Airsoft Systems is a young and fast growing company founded in 2008 in Bulgaria. The company was born from the mutual passion to airsoft of two friends, a computer engineer and a real gun designer. The out-of-the-box thinking of this young men led to the idea to find a solution that will make every affordable priced AEG to perform as, or even better than the most expensive Professional Training Weapons.

The project took two years of intensive work, research and testing. The final goal was reached: the Airsoft Smart Control Unit (ASCU) - a 'drop-in' combination of Sensor Unit that detects very accurately the exact position of the sector gear and also monitoring the position of the fire-selector and the trigger. The data from the sensor unit is transferred to the CPU of the Control Unit, that is starting and stopping the motor of the AEG, using a state of the art MOSFET.

The two friends took the design even further, by designing a electronic hop-up unit that can detect when the magazine is empty. In this way they found the solution how to make an ordinary AEG to work and to perform as realistic as it is actually possible.

The way to the final product was hard and full with obstacles. But the consistent hard work and the will to find the best possible solutions finally did pay-off. Now the airsoft players, all over the world, can enjoy the new level of performance of their AEGs.
