

8 + 1 Phase Output Controller with SVID Interface for Computer CPU Applications

NCP81566

The NCP81566 is a dual rail, eight plus one phase buck solution optimized for Intel's IMVP9.2 CPUs. The multi-phase rail control system is based on Dual-Edge pulse-width modulation (PWM) combined with DCR current sensing. This provides an ultra-fast initial response to dynamic load events and reduced system cost. The NCP81566 has an ultra-low offset current monitor amplifier with programmable offset compensation for high accuracy current monitoring.

Features

- Vin Range 4.5 V to 21 V
- Startup into Pre-Charged Loads While Avoiding False OVP
- Digital Soft Start Ramp
- Adjustable Vboot
- High Impedance Differential Output Voltage Amplifier
- Dual VID Table Support to Be Compatible with IMVP9.2
- Support High Current Extensions
- Dynamic Reference Injection
- Programmable Output Voltage Slew Rates
- Dynamic VID Feed-Forward
- Differential Current Sense Amplifiers for Each Phase
- Programmable Adaptive Voltage Positioning (AVP)
- Adjustable Switching Frequency Range
- Digitally Stabilized Switching Frequency
- UltraSonic Operation
- Supports Acoustic Noise Mitigation Function
- PSYS Input Monitor
- Support for VCCIN_AUX IMON Input
- Meets Intel's IMVP9.2 Specifications
- Current Mode Dual Edge Modulation for Fast Initial Response to Transient Loading
- This is a Pb-Free Device

Typical Applications

- Computers

QFN52 6x6, 0.4P

Figure 3. Pinout

Table 1. PIN FUNCTION DESCRIPTION

Pin No.	Pin Name	Description
1	IOUT	Total output current monitor for regulator 1
2	EN	Enable. High enables both rails
3	SDIO	Serial VID data interface
4	ALERT#	Serial VID ALERT#
5	SCLK	Serial VID clock
6	VR_RDY	VR_RDY indicates both rails are ready to accept SVID commands
7	VCC	Power for the internal control circuits. A decoupling capacitor is connected from this pin to ground
8	PSYS	System power signal input. A resistor to ground scales this signal.
9	VRMP	Feed-forward input of Vin for the ramp-slope compensation. The current fed into this pin is used to control the ramp of the PWM slopes
10	VR_HOT#	OD output. Indicates high VR temperature.
11	AUX_IN	AUX IMON Input. A resistor to ground scales this signal.
12	NC	Reserved.
13	IOUTA	Total output current monitor for regulator 2
14	VSNA	Differential output voltage negative sense for regulator 2
15	VSPA	Differential output voltage positive sense for regulator 2
16	DIFFA	Output of the regulator 2's differential remote sense amplifier
17	FBA	Error amplifier voltage feedback for regulator 2
18	COMPA	Output of the error amplifier and the inverting inputs of the PWM comparators for regulator 2
19	CSCOMPA	Output of total-current-sense amplifier for regulator 2
20	ILIMA	Over-current threshold setting – programmed with a resistor to CSCOMPA for regulator 2
21	CSSUMA	Inverting input of total-current-sense amplifier for regulator 2
22	CSREFA	Total-current-sense amplifier reference voltage input for regulator 2
23	CSP1A	Non-inverting input to current-balance amplifier for Phase 1 of regulator 2
24	TSENSEA	Temperature sense input for regulator 2
25	PWM1A / ICCMAXA	PWM1 output for regulator 2. Pulldown on this pin programs ICCMAX for regulator 2 during startup

Table 1. PIN FUNCTION DESCRIPTION

Pin No.	Pin Name	Description
26	DRON	External FET driver enable for discrete driver or onsemi DrMOS
27	PWM8	PWM8 output for regulator 1
28	PWM7 / ICC*2_MAIN_RAIL	PWM7 output for regulator 1 / Pulldown on this pin programs ICCMAX on main rail from 255 to 511A
29	PWM6 / ICCMAX_AUXIN	PWM6 output for regulator 1 / Pulldown resistor on this pin programs ICCMAX for the AUX_IN monitoring rail
30	PWM5 / ROSCA	PWM5 output for regulator 1 / Pulldown on this pin programs RoscA value for regulator 2
31	PWM4 / ROSC	PWM4 output for regulator 1 / Pulldown on this pin programs Rosc value for regulator 1
32	PWM3 / ICCMAX	PWM3 output for regulator 1 / Pulldown on this pin programs ICCMAX for regulator 1 during startup
33	PWM2 / VBOOT	PWM2 output for regulator 1 / Pin-program for regulator 1 and regulator 2 Vboot.
34	PWM1 / SV_ADDR_SR	PWM1 output for regulator 1 / Pulldown on this pin configures SVID address, slew rate and Intel Proprietary Current Protection Feature
35	TSENSE	Temperature sense input for regulator 1
36	CSP1	Differential current sense positive for Phase 1 of regulator 1
37	CSP2	Differential current sense positive for Phase 2 of regulator 1
38	CSP3	Differential current sense positive for Phase 3 of regulator 1
39	CSP4	Differential current sense positive for Phase 4 of regulator 1
40	CSP5	Differential current sense positive for Phase 5 of regulator 1
41	CSP6	Differential current sense positive for Phase 6 of regulator 1
42	CSP7	Differential current sense positive for Phase 7 of regulator 1
43	CSP8	Differential current sense positive for Phase 8 of regulator 1
44	CSREF	Total-current-sense amplifier reference voltage input for regulator 1
45	CSSUM	Inverting input of total-current-sense amplifier for regulator 1
46	ILIM	Over-current threshold setting – programmed with a resistor to CSCOMP for regulator 1
47	CSCOMP	Output of total-current-sense amplifier for regulator 1
48	COMP	Output of the error amplifier and the inverting inputs of the PWM comparators for regulator 1
49	FB	Error amplifier voltage feedback for regulator 1
50	DIFF	Output of the regulator 1's differential remote sense amplifier
51	VSP	Differential output voltage sense positive for regulator 1
52	VSN	Differential output voltage sense negative for regulator 1
	Flag	GND

1. "Regulator 1" is referred to as "Main" rail throughout the datasheet. "Main" is the primary rail with the highest phase count.
2. "Regulator 2" is referred to as "A" rail throughout the datasheet.

Table 2. MAXIMUM RATINGS (Note 3)

Pin Symbol	V _{MAX}	V _{MIN}	I _{SOURCE}	I _{SINK}
COMP, COMPA	VCC + 0.3 V	–0.3 V	2 mA	2 mA
CSCOMP, CSCOMPA	VCC + 0.3 V	–0.3 V	2 mA	2 mA
PWMX	VCC + 0.3 V	–0.3 V	–	1 mA
VSN, VSNA	GND + 0.3 V	GND – 0.3 V	1 mA	2 mA
DIFF, DIFFA	VCC + 0.3 V	–0.3 V	2 mA	2 mA
VR_RDY	VCC + 0.3 V	–0.3 V	2 mA	–
VCC	6.0 V	–0.3 V	–	–
VRMP	VCC + 0.3 V	–0.3 V	–	–
SCLK, SDIO	3.6 V	–0.3 V	–	–
All Other Pins	VCC + 0.3 V	–0.3 V	–	–

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

3. All signals referenced to GND unless noted otherwise

Table 3. ESD CAPABILITY

Description	Symbol	Typ	Unit
ESD Capability, Human Body Model (Note 4)	ESD _{HBM}	2000	V
ESD Capability, Charged Device Model (Note 4)	ESD _{CDM}	750	V

4. This device series incorporates ESD protection and is tested by the following methods:

ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)

ESD Charge Device Model tested per AEC-Q100-011 (EIA/JESD22-C101)

Latch-up Current Maximum Rating: 200 mA per JEDEC standard: JESD78.

Table 4. RECOMMENDED OPERATING CONDITIONS

Description	Symbol	Min	Max	Unit
VCC Voltage Range	VCC	4.75	5.25	V
Operating Junction Temperature Range (Note 5)	T _J	–40	125	°C
Operating Ambient Temperature Range	T _A	–40	100	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

5. JEDEC JESD 51-7 with 0 LFM.

PSYS

Full Scale Input Voltage		-	2.5	-	V
Disable Threshold		-	$V_{CC} - 0.4$	-	V

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

*N is the phase configuration number in PS0.

Start Up

Following the rise of VCC above the UVLO threshold, externally programmed configuration data is collected, and all PWM outputs are set to Mid-level to prepare the gate drivers of the power stages for activation. When the controller is enabled, DRON is asserted (high) to activate the external gate drivers. A digital counter steps the DAC up from zero to the target boot voltage based on the Soft Start

Slew Rate in the spec table. As the DAC ramps, the PWM outputs of each rail will change from Mid-level to high when the first PWM pulse for that rail is produced. When the controller is disabled, the PWM signals return to Mid-level. The VR_RDY signal is asserted when the controller is ready to accept the first SVID command.

DEVICE CONFIGURATION

Phase and Rail Configuration

During start-up, the number of operational phases of the multiphase rail is determined by the internal circuitry monitoring the CSP inputs. If a reduced phase count is required, the appropriate CSP pins should be externally pulled to VCC with a resistor during startup. When used with the NCP81568 controller, the PSYS input needs to be connected to VCC so that it does not respond to any calls on the SVID bus. PSYS functionality is enabled on the NCP81568 only.

Basic Configuration

The controller has four basic configuration features. On power up a 10 μ A current is sourced from these pins through a resistor connected to this pin and the resulting voltage is measured. The following features will be programmed:

- SVID Address
- Slew Rate
- V_{BOOT}
- Output Voltage Step

SVID address and slew rate options are shown in Table 9.

V_{BOOT} and output voltage step options are shown in Table 10.

Intel Proprietary Current Protection Feature

VR_HOT assertion for Intel Proprietary Current Protection Feature on/off selection as shown in Table 9.

Switching Frequency

Switching frequencies between 180 kHz and 1.17 MHz are programmed at power up with pulldown resistors on Rosc and RoscA pin. Switching frequency options are shown in Table 12. IA rail follows phase configuration number in PS0. GT rail follows 1-phase switching frequency settings.

ICCMAX

The SVID interface provides the platform ICCMAX values at register 21h. Resistors to ground on the PWM3/ICCMAX, PWM1A/ICCMAXA and PWM6/ICCMAX_AUXIN pins programs these registers on power up. 10 μ A is sourced from this pin to generate a voltage on the program resistor. The value of the register is set by the equation below. The resistor value should be no less than 10 k Ω .

$$ICC_{MAX_{21h}} = \frac{R \cdot 10 \mu A \cdot 255 A}{2.5 V} \quad (\text{eq. 1})$$

ICCMAX Additional Capability

IMVP9.2 adds an option to extend the current range of the main rail by scaling the LSB size of register ICCMAX_{21h} by 2^{ICCMAX_ADD50h[1:0]} amps (See Table 7). On the NCP81566, these register bits can be configured to 2 A per bit by enabling ICC*2_MAIN_RAIL mode. See Table 11 for details on how to enable this mode.

Table 7. ICCMAX CAPABILITY SCALING

ICCMAX_ADD50h[4:0]		ICC Scaling	Power Scaling
Power [4:2]	Current [1:0]		
010	00	1 A / bit	4 W / bit
011	01	2 A / bit	8 W / bit

When ICC*2_MAIN_RAIL mode is enabled, the bits ICCMAX_ADD50h[1:0] are set to 01b to indicate a scaling of 2 A per bit. This scaling applies to both the ICCMAX_{21h} and the IOUT_H15h SVID registers. The bits ICCMAX_ADD50h[4:2] are also set to 011b to indicate that the POUT_H18h register value is scaled to 8 W per bit. Table 8 shows the rail configurations when ICC*2_MAIN_RAIL mode is enabled and disabled.

Table 8. RAIL SETTINGS FOR ICC*2_MAIN_RAIL MODE

		ICC*2_MAIN_RAIL	
		Disabled	Enabled
Main Rail	ICCMAX _{21h} LSB Size	1A	2A
	IOUT _{15h} LSB Size	1A	2A
	POUT _{18h} LSB Size	4 W	8 W
	HIGHPOWER_ICCMAX_ADD _{50h} [1:0]	00	01
	HIGHPOWER_ICCMAX_ADD _{50h} [4:2]	010	011
	Loadline Weighting	93.75%	187.5%
A Rail	ICCMAX _{21h} LSB Size	1A	
	IOUT _{15h} LSB Size	1A	
	POUT _{18h} LSB Size	4 W	
	HIGHPOWER_ICCMAX_ADD _{50h} [1:0]	00	
	HIGHPOWER_ICCMAX_ADD _{50h} [4:2]	010	
	Loadline Weighting	93.75%	
VCCIN_AUX	ICCMAX _{21h} LSB Size	1A	
	IOUT _{15h} LSB Size	1A	
	POUT _{18h} LSB Size	4 W	
	HIGHPOWER_ICCMAX_ADD _{50h} [1:0]	00	
	HIGHPOWER_ICCMAX_ADD _{50h} [4:2]	010	

Ultrasonic Mode

The switching frequency of a rail in DCM will decrease at very light loads. Ultrasonic Mode forces the switching frequency to stay above the audible range.

CCM/DCM Operation

In PS0, all rails operate in Continuous Conduction Mode (CCM) which uses the dual-edge control methodology. However, if PS0 is configured as one-phase instead of multi-phase, the control methodology changes to RPM operation. RPM has great transient performance in one-phase CCM operation. The RPM frequency average DC value is targeted to be similar to the PS0 Dual Edge frequency. However, the switching frequency of RPM depends on input voltage, output voltage, load current, inductor value, and output capacitor value. In PS1, all rails operate in one-phase CCM RPM. In PS2 and PS3, all rails operate in either CCM or Discontinuous Conduction Mode (DCM). It depends on load current in order to prevent loss of efficiency from negative inductor current.

Table 9. NCP81566 SVID ADDRESS, SLEW RATE AND FAST V MODE

Resistor (kΩ)	SR (mV/μs)	Main Rail SVID Address	A Rail SVID Address	Intel Proprietary Current Protection Feature

86.6	0 V	1.8 V	
105	1.05 V	0 V	
127	1.05 V	1.8 V	
154	0 V	0 V	Main rail 10 mV/step. A rail 5 mV/step.
187	1.8 V	0 V	
221	0 V	1.05 V	
280	1.8 V	1.05 V	

PSYS

The PSYS pin is an analog input to the VR controller. PSYS is a system input power monitor that facilitates the

monitoring of the total platform system power. For more information regarding PSYS please contact Intel, inc.

AUX_IN

The AUX_IMON current monitor input is a means of measuring the VCCIN_AUX platform VR output current using the IMVP9.2 ADC.

Programming Pin

This is a multifunction select pin used to set the operation of multiple features and the combination of these features enabled/disabled. Items programmed on this pin are ICC*2_MAIN_RAIL which allows the user to select if the ICCMAX and IOUT reporting for the main rail is a 1 A or 2 A LSB step size. When off, the resolution is 1 A per LSB. When on, the resolution is set to 2 A per LSB which allows reporting of over 255 A on the main rail only.

Automatic Power Management is used to add or remove phases based on real time load current requirements sensed by the controller. The phase configuration levels are defined as:

- <5A = DCM
- <15A = CCM 1-phase
- <25A = CCM 2-phase
- >25A = CCM All phases on

The other options include dithering and acoustic noise solution.

THEORY OF OPERATION

Input Voltage Feed-Forward (VRMP Pin)

Ramp generator circuits are provided for the dual-edge modulator. The ramp generators implement input voltage feed-forward control by varying the ramp slopes proportional to the VRMP pin voltage. The VRMP pin also has a UVLO function, which is active only after the controller is enabled. The VRMP pin is high impedance input when the controller is disabled. For multi-phase operation, the dual-edge PWM ramp amplitude is changed according to the following:

$$VRMP_{PP} = 0.1 \times V_{VRMP} \quad (\text{eq. 2})$$

Figure 4. Ramp Feed Forward

An external voltage divider is required on this VRMP pin in order to scale the voltage seen on the VRMP pin the voltage divider on the pin needs to be setup to maintain a ratio of 1/12. Typical resistor values may include 1 MOhm R_{up} / 90.9 KOhm R_{down} or 1.1 MOhm R_{up} / 100 KOhm R_{down} . UVLO on VRMP is inactive in PS4 power state and PS3 when a VID to 0 V is received.

Figure 5. Ramp Feed Forward Circuit

Differential Current Feedback Amplifiers

Each phase of the rail has a low offset, differential amplifier to sense the current of that phase in order to balance current. The CSREF and CSPx pins are high impedance inputs, but it is recommended that any external filter resistor RCSN does not exceed 10 kΩ to avoid offset due to leakage current.

It is also recommended that the voltage sense element be no less than 0.5 mΩ for best current balance.

The external filter RCSN and CCSN time constant should match the inductor L/DCR time constant, but fine tuning of this time constant is generally not required. Phase current

signals are summed with the COMP or ramp signals at their respective PWM comparator inputs in order to balance phase currents via a current mode control approach.

$$R_{CSN} = \frac{L_{PHASE}}{C_{CSN} \times DCR} \quad (\text{eq. 3})$$

Figure 6. Per Phase Current Sense Network

Total Current Sense Amplifier

The multiphase rail uses a patented approach to sum the phase currents into a single, temperature compensated, total current signal. This signal is then used to generate the output voltage droop, total current limit, and the output current monitoring functions. The $R_{ref}(n)$ resistors average the voltages at the output terminals of the inductors to create a low impedance reference voltage at CSREF. The R_{ph} resistors sum currents from the switch nodes to the virtual CSREF potential created at the CSSUM pin by the amplifier. The total current signal is the difference between the CSCOMP and CSREF voltages.

The amplifier filters, and amplifies, the voltage across the inductors in order to extract only the voltage across the inductor series resistances (DCR). An NTC thermistor (R_{th}) in the feedback network placed near the Phase 1 inductor senses the inductor temperature, and compensates both the DC gain and the filter time constant for the change in DCR with temperature. The Phase 1 inductor is chosen for the thermistor location so that the temperature of the inductor providing current in the PS1 power mode.

The DC gain equation for the DC total current signal is:

$$V_{CSCOMP} - V_{CSREF} = - \frac{R_{CS2} + \frac{R_{CS1} \times R_{th}}{R_{CS1} + R_{th}}}{R_{ph}} \times DCR \times I_{OUT} \quad (\text{eq. 4})$$

Set the DC gain by adjusting the value of the R_{ph} resistors in order to make the ratio of total current signal to output current equal the desired loadline. The values of R_{cs1} and R_{cs2} are set based on the effect of temperature on both the thermistor and inductor, and may need to be adjusted to eliminate output voltage temperature drift with the final product enclosure and cooling.

Figure 7. Total Current Sense Amplifier

The pole frequency of the CSCOMP filter should be set equal to the zero of the output inductor. This causes the total current signal to contain only the component of inductor voltage caused by the DCR voltage, and therefore to be proportional to inductor current. Connecting Ccs2 in parallel with Ccs1 allows fine tuning of the pole frequency using commonly available capacitor values. It is best to perform fine tuning during transient testing.

$$F_z = \frac{DCR_{25^\circ C}}{2\pi \times L_{Phase}} \quad (\text{eq. 5})$$

$$F_p = \frac{1}{2\pi \times \left(R_{CS2} + \frac{R_{CS1} \times R_{th}}{R_{CS1} + R_{th}} \right) \times (C_{CS1} + C_{CS2})} \quad (\text{eq. 6})$$

This signal then goes through a standard error compensation network and into the inverting input of the error amplifier.

The value of the CREF capacitor (in nF) on the CSREF pin should be:

$$C_{ref} = \frac{0.02 \times R_{ph}}{R_{ref}} \quad (\text{eq. 7})$$

High Performance Voltage Error Amplifier

The Remote Sense Amplifier output feeds a Type III compensation network formed by the Error Amplifier and external tuning components. The non-inverting input of the error amplifier is connected to the same reference voltage used to bias the Remote Sense Amplifier output.

Figure 8. Error Amplifier

Loadline Programming (V_{DROOP})

An output loadline is a power supply characteristic wherein the regulated (DC) output voltage decreases proportional to load current. This characteristic can reduce the output capacitance required to maintain output voltage within limits during load transients faster than those to which the regulation loop can respond.

A load line is produced by adding a signal proportional to output load current (V_{DROOP}) to the output voltage feedback signal – thereby satisfying the voltage regulator at an output voltage reduced proportional to load current. The load line is programmed by setting the gain of the Total Current Sense Amplifier such that the total current signal is equal to the desired output voltage droop.

$$V_{DROOP} = \frac{R_{CS2} + \frac{R_{CS1} \times R_{th}}{R_{CS1} + R_{th}}}{R_{ph}} \times DCR \times I_{OUT} \quad (\text{eq. 8})$$

For the main rail, loadline programming is dependent on its programmed ICCMAX value.

$$\text{Loadline} = DCR \times \frac{R_{CS}}{R_{ph}} \times \text{Weighting} \quad (\text{eq. 9})$$

For ICC*2_MAIN_RAIL configuration enabled, weighting = 87.50%.

For ICC*2_MAIN_RAIL configuration disabled, weighting = 43.75%.

For the A rail, load line weighting = 93.75%.

Rail Remote Sense Amplifier

A high performance high input impedance true differential amplifier is provided to accurately sense regulator output voltage. The VSP and VSN inputs should be connected to the regulator's output voltage sense points. The remote sense amplifier takes the difference of the output voltage with the DAC voltage and adds the droop voltage.

$$V_{DIFFOUT} = (V_{VSP} - V_{VSN}) + (1.3 \text{ V} - V_{DAC}) + (V_{DROOP} - V_{CSREF}) \quad (\text{eq. 10})$$

Programming the Current Limit

The current limit thresholds are programmed with a resistor between the ILIM and CSCOMP pins. The multiphase rails generates a replica of the CSREF pin voltage at the ILIM pin, and compares ILIM pin current to ICL0 and ICLM0 (ICL1 and ICLM1 in PS1, PS2 and PS3). The controller latches off if ILIM pin current exceeds ICL0 (ICL1 for PS1, PS2, and PS3) for t_{OCP_DELAY} and latches off immediately if ILIM pin current exceeds ICLM0 (ICLM1 for PS1, PS2 and PS3). Set the value of the current limit resistor RLIMIT according to the desired current limit I_{out} LIMIT.

$$R_{LIMIT} = \frac{R_{CS2} + \frac{R_{CS1} \times R_{th}}{R_{CS1} + R_{th}}}{R_{ph}} \times DCR \times I_{OUT_LIMIT} \quad (\text{eq. 11})$$

Table 13. PHASE CONFIGURATION

Phase Configuration	Programming Pin in CSPx	Unused Pin
8 + 1	All CSP pins are connected normally	No unused Pin
7 + 1	CSP1 to CSP7 and CSP1A pins connected normally. CSP8 connected to VCC through a 2 kΩ resistor.	Float PWM8.
6 + 1	CSP1 to CSP6 and CSP1A pins connected normally. CSP7 connected to VCC through a 2 kΩ resistor.	Float PWM8 and CSP8. Use PWM7 for programming ICC*2_MAIN_RAIL only.
5 + 1	CSP1 to CSP5 and CSP1A pins connected normally. CSP6 connected to VCC through a 2 kΩ resistor.	Float PWM8, CSP7, and CSP8. Use PWM7 for programming ICC*2_MAIN_RAIL only. Use PWM6 for programming ICCMAX_AUXIN only.
8 + 0	CSP1 to CSP8 pins connected normally. CSP1A connected to VCC through a 2 kΩ resistor.	Float PWM1A.
4 + 1	CSP1 to CSP4 and CSP1A pins connected normally. CSP5 connected to VCC through a 2 kΩ resistor.	Float PWM8, CSP6, CSP7, and CSP8. Use PWM7 for programming ICC*2_MAIN_RAIL only. Use PWM6 for programming ICCMAX_AUXIN only. Use PWM5 for programming ROSCA only.
3 + 1	CSP1 to CSP3 and CSP1A pins connected normally. CSP4 connected to VCC through a 2 kΩ resistor.	Float PWM8, CSP5, CSP6, CSP7, and CSP8. Use PWM7 for programming ICC*2_MAIN_RAIL only. Use PWM6 for programming ICCMAX_AUXIN only. Use PWM5 for programming ROSCA only. Use PWM4 for programming ROSC only.
2 + 1	CSP1 to CSP2 and CSP1A pins connected normally. CSP3 connected to VCC through a 2 kΩ resistor.	Float PWM8, CSP4, CSP5, CSP6, CSP7, and CSP8. Use PWM7 for programming ICC*2_MAIN_RAIL only. Use PWM6 for programming ICCMAX_AUXIN only. Use PWM5 for programming ROSCA only. Use PWM4 for programming ROSC only. Use PWM3 for programming ICCMAX only.
1 + 1	CSP1 and CSP1A pins connected normally. CSP2 connected to VCC through a 2 kΩ resistor.	Float PWM8, CSP3, CSP4, CSP5, CSP6, CSP7, and CSP8 Use PWM7 for programming ICC*2_MAIN_RAIL only. Use PWM6 for programming ICCMAX_AUXIN only. Use PWM5 for programming ROSCA only. Use PWM4 for programming ROSC only. Use PWM3 for programming ICCMAX only. Use PWM2 for programming VBOOT only.

FAULT PROTECTION

Over Current Protection (OCP)

A programmable total phase current limit is provided that is decreased when not operating in PS0 mode. This limit is programmed with a resistor between the CSCOMP and ILIM pins. The current from the ILIM pin to this resistor is compared to the ILIM Threshold Currents (ICL0, ICLM0, ICL1, and ICLM1). When the A rail is operating in PS0, if the ILIM pin current exceeds ICL0, an internal latch-off timer starts.

If the fault is not removed, the controller shuts down when the timer expires. If the current into the pin exceeds ICLM0, the controller shuts down immediately. When operating in PS1, PS2, or PS3, the ILIM pin current limits are ICL1 and ICLM1. To recover from an OCP fault, the EN pin or VCC voltage must be cycled low.

Input Under-voltage Lockouts (UVLO)

The VR monitors the 5 V VCC supply as well as the VRMP pin voltage. Hysteresis is incorporated within these monitors.

Output Under Voltage Monitor

The multiphase phase rail output voltage is monitored for under voltage at the output of the differential amplifier. If the

multiphase-phase rail output falls more than VUVM2 below the DAC-DROOP voltage, the UVM comparator will trip – sending the VR_RDY signal low.

Output Over Voltage Protection

The multiphase phase output voltage is monitored for OVP at the VSP pin. During normal operation, if an output voltage exceeds the DAC voltage by VOVP, the VR_RDY flag goes low, and the DAC voltage of the overvoltage rail will be slowly ramped down to 0 V to avoid producing a negative output voltage. At the same time, the PWM outputs of the overvoltage rail are sent low. The PWM output will pulse to mid-level during the DAC ramp down period if the output decreases below the DAC + OVP threshold as DAC decreases. When the DAC gets to zero, the PWMs will be held low, and the VR will stay in this mode until the VCC voltage or EN is toggled.

Absolute OVP

During start up, the OVP threshold is set to the absolute over voltage threshold. This allows the controller to start up without false triggering OVP.
