Published Date : 2023 Pages : 200 Region :

Share:   

PD-1 Non-Small Cell Lung Cancer Market

- The total **PD-1 Non-small Cell Lung Cancer Market Size** in the **7MM** was estimated to be nearly **USD 11,000 million** in **2023**, which is expected to show positive growth by 2034.
- In 2023, the US accounted for the maximum share of the total PD-1 Non-small Cell Lung Cancer Market in the 7MM, i.e., approximately 65%.
- PD-(L)1 therapies are mainly utilized in patients without genetic drivers. Merck's **KEYTRUDA** is generally considered the 'gold standard' of care in 1L **NSCLC** when combined with platinum chemotherapy, regardless of PD-1 status.
- Interestingly, the position of leading brands in the current competitive landscape largely mirrors the order of their market entry. KEYTRUDA and OPDIVO continue to command the checkpoint inhibitor market due to their early entry and established track record.
- Acquired resistance to these anti-PD-(L)1 therapies is a key issue. Given the high unmet need in this area, many companies are exploring novel molecules and combinations in second-line NSCLC post-IO.
- When KEYTRUDA loses exclusivity, the introduction of biosimilars is expected to significantly impact the PD- (L)1 inhibitor market. This event could potentially reshape the competitive landscape and influence patients' treatment options.
- DATO-Dxd and TRODELVY target the non-actionable genomic aberration NSCLC market. DATO-DxD targets TROP2, not HER2-expressing malignancies, and uses half as

Emerging players such as Merck, Bristol Myers Squibb, and AstraZeneca,

Genentech/Hoffmann-La Roche, CStone, Daiichi Sankyo/AstraZeneca, BeiGene, and others are evaluating their PD-1 Non-small Cell Lung Cancer therapies.

- The development of new targets beyond PD-(L)1 has faced challenges. TIGIT and TIM-3 were once promising new targets but have seen limited progress after experiencing high-profile failures. Despite this, both TIM-3 and TIGIT products are still in development.
- In May 2022, tiragolumab NSCLC trial, SKYSCRAPER-01, previously found the anti-TIGIT failed to improve PFS, but leaked overall survival data suggested it may be having a positive effect on overall survival. Recently, in July 2024, Roche halted another Phase II/III SKYSCRAPER-06 trial in first-line NSCLC because the combination of tiragolumab, + atezolizumab + pemetrexed, and carboplatin/cisplatin did not show a benefit over the established treatment comparator, pembrolizumab + pemetrexed and carboplatin/cisplatin. Roche hopes for tiragolumab mix in dust after multiple failure trials.

PD-1 Non-small Cell Lung Cancer Treatment Market: Understanding and Algorithm

There are mainly two types of lung cancer: small cell lung cancer (SCLC) and NSCLC. NSCLC is the most common type of lung cancer, accounting for approximately 85% of all lung cancer cases. If untreated, SCLC can be fatal in a few weeks, in contrast to most cases of NSCLC. The results of the standard treatment of NSCLC are poor except for the most localized cancers. The newly diagnosed patients with NSCLC are potential candidates for studies evaluating new forms of treatment. Immune checkpoint inhibitor therapy PD-(L)1 is a type of immunotherapy that is used in the treatment of NSCLC. PD-L1 can be aberrantly expressed on tumor cells, allowing them to escape immune surveillance and consequent killing by the host adaptive immune system. In NSCLC, PD-(L)1 expression reported as the percentage of viable tumor cells showing membranous staining for PD-(L)1 at immunohistochemistry (tumor proportion score, TPS) is a predictive biomarker of response to ICI targeting.

Further details related to diagnosis are provided in the report...

PD-1 Non-small Cell Lung Cancer Treatment

The results of the standard treatment of NSCLC are poor except for the most localized cancers. Newly diagnosed patients with NSCLC are potential candidates for studies evaluating new forms of treatment. Different types of treatment are available for NSCLC; however, mainly 10 types of standard treatment are used, which include Surgery, Radiation therapy, Chemotherapy, Targeted therapy, Immunotherapy, Laser therapy, Photodynamic therapy (PDT), Cryosurgery, Electrocautery, and Watchful waiting.

Several PD-(L)1 are expected to enter the NSCLC market; however, given the physicians' familiarity with the existing products on the market, we do not expect new entrants to disrupt the market significantly.

In the US, **KEYTRUDA**, **OPDIVO**, **TECENTRIQ**, **IMFINZI**, and **LIBTAYO** are the five main PD-(L)1 players. Both KEYTRUDA and OPDIVO were introduced in 2014 and had a sizable time advantage over rival drugs. KEYTRUDA and OPDIVO dominate the PD-1 market and, to some extent, compete with PD-(L)1.

PD-1 Non-Small Cell Lung Cancer Epidemiology

Source: PD-1 Non-Small Cell Lung Cancer Market Insight Report

PD-1 Non-small Cell Lung Cancer Epidemiology

The PD-1 Non-small Cell Lung Cancer epidemiology chapter in the report provides historical as well as forecasted epidemiology segmented by **Total Incident Cases of NSCLC**, **Gender-specific**

The total number of incident cases of NSCLC in the **FWM** was nearly **327,000** cases in **2023** and is projected to increase during the forecasted period.

- In **2023**, the incidence of NSCLC cases in the **United States** was ~**56%** in **males** and ~**44%** in **females**.
- In **2023**, the total number of cases of NSCLC in **EU4 and the UK** was estimated to be nearly **203,220**. Among **EU4 and the UK**, the **highest** number of cases of NSCLC was found in **Germany**.
- The biomarker testing rate for PD-(L)1 in the US is around 85%. In Japan, the PD-(L)1 testing rate is more compared to EU4 and the UK.
- The total number of PD-(L)1 NSCLC cases in the **US** was nearly **101,300** in **2023**.

PD-1 Non-small Cell Lung Cancer Drug Chapters

The drug chapter segment of the PD-1 Non-small Cell Lung Cancer report encloses a detailed analysis of the marketed and the late-stage (Phase III) pipeline drug. The marketed drugs segment encloses drugs such as **KEYTRUDA** (Merck), **OPDIVO** (Bristol-Myers Squibb/Ono Pharmaceutical), **TECENTRIQ** (Genentech/Hoffmann-La Roche), **LIBTAYO** (Regeneron/Sanofi), and **TIZVENI** (BeiGene). The drug chapter also helps understand the PD-(L)1 NSCLC clinical trial details, expressive pharmacological action, agreements and collaborations, approval and patent details, and the latest news and press releases.

PD-1 Non-small Cell Lung Cancer Marketed Drugs

- **KEYTRUDA (pembrolizumab): Merck**

KEYTRUDA is a PD-1-blocking antibody. It is mainly used for advanced cancers that have spread to other body parts or are not responding to other treatments. In some cancers, it is only given to patients whose tumors produce high protein levels known as PD-(L)1. In NSCLC, it is in combination with pemetrexed and platinum chemotherapy as first-line treatment of patients with metastatic non squamous NSCLC, with no EGFR or ALK genomic tumor aberrations. Combining with carboplatin and either paclitaxel or paclitaxel protein-bound as first-line treatment of patients with metastatic squamous NSCLC.

The dominance of KEYTRUDA in the oncology drugs market highlights the success of Merck's commercial tactics and the direction of its R&D department. The department is also tasked with evaluating the efficacy of this blockbuster in combination with drugs such as vibostolimab, quavonlimab, and faveselimab.

- **OPDIVO (nivolumab): Bristol-Myers Squibb/Ono Pharmaceutical**

OPDIVO by Bristol-Myers Squibb is a human immunoglobulin (Ig) G4 monoclonal antibody directed against the negative immunoregulatory human cell surface receptor PD-1, with immune

to tackle the biosimilar impact, Bristol Myers Squibb has already developed the subcutaneous formulation of OPDIVO. In May 2024, the FDA accepted a biologics license application (BLA) seeking the approval of OPDIVO co-formulated with Halozyme's proprietary recombinant human hyaluronidase (rHuPH20; subcutaneous nivolumab)

<u>Product</u>	<u>Company</u>	<u>RoA</u>	<u>MoA</u>

PD-1 Non-small Cell Lung Cancer Emerging Drugs

- Sugemalimab (CS1001): CStone

[Request Sample](#)
[View Pricing](#)

and commercializing sugemalimab outside Greater China upon terminating the license agreement for sugemalimab between CStone and EQRx. Upon transition completion, CStone will lead the regulatory process for sugemalimab MAA reviews by the EMA and the UK MHRA.

- **Datopotamab Deruxtecan:** Daiichi Sankyo/AstraZeneca

Datopotamab Deruxtecan (Dato-DXd) is an investigational TROP2-directed ADC. Designed using Daiichi Sankyo’s proprietary DXd ADC technology, Datopotamab Deruxtecan is one of five lead ADCs in the oncology pipeline of Daiichi Sankyo and one of the most advanced programs in AstraZeneca’s ADC scientific platform.

In February 2024, the BLA for datopotamab deruxtecan was accepted in the US for the treatment of adult patients with locally advanced or metastatic nonsquamous NSCLC who have received prior systemic therapy. The BLA was based on results from the pivotal TROPION-Lung01 Phase III trial in which datopotamab deruxtecan demonstrated a statistically significant improvement for the dual primary endpoint of progression-free survival (PFS) compared to docetaxel, the current standard of care, in patients with locally advanced or metastatic NSCLC treated with at least one prior line of therapy. The regulatory agency has set a Prescription Drug User Fee Act date in Q4 2024 for making its decision on approving dato-DXd in the population as mentioned earlier

Comparison of Emerging Drugs Under Development for PD-(L)1 NSCLC			
Product	Company	Mechanism of Action	Phase
Sugemalimab (CS1001)	EQRx/CStone	PD-1 Inhibitor	Registration in Europe
Datopotamab deruxtecan	Daiichi Sankyo/ AstraZeneca	TROP2-directed DXd	III

<u>govitecan) + pembrolizumab</u>	<u>Gilead Sciences</u>	<u>expressing cancer cells</u>	<u>III</u>
<u>JEMPERLI (dostarlimab)</u>	<u>GlaxoSmithKline</u>	<u>PD-1 Inhibitor</u>	<u>II</u>

Note: Detailed list will be provided in the final report.

PD-1 Non-small Cell Lung Cancer Drugs Market Insights

Checkpoint inhibitors targeting PD-(L)1 have emerged as dominant forces in the immunotherapy landscape for cancer treatment, with ten PD-(L)1 inhibitors approved, comprising seven PD-1 and three PD-L1 inhibitors in the United States. Their efficacy has been notable across various solid tumors, with **KEYTRUDA being a standout among these agents, approved for a remarkable twenty indications and holding a significant market presence for several years.** However, recent concerns over adverse events have prompted a shift towards combination approaches aimed at enhancing both efficacy and safety. This **strategy involves combining PD-(L)1 inhibitors with other checkpoint inhibitors such as CTLA-4, TIGIT, and LAG-3, as well as exploring novel targets like TROP-2.** Due to its numerous indication approvals, which led to a comprehensive FDA label and widespread use across a number of indications, PD-1 exceeds the sales of PD-L1 in the 7MM market. **Despite their potential, immune checkpoint inhibitors face challenges, including immune-related side effects and high costs, highlighting the critical need for reliable biomarkers to identify patients who would benefit most from these treatments.**

metastatic stages until the first-line KEYTRUDA got approved in 2015 as a second-line treatment option for such advanced patients; a similar path was followed by TECENTRIQ who entered the market in 2016. These therapies entered the first-line domain after 2016 and expanded their labels by expanding the targetable pool. In 2020, OPDIVO + ipilimumab was approved as a 1L treatment for patients with metastatic NSCLC. In the United States, OPDIVO sales are largely fueled by continued demand growth across indications such as NSCLC, melanoma, renal cancer, and upper gastrointestinal cancers. Chinese companies are trying to enter the US and EU markets, especially the EU markets where TIZVENI-approved in 2024 and sugemalimab is currently under review.

The new area of development in NSCLC includes **TROP-2-directed ADC's**, **TIGIT**, and **LAG-3 inhibitors** majorly being targeted by the researchers and the big companies such as **AstraZeneca**, **Daiichi Sankyo**, **Hoffmann-La Roche**, **Gilead Sciences**, and others have their potential candidates in late stages of development. Although there is only one ADC approved for NSCLC, and it is only for a limited subgroup (HER2m NSCLC), companies are attempting to target a larger NSCLC population, particularly in areas where KEYTRUDA is the market leader. Targeting the non-actionable genomic aberration, NSCLC markets are DATO-Dxd and TRODELVY.

Key Findings

- The total **PD-1 Non-small Cell Lung Cancer Market Size** in the **US** was estimated to be **USD 6,200 million** in **2023**, and it is expected to increase due to the launch of emerging therapies and label expansion of current therapies.
- The development of the TIGIT class in NSCLC has been hampered by the fact that several high-profile TIGIT clinical studies have revealed underwhelming results. Effective combinations to augment current ICIs have historically been challenging as seen with Merck's and Roche's recent anti-TIGIT/PD-1 disappointment.
- Several PD-L1 are expected to enter the NSCLC market; however, given the physicians' familiarity with the existing products on the market, we do not expect new entrants to disrupt the market significantly.
- In **2023**, **KEYTRUDA** captured the largest PD-1 Non-small Cell Lung Cancer Treatment Market Size, approximately **USD 3,500 million**, in the **US** for the PD-(L)1 NSCLC market.
- Front-line NSCLC represents a large market, currently only being dominated by anti-PD 1 drugs and anti-PD-1 + CTx combination, leaving a significant opportunity for therapy beyond anti-PD1 to deliver higher clinical benefit.
- According to GlaxoSmithKline H1 2024 presentation, the company anticipates Phase III data readout of JEMPERLI + cobolimab COSTAR, 2L NSCLC in 2025.
- In April 2024, BeiGene announced that the European Commission (EC) had approved TIZVENI (tislelizumab) as a treatment for NSCLC across three indications, including first-

standards of care. Furthermore, the increased uptake of these transformative drugs is a testament to the unwavering dedication of physicians, oncology professionals, and the entire healthcare community in their tireless pursuit of advancing cancer care.

This momentous shift in treatment paradigms is a testament to the power of research, collaboration, and human resilience. In the emerging therapies, Dato-DXd has the upper hand; findings from the Phase III TROPION-Lung01 trial support the BLA for Dato-DXd as a treatment for those with advanced nonsquamous NSCLC. **Dato-DXd's** advantage in treating NSCLC and its higher efficacy in early-stage studies, this drug is **expected to surpass alternative therapy eventually approaches presently being researched as the market's top TROP2 ADC for NSCLC.**

KOL Views

To keep up with current market trends, we take KOLs and SMEs’ opinions working in the domain through primary research to fill the data gaps and validate our secondary research. Industry Experts contacted for insights on PD-(L)1 NSCLC evolving treatment landscape, patient reliance on conventional therapies, patient therapy switching acceptability, and drug uptake, along with challenges related to accessibility, including oncologists, radiation oncologists, surgical oncologists, and others.

Delveinsight’s analysts connected with **30+ KOLs** to gather insights; however, interviews were conducted with **15+ KOLs** in the 7MM. Centers such as MD, The University of Texas MD Anderson Cancer Center, MD, Duke Cancer Institute at Duke University, PhD, MD, MPH, Dana-Farber Brigham Cancer Center, Michigan State University, Director, Massachusetts General Hospital etc., were contacted. Their opinion helps understand and validate current and emerging therapy treatment patterns or PD-(L)1 NSCLC market trends. This will support the clients in potential upcoming novel treatments by identifying the overall scenario of the market and the unmet needs.

<u>Region</u>	<u>KOL Views</u>
<u>United States</u>	<u>“Patients with NSCLC that doesn’t respond to checkpoint inhibitors known as PD(L)-1 inhibitors have few treatment options. In this</u>

Request Sample

View Pricing

<u>United States</u>	<u>"I would say that based upon the success of checkpoint inhibitors in the metastatic and locally advanced setting, we're now seeing checkpoint inhibitors move to both the adjuvant and neoadjuvant settings in non-small cell lung cancer. I think you're hearing from all of us that we'd be more ready to adopt adjuvant PD-1 pathway blockade despite seeing some promising new adjuvant data using the combination of chemo plus PD-1 pathway blockade. Most of us now want to see event-free survival data rather than just pathCR data, but it is a very exciting area. And we eagerly await long-term follow-up for all of these studies."</u>
<u>France</u>	<u>"Currently, immune checkpoint inhibitors treatment, particularly anti-PD-1/PD-L1 monoclonal antibodies, is a cornerstone in non-small cell lung cancer therapy. There is significant interest in exploring combination therapies involving approved and investigational agents alongside PD-1 and PD-L1 inhibitors, which will certainly provide data about the pharmacodynamic and clinical properties of these associations, enhancing our understanding of ICIs and cancer immunotherapy. Additionally, there is a pressing need for new predictive biomarkers, given the evolving role of PD-L1 in treatment strategies combining chemotherapy and immunotherapy and the absence of other validated predictors."</u>

Qualitative Analysis

We perform Qualitative and market Intelligence analysis using various approaches, such as **SWOT analysis** and **Conjoint Analysis**. In the SWOT analysis, strengths, weaknesses, opportunities, and threats in terms of gaps in disease diagnosis, patient awareness, physician acceptability, competitive landscape, cost-effectiveness, and geographical accessibility of therapies are provided.

Conjoint Analysis analyzes multiple approved and emerging therapies based on relevant attributes such as **safety, efficacy, frequency of administration, route of administration, and order of entry**. Scoring is given based on these parameters to analyze the effectiveness of therapy. In efficacy, the trial's **primary and secondary outcome measures** are evaluated; for instance, in event-free survival, one of the most crucial primary outcome measures is event-free survival and overall survival.

Further, the therapies' safety is evaluated, wherein the acceptability, tolerability, and adverse
