amount of experimental data must be collected in order to find the distribution. Furthermore, the accuracy of any cellular location method is dependent on the network density as well as radio propagation effects.

Most of the proposed methods aiming at higher accuracy than simple cell identification are based either on signal time delay or angle of arrival measurements. Angle of arrival (AOA) technique requires antenna arrays at base stations [1], which makes it expensive to implement in current networks and impractical in microcell sites. GSM standardization includes two methods based on cellular signal timing measurements: uplink Time of Arrival (TOA) and downlink Enhanced Observed Time Difference (E-OTD) [2]. Also these methods require new hardware to the network, and E-OTD requires modifications to handsets as well. Another drawback of these methods is the narrow bandwidth of GSM signals, which does not allow highly accurate signal timing measurements.

In general, the performance of AOA and signal timing based methods is not optimal in densely built urban environments. With these methods, the location of the mobile station (MS) is calculated under the assumption of line-of-sight propagation between the base stations (BSs) and the MS. This assumption is not valid in city centers where high buildings often block the line of sight and signal propagates with less attenuation along street canyons than through the buildings. Moreover, severe multipath propagation characteristic to these environments makes it difficult to detect the angle of arrival or time of arrival of the direct component i.e. the resolution of these measurements is not as good as in more open propagation environments. Consequently, these methods can not fully exploit the dense cellular network of urban environments.

Some location methods, e.g. Enhanced Signal Strength method and Location Fingerprinting [3] have been designed to obtain optimal performance in urban environments. Such methods are important because many foreseen location applications will be used in urban environments and the accuracy requirement in such an environment is typically higher than in an open rural environment. In this paper, we present a new method [4], referred to as the Database Correlation Method (DCM), which can be implemented in GSM using the signal strength measurements performed by all GSM handsets. A common feature of all cellular location methods that are

0-7803-6728-6/01/$10.00 ©2001 IEEE.

designed to perform well in urban environments is that they can not rely on the assumption of line-of-sight propagation. As opposed to Location Fingerprinting, DCM is an approach that requires no new hardware at BS sites because it takes advantage of the measurements available in the system. The difference between Enhanced Signal Strength method and our DCM trial is that we have obtained the signal strength database through measurements instead of computations.

2. Database Correlation Method

2.1. Generic location method

DCM is a general location method that can be applied to any cellular or WLAN network. The key idea is to store the signal information seen by a MS, from the whole coverage area of the location system, in a database that is used by a location server. The database should contain signal information samples, called fingerprints, with a resolution comparable to the accuracy that can be achieved with the method, and this resolution may vary in different environments. Depending on the particular cellular system, the signal fingerprints could include signal strength, signal time delay, or even channel impulse response. Any location-dependent signal information that can be measured by the MS is useful for the DCM technique. Also, it is possible to use measurements performed by the network as well as by the MS. When the MS needs to be located, the necessary measurements are performed and transmitted to the location server. The location server then calculates the MS location by comparing the transmitted fingerprint and the fingerprints of the database. The architecture of a DCM location system is illustrated in Figure 1. It is highlighted that DCM can be implemented in any wireless system, the MS only needs to be able to transmit a location-dependent fingerprint to the location server. This fingerprint may consist of signals measured from GSM, UMTS, WLAN, or GPS system also. The location server must be powerful enough to process all location requests in a reasonable time. In a large-scale implementation, this may require distributed processing.

The major effort in applying DCM is the creation and maintenance of the database. The signal fingerprints for the database can be collected either by measurements or by a computational network planning tool. Measurements are more laborious but produce more accurate fingerprint data. Also a combination of measured and computed fingerprints can be used. The compensation for the effort to build the database is an optimal location accuracy in environments where the assumption of line-of-sight propagation is not valid, e.g. in dense urban and indoor environments. The only assumption is that the database contains up-to-date data. However, minor changes in the

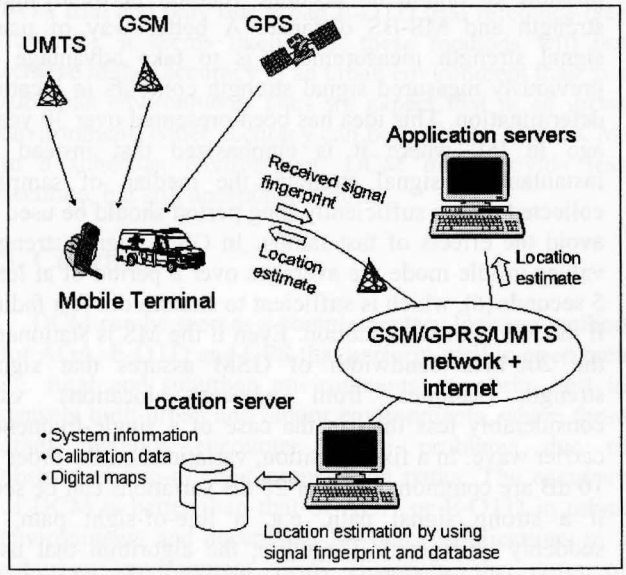

Figure 1. Architecture of DCM system.

network or propagation environment, e.g. new buildings, will only be seen as lowered location accuracy if the database is not updated. Also, it should be noted that similar information that is contained in the DCM database is also needed in network planning. Therefore, the creation and maintenance of the database also support network planning.

2.2. Application to GSM

The essential location-dependent parameters defined in GSM standard are Location Area Code (LAC), serving cell ID, timing advance (TA), and the measured signal strength of the serving cell and its neighbors. In dedicated mode (call on) all these parameters are known to both the MS and the network (signal strength measurements from up to 6 neighbor cells are reported from the MS back to the network). However, in idle mode only the LAC is known to the network. The MS, on the other hand, continuously makes signal strength measurements and also knows the cell ID of the strongest cell. Thus, in order to locate an idle-mode MS using these parameters, the MS must be able to transmit the available parameters to the location server. GSM handsets with the capability to send these measurements through SMS are already available.

LAC, cell ID, and TA, which is known with a resolution of 554 m in dedicated mode only, can be used for rough positioning. For more accurate positioning, it is possible to use signal strength measurements to estimate the distance between the MS and each BS, based on some path loss model. However, this is an unreliable way to measure distance since signal strength variations caused by shadowing will introduce large errors in distance estimates. Especially in urban environments it is seldom

possible to obtain an accurate relation between signal strength and MS-BS distance. A better way of using signal strength measurements is to take advantage of previously measured signal strength contours in location determination. This idea has been presented over 30 years ago in [5], where it is emphasized that instead of instantaneous signal strength, the median of samples collected over a sufficiently long period should be used to avoid the effects of fast fading. In GSM, signal strength values in idle mode are averages over a period of at least 5 seconds [6], which is sufficient to smooth out fast fading if the MS is in slow motion. Even if the MS is stationary, the 200 kHz bandwidth of GSM assures that signal strength samples from adjacent locations vary considerably less than in the case of a single-frequency carrier wave. In a fixed position, variations on the order of 10 dB are common, but over 20 dB variations can be seen if a strong signal path, e.g. a line-of-sight path, is suddenly obstructed. Therefore, the algorithm that uses signal strength values for positioning should not be sensitive to such variations.

We have used a simple correlation-type algorithm for finding the best match between the fingerprint to be located and the fingerprints of the database. A difference between the fingerprint to be located and each fingerprint of the database is calculated as

$$d(k) = \sum_i (f_i - g_i(k))^2 + p(k)$$

where f_i is the signal strength of the request fingerprint on the i^{th} Broadcast Control Channel, $g_i(k)$ is the signal strength of k^{th} database fingerprint on the same channel, and the summation is taken over channels that are found in both fingerprints. Each channel that is found in only one of the fingerprints contributes to the penalty term $p(k)$. The coordinates of the database fingerprint that minimizes this difference are returned as the location result. It should be noted that the database search can be limited, based on LAC and cell ID, to a relatively small area. Also other types of algorithms, e.g. pattern matching, could be used.

3. Location trial

We have performed a location trial in two environments: a densely built urban environment (the center of Helsinki, Finland) and a suburban environment (the campus area of Otaniemi in Espoo, Finland). The trial area was approximately 3 km^2 in urban and 1.4 km^2 in suburban environment. In both cases, measurements were performed with a standard GSM phone, which was attached to the dashboard inside a car and connected to a laptop PC. Part of the urban measurements was performed on foot. In all measurements, the phone was in idle mode. The street grid of the trial area was covered once in order to create the database, by collecting on the average two measured fingerprints per second. Reference coordinates for the measured fingerprints were obtained by mouse-clicking marker points on the laptop PC each time the car stopped, started moving, turned, or passed a street corner. Between the marker points, reference coordinates were calculated assuming that the car moved with constant velocity. It was estimated that the errors in reference coordinates caused by the non-constant velocity and inaccurate marker coordinates should be below 20 meters.

During the measurements, the speed of the car was kept below 45 km/h in order to keep the distance the MS moves in 5 seconds, which is approximately the period over which the signal strength is averaged, reasonable. It was observed that lower speed leads to better location accuracy. Furthermore, when inserted in the database, the coordinates for a measured fingerprint were taken to be the reference coordinates of an earlier sample to compensate for the averaging time. We also tried averaging the fingerprints of the database with various grid spacings. If the grid spacing is not too large, averaging has no effect on location accuracy, but reduces the amount of fingerprints in the database and thus processing speed for one location request.

In addition to the measurements forming the database, we drove test routes through the trial area in order to evaluate the location accuracy of our method. In the urban area, three test routes of total length 15 km and in the suburban area one 1.5-km long test route were driven. The lengths of all test routes and the numbers of fingerprints collected are summarized in Table 1. Again, the reference coordinates for a sample fingerprint were taken from an earlier sample to compensate for the delay caused by averaging. This simulates the positioning of a stationary MS. Obviously, such compensation can not be done if a moving vehicle is to be located or tracked in real time. In this case, a tracking algorithm can be used to estimate the current location, but in a one-shot location the averaging delay causes an error proportional to the speed of the vehicle. However, this is true for any cellular location method due to the unavoidable delays in measurements, signaling, and location calculation.

Table 1. Test route lengths and numbers of collected fingerprints.

test route	length	fingerprints
urban 1	1450 m	389
urban 2	8600 m	3604
urban 3	4550 m	1240
suburban	3500 m	766

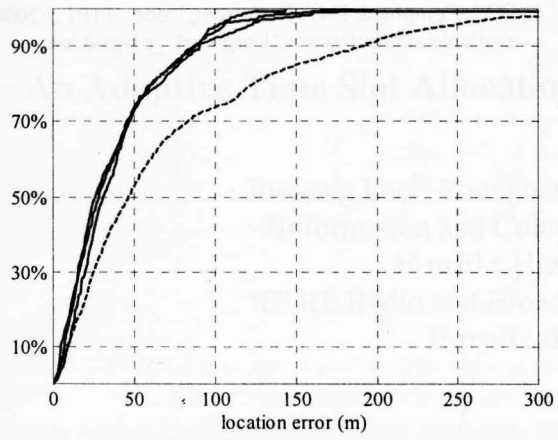

Figure 2. Cumulative location error distribution in urban test routes (solid curves) and suburban test route (dashed curve).

4. Trial results

The cumulative distributions of location error along the test routes are shown in Figure 2. It is seen that the error distribution in the urban test routes does not vary much, but there is a clear difference between urban and suburban accuracy. There are two factors that cause the higher accuracy in the urban environment: denser network and building shadowing. In an urban microcellular environment, the difference in signal strength values on different sides of a (heavy) building is so large that it exceeds random variations caused by e.g. antenna orientation or body shadowing. The signal propagates along street canyons and, as a consequence, the location error is typically directed along the street.

A comparison with the published results from AOA [1] and E-OTD [7,8] trials is shown in Table 2. The results from the two suburban E-OTD trials differ somewhat surprisingly, but the more accurate results [8] are very close to the AOA results [1]. Nevertheless, it can be observed that DCM can be as accurate in an urban environment as AOA or E-OTD in a suburban environment. Although we have no data from an urban AOA trial and only one urban E-OTD trial reference (see Table 2), it seems likely that these methods will not achieve higher accuracy in an urban environment than in a suburban environment. Thus we expect that in an urban environment, better accuracy can be achieved with DCM. In a suburban environment, DCM may provide less accurate, but still acceptable results.

Table 2. Comparison of DCM, AOA [1], and E-OTD [7,8] trial results. 67th and 90th percentiles are shown in all except the last row.

Trial	67%	90%
DCM urban	44 m	90 m
E-OTD urban [7]	141 m	237 m
DCM suburban	74 m	190 m
AOA suburban [1]	45 m	89 m
E-OTD suburban [7]	125 m	231 m
E-OTD suburban [8]	50 m (69%)	100 m (97%)

5. Conclusions

DCM can be seen as a complementary location method for AOA, E-OTD and GPS that perform well in open area i.e. rural and suburban environments. It works best in densely built urban and indoor environments, where these other methods encounter severe problems due to obstructed line-of-sight propagation paths. The accuracy of DCM is better than that of AOA or E-OTD in urban environments and acceptable for many applications in a suburban environment also. However, the costs of applying DCM are lower than for these two methods, since no modifications to the cellular network are needed. The only major cost comes from the construction and maintenance of the database. However, the database can be utilized in network planning and monitoring also.

With DCM, it is possible to use any location-dependent measurements available in the system. Therefore it would be possible to enhance the accuracy of E-OTD in urban environments using DCM. Also, DCM can be used for accurate positioning in WLAN (indoor) and UMTS (urban and indoor) systems.
