Drawing with precision

Welcome to Corel DESIGNER®, a comprehensive vector-based drawing application for creating technical graphics.

Precision is essential in creating technical graphics. This tutorial introduces you to the two groups of precision tools in Corel DESIGNER. The first group consists of on-screen tools that provide visual aids in the drawing window — such as gravity snapping, dynamic guides, and guidelines. The second group includes items such as the **Object coordinates** docker, the **Transformations** docker, and the **Transform** toolbar, which let you draw or transform objects by specifying values.

In this tutorial, you will use these precision tools to complete the drawing of a door. The following illustration shows what your completed project will look like.

If you are just starting to use the precision tools in Corel DESIGNER, it is recommended that you work your way through the tutorial from this point. If you have used some of these tools already,
