TWENTY-FIFTH IEEE PHOTOVOLTAIC SPECIALISTS CONFERENCE - 1996

IEEE Catalog Number: 96CH35897

ISBN:	0-7803-3166-4	Softbound Edition
	0-7803-3167-2	Casebound Edition
	0-7803-3168-0	Microfiche Edition

Library of Congress: 84-640812

ISSN: 0160-8371

TABLE OF CONTENTS

CHERRY AWARD ADDRESS		
Solar Electric Power for a Better Tomorrow A.M. Barnett	1	
INTERNATIONAL PROGRAMS		
Super-High Efficiency Solar Cell R&D Program in Japan M. Yamaguchi and S. Wakamatsu	9	
The Swiss 1 MWp PV-School Demonstration Program Th. Nordmann	13	
PV Applications in Australia M. Watt	19	
1. III-V MATERIALS AND DEVICES		
A Review of Recent Advances in Thermophotovoltaics T.J. Coutts, M.W. Wanlass, J.S. Ward and S. Johnson	25	
18.2% (AM1.5) Efficient GaAs Solar Cell on Optical-Grade Polycrystalline Ge Substrate R. Venkatasubramanian, B.C. O'Quinn, J.S. Hills, P.R. Sharps, M.L. Timmons, J.A. Hutchby, H. Field, R. Ahrenkiel and B. Keyes	31	
Hidden But Important Parameters in $\text{Ga}_{0.5}\text{In}_{0.5}\text{P}$ Cell Growth S.R. Kurtz, J.M. Olson, K.A. Bertness, K. Sinha, B. McMahon and S. Asher	37	
Monolithically Interconnected InGaAs TPV Module Development D.M. Wilt, N.S. Fatemi, P.P. Jenkins, R.W. Hoffman, Jr., G.A. Landis and R.K. Jain	43	
High-Power Density (1040 W/kg) GaAs Cells for Ultralight Aircraft S. Wojtczuk and K. Reinhardt	49	
Thin Film GaAs Solar Cells on Glass Substrates by Epitaxial Lift-off X.Y. Lee, A.K. Verma, C.Q. Wu, M. Goertemiller, E. Yablonovitch, J. Eldredge and D. Lillington	53	
Large Area, Thin Film Epitaxial Lift Off III/V Solar Cells P.R. Hageman, G.J. Bauhuis, A. van Geelen, P.C. van Rijsingen, J.J. Schermer and L.J. Giling	57	
GaAs Solar Cells Grown on GaP L.C. Olsen, X. Deng, W. Lei, F.W. Addis and J. Li	61	
ZnSe Window Layers for GaAs Solar Cells J.A. Yater, G.A. Landis, S.G. Bailey, L.C. Olsen and F.W. Addis	65	
A Computational Approach to the Analysis of Distributed Bragg Reflectors in Direct-Gap Solar Cells S.M. Durbin	69	
On-Sun Concentrator Performance of GaInP/GaAs Tandem Cells D.J. Friedman, S.R. Kurtz, K. Sinha, W.E. McMahon, C.M. Kramer, J.M. Olson, J.B. Lasich, A.X. Clevee and I. Connaughton	73	
Production Data on 0.55 eV InGaAs Thermophotovoltaic Cells S. Wojtczuk, P. Colter, G. Charache and B. Campbell	77	
Recent Progress in InGaAsSb/GaSb TPV Devices Z.A. Shellenbarger, M.G. Mauk, L.C. DiNetta and G.W. Charache	81	
Ultra-Low Resistance, Nondestructive Contact System for InP/InGaAs/InP Double Heterostructure TPV Devices N.S. Fatemi, V.G. Weizer, D.M. Wilt and R.W. Hoffman, Jr.	85	
Modelling of Tandem Cell Temperature Coefficients D.J. Friedman	89	
Silicon Carbide Alphonvoltaic Battery G. Rybicki, C. Vargas-Aburto and R. Uribe	93	
Molecular Beam Epitaxy Grown GaInP Top Cells and GaAs Tunnel Diodes for Tandem Applications J. Lammasniemi, K. Tappura, R. Jaakkola, A. Kazantsev, K. Rakennus, P. Uusimaa and M. Pessa	97	
GaAs Converter for High Power Laser Diode A. Fave, A. Kaminski, M. Gavand, L. Mayet and A. Laugier	101	
Analysis of Heteroepitaxial ALGAAS/Si Tandem Solar Cell for Concentrator Applications M.-J. Yang, S.J. Taylor and M. Yamaguchi	105	
Use of High Back Surface Reflectance in PV Cell Design P.A. Iles and C.L. Chu	109	
A New Approach to P-Doping and the Observation of Efficiency Enhancement in InP/InGaAs Quantum Well Solar Cells A. Zachariou, K.W.J. Barnham, P. Griffin, J. Nelson, C. Button, M. Hopkinson, M. Pate and J. Epler	113	
GaAs- and InAlGaAs-Based Concentrator-Type Cells for Conversion of Power Transmitted by Optical Fibers A.L. Fahrenbruch, A. Lopez-Otero, J.G. Werthen and T.-C. Wu	117	
Development of the GaAs Solar Cell for Space Application C. Mingbo and Z. Zhongwei	121	
Hydrocarbon Fired Thermophotovoltaic Generator Prototypes Using Low Bandgap Gallium Antimonide Cells L. Fraas, H.H. Xiang, J. Samaras, R. Ballantyne, D. Williams, S. Hui and L. Ferguson	125	

The Combined Photovoltaic Converters Based on Gallium Arsenide for Space Application M. Kagan, V. Letin and T. Nuller	129	Experimental Results of GaInP₂/GaAs/Ge Triple Junction Cell Development for Space Power Systems P.K. Chiang, J.H. Ermer, W.T. Nishikawa, D.D. Krut, D.E. Joslin, J.W. Eldredge, B.T. Cavicchi and J.M. Olson	183
GaSb-Based (Thermo)Photovoltaic Cells with Zn Diffused Emitters A.W. Bett, S. Keser, G. Stollwerck, O.V. Sulima and W. Wettling	133	Production Experience with Large Area, Dual Junction Space Cells Y.C.M. Yeh, C.L. Chu, J. Krogen, F.F. Ho, G.C. Datum, S. Billets, J.M. Olson and M.L. Timmons	187
Current Status of Low-Temperature Radiator Thermophotovoltaic Devices G.W. Charache, J.L. Egle, L.R. Danielson, D.M. DePoy, P.F. Baldasaro, B.C. Campbell, S. Hui, L.M. Fraas and S.J. Wojtczuk	137	Lightweight, Light-Trapped, Thin GaAs Solar Cell for Spacecraft Applications: Progress and Results Update M.H. Hannon, M.W. Dashiell, L.C. DiNetta and A.M. Barnett	191
Non-Destructive Testing by Absolute Room Temperature Photoluminescence Quantum Efficiency of GaAs Solar Cells X.Y. Lee, C.Q. Wu, A.K. Verma, R. Ranganathan and E. Yablonovitch	141	Final Results from the PASP Plus Flight Experiment H. Curtis and D. Marvin	195
GaAs and GaSb Based Solar Cells for Concentrator and Thermophotovoltaic Applications V.M. Andreev, V.P. Khvostikov, E.V. Paleeva, S.V. Sorokina and M.Z. Shvarts	143	Results of Three Recent GaAs Flight Experiments: ASCOT, PASP-Plus and STRV-1b D.C. Marvin and M. Gates	199
"Buried" Metal/Dielectric/Semiconductor Reflectors for Light Trapping in Epitaxial Thin-Film Solar Cells M.G. Mauk, P.A. Burch, S.W. Johnson, T.A. Goodwin and A.M. Barnett	147	Laboratory Instrumentation and Techniques for Characterizing Multi-Junction Solar Cells for Space Applications J.R. Woodyard	203
		The Effect of an Applied Electric Field on Defect Introduction Rates in N-Type InP M.J. Panunto and G.P. Summers	207
2. SPACE SOLAR CELLS		Deep Space Degradation of Si and GaAs Solar Cells J.C. Bourgoin, R. Kiliulis, C. Gonzales, G. Strobl, C. Flores, K. Bogus and C. Signorini	211
Radiation-Hard, Lightweight 12% AM0 BOL InP/Si Solar Cells S. Wojtczuk, P. Colter, N.H. Karam, H.B. Serreze, G.P. Summers and R.J. Walters	151	High Efficiency Line-Focus Photovoltaic Receivers Using Optical Secondaries for Radiation Resistance J. Avery, K. Kimes, P. Custard, L. Fraas, M. Piszczor and M. O'Neill	215
Flexible and Light Weight Copper Indium Diselenide Solar Cells B.M. Başol, V.K. Kapur, C.R. Leidholm and A. Halani	157	Spectral Response of Electron-Irradiated Homoepitaxial InP Solar Cells H.L. Cotal, S.R. Messenger, R.J. Walters and G.P. Summers	219
Radiation-Resistance of INGAP Solar Cells M. Yamaguchi, C. Vargas-Aburto, S.J. Taylor, M.-J. Yang, T. Takamoto, E. Ikeda, H. Kurita, M. Ohmori, R.M. Uribe, D. Brinker and D.A. Scheiman	163	A New Proton Irradiation Facility to Investigate the Effect of Test Conditions on Solar Cell Degradation C. Goodbody, R. Kimber and S. Sugden	223
Analysis of Damage to Silicon Solar Cells by High Fluence Electron Irradiation M. Yamaguchi, S.J. Taylor, S. Matsuda, O. Kawasaki and K. Ando	167	Development of Back Junction Point Contact Photovoltaic Cells and Arrays for Space V. Garboushian, G. Turner, S. Yoon and G.J. Vendura Jr.	227
Development of High Efficiency p⁺/n InP Solar Cells for Hetero-Epitaxial Applications R.W. Hoffman Jr., N.S. Fatemi, P.P. Jenkins, D.A. Scheiman, S.A. Ringel, W. Davis, V.G. Weizer, D.M. Wilt and D.J. Brinker	171	A Novel, Non-Destructive, Technique Using EBIC to Determine Diffusion Lengths in GaAs Solar Cells C. Hardingham	231
Development of P/N and N/P Thick Emitter InP Solar Cells P.R. Sharps, M.L. Timmons, S.R. Messenger, H.L. Cotal, G.P. Summers and P.A. Iles	175	The UoSAT-5 Solar Cell Experiment—Over 4 years in Orbit C. Goodbody and R. Kimber	235
A Comparison of Hydrogen Passivation in Heteroepitaxial N⁺P and P⁺N Solar Cells B. Chatterjee, S.A. Ringel and R. Hoffman, Jr.	179	The Effects of Irradiation on Heteroepitaxial InP/InGaAs Solar Cells L.B. Karlina, V.V. Kozlovskii, V.A. Solov'ev and M.Z. Shvarts	239

Angle of Incidence Corrections for GaAs/Ge Solar Cells with Low Absorptance Coverglass	243	Low Intensity Low Temperature (LILT) Measurements and Coefficients of New Photovoltaic Structures	317
D.R. Burger, R.L. Mueller, G. Goodelle, J. Powe and J. Schwartz		P.P. Jenkins, D.A. Scheiman, D.J. Brinker and J. Appelbaum	
Lightweight CuInSe₂ Space Solar Cells Fabricated by Chemical Thinning	247	The Development of High Efficiency Flexible Solar Array Paddle of Adeos-II	321
N.P. Kim, J.A. Nielsen and M.A. Verzwylt		Y. Kojima, T. Tamura, Y. Nozaki and Y. Onishi	
Reverse Bias Characteristics of Modules Made of Solar Cells with and without Integrated Bypass Function (IBF)	251	Magnetic Field Cancellation Techniques for the Mars Global Surveyor Solar Array	325
T. Hisamatsu, O. Kawasaki, S. Matsuda, H. Washio, T. Saga, T. Matsutani and A. Suzuki		M.H. Acuña, J.L. Scheifele, P. Stella, C. Kloss, B. Smith, G. Heinsohn and K. Sharmit	
Ultrathin GaAs Space Solar Cell Devices	255	Lessons Learned About Fabrication of Space Solar Arrays from Thermal Cycle Failures	329
C. Hardingham, C.R. Huggins, J.W. Simpson and T.A. Cross		I.N. Blake III	
Thin, Lightweight, 18% Efficient Space Silicon Solar Cell and Array	259	The Design, Qualification and Use of Bypass Diode Integration Onto GaAs/Ge Solar Cells	333
S. Yoon, G. Turner and V. Garboushian		R.B. Dally, J.R. Kulkula and J.A. Schwartz	
Analysis of Lips III Satellite a-Si:H Alloy Solar Cell Data	263	CdTe Terrestrial Modules as a Power Source for a Regenerative Fuel Cell Power Plant for Space Applications	337
J.R. Woodyard and J.G. Severns		H.S. Edwards, G.D. Smith, G. Voecks, N. Rohatgi, P. Prokopus, K. Zweibel and J.F. Hoelscher	
3. SPACE SYSTEMS		Development of PV Receivers for Space Line-Focus Concentrator Modules	341
Manufacturing Experience with GaInP₂/GaAs/Ge Solar Panels for Space Demonstration	267	V.M. Andreev, V.M. Lantratov, V.R. Larionov, V.D. Rumyantsev and M.Z. Shvarts	
E.B. Linder and J.P. Hanley		Indoor and Outdoor Testing of Space Concentrator AlGaAs/GaAs Photovoltaic Modules with Fresnel Lenses	345
The AstroEdge* Solar Array for the NASA Small Spacecraft Technology Initiative "Clark" Satellite	271	V.A. Grilikhes, V.D. Rumyantsev and M.Z. Shvarts	
J.T. Renshall and G.W. Marks		Line-Focus Optics for Multijunction Cells in Space Power Arrays	349
GaAs Solar Panels for Small Satellites: Performance Data and Technology Trends	277	M.J. O'Neill	
T.A. Cross, C.M. Hardingham, C.R. Huggins and S.P. Wood		The Scarlet Light Concentrating Solar Array	353
Mars Global Surveyor (MGS) High Temperature Survival Solar Array	283	D.M. Allen, P.A. Jones, D.M. Murphy and M.F. Piszczor	
P.M. Stella, R.G. Ross, Jr., B.S. Smith, G.S. Glenn and K.S. Sharmit		Design and Manufacturing Experience with GaAs/Ge Solar Cells as Gained with the Tempo Solar Generator Program	357
Application of Extreme Value Statistics to the Prediction of Solar Flare Proton Effects on Solar Cells	289	W.D. Schultze	
G.P. Summers, M.A. Xapsos and E.A. Burke		Estimating and Controlling Chromatic Aberration Losses for Two-Junction, Two-Terminal Devices in Refractive Concentrator Systems	361
Cost Performance of Multi-Junction, Gallium Arsenide and Silicon Solar Cells on Spacecraft	293	S.R. Kurtz and M.J. O'Neill	
E.M. Gaddy		4. SILICON MATERIALS AND DEVICES	
Advanced Solar Panel Designs	297	Crystalline Silicon Films by Chemical Vapor Deposition on Glass for Thin Film Solar Cells	365
E.L. Ralph and E.B. Linder		R.B. Bergmann, R. Brendel, M. Wolf, P. Lölgen, J.H. Werner, J. Krinke and H.P. Strunk	
The First Solar Array with 5 µm GaAs Solar Cells	301	Advances in Low-Temperature Passivated Silicon Solar Cells	371
H. Bebermeier, H. Bröker and K.-H. Wehner		A.G. Aberle and R. Hezel	
The GGS Spacecraft, Solar Arrays for Space Physics	305	PC1D Version 4 for Windows: From Analysis to Design	377
T. Spitzer		P.A. Basore and D.A. Clugston	
Environmental Testing of Chemically Thinned, Lightweight CuInSe₂ Solar Cells	309		
N.P. Kim, M.A. Verzwylt, M. Thompson and K. Coates			
Solar Array Passive Functional Tests	313		
R.L. Mueller and D.R. Burger			

The Coming of Age of a New PV Wafer Technology—Some Aspects of EFG Polycrystalline Silicon Sheet Manufacture	383	The Optimization and Fabrication of High Efficiency HEM Multicrystalline Silicon Solar Cells	449
M.J. Kardauskas, M.D. Rosenblum, B.H. Mackintosh and J.P. Kalejs		S. Narasimha, S. Kamra, A. Rohatgi, C.P. Khattak and D. Ruby	
Simplified Buried Contact Solar Cell Process	389	Identification of Factors Reducing Voc in MC Silicon Solar Cells	453
S.R. Wenham, C.B. Honsberg, S. Edmiston, L. Koschier, A. Fung, M.A. Green and F. Ferrazza		O. Breitenstein, K. Iwig and I. Konovalov	
A Novel Technology for the Simultaneous Diffusion of Boron, Aluminum and Phosphorus in Silicon	393	Quasi-Steady-State Photoconductance, a New Method for Solar Cell Material and Device Characterization	457
T. Krygowski, P. Sana, G. Crotty and A. Rohatgi		R.A. Sinton, A. Cuevas and M. Stuckings	
Selective Emitter Formation Using Optical Thermal Heating	397	Porous Silicon Gettering	461
A. Slaoui, A. Lachiq, L. Ventura and J.C. Muller		Y.S. Tsuo, P. Menna, J.R. Pitts, K.R. Jantzen, S.E. Asher, M.M. Al-Jassim and T.F. Cizek	
Elimination of Parasitic Effects in Floating Junction Rear Surface Passivation for Solar Cells	401	High-Efficiency CVD Multi-Layer Thin-Film Silicon Solar Cells	465
C.B. Honsberg, S.B. Ghazati, A.U. Ebong, Y.-H. Tang and S.R. Wenham		G.F. Zheng, A.B. Sproul, S.R. Wenham and M.A. Green	
Solar Cells with Efficiencies Above 21% Processed from Czochralski Grown Silicon	405	Numerical Simulation of Innovative Device Structures for Silicon Thin-Film Solar Cells	469
J. Knobloch, S.W. Glunz, D. Biro, W. Warta, E. Schäffer and W. Wettling		U. Rau, T. Meyer, M. Goldbach, R. Brendel and J.H. Werner	
High-Efficiency Cell Structures and Processes Applied to Photovoltaic-Grade Czochralski Silicon	409	Grain Boundaries in Silicon: Microstructure and Minority Carrier Recombination	473
J.M. Gee, R.R. King and K.W. Mitchell		J. Krinke, M. Albrecht, W. Dorsch, A. Voigt, H.P. Strunk, B. Steiner and G. Wagner	
Record Low Surface Recombination Velocities on Low-Resistivity Silicon Solar Cell Substrates	413	13% Silicon Film® Solar Cells on Low-Cost Barrier-Coated Substrates	477
J. Schmidt, T. Lauinger, A.G. Aberle and R. Hezel		A.E. Ingram, A.M. Barnett, J.E. Cotter, D.H. Ford, R.B. Hall, J.A. Rand and C.J. Thomas	
UV Stability of Highest-Quality Plasma Silicon Nitride Passivation of Silicon Solar Cells	417	In-Situ Control in Zone-Melting Recrystallization Process for Formation of High-Quality Thin Film Polycrystalline Si	481
T. Lauinger, J. Moschner, A.G. Aberle and R. Hezel		Y. Kawama, A. Takami, H. Naomoto, S. Hamamoto and T. Ishihara	
High-Efficiency Silicon Solar Cells by Low-Cost Rapid Thermal Processing, Screen Printing and Plasma-Enhanced Chemical Vapor Deposition	421	Crystal-Orientation Dependence of Surface Recombination Velocity for Silicon Nitride Passivated Silicon Wafers	485
P. Doshi, J. Mejia, K. Tate, S. Kamra, A. Rohatgi, S. Narayanan and R. Singh		F.M. Schuurmans, A. Schönecker, J.A. Eikelboom and W.C. Sinke	
Experimental Investigation of a Field Effect Back Surface Passivation of Silicon Solar Cells	425	Cost-Effective Bifacial Silicon Solar Cells with 19% Front and 18% Rear Efficiency	489
Y. Bai, J.E. Phillips and A.M. Barnett		A. Hübner, A.G. Aberle and R. Hezel	
Microcrystalline-Crystalline Silicon Heterojunction Solar Cells Using Highly Conductive Thin P-Type Microcrystalline Silicon Window Layers	429	Fabrication and Characterisation of 662-mV Open-Circuit Voltage High-Efficiency Inversion-Layer Silicon Solar Cells	493
M.W.M. van Cleef, J.K. Rath, F.A. Rubinelli, C.H.M. van der Werf and R.E.I. Schropp		B. Kuhlmann, A.G. Aberle, R. Meyer, A. Hübner, C. Hampe and R. Hezel	
17.1% Efficient Truncated-Pyramid Inversion-Layer Silicon Solar Cells	433	Series Resistance in Double-Polysilicon-Contacted Silicon Solar Cells	497
M. Grauvogl, A.G. Aberle and R. Hezel		S. Silvestre, D. Parton, L. Castañer, J. Carter and P. Ashburn	
Phosphorus and Aluminum Gettering—Investigation of Synergistic Effects in Single-Crystal and Multicrystalline Silicon	437	Control of Back Surface Reflectance From Aluminum Alloyed Contacts on Silicon Solar Cells	501
W.K. Schubert and J.M. Gee		M. Cudzinovic and B. Sopori	
Aluminum Backside Segregation Gettering	441	Dependence of Cell Performance on Wafer Thickness for BSF and Non-BSF Cells	505
H. Hieslmair, S. McHugo and E.R. Weber		T. Koval, J. Wohlgemuth and B. Kinsey	
Combined Characterization of Inhomogeneities in DCM Multicrystalline Silicon Wafers	445		
A. Fukatsu, T. Saitoh and I. Hide			

Single Step Rapid Thermal Diffusion for Selective Emitter Formation and Selective Oxidation	509	Conduction Processes in Silicon Solar Cells	573
R. Schindler, A. Breymesser, H. Lautenschlager, C. Marckmann, S. Noël and U. Schubert		A. Kaminski, J.J. Marchand, H. El Omari, A. Laugier, Q.N. Le and D. Sarti	
Optimization of Boron Groove Diffusion for Double Sided Buried Contact Silicon Solar Cells	513	Influence of Baking Conditions of Doped Spin-On Glass Sources on the Formation of Laser Assisted Selective Emitters	577
A.U. Ebong, S.H. Lee, C.B. Honsberg and S.R. Wenham		L. Ventura, J.P. Schunck, J.C. Muller, S. Barthe, U.B. Vetrella, L. Pirozzi and E. Salza	
Improved Geometry of Heavily Diffused Emitters in High-Efficiency Silicon Solar Cells	517	Improved Understanding and Characterisation of Rapid Thermal Oxides	581
H. Ohtsuka, S. Muramatsu, Y. Nagata, M. Sakamoto, K. Tsutsui, T. Uematsu and T. Warabisako		J. Horzel, W. Storm, T. Trenkler, S. Sivoththaman, J. Nijs, R. Mertens and G. Adriaenssens	
Mechanically Grooved High-Efficiency Silicon Solar Cells with Self-Aligned Metallisation	521	Screen Printed Contacts Formation by Rapid Thermal Annealing in Multicrystalline Silicon Solar Cells	585
M. Verbeek, A. Metz, A.G. Aberle and R. Hezel		H. El Omari, J.P. Boyeaux and A. Laugier	
Highly Efficient Crystalline Silicon Solar Cells Using a Novel Shallow Angle Metallization (SAM) Technique	525	Effect of Porous Silicon Layer Re-Emission on Silicon Solar Cell Photocurrent	589
P. Fath, E. Bucher and G. Willeke		V.A. Skryshevsky, A. Laugier, V.I. Strikha, V.A. Vikulov and A. Kaminski	
Building a Cost-Effective, Fabrication Facility for Silicon Solar Cell R & D and Production	529	Sunalyzer—A Powerful and Cost-Effective Solar Cell I-V Tester for the Photovoltaic Community	593
R.A. Crane, P.J. Verlinden and R.M. Swanson		A.G. Aberle, T. Lauinger, S. Bowden, S. Wegener and G. Betz	
Properties of Sputtered Amorphous Silicon/ Crystalline Silicon Solar Cells	533	Automation in HEM Silicon Ingot Production	597
B. Jagannathan and W.A. Anderson		C.P. Khattak and F. Schmid	
Quantum Efficiencies Exceeding Unity in Amorphized Silicon Layers	537	High Power, Commercial Silicon-Film® Solar Cells	601
Z.T. Kuznicki		D.H. Ford, A.M. Barnett, R.B. Hall, C.L. Kendall and J.A. Rand	
Cz Si Photovoltaics: Towards 100 MW	541	Process Development Toward a 15% Efficient 230 cm² Screen Printed Multicrystalline Silicon Solar Cell	605
K.W. Mitchell, R.R. King and T.L. Jester		S. Narayanan, J. Creager, M. Roy and J. Wohlgemuth	
Concept for an Online Material Quality Control by Numerical Simulation of a Silicon Ingot Solidification Process	545	Transient Thermal Effects into a 155 KG Polix Ingot	609
D. Franke, I. Steinbach, W. Krumbe, J. Liebermann and W. Koch		A. Laugier, E. Borne, H. El Omari, G. Goer and D. Sarti	
Grain Boundary Modeling and Characterization of Thin-Film Silicon Solar Cells	549	Solidification of Multicrystalline Silicon Ingots: Comparison Between Conventional Casting and Electromagnetic Casting Processes	613
A.B. Sproul, S.A. Edmiston, T. Puzzer, G. Heiser, S.R. Wenham, M.A. Green and T.L. Young		E. Ehret, A. Laugier and H. El Omari	
Surface Recombination Velocity in Silicon Substrates Determined from Light Beam Induced Current Measurements	553	From mc-Si Material Made by Cold Crucible Continuous Pulling to Solar Cells	617
A. Morales-Acevedo and G. Santana		S. Martinuzzi, I. Périchaud, L. Clerc, M. Bacon, F. Floret, D. Sarti, G. Dour, Q.N. Le, G. Goer and F. Durand	
A Simple Procedure to Analyze Rear-Surface Internal Quantum Efficiency	557	Rapid Thermal Processing of Conventionally and Electromagnetically Cast 100 cm² Multicrystalline Silicon	621
J.M. Gee		S. Sivoththaman, W. Laureys, P. De Schepper, J. Nijs and R. Mertens	
Interpretation of the Spectral Response of a Solar Cell in Terms of the Spatial Collection Efficiency	561	A Comparison of Gettering in Single- and Multicrystalline Silicon for Solar Cells	625
J. Sinkkonen, A. Hovinen, T. Siirtola, E. Tuominen and M. Acerbis		B.L. Sopori, L. Jastrzebski and T. Tan	
Statistical Analysis for Solar Cell Research	565	Gettering Effect of Aluminium in mc-Si and c-Si Wafers and in Solar Cells	629
A.W. Weeber and W.C. Sinke		O. Porre, S. Martinuzzi, M. Pasquinelli, I. Périchaud and N. Gay	
Improved Treatment of the Strongly Varying Slope in Fitting Solar Cell I-V Curves	569		
A.R. Burgers, J.A. Eikelboom, A. Schönecker and W.C. Sinke			

Localization and Identification of Microscopic Defects Leading to Locally Enhanced Currents Across PN-Junctions of Solar Cells	633	A Device Structure for Thin, Light Trapped Epitaxial Silicon Solar Cells	685
A. Voigt, T. Göbel, H.P. Strunk, C. Hässler, W. Koch, D. Karg and G. Pensl		D.J. Aiken, D.D. Smith and A.M. Barnett	
Optimization of Plasma Deposition and Etching Processes for Commercial Multicrystalline Silicon Solar Cells	637	Surface Segregation as a Means of Gettering Cu IN Liquid-Phase-Epitaxy Silicon Thin Layers Grown from Al-Cu-Si Solutions	689
D.S. Ruby, W.L. Wilbanks, C.B. Fleddermann, M.D. Rosenblum, S. Roncin and S. Narayanan		T.H. Wang, T.F. Ciszek, R. Reedy, S. Asher and D. King	
Open Circuit Voltage Losses in Multicrystalline Silicon: An Investigation by Mini Solar Cells (MSC)	641	High-Efficiency Drift-Field Thin-Film Silicon Solar Cells by Liquid-Phase Epitaxy and Substrate Thinning	693
R. Baldner, H. Lautenschlager, C. Schetter, R. Schindler and W. Warta		G.F. Zheng, W. Zhang, Z. Shi, D. Thorp and M.A. Green	
MC-Si Thin Film Solar Cells by Fast CVD On Low Cost SSP Pre-Ribbons	645	Solution Grown Polysilicon for Photovoltaic Devices	697
F. Faller, N. Schillinger, A. Hurre, C. Schetter, A. Eyer		R.L. Wallace, W.A. Anderson, K.M. Jones and R. Ahrenkiel	
Recrystallized Silicon on SiO₂-Layers for Thin Film Solar Cells	649	Polycrystalline Silicon Thin Films by Rapid Thermal Chemical Vapor Deposition (RTCVD) on Graphite Substrates	701
C. Hebling, R. Gaffke, P. Lanyi, H. Lautenschlager, C. Schetter, B. Wagner and F. Lutz		R. Monna, D. Angermeier, A. Slaoui and J.C. Muller	
Interaction Between Bulk and Surface Passivation Mechanisms in Thin Film Solar Cells on Defected Silicon Substrates	653	Absorption Enhancement in Conformally Textured Thin-Film Silicon Solar Cells	705
T. Vermeulen, J. Poortmans, K. Said, O. Evrard, W. Laureys, M. Caymax, J. Nijs, R. Mertens and C. Vinckier		D. Thorp, P. Campbell and S.R. Wenham	
Ceramic Substrates for Thin-Film Crystalline Silicon Solar Cells	657	Structural and Optical Properties of Polycrystalline Silicon Thin Films Deposited by PECVD Method	709
J.A.M. van Roosmalen, C.J.J. Tool, R.C. Huijberts, R.J.G. Beenen, J.P.P. Huijsmans and W.C. Sinke		F. Zhu, H. Kohara, T. Fuyuki and H. Matsunami	
Low Temperature Fabrication of Thin Film Polycrystalline Si Solar Cell on the Glass Substrate and its Application to the a-Si:H/Polycrystalline Si Tandem Solar Cell	661	Single-Crystal Si Infrared Improvements	713
K. Yamamoto, T. Suzuki, M. Yoshimi and A. Nakajima		Z.T. Kuznicki, L. Wu and E. Christoffel	
Initial Results for the Silicon Monolithically Interconnected Solar Cell Product	665	A Technique for Separating Bulk and Surface Lifetimes in the Analysis of Photoconductance Decay Measurements	717

Inter-university Micro Electronics Center (IMEC), Kapeldreef-75, Leuven 3001, Belgium

ABSTRACT

100 cm² n⁺pp⁺ solar cells have been fabricated by rapid thermal processing (RTP) on conventionally cast (CC) and electromagnetically cast (EMC) multicrystalline silicon (mc-Si). All thermal steps were carried out by fast-ramp (>30°C/s) RTP using tungsten-halogen lamps. Emitter and BSF were simultaneously formed by RTP co-diffusion of phosphorous and boron / or aluminum (50 - 60 seconds) and surface passivation by rapid thermal oxidation, RTO (40 - 50 seconds). The all-RTP process resulted in 14.1% and 13.3% efficient cells on CC and EMC mc-Si respectively. The EMC cells, when subjected to an additional plasma hydrogen treatment, improved to give the same efficiency as the CC mc-Si cells. Systematic lifetime measurements performed on these materials show that the degradation in the EMC mc-Si is mainly due to the activated crystallographic defects, responding favourably to hydrogenation treatments but poorly to RT-gettering treatments. On the other hand, significant gettering effects are observed in CC mc-Si.

INTRODUCTION

Rapid thermal processing (RTP) is used in various stages of integrated circuit processing such as implantation damage anneal, silicidation, sintering, oxide anneals etc., where a low thermal budget is essential to have strict control on junction profiles and to avoid lateral dopant diffusions etc.. A more recent application of RTP is the development of silicon solar cells [1-5]. Recently we reported realisation of 15.4% efficient solar cells made entirely by RTP on 100 cm² industrial Cz-Si wafers [6]. The degradation in the bulk Si by the activation of crystallographic defects and residual impurities due to very fast temperature ramps is an issue of concern. These effects are expected to be minimal in single crystal Si. However, the case of mc-Si, which contains variety of inter-grain and intra-grain crystallographic defects and residual impurities is more complicated. Further, the grain structure and residual impurities (metals, O, C) depend also on the casting method used. In the present paper, we report on the response of differently cast mc-Si materials to fast-ramp RT-anneals, and on the presence of gettering effects during RT-dopant diffusion. Also reported is the performance of 100 cm² mc-Si cells fabricated by RTP without involving any conventional furnace processes.

EXPERIMENTAL

Investigation on minority carrier lifetime

To study the influence of RTP on the minority carrier lifetime of mc-Si wafers we chose two different kinds of materials from different manufacturers. One is conventionally cast (CC mc-Si) with larger grains (1.5 - 2 cm²), while the other electromagnetically cast (EMC mc-Si) with very small (0.25 cm²) grains. To take into account the lateral non-uniformities in the properties and to have a statistical approach, 100 cm² wafers were used.

Sample preparation

The surface damage of the as-cut wafers was first removed by removing 10-15 µm of Si from each side in a solution containing HNO₃:HF:CH₃COOH. The resulting surface was mirror-like. All the wafers were then subjected to a cleaning sequence, (i) 4H₂SO₄:H₂O₂, (ii) 5H₂O:NH₄OH:H₂O₂, (iii) 5H₂O:HCl:H₂O₂ with 1% HF dips in between. Initial lifetime measurements were performed on all wafers (see section below). Following the lifetime measurements, another 1-2 µm of Si was etched away from both surfaces of the wafers in a weak HF:HNO₃ solution, and the same cleaning sequence was performed again. The wafers were then divided into two groups: The first group of wafers underwent an RT-annealing (RTA) treatment in pure N₂ ambient. A commercial RTP furnace was used. All the quartzware was carefully etch-cleaned prior to the experiments to avoid any external contaminations. RT-anneals were performed in the temperature range 875-950°C for various samples. The temperature ramps were typically 50°C/s up and 30°C/s down. After the RTA treatments, the samples were cleaned again and lifetime measurements performed. For the second group of wafers, approximately 5000Å of phosphosilicate glass PSG (P₂O₅:SiO₂) was deposited on one side in an APCVD reactor at 400°C with SiH₄, PH₃, and O₂ as process gases. 1 µm of pure aluminum was then evaporated at 10⁻⁶ Torr on the other side of the wafers in an e-beam chamber. Rapid thermal diffusion (RTD) was then carried out using the same thermal cycles as before, simultaneously diffusing P and Al into the two sides of the wafers. Excess PSG and Al-Si alloy were stripped away in HF and HCl solutions respectively. At least 10 µm of Si was then removed from each side of the RT-diffused

wafers in a polishing $\text{HNO}_3\text{:HF:CH}_3\text{COOH}$ solution. All the wafers underwent the cleaning sequence once again and the lifetime measurements were performed on all group II wafers.

Carrier lifetime measurements

Time-resolved microwave photoconductivity (TRMC) measurements were used to evaluate the effective minority carrier lifetime (τ_{eff}) distributions. A μ -wave PCD measurement system with a laser beam of 1057 nm wavelength was used. The τ_{eff} that includes both the surface and bulk recombinations ($1/\tau_{\text{eff}} = 1/\tau_b + 1/\tau_s$) can be extracted from the decay of the μ -wave photoconductivity. In our case, the surfaces were passivated by 20 vol% HF. Measurements were performed on a large number of points in each wafer covering the whole 100cm^2 area. The diameter of the laser-illuminated area was approximately 2mm. For all wafers, τ_{eff} measurements were carried out before and after the RTP treatments with the surface preparations as described above.

Solar cell fabrication

Both conventionally cast (0.75, 0.9 and $2.8\ \Omega\text{-cm}$), and electromagnetically cast ($1\ \Omega\text{-cm}$) mc-Si materials from different manufacturers were used to fabricate 100cm^2 all-RTP cells. The wafers were saw-damage etched and cleaned as described above. For the emitter formation by RTD, APCVD deposited PSG was used as diffusion source. For the BSF, either APCVD borosilicate glass (BSG), or evaporated aluminum was used as RT-diffusion sources. The emitter and BSF were formed in a single RTD step in N_2 ambient. After removing the remains of the diffusion sources in appropriate chemical solutions, the samples were HF-dipped and rapid thermal oxidation (RTO) was carried out in an O_2 ambient for emitter surface passivation. During the RTO, 10 seconds before the end of the high temperature plateau, the ambient was switched back to N_2 . Most of the RT-diffusions were carried out in the temperature range $900 - 925^\circ\text{C}$, for durations upto 60 seconds and the RT-oxidations at 900°C for upto 50 seconds. Some of the EMC wafers underwent a plasma hydrogenation treatment after the RTO. Direct hydrogenation was carried out from the rear side of the wafers in an rf (13.56 MHz) plasma system at 350°C . This treatment was limited only to the EMC wafers to see the effect of hydrogenation after the RTP treatments. The frontside contacts were formed by photolithography/lift-off technique and the rear contact was evaporated aluminum. Finally, a double layer antireflection coating of ZnS/MgF_2 was evaporated onto the frontside of the wafers.

RESULTS AND DISCUSSION

τ_{eff} after RTA without involving dopant diffusion

Figure 1 shows an example for the distribution of τ_{eff} in 100cm^2 CC mc-Si before and after an RTA treatment of 925°C , 60s, without involving any dopant diffusion.

Considerable diversity in τ_{eff} is observed in 100cm^2 virgin wafers even before the RTP treatment. Regions of high and very low lifetimes are due to the randomness of various crystallographic defects and recombination centers in cast mc-Si material.

Figure 1. Distribution of τ_{eff} in CC mc-Si, (a) before, and (b) after an RTA treatment of 925°C , 60s, without involving any dopant diffusion

Figure 2. Distribution of τ_{eff} in EMC mc-Si, (a) before, and (b) after an RTA treatment of 925°C , 60s, without involving any dopant diffusion

From figure 1, it seems there occurred a severe lifetime degradation after the RTA treatment. More than half of the points measured showed τ_{eff} below $4\ \mu\text{s}$. Since external contamination in these experiments is highly unlikely, the main reason for the lifetime degradation should be the activation of crystallographic defects & metallic impurities as a result of quenching effect inflicted by the high cooling rates of $>30^\circ\text{C/s}$. Similar degradations in τ_{eff} was also noted in the case of EMC mc-Si. Figure 2 shows the distribution bar-chart of τ_{eff} measured on EMC mc-Si before and after an RTA of 925°C , 60s. Due to the cold crucible casting method, it is generally believed that the EMC mc-Si material contains much less amounts of oxygen and metallic impurities as compared to CC mc-Si material. However, the EMC mc-Si contains a very high density of grain- and sub grain-boundaries, whose activation due to the rapid thermal ramps might have contributed to the lifetime degradation after the RTA. Similar tendencies were observed in other temperatures as well. The above results indicate that RTA of mc-Si wafers without involving any dopant diffusion can result in strong degradations in minority carrier lifetime.

τ_{eff} after RT anneals involving dopant diffusion

Figure 3 shows the lifetime distribution of a CC mc-Si wafer before and after RT co-diffusion of phosphorous and aluminum (900°C, 50s.). Unlike the cases described above, when the RT annealing involved RT-diffusion of dopants such as P and Al, an improvement in τ_{eff} is noted. This evidences the presence of an RT-gettering effect after co-diffusion of P and Al. The resulting distribution chart after RTD shows a much wider spread in τ_{eff} as compared to the virgin wafers. Unlike what was reported for single crystal Si [7], some points still showed a degradation after the RTD treatment of CC mc-Si. This tendency was observed in all the CC mc-Si wafers that were subjected to RTD above 875°C.

Figure 3. Distribution of τ_{eff} in CC mc-Si, (a) before, and (b) after an RT co-diffusion of P/Al at 925°C, 60s. (junctions were removed after RTD).

Figure 4. Distribution of τ_{eff} in EMC mc-Si, (a) before, and (b) after an RT co-diffusion of P/Al at 925°C, 60s. (junctions were removed after RTD).

Figure 4 shows a typical example of RTD gettering treatment on an EMC mc-Si wafer (900°C, 50s.). In the case of EMC mc-Si, however, the improvement in τ_{eff} is not as pronounced as in the case of CC mc-Si. These results suggest that, (i) a strong gettering effect exists in the case of CC mc-Si after RT co-diffusion of P and Al, whereas this effect is very marginal in the case of EMC mc-Si, and (ii) the RT-induced degradations can be attributed to activation of residual impurities and/or crystallographic defects, the latter being more dominant in the case of EMC mc-Si, which might require treatments like hydrogenation for further improvement.

Performance of 100cm² RTP mc-Si cells

Table 1 shows the performance of the CC mc-Si cells fabricated by RTP. In the case of P and Al co-diffused samples, the RTO treatment increases the V_{OC} by more than 13 mV. The 40s RTO followed by 10s N₂ anneal results in good quality oxides. Ramping down in O₂ results in less good interface quality. Figure 5 compares the internal quantum efficiency (IQE) of two RTP CC mc-Si cells with and without RTO surface passivation. The blue response is further increased by the RT-oxidation of the shallow emitter surface. RTO treatment was found to be beneficial for p-type (boron) emitters as well [8].

Figure 5. Internal quantum efficiency (IQE) of two RTP CC mc-Si cells showing the effect of RTO surface passivation

In Table 1, the comparison between the n^+pp^+ (P/Al) and n^+p cells show also the beneficial effects of aluminum. However, the 2.8 ohm-cm mc-Si material did not give a high enough V_{OC} with an oxide passivated n^+pp^+ structure, even though it gave the highest J_{SC} . One of the reasons for the low V_{OC} may be higher base saturation currents due to low substrate doping level. The main results of the EMC mc-Si cells are given in Table 2. The improvement brought about by the hydrogen plasma treatment is quite large. Figure 6 compares the IQE of two RTP EMC mc-Si cells with and without hydrogen passivation. From Table 2, it seems that the incorporation of aluminum BSF does not help much in the EMC cell performance. Comparing these results with the lifetime measurements mentioned above, it seems that RT-induced degradation can be conveniently minimized to acceptable levels by RT-gettering of metallic impurities in the case of large grain CC mc-Si materials. For EMC mc-Si, however, treatments like hydrogenation might be necessary to recover the degradations in materials like EMC mc-Si which contains a large density of grain boundaries and crystallographic defects, whose activation can be the main mechanism for the τ_{eff} degradation.

Table 1. Performance of 100 cm² RTP CC mc-Si cells

Resistivity ($\Omega\text{-cm}$)	structure	dopant(s)	RTD T(°C) / t(s)	RTO T(°C) / t(s)	J _{sc} (mA/cm ²)	V _{oc} (mV)	FF (%)	η (%)
0.75	n ⁺ pp ⁺	P/B	925/60	900/50	31.4	595	75.1	14.0
0.90	n ⁺ pp ⁺	P/Al	925/50	925/50	30.8	592	77.3	14.1
0.90	n ⁺ pp ⁺	P/Al	925/50	925/50	30.5	592	77.3	13.9
0.90	n ⁺ p	P	925/50	925/50	29.7	587	77.1	13.4
0.90	n ⁺ pp ⁺	P/Al	925/50	-	30.2	579	76.1	13.3
2.8	n ⁺ pp ⁺	P/Al	900/50	900/50	32.2	581	75.2	14.1

Table 2. Performance of 100 cm² RTP EMC mc-Si cells

structure	dopant(s)	plasma hydrogen	RTD T(°C) / t(s)	RTO T(°C) / t(s)	J _{sc} (mA/cm ²)	V _{oc} (mV)	FF (%)	η (%)
n ⁺ pp ⁺	P/Al	no	925/50	900/50	29.6	583	76.9	13.3
n ⁺ p	P	yes	925/50	900/50	30.8	595	76.6	14.0
n ⁺ pp ⁺	P/Al	yes	925/50	900/50	30.9	593	77.1	14.1

Figure 6. Internal quantum efficiency (IQE) of two RTP EMC mc-Si cells showing the effect of hydrogen plasma passivation

In general, the J_{sc} values obtained in all our mc-Si cells seem quite moderate. Better surface texturing and/or optical confinement techniques can further improve J_{sc}.

CONCLUSIONS

The influence of RTP treatments on minority carrier lifetime of mc-Si materials has been studied. RT anneals, when not accompanied by diffusion of dopants such as P and/or Al, cause serious degradation in minority carrier lifetime by RT-induced activation of impurities, grain boundaries, and other crystal defects. Significant impurity gettering effects have been observed in large grain mc-Si material, whereas small grain EMC material was not very sensitive to gettering treatments. On the other hand, grain boundary passivation by hydrogenation treatment is very

efficient in the case of EMC material. 100 cm² mc-Si cells have been fabricated using only rapid thermal processes. n⁺pp⁺ cells with RTO surface passivation demonstrated >14% conversion efficiencies, using CC mc-Si wafers. Comparable efficiencies have been obtained with all-RTP EMC mc-Si cells after a plasma hydrogenation treatment.
