**UTILITY  
PATENT APPLICATION  
TRANSMITTAL**

(Only for new nonprovisional applications under 37 CFR 1.53(b))

|                        |                                                          |
|------------------------|----------------------------------------------------------|
| Attorney Docket No.    | MN1-001US                                                |
| First Inventor         | William J. Crilly, Jr.                                   |
| Title                  | Improved Multipath Communication Methods And Apparatuses |
| Express Mail Label No. |                                                          |

**APPLICATION ELEMENTS**

See MPEP chapter 600 concerning utility patent application contents.

1. ☒ Fee Transmittal Form (e.g., PTO/SB/17)  
(Submit an original and a duplicate for fee processing)
2. ☐ Applicant claims small entity status.  
See 37 CFR 1.27
3. ☒ Specification [Total Pages **56**]  
(preferred arrangement set forth below)
  - Descriptive title of the invention
  - Cross Reference to Related Applications
  - Statement Regarding Fed sponsored R & D
  - Reference to sequence listing, a table, or a computer program listing appendix
  - Background of the Invention
  - Brief Summary of the Invention
  - Brief Description of the Drawings (if filed)
  - Detailed Description
  - Claim(s)
  - Abstract of the Disclosure
4. ☒ Drawing(s) (35 U.S.C. 113) [Total Sheets **5**]
5. Oath or Declaration [Total Pages **3**]
  - a. ☒ Newly executed (original or copy)  
Copy from a prior application (37 CFR 1.63 (d))  
(for continuation/divisional with Box 18 completed)
  - b. ☐ **DELETION OF INVENTOR(S)**  
Signed statement attached deleting inventor(s)  
named in the prior application, see 37 CFR 1.63(d)(2) and 1.33(b)
6. ☐ Application Data Sheet. See 37 CFR 1.76

**ADDRESS TO:** Assistant Commissioner for Patents  
Box Patent Application  
Washington, DC 20231

7. ☐ CD-ROM or CD-R in duplicate, large table or Computer Program (Appendix)
8. Nucleotide and/or Amino Acid Sequence Submission (if applicable, all necessary)
  - a. ☐ Computer Readable Form (CRF)
  - b. Specification Sequence Listing on.
    - i. ☐ CD-ROM or CD-R (2 copies), or
    - ii. ☐ paper
  - c. ☐ Statements verifying identity of above copies

**ACCOMPANYING APPLICATION PARTS**

9. ☒ Assignment Papers (cover sheet & document(s))
10. ☐ 37 CFR 3.73(b) Statement (when there is an assignee) ☒ Power of Attorney
11. ☐ English Translation Document (if applicable)
12. ☐ Information Disclosure Statement (IDS)/PTO-1449 ☐ Copies of IDS Citations
13. ☐ Preliminary Amendment
14. ☒ Return Receipt Postcard (MPEP 503) (Should be specifically itemized)
15. ☐ Certified Copy of Priority Document(s) (if foreign priority is claimed)
16. ☐ Nonpublication Request under 35 U.S.C. 122 (b)(2)(B)(i). Applicant must attach form PTO/SB/35 or its equivalent.
17. ☐ Other:

18. If a CONTINUING APPLICATION, check appropriate box, and supply the requisite information below and in a preliminary amendment, or in an Application Data Sheet under 37 CFR 1.76:

☐ Continuation ☐ Divisional ☐ Continuation-in-part (CIP) of prior application No. \_\_\_\_\_  
Prior application information: Examiner \_\_\_\_\_ Group Art Unit \_\_\_\_\_

For CONTINUATION OR DIVISIONAL APPS only: The entire disclosure of the prior application, from which an oath or declaration is supplied under Box 5b, is considered a part of the disclosure of the accompanying continuation or divisional application and is hereby incorporated by reference. The incorporation can only be relied upon when a portion has been inadvertently omitted from the submitted application parts.

**19. CORRESPONDENCE ADDRESS**

**Improved Multipath Communication Methods And  
Apparatuses**

Inventor:  
William J. Crilly, Jr.

ATTORNEY'S DOCKET NO. MN1-001US

## Improved Multipath Communication Methods And Apparatuses

### RELATED APPLICATIONS

This application is related to and hereby claims priority to provisional Patent Application Serial Number 60/287,163, filed April 27, 2001, and titled "Improved Multipath Communication Methods And Arrangements", and which is included herein by reference.

### TECHNICAL FIELD

This invention relates to data communications, and more particularly to wireless communication systems, apparatuses and related methods that support wireless communication in a multipath signal propagation environment.

### BACKGROUND

Computers and other like devices can be interconnected in a variety of ways to allow data to be communicated between them. One of the most common ways to provide such data communication is through a wired network. Wired networks, such as, e.g., wide area networks (WANs) and local area networks (LANs) tend to have a high bandwidth and therefore can be configured to carry digital data at high data rates. One obvious drawback to wired networks is that a user's movement is constrained since the computer needs to be physically connected to the network. Thus, for example, a user of a portable computer will need to remain near to a wired network junction to stay connected to the wired network.

1       An alternative to wired networks is a wireless network that is configured to  
2 support similar data communications but in a more accommodating manner. Here,  
3 the user of a portable device will be free to move around a region that is supported  
4 by the wireless network. A well known example of a wireless network is a cellular  
5 telephone network. Indeed, in the past, cellular telephone modems have proven  
6 popular for use with portable laptop computers and other like devices, despite their  
7 relatively low bandwidth.

8       In the future it is expected that higher bandwidth wireless networks will  
9 become more popular, especially in creating metropolitan area networks (MANs)  
10 in which users, i.e., subscribers, have the ability to freely move their portable  
11 communicating devices around within a coverage area. However, as the  
12 subscribers move about freely there will not always be a clear or otherwise  
13 unobstructed communication path between a transmitting network resource and  
14 the receiving device. For example, one or more buildings, roadways, bridges, or  
15 other man-made objects may interfere with the transmission of signals in the  
16 wireless network. So too may non-manmade objects, such as, e.g., mountains,  
17 hills, valleys, trees, etc., reduce the effectiveness of the wireless network.

18       For these and other reasons, there is need for improved methods and  
19 apparatuses that can support wireless communications within such varying  
20 environments.

## 21 **SUMMARY**

22  
23       In accordance with certain aspects of the present invention, improved  
24 packet switched wireless data communication systems, networks, apparatuses, and  
25 related methods are provided.

1       The above stated needs and/or others are satisfied, for example, by a  
2 method in accordance with certain exemplary implementations of the present  
3 invention that includes identifying at least one multipath transmission delay within  
4 a reverse path data signal, determining at least one forward path pre-equalization  
5 parameter based on the transmission delay, and modifying a forward path data  
6 signal based on the forward path pre-equalization parameter.

7       In certain further implementations, the method also includes receiving the  
8 reverse path data signal over at least one reverse transmission path and  
9 transmitting the modified forward path data signal over at least one forward  
10 transmission path. Here, it is preferred that the reverse transmission path be  
11 substantially reciprocal to the forward transmission path, for example, at a given  
12 moment in time between a base station device and a consumer premise equipment  
13 device.

14       The reverse link transmission is essentially used to help characterize the  
15 multipath delays that may exist between the communicating devices. As such, in  
16 certain implementations the reverse path data signal includes a training sequence  
17 or other like known/substantially-known data that can be analyzed to detect  
18 transmission delays, especially delays that extend beyond established guard  
19 intervals.

20       In accordance with certain other implementations, such pre-equalization  
21 techniques can be advantageously combined, for example, with antenna  
22 arrangements that support transmission diversity, spatial division transmission,  
23 and/or other like techniques.  
24  
25

## **BRIEF DESCRIPTION OF THE DRAWINGS**

Fig. 1 is a block diagram depicting a communication system operating in a multipath environment, in accordance with certain exemplary implementations of the present invention.

Fig. 2 is a block diagram depicting certain functional blocks within a base station device and a CPE device, for example, as shown in Fig. 1, in accordance with certain exemplary implementations of the present invention.

Fig. 3 is a block diagram depicting certain functions within a transceiver functional block, for example, as shown in Fig. 2, in accordance with certain exemplary implementations of the present invention.

Fig. 4 is a graph depicting the magnitude of selected cross-correlation time samples illustrating, for example, that the multipath environment has caused certain delays with a transmitted signal, in accordance with certain exemplary implementations of the present invention.

Fig. 5 is a graph depicting the phase of a transmitted signal as received by various antenna elements within an antenna array, in accordance with certain exemplary implementations of the present invention.

Fig. 6 is a graph depicting the results of certain calculations showing the Fourier transform magnitude/delay for various FFT bins, in accordance with certain exemplary implementations of the present invention.

Fig. 7 is an illustrative diagram showing data that can be transmitted from the CPE device to the base station device to help characterize the multipath communication environment, in accordance with certain exemplary implementations of the present invention.

1 Fig. 8 is an illustrative diagram further showing data that can be transmitted  
2 from the CPE device to the base station device to help characterize the multipath  
3 communication environment, in accordance with certain exemplary  
4 implementations of the present invention.

5 Fig. 9 is a block diagram depicting a frequency domain based pre-equalizer  
6 process suitable for use in a pre-equalization function, for example, as in Fig. 3, in  
7 accordance with certain exemplary implementations of the present invention.

## 8 9 10 **DETAILED DESCRIPTION**

### 11 **Multipath Propagation Delays:**

12  
13 Wireless communication systems often operate under conditions that lead  
14 to multipath propagation of transmitted signals. Multipath propagation is  
15 primarily the result of reflections and diffraction from objects in the coverage area  
16 of the transmitting and receiving antennas.

17 High data rate communication systems may be subject to detrimental  
18 intersymbol interference caused by such multipath propagation or fading. As the  
19 symbol rate increases, for example, multipath fading from one symbol affects the  
20 next symbol, making it difficult, if not impossible, for the receiver to identify the  
21 desired (next) symbol and therefore determine its information content.

22 Multipath fading may be observed by examining the frequency domain  
23 characteristics of the communication channel. Here, for example, multipath  
24 fading will often cause the channel transfer function to have frequency-dependent  
25 responses that alter the amplitude and phase modulation content of a received

1 signal. Symbols having high information content may therefore be difficult to  
2 separately identify. This can be true even for small amplitude and/or phase shifts  
3 that exist across the modulation bandwidth of the signal.

4  
5 Traditional Modulation Techniques For Dealing With Multipath Propagation

6 Delays:

7 Various modulation techniques have been used independently and/or in  
8 combination to ameliorate or avoid intersymbol interference.

9 By way of example, certain modulation techniques include equalization  
10 techniques at the receiving node. Such equalization techniques are usually  
11 designed to calculate a channel correction in the time and/or frequency domain,  
12 and in response significantly correct for any associated multipath fading. Correct  
13 symbol identification decisions may also be used to estimate the channel at  
14 subsequent times. One of the drawbacks to this solution is that it places an  
15 additional burden on the receiving node to provide such equalization capabilities.

16 Additionally such equalization techniques are usually limited by their  
17 capability to estimate and correct the channel. However, some difficulty may be  
18 caused by the changing nature of the multipath channel. For example, the  
19 computation of multipath propagation correction parameters that is made at a  
20 receiver may need to be repeated if/when the channel changes in some way.  
21 Examples of dynamic multipath propagation changes include the movement of the  
22 receiver/antenna, trees moving in the wind, nearby vehicular traffic, etc. Such  
23 changes may have time scales ranging from a few milliseconds to a few seconds,  
24 depending on environmental conditions. Unfortunately, implementing such  
25 complex equalization techniques in a receiver may not always be feasible.

1 Other modulation techniques that have been developed include the use of  
2 Orthogonal Frequency Division Multiplexing (OFDM) to significantly increase  
3 the symbol time. This prevents a delayed symbol from deleteriously effecting a  
4 subsequent symbol. Basically, OFDM operates by coding a series of bits into a set  
5 of modulated orthogonal sub-carriers, thus producing a symbol to be transmitted.  
6 The transmitted OFDM symbol typically includes a guard interval (GI) that  
7 contains a cyclic extension of the basic symbol. When a GI is employed, it is  
8 typically designed to be longer than the expected multipath propagation delay  
9 spread of the channel.

10 OFDM is usually generated using an inverse fast Fourier transform (IFFT)  
11 process. Consequently, OFDM is then received using a fast Fourier transform  
12 (FFT) process. Techniques that establish the correct timing of FFT blocks and  
13 channel correction techniques for the GI based on the multipath fading are well  
14 known. One common technique, for example, is to use a complex correction value  
15 for each OFDM sub-carrier. The magnitude of the complex correction value can  
16 be obtained from the inverse of the sub-carrier magnitude, and the phase can be  
17 determined from a linear regression of the phase of pilot sub-carriers and other  
18 signals in training symbols.

19 One of the drawbacks to the OFDM GI is that the system may still be  
20 susceptible to multipath delays that are beyond the GI.

21 In still other systems, spread spectrum techniques may be used to encode a  
22 bit into a long coded sequence having a narrow autocorrelation function. A spread  
23 spectrum receiver would then include, for example, a RAKE receiver with cross  
24 correlators, which are configured to identify and handle individual multipath  
25

1 signals arriving at the receiver. Such spread spectrum techniques, however, may  
2 not prove to be economically viable solutions in every situation.

3 Other modulation techniques that can reduce the affects of multipath delays  
4 on a communication system include ideas such as rapidly changing channels to  
5 produce an adequate signal at a different time. For example, see "Multicarrier  
6 Modulation For Data Transmission: An Idea Whose Time Has Come" by John A.  
7 C. Bingham, published in *IEEE Communications Magazine*, May 1990.

8 In general, the various techniques described above utilize time and/or  
9 frequency diversity to overcome potential multipath transmission problems. The  
10 corresponding modulation systems, therefore, tend to spread a given amount of  
11 information over a band of frequencies or in time to provide improved  
12 performance within the multipath environment.

13  
14 Traditional Antenna Techniques For Dealing With Multipath Propagation Delays:

15 In addition to the above techniques, various antenna designs may be used to  
16 further ameliorate the effects of multipath propagation and fading. Certain  
17 systems, for example, employ what is commonly referred to as spatial division  
18 techniques. Here, transmitting antennas having narrow beam widths are employed  
19 to reduce multipath propagation caused by reflections from various objects by not  
20 illuminating those objects in the first place. Thus, usually only local diffraction  
21 and retro-reflection from objects more directly behind the receiving antenna, for  
22 example, remain to produce multipath fading.

23 Similarly, a receiving antenna with a narrow beam width may also help to  
24 reduce some remaining multipath fading. Here, however, one disadvantage is that  
25 the intended receiving node must determine or otherwise be specifically

1 configured to receive signals from a direct path while avoiding certain multipath  
2 propagation signals.

3 Spatial division techniques may be performed with single or multielement  
4 transmitting and/or receiving antennas. Some multielement antennas, for example,  
5 are also referred to as phased array antennas.

6 Multielement transmitting antennas are advantageous for several reasons.  
7 For example, multielement transmitting antennas distribute required average  
8 signal power over a number of separate low power amplifiers, which tends to  
9 reduce the complexity of each of the associated power amplifiers.

10 Furthermore, multielement transmitting and receiving antennas often have  
11 the advantage of reducing or eliminating antenna pointing requirements. Phased  
12 arrays, for example, are capable of providing flexible antenna patterns and  
13 simultaneously transmitting and receiving in several directions using the same  
14 antenna aperture. Due to this flexibility and the other advantages, phased arrays  
15 are very helpful in the reception and amelioration of signals that are affected by  
16 multipath fading.

17 Antenna spatial diversity is yet another subset of antenna techniques used  
18 to reduce the effects of multipath fading. Here, for example, multiple transmitting  
19 antennas that are physically spaced apart, e.g., by more than a wavelength, have  
20 the ability to produce different amplitude and phase shifts over the frequency band  
21 that is used. Computations based on the received signals from the antennas may  
22 be used to establish one or more paths between the transmitting and receiving  
23 sites. In addition, the signal-to-noise ratio (SNR) may be improved by combining  
24 signal paths coherently, and/or errors reduced in multiple post-detection decoders.  
25 Coherent combining techniques basically overlap spatial division techniques,

1 because coherent combining enhances antenna patterns in some directions and  
2 minimizes the pattern in other directions.

3 Indeed, antenna processing techniques may also be employed to actually  
4 take advantage of multipath propagation. By way of example, in an extension of  
5 the spatial diversity techniques, multiple transmitting antennas having physical  
6 spacing of more than a few wavelengths may be used to illuminate scattering areas  
7 with slightly different wave fronts. As such, the separate transmit signals diffract  
8 or reflect off the illuminated areas and are picked up by a receiver antenna array.

9 In effect, the scattering regions become somewhat poor, yet at times very  
10 large, pseudo-lenses that can be intentionally illuminated by the distant  
11 transmitting antennas. A large pseudo-lens has the ability to resolve closely  
12 spaced distant points, as determined by the Aires Disk of the effective pseudo-lens  
13 aperture. Receiver signal processing may then act to correct the phase and  
14 amplitude errors of such large pseudo-lenses.

15 Thus, in one example, a number of separate possible paths between the  
16 transmitter and receiver may be determined by the rank of a matrix establishing  
17 the paths between the transmitter and receiver antennas. This ranking may be  
18 determined by the richness of the scattering paths and the number of receiving and  
19 transmitting antennas. When the ranking is high, it is often possible to provide  
20 high spectral efficiency as measured in bits per second per Hz.

21 The antenna signal processing techniques described above are limited,  
22 however, by a fundamental capability of the average-power-limited transmitter to  
23 adequately transmit the signals to the receiver. Here, Shannon's Capacity  
24 Theorem determines the bit rate capacity of each of the effective multipath  
25 channels between the transmitter and receiver. For example, in a multipath

1 channel with equal-amplitude direct and reflecting paths, an identical minimum  
2 SNR is required for each received path. Hence, adequate received signal power  
3 needs to be available to maintain the SNR above this minimum value.

4 The SNR may be improved by increasing the average transmitter power, by  
5 directing greater power at the receiver and at the scattering object, and/or by  
6 gathering more power at the receiver, e.g., by using a larger receiver antenna  
7 aperture. In the case of a larger receiver antenna aperture, a multielement large  
8 aperture receive antenna may be used in combination with signal processing to  
9 separately extract data from each multipath propagation. At the transmitting site,  
10 single element antennas or multielement transmit antennas with array signal  
11 processing may be used to direct power in specific directions.

12  
13 Conclusion Regarding Such Traditional Techniques:

14 Although the various techniques described above greatly improve the  
15 capacity of a wireless system/network to carry information, there are remaining  
16 difficulties.

17 By way of example, channel equalization of high symbol rate systems  
18 typically requires many taps in a transversal filter, and/or requires long IFFT/FFTs  
19 to be calculated.

20 Another example relates to the use of a GI or the like. Low symbol rate  
21 systems, such as, e.g., OFDM symbols, can be very robust for a pre-determined  
22 multipath delay spread by providing an appropriate guard interval (e.g., a guard  
23 interval that is longer than the longest expected multipath delay spread).  
24 However, such potentially long GIs essentially set the time duration of the FFT  
25 processing step in OFDM. Thus, a long GI tends to reduce capacity. A long FFT

1 processing tends to increase latency. Long FFTs also usually require data to be  
2 placed in large blocks, and/or zero-padded, which adds overhead.

3 Spread spectrum systems, such as those described above, tend to lose the  
4 orthogonality of sequences when multipath fading is present, thereby reducing the  
5 capacity of the system.

6 While transmit spatial division antenna processing is sometimes capable of  
7 eliminating highly-delayed multipath fading, it may not be capable of eliminating  
8 retro-reflected multipath fading.

9 Spatial receive diversity techniques usually increase the reliability, and  
10 potentially the capacity of the channel. However, spatial diversity techniques have  
11 the disadvantage that significant antenna signal processing is required at the  
12 receiver. Indeed, such receive antenna signal processing usually requires separate  
13 receive antennas and receivers for each path.

14 Consequently, none of the various techniques provide a simple and cost  
15 effective solution to multipath fading. For this reason, it may be advantageous to  
16 combine a plurality of these techniques and/or others within one system. For  
17 example, the combination of OFDM and other techniques has been shown, see,  
18 e.g., United States Patent No. 5,282,222, and/or United States Patent No.  
19 5,029,184.

20 The Wi-LAN transmitter described by United States Patent No. 5,282,222  
21 uses a measurement of the differential channel amplitude and estimates the  
22 differential channel phase based on the assumption of a minimum phase multipath  
23 characteristic. A training signal and GI are not required. However, multiple point  
24 channel equalization is not possible within a single OFDM sub-channel. This  
25 limits the maximum delay spread to approximately the symbol duration.

1 The OFDM equalizer in the receiver taught by United States Patent No.  
2 5,029,184 requires two symbols to be transmitted per desired symbol.

3 Note that the above-described techniques/systems do not provide  
4 equalization for a large delay spread when the radio chipsets and associated  
5 physical layer standards do not include amelioration of these long delay spreads.

6 In accordance with certain aspects of the present invention, improved  
7 methods, apparatuses and systems are provided to overcome these and/or other  
8 shortcomings of conventional wireless systems/networks.

9  
10 Introducing Novel Pre-Equalization Techniques:

11 As signal processing costs are reduced, techniques involving greater  
12 computation are usually preferred over those requiring more transmitter power.  
13 Furthermore, as part of a design process it is usually preferred that any required  
14 additional processing complexity be implemented at the node/location which is  
15 least subject to complexity restrictions, such as a base station or the like in a  
16 wireless communication system/network. With these and/or other design  
17 considerations in mind, in accordance with certain aspects of the present invention  
18 equalization techniques are provided for use at a transmitting node and configured  
19 to perform pre-equalization that substantially reduces unwanted effects associated  
20 with multipath fading, including retro-reflected propagation delays. Such pre-  
21 equalization techniques are discussed in greater detail in later sections.

22 As is well known, many materials are electromagnetically isotropic, which  
23 is a property resulting from symmetry in their associated permittivity and  
24 permeability tensors. The Lorentz Reciprocity Theorem applies to such materials.  
25 Refraction and dielectric reflection from materials therefore often show

1 reciprocity, or equivalence of forward and reverse channel characteristics.  
2 Diffraction and reflection are inherently reciprocal due to the minimal media  
3 affecting the electromagnetic wave. Thus, reciprocity can be used to determine  
4 channel characteristics that are used while pre-equalizing a transmitted path. The  
5 use of a reciprocal channel is very useful, for example, when Time Division  
6 Duplex (TDD) channels are implemented.

7 In accordance with certain implementations of the present invention, a  
8 wireless system/network is provided which is capable of operating in a multipath  
9 environment. For example, improved methods and apparatuses are provided for  
10 use in the wireless system/network to significantly minimize the complexity of  
11 signal processing required at the receiving node. Here, the receiving node may  
12 include a single receive antenna or multiple receive antennas.

13 As described above, some conventional techniques use OFDM signal  
14 sequences to correct for multipath effects due to multipath delay spread shorter  
15 than the guard interval. A new wireless system/network is described herein, which  
16 uses a novel combination of new and known techniques to further improve  
17 multipath propagation delay handling and to also reduce the complexity of signal  
18 processing required at the receiver.

19 Although several OFDM-based system examples are provided herein, it  
20 should be recognized that the various methods and apparatuses are fully  
21 adaptable/applicable to other communication protocols, standards, schemes, and/or  
22 systems. Moreover, such pre-equalization and like methods and apparatuses may  
23 also be advantageously combined with other existing techniques to improve  
24 communication within a multipath environment.  
25

1 With this in mind, in certain exemplary implementations a signal  
2 processing technique combines or otherwise includes transmitter antenna spatial  
3 division processing, antenna diversity processing, and/or receiver OFDM sub-  
4 carrier equalization, with OFDM pre-equalization. The exemplary OFDM pre-  
5 equalization technique basically acts within the frequency band of OFDM sub-  
6 carriers to pre-equalize the multipath channel to handle multipath delay spread  
7 greater than the delay protection provided by conventional OFDM signal  
8 processing techniques, such as, e.g., the OFDM GI. Thus, the receiver can still  
9 correct multipath effects that are less than the GI.

10 The pre-equalization techniques use training sequences, which are  
11 contained within a reverse link received OFDM burst, to specifically adjust  
12 associated transmission signals/parameters applied to subsequent OFDM  
13 transmissions back towards that particular node. In accordance with certain  
14 implementations, for example, the training sequences may or may not be part of  
15 the header and equalization sequences provided for in a conventional chipset or  
16 standard. Furthermore, in certain implementations substantially fewer OFDM  
17 symbols may be transmitted, than may be in more traditional systems.

18  
19 An Exemplary Multipath Environment:

20 Reference is now made to Fig. 1, which is a block diagram depicting an  
21 exemplary communication system 100 operating in a multipath environment.  
22 Here, a base station device 102 is configured to exchange data with at least one  
23 customer premise equipment (CPE) device 104 through an antenna 108 and over a  
24 wireless communication link. Base station device 102 is further operatively  
25 configured to send and receive data via one or more networks 106. In this manner,

1 data can be received through network 106 by base station 102, and then forwarded  
2 over a wireless communication link to CPE device 104 using antenna 108.  
3 Likewise, in reverse order, CPE device 104 can transmit data over a wireless  
4 communication link to base station device 102 through antenna 108, and base  
5 station 102 may then forward the received data to other device via network 106.

6 As illustrated in this example, a transmission 109, which is generated by  
7 base station device 102, is emitted from antenna 108. Transmission 109 takes a  
8 direct path to CPE device 104. However, given the physical surroundings,  
9 transmission 109 radiates and is reflected or diffused, for example, by one or more  
10 objects 110 that are closer to antenna 109. This causes a multipath propagation  
11 signal 111 to be directed towards CPE device 104. Similarly, some of the  
12 electromagnetic energy in transmission 109 can be retro-reflected back towards  
13 CPE device 104, as multipath propagation signal 115, by one or more objects 114  
14 located further away from antenna 109. Other types of multipath propagation  
15 signals may also be created by various other objects within the coverage field of  
16 transmission 109.

17 CPE device 104 is representative of any type of device that may be capable  
18 of sending and receiving data over a wireless communication link. By way of  
19 example, CPE device 104 may include a computer, a portable computer, a personal  
20 digital assistant (PDA), a mobile communication device, such as, e.g., a mobile  
21 telephone or other like handheld device.

22  
23 Exemplary Base Station and CPE Nodes:

25

1 mechanisms associated with the functionality of CPE device 104. Thus, for  
2 example, in certain implementations CPE device 104 includes a computer or like  
3 computing device. As such, CPE mechanism(s) 210 may take the form of a  
4 processor that is coupled to memory and operatively configured to perform  
5 functions in accord with one or more computer instructional programs, e.g.,  
6 application programs. In still other implementations, CPE device 1-4 may include  
7 a mobile telephone, in which case, CPE mechanism(s) 210 may include a signal  
8 processor and other circuitry for converting digital audio data into an applicable  
9 analog audio signal and converting an analog audio signal into corresponding  
10 digital data.

11 Logic 212 is provided in this example to represent any applicable additional  
12 logic/circuitry that may be used to implement the all or part of the methods and  
13 apparatuses of the present invention. In certain implementations, logic 212 may  
14 be incorporated in transceiver 208. For this reason, logic 212 is depicted within a  
15 dashed line box.

16  
17 Providing A Pre-Equalization Capability At An Exemplary Base Station Node:

18 Attention is now drawn to the block diagram in Fig. 3, which depicts  
19 exemplary functions provided within in transceiver 204, in accordance with  
20 certain implementations of the present invention.

21 Fig. 3 is a functional block diagram, wherein a set of coded data to be  
22 transmitted from base station device 102 to CPE device 104 is further prepared,  
23 pre-equalized and eventually transmitted. Here, for example, a set of coded data  
24 may comprise ninety-six bits of binary data, which is applied in pairs to (or  
25 otherwise processed by) OFDM processing block 302.

1 In this example, OFDM processing block 302 is configured to generate  
2 corresponding Quadrature Phase Shift Keying (QPSK) modulation values for each  
3 of forty-eight OFDM sub-carriers. These OFDM modulated sub-carriers may, for  
4 example, be output by an OFDM IFFT (not shown). The OFDM modulated sub-  
5 carriers are then provided to a pre-equalization block 304.

6 Pre-equalization block 304 is configured to modify one or more of the  
7 OFDM modulated sub-carriers based on information from a reverse link  
8 processing block 308. Reverse link processing block 308 is basically configured  
9 to identify multipath propagation delays and/or problems for packets transmitted  
10 from CPE device 104 to base station device 102. One exemplary way to recognize  
11 multipath delays is to have CPE device 104 transmit a known sequence of  
12 data/tones. The received signal can then be compared or contrasted with the  
13 known sequence and differences detected, the differences being at least partially  
14 associated with the multipath communication environment. The differences, or  
15 information derived from such differences can then be used within pre-  
16 equalization block 304 to modify, in some manner, as applicable, the OFDM  
17 modulated sub-carriers. The modified OFDM modulated sub-carriers are then  
18 provided to antenna processing block 306, wherein they are further processed and  
19 eventually transmitted using one or more antennas 108.

20 Those skilled in the art will recognize that reverse link processing block  
21 308 and pre-equalization block 304 may be implemented in a variety of ways. In  
22 certain exemplary implementations, for example, reverse link processing block  
23 308 may include a tapped transversal filter, or FFT/multipliers/IFFT filter of  
24 length on the order of the longest expected multipath delay. The complex  
25 coefficients of the tapped filter, or the complex multiplier values, may be derived

1 from the complex cross-correlation of the known OFDM signal sequences and the  
2 sequences received from the reverse path signal 310.

3 The result of a sample cross-correlation output is shown in Fig. 4, which  
4 shows a graph 400 illustrating the magnitude of cross-correlation time samples  
5 plotted as line 402. Here, the period covered by an exemplary OFDM GI is also  
6 depicted. Line 402 illustrates that a multipath delay spread that is greater than the  
7 OFDM guard interval should be used.

8 Thus, pre-equalization block 304 may be configured, in this example, to  
9 invert the measured channel response so that the pre-equalization and the actual  
10 subsequently induced channel response errors substantially cancel out. As a result,  
11 transceiver 208 in the receiving CPE device will receive a signal that is essentially  
12 significantly free of troublesome multipath signals that are longer than the GI.  
13 Transceiver 208, therefore, will be able to reproduce and output the set of coded  
14 data, perhaps only with correctable errors. Such errors can be overcome/corrected  
15 by further employing error control coding techniques, such as, e.g., CRC and other  
16 like techniques.

17 In certain systems, it may be likely that the reverse link bursts transmitted  
18 to base station device 102 fall below the noise level in the full bandwidth of the  
19 system. However, header signals, e.g., SIGNAL and pre-SIGNAL headers in  
20 IEEE 802.11a can be detected at lower levels. For example, the cross-correlation  
21 of the known header with signals received on two phased arrays would usually  
22 allow for improved sensitivity detection. This detection may be necessary for pre-  
23 equalization of the channel and for diversity summing to take place. An OFDM  
24 signal, for example IEEE 802.11a, may be detected at lower levels by using cross-  
25 correlation with a known PILOT tone sequence. If fewer pilots are transmitted,

1 then power may be concentrated in the pilots (provided, regulatory limitations are  
2 not exceeded). The offset of the cross correlation of known headers is to reduce  
3 the effective bandwidth, essentially establishing an effect similar to a RAKE  
4 receiver receiving a direct sequence waveform.

5 Continuing with this example, the subsequent multipath estimate can then  
6 be used to estimate antenna pointing and/or determine the near-optimal summation  
7 of signals received by the two phased array antennas. The base station device 102  
8 produces a directed signal to CPE device 104 using substantially the same antenna  
9 and pre-equalized settings/parameters. If TDD is used, then the channel can be  
10 assumed to be reciprocal for durations (coherence time) of approximately 10 ms.  
11 The 10 ms duration can be determined in a fixed wireless system by passing  
12 vehicles, moving people, blowing trees, and/or other interruptions nearby or  
13 within the communication path/region.

14 An important aspect in certain implementations is that no attempt need be  
15 made to pre-equalize multipath delays less than the provided GI of the OFDM  
16 signal. Only those multipath signals that have an impact on the signal through  
17 OFDM inter symbol interference need be pre-equalized for at base station 102.  
18 Moreover, base station 102 can be further configured to post equalize the signals  
19 received from CPE device 104 based on the results of the reverse link processing.

20 The presence of fewer tones in the header and pilots potentially complicates  
21 the process of determining pre/post –equalization channel coefficients and/or other  
22 like parameters. This is due, for example, to the inadequate resolution in  
23 frequency, and thus inversely in time, which leads to aliasing as described in later  
24 sections.  
25

1       The typical GI used in an OFDM system is usually only a small portion of  
2       the overall symbol time. For example, an OFDM symbol time of ten  
3       microseconds results from a sixty-four subcarrier OFDM system operating in a 6.4  
4       MHz bandwidth. Thus, in this example, a GI may be chosen to be one  
5       microsecond to reduce overhead.

6       The delay spread is the time difference between the first and last arriving  
7       (significant) multipath propagated signal. In this example, the first and last  
8       arriving multipaths must arrive within one microsecond of each other to allow for  
9       successful conventional OFDM reception. As mentioned, however, some retro-  
10      reflected multipath propagated signals may produce delays that exceed this GI.  
11      For example, retro-reflected signals propagating from an object 114 (see Fig. 1)  
12      located at a distance of about one km behind the receiving CPE device 104 will  
13      result in an approximate 6.6 microsecond delay spread. Thus, the resulting  
14      composite signal cannot be handled by a conventional OFDM transceiver using a  
15      one microsecond GI.

16      When a phased array antenna 108 is used at the base station node to further  
17      ameliorate the effect of multipath, antenna element coefficients may be determined  
18      by evaluating, for example, the discrete Fourier transform (DFT) of the signals  
19      received on the elements of the phased array.

20      Referring next to graph 500 in Fig. 5, the effect of a direct and multipath  
21      signal can be seen by line 502, which plots the received signal phase for various  
22      numbered antenna elements.

23      After computation, for example, using an FFT to derive the angular  
24      distribution of the received signals, and cross-correlated the signals with known  
25      sequences, the delay and angle of arrival of the direct and multipath signal may be

1 determined. Graph 600 in Fig. 6 shows the results of such calculations in the form  
2 of plotted lines 602 and 604 corresponding to the Fourier transform  
3 magnitude/delay for various FFT bins. Also shown is the corresponding delay  
4 period covered by a traditional GI 606.

5 In some situations the direct and multipath signals may be combined to  
6 actually improve the signal-to-noise ratio (SNR). However, in the exemplary  
7 situation shown in Fig. 6, the additional delay of a multipath signal 604 exceeds  
8 the GI used in the OFDM modulation. Knowing that the channel is essentially  
9 reciprocal allows a pre-equalization of the signals to be applied to the phased array  
10 during subsequent forward path transmissions from base station device 102 to  
11 CPE device 104. Alternatively, the pre-equalized signals may be applied at only  
12 one angle. In this case, pre-equalization may not be desired/necessary. In some  
13 cases two delays, in the same direction, may be determined in the cross-  
14 correlation/reverse link processing, as a result of retro-reflected multipath  
15 propagation. In which case, pre-equalization can then be employed to  
16 substantially correct the channel.

17 In those systems where only a few transmit antennas are used, transmit  
18 antenna diversity and like techniques may also be implemented in place of phased  
19 array transmission/processing.

20 For example, reverse link processing block 308 can be configured to  
21 determine or otherwise identify the best antenna to be used for reception based on  
22 measurements of the reverse link. Here, SNR, cross-correlation of the known  
23 sequences, or other measurements may be made. As multipath propagated signals  
24 longer in duration than the guard interval may be present, a determination can be  
25 made as to which antenna to select for the transmission of the pre-equalized

1 signals. Thus, the combination of pre-equalization and diversity help to reduce the  
2 multipath signals at CPE device 104 to a level that allows the detection of user  
3 data, perhaps with correctable errors.

4 In accordance with certain further aspects of the present invention, transmit  
5 diversity may be implemented using simultaneous transmission of coded user data  
6 on diversity antennas. In systems where many transmit elements are used,  
7 transmit antenna diversity may be implemented in combination with phased array  
8 processing.

9 For example, base station device 102 may be configured to generate two  
10 simultaneous beams illuminating separate areas of a multipath environment. The  
11 transmit signals applied to the two antennas can be selectively adjusted in phase  
12 and amplitude to produce a signal at CPE device 104 that is substantially free of  
13 multipath propagated signals greater in delay than the GI. If a strong composite  
14 signal is received still containing a relatively large delay spread, then pre-  
15 equalization techniques may be applied by base station device 102, thereby driving  
16 the two beams to ameliorate the long delay spread of one or both of the multipaths.  
17 The system may further be configured to include antenna patterns other than a  
18 dual beam approach. For example, the transmitted pattern may be determined by  
19 an incident reverse path power pattern.

20 As an example of known headers that may be used to support training  
21 sequences, can be found in the IEEE 802.11a standard. IEEE 802.11a provides  
22 short and long sequences totaling a duration of about 8  $\mu$ s. The 8  $\mu$ s may be used  
23 to ascertain delay spread to approximately 8  $\mu$ s delay. The known sequences have  
24 sufficient low frequency energy per burst (here, low being between about 100 kHz  
25

1 and 125 kHz, 1/8  $\mu$ s resolution) to determine fine variations in the complex  
2 channel response.

3 As described, traditional OFDM systems rely on the GI to eliminate  
4 multipath effects during transmission of the tones in the OFDM signal. Longer  
5 delays require longer GIs. The techniques shown here use the long and short  
6 sequences to perform channel estimation, and decision feedback equalization,  
7 following the headers to equalize the channel for delays that are greater than  $1/\Delta f$ ,  
8 where  $\Delta f$  is the subcarrier (in OFDM) spacing.

9  
10 Some Exemplary Training Sequences:

11 As described, CPE device 104 is configured to transmit a signal or signals  
12 back to base station device 102 over the reverse link transmission path. One or  
13 more of these transmissions may include training sequences that are designed to  
14 allow reverse link processing block 308 (see Fig. 3) to determine what if any  
15 changes need to be made in pre-equalizing the signals transmitted on the forward  
16 link transmission path from base station device 102 to CPE device 104.

17 The training sequences preferably include either substantially known or  
18 perfectly known training sequences. The training sequences in certain  
19 implementations, for example, may be included in the data or payload section of  
20 the OFDM symbols. In other implementations, known portions of a header or  
21 preamble may be used as the training sequence. The resulting training sequence  
22 signals may take a number of modulated forms, such as, e.g., spread spectrum  
23 signals, OFDMA signals, or other like signals.

24 One exemplary implementation includes a training sequence within a  
25 physical layer PDU in an IEEE 802.11(a) system as illustrated in Fig. 7. Here, a

1 frame 700 includes a preamble portion 702, a signal portion 704, and a payload  
2 portion 706. Payload portion 706 includes a training sequence 708 in the form of  
3 OFDM data/symbols. Preferably, training sequence 708 is adequately long  
4 enough to serve its purpose for the intended system and the OFDM data/symbols  
5 are not repeated.

6 An illustrative waterfall representation is shown in Fig. 8. Here, power,  
7 time and frequency are plotted in a first graph 802 along with a corresponding  
8 constellation map (Q-I) in a second graph 804 illustrating the trajectory of the  
9 training sequence for an exemplary 16 QAM system. Here, the training sequence  
10 includes unique symbols identified by blocks 806 lettered A, B, C, D, E, F, G, and  
11 H, for example.

#### 12 13 Exemplary Techniques For Dealing With Aliasing:

14 As described earlier, aliasing may occur, for example, when too few  
15 symbols are transmitted. Aliasing may be dealt with by estimating on which  
16 aliased signal set the delay that needs to be pre/post-equalized actually exists, and  
17 making corrections accordingly. Thus, for example, if several potential aliased  
18 delays are found and in amongst them lies the actual delay to be pre/post –  
19 equalized against, then an iterative procedure can be followed wherein guesses are  
20 made, parameters set, and signals pre-equalized and transmitted. When the correct  
21 (actual) signal set is found and attempted to be equalized, then CPE device 104  
22 will successfully receive the transmission and reply accordingly. If after  
23 transmitting a pre-equalized signal no reply (e.g., an acknowledgement) is  
24 received then it can be assumed that the signal set that was selected is only an  
25 aliased signal set. Subsequent transmission attempts with other selected signal

sets (or regions) being pre-equalized can then be made. Preferably error correction techniques will also be employed to help CPE device 104 to process the transmitted signals.

Exemplary Low Bandwidth Reverse Link:

In accordance with certain further aspects of the present invention, it was recognized that in certain implementations it may be possible to use an IEEE 802.11a transmission on the reverse link to base station device 102 at a bit rate much less than the minimum 6 Mbps in the current standard. This may prove useful, for example, when CPE device 104 operates at much lower power levels than base station device 102 (which may operate at 1 watt, for example). Here, a slower speed reverse link may actually work better anyway due to shadow fading or otherwise poor link budget.

Thus, CPE device 104 can be configured to selectively make changes to the transmission process by backing out the effects of an interleaver, a FEC convolutional coder, and/or scrambler that may be included, for example, within transceiver 208. Furthermore, the same or other logic within CPE device 104 may be configured to force a constant phase shift, e.g., QPSK symbol over a long number of OFDM symbols, e.g., 16. Within transceiver 204 of base station device 102, the GI can then be removed and a long FFT performed on the compressed time interval due to GI removal. The long FFT length may be, e.g.,  $16 \times 64$  point = 1024 point, wherein the bandwidth is 1/16 of the 64 point FFT, resulting in an SNR improvement of about 16, i.e.,  $10 \log 16 = 12.04$  dB.

The systems above may be used with any OFDM modulated CPE devices. For example, by allowing for a slow phase rotation during the 16 symbol interval,

1 OFDMA may be implemented. This would allow for more than one reverse link  
2 to be present at a time, thereby improving the reverse link capacity. If QAM  
3 modulation is used, for example, as opposed to QPSK, then slower phase rotation  
4 may be used. This would allow more of the 16 bins per 64 bins to be used. The  
5 data is provided in the tones in the usual way, but with a different phase, amplitude  
6 (QAM) per tone (of the 64 tones). This coding can be performed, for example, by  
7 applicable computer instructions within the logic of CPE device 104. This allows  
8 for the applicable power control, QAM modulation mapping and virtually all other  
9 “normal” operations to appear in the resulting modulation. This provides the  
10 ability to deploy IEEE 802.11a, for example, client devices and subsequently  
11 provide infrastructure that is capable of receiving the weak reverse link signals  
12 from such client devices.

13  
14 Exemplary Frequency Domain Pre-Equalization Techniques:

15 In accordance with certain further implementations of the present invention,  
16 the pre-equalization techniques described herein may, for example, take advantage  
17 of frequency domain equalization techniques such as those described by Van  
18 Acker, et al., in an article titled “Per Tone Equalization For DMT-Based Systems”,  
19 as published in *IEEE Transactions On Communications*, Vol. 49, No. 1, January  
20 2001, and which is incorporated herein by reference. Van Acker et al., teach that a  
21 receiver can benefit from certain frequency domain equalization techniques.

22 Here, the Van Acker et al. equalization techniques are adapted for use in  
23 pre-equalizing signals in the transmitting portion of a base station or like  
24 device/node. An example of a frequency domain based pre-equalizer process 900  
25

1 suitable for use in pre-equalization process 304 (see Fig. 3) is shown in the block  
2 diagram of Fig. 9.

3 In this example, frequency domain based pre-equalizer process 900 is  
4 shown to include, within the base station device transceiver, a pre-equalization  
5 processing block 304' having its output coupled to an antenna processing block  
6 306, similar to that shown in Fig. 3. Here, however, pre-equalization processing  
7 block 304' includes several FFTs and IFFTs that are arranged to allow equalization  
8 parameters to be operatively applied to signals transformed from the time domain  
9 to a corresponding frequency domain. More particularly, several FFTs 902 are  
10 provided to receive signals that are to be transmitted. FFTs 902 convert these time  
11 domain signals, each of which is associated with a particular OFDM tone, into  
12 corresponding frequency domain signals. The outputs from FFTs 902 are  
13 provided to a scaling process 908 (or other like process) along with the  
14 desired/calculated channel coefficients or like parameters from a reverse link  
15 processing block 308 (not shown). Scaling process 908 modifies each tone as  
16 needed in accordance with the measured/estimated channel characteristics.

17 The scaled signals output by scaling process 908 are still frequency domain  
18 signals. To convert the scaled signals back in to a corresponding time domain, the  
19 scaled signals are then input to IFFTs 904. IFFTs 904 convert the scaled signals  
20 into corresponding time domain scaled signals. These time domain scaled signals  
21 are then selectively input to a longer (e.g., 64 input/output) FFT 906 that is used to  
22 complete the sub-band frequency domain equalization. In this illustrative  
23 diagram, each input to FFT 906 is switched such that it selects one of the time  
24 domain scaled signals output by an IFFT 904. The 64 selected scaled tone signals  
25

1 output by IFFT 904 are then provided to antenna processing block 306 for further  
2 processing and eventual transmission.

3 During transmission, the multipath environment alters the transmitted  
4 signals as represented by a summation process 912 that includes channel noise, for  
5 example, within the transmitted signals. The environmentally modified signals are  
6 received by the transceiver in the CPE device, wherein the signals may be stored  
7 in a memory device 914 and then provided to an FFT 916. Here, FFT 916 would  
8 be a longer (e.g., 64 input/output) FFT configured to process/convert the received  
9 signals. For example, FFT 916 can provide a one point FIR correction for each  
10 received tone signal.

11 In this implementation, the frequency domain processing provided above  
12 essentially acts a sub-band equalizer in the transmitting node (here, the base  
13 station device). The GI and other one point FIR correction is then provided in the  
14 receiver (here, the CPE device). Another aspect of this type of system is that  
15 power may be set to be equal in each of the sub-bands, allowing regulatory rules,  
16 such as FCC rules, to be satisfied. In this manner, the power may be substantially  
17 flattened over the spectrum.

18  
19 Using Reduced Spectral Power Density Transmissions:

20 The power in each sub-carrier in the above example may be held  
21 substantially constant. A modification to the system involves the determination of  
22 a worst case path loss over the OFDM tones, for example, through the use of  
23 reciprocal measurements. Then the highest allowed power spectral density for that  
24 particular sub-carrier is used, while the power spectral density for other tones is  
25 reduced to allow the other tones to sustain the same level of QAM, QPSK, BPSK,

1 etc. By reducing the power of the other tones, an improvement may be had with  
2 respect to the capacity of the system as a result of lower interference being  
3 generated. Thus, for example, doing so could allow the power amplifier to carry  
4 additional channels for the same PEP level.

5 The requisite power spectral density needed to establish a level of QAM  
6 can be determined, for example, by path loss estimation and the knowledge of the  
7 reverse link power level transmitted on the reverse link. Thus, logic operating on  
8 the CPE device may assist in the determination.

9 One exemplary method involves establishing a reverse link, having the  
10 CPE device provide information to the base station device regarding the power  
11 levels being used on the reverse link. Next, reciprocal path loss measurements are  
12 made by the base station device and a link budget for a particular QAM level is  
13 determined. Then variations in channel path loss can be used to set/reset  
14 minimum/maximum power levels for a particular QAM level, e.g., 16 QAM.

15 Sub-carrier/channel equalization is then provided by the base station device  
16 and the signals are transmitted to the CPE device. The CPE device then performs  
17 single point FIR equalization to decode the QAM (e.g., 16 QAM) tones. Then a  
18 decoder process corrects the errors caused, for example, by the tones that are  
19 below the QAM threshold.

20  
21 Further Extensions Of The Above Methods and Apparatuses:

22 As described and shown, cross-correlation processing, FFT processing and  
23 filtering may be implemented in a variety of ways. For example, it is possible to  
24 combine OFDM FFT processing and pre-equalization filtering. Cross-correlation  
25 may be best performed in the frequency domain using the previously calculated

1 DFTs of the known OFDM signal sequences. The resulting calculations reduce to  
2 the calculation of a single FFT and a set of multiplications. Many other signal  
3 processing techniques may also be used.

4 Other implementations of this invention may be derived from the disclosed  
5 contents herein. By way of example, a practitioner may implement a high data  
6 rate communication system using separately calculated multipaths, with all of the  
7 paths transmitting on the same frequency. Another implementation may use  
8 receiver OFDM channel equalization for delays greater than the guard interval,  
9 thus improving performance.

10 In still other implementations, a reverse channel quality indicator, and/or  
11 the measured forward channel impulse response, may be transmitted on the  
12 reverse path when channel reciprocity is not available. Such a system may be  
13 useful when Frequency Division Duplex or Half Frequency Division Duplex is  
14 used.

15 In Frequency Division Duplex systems, short training signals may be  
16 periodically transmitted using Time Division Duplex on each of the frequencies  
17 used for Frequency Division Duplex. Multiple RF signals, operating on the same  
18 and different frequencies, may also be simultaneously transmitted and received.  
19 Furthermore, the operation of the described wireless system on the forward path  
20 may be similarly implemented in a wireless system on the reverse path.

21  
22 An example of channel measurement and correction:

23 Certain exemplary 64-point FFT OFDM systems have a first tone measured  
24 on the reverse link to have a normalized amplitude slope from about 0.4 to about  
25 0.25 and a phase shift from about 10 to about 100 degrees. The measurement can

1 be performed using a 256-point FFT, for example. As such, eight samples are  
2 available to determine channel characteristics. Pre-equalization, for example, can  
3 then be applied on the forward link in the frequency domain using a 2.5 to 4  
4 normalized amplitude and -10 to -100 degree slope across the eight frequency  
5 domain samples. A second OFDM tone can be calculated in a similar way.

#### 6 7 Conclusion

8 Although some preferred implementations of the various methods and  
9 arrangements of the present invention have been illustrated in the accompanying  
10 Drawings and described in the foregoing Detailed Description, it will be  
11 understood that the invention is not limited to the exemplary implementations  
12 disclosed, but is capable of numerous rearrangements, modifications and  
13 substitutions without departing from the spirit of the invention as set forth and  
14 defined by the following claims.

**CLAIMS**

What is claimed is:

1. A method comprising:
  - identifying at least one multipath transmission delay within a reverse path data signal;
  - determining at least one forward path pre-equalization parameter based on said at least one transmission delay; and
  - modifying a forward path data signal based on said at least one forward path pre-equalization parameter.
2. The method as recited in Claim 1, further comprising:
  - receiving said reverse path data signal over at least one reverse transmission path.
3. The method as recited in Claim 2, further comprising:
  - transmitting said modified forward path data signal over at least one forward transmission path.
4. The method as recited in Claim 1, wherein said reverse path data signal includes at least one type of data selected from a group of different types of data comprising Orthogonal Frequency Division Multiplexing (OFDM) data and Quadrature Phase Shift Keying (QPSK) data.

5. The method as recited in Claim 1, wherein said modified forward path data signal includes at least one type of data selected from a group of different types of data comprising Orthogonal Frequency Division Multiplexing (OFDM) data and Quadrature Phase Shift Keying (QPSK) data.
6. The method as recited in Claim 5, wherein said modified forward path data signal includes sub-carrier pre-equalized OFDM data.
7. The method as recited in Claim 6, further comprising:  
generating corresponding Quadrature Phase Shift Keying (QPSK) modulation values based on said sub-carrier pre-equalized OFDM data.
8. The method as recited in Claim 4, wherein identifying said at least one multipath transmission delay includes:  
identifying at least one multipath transmission delay spread that is greater than a guard interval.
9. The method as recited in Claim 1, wherein said reverse path data signal includes identifiable training data.

- 1 10. The method as recited in Claim 9, further comprising:  
2 comparing said received identifiable training data to a local  
3 version of said training data to identify said at least one multipath  
4 transmission delay within said reverse path data signal.  
5
- 6 11. The method as recited in Claim 3, wherein modifying said forward  
7 path data signal based on at least one forward path pre-equalization  
8 parameter further includes:  
9 selectively inverting and applying a measured channel  
10 response to said forward path data signal to significantly reduce  
11 subsequent induced deleterious channel response changes to said  
12 modified forward path data signal during transmission over said at  
13 least one forward transmission path.  
14
- 15 12. The method as recited in Claim 3, wherein said at least one reverse  
16 transmission path is substantially reciprocal to said at least one  
17 forward transmission path.  
18
- 19 13. The method as recited in Claim 1, wherein identifying said at least  
20 one multipath transmission delay, determining said at least one  
21 forward path pre-equalization parameter, and modifying said  
22 forward path data signal are performed by a first device.  
23  
24  
25

- 1 14. The method as recited in Claim 13, wherein said first device  
2 includes a base station device that is operatively configurable for use  
3 in a wireless communication system.  
4
- 5 15. The method as recited in Claim 13, further comprising:  
6 using at least one first device receive antenna operatively  
7 coupled to said first device to receive said reverse path data signal  
8 over at least one reverse transmission path from a second device.  
9
- 10 16. The method as recited in Claim 15, wherein said second device  
11 includes a customer premise equipment (CPE) device that is  
12 operatively configurable for use in a wireless communication  
13 system.  
14
- 15 17. The method as recited in Claim 16, wherein said CPE device  
16 includes at least one device selected from a group of devices  
17 comprising a computer, a portable computer, a personal digital  
18 assistant (PDA), and a mobile communication device.  
19
- 20 18. The method as recited in Claim 15, wherein said at least one first  
21 device receive antenna includes at least one type of antenna selected  
22 from a group of suitable types of antennas comprising at least one  
23 omnidirectional type of antenna, at least one beam type of antenna,  
24 at least one phased array type of antenna, and at least one adaptive  
25 antenna.

1  
2 19. The method as recited in Claim 15, wherein said first device is  
3 operatively coupled to a plurality of first device receive antennas.

4  
5 20. The method as recited in Claim 13, further comprising;  
6 receiving said reverse path data signal over at least one  
7 reverse transmission path; and  
8 causing said first device to post equalize at least a portion of  
9 said received reverse path signal.

10  
11 21. The method as recited in Claim 15, wherein determining said at least  
12 one forward path pre-equalization parameter based on said at least  
13 one transmission delay further includes:  
14 determining at least one angle of arrival of said reverse path  
15 data signal with respect to said at least one first device receive  
16 antenna.

17  
18 22. The method as recited in Claim 15, further comprising:  
19 using at least one second device transmit antenna operatively  
20 coupled to said second device and configured to transmit said  
21 reverse path data signal over said at least one reverse transmission  
22 path to said first device.  
23  
24  
25

- 1 23. The method as recited in Claim 22, wherein a plurality of second  
2 device transmit antennas are operatively coupled to said second  
3 device and configured to transmit said reverse path data signal over  
4 said at least one reverse transmission path to said first device.  
5  
6 24. The method as recited in Claim 22, further comprising:  
7 causing said second device to transmit at least two reverse  
8 path data signals over said at least one reverse transmission path to  
9 said first device.  
10  
11 25. The method as recited in Claim 24, wherein said at least two reverse  
12 path data signals include Orthogonal Frequency-Division Multiple  
13 Access (OFDMA) data.  
14  
15 26. The method as recited in Claim 22, further comprising:  
16 causing said second device to transmit said reverse path data  
17 signal over said at least one reverse transmission path to said first  
18 device at a bit rate less than about 6 Mbps.  
19  
20 27. The method as recited in Claim 22, further comprising:  
21 causing said second device to transmit corresponding second  
22 device transmission power level information to said first device; and  
23 causing said first device to adjust at least one transmission  
24 power level associated with said forward path data signal based on  
25 said second device transmission power level information.

28. The method as recited in Claim 13, further comprising:  
using at least one first device transmit antenna operatively coupled to said first device to transmit said modified forward path data signal over at least one forward transmission path to a second device.
29. The method as recited in Claim 28, wherein said at least one first device transmit antenna is operatively configurable to provide transmission diversity when transmitting said modified forward path data signal.
30. The method as recited in Claim 28, wherein said at least one first device transmit antenna is operatively configurable to provide spatial division transmission when transmitting said modified forward path data signal.
31. The method as recited in Claim 28, wherein said at least one first device transmit antenna includes at least one type of antenna selected from a group of suitable types of antennas comprising at least one omnidirectional type of antenna, at least one beam type of antenna, at least one phased array type of antenna, and at least one adaptive antenna.

- 1 32. The method as recited in Claim 28, further comprising:  
2 setting at least one antenna pointing parameter associated  
3 with said at least one first device transmit antenna based on said at  
4 least one forward path pre-equalization parameter.  
5
- 6 33. The method as recited in Claim 28, further comprising:  
7 setting at least one phased array antenna transmission  
8 directing parameter associated with said at least one first device  
9 transmit antenna based on said at least one forward path pre-  
10 equalization parameter.  
11
- 12 34. The method as recited in Claim 28, further comprising;  
13 selectively transmitting said modified forward path data  
14 signal at one angle with respect to said first device transmit antenna.  
15
- 16 35. The method as recited in Claim 28, further comprising:  
17 selecting said at least one first device transmit antenna from a  
18 plurality of first device transmit antennas that are each operatively  
19 coupled to said first device.  
20
- 21 36. The method as recited in Claim 35, further comprising:  
22 selectively transmitting a plurality of beams using two or  
23 more first device transmit antennas.

1 41. The method as recited in Claim 1, wherein determining said at least  
2 one forward path pre-equalization parameter based on said at least  
3 one transmission delay further includes:

4 sub-band equalizing said forward path data signal using  
5 corresponding frequency domain reverse path data.  
6

7 42. The method as recited in Claim 1, wherein modifying said forward  
8 path data signal based on said at least one forward path pre-  
9 equalization parameter further includes:

10 selectively setting different transmission power levels for at  
11 least two Orthogonal Frequency Division Multiplexing (OFDM)  
12 tones in said forward path data signal based on said at least one  
13 forward path pre-equalization parameter.  
14

15 43. A system comprising:

16 a first device operatively configurable to connect to at least a  
17 second device over a wireless communication path, said first device  
18 having logic that is configured to detect a multipath transmission  
19 delay in at least one reverse path data signal transmitted by said  
20 second device, determine at least one forward path pre-equalization  
21 parameter based on said detected multipath transmission delay, and  
22 pre-equalize a forward path data signal that is to be transmitted to  
23 said second device based on said at least one forward path pre-  
24 equalization parameter.  
25

- 1 44. The system as recited in Claim 43, wherein said first device further  
2 comprising:  
3 at least one first device antenna; and  
4 at least one transceiver operatively coupled to said at least  
5 one first device antenna and said logic, said at least one transceiver  
6 being configurable to receive said reverse path data signal over at  
7 least one reverse transmission path using said at least one first device  
8 antenna and provide said reverse path data signal to said logic, and  
9 transmit said modified forward path data signal from said logic over  
10 at least one forward transmission path.  
11
- 12 45. The system as recited in Claim 43, wherein said reverse path data  
13 signal includes at least one type of data selected from a group of  
14 different types of data comprising Orthogonal Frequency Division  
15 Multiplexing (OFDM) data and Quadrature Phase Shift Keying  
16 (QPSK) data.  
17
- 18 46. The system as recited in Claim 43, wherein said modified forward  
19 path data signal includes at least one type of data selected from a  
20 group of different types of data comprising Orthogonal Frequency  
21 Division Multiplexing (OFDM) data and Quadrature Phase Shift  
22 Keying (QPSK) data.  
23
- 24 47. The system as recited in Claim 46, wherein said modified forward  
25 path data signal includes sub-carrier pre-equalized OFDM data.

- 1  
2 48. The system as recited in Claim 47, wherein said logic is further  
3 configured to produce corresponding Quadrature Phase Shift Keying  
4 (QPSK) modulation values based on said sub-carrier pre-equalized  
5 OFDM data.  
6  
7 49. The system as recited in Claim 45, wherein said logic detects said  
8 multipath transmission delay by identifying at least one multipath  
9 transmission delay spread that is greater than a guard interval.  
10  
11 50. The system as recited in Claim 43, wherein said reverse path data  
12 signal includes identifiable training data.  
13  
14 51. The system as recited in Claim 50, wherein said logic is further  
15 configured to compare said received identifiable training data to a  
16 non-multipath delayed version of said training data to detect said  
17 multipath transmission delay.  
18  
19 52. The system as recited in Claim 44, wherein said logic is configured  
20 to selectively invert and apply a measured channel response to said  
21 forward path data signal to significantly reduce subsequent induced  
22 deleterious channel response changes to said modified forward path  
23 data signal during transmission over said at least one forward  
24 transmission path.  
25

- 1 53. The system as recited in Claim 44, wherein said at least one reverse  
2 transmission path is substantially reciprocal to said at least one  
3 forward transmission path.  
4
- 5 54. The system as recited in Claim 43, wherein said first device includes  
6 a base station device that is operatively configurable for use in a  
7 wireless communication system.  
8
- 9 55. The system as recited in Claim 44, further comprising:  
10 said second device, in the form of a customer premise  
11 equipment (CPE) device that is operatively configurable for use in a  
12 wireless communication system.  
13
- 14 56. The system as recited in Claim 55, wherein said CPE device  
15 includes at least one device selected from a group of devices  
16 comprising a computer, a portable computer, a personal digital  
17 assistant (PDA), and a mobile communication device.  
18
- 19 57. The system as recited in Claim 44, wherein said first device is  
20 operatively coupled to a plurality of first device receive antennas.  
21
- 22 58. The system as recited in Claim 44, wherein said logic is configured  
23 to post-equalize at least a portion of said received reverse path  
24 signal.  
25

- 1 59. The system as recited in Claim 44, wherein said logic is further  
2 configured to determine at least one angle of arrival of said reverse  
3 path data signal with respect to said at least one first device antenna.  
4
- 5 60. The system as recited in Claim 55, wherein said second device  
6 includes at least one second device antenna that is operatively  
7 configurable to transmit said reverse path data signal over said at  
8 least one reverse transmission path to said first device and receive  
9 said transmitted modified forward path data signal from said first  
10 device over said at least one forward transmission path.  
11
- 12 61. The system as recited in Claim 60, wherein said second device  
13 includes a plurality of second device antennas that are operatively  
14 configurable to transmit said reverse path data signal over said at  
15 least one reverse transmission path to said first device.  
16
- 17 62. The system as recited in Claim 60, wherein said second device is  
18 configurable to transmit at least two reverse path data signals over  
19 said at least one reverse transmission path to said first device.  
20
- 21 63. The system as recited in Claim 62, wherein said at least two reverse  
22 path data signals include Orthogonal Frequency-Division Multiple  
23 Access (OFDMA) data.  
24  
25

- 1 64. The system as recited in Claim 60, wherein said second device is  
2 configurable to transmit said reverse path data signal over said at  
3 least one reverse transmission path to said first device at a bit rate  
4 less than about 6 Mbps.  
5
- 6 65. The system as recited in Claim 60, wherein said second device is  
7 configurable to transmit corresponding second device transmission  
8 power level information to said first device, and said first device is  
9 further configurable to adjust at least one transmission power level  
10 associated with said forward path data signal based on said second  
11 device transmission power level information.  
12
- 13 66. The system as recited in Claim 44, wherein said at least one first  
14 device antenna is operatively configurable to provide transmission  
15 diversity when transmitting said modified forward path data signal.  
16
- 17 67. The system as recited in Claim 44, wherein said at least one first  
18 device antenna is operatively configurable to provide spatial division  
19 transmission when transmitting said modified forward path data  
20 signal.  
21
- 22 68. The system as recited in Claim 44, wherein said at least one first  
23 device antenna includes at least one first device transmit antenna and  
24 at least one first device receive antenna.  
25

- 1 69. The system as recited in Claim 68, wherein said at least one first  
2 device transmit antenna includes at least one type of antenna  
3 selected from a group of suitable types of antennas comprising at  
4 least one omnidirectional type of antenna, at least one beam type of  
5 antenna, at least one phased array type of antenna, and at least one  
6 adaptive antenna.
- 7
- 8 70. The system as recited in Claim 68, wherein said at least one first  
9 device receive antenna includes at least one type of antenna selected  
10 from a group of suitable types of antennas comprising at least one  
11 omnidirectional type of antenna, at least one beam type of antenna,  
12 at least one phased array type of antenna, and at least one adaptive  
13 antenna.
- 14
- 15 71. The system as recited in Claim 68, wherein said logic is further  
16 configured to establish at least one antenna pointing parameter  
17 associated with said at least one first device transmit antenna based  
18 on said at least one forward path pre-equalization parameter.
- 19
- 20 72. The system as recited in Claim 68, wherein said logic is further  
21 configured to establish at least one phased array antenna  
22 transmission directing parameter associated with said at least one  
23 first device transmit antenna based on said at least one forward path  
24 pre-equalization parameter.
- 25

- 1 73. The system as recited in Claim 68, wherein said logic is further  
2 configurable to cause said at least one transceiver to selectively  
3 transmit said modified forward path data signal at one angle with  
4 respect to said at least one first device transmit antenna.  
5  
6 74. The system as recited in Claim 68, wherein said logic is further  
7 configurable to cause said at least one transceiver to select said at  
8 least one first device transmit antenna from a plurality of first device  
9 transmit antennas that are each operatively coupled to said first  
10 device.  
11  
12 75. The system as recited in Claim 74, wherein said logic is further  
13 configurable to cause said at least one transceiver to selectively  
14 transmit a plurality of beams using two or more first device transmit  
15 antennas.  
16  
17 76. The system as recited in Claim 75, wherein each of said transmitted  
18 plurality of beams is selectively adjusted in phase and amplitude to  
19 reduce multipath affects when received by said second device.  
20  
21 77. The system as recited in Claim 60, wherein said at least one second  
22 device antenna includes at least one second device transmit antenna  
23 and at least one second device receive antenna.  
24  
25

- 1 78. The system as recited in Claim 77, wherein said second device  
2 includes a plurality of second device receive antennas that are  
3 configurable to receive said transmitted modified forward path data  
4 signal over said at least one forward transmission path from said first  
5 device.  
6
- 7 79. The system as recited in Claim 43, wherein said logic is further  
8 configurable to iteratively selectively test different forward path pre-  
9 equalization parameters over time such that aliased multipath delays  
10 within said reverse path data signal are identifiable.  
11
- 12 80. The system as recited in Claim 43, wherein said logic is configured  
13 to provide sub-band equalizing of said forward path data signal  
14 using corresponding frequency domain reverse path data.  
15
- 16 81. The system as recited in Claim 43, wherein said logic is further  
17 configurable to cause said transceiver to selectively establish  
18 different transmission power levels for at least two Orthogonal  
19 Frequency Division Multiplexing (OFDM) tones in said forward  
20 path data signal based on said at least one forward path pre-  
21 equalization parameter.  
22  
23  
24  
25

- 1 82. An apparatus comprising:
  - 2 an Orthogonal Frequency Division Multiplexing (OFDM)
  - 3 processor configured to receive coded data and output corresponding
  - 4 OFDM data;
  - 5 a pre-equalizer operatively coupled to said OFDM processor
  - 6 and configured to receive said OFDM data and output pre-equalized
  - 7 OFDM data based on gathered reverse link data;
  - 8 at least one antenna; and
  - 9 a transceiver operatively coupled to said pre-equalizer and
  - 10 said at least one antenna, said transceiver being configured to receive
  - 11 said pre-equalized OFDM data from said pre-equalizer and apply a
  - 12 corresponding transmittable forward link data signal to said at least
  - 13 one antenna.
- 14
- 15 83. The apparatus as recited in Claim 82, wherein said transceiver is
- 16 configurable to receive a transmitted reverse link data signal using
- 17 said at least one antenna and output corresponding reverse link data,
- 18 and further comprising:
  - 19 reverse link logic operatively coupled to said at least one
  - 20 antenna and said operatively coupled to said at least one first device
  - 21 antenna, said reverse link logic being configured to detect at least
  - 22 one multipath induced delay in said reverse link data and provide
  - 23 associated said gathered reverse link data to said pre-equalizer.
  - 24
  - 25

- Lee & Hayes, PLLC*

1  
2 90. The apparatus as recited in Claim 82, wherein said apparatus  
3 includes a base station device suitable for use in a wireless  
4 communication system.

5  
6 91. The apparatus as recited in Claim 82, wherein said at least one  
7 antenna is operatively configurable to provide transmission diversity.

8  
9 92. The apparatus as recited in Claim 82, wherein said at least one  
10 antenna is operatively configurable to provide spatial division.

11  
12 93. The apparatus as recited in Claim 82, wherein said at least one  
13 antenna includes at least one transmit antenna and at least one  
14 receive antenna.

15  
16 94. The apparatus as recited in Claim 93, wherein said at least one  
17 transmit antenna includes at least one type of antenna selected from  
18 a group of suitable types of antennas comprising at least one  
19 omnidirectional type of antenna, at least one beam type of antenna,  
20 at least one phased array type of antenna, and at least one adaptive  
21 antenna.

95. The apparatus as recited in Claim 93, wherein said at least one receive antenna includes at least one type of antenna selected from a group of suitable types of antennas comprising at least one omnidirectional type of antenna, at least one beam type of antenna, at least one phased array type of antenna, and at least one adaptive antenna.

1  
2 **ABSTRACT**

3       Methods, apparatuses and systems are provided for identifying at least one  
4       multipath transmission delay within a reverse path data signal, determining at least  
5       one forward path pre-equalization parameter based on the transmission delay, and  
6       modifying a forward path data signal based on the forward path pre-equalization  
7       parameter. A reverse link transmission is used to help characterize the multipath  
8       delays that may exist between communicating devices. The reverse path data  
9       signal can include a training sequence or other like known/substantially-known  
10      data that can be analyzed to detect transmission delays, especially delays that  
11      extend beyond established guard intervals. Such pre-equalization techniques can  
12      be advantageously combined, for example, with antenna arrangements that support  
13      transmission diversity, spatial division transmission, and/or other like techniques.

2   Inventorship.....Crilly Jr.  
 3   Applicant .....Mabuhay Networks, Inc.  
 4   Attorney's Docket No. ....MN1-001US  
 5   Title: Improved Multipath Communication Methods And Apparatuses

6                   **DECLARATION FOR PATENT APPLICATION**

7                   As a below named inventor, I hereby declare that:

8                   My residence, post office address and citizenship are as stated below next to  
 9                   my name.

10                  I believe I am the original, first and sole inventor (if only one name is listed  
 11                  below) or an original, first and joint inventor (if plural names are listed below) of the  
 12                  subject matter which is claimed and for which a patent is sought on the invention  
 13                  entitled "Wireless Packet Switched Communication Systems And Networks Using  
 14                  Adaptively Steered Antenna Arrays," the specification of which is attached hereto.

15                  I have reviewed and understand the content of the above-identified  
 16                  specification, including the claims.

17                  I hereby claim benefit under 35 U.S.C. 119(e) of United States Provisional  
 18                  Application 60/287,163, filed April 27, 2001.

19                  I acknowledge the duty to disclose information which is material to the  
 20                  examination of this application in accordance with Title 37, Code of Federal  
 21                  Regulations, § 1.56(a).

22                  PRIOR FOREIGN APPLICATIONS: no applications for foreign patents or  
 23                  inventor's certificates have been filed prior to the date of execution of this  
 24                  declaration.  
 25

**Power of Attorney**

I appoint the following attorneys to prosecute this application and transact all future business in the Patent and Trademark Office connected with this application: Lewis C. Lee, Reg. No. 34,656; Daniel L. Hayes, Reg. No. 34,618; Allan T. Sponseller, Reg. 38,318; James R. Banowsky, Reg. No. 37,773; Lance R. Sadler, Reg. No. 38,605; Thomas A. Jolly, Reg. No. 39,241; Kasey C. Christie, Reg. No. 40,559; Nathan R. Rieth, Reg. No. 44,302; Brian G. Hart, Reg. No. 44,421; David S. Thompson, Reg. No. 37,954; Paul W. Mitchell, Reg. No. 44,453; Bradley K. DeSandro, Reg. No. 34,521; Brian J. Pangrle, Reg. No. 42,973; David A. Morasch, Reg. No. 42,905; Robert R. Axenfeld, Reg. No. 37,276; Keith W. Saunders, Reg. No. 41,462; Kayla D. Brant, Reg. No. 46,57; and Michael G. Smith, Reg. No. 45,368.
