Petitioners' Exhibit 1007, p. 2
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

I. INTRODUCTION

I, Craig Bishop, declare the following:

1. I have been retained as an independent expert witness on behalf of AT&T Services Inc., T-Mobile USA, Inc., Cellco Partnership d/b/a Verizon Wireless, Ericsson Inc., and Nokia of America Corporation ("Petitioners"), related to the *Inter Partes* Review ("IPR") of U.S. Patent No. 10,148,402 ("the '402 patent").

2. I am being compensated for my work in this matter at my normal consulting hourly rate. I am also being reimbursed for reasonable and customary expenses associated with my work and testimony in this investigation. My compensation is not contingent on the results of my study, the substance of my opinions, or the outcome of this matter.

3. I have no financial interest in the '402 patent and have had no contact with the named inventors of said patent. Neither have I reviewed the '402 patent in detail, nor do I have any personal interest in the outcome of this IPR.

4. In forming the opinions expressed in this declaration, I have considered the reference materials cited herein and my own academic background and professional experiences as outlined below.

5. Whilst I have attempted to organize the information presented in this declaration into helpful sections and/or divisions, my opinions are supported by the

Petitioners' Exhibit 1007, p. 3
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

information in the declaration in its entirety.

II. QUALIFICATIONS

6. My complete qualifications and professional experience are described in my *curriculum vitae*, a copy of which is attached as **Appendix 1**. The following is a summary of my relevant qualifications and professional experience.

7. I earned my Bachelor of Electronic Engineering degree with Honors from Polytechnic of Central London in 1989. In 2005, I earned my MSC in Computer Science with Distinction from the University of Kent.

8. After graduating with my first degree, I worked as an operations engineer at the British Broadcasting Corporation (BBC) for 4 years, then as a civil servant at the UK Radiocommunications Agency until 1996, during which time I became involved in telecommunications standardization in the European Telecommunication Standards Institute ("ETSI"), working in particular in Technical Committee Radio Equipment and Systems (TC RES2) concerned with the standardization of Private Mobile Radio (PMR). From 1994 through 1996, I acted as Rapporteur for voice and data related PMR standards ETS 300 113, ETS 300 219 and ETS 300 390. I participated as the only TC RES2 delegate on behalf of the UK Radiocommunications Agency, generating proposals in support of UK administration and business requirements, downloading and reviewing other meeting input documents, and proposing changes as necessary to ensure input

Petitioners' Exhibit 1007, p. 4
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

documents and the resulting specifications were in line with said requirements.

9. In 1996, I joined Samsung Electronic Research Institute as a Senior Standards Engineer where I worked for 16 years, eventually becoming Director of Standards and Industry Affairs in 2011. My work at Samsung mainly focused on the standardization of Global System for Mobile Communications (GSM)/ General Packet Radio Service (GPRS), Universal Mobile Telecommunications System (UMTS), the IP Multimedia subsystem (IMS), and Long-Term Evolution (LTE)/ Evolved Packet System (EPS) systems. Initially, I participated in ETSI Special Mobile Group (SMG) committees SMG1, SMG2, SMG4, SMG5, and SMG9, and relevant UMTS related sub-committees working on the air interface radio access network protocols, service, and terminal aspects of UMTS and GSM/GPRS until 1999. In particular, I was a participant in the ETSI SMG2 meetings leading up to selection of Wideband Code Division Multiple Access (WCDMA) as the radio access technology for the Frequency Division Duplex (FDD) mode of UMTS.

10. Beginning in 1998, I worked as a Principal Standards Engineer on the 3rd Generation Partnership Project (3GPP) on UMTS. I have been involved with 3GPP since its inception. I attended the inaugural 3GPP Technical Specification Group (TSG) meetings held in December 1998, and I began attending Working Group (WG) meetings in 1999. Specifically, I was a regular participant in Radio Access Network (RAN) WG1, Services & System Aspects (SA) WG1, Terminals

Petitioners' Exhibit 1007, p. 5
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

(T) WG2, but I also attended TSG RAN and T plenary meetings and sometimes other Working Groups and covering similar technical aspects as in my previous work in ETSI. As an example, RAN WG1 was, and is, a Working Group responsible for the specification of the physical layer of the radio Interfaces for UE including physical layer procedures. As part of this work, I would prepare meeting contributions in support of Samsung's research and development activities. Also, by way of preparation for each meeting, I would download all contributions and review those of interest to Samsung, and where necessary, prepare additional input to the meeting based on said review.

11. Beginning in 2000, I acted as project manager and then as system engineering manager at Samsung, providing technical requirements for the team working on Samsung's UMTS modem development. This involved scrutiny of ongoing standardization work, particularly in RAN WG1, RAN WG2, and TSG Core Network (CN) WG1, from which I would download, and assess the impact of, contributions on Samsung's development projects, ensuring that Samsung's development team was kept informed about the latest developments as layers 2 and 3 of the UMTS standard were stabilized.

12. During this period, in addition to authoring and presenting technical contributions for the 3GPP standard, and producing technical requirements for the radio modem, I acted as Rapporteur for 3GPP Technical Reports covering User

Petitioners' Exhibit 1007, p. 6
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Equipment ("UE") capability requirements (3GPP TR 21.904) from 1999–2000, and the Evolution of the 3GPP System (3GPP TR 21.902) in 2003 (the first Study Item to consider the 3GPP system beyond UMTS towards LTE/EPS).

13. In 2005, I became Head of Advanced Technologies, Standards and Regulation (ATSR) at Samsung. In addition to my managerial duties which included responsibility for standards, research, and regulatory engineers including three standards engineers who were regularly attending 3GPP RAN WG2 and Core Network and Terminals (CT) WG1 Working Groups, I personally continued to work on 3GPP standardization issues. From 2005 until 2008, I regularly attended and participated in SA WG2 meetings, mainly focusing on IP Multimedia Subsystem (IMS) including voice over IMS but also looking at wider Evolved Packet System (EPS) related issues. From 2008 until 2011, I regularly attended and participated in SA WG1 meetings. I also attended SA plenary meetings from 2008 until I left Samsung in 2013. As well as generating contributions in support of Samsung's research and development as preparation for each meeting, I would download and review documents from other 3GPP members, identifying those of interest to Samsung and, where necessary, preparing additional contributions on behalf of Samsung. The work required a sound working knowledge of the broader 3GPP system to ensure effective management of the ATSR team, effective participation in meeting discussions, expert assessment of third-party standards contributions, and

Petitioners' Exhibit 1007, p. 7
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

provision of implementation guidance to Samsung developers.

14. From 2005 until I stopped attending SA WG1 meetings in 2011, I authored and presented over 100 contributions to SA WG2 and SA WG1 meetings at 3GPP and appeared as an author/co-author on 18 patent applications related to User Equipment operation in the IMS and the 3GPP Core Network.

15. In 2011, I became Director of Standards and Industry Affairs at Samsung, and in November of that year I was elected to the Board of ETSI on which I served for a term of 3 years until November 2014. In this position I gained further perspective on the organisation, management, and activities of ETSI and its Technical Committees and Partnership Projects including 3GPP.

16. Since leaving Samsung in January 2013, I have formed my own consulting company which is a member of ETSI, and as part of various projects undertaken, I have continued to regularly access the ETSI and 3GPP document servers, and to keep abreast of ETSI and 3GPP document handling and publication practices.

17. Through my extensive work in ETSI and on 3GPP standardization issues over the years, I have become very familiar with ETSI and 3GPP practices for when and how the technical standards (including revisions thereto) and other standards-related contributions are made publicly available, including in the 1999-2012 timeframe when I was attending or monitoring various 3GPP Working Groups

Petitioners' Exhibit 1007, p. 8
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

including RAN WG1 and RAN WG2, and since 2013 in support of my work as a independent standardisation consultant.

18. For purposes of my analysis in this declaration, I have been informed that a person of ordinary skill in the art ("POSITA") in the field of the '402 patent at the time of the alleged invention of the '402 patent would have had a B.S. in Electrical Engineering or a related field with at least three years of experience designing, developing, and/or testing telecommunication systems. A POSITA would also have familiarity with the wireless standards and well-known protocols for accessing wireless networks. This definition is approximate, and more education may substitute for industry experience or vice versa.

III. PUBLIC AVAILABILITY OF 3GPP STANDARDS PROPOSALS AND OTHER DOCUMENTS

19. Based on my years of experience working in various capacities in 3GPP and on 3GPP standards issues, I am familiar with the regular business practices of the 3rd Generation Partnership Project (3GPP) relating to technical documents including specifications, draft standards and proposals, and standards-related technical contributions, as well as the business practices through which 3GPP makes these documents public.

A. Prominence and Purpose of 3GPP

20. 3GPP was inaugurated in December 1998 to produce Technical

Petitioners' Exhibit 1007, p. 9
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Specifications and Technical Reports for the Universal Mobile Telecommunications System (UMTS), a 3G Mobile System based on evolved GSM core networks and a new radio access network known as UTRA (UMTS Terrestrial Radio Access). **Appendix 2** at 2, 3 ("[3GPP] Partnership Project Description"); **Appendix 3** at 1; **Appendix 4** at 5. At that time, various standards organisations agreed to cooperate to produce a "complete set of globally applicable Technical Specifications" that would then be transposed into standards by the relevant standardization bodies (also known as Organizational Partners). **Appendix 2** at 3, 5 ("[3GPP] Partnership Project Description"). 3GPP "attracted a very strong commitment from organisations and companies around the world, reflecting the truly global nature of the project". **Appendix 4** at 7.

21. 3GPP is a global initiative partnership made up of Organizational Partners, Market Representation Partners, and Individual Members. **Appendix 5** at 8, 9; **Appendix 2** at 10. Today, 3GPP unites seven telecommunications standard development organisations ("Organizational Partners") from around the world: the Association of Radio Industries and Businesses (ARIB) and the Telecommunication Technology Committee (TTC) from Japan, the China Communications Standards Association (CCSA) from China, the Telecommunications Standards Development Society, India (TSDSI) from India, the Telecommunications Technology Association (TTA) from Korea, the European Telecommunications Standards

Petitioners' Exhibit 1007, p. 10
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Institute (ETSI), and the Alliance for Telecommunications Industry Solutions (ATIS) from the United States. These Organizational Partners are regional standards organisations that have the authority to define, publish, and set standards for their respective regions. **Appendix 2** at 12. 3GPP also includes "Market Representation Partners" that represent various industry perspectives and offer market advice. **Appendix 5** at 9 (3GPP Working Procedures, "Market Representation Partnership"); **Appendix 2** at 14; **Appendix 4** at 5. Additionally, 3GPP includes individual member companies ("Individual Members") that participate in 3GPP through their membership in a 3GPP Organizational Partner. **Appendix 5** at 9 (3GPP Working Procedures, "Individual Membership"); **Appendix 6** at 5 (textbook including a chart showing 3GPP structure at the time of publication); **Appendix 8** at 9, 10. As an example of how prominent 3GPP was and remains in the industry, there were 471 participating Individual Members in 2016. **Appendix 7** at 7 (3GPP Project Coordination Group document showing 3GPP membership numbers to 2016). There were 781 individual members as of February 2024. **Appendix 9**.

22. As noted in paragraph 20, a primary goal of 3GPP is to provide an environment to produce technical specifications and technical reports that define and standardize technologies covering cellular telecommunications networks, including User Equipment or Mobile Device (UE) technologies, Radio Access Network (RAN) technologies, Core Network (CN) technologies, and service and system

Petitioners' Exhibit 1007, p. 11
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

capabilities such as work on codecs, security and quality of service. The specifications also provide hooks for interworking with non-3GPP networks including but not limited to Wi-Fi networks.

23. Given the prominence of 3GPP in the wireless communication industry, beginning in 1999 and continuing through today, interested POSITAs were tracking the developments of the latest 3GPP specifications and reports to ensure timely development of products and services by their companies that were consistent with the standards being developed. In other words, it is my opinion that a POSITA would have to be familiar with 3GPP and with the specification-related documents produced as part of the 3GPP process in order to properly perform his or her job. Without access to and knowledge of the 3GPP documentation, including for example the substantive contents of 3GPP technical specifications, an engineer could not develop products that were interoperable with the worldwide 3G, 4G, and 5G standards. Because 3GPP documents were an important aspect of a POSITA's professional experience, textbooks and articles about cellular communications commonly directed readers to the 3GPP website for information regarding standards development. **Appendix 4** at 9 (directing readers to the 3GPP website at the conclusion of the chapter on the success of 3GPP in the standards development process). As a POSITA myself, I would regularly visit the 3GPP website for the latest developments mobile communications standards setting and refer colleagues

Petitioners' Exhibit 1007, p. 12
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

involved in the development of such devices to the 3GPP website as a valuable reference.

24. My personal experience at Samsung confirms 3GPP's prominence in the wireless industry. For example, engineers and managers at Samsung who were responsible for implementing 3GPP compliant modem software (and who were not attending 3GPP meetings or involved with development of the 3GPP standard in any direct way) would often enquire as to which version of a given 3GPP specification they should be developing. Further, between 2000 and 2004, part of my role at Samsung involved advising software engineers implementing the 3GPP standard on the correct interpretation of the specifications and ensuring that they were made aware of any changes and proposals made during the 3GPP standards development process that would impact their work. I also for a time maintained an internal company database that tracked 3GPP approved changes, to help the software engineers at Samsung implementing the 3GPP standard more readily stay informed as to changes that would impact their work. The database also included links to relevant 3GPP documents so that engineers could access the documents directly. In short, the technical output of 3GPP was, and continues to be, well known at 3GPP member companies, even for engineers who were not directly involved with designing the 3GPP system or contributing to the 3GPP standard process.

B. 3GPP's Policy of Making Documents Public

Petitioners' Exhibit 1007, p. 13
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

25. 3GPP's policy was to make 3GPP documents available to the public, including to interested POSITAs. The free availability of 3GPP documents to any interested member of the public was widely recognized in the industry. As an example of the prominence of 3GPP and its place in the wireless standards industry, I note that textbooks directed readers to the 3GPP website for information about relevant standards. For example, **Appendix 6** at 6, 9 ("The latest specifications can be obtained from 3GPP [9]", "[9] http//:www.3GPP.org"); **Appendix 8** at 10 ("3GPP TSs and TRs are publicly available at the 3GPP web site at either of the following URIs: http://www.3gpp.org/specs/specs.htm http://www.3gpp.org/ftp/Specs/archive/"). Because the purpose of 3GPP is worldwide adoption of a common standard, no restrictions on distribution or discussion have ever been placed on 3GPP documents. **Appendix 10** at 9 ("No password is needed to access any information on the 3GPP Web site, all information is openly published").

C. 3GPP Structure and Standards Development Process

26. Within 3GPP, responsibility for producing specifications was delegated to the Technical Specification Groups (TSGs). **Appendix 5** at 13 (3GPP Working Procedures, "TSG tasks"). At its inception, 3GPP was divided into four Technical Specification Groups (TSGs), each covering a particular category of technology. **Appendix 2** at 31 (3GPP Partnership Project Description); **Appendix 6** at 5, 6

Petitioners' Exhibit 1007, p. 14
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

(textbook listing four TSGs and noting the subsequent addition of a fifth TSG); **Appendix 4** at 6, 11, 12. Each TSG is further divided into a number of Working Groups (WGs). **Appendix 8** at 8, 9; **Appendix 4** at 6; see also **Appendix 5** at 13 (3GPP Working Procedures). Two of the TSGs from 1999 are still in existence in 2024: TSG Radio Access Networks (RAN) and TSG Service & Systems Aspects (SA). The activities of two other TSGs, TSG Core Networks (CN) and TSG Terminals (T), were amalgamated under Core Network and Terminals (CT) following the closure of TSG T in 2005, with responsibility for terminal test specifications being moved to a RAN working group (RAN WG5). The fifth TSG, GSM EDGE Radio Access Networks (GERAN), was responsible for evolution of the GSM radio technology from 2000 until that TSG closed in 2016 and its work was transferred to a RAN working group (RAN WG6) which was itself closed in July 2020.

27. The TSGs held quarterly plenary meetings where members' contributions, draft specifications/reports, and other documents that had been agreed upon by the Working Groups were presented for discussion and approval. **Appendix 5** at 23 (3GPP Working Procedures, "Deliverable types," stating that Technical Specifications and Technical Reports are "drawn up by the TSGs" and are approved by TSGs); **Appendix 8** at 9 ("3GPP Deliverables"). Once a Technical Specification was or Change Requests creating a new version of a Technical Specification were,

Petitioners' Exhibit 1007, p. 15
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

formally approved by TSG plenary, the latest version of said Technical Specification would be created by the Mobile Competence Centre (MCC) and uploaded to the file server. **Appendix 10** at 6; **Appendix 11** at 1. In that way, the conclusion of 3GPP TSG plenary meetings serves as notice that new versions of specifications incorporating Change Requests approved by the TSG meeting will shortly be made available on the public 3GPP server.

28. As part of the standards development process, delegates could submit contributions on behalf of the Individual Members. Members had an incentive to stay updated on 3GPP developments because those members usually wanted to contribute to the standard and make suggestions as to what technology and/or features should (or should not) be included. Delegates also attended 3GPP meetings to keep their employers abreast of developments related to the standards that would ultimately apply to those members and the products those members (*e.g.*, companies) produced. 3GPP members around the world and the interested POSITAs employed by them would have been motivated to stay up to date regarding 3GPP technology evolution to ensure their research and development programmes remained relevant to the systems being specified and that their products were compliant with the published 3GPP specifications. In light of this need to follow the standards development process, delegates often distributed 3GPP-related documents far beyond the attendees at 3GPP meetings. This was certainly my experience at

Petitioners' Exhibit 1007, p. 16
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Samsung.

D. 3GPP Documents

1. Technical Specifications and Reports

29. The technical specifications and reports developed by 3GPP were, and still are, driven by the technical contributions of 3GPP members. As part of that development process, various types of documents were produced. The 3GPP process involved the consideration of temporary documents ("TDocs," also referred to as "contributions,"), many of which constituted technical proposals for how the system should be implemented and were adopted as the basis for parts of the technical specifications.

30. As I noted in paragraphs 20 and 22, a primary purpose of 3GPP is to prepare, approve, and maintain globally applicable Technical Specifications and Technical Reports. **Appendix 5** at 7 (3GPP Working Procedures, "Purpose"). A "Technical Specification," as defined by 3GPP, is "[a] 3GPP output document containing normative provisions approved by a Technical Specification Group". **Appendix 5** at 28. 3GPP would (and still does) periodically freeze a complete set of standards (referred to as a "Release"), and each set would include many new specifications. **Appendix 10** at 6. 3GPP would also make publicly available draft specifications that would usually be included as part of the next Release once approved.

Petitioners' Exhibit 1007, p. 17
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

31. It was widely known that Technical Specifications (and Technical Reports) were publicly available on 3GPP's website. It was also well known that the latest version of a given specification that was under change control would be made available following each TSG Plenary meeting responsible for that specification, and that TSG Plenary meetings usually occur four times per year. **Appendix 10** at 7; **Appendix 11** at 1.

32. Latest and previous versions of technical specifications could be easily accessed from the 3GPP website. The specifications page provided direct links to the specifications area in the 3GPP website's file repository. **Appendix 11** at 1. In the 2016 timeframe, the specifications page listed the specifications by the date of the approval of the latest versions reflecting the TSG plenary meeting date. *E.g.*, **Appendix 11** at 1.

33. Additionally, the 3GPP specifications followed a clear numbering scheme to help the public, including interested POSITAs, identify the subject matter of each specification. **Appendix 12** at 1. As described on the 3GPP Numbering Scheme webpage, all 3G and GSM specifications had a specification number of 4 or 5 digits, where the first two digits defined the series. **Appendix 12** at 1. The Numbering Scheme webpage included a table showing the subject matter corresponding to each series. **Appendix 12** at 1. For example, the "36 series" focused on Evolved UTRA (LTE) aspects. **Appendix 12** at 1. An interested POSITA

Petitioners' Exhibit 1007, p. 18
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

could narrow down the relevant specifications based on whether the specification applied to only 5G NR, evolved UTRA (aka 4G or LTE), to 3G, to GSM, or to GSM, 3G and evolved UTRA (GSM only specifications were transferred from ETSI to 3GPP in July 2000). For a specification in the 21–35 series, this could be determined based on the third digit of the specification number, where a "0" would indicate that the specification applied to both systems. **Appendix 12** at 1. Specifications outside the 21–38 series in 2016 applied only to GSM systems. **Appendix 12** at 1.

34. The specifications were stored on the 3GPP website's file repository as zipped files, where the filenames followed the structure: SM[-P[-Q]]-V.zip. This format corresponded to the numbering scheme discussed in paragraph 33. "S" represented the series number; "M" represented the mantissa (the part after the series number); "P" represented an optional part number; "Q" represented an optional sub-part number; and "V" represented the version number (without the separating dots). **Appendix 12** at 2.

35. The Working Groups would create incremental versions of the draft specifications (*e.g.*, V0.2.1, V1.0.0, V1.1.0, etc.). These versions were made available on the 3GPP website's file repository which is accessible from the 3GPP specifications page. The version numbering scheme for Technical Specifications and Technical Reports was standardized by 3GPP. The version number included three fields: the major version field, the technical version field, and the editorial version

Petitioners' Exhibit 1007, p. 19
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

field. **Appendix 13** at 3. The major version field reflects the stage of the specification, with "0" representing an immature draft and a value of "3" or greater representing a specification that has been approved by the relevant TSG and thus had been moved to change control. **Appendix 13** at 3. The technical version field begins at zero and is incremented every time a technical change is made to the specification (either as part of the drafting process or as part of an approved change request). **Appendix 13** at 3. The editorial version field begins at zero and is incremented each time a non-technical change is made to the specification (*e.g.*, to fix a typo or formatting issue). **Appendix 13** at 3.

36. I understand that the alleged invention in the '402 patent relates to cellular telecommunications networks, and more particularly to methods, systems, and computer program products for handling, or assisting in handling, control signalling for beam management. Any POSITA interested in methods, systems, and computer program products for handling, or assisting in handling, control signalling for beam management would have been monitoring 3GPP's activities in this area and would probably have been already participating as a full or associate member or observer in the standard development process or would have at least known that information regarding the proposed revisions to the technical specifications under discussion were available through 3GPP.

Petitioners' Exhibit 1007, p. 20
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

2. 3GPP TDocs

37. As mentioned in paragraph 29, the technical specifications and reports developed by 3GPP were and are driven by the technical contributions of 3GPP member companies. As part of that development process, various types of documents were produced and submitted. As relevant to this case, the 3GPP process involved the consideration of temporary documents or "TDocs," which are also referred to as proposals, contributions, or change requests. The agreement of proposals submitted as TDocs results in the production of technical specifications.

38. Prior to each Working Group meeting, members of the Working Group would prepare TDocs to identify, discuss, and/or propose a new feature or change(s) to an existing feature or to identify a technical issue for discussion. Interested POSITAs would have known that TDocs could be a helpful source of technical information regarding the 3GPP specifications.

39. Each TDoc was assigned a TDoc number, according to a standard format set by 3GPP.[1] As described in the 3GPP Working Procedures, the numbering system followed the format xminnzzzz. **Appendix 5** at 20. This general naming convention has been in use since at least 1999 with only minor variations. Within that format, "x" referred to the relevant TSG. For example, "R" was used for TSG

[1] Documents other than technical contributions (such as meeting reports) were also assigned TDoc numbers for ease of reference.

Petitioners' Exhibit 1007, p. 21
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

RAN. Likewise, "m" referred to the relevant Working Group. **Appendix 5** at 20. A document for RAN WG1 would therefore begin with "R1". The two digits "nn" represented the year (*e.g.*, 16), and the digits "zzzz" represented the unique document number. This document number was used as the TDoc's filename.

40. Each TDoc would include in its header the meeting at which the contributor intended the TDoc to be discussed. Most TDocs were uploaded to the 3GPP website for public viewing prior to the relevant Working Group meeting listed on the TDoc, although some TDocs including those created at meetings, were uploaded during or after the meeting. **Appendix 10** at 8. The documents were uploaded to the public file repository in an area allocated to the particular Working Group. **Appendix 14** at 2 (RAN WG1 homepage with link to WG1's "Documents area"). Immediately upon upload, any member of the public could download and access the TDocs and other documents offered for discussion. This process has been in place since I began attending Working Group meetings in 1999.

E. The 3GPP Website's Public File Repository

41. All TDocs, technical reports, and technical specifications were also freely available to interested member of the public through the public file repository accessible via the 3GPP website. Interested members of the public would have been well aware of 3GPP and of the 3GPP website. 3GPP documents were accessible to any member of the public through the 3GPP website without providing any login

Petitioners' Exhibit 1007, p. 22
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

credentials or other exclusive access criteria.

42. It is my recollection that, during the 2016 timeframe, any interested member of the public could locate relevant documents of interest on the 3GPP website using reasonable diligence based on the website's indexing scheme or the TDoc's naming convention. The documents on the 3GPP website were (and remain) organized according to the relevant Working Groups within 3GPP (each of which focused on particular subject matter) and then further organized based on the meetings of those groups. POSITAs would have known which Working Groups focused on particular subject matter.

43. An interested member of the public could locate documents of interest by first navigating a web browser to the 3GPP website (www.3gpp.org). In the 2016 timeframe, to locate documents from the 3GPP home page, a user could have clicked "Specification Groups" **Appendix 15**. The corresponding webpages contained links to the 3GPP's public file repository (*e.g.*, through the "Documents area" of a Working Group page). **Appendix 14**. Instead of accessing the 3GPP file repository from the 3GPP website home page, a user could have also accessed the file repository through the web address www.3gpp.org/ftp or directly using ftp client software connected to ftp.3gpp.org. A POSITA was also able to search for relevant documents using keywords on the search facility on the 3GPP website from at least 2000, and from 2015 using the 3GPP search portal (https://portal.3gpp.org/#/),

Petitioners' Exhibit 1007, p. 23
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

where an interested person could search for documents by title and source, among other things.

44. The top two levels of indexing within the file repository were based wholly on subject matter, as reflected by the division of subject matter among the various TSGs and Working Groups. Specifically, an individual would select the relevant TSG covering the subject matter of interest. **Appendix 16**.

45. If the individual were interested in the radio access aspects of 3GPP, they would click "tsg_ran". From there, the individual would click on the particular RAN Working Group covering the subject matter of interest. **Appendix 17**.

46. For example, if the individual were interested in the Radio Interface physical layer, the individual would know to choose the folder for WG1. Once a user is in the relevant Working Group folder (RAN WG1 in this example), an individual would see a list of all meetings held by RAN WG1. **Appendix 18**.

47. As shown, a folder existed for each meeting. For example, "TSGR1_86b" corresponded to TSG RAN WG1 Meeting #86bis, and the timestamp associated with the meeting #86b directory indicates that, as of July 2016, the TSGR1_86b directory had most recently been updated on 5 January, 2016. **Appendix 18** at 3.

48. A POSITA would know which meeting(s) would have covered particular subject matter based on the working groups area of responsibility (*e.g.* for

Petitioners' Exhibit 1007, p. 24
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

RAN WG1 - **Appendix 14)**, and from publicly available meeting agendas. *E.g.*, **Appendix 19** (see link to agenda for RAN WG1 Meeting #86b). Many POSITAs received a link to the meeting agenda directly via the 3GPP Working Group email reflector lists. **Appendix 20**. Further, an individual could ascertain what subject matter was addressed at each meeting by reviewing the report issued after each meeting, stored in the Report directory and also linked in, or attached to, an email sent via the group's email reflector. **Appendix 19**; **Appendix 21**.

49. In my experience, whilst the servers used for 3GPP file repository and many of its directories have been updated since 1999, and directories may as a result have later dates associated with them (*e.g.*, reflecting the last time they were modified in some way or their contents were updated), the original upload date for files including specifications has always been preserved, providing a true and accurate indication of their earliest availability for download.

50. Once an individual navigated to the desired meeting folder, for example "TSGR1_86b" the individual could then select the "Docs" folder to view the documents associated with that meeting. The documents within this folder were listed by TDoc number, and interested members of the public would have known to review the meeting report for each meeting to confirm which topics were discussed at that meeting. *E.g.*, **Appendix 22**.

51. Many TDocs were uploaded to the public file server for public viewing

Petitioners' Exhibit 1007, p. 25
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

prior to the relevant meeting (although some TDocs, particularly those created during meetings, were submitted during or soon after the meetings). Throughout and since my participation in 3GPP, it was always recommended that delegates attending a meeting download the relevant set of documents from the 3GPP file repository onto their personal computers prior to each meeting. Given that any interested member of the public could and was likely to subscribe to the Working Group listserv, it would have been simple to locate the location of relevant TDocs on the 3GPP server based on the information sent out over the listserv.

52. 3GPP's public file repository provides a reliable mechanism for identifying the date and time a document was uploaded to the website and then available to download for public viewing. When a document is uploaded, the file server automatically assigns the document a time stamp—*i.e.*, an accurate and automatically computer-generated electronic record of when the document was uploaded—as part of the regular business practices of 3GPP. **Appendix 10** at 8 (3GPP FAQs). This has always been the practice regarding uploading documents to the 3GPP file repository, and my personal experience confirms that the time stamps have always been a reliable way to determine when a file was uploaded to the 3GPP website and immediately available for public download.

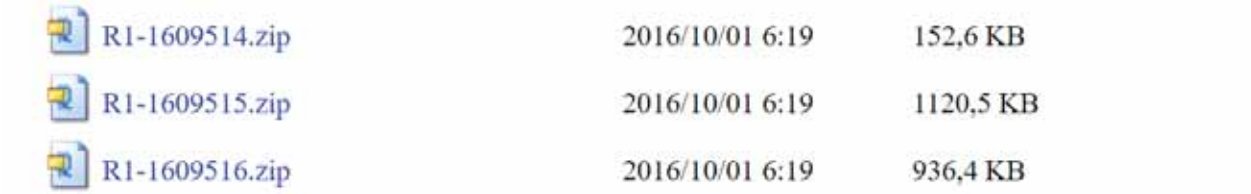
53. Following each 3GPP meeting, the secretary would usually distribute the meeting minutes via the corresponding email list with a request for comments.

Petitioners' Exhibit 1007, p. 26
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

E.g., **Appendix 21**. Said email would effectively therefore inform subscribers that the meeting had taken place, would inform subscribers of the documents that had been treated (or not), and in the event that the meeting was a TSG plenary meeting, serve as notice that new versions of specifications incorporating Change Requests approved by the TSG meeting, would shortly be made available on the 3GPP public server. Further, an interested member of the public following a certain topic would have known to check said report for related contributions as the reports always included a list of all TDocs submitted, indexed by contribution title, TDoc number, source, and agenda item (*e.g.*, Annex B of the report of RAN1 #86b, **Appendix 22a**).

IV. 3GPP EXHIBITS

A. Ex-1006: R1-1609515, TSG-RAN Working Group 1 Meeting #86b; Agenda Item 8.1.4.1: "On network beam switching and refinement (BM P-2)"

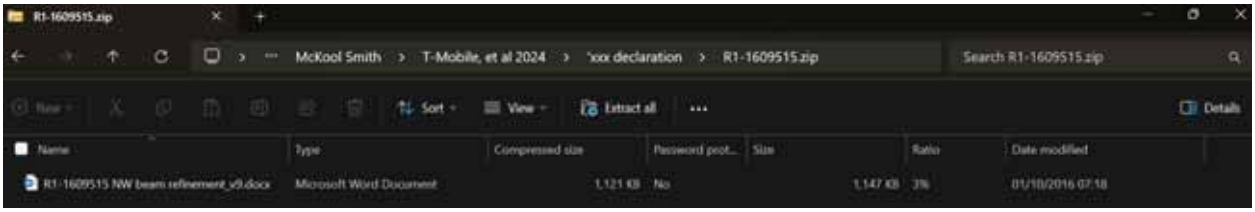


54. R1-1609515 is a technical contribution submitted to 3GPP TSG RAN WG1, meeting #86b, which was held between October 10 – 14, 2016. It follows the general naming format ("xminnzzzz") described in paragraph 39[2]. Accordingly, "R1" indicates that the contribution was submitted to RAN WG1, "16" indicates the year (2016) that this technical contribution was submitted, and "09515" is the unique

[2] Note that from RAN1 #86b in October 2016, RAN1 added another digit to the unique identifier "z" field to cater for the increasing number of Tdocs being submitted.

Petitioners' Exhibit 1007, p. 27
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

number that was assigned to this contribution document. It is titled "On network beam switching and refinement (BM P-2)".



55. As I mention in paragraph 41 above, 3GPP meeting documents have always been, and were in the 2016 timeframe, made publicly available on the 3GPP public file server from where an interested member of the public exercising reasonable diligence could freely access them. To confirm the availability of R1-1609515 on the 3GPP document server in the 2016 timeframe, I navigated to the 3GPP website at http://www.3gpp.org, selected "3GPP Groups" from the drop down menu, and then selected the "RAN1 – Radio Layer 1 (Physical Layer)" from the 3GPP Groups page, and the "Documents area" link to access the public file server where documents for the TSG-RAN Working Group 1 are stored, and from where I navigated to the documents for RAN WG1 #86b. A true and correct copy of the relevant portion of the Documents directory listing produced by the file server website is provided below and in **Appendix 23** at 28.

56. The Docs directory index stated that R1-1609515 was uploaded on "2016/10/01". I selected the link for "R1-1609515.zip" and downloaded a zip file of

Petitioners' Exhibit 1007, p. 28
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

the same name. The zip file contained a Microsoft Word document, "R1-1609515 NW beam refinement_v9.docx", with a date stamp of "01/10/2016" (European date format) the same date that the zip file was uploaded.

57. A true and correct copy of the document within the zip file (R1-1609515 NW beam refinement_v9.docx) is provided as Ex-1006. Based on my experience, I understand that these date stamps mean that R1-1609515.zip was uploaded to 3GPP's publicly available website on October 1, 2016, prior to the RAN WG1 #86b meeting, and that any member of the public could have downloaded the zip file, extracted the Word document enclosed, and viewed the contents of said document without restriction on October 1, 2016 and thereafter. The draft report from RAN WG1 #86b, first made available on October 20, 2016 (**Appendix 21**), confirms the availability of R1-1609515 at the meeting (**Appendix 22** at 78). I have no reason to believe that either the date stamp or the report from RAN WG1 #86b are inaccurate. I have therefore determined that R1-1609515 was publicly available on the file server no later than October 1, 2016.

58. Based on the information above, it is my opinion that R1-1609515 titled "On network beam switching and refinement (BM P-2)" and provided as Ex-1006

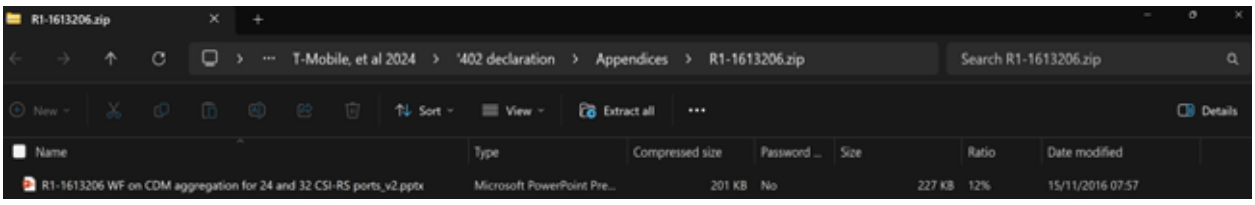
Petitioners' Exhibit 1007, p. 29
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

was publicly available to download from the 3GPP file server no later than October 1, 2016 and could have been distributed thereafter without restriction. Further, it was publicly available at the 3GPP TSG RAN WG1 #86b meeting held October 10 – 14, 2016.

B. Ex-1012: R1-1613206, TSG-RAN Working Group 1 Meeting #87; Agenda Item 6.2.2.3: "WF on CDM Aggregation for 32 and 24 CSI-RS ports"

59. R1-1613206 is a technical contribution submitted to 3GPP TSG RAN WG1, meeting #87, which was held between November 14 – 18, 2016. It follows the general naming format ("xminnzzzz") described in paragraph 39[3]. Accordingly, "R1" indicates that the contribution was submitted to RAN WG1, "16" indicates the year (2016) that this technical contribution was submitted, and "13206" is the unique number that was assigned to this contribution document. It is titled "WF on CDM Aggregation for 32 and 24 CSI-RS ports".

60. As I mention in paragraph 41 above, 3GPP meeting documents have always been, and were in the 2016 timeframe, made publicly available on the 3GPP public file server from where an interested member of the public exercising reasonable diligence could freely access them. To confirm the availability of R1-



[3] Note that from RAN1 #86b in October 2016, RAN1 added another digit to the unique identifier "z" field to cater for the increasing number of Tdocs being submitted.

Petitioners' Exhibit 1007, p. 30
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

1613206 on the 3GPP document server in the 2016 timeframe, I navigated to the 3GPP website at http://www.3gpp.org, selected "3GPP Groups" from the drop down menu, and then selected the "RAN1 – Radio Layer 1 (Physical Layer)" from the 3GPP Groups page, and the "Documents area" link to access the public file server where documents for the TSG-RAN Working Group 1 are stored, and from where I navigated to the documents for RAN WG1 #87. A true and correct copy of the relevant portion of the Documents directory listing produced by the file server website is provided below and in **Appendix 24** at 62.

R1-1613205.zip	2016/11/19 22:23	23,2 KB
R1-1613206.zip	2016/11/19 22:23	200,4 KB
R1-1613207.zip	2016/11/19 22:23	22 KB

61. The Docs directory index stated that R1-1613206 was uploaded on "2016/11/19". I selected the link for "R1-1613206.zip" and downloaded a zip file of the same name. The zip file contained a Microsoft Power Point document, "R1-1613206 WF on CDM Aggregation for 32 and 24 CSI-RS ports_v2.pptx", with a date stamp of "15/11/2016" (European date format) four days before the date that the zip file was uploaded.

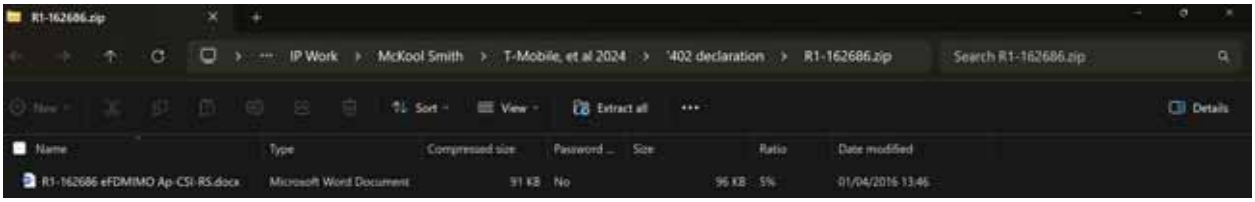
62. A true and correct copy of the document within the zip file (R1-1613206 WF on CDM Aggregation for 32 and 24 CSI-RS ports_v2.pptx) is provided as Ex-1012. Based on my experience, I understand that these date stamps mean that R1-1613206.zip was uploaded to 3GPP's publicly available website on November 19, 2016, following the RAN WG1 #87 meeting, and that any member of the public could have downloaded the zip file, extracted the Power Point document enclosed, and viewed the contents of said document without restriction on November 19, 2016 and thereafter. The draft report from RAN WG1 #87, first made available on November 24, 2016 (**Appendix 25**), confirms the availability of R1-1613206 at the meeting (**Appendix 26** at 35). I have no reason to believe that either the date stamp or the report from RAN WG1 #87 are inaccurate. I have therefore determined that R1-1613206 was publicly available on the file server no later than November 19, 2016.

63. Based on the information above, it is my opinion that R1-1613206 titled "WF on CDM Aggregation for 32 and 24 CSI-RS ports" and provided as Ex-1012 was publicly available to download from the 3GPP file server no later than November 19, 2016 and could have been distributed thereafter without restriction. Further, it was publicly available at the 3GPP TSG RAN WG1 #87 meeting held November 14 -18, 2016.

Petitioners' Exhibit 1007, p. 32
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

C. Ex-1013: R1-162686, TSG-RAN Working Group 1 Meeting #84bis; Agenda Item 7.3.3.1.2: "Specification impact of aperiodic CSI-RS"

64. R1-162686 is a technical contribution submitted to 3GPP TSG RAN WG1, meeting #84bis, which was held between April 11 - 15, 2016. It follows the general naming format ("xminnzzzz") described in paragraph 39. Accordingly, "R1" indicates that the contribution was submitted to RAN WG1, "16" indicates the year (2016) that this technical contribution was submitted, and "2686" is the unique number that was assigned to this contribution document. It is titled "Specification impact of aperiodic CSI-RS".



65. As I mention in paragraph 41 above, 3GPP meeting documents have always been, and were in the 2016 timeframe, made publicly available on the 3GPP public file server from where an interested member of the public exercising reasonable diligence could freely access them. To confirm the availability of R1-162686 on the 3GPP document server in the 2016 timeframe, I navigated to the 3GPP website at http://www.3gpp.org, selected "3GPP Groups" from the drop down menu, and then selected the "RAN1 – Radio Layer 1 (Physical Layer)" from the 3GPP Groups page, and the "Documents area" link to access the public file server where documents for the TSG-RAN Working Group 1 are stored, and from where I navigated to the documents for RAN WG1 #84bis. A true and correct copy of the relevant portion of the Documents directory listing produced by the file server

Petitioners' Exhibit 1007, p. 33
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

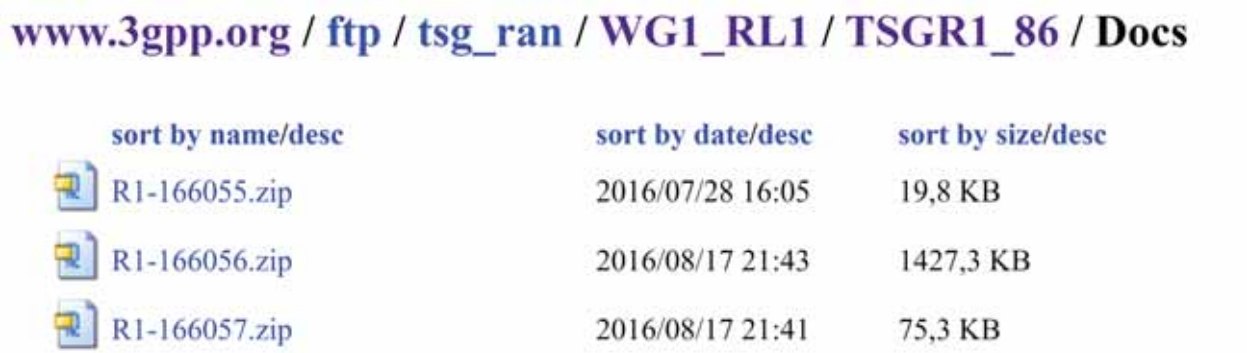
website is provided below and in **Appendix 27** at 18.

66. The Docs directory index stated that R1-162686 was uploaded on "2016/04/01". I selected the link for "R1-162686.zip" and downloaded a zip file of the same name. The zip file contained a Microsoft Word document, "R1-162686 eFDMIMO Ap-CSI-RS.docx", with a date stamp of "01/04/2016" (European date format) the date that the zip file was uploaded.

67. A true and correct copy of the document within the zip file (R1-162686 eFDMIMO Ap-CSI-RS.docx) is provided as Ex-1013. Based on my experience, I understand that these date stamps mean that R1-162686.zip was uploaded to 3GPP's publicly available website on April 1, 2016, prior to the RAN WG1 #84bis meeting, and that any member of the public could have downloaded the zip file, extracted the Word document enclosed, and viewed the contents of said document without restriction on April 1, 2016 and thereafter. The draft report from RAN WG1 #84bis, first made available on April 21, 2016 (**Appendix 28**), confirms the availability of

R1-162686 at the meeting (**Appendix 29** at 55). I have no reason to believe that either the date stamp or the report from RAN WG1 #84bis are inaccurate. I have therefore determined that R1-162686 was publicly available on the file server no later than April 1, 2016.

68. Based on the information above, it is my opinion that R1-162686 titled "Specification impact of aperiodic CSI-RS" and provided as Ex-1013 was publicly available to download from the 3GPP file server no later than April 1, 2016 and could have been distributed thereafter without restriction. Further, it was publicly available at the 3GPP TSG RAN WG1 #84bis meeting held April 11 - 15, 2016.



D. Ex-1014: R1-166056, TSG-RAN Working Group 1 Meeting #86; "Final Report of 3GPP TSG RAN WG1 #85 v1.0.0 (Nanjing, China, 23rd – 27th May 2016)"

69. R1-166056 is a meeting report submitted to 3GPP TSG RAN WG1, meeting #86, which was held between August 22 - 26, 2016. It follows the general naming format ("xminnzzzz") described in paragraph 39. Accordingly, "R1" indicates that the contribution was submitted to RAN WG1, "16" indicates the year (2016) that this technical contribution was submitted, and "6056" is the unique number that was assigned to this contribution document. It is titled "Final Report of 3GPP TSG RAN WG1 #85 v1.0.0 (Nanjing, China, 23rd – 27th May 2016)".

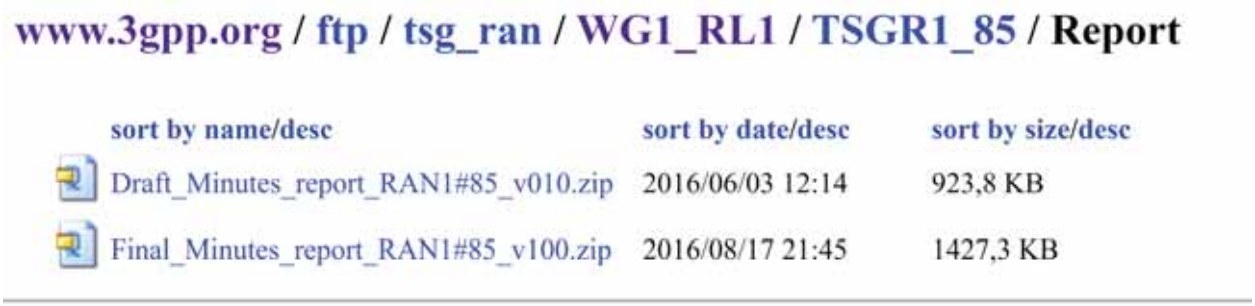
70. As I mention in paragraph 41 above, 3GPP meeting documents have always been, and were in the 2016 timeframe, made publicly available on the 3GPP

Petitioners' Exhibit 1007, p. 35
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

public file server from where an interested member of the public exercising reasonable diligence could freely access them. To confirm the availability of R1-166056 on the 3GPP document server in the 2016 timeframe, I navigated to the 3GPP website at http://www.3gpp.org, selected "3GPP Groups" from the drop down menu, and then selected the "RAN1 – Radio Layer 1 (Physical Layer)" from the 3GPP Groups page, and the "Documents area" link to access the public file server where documents for the TSG-RAN Working Group 1 are stored, and from where I navigated to the documents for RAN WG1 #86. A true and correct copy of the relevant portion of the Documents directory listing produced by the file server website is provided below and in **Appendix 30** at 1.

www.3gpp.org / ftp / tsg_ran / WG1_RL1 / TSGR1_86 / Docs

sort by name/desc	sort by date/desc	sort by size/desc
R1-166055.zip	2016/07/28 16:05	19,8 KB
R1-166056.zip	2016/08/17 21:43	1427,3 KB
R1-166057.zip	2016/08/17 21:41	75,3 KB



71. The Docs directory index stated that R1-166056 was uploaded on "2016/08/17". I selected the link for "R1-166056.zip" and downloaded a zip file of the same name. The zip file contained three files including a Microsoft Word document, "R1-166056 Final_Minutes_report_RAN1#85_v100.docx", with a date stamp of "17/08/2016" (European date format) the date that the zip file was

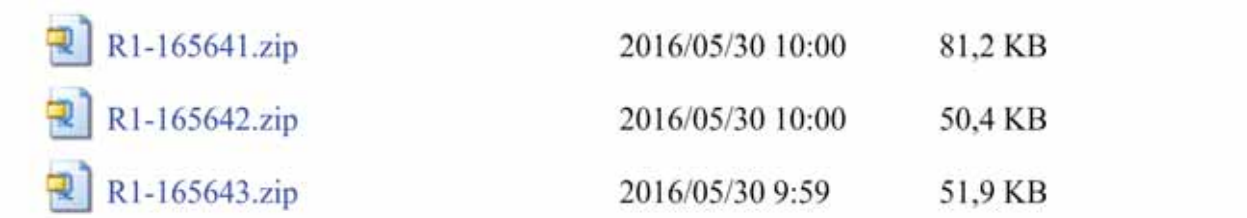
Petitioners' Exhibit 1007, p. 36
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

uploaded.

72. A true and correct copy of the document within the zip file (R1-166056 Final_Minutes_report_RAN1#85_v100.docx) is provided as Ex-1014. Based on my experience, I understand that these date stamps mean that R1-166056.zip was uploaded to 3GPP's publicly available website on August 17, 2016, prior to the RAN WG1 #86 meeting, and that any member of the public could have downloaded the zip file, extracted the Word document enclosed, and viewed the contents of said document without restriction on August 17, 2016 and thereafter. Being a RAN1 meeting report, the file was also made publicly available in the RAN1 #85 meeting report directory on the same date.

73. The draft report from RAN WG1 #86, made available on September 3, 2016 (**Appendix 31**), confirms the availability of R1-166056 at the meeting

(**Appendix 32** at 8). I have no reason to believe that either the date stamps or the report from RAN WG1 #86 are inaccurate. I have therefore determined that R1-166056 was publicly available on the file server no later than August 17, 2016.

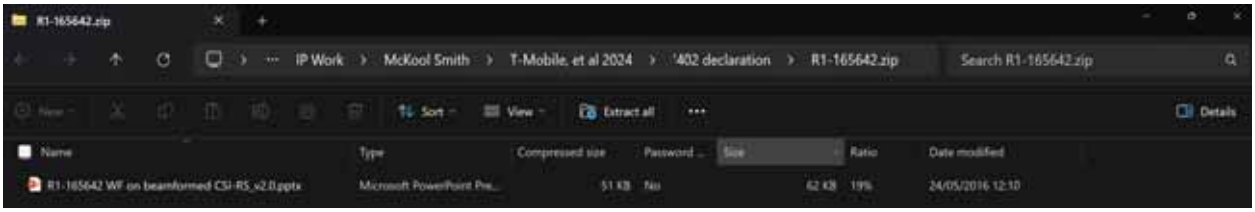


74. Based on the information above, it is my opinion that R1-166056 titled "Final Report of 3GPP TSG RAN WG1 #85 v1.0.0 (Nanjing, China, 23rd – 27th May 2016)" and provided as Ex-1014 was publicly available to download from the 3GPP file server no later than August 17, 2016 and could have been distributed thereafter without restriction. Further, it was publicly available at the 3GPP TSG RAN WG1 #86 meeting held August 22 - 26, 2016.

E. Ex-1015: R1-165642, TSG-RAN Working Group 1 Meeting #85; Agenda Item 7.1.6: "WF on Beamformed CSI-RS"

75. R1-165642 is a technical contribution submitted to 3GPP TSG RAN WG1, meeting #85, which was held between May 23 - 27, 2016. It follows the general naming format ("xminnzzzz") described in paragraph 39. Accordingly, "R1" indicates that the contribution was submitted to RAN WG1, "16" indicates the year (2016) that this technical contribution was submitted, and "5642" is the unique number that was assigned to this contribution document. It is titled "WF on Beamformed CSI-RS".

76. As I mention in paragraph 41 above, 3GPP meeting documents have always been, and were in the 2016 timeframe, made publicly available on the 3GPP



public file server from where an interested member of the public exercising reasonable diligence could freely access them. To confirm the availability of R1-165642 on the 3GPP document server in the 2016 timeframe, I navigated to the 3GPP website at http://www.3gpp.org, selected "3GPP Groups" from the drop down menu, and then selected the "RAN1 – Radio Layer 1 (Physical Layer)" from the 3GPP Groups page, and the "Documents area" link to access the public file server where documents for the TSG-RAN Working Group 1 are stored, and from where I navigated to the documents for RAN WG1 #85. A true and correct copy of the relevant portion of the Documents directory listing produced by the file server website is provided below and in **Appendix 33** at 49.

R1-165641.zip	2016/05/30 10:00	81,2 KB
R1-165642.zip	2016/05/30 10:00	50,4 KB
R1-165643.zip	2016/05/30 9:59	51,9 KB

77. The Docs directory index stated that R1-165642 was uploaded on "2016/05/30". I selected the link for "R1-165642.zip" and downloaded a zip file of the same name. The zip file contained a Microsoft Power Point document, "R1-165642 WF on beamformed CSI_RS_v2.0.pptx", with a date stamp of "24/05/2016" (European date format) six days before the date that the zip file was uploaded.

Petitioners' Exhibit 1007, p. 39
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

78. A true and correct copy of the document within the zip file (R1-165642 WF on beamformed CSI_RS_v2.0.pptx) is provided as Ex-1015. Based on my experience, I understand that these date stamps mean that R1-165642.zip was uploaded to 3GPP's publicly available website on May 30, 2016, following the RAN WG1 #85 meeting, and that any member of the public could have downloaded the zip file, extracted the Word document enclosed, and viewed the contents of said document without restriction on May 30, 2016 and thereafter. The draft report from RAN WG1 #85, made available on April 21, 2016 (**Appendix 34**), confirms the availability of R1-165642 at the meeting (**Appendix 29** at 50). I have no reason to believe that either the date stamp or the report from RAN WG1 #85 are inaccurate. I have therefore determined that R1-165642 was publicly available on the file server no later than May 30, 2016.

79. Based on the information above, it is my opinion that R1-162686 titled "WF on Beamformed CSI-RS" and provided as Ex-1015 was publicly available to download from the 3GPP file server no later than May 30, 2016 and could have been distributed thereafter without restriction. Further, it was publicly available at the 3GPP TSG RAN WG1 #84bis meeting held May 23 - 27, 2016.

Petitioners' Exhibit 1007, p. 40
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

V. CONCLUSION

80. Based on the information in section IV, A above, it is my option that Ex-1006, 3GPP R1-1609515 titled: "On network beam switching and refinement (BM P-2)" was publicly available to download from the 3GPP server without restriction on October 1, 2016.

81. Based on the information in section IV, B above, it is my option that Ex-1012, 3GPP R1-1613206 titled: "WF on CDM Aggregation for 32 and 24 CSI-RS ports" was publicly available to download from the 3GPP server without restriction on November 19, 2016.

82. Based on the information in section IV, C above, it is my option that Ex – 1013, 3GPP R1-162686 titled: "Specification impact of aperiodic CSI-RS" was publicly available to download from the 3GPP server without restriction on April 1, 2016.

83. Based on the information in section IV, D above, it is my option that Ex-1014, 3GPP R1-166056 titled: "Final Report of 3GPP TSG RAN WG1 #85 v1.0.0 (Nanjing, China, 23rd – 27th May 2016)" was publicly available to download from the 3GPP server without restriction on August 17, 2016.

84. Based on the information in section IV, E above, it is my option that Ex-1015, 3GPP R1-165642 titled: "WF on Beamformed CSI-RS" was publicly available to download from the 3GPP server without restriction on May 30, 2016.

Petitioners' Exhibit 1007, p. 41
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

85. I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct. I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that wilful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code.

June 24, 2024

APPENDIX 1

Curriculum Vitae

Name: Craig Bishop

Contact Tel No.: +44 (0)7984 564949 (mobile)

Email: craig@bishopcom.co.uk

Current job title: Independent Consulting Engineer, CEO

Address: 43 Ospringe Street, Faversham, Kent, ME13 8TW

Key Skills and Experience

- 35 years Telecoms, Radio and Broadcast experience
- 27 years experience of 2G/3G/4G telecoms standardisation
- Extensive knowledge of 3GPP and ETSI specifications and procedures including document handling and publication practices
- Sound understanding of 3GPP systems, including Radio Access Interfaces and Networks, Access Stratum protocols, Core Networks, Non-Access Stratum protocols, and IMS
- Experience of ETSI role from regulatory perspective (harmonised standards, mandates, spectrum, etc)
- Depositions, reports, and declarations as expert witness in cases on 3GPP technologies and on 3GPP & ETSI practices and procedures.
- Intellectual property analysis including prior art search and evaluation of patent essentiality
- Application of data analytics and machine learning techniques to standards and IP data
- Programming in Java, Python, C, Octave (Matlab)

Career History

Bishop Communications Ltd. 01/13 –

Independent Telecommuncations Standards and Intellectual Property Consultant

Company is a full ETSI member

Activities have included:

- Provision of expert support for IPR litigation from standards landscape analysis / background technical reports to expert testimony reports / declarations and depositions on matters including the public availability of 3GPP and ETSI prior art.
- Intellectual property analysis assessing strengths and weaknesses of patents and patent portfolios, conducting searches for prior art, evaluating patent essentiality, and acquring relevant documentation.
- Provision of expertise for EC funded ETSI Specialist Task Force (STF489) to produce implementation guidelines for Total Conversation for emergency services. Project delivered on time / budget and well received. Ouput published March 2016 as ETSI TR 103 201.
- Provision of expertise for ETSI Specialist Task Force (STF555) assessing the impact on existing standards of communications involving IoT devices in all types of emergency situations. Project delivered on time / budget and well received. Ouput published July 2019 as ETSI TR 103 582.
- Provision of standards consultancy services for Samsung Electronics in ETSI including membership of the ETSI Board until November 2014

Technologies covered in patent related work include: 3GPP GSM, UMTS, LTE, 5G NR radio interface technologies (Phy, MAC, RLC, RRC), 3GPP access and core networks (GPRS/UMTS & EPC NAS), IMS. Organisations covered include 3GPP & ETSI.

Petitioners' Exhibit 1007, p. 44
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Clients served / represented include: ADT, Apple, AT&T, Blackberry, Cradlepoint, DELL, Ericsson, Honeywell, HTC, Huawei, LG, Lenovo, Motorola, Nokia, Oneplus, Oppo, Samsung, Sierra Wireless, Thales, T-Mobile, Sprint, Verizon, Vodafone, Xiaomi, ZTE.

Working with: Addy Hart LLP, Alston & Bird LLP, Baker Botts LLP, Banner Witcoff LLP, DLA Piper LLP, European Telecommunications Standards Institute (ETSI), Fish & Richardson P.C., Gibson Dunn LLP, Haynes and Boone LLP, Hillebrand-CE GmbH, Kirkland & Ellis LLP, K&L Gates LLP, MckoolSmith LLP, PV Law LLP, Paul Hastings LLP, Perkins Coie LLP, Powell Gilbert LLP, Sidley Austin LLP, Samsung Electronics Research & Development Institute UK (SRUK), Taylor Wessing LLP, Williams & Connolly LLP, WilmerHale LLP.

Expert testimony through deposition:

- *Huawei Technologies Co. Ltd. vs. T-Mobile US, Inc., et al.*, Case Nos. 2:16-cv-0052-JRG-RSP, 2:16-cv-0055-JRG-RSP, 2:16-cv-0056-JRG-RSP, and 2:16-cv-0057-JRG-RSP (E.D. Tex.). On behalf of T-Mobile US Inc.
- *T-Mobile US, Inc., et al.* v. *Huawei Technologies Co. Ltd.*, Case Nos. IPR2017-00696 and IPR2017-00697 (PTAB). On behalf of T-Mobile US Inc.
- *LG Electronics, Inc., v. Koninklijke KPN N.V.*, Case No. IPR2018-00558 (PTAB). On behalf of LG Electronics, Inc.
- *Nokia of America Corp. and Ericsson Inc. v. IPCOM, GMBH & Co.,* Case No. IPR2021-00533 (PTAB). On behalf of Ericsson Inc.
- *IPCom, GmbH & Co., Plaintiff, v. AT&T Inc., et al, Defendant, Nokia of America Corp., Intervenor, Ericsson Inc., Intervenor.,* Civil Action No. 2:20-CV-322-JRG*, and IPCom, GmbH & Co., Plaintiff, v. Verizon Communications, et al., Defendant, Nokia of America Corp., Intervenor, Ericsson* nc*., Intervenor.,* Civil Action No. 2:20-CV-323-JRG. On behalf of Ericsson Inc.
- *Ericsson Inc. v. Koninklijke KPN N.V.,* Case No. IPR2022-00069 (PTAB). On behalf of Ericsson Inc.

Expert testimony in court:

- *Between IPCom GmbH and Vodafone, et al.,* Claim No. HP-2018-000030 Claim No. HP-2018-000031, High Court of Justice, Business & Property Courts of England and Wales, Intellectual Property List (ChD), Patents Court. Retained by Vodafone.
- *Between (1) Mitsubishi Electric Corporation (2) Sisvel International SA and Oneplus Mobiletech UK Limited, Oppo Mobile UK Ltd, Xiaomi Technology UK Limited, et al.,* Claim No. HP-2019-000014, High Court of Justice, Business & Property Courts of England and Wales, Intellectual Property List (ChD), Patents Court. Retained by Oneplus, Oppo, and Xiaomi (trial held remotely due to COVID-19 restrictions)

Samsung Electronics Research Institute (SERI) 12/96 – 01/13

Director Standards and Industry Affairs 03/11 – 01/13

Mission and Tasks as for previous role plus:

- Proactive member of ETSI Board following election as Board member in November 2011
- Worked with Samsung internal and external legal counsel in response to EC investigation into Samsung suspected abuse of Standards Essential Patents.
- Deposed by Apple as fact witness in ITC investigation 337-TA-794.

Head of Advanced Technologies Standards & Regulation 09/05 - 03/11

Mission: To help position Samsung and SERI at the forefront of mobile telecommunication developments through participation in and leadership of mobile communications standards and European regulatory affairs

Key tasks:

- Developed standards and research strategy and coordinated activites with head office, acting as official Samsung contact for the European Telecommunications Standars Institute.
- Programme managed standardisation and regulation projects covering 3GPP (RAN2, CT1, SA2, SA1, SA, RAN, CT), OMA, and mobile Broadcast strategies and technologies (DVB Forum), European Framework projects (FP7), Spectrum Management (CEPT, ETSI EM, TFES, BRAN, …) and European Regulatory affairs (Digital Europe, relations with European Commission, …). - Grew department from 3 to 12 persons to cater for these activities.
- Participated and actively contributed to 3GPP SA1 (11/08 – 11/11), SA2 (10/05 – 08/11) , SA and ETSI TC SCP groups on issues including IMS / CS Interworking (VCC / SRVCC, VoLTE, T-ADS, ICS), Local IP Access & Selected IP Traffic Offload (LIPA-SIPTO), MOSAP, M2M/MTC, Embedded / 4FF UICC.
- Drafted and filed communication technology related patents related to 3GPP SA2 and CT1 technologies – 18 filed, mainly IMS and 3GPP NAS related
- Supported Samsung IP team with analysis of Samsung and 3rd party communication technology related patents and claim charts including GSM/GPRS, UTRAN, NAS, and IMS patents
- Chaired SERI Patent Committee from 2007-2009 - SERI achieved patent targets for first time in 2007 and did so in every year following

Standards consultant – part time 09/04 – 09/05

(Whilst studying fulltime for MSC)

During this time, I conducted a review of the wireless communication technolgies and the associated standards space, with a particular emphasis on 802.16a, as well as 3G and 802.11 evolutions. I was also involved in analysis of 3rd party patents and claim charts on request from Samsung IP team.

Technology Manager System Engineering group 06/03 – 09/04

Mission: To establish a System Engineering group within SERI to support development of SERI's dual mode GSM/UMTS radio modem platform.

Key Tasks:

- Defined and implemented System Engineering group strategy including recruitment and line management of the group which grew from 3 to 10 engineers during this period.
- Developed detailed system requirements for SERI's dual mode 2G/3G radio modem platform(s) including production of background documentation describing system wide behaviour
- Defined system test programme for platform, including example test cases using off the shelf test equipment. This project outsourced (under my supervision) to a third party company for completion.
- Provided continued support to development engineers in terms of understanding specification and system requirements, particularly with respect to Access Stratum and Non Access Stratum specifications and protocols.
- Instigated and managed studies investigating optimised system architecture for future Samsung mobile platforms.
- Analysed Samsung and 3rd party 3GPP technology related patents and claim charts on request by Samsung IP team and reported on their value and standards essentiality.

Technology Manager Standards & System Group 04/02 – 06/03

Mission: To provide Standards support to SERI development teams and Samsung's global standardisation activities.

Key Tasks:

- Devised and implemented revised strategy to improve the focus of activities and provide improved support for software developers from a system perspective.

- Attended 3GPP TSG SA plenary and occasional SA WG1 meetings - acted as rapporteur for 3GPP Evolution technical report 3GPP TR 21.902.
- Analysed 3rd party GSM/GPRS technology related patents and claim charts on request by Samsung IP team and reported on their value and standards essentiality.
- Line managed 3 engineers, ensuring that the group provided expert support for SERI SW and HW developers in terms of standards interpretation and system requirements, particularly with respect to the Radio Access Network.

Project Manager 04/00 – 04/02

Mission: To establish and manage development of a dual mode GSM/UMTS modem platform.

Key tasks:

- Defined and managed work relating to core technology development for Samsung's 3G handsets.
- Determined major technical architecture and parameters for the platform producing high level system requirements specification and project development plan.
- As a technical authority on UMTS, supported the project in terms of requirements specification and interpretation (L1, MAC/RLC, RRC, and NAS specifications), and contributed towards the training of UMTS project team members.
- Acting in a consultative capacity, interfaced with other departments in Samsung and with external customers/suppliers on issues relating to 2G and 3G technologies
- Responsible for the overall planning, work allocation and co-ordination of engineers for the project, as well as being involved in recruitment – during this period the number of engineers working on the project increased from 10 to over 40.
- Instigated, defined and managed a feasibility study involving HW and SW engineers, as essential preparation for the development of a dual mode GSM/UMTS radio modem platform.

Senior/Principal Standards Engineer 12/96 – 04/00

Mission: To support Samsung standards and development activities in ETSI and 3GPP.

Key Tasks:

- Gathered and disseminated information throughout Samsung concerning latest specifications and trends in telecommunications, providing advice to Senior Management on future strategies for telecommunications development.
- Acted as sole Samsung representative in ETSI TC SMG2 from December 1996 and during the selection phase for the UMTS Radio Acces Technology providing training for Samsung engineers on elaborated technologies
- Participated in 3GPP TSG RAN WG1 (UTRA Physical Layer), and RAN WG2 (L2/3) contributing specifically in areas related to FEC, Common Packet Channel, and Transmit Diversity
- In 3GPP TSG T WG2 I initiated and acted as rapporteur for the UE capabilities work item. I also acted as liaison officer between TSG T WG2, TSG RAN WG1 and TSG SA WG1 (Service Aspects) on issues of common interest
- Acted as main spokesperson for and advisor on Samsung strategic activities in, 3GPP TSG RAN from 3GPP's creation until April 2000
- Acted in a consultative capacity advising the company on technical, commercial and regulatory issues relating to 3rd generation telecommunications development and implementation.
- Developed and promoted programme to co-ordinate standards activities throughout Samsung. – Samsung Global Standards Strategy Group established in September 1998.
- Attended ETSI TCs, SMG1, SMG4, SMG5, SMG7, SMG9 and SMG11 as required by Samsung to keep abreast of developments prior to establishment of 3GPP

Radiocommunications Agency 06/93 -11/96

HPTO Spectrum Engineer

- Responsible for the management of spectrum for use by PMR and Wireless LAN technologies.
- Defined and instigated development of an improved assignment methodology for Private Mobile Radio (PMR) channels, promoting increased quality and spectrum efficiency.
- Managed research projects involving the assessment and selection of bids from external companies, submitted under competitive tender.
- Represented the Agency in the National and International fora associated with the use of Land Mobile Radio, acting as rapporteur for PMR voice and data standards in ETSI Sub-Technical-Committee RES02, and as chairman of a sub-working group under ITU WP8A drafting the recommendation for use of the radio spectrum by Radio LANs.
- Involved in CEPT Spectrum Engineering Project Teams, dealing with spectrum for Narrow band PMR technology and co-ordination between that technology and T-DAB transmissions in Band III.
- Dispensed technical advice both within the Agency and to external customers, on national and international PMR standards, assessing requests for additional frequencies, and providing technical justification for assignments and wider spectrum policy

BBC Radio 11/89 – 05/93

Radio Operations Engineer

- Worked on projects requiring the design, development, maintenance and testing of equipment for use within the broadcasting chain.
- Responsible for acceptance testing of new studios for Radio 5, and in particular redesign of outside source circuits for the main sports continuity studio.
- Involved in acceptance testing for NICAM transmission routers. Designed and implemented modifications to synchronise transmission feeds, resulting in seamless switching between routers.

Education

1. MSC in Computer Science from the University of Kent

   Awarded (with distinction): 07/2006

   Dissertation title: Roles Variables and Program Analysis – Received prize for outstanding achievement

2. B.Eng. (Hons) in Electronic Engineering from the Polytechnic of Central London

   Awarded: 07/1989

3. In house and external technical and management training including: Learning Tree courses on System Analysis and Design, User Requirements, UML, and Project Management.
4. On-line courses from: Cousera, Udemy, and Zenva courses covering Machine Learning, Python, Data Science, and Natural Language Processing

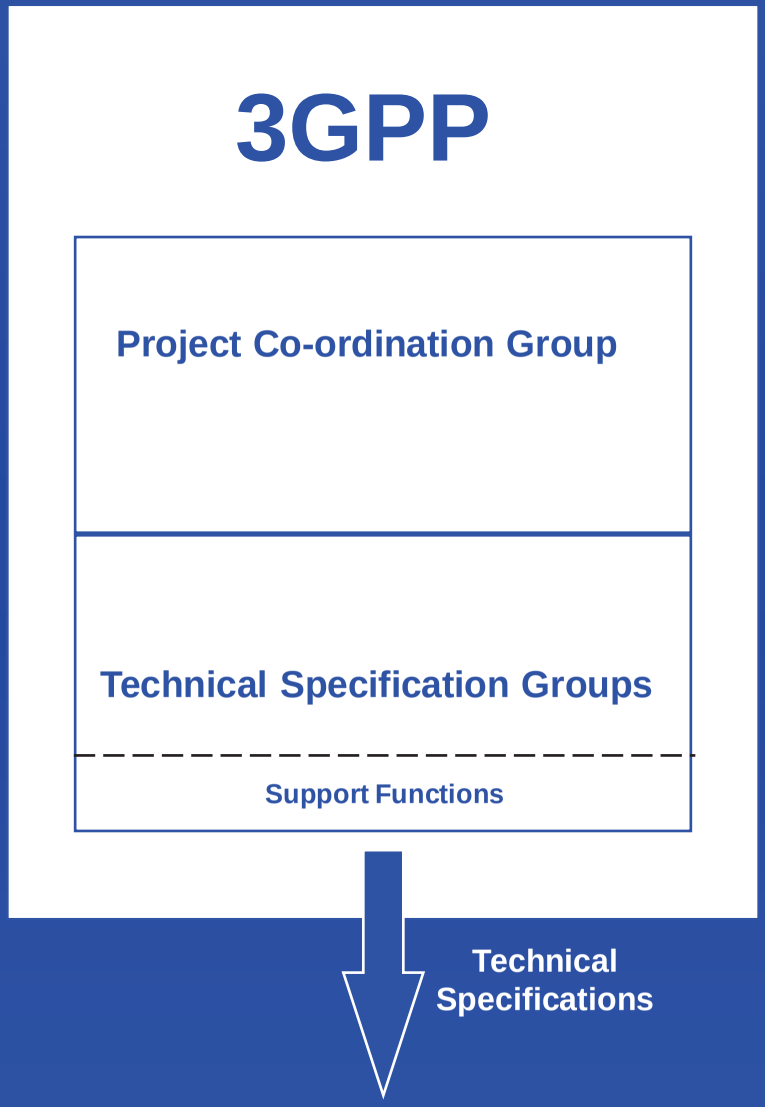
THIRD GENERATION PARTNERSHIP PROJECT (3GPP)

PARTNERSHIP PROJECT DESCRIPTION

During the meeting held in Copenhagen, 2 - 4 December 1998 ARIB, ETSI, T1, TTA and TTC agreed this Partnership Project Description.

Petitioners' Exhibit 1007, p. 51
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121



Preamble

Standards organizations and other related bodies have agreed to co-operate for the production of a complete set of globally applicable Technical Specifications for a 3rd Generation Mobile System based on the evolved GSM core networks and the radio access technologies supported by 3GPP partners (i.e., UTRA both FDD and TDD modes).

The Project is entitled the "Third Generation Partnership Project" and may be known by the acronym "3GPP".

3GPP has been established for the preparation and maintenance of the above mentioned Technical Specifications, and is not a legal entity.

3GPP Overview

Definition of the Third Generation Partnership Project

3GPP will provide globally applicable Technical Specifications for a 3rd Generation Mobile System based on the evolved GSM core network, and the Universal Terrestrial Radio Access (UTRA), to be transposed by relevant standardization bodies (Organizational Partners) into appropriate deliverables (e.g., standards).

Petitioners' Exhibit 1007, p. 54
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Scope and objectives (1)

The Technical Specifications will be developed in view of global roaming and circulation of terminals.

The 3rd Generation Mobile System and its capabilities will be developed in a phased approach. Initially, 3GPP will elaborate, approve and maintain the necessary set of Technical Specifications for the first phase of a 3rd Generation Mobile System including:

- **UTRAN (including UTRA; W-CDMA in Frequency Division Duplex (FDD) mode and TD-CDMA in Time Division Duplex (TDD) mode)**
- **3GPP Core Network (Third Generation networking capabilities evolved from GSM . These capabilities include mobility management and global roaming.)**
- **Terminals for access to the above (including specifications for a UIM)**
- **System and service aspects**

Petitioners' Exhibit 1007, p. 55
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Scope and objectives (2)

The set of global specifications for the first phase of the 3GPP core network and the specifications for the GSM core network should be common to the largest extent possible and should not be needlessly different.

The results of the 3GPP work will form the basis of member contributions to the ITU in accordance with existing procedures.

3GPP will take account of emerging ITU recommendations on interworking between IMT-2000 family members.

In the framework of agreed relationships, 3GPP will elaborate Technical Specifications that will form the basis of standards, or parts of standards, of the Organizational Partners.

Petitioners' Exhibit 1007, p. 56
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Characteristics of 3GPP (1)

3GPP is characterized by the following attributes:

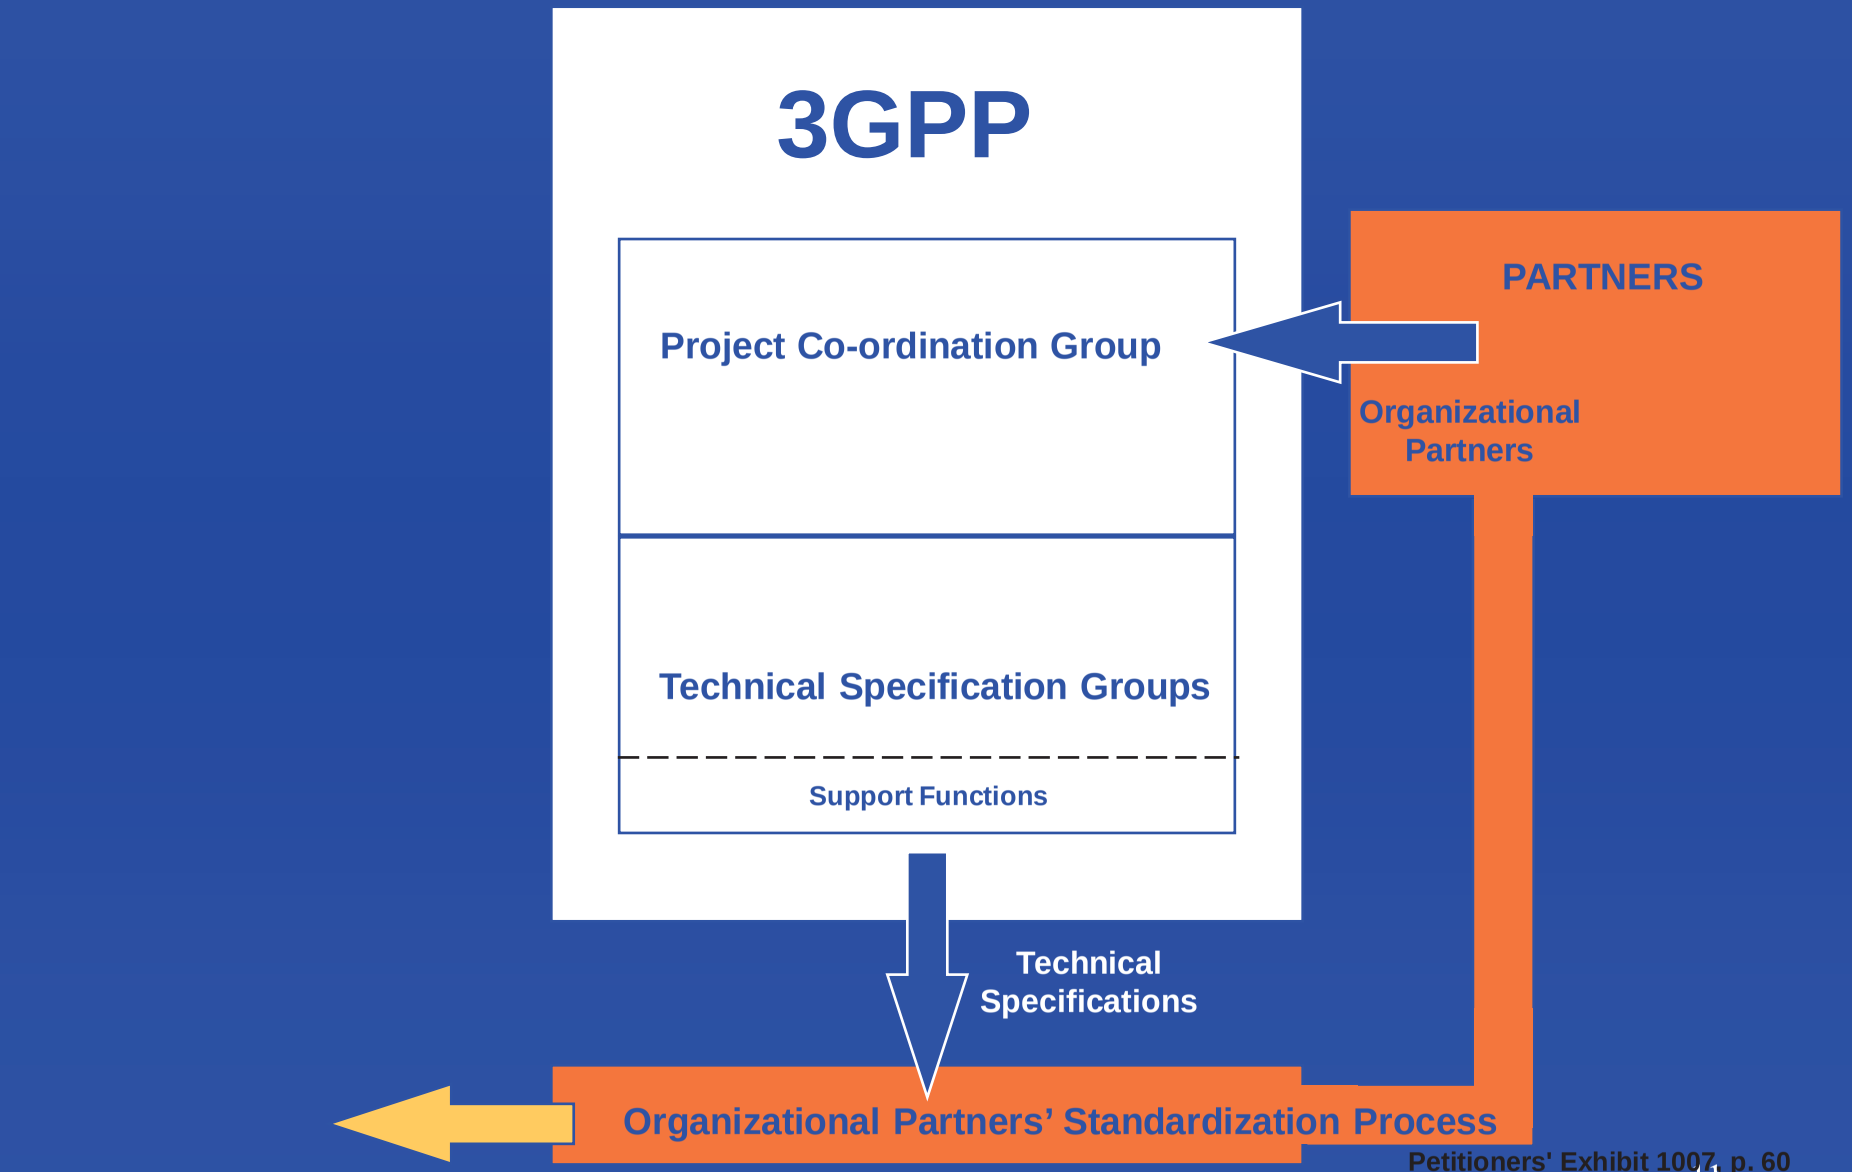
- **Minimum production time for Technical Specifications from conception to approval**
- **Fast, electronic based approval process**
- **Maximum use of modern (electronic) working methods**
- **Minimum number of hierarchical levels with decision making taking place at the lowest appropriate levels**

Petitioners' Exhibit 1007, p. 57
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Characteristics of 3GPP (2)

- **A Project Co-ordination function and a Technical Specification function**
- **Task oriented, ensuring that on completion of the tasks the future of the project is re-evaluated**
- **Cost effective use of financial/human resources provided by Partner Organizations (if required)**

Petitioners' Exhibit 1007, p. 58
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121



Partnership and Membership

3GPP comprises of:

- **Partners:**
  - **Organizational Partners**
    - **3GPP is open to all standards organizations irrespective of the geographical location.**
  - **Market Representation Partners**
- **Individual Members**

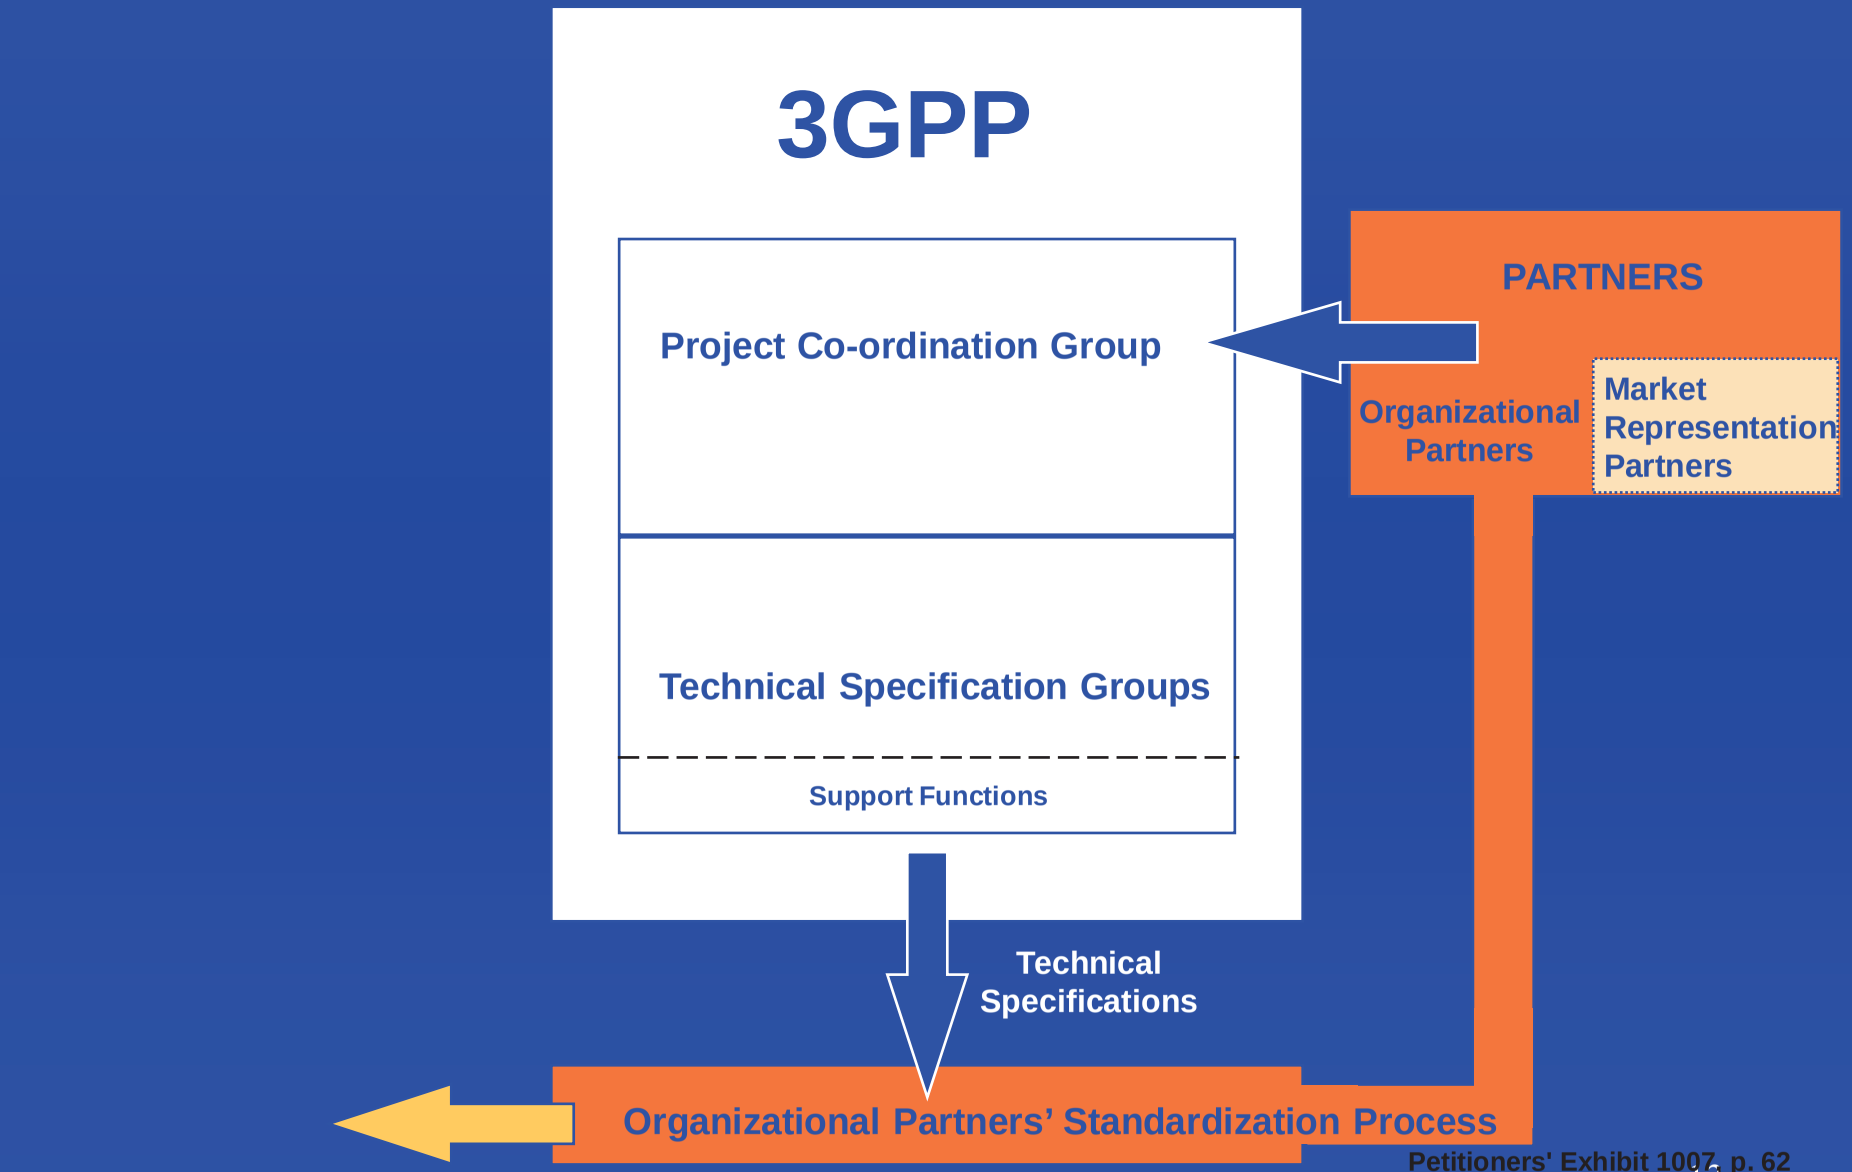
Petitioners' Exhibit 1007, p. 59
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Organizational Partners (1)

Organizational Partners (2)

An Organizational Partner is:

An open standards organization with a national, regional or other officially recognized status (in their country or region)



that:

- **has the capability and authority to define, publish and set standards nationally or regionally and**
- **has signed (or whose sponsor has signed) the Partnership Project Agreement**

Organizational Partners will meet as approriate and make decisions by consensus.

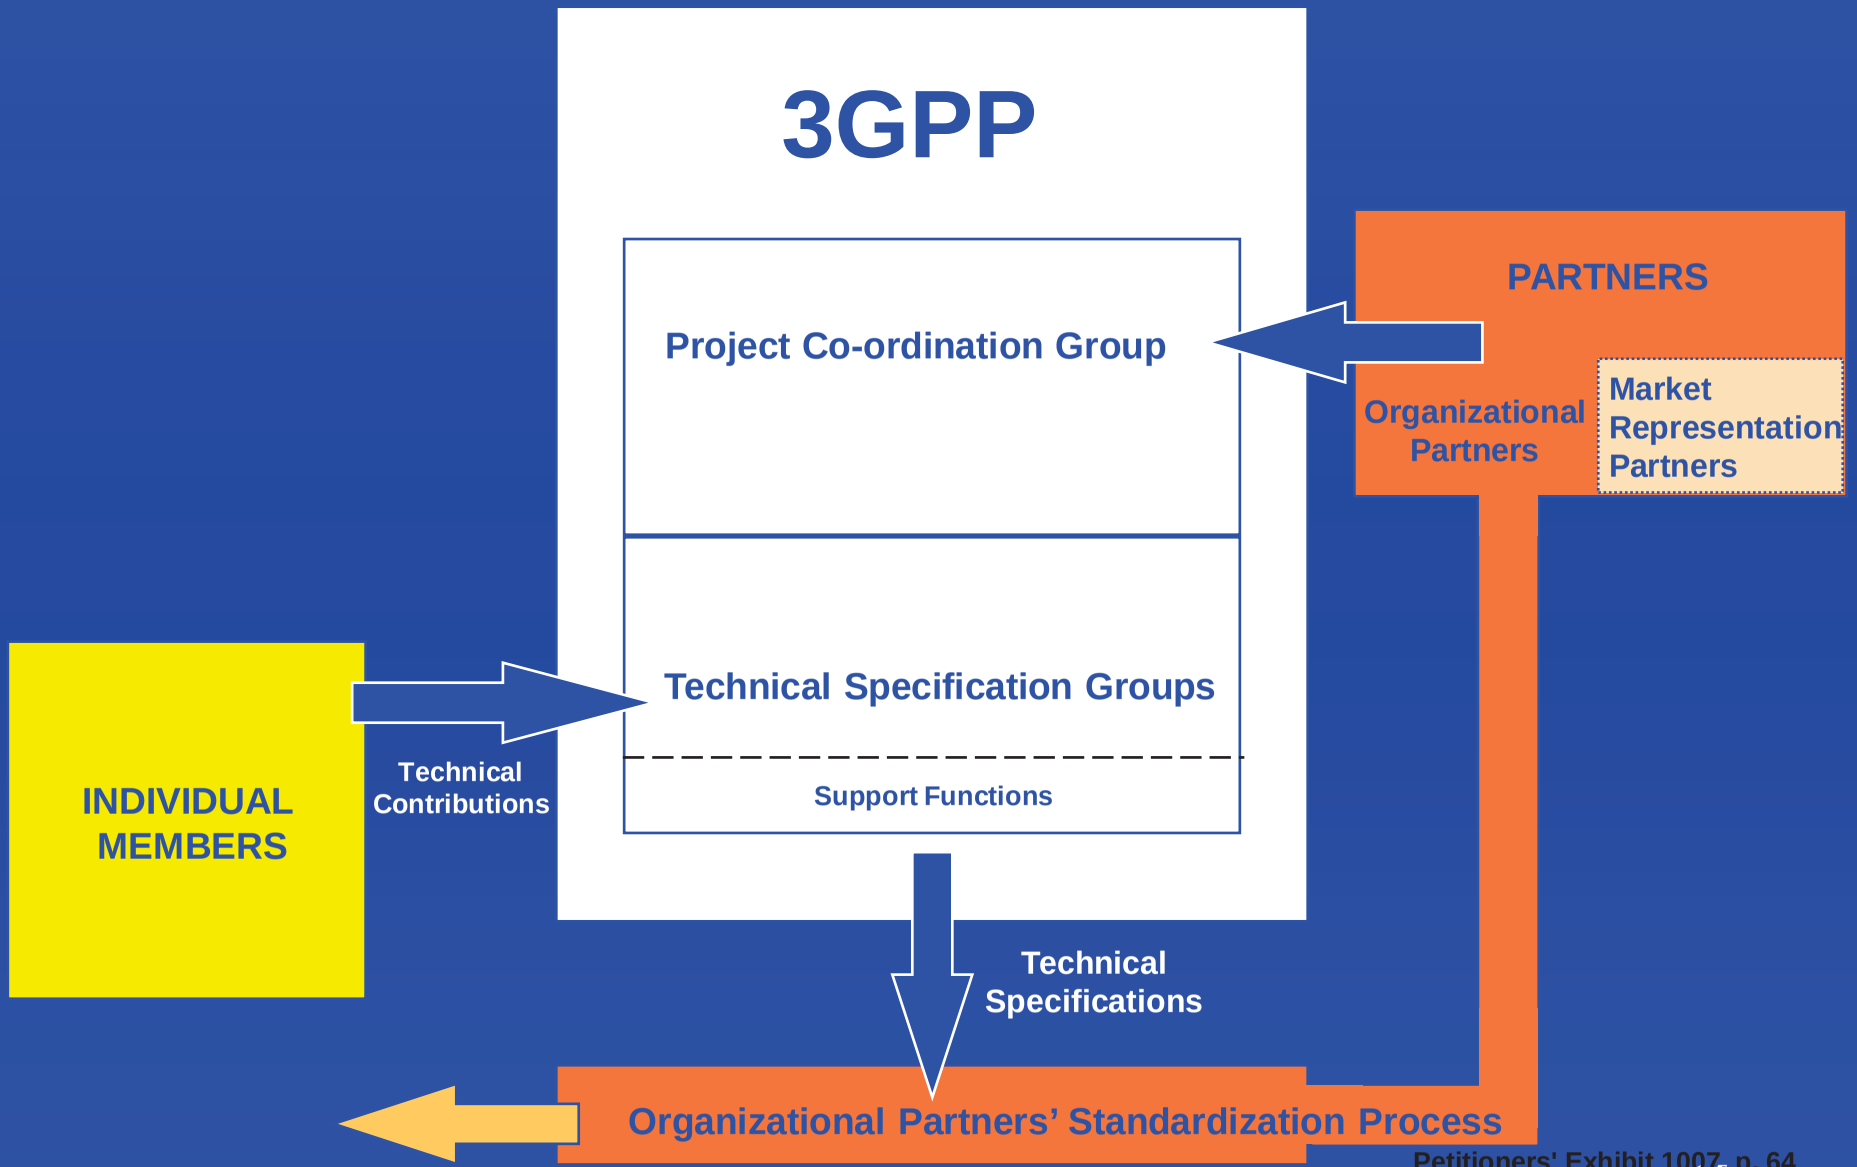
Petitioners' Exhibit 1007, p. 61
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Market Representation Partners (1)

Market Representation Partners (2)

Standardization should meet market needs.

In order to identify market requirements, the high competence of Market Representation Partners should be used.



A Market Representation Partner is an organization invited to participate by the Organizational Partners to offer market advice to 3GPP and to bring into 3GPP a consensus view of market requirements (e.g. services, features and functionality) falling within the 3GPP scope.

A Market Representation Partner:

- **does not have the capability and authority to define, publish and set standards nationally or regionally**
- **has signed (or whose sponsor has signed) the Partnership Project Agreement**
- **has committed itself to the 3GPP scope**

Petitioners' Exhibit 1007, p. 63
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Individual Members (1)

Petitioners' Exhibit 1007, p. 64
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Individual Members (2)

Membership in an Organizational Partner is a pre-requisite for Individual Membership in 3GPP.

Individual Membership is open to legal entities committed to support 3GPP and to:

- **contribute technically or otherwise to one or more of the Technical Specification Groups within the 3GPP scope**
- **use the 3GPP results to the extent feasible**

Individual Membership in 3GPP will be terminated by dissolution, abolition, resignation or expulsion from the related Organizational Partner.

Petitioners' Exhibit 1007, p. 65
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Individual Members (3)

All entities registered as members of an Organizational Partner and eligible for participation in the technical work of that Partner, can become Individual Members of 3GPP. Individual members shall apply to their Organizational Partner to participate in 3GPP.

Individual Members act in the 3GPP in their own right; they carry the full responsibility for their contributions.

Individual Membership applicants residing in a country/area without an Organizational Partner can apply for membership in an Organizational Partner according to the rules of each Partner. (e.g. ETSI Associate Membership is available)

Petitioners' Exhibit 1007, p. 66
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Observership

In order to ensure globally applicable Technical Specifications, the status of "Observer" may be granted by the Organizational Partners to an entity which has the qualifications to become a future Organizational Partner. The status of "Observer" includes obligations to:

- **identify as early as possible any regulatory requirements that may lead to options within Technical Specifications**
- **make their IPR policy available for consideration**
- **contribute to the common objective of the 3GPP and avoid duplication of work related to the 3GPP**

The participation rights of an Observer will be decided on a case by case basis.

Petitioners' Exhibit 1007, p. 67
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121
3GPP-04/12/1998

Documentation for 3GPP

The following 3 documents describe 3GPP:

- **The Partnership Project Agreement**
- **The Partnership Project Description (this present document)**
- **The Partnership Project Working Procedures**

Petitioners' Exhibit 1007, p. 68
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The Partnership Project Agreement (1)

The Partnership Project Agreement is a concise legal document signed by participating Partners (or their sponsor).

It contains the minimum legal text necessary for 3GPP to function correctly.

The Partnership Project Agreement refers to the Partnership Project Description and the Partnership Project Working Procedures.

Petitioners' Exhibit 1007, p. 69
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The Partnership Project Agreement (2)

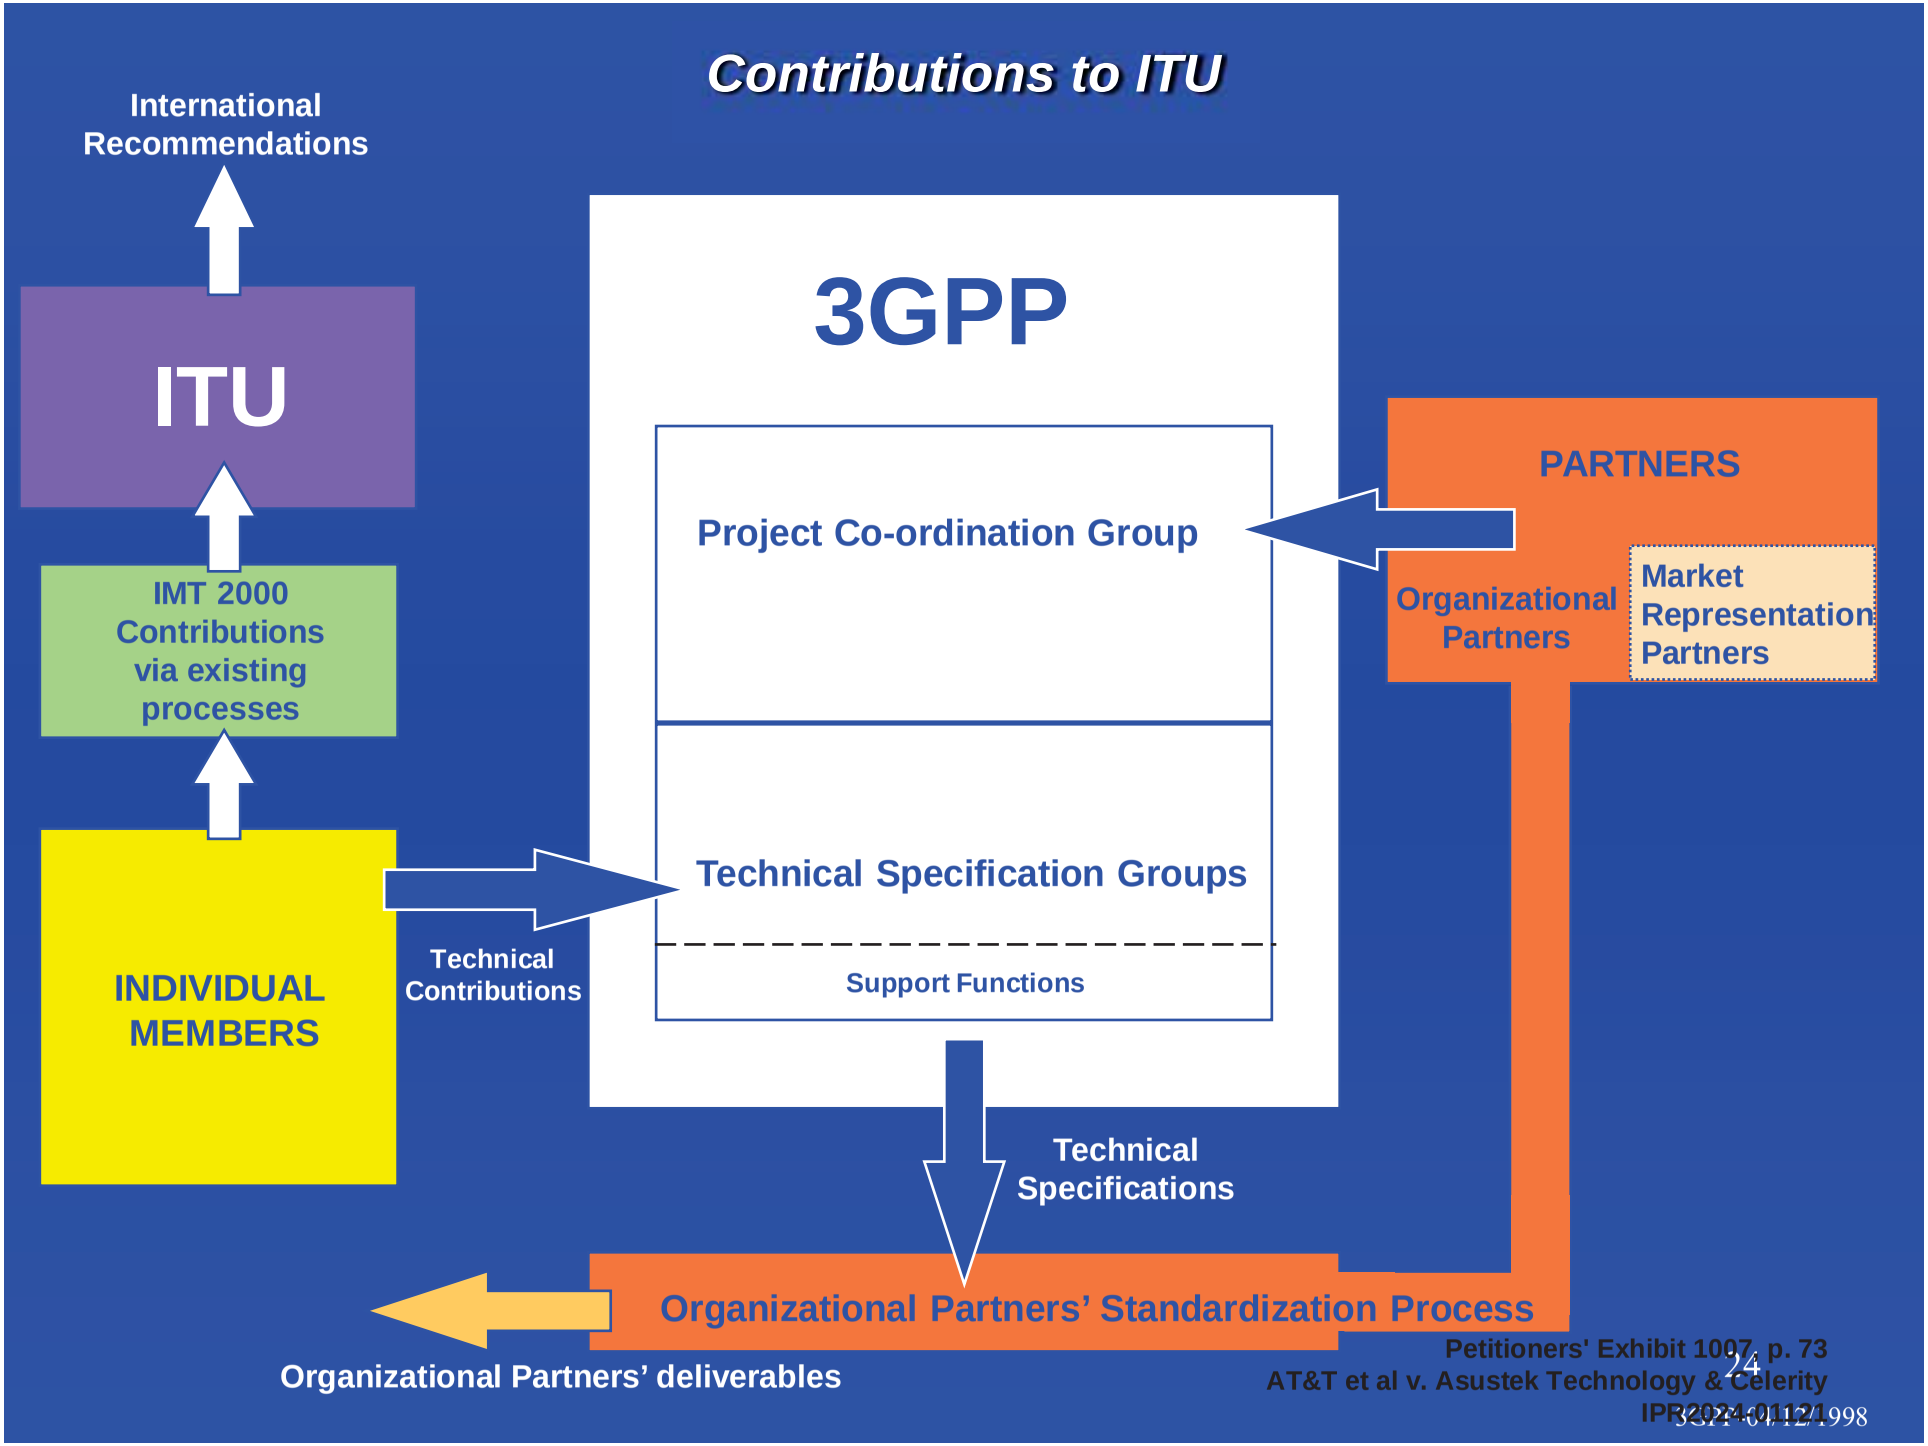
The Partnership Project Agreement includes obligations on Organizational Partners to commit themselves to the 3GPP scope:

- **to encourage their members to contribute to the common set of Technical Specifications and to avoid duplication of work**
- **to convert / transpose / adopt all relevant Technical Specifications resulting from 3GPP into their own relevant deliverables through their normal processes**
- **to identify as early as possible, any national / regional regulatory requirements that may lead to options within the Technical Specifications**
- **to make their IPR Policy available for consideration**

The Partnership Project Agreement (3)

The Partnership Project Agreement includes obligations on Market Representation Partners to identify market and service requirement of 3GPP and to contribute to:

- **the promotion of 3GPP**
- **the definition of 3GPP System and Service scenarios**



The Market Representation Partners should also encourage their members to contribute to the common objectives of 3GPP and to avoid duplication of work.

Petitioners' Exhibit 1007, p. 71
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Ownership of the Partnership Project results

The Organizational Partners of 3GPP will have joint ownership (including copyright) of the Technical Specifications.

Petitioners' Exhibit 1007, p. 72

IPR2024-01121

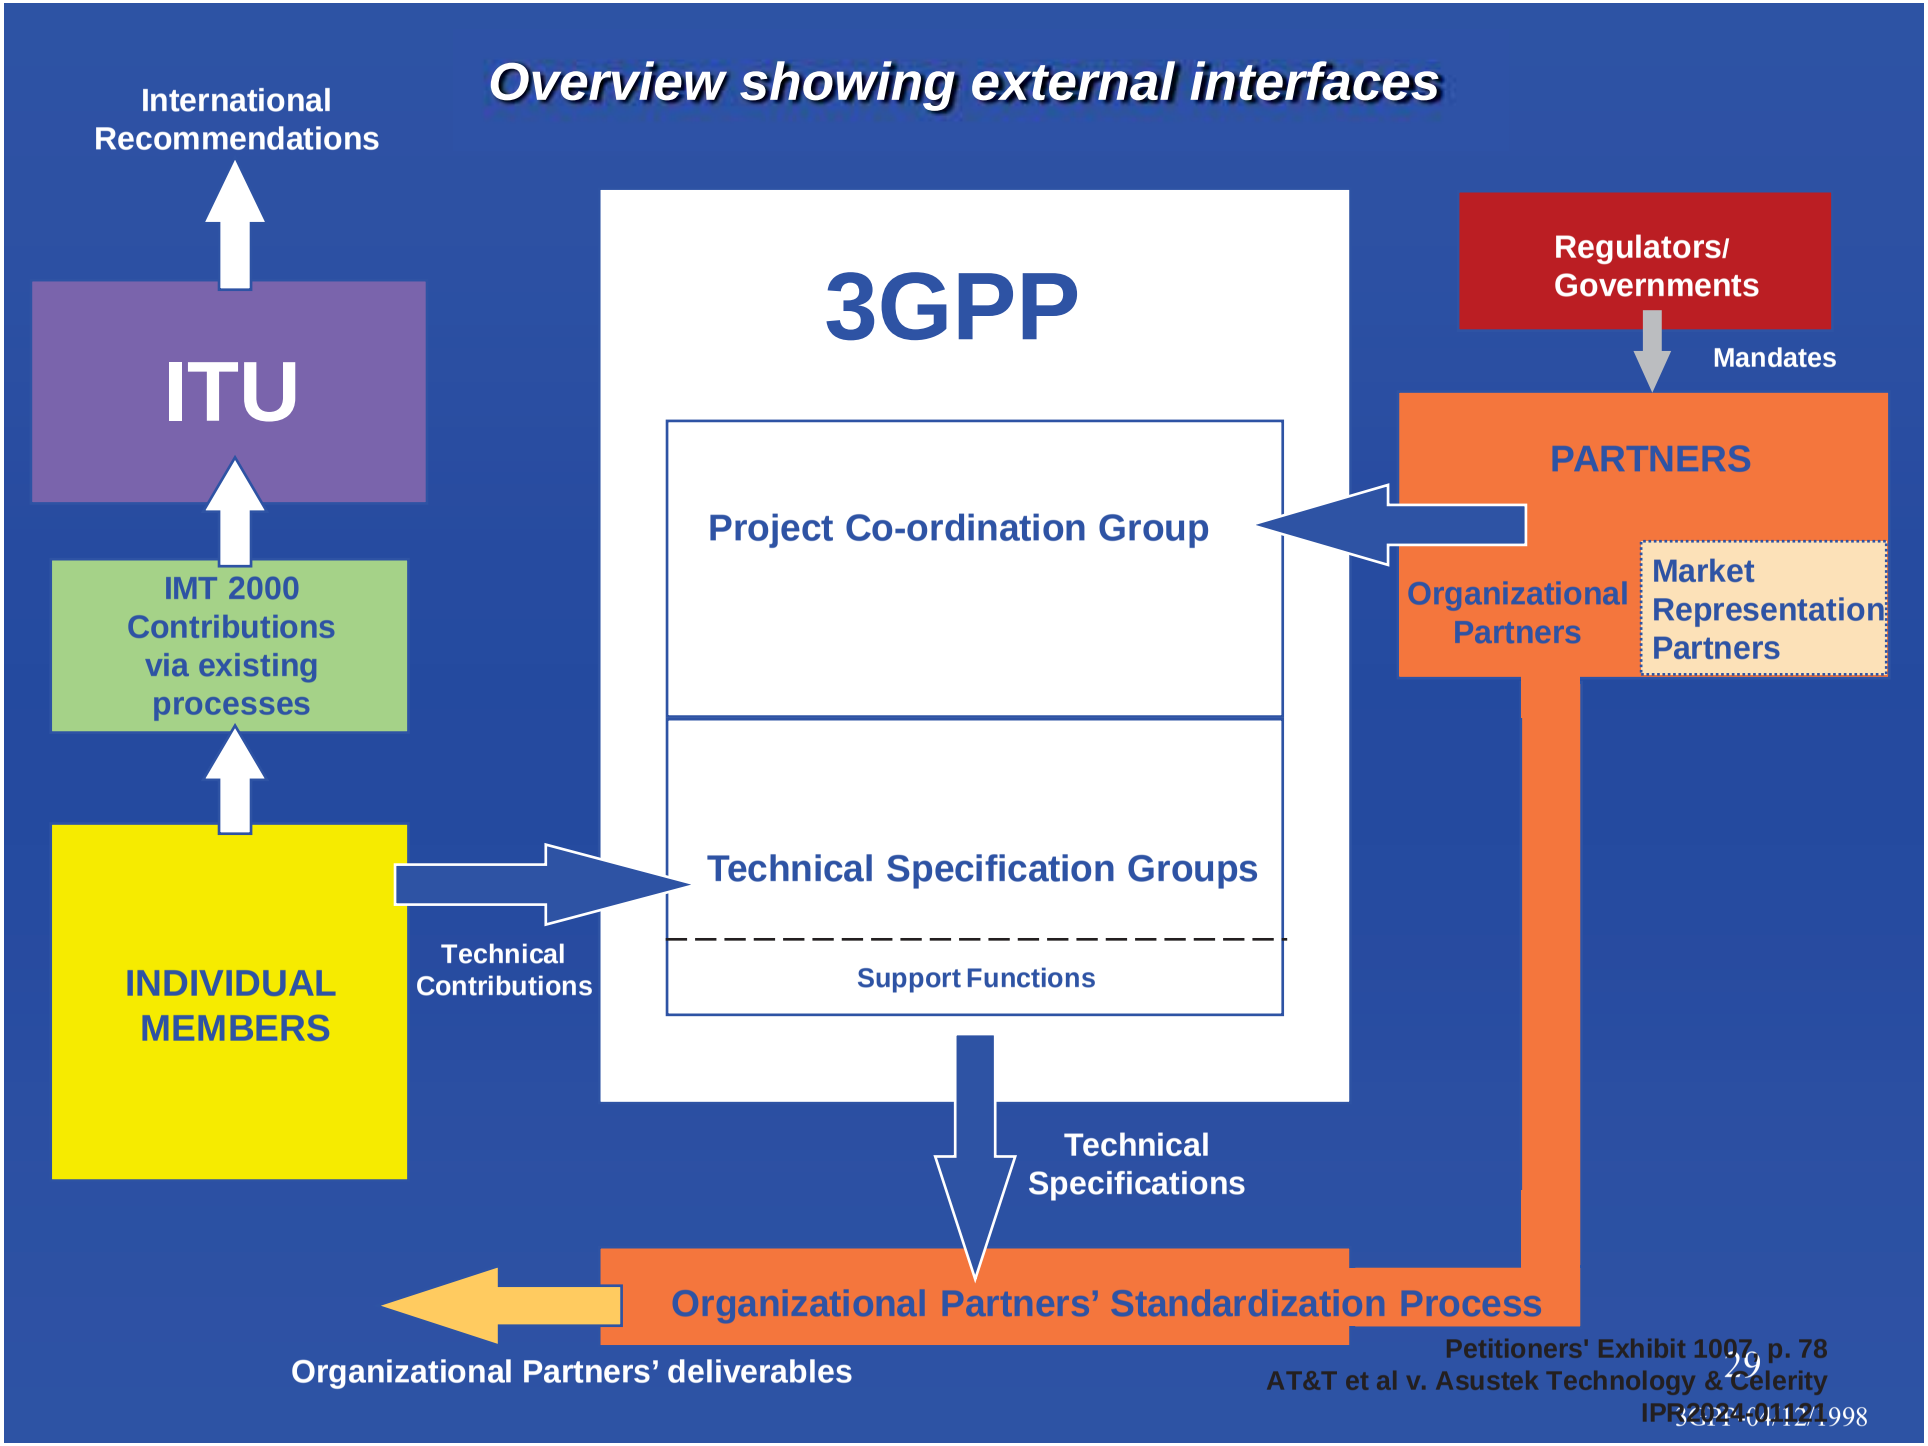
Resource requirements for establishing 3GPP



ETSI will absorb the initial cost of establishing the 3GPP, if required.

Thereafter, the costs will be shared by the Organizational Partners. There will be no direct 3GPP membership fee for Individual Members.

Partners and Individual Members may provide support functions to the extent that they are able (eg hosting of meetings and provision of Secretariat support).

The longer term financial requirements are for further study.

Internal structure of 3GPP (1)

3GPP consists of a Project Co-ordination Group (PCG) and Technical Specification Groups (TSGs).

To assist in the co-ordination of the technical activities, the TSGs are encouraged to meet at the same time and place, as and when appropriate (e.g. twice per year).

Petitioners' Exhibit 1007, p. 79
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Internal structure of 3GPP (2)

Petitioners' Exhibit 1007, p. 80
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Work areas to be covered by the Radio Access Network TSG

- Radio Layer 1 specification
- Radio Layer 2 specification
- Radio Layer 3 RR specification
- Iub specification
- Iur Interface
- Iu Interface
- UTRAN O&M requirements
- Base station radio performance specification
- Conformance test specification for testing of radio aspects of base stations
- Specifications for radio performance aspects from the system point of view

Petitioners' Exhibit 1007, p. 81
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Work areas to be covered by the Core Network TSG

- **Mobility management, call connection control signalling between the user equipment and the core network**
- **Core network signalling between the core network nodes. the signalling supports functionality such as user location information, subscription information and control of network services**
- **Definition of interworking functions between the core network and external networks**
- **Packet related questions such as mapping of QoS (e.g. transparency for IP domain applications, general for bearer types, special for optimized applications such as Voice over IP)**
- **Core network aspects of the lu interface**
- **Core network O&M requiremnents**

Petitioners' Exhibit 1007, p. 82
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Work areas to be covered by the Terminal TSG

- **Service capability protocols**
- **Messaging**
- **Services end-to-end interworking**
- **USIM to Mobile Terminal interface**
- **Model/framework for terminal interfaces and services (application) execution**
- **Conformance test specifications of terminals, including radio aspects**

Petitioners' Exhibit 1007, p. 83
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Work areas to be covered by the Service and System Aspects TSG

- **Service capabilities**
  - **Definition of services and feature requirements**
  - **Development of service capabilities and a service architecture for cellular, fixed (and cordless) applications**
- **Stage one and two descriptions for:**
  - **Charging and accounting**
  - **Network Management**
  - **Security Aspects**
- **Architecture**
  - **Definition, evolution, and maintenance of overall architecture, including assignment of functions to particular sub-systems and identification of key information flows**
  - **In co-operation with other TSGs, define required services, service capabilities and bearer capabilities offered by the different sub-systems**
- **Codec aspects**
  - **Principles for definition of end-to-end transmission**
  - **Definition, evolution and maintenance of relevant specifications**
- **Project co-ordination**
  - **High level co-ordination of the work performed in other TSGs and monitoring of progress**

Petitioners' Exhibit 1007, p. 84
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Primary responsibilities of PCG and TSGs (1)

The primary responsibilities of PCG, TSGs and Organizational Partners are given in the following tables:

	Function	Org Partners collectively	PCG	TSGs
1	Approval of new Partners for 3GPP	X		
2	Approval of Organizational Partner funding requirements and contributions	X		
3	Allocation of human and financial resources provided by Partners to PCG	X		
4	Allocation of resources to TSGs		X	
5	Allocation of resources within TSGs			X

Petitioners' Exhibit 1007, p. 85
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Primary responsibilities of PCG and TSGs (2)

	Function	Org Partners collectively	PCG	TSGs
6	Allocation of voluntary human and financial resources by Market Representation Partners and Individual Members		X	X
7	Handling of appeals from Individual Members on procedural matters	2nd step	1st step	
8	Handling of appeals from Individual Members on technical matters		2nd step	1st step
9	Determine overall time frame and manage overall work progress		X	

Primary responsibilities of PCG and TSGs (3)

	Function	Org Partner collectively	PCG	TSGs
10	Detailed time frame and manage detailed work progress			X
11	Approval of Technical Specifications			X
12	Proposal and approval of work items within the agreed scope and terms of reference			X
13	Final adoption of work items within the agreed scope and terms of reference		X	
14	Management of work items			X

Petitioners' Exhibit 1007, p. 87
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Primary responsibilities of PCG and TSGs (4)

	Function	Org Partners collectively	PCG	TSGs
15	Technical Co-ordination (System Aspects TSG will play a role here)			X
16	Appointment of Org Partners meeting Chairman (provided by host on a rotational basis)	X		
17	Appointment of PCG Chairman (for one year term)		X	
18	Election of TSG Chairman and Vice Chairmen			X
19	Creation of TSGs and approval of their terms of reference	X		

Petitioners' Exhibit 1007, p. 88
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Primary responsibilities of PCG and TSGs (5)

	Function	Org Partners collectively	PCG	TSGs
20	Creation of TSG working groups and approval of their terms of reference			X
21	Election of TSG Working Group Chairmen and Vice Chairmen			X
22	Confirmation of individual member participation rights	X		
23	Approval of 3GPP scope and terms of reference	X		
24	Maintain Partnership Project Agreement, Project Description and Working Procedures (consensus agreement by all Partners)	X		

Petitioners' Exhibit 1007, p. 89
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Participation rights in PCG and TSGs

The following have a right to participate in the PCG:

- **Representatives of participating Organizational Partners**
- **Representatives of participating Market Representation Partners**
- **Chairman and Vice Chairmen of the TSGs, as ex-officio members**

The following have a right to participate in the TSGs :

- **Representatives of members of participating Organizational Partners (i.e. Individual Members)**
- **Representatives of participating Organizational and Market Representation Partners**

Principles for decision making within 3GPP

Decision making within PCGs

- **By consensus amongst the Organizational Partners**
- **By vote amongst the Organizational Partners in unavoidable cases**

Decision making within TSGs

- **By consensus amongst the Individual Members**
- **By vote amongst the Individual Members in unavoidable cases**

The Organizational Partners will conduct a fairness review of the decision making process six months after 3GPP start-up, taking into account all concerns raised

(Note: voting will not be permitted on National/Regional regulatory requirements)

Petitioners' Exhibit 1007, p. 91
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Principles for voting within TSGs

The following principles will be applied for voting within the TSGs

- **One "Individual company Member", one vote**
- **Organizational Partners to interpret " Individual company Member" according to its own rules of membership**
- **The PCG will maintain a register of eligible voters for the TSGs**
- **Each Individual Member may carry the proxy for up to five other Individual Members**

Petitioners' Exhibit 1007, p. 92
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121
3GPP-04/12/1998

Working language for 3GPP

The working language for 3GPP shall be English

- **Meetings of the PCG and TSGs shall be conducted in English**
- **3GPP Technical Specifications shall be prepared in English**

Petitioners' Exhibit 1007, p. 93
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Relationship with other groups

3GPP will establish and maintain good relationships with groups working on standards for other IMT-2000 family members.

Petitioners' Exhibit 1007, p. 94
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Intellectual Property Rights (IPR) Principles (1)

The Individual Members of 3GPP are bound by the IPR Policies of their respective Organizational Partner.

Individual Members are encouraged to declare at the earliest opportunity, any IPRs which they may have and believe to be essential, or potentially essential, to any work ongoing within 3GPP.

After comparing their respective IPR policies, ARIB, ETSI, T1, TTA and TTC have agreed that their IPR policies share common principles are quite similar and have agreed on the following additional principles to maximize the success of 3GPP.

Intellectual Property Rights (IPR) Principles (2)

(i) **To encourage their respective members' declaration of willingness to grant licences on fair, reasonable terms and conditions on a non-discriminatory basis, and consistent with the respective Organizational Partners' IPR policies.**

(ii) **To encourage their respective members who may have IPR which they believe to be essential, or potentially essential, and are unwilling to license such IPR, that early indication of such unwillingness be provided to their respective Organizational Partners.**

(iii) **To understand that essential IPRs mean essential IPRs relative to any or all parts of the content of the 3GPP technical specifications.**

(iv) **A mechanism for exchanging information associated with the patent statement among the Organizational Partners will be introduced so that such information may be used when adopting relevant standards in each Partner Organization.**

APPENDIX 3

Introducing 3GPP

The 3rd Generation Partnership Project (3GPP) unites seven telecommunications standard development organizations (ARIB, ATIS, CCSA, ETSI, TSDSI, TTA, TTC), known as “Organizational Partners” providing their members with a stable environment to produce the Reports and Specifications that define 3GPP technologies.

3GPP specifications cover cellular telecommunications technologies, including radio access, core network and service capabilities, which provide a complete system description for mobile telecommunications. The 3GPP specifications also provide hooks for non-radio access to the core network, and for interworking with non-3GPP networks

The Project’s Scope

The original scope of 3GPP (1998) was to produce Technical Specifications and Technical Reports for a 3G Mobile System based on evolved GSM core networks and the radio access technologies that they support (i.e., Universal Terrestrial Radio Access (UTRA) both Frequency Division Duplex (FDD) and Time Division Duplex (TDD) modes).

The scope was subsequently amended to include the maintenance and development of the Technical Specifications and Technical Reports for evolved 3GPP technologies, beyond 3G.

- The latest 3rd Generation Partnership Project Agreement (Annex 42).
- The discussions that led to the signing of the 3GPP Project Agreement were recorded in a series of slides called the “Partnership Project Description” that describes the basic principles and ideas on which the project is based. The document has not been maintained since its first creation, but the principles within do still remain valid.

Petitioners' Exhibit 1007, p. 98
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Organizing the work

The 3GPP Working Procedures are the rule book of 3GPP, with sections covering:

- Description, Purpose, Scope and objectives
- Participation
- Structure
- Partners' collective responsibilities
- Project Coordination Group (PCG)
- Technical Specification Groups (Incl. Elections)
- Work Programme & technical co-ordination
- Deliverables (Technical Specifications and Technical Reports)
- Reporting

The 3GPP production of specifications and studies (TRs) are contribution-driven, by member companies, in Working Groups and at the Technical Specification Group (TSG) level. The Technical Specification Groups in 3GPP are:

- Radio Access Networks (RAN)
- Services & Systems Aspects (SA)
- Core Network & Terminals (CT)

The Working Groups, within the TSGs, meet regularly and come together for their quarterly TSG Plenary meeting, where their work is presented for information, discussion and approval. The last meeting of the week of TSG Plenary meetings is TSG SA, which also has responsibility for the overall coordination of the technical work and for the monitoring of its progress.

Generational Approach

The 3GPP technologies from these groups are constantly evolving through Generations of commercial cellular / mobile systems (see table below). With LTE and 5G work, 3GPP has become the focal point for the vast majority of mobile systems beyond 3G.

Although these Generations have become an adequate descriptor for the type of network under discussion, real progress on 3GPP standards is measured by the milestones achieved in particular Releases. New features

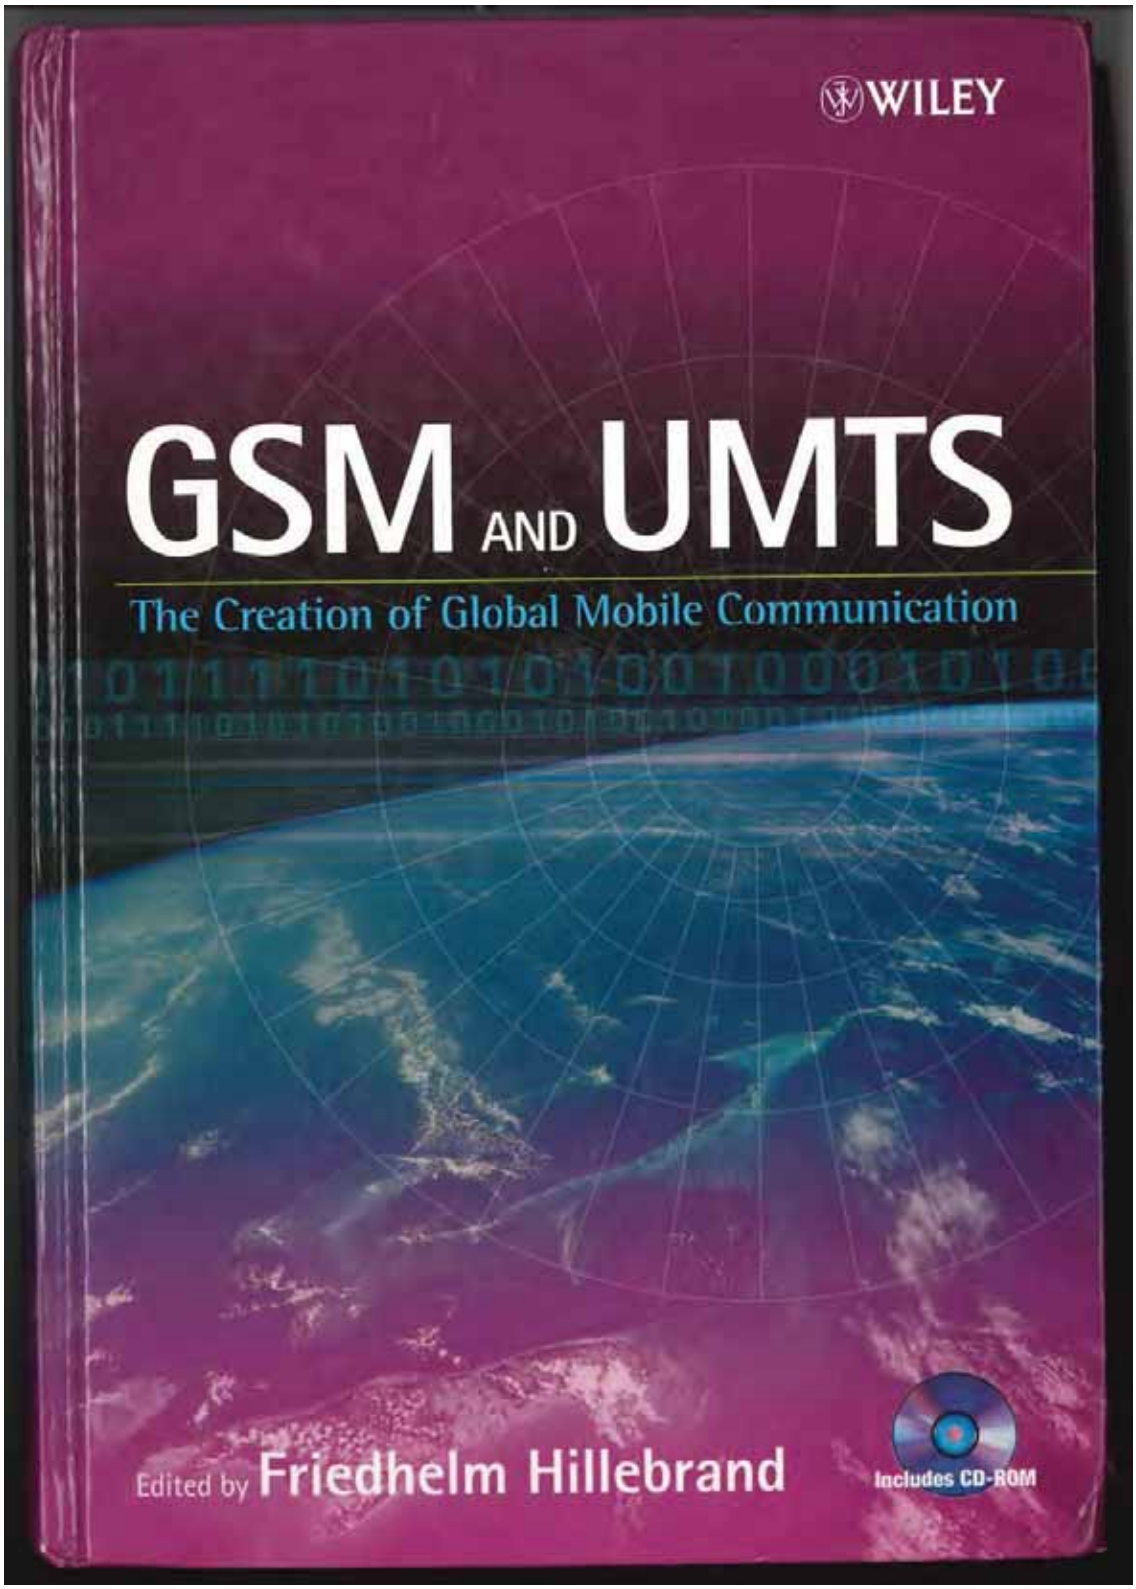
Petitioners' Exhibit 1007, p. 99
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

are 'functionality frozen' and are ready for implementation when a Release is completed. 3GPP works on a number of Releases in parallel, starting future work well in advance of the completion of the current Release. Although this adds some complexity to the work of the groups, such a way of working ensures that progress is continuous & stable.

Backward Compatibility

The major focus for all 3GPP Releases is to make the system backwards and forwards compatible where possible, to ensure that the operation of user equipment is uninterrupted.

For 5G, many operators are starting with dual connectivity between LTE and 5G NR equipment – using the 'Non-Standalone' work completed early in Release 15. In the process of completing the early drop of 5G NR care has been taken to build 'forward compatibility' into Non-Standalone NR equipment, to ensure that it will be fit for use on Standalone 5G NR systems.



For details of the contents of each Release, see the appropriate 'Release Description' document or go to our dedicated Release page.

Details of all 3GPP Work Items are in the 3GPP Work Plan, which provides details of the cooperation between all of the 3GPP groups on "Features", defined as 'new or substantially enhanced functionality which represents added value to the existing 3GPP system'.

Chapter 9: The Third Generation Partnership Project (3GPP)

Section 1: The Creation of 3GPP

Karl Heinz Rosenbrock[1]

Having read the title, it should not surprise you that this section deals with the creation of the Partnership Project for the standardisation of a Third Generation Mobile Communications System (3GPP).

Why, you may ask, in a history book about the GSM and UMTS development, do I want to talk about the establishment of a partnership project? Isn't it the most natural thing to do? This is, of course, a stance an insider can take today – after nearly 30 months of 3GPP's creation and the smooth and successful running of this project.

As this section will eventually show, it took quite some time, filled with tough and even passionate discussions, before the goal was achieved. Approaching this idea from a rather philosophical point of view, one should not be too surprised about the big efforts needed, because already the old Greek ancestors knew that "prior to being successful the Gods will demand some sweat"...[2]

This section starts with some general considerations leading the European Telecommunications Standards Institute (ETSI) membership towards a global approach in standardisation and then deals with the establishment of an ad hoc group of the ETSI Board (UGG = UMTS Globalisation Group) to address the matter of global standardisation in this context and the related meetings and discussions. Afterwards, the 3GPP will be described in a rather general manner, highlighting how it works, who the stakeholders are and dealing with the results achieved so far. The section is rounded up with the relationship towards the International Telecommunication Union (ITU) and other initiatives as well as a few concluding remarks.

9.1.1 First Approaches to Globalisation

The re-engineering process ETSI, the "Excellent" Telecommunications Standards Institute in Europe, undertook in the years 1995/1996 – only 7 years after its creation – resulted in among others a kind of mission statement for the Institute: "Making international standards happen first in Europe".

[1] The views expressed in this section are those of the author and do not necessarily reflect the views of his affiliation [illegible].

[2] One of my cruel translations of a German idiom "Vor den Erfolg haben die Götter den Schweiß gesetzt"...

Petitioners' Exhibit 1007, p. 105
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- unanimously requested the ETSI Board (through its UMTS Globalisation Group) to complete the negotiations with potential partners and to oversee the creation of the Partnership Project;
- unanimously requested the ETSI Board to agree and maintain on behalf of ETSI the final versions of the Partnership Project Description, the Partnership Project Working Procedures, and the Partnership Project Agreement;
- unanimously authorised the director-general to sign the Partnership Project Agreement.

9.1.2.4.14 Happy End in Copenhagen

It was in Copenhagen where the last 3GPP preparatory meeting with all six OPs took place on 2–4 December 1998.

Here, the final fine-tuning of the 3GPP documentation was achieved. In addition, the 3GPP agreement[8] was signed (in a nice framework provided by the host, TeleDenmark) by the following OPs: ARIB, ETSI, T1, TTA, and TTC.

Unfortunately, the partners from CWTS (China) were not authorised to sign the 3GPP agreement yet. Furthermore, owing to the fact that the UMTS Forum was unable to participate in Copenhagen, they were prevented from co-signing the 3GPP agreement as a first Market Representative Partner (MRP).

During that Copenhagen meeting, another discussion ensued about the role the MRPs should play. Finally, it was concluded that the high competence of MRPs should be used in order to identify market requirements, thus enabling 3GPP standardisation to meet the needs of the market. An MRP is an organisation invited by the OPs to participate in 3GPP with the objective of offering market advice to 3GPP and to bring into 3GPP a consensus view of market requirements.

9.1.3 What is 3GPP?

The 3GPP is a global standardisation initiative created in December 1998. Its task was to develop a complete set of globally applicable Technical Specifications for a third generation (3G) mobile telecommunications system based on the evolved GSM core network and an innovative radio interface known as UTRA. The Project is based on a concept devised by ETSI aimed at facilitating better co-operation between regional standards organisations, fora and other industry groupings. 3GPP is a collaborative activity between officially recognised SDOs, with the participation of other industry groups and individual members.

Partnership in 3GPP is open to all national, regional or other SDOs, irrespective of their geographical location – within the project the participating SDOs are referred to as OPs. The OPs may invite MRPs to participate: these may be any organisation from anywhere in the world that can offer market advice to 3GPP and bring a consensus view of market requirements that fall within the project's scope. Individual membership is open to companies and organisations within the communications industry that are active members of one of the OPs. The truly global nature and the breadth of the market interest in the task of specifying this 3G system is evident from the identity of the 3GPP partners (see further in sub-paragraph 9.1.3.2) and all agree that 3GPP is proving a highly successful initiative.

[8] The 3GPP Agreement and the 3GPP Project Description can be found on the attached CD-ROM in

Petitioners' Exhibit 1007, p. 106
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The 3GPP has no legal status. Ownership (including copyright) of the specifications and reports it produces is shared between the partners. The 3GPP process includes a conversion (transposition) of the project's output into official standards and reports by one or more of the OPs.

The specifications being prepared by 3GPP are evolved in part from the enormously successful GSM standard, which is currently (February 2001) serving over 400 million subscribers in more than 140 countries. Building on this massive installed base, the system being specified by 3GPP will be an attractive upgrade path for existing operators and users. It also has an assured compatibility with GSM – good news for both operators and users who are unable, or unwilling, to upgrade to 3G.

Paramount among the 3GPP specifications is the definition of UTRA, the innovative radio access technology that is the key to the new system's high data rates and dramatically improved performance. UTRA is spectrum-efficient and supports FDD and TDD modes. This interface has been accepted by ITU as a member of the IMT-2000 family – or more correctly, as *two* family members: IMT-DS, the FDD mode; and IMT-TC, the TDD mode. IMT-2000 family membership requires the ability for users to roam globally and seamlessly, which implies interoperability with other family members: 3GPP thus co-operates closely with the 3GPP2 project which is specifying another family member, a 3G CDMA system based on an evolution of the ANSI-41 architecture.

9.1.3.1 How Does 3GPP Work?

3GPP has been designed to minimise delays and inefficiencies. As a result, it has a "flat" organisational structure and a large degree of distributed autonomy. Overall project planning and co-ordination is the responsibility of the PCG, with input primarily from the OPs, guided by the MRPs. It is mainly at this level that regulatory requirements, provided by the telecommunications administrations and governments around the world, are taken into account.

The development of the specifications is performed by TSGs and their subordinate working groups. Here, the main participation is by technical experts from the individual members of the OPs. Individual members in their capacity as ITU members are also responsible for carrying the results of the 3GPP work to the ITU.

At the time of the creation, 3GPP had structured around four principal aspects of the 3G system being defined as TSGs:

- TSG CN: core network
- TSG RAN: radio access network
- TSG SA: services and systems aspects
- TSG T: terminals

Each TSG is authorised to develop and approve specifications and reports within its scope, and TSG SA also has a role of co-ordinating the work of the TSGs at a more detailed level than the PCG. The result is a process that is able to rapidly produce and approve specifications and reports in response to the needs of the market, although it is important to note that the deliverables do not have a formal status until they have been transposed by one or more of the OPs.

The formal status is necessary for regulatory and other purposes in the various regions, and so the OPs have committed themselves to complete this process rapidly. Each OP will apply

Petitioners' Exhibit 1007, p. 107
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

its own procedures, appropriate to their respective regions. As the official European SDO within 3GPP, ETSI recognises the 3GPP output as ETSI Technical Specifications and ETSI Technical Reports without a need for any further endorsement within the Institute. This means that the 3GPP documents are published – within a matter of a few weeks – as identical text directly as ETSI deliverables. In addition, ETSI is transposing, i.e. adapting, a few of the initial 3GPP specifications into ENs for specific European regulatory requirements. This is happening in parallel with the publication of the initial Technical Specifications and will not impede the implementation of 3G in Europe.

9.1.3.1.1 Electronic Working

3GPP has taken a leading role in changing the traditional ways of standards making. A very heavy dependence is now placed on electronic working, both outside and within meetings, advancing a trend that started in ETSI a year or two ago. This means that paper copies of draft documents have been almost entirely eliminated, saving time and expense, and making a significant contribution to the environment.

Given that 3GPP has participants from all over the world, the use of the Internet, e-mail exploders and other such facilities have proved invaluable for distributing and sharing information, working drafts and so on. Delegates to meetings had already become used to downloading working documents from the Internet and having updates to the documents distributed in meetings on CD-ROM. But in recent months, in meetings around the world, participants have experienced the benefits of a local area network (LAN) solution as the latest step in improving working methods. ETSI's headquarters premises already have LANs in all its meeting rooms, but most other venues currently rely on temporary LANs (wired or radio) using equipment and support kindly donated by individual members.

Such facilities permit delegates to access all the meeting documents electronically from their laptop computers. As a result, the huge burden of producing paper copies (as many as 40 000 pages per delegate for some meetings) can be eliminated. Delegates can access new documents as soon as they are available, rather than having to wait for paper copies to be made or for the documents to be distributed by other means, such as diskette or CD-ROM.

9.1.3.1.2 Project Support

For administrative and support purposes the 3GPP Partners have established a Mobile Competence Centre (MCC) which is hosted by ETSI at its premises in Sophia Antipolis, Southern France. The MCC was created in March 1999 to provide support not only to the 3GPP but also to ETSI's own studies in mobile technologies. A full description of MCC including the financing is given in Chapter 15, Section 3.

9.1.3.2 Who are the Stakeholders in 3GPP?

3GPP has attracted a very strong commitment from organisations and companies around the world, reflecting the truly global nature of the project. There are currently six OPs (in alphabetical order):

- The Association of Radio Industries and Businesses (ARIB), Japan

Petitioners' Exhibit 1007, p. 108
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

being TD-SCDMA, proposed by CWTS. A similar group, 3GPP2, is preparing the cdma2000 specifications, UWC-136 TDMA specifications are being developed principally by UWCC, and DECT specifications are defined by a set of ETSI standards (Figure 9.1.1).

Since the UWCC and ETSI are both partners in 3GPP (as an MRP and OP respectively), there is direct liaison between the Project and these two sources of specifications for other IMT-2000 family members.

When 3GPP and 3GPP2 were created it was felt that the interests of each group were sufficiently different to require them to remain separate but here again many of the OPs and MRPs are common to both groups, so there are natural channels for information exchange. Particular instances of formal co-operation between the groups were the two joint 3GPP-3GPP2 workshops held in 1999 to address the "Hooks and Extensions" issue aimed at ensuring interworking between the respective technologies.

In addition to all this, the 3GPP TSGs and their working groups are encouraged to liase directly with relevant technical bodies within the Project as well as among the Partners.

9.1.6 Conclusions

The attentive reader, and let's assume that you are one, may still be astonished to learn what big efforts have been necessary in order to establish 3GPP.

In the meantime, i.e. in the course of year 2000 nearly the whole work of the former ETSI TC SMG has been incorporated into 3GPP, to a large extent within the new TSG GERAN.

Well, our Japanese friends were not happy about this shift because they feared that it could result in delays in the 3G introduction in their country. They accepted this because a separate TSG for the GSM work was created.

Trying to recall the heated discussions within ETSI about the scope of 3GPP from 1998, one has to admit that such a move would have been violently rejected by a lot of ETSI members, maybe even by the majority. Using a philosophic approach, one can, of course, state that time helps healing (even wounds).

Today, i.e. February 2001, we can conclude from ETSI's point of view that all standardisation work related to further evolution of the second generation mobile system, i.e. GSM, and to UMTS is being done well within 3GPP. Thus, the objective to avoid parallel work within ETSI TBs and 3GPP has been fully achieved.

The ability of organisations and individuals around the world to co-operate and make available a full set of stable, agreed 3GPP specifications in 1 year is a remarkable achievement, one that is unprecedented in the world of standardisation. 3GPP meetings have taken place in many parts of the world, emphasising the strong commitment of the SDOs from China, Europe, Japan, Korea and the US. The MRPs have also lent very strong support to the work. Thanks to this widespread and determined commitment it has been possible to meet the very aggressive targets for 3G.

But Release 99 was only the first step – the workload has continued to intensify this year, as the initial specifications are refined and many new ones added, opening the path to full, seamless, global 3G services, changing forever the way that people communicate.

In the meantime, 3GPP has changed the designation of the releases and dropped to mention the year in order to avoid irritations and wrong expectations. Release 99 was first established in December 1999 and got its maturity in the course of year 2000. In 2000, more than 5700 change requests were implemented. The next big event will be Release #4 as a result of the

Petitioners' Exhibit 1007, p. 109
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

series of TSG meetings scheduled for March 2001 in Palm Springs, US. This will obviously result in a further stabilisation and extension of the UMTS specifications.

3GPP is running very well. The individual members from the six OPs seem to be very satisfied with this arrangement – and the production line is in full swing.

Without exaggeration, one can give 3GPP the attribute of a success story. One may quote again here Mr Ed Roney who even addressed the 3GPP concept – prior to its realisation – as a "paradigm shift".

As the results of the GSM and UMTS related standardisation work represent a great part of ETSI's deliverables, it might be justified to note here that during the year 2000, ETSI published more than seven new deliverables each working day (Monday through Friday), i.e. one deliverable per hour!

Further information may be found on the 3GPP website at http://www.3gpp.org.

Chapter 9: The Third Generation Partnership Project (3GPP)

Section 2: UMTS in 3GPP (December 1998–May 2001)

Niels Peter Skov Andersen[1]

9.2.1 A Change of Environment

In the period 1982 until end of 1998 the work on the GSM standard, and in the later part of the period on UMTS, had been performed in the same environment, starting under CEPT and later transferred into ETSI. The Technical Committee GSM, during this period renamed to SMG, and its working groups (Sub Technical Committees) had continuously existed and evolved. The same was the case for the working methods and procedures used within the work. Over time with the success of the GSM system more and more interested parties became involved in the work including parties from outside the original CEPT area. However, this was all a relatively slow evolution and no major revolutions in the organisation or the working methods occurred in this period.

After all these years of continuity in the work the discussions around the creation of 3GPP and the decision to establish 3GPP for the initial phase of UMTS[2] naturally created some uncertainty amongst the members of SMG. Especially the resulting split of the GSM standardisation, with the responsibility for the GSM core network transferred to 3GPP, but the responsibility for the GSM radio access Network maintenance remained in ETSI in SMG. This caused some concern amongst many delegates. Also the internal structure for the technical work within 3GPP was different from the well-known structure in SMG. SMG was based on a technical plenary with a number of working groups (SMG1, SMG2, …, SMG12) performing the detailed technical work. The SMG plenary was the approving authority for the results of the work performed by the working groups. Also the plenary was the group responsible for approval of all new work items and the content of the releases. The structure for the work in 3GPP, as agreed by the partners, was quite different. The project

[1] The views expressed in this section are those of the author and do not necessarily reflect the views of his affiliation [illegible].

[2] The term UMTS is throughout this section used to keep consistency of terminology with the other chapters and sections. The term UMTS do not appear in the in 3GPP agreement, which defines the system as a third generation mobile system based on an evolved GSM core network and UTRAN (including UTRAN (FDD and TDD modes)).

Petitioners' Exhibit 1007, p. 111
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

was organised with four equal Technical Specification Groups (TSGs), who had complete autonomy for their area of responsibility, i.e. they were responsible for approval of new work items and final approval of deliverables. The four technical groups originally defined were:

TSG CN	Responsible for the core network development
TSG-RAN	Responsible for the radio access network based on UTRAN (FDD and TDD modes)
TSG-SA	Responsible for services and system aspects
TST-T	Responsible for Terminal and UIM

In addition to the technical groups the 3GPP organisation has a Project Coordination Group (PCG). However, the role of this PCG cannot be compared to the role the SMG plenary played. The SMG plenary was an open technical group with the approving authority in all technical questions including approval of new work items. The 3GPP PCG is a closed group with a defined membership consisting of a limited number representative of each of the partners (SDOs, MRPs) and the leadership (chairman and two vice-chairmen) of each TSG. Thus as a closed group the role of the PCG becomes more like a board overlooking the overall well being of the project.

This structure made many long-term SMG delegates concerned about how the overall coordination of the project could be ensured. This new structure was not introduced to overcome known deficits of the SMG organisation, but in my opinion, by political considerations to ensure than no single individual, individual member, organisational partner could obtain a controlling position in the project.

9.2.2 The First Two TSG Meetings

The inauguration meeting of the 3GPP TSGs was held in December 1998 in Sophia Antipolis, France. In the process of creation of 3GPP this was the first time that the 3GPPs real work force – the technical experts – met. The main objectives for this first meeting was to get the work started. One of the elements of the meeting was a presentation from the different partners on the status of their work on the third generation mobile system, the work, which they now were in the process of handing over to 3GPP.

Listening to the presentations and the discussions during the breaks it was very obvious that the background for standardization amongst the delegates was quite different. As an example, I remember that during the coffee break just after I, as chairman of ETSI SMG2, had presented the status of the UMTS radio work in ETSI, and had ended my presentation by stating that the UMTS radio work would only be on the agenda of one more meeting of ETSI SMG2. This was in order to complete the documentation to be handed over to 3GPP and then the work on UMTS radio in ETSI would cease, a small group of non-ETSI delegates came to me and asked "if all work on UMTS radio in ETSI ceases, how do the Europeans then coordinate their views on 3GPP?" Coming from the ETSI SMG background this was a completely unexpected question, as the working procedures for 3GPP were very similar to those of ETSI, it was clear to me that the contributions to 3GPP in general should come from the individual members – the companies, regulators etc. – in their own name and not as regional contributions. I explained this, but I also understood that for delegates with a background in international standardization from, e.g. ITU this was the normal way of thinking. During the

IPR2024-01121

Annex 2: Organisation Evolution of the Technical Groups

Section 3: 3GPP

Adrian Scrase[1]

A2.3.1 December 1998 to Mid-1999

During the preparatory talks that led to the creation of 3GPP, many discussions took place to find the optimum organizational structure. The ETSI TC SMG model had worked well for many years and it was very tempting to adopt a similar structure and just widen the sphere of participation. However, some voices called for a more radical approach in order to streamline the structure and to reduce the time taken for specifications production. As a result of these discussions, the following key principles were established on which 3GPP was structured:

- Minimum number of hierarchical levels;
- Large degree of distributed autonomy;
- Clear separation of technical activities from political and administrative activities.

When 3GPP was created, four Technical Specification Groups (TSGs) were formed to undertake the preparation of technical specifications. The four TSGs were as follows:

- TSG CN – core network
- TSG RAN – radio access network
- TSG SA – services and system aspects
- TSG T – terminals

Each of the TSGs was authorized to develop and approve specifications and reports within its terms of reference. This represented a departure from the more traditional approach where a single entity (i.e. a plenary) within a project has the authority to approve a project's output. It was believed that by distributing the approval authority, the time taken to produce specifications would be reduced since this effectively removes one level of hierarchy from the approval procedure. However, it was apparent from the outset that distributing the approval of specifications would lead to a greater requirement for technical co-ordination and thus TSG SA was tasked to perform a co-ordination role across all TSGs. This co-ordination role

SECTION A: GENERAL

Article 1: Description

The Partnership Project is not a legal entity but is a collaborative activity between the following recognized Standards Development Organizations:

ARIB (Japan)

CCSA (China)

ETSI (Europe)

ATIS (US)

TTA (Korea)

TTC (Japan)

TSDSI (India)

The Partnership Project is entitled the "THIRD GENERATION PARTNERSHIP PROJECT" and may be known by the acronym "3GPP".

top

Article 2: Purpose

The purpose of 3GPP is to prepare, approve and maintain globally applicable Technical Specifications and Technical Reports for

- a 3rd Generation Mobile System based on the evolved GSM core network, and the Universal Terrestrial Radio Access (UTRA),
- further development of radio technologies such as LTE, coupled with evolution of core network elements such as the Evolved Packet Core (EPC),
- continuing evolution of the 2nd generation GSM/EDGE Radio Access Network (GERAN),

to be transposed by the Organizational Partners into appropriate deliverables (e.g., standards).

top

Article 3: Scope and objectives

The 3rd Generation Mobile System and its capabilities shall be developed in a phased approach. Initially, 3GPP shall prepare, approve and maintain the necessary set of Technical Specifications and Technical Reports for a 3rd Generation Mobile System including:

- UTRAN (including UTRA; in Frequency Division Duplex (FDD) and Time Division Duplex (TDD) modes);
- 3GPP Core Network (Third Generation networking capabilities evolved from GSM. These capabilities include mobility management, global roaming, and utilisation of relevant Internet Protocols);
- Terminals for access to the above (including specifications for a UIM); and
- System and service aspects.

3GPP shall prepare, approve and maintain the necessary set of Technical Specifications and Technical Reports for:

- the Global System for Mobile communication (GSM) including GSM evolved radio access technologies (e.g., General Packet Radio Service (GPRS) and Enhanced Data rates for GSM Evolution (EDGE)).

3GPP shall consider the long term evolution.

The Technical Specifications and Technical Reports shall be developed in view of global roaming and circulation of terminals.

The set of 3GPP Technical Specifications and Technical Reports for the 3GPP core network and the specifications for the GSM core network should be common to the greatest extent possible and should not be unnecessarily different.

Options in the form of a regulatory requirement particular to one or more regions / nations shall be included in 3GPP specifications. TSGs should not debate the inclusion or rejection of such options.

The results of the 3GPP work shall form the basis of member contributions to the ITU in accordance with existing procedures.

3GPP shall take account of emerging ITU recommendations on interworking between IMT-2000 family members.

In the framework of agreed relationships, the 3GPP Technical Specifications and Technical Reports will form the basis of standards, or parts of standards, of the Organizational Partners.

top

SECTION B: PARTICIPATION

Article 4: Categories

Participation in 3GPP shall be classified into one of the following categories:

- Partners;
- Individual Members;
- ITU Representatives;
- Observers;
- Guests.

top

Article 5: Partnership

Partners in 3GPP shall be classified into one of the following two categories:

- Organizational Partners;
- Market Representation Partners.

top

Article 6: Organizational Partnership

Organizational Partnership is open to any Standards Organization, irrespective of its geographical location, which has:

- a national, regional or other officially recognized status and the capability and authority to define, publish and set standards within the 3GPP scope, in that nation or region;
- an Intellectual Property Rights (IPR) Policy which is compatible with those of the Organizational Partners;
- committed itself to all or part of the 3GPP scope;
- signed the Partnership Project Agreement.

Standards Organizations may apply to become an Organizational Partner by writing to any of the existing Organizational Partners.

top

Article 7: Market Representation Partnership

The Organizational Partners may invite Market Representation Partners to take part in 3GPP.

An invitation for Market Representation Partnership is open to any organization, irrespective of its geographical location, which:

- has the ability to offer market advice to 3GPP and to bring into 3GPP a consensus view of market requirements (e.g., services, features and functionality) falling within the 3GPP scope;
- does not have the capability and authority to define, publish and set standards within the 3GPP scope, nationally or regionally;
- has committed itself to all or part of the 3GPP scope;
- has signed the Partnership Project Agreement.

Organizations may apply to become Market Representation Partners by writing to any of the existing Partners. Further guidance for MRP applicants can be found in annex E.

top

Article 8: Individual Membership

Membership in an Organizational Partner is a pre-requisite for Individual Membership of 3GPP. All entities registered as members of an Organizational Partner and eligible for participation in the technical work of that Organizational Partner, can become Individual Members of 3GPP if they are committed to support 3GPP and:

- to contribute technically or otherwise to one or more of the Technical Specification Groups within the 3GPP scope;
- to use the 3GPP results to the extent feasible.

An Individual Member has the right to participate in the work of 3GPP by attending meetings of the Technical Specification Groups and subtending groups.

Applications for Individual Membership of a Technical Specification Group shall be made in writing to the relevant Organizational Partner using the form given at annex C. Applications may also be made on-line using the template available at http://www.3gpp.org.

Individual Members act in 3GPP in their own right and carry the full responsibility for their contributions.

top

Article 9: Termination of Individual Membership

Individual Membership of 3GPP may be terminated by dissolution, abolition, resignation or expulsion from the related Organizational Partner.

top

Article 10: Observers and Guests

The status of Observer may be granted by the Organizational Partners to an entity which has the qualifications to become a future Partner.

An Observer may send a single representative to an Organizational Partners or PCG meeting. An Observer may also have representatives at TSG meetings. Representatives of Observers may receive documents and contribute documents for information, but shall not submit documents that propose changes to the specifications, reports, work item descriptions, work plan, or any other document under the control of the TSG. Observers shall not take part in decision making or hold any leadership positions.

Additional participation rights of an Observer shall be decided by the Organizational Partners on a case-by-case basis.

The status of Guest may be granted for a limited period, by the Organizational Partners to an entity which has the qualifications to become a future Individual Member. The limited period shall be decided by the Organizational Partners on a case-by-case basis.

A Guest may have representatives at TSG and subtending group meetings. Representatives may receive documents but shall not take part in decision making, participate in discussions, contribute documents, or hold any leadership positions.

top

SECTION C: STRUCTURE

Article 11: Structure of 3GPP

3GPP shall consist of a Project Co-ordination Group (PCG) and Technical Specification Groups (TSGs). The Technical Specification Groups may establish Working Groups if required.

The Organizational Partners may decide to call a meeting of the full 3GPP membership if required.

top

SECTION D: PARTNERS' COLLECTIVE RESPONSIBILITIES

Article 12: Organizational Partners' Collective Responsibilities

The Organizational Partners shall determine the general policy and strategy of 3GPP.

In addition the Organizational Partners shall perform the following tasks:

- approval and maintenance of the 3GPP scope;

- maintenance of the Partnership Project Description;
- taking decisions on the creation or cessation of Technical Specification Groups, and approving their scope and terms of reference;
- approval of Organizational Partner funding requirements;
- allocation of human and financial resources provided by the Organizational Partners to the Project Co-ordination Group;
- acting as a body of appeal on procedural matters referred to them;
- conduct compliance training at least annually for elected leadership, relevant Support Team personnel and interested parties on best practices to follow to
  - avoid issues with respect to antitrust/competition laws and regulations;
  - fulfil the leadership/support role with impartiality and in the interests of 3GPP.

top

Article 13: Collective responsibilities of all Partners

Organizational Partners and Market Representation Partners shall perform the following tasks:

- maintenance of the Partnership Project Agreement;
- approval of applications for 3GPP partnership;
- taking decisions relating to the dissolution of 3GPP.

top

SECTION E: PROJECT CO-ORDINATION GROUP (PCG)

Article 14: PCG tasks

The PCG shall perform the following tasks:

- appointment of PCG Chair and Vice Chairs;
- allocation of human and financial resources provided by Organizational Partners to TSGs;
- allocation of voluntary human and financial resources provided by Market Representation Partners and Individual Members;
- management of the 3GPP Support Team;
- handling of appeals from Individual Members on procedural matters referred to them;
- propose and approve modifications to the Partnership Project Working Procedures;
- handling of appeals from Individual Members on technical matters referred to them;
- determination of the overall time frame and manage overall work progress;
- final adoption of new and stopped work items proposed by the TSGs within the agreed 3GPP scope and objectives;
- when a work item is outside the scope of the 3GPP, and where a common global solution is desired, recommend how to achieve a global solution;

- appointment or dismissal of TSG Chairs and Vice Chairs, as proposed by TSGs based on election results. (The proposed candidate shall be appointed unless there are extraordinary reasons that prevent such an appointment, e.g., severe company or geographical imbalance within 3GPP. In such cases the TSG shall be requested to elect an alternative candidate. The decision not to appoint a candidate shall be made by consensus.);
- authorizing requests from the TSGs for approval to liaise with external organizations, and maintain a list of approved requests;
- maintenance of the register of Individual Members eligible to participate in 3GPP;
- maintenance of the register of IPR declarations relevant to 3GPP, received by the Organizational Partners.

The PCG may decide to call a meeting of the full 3GPP membership if required.

top

Article 15: PCG participation

The following shall have a right to participate in the PCG:

- Typically, a maximum of five representatives of each Organizational Partner (not counting the Chair and Vice-Chairs);
- A maximum of three representatives of each Market Representation Partner. (MRPs are however urged to limit their participation to one representative wherever possible.);
- The Chairs and Vice Chairs of the TSGs as ex-officio members;
- A maximum of three ITU representatives;
- One representative of each Observer.

top

Article 16: PCG appointment of Chair and Vice Chairs

The PCG shall appoint their Chair and Vice Chairs from amongst the Organizational Partner representatives.

The Chair and Vice Chairs shall be appointed for a one year term of office.

The Chair and Vice Chairs shall normally serve one term of office. If no other candidates are available, the Chair or Vice Chairs may be appointed for a further term.

Successive Chairs and Vice Chairs should not be from the same Organizational Partner, the same region or from the same group of companies, unless no other candidate is available.

top

Article 17: PCG Chair and Vice Chair Responsibilities

The PCG Chair is responsible for the overall management of the co-ordination work within 3GPP.

The Chair has the overall responsibility to ensure that the Partnership Project Agreement, Partnership Project Description and Partnership Project Working Procedures are followed.

The Chair may nominate officials to assist in the work.

The Chair may be assisted by the Support Team.

The Chair may delegate tasks to the Vice Chairs.

In performing their leadership role, the Chair and Vice Chairs shall maintain impartiality and act in the interests of 3GPP.

At the commencement of each meeting of the PCG, the group shall be reminded that:

(i) compliance with all applicable antitrust and competition laws is required; and

(ii) the leadership will conduct the meeting with impartiality and in the interests of 3GPP.

top

Article 18: PCG meetings

A meeting of the PCG shall be held at least twice per year.

At least thirty days before the due date, a calling notice, draft agenda and supporting documents shall be issued.

top

Article 19: PCG decision making

In any meeting of the PCG, the quorum required for decision making shall be 50% of the total number of Organizational Partners. Proxies shall not be permitted.

The PCG shall endeavour to reach consensus on all issues. The views and opinions of the Market Representation Partners and the Chairs and Vice Chairs of the TSGs shall be taken into account during the consensus building process. If consensus cannot be achieved, the PCG Chair can decide to take a vote. The vote may exceptionally be performed by a secret ballot if decided by the PCG.

Each Organizational Partner shall have one vote. A proposal shall be deemed to be approved if 71% of the votes cast are in favour. Abstentions or failure to submit a vote shall not be included in determining the number of votes cast.

top

SECTION F: TECHNICAL SPECIFICATION GROUPS

Article 20: TSG tasks

The TSGs shall prepare, approve and maintain the 3GPP Technical Specifications and Technical Reports taking into account the market requirements provided by Market Representation Partners.

The TSGs shall also perform the following tasks:

- Propose to the PCG for appointment TSG Chair and Vice Chairs based on election results;
- Creation of TSG Working Groups and approval of their terms of reference;
- When a new Working Group is created, the appointment of TSG Working Group Convenor;
- Allocation of resources within the TSG;
- Allocation of voluntary human and financial resources provided by Market Representation Partners and Individual Members;
- Handling of appeals from Individual Members on technical matters;
- Preparation of a detailed time frame and management of detailed work progress;

- Management of work items;
- Technical Co-ordination;
- Proposal and approval of work items within the agreed scope and terms of reference of the TSG;
- Where a work item is outside the scope of the 3GPP, but a common global solution is desired, recommend an approach to the PCG;
- Assignment of work to Partners. (Specification development may be accomplished using various methods, including the assignment of work to Partners.);
- Maintenance of the list of Individual Members eligible to vote within the TSG (Voting Members).

top

Article 21: TSG participation

The following shall have a right to participate in the TSGs:

- Representatives of members of participating Organizational Partners (i.e. Individual Members);
- Representatives of Organizational Partners;
- Representatives of Market Representation Partners;
- Representatives of Observers;
- Representatives of Guests.

top

Article 22: TSG and WG election of Chair and Vice Chairs

22.1 TSG elections

Regular TSG elections shall be held every two years in the first semester of odd numbered years.

The TSG Chair and Vice Chairs shall be elected by the Technical Specification Group from amongst the Individual Member representatives. Each TSG shall elect a maximum of three Vice Chairs.

A candidate for election to a TSG Chair or Vice Chair position shall provide a letter of support from the Individual Member that they represent. The support letter from the Individual Member shall indicate that the candidate will avail or has availed themselves of 3GPP supplied antitrust and competition law training in order to comply with all applicable antitrust/competition laws and regulations while acting in the capacity of TSG Chair or Vice Chair.

Nominations may be made up to the point when an election takes place.

The Chair and the Vice Chairs shall be elected for a two year term of office. The Chair and Vice Chairs may offer themselves for election for a second consecutive term. The term “consecutive” is taken to mean terms one after the other without another person being elected to the position in the interim. Exceptionally, they may offer themselves for further consecutive terms, subject to the following:

- A two week deadline that expires at noon Central European Time on the Friday which falls between 20 and 14 days prior to the first day of the meeting at which elections are due to be held shall be established.
- A Chair is not permitted to stand for another consecutive term if another candidate is announced via the 3GPP web site or via the relevant 3GPP email reflector prior to this deadline.
- A Chair is not permitted to stand for another consecutive term until after this deadline.

- A Vice Chair is not permitted to stand for another consecutive term in a Vice Chair position for which there is a candidate announced via the 3GPP web site or via the relevant 3GPP email reflector prior to this deadline.

- A Vice Chair is not permitted to stand for another consecutive term until after this deadline. If, by the deadline, the number of candidatures is less than the number of Vice Chair positions, then any incumbent Vice Chair may put forward their candidature.

There is no restriction on a Vice Chair whose term of office is due to expire offering himself for the position of Chair; neither is there any restriction on a Chair whose term of office is due to expire offering himself as a Vice Chair. There is no restriction of a retiring Chair or Vice Chair of one TSG offering himself for election as either Chair or Vice Chair of any other TSG (or WG).

Should the office of Chair or Vice Chair of a TSG become vacant for reasons other than expiration of term of office, a special election shall be conducted to fill the unexpired term. This special election shall be conducted at a meeting of the TSG, and shall be announced in the agenda according to the provisions of article 32.

When such a special election is held to fill the office of Chair, and one or more of the Vice Chairs of the TSG intends to stand for election to that position, the announcement shall also indicate that there will be an election to fill the position of Vice Chair in the event that a Vice Chair be elected to the office of Chair. If at the special election the Vice Chair is elected to the office of Chair, that individual shall become Chair immediately, and, the position of Vice Chair thus being vacant, an election shall be held for the office of Vice Chair.

Similarly, if an incumbent Chair intends to stand for election to the position of Vice Chair, the same applies, with the necessary changes to the text above.

If a Chair or Vice Chair changes the Individual Member that they represent (e.g., job change, merger or acquisition) during their term of office, a new letter of support shall be provided. In order to provide a new letter of support, a Chair or Vice Chair may request a grace period allowing their term to be extended the lesser of 6 weeks or until the day before the next scheduled regular term (e.g., every 2 years) election. Although the term is extended, under the rules of article 22, the Chair or Vice Chair can only chair meetings when representing an Individual Member. This rule continues to apply during the grace period. If the change of company affiliation is due to a move to another company, then the decision for the Chair or Vice Chair to continue in office to the end of the present term shall be made by consensus of the TSG. If consensus cannot be achieved, a special election shall be held for the office. The incumbent Chair or Vice Chair is permitted to offer their candidacy in a special election even if they have held the position for 2 terms or more.

The term of office for a Chair or Vice Chair elected at a special election is a partial term lasting until the end of the current term. If a new Chair or Vice Chair is elected at a special election then the partial term of office does not count towards the two consecutive term limit. If the previous Chair or Vice Chair is re-elected at a special election then the entire term (of two parts) is considered as a single term and does count towards the two consecutive term limit.

Chairs and Vice Chairs should not be from the same region, Organizational Partner, or from the same group of companies, unless no other candidate is available.

Successive Chairs should not be from the same Organizational Partner, the same region or from the same group of companies, unless no other candidate is available. This does not apply to special elections or to regular elections for a second or subsequent consecutive term of office .

When a new TSG is established, the Organizational Partners shall appoint a convenor for the first two TSG meetings. The election for TSG Chair and Vice Chairs shall take place at the second TSG meeting. If the election takes place other than at the normal time for TSG elections (see above), the elected Chair and Vice Chairs shall serve until the next regular TSG election. This partial term of office does not count towards the two consecutive term limit. The provisions of this paragraph may be overridden by consensus of the PCG where a new TSG is formed by the merger of existing TSGs; under these circumstances, the PCG shall establish a set of ad hoc rules for the creation of the new TSG.

Following election by the TSG, the TSG Chair and Vice Chairs shall be appointed by the PCG on the proposal of the TSG.

top

22.2 WG elections

The provisions concerning the election of WG Chairs and Vice Chairs shall be as for TSG Chairs and Vice Chairs as defined in 22.1 above, changing TSG to WG wherever TSG is mentioned, with the following differences.

Each WG shall elect a maximum of two Vice Chairs.

WG elections shall be held when the corresponding terms of office expire or when an existing Chair or Vice Chair resigns. WG elections need not be synchronized within the WG (i.e. elections for Chair and each Vice Chair may occur at different times), across different WGs of the same or other TSGs, nor with the regular TSG elections.

WG Chairs and Vice Chairs are always elected for a period of two years (and not, as is the case with special elections in TSGs, for the unexpired period of the present term of office). An exception to this is where the previous Chair or Vice Chair is re-elected in the special election. In this case the Chair or Vice Chair continues for the unexpired period of the present term of office.

Note: For this reason, elections for WG Chairs and Vice Chairs are likely to become spread over a period of time, rather than being grouped like the TSGs' regular elections.

When a new WG is established, the parent TSG is responsible for appointing a convenor for the first two meetings.

Following election by the WG, the Chair and Vice Chairs hold office immediately, without need of appointment by TSG or PCG.

If a WG does not meet physically with enough frequency to maintain an up to date voting list, the working group may elect to escalate the voting for officers to the parent TSG.

top

Article 23: TSG and WG Chair and Vice Chair responsibilities

The TSG Chair is responsible for the overall management of the technical work within the TSG and its Working Groups. The Chair has an overall responsibility to ensure that the activities of the TSG follow the Partnership Project Working Procedures.

The WG Chair is responsible for the overall management of the technical work within the WG and its sub-groups.

The Chair may nominate officials to assist in the work.

The Chair may delegate tasks to the Vice Chairs.

The Chair may be assisted by the Support Team.

The Chair shall form a Management Team, including the Vice Chairs and Support Team, in order to assist in discharging the Chair’s duties.

Recognizing the need to balance the requirement of rapid specification development with the limited resources of delegates, the Chair should encourage a minimum number of meetings, especially parallel meetings, and maximize the use of electronic means to advance the work.

In performing their leadership role, the Chair and Vice Chairs shall maintain impartiality and act in the interests of 3GPP.

At the commencement of each meeting of a TSG or WG, the group shall be reminded that:

(i) compliance with all applicable antitrust and competition laws is required;

(ii) timely submissions of work items in advance of TSG or WG meetings are important to allow for full and fair consideration of such matters; and

(iii) the leadership will conduct the meeting with impartiality and in the interests of 3GPP.

top

Article 24: TSG and WG Chair and Vice Chair dismissal

A secret ballot shall be taken for the proposal to dismiss a TSG or WG Chair or Vice Chair because of a failure to effectively perform their duties, if requested by 30% of the TSG or WG membership list. 71% of the votes cast are required to recommend dismissal.

The PCG shall dismiss a Chair or Vice Chair on the proposal of the TSG.

top

Article 25: TSG and WG decision making

TSGs and WGs shall endeavour to reach consensus on all issues, including decisions on Technical Specifications and Technical Reports. Informal methods of reaching consensus are encouraged (e.g., a show of hands). If consensus cannot be achieved, the Chair can decide to take a vote. The vote may exceptionally be performed by a secret ballot if decided by the TSG or WG. A vote may be conducted during a TSG or WG meeting or by correspondence.

A proposal shall be deemed to be approved if 71% of the votes cast are in favour. Abstentions or failure to submit a vote shall not be included in determining the number of votes cast.

It is the responsibility of the Chair to ensure that questions to be voted upon are phrased in a positive yes/no manner, with 71% required to approve the question. Questions should not be phrased as the TSG shall not do something. Examples of appropriate questions are; Shall the TSG approve the Specification and send it to the SDOs? Shall the liaison be approved? Shall the new WI be approved? Shall the existing WI be stopped? If the issue is to choose option A or B, the question should be split into two questions, with the Chair selecting the order. First, shall the TSG take option A as the way forward? If this question fails the second question is, shall the TSG take option B as the way forward?

Contributions on which decisions will be based should be made available in good time before each meeting. TSGs may establish informal guidelines for dealing with late contributions.

If a WG does not meet physically with enough frequency to maintain an up to date voting list, the working group may elect to escalate the voting to the parent TSG.

Working Agreements may be used to establish tentative agreements in cases where consensus cannot be obtained. The working agreement process is described in annex G.

top

Article 26: TSG and WG voting during a meeting

The following procedures apply for voting during a TSG or WG meeting:

- before voting, a clear definition of the issues shall be provided by the Chair;
- Voting Members shall only be entitled to one vote;
- if a Voting Member has more than one representative present, only one representative may vote;
- each Voting Member may only cast the vote once;
- each Voting Member may carry proxy votes for up to five other Voting Members. All proxy votes shall be accompanied by a letter of authority from the authorising Voting Member. Proxies will not be taken into account when determining the quorum;
- the quorum required for voting during a TSG or WG meeting shall be 30% of the total number of Voting Member companies on the TSG or WG voting list;
- the result of the vote shall be recorded in the meeting report.

For the determination of the quorum, see annex H.

top

Article 27: TSG or WG voting by correspondence

The following procedures apply for voting by correspondence:

- before voting, a clear definition of the issues shall be provided by the Chair and disseminated to all on the TSG or WG membership list;
- Voting Members shall only be entitled to one vote;
- each Voting Member may only cast the vote once within the voting period;
- the voting period shall be 30 days;
- there are no quorum requirements;
- The result of the vote should be disseminated to the TSG or WG.

- top

Article 28: TSG or WG voting for the election of TSG or WG Chair and Vice Chair

In the case where there is more than one candidate for TSG or WG Chair or Vice Chair, a secret ballot shall be used. For interpreting the result of the secret ballot the following procedure shall apply:

When, in the first ballot, no candidate has obtained 71% of the votes cast, a second ballot shall be held. In the second ballot, in cases where there are only two candidates, the candidate obtaining the higher number of votes is elected. In cases where there are more than two candidates, if none of them has obtained 71% of the votes, a third and final ballot shall be held among the two candidates who have obtained the highest number of votes in the second ballot. The candidate obtaining the higher number of votes in the third ballot is then elected.

The TSG or WG Chair shall be responsible for the voting process and shall ensure that confidentiality is maintained.

top

Article 29: TSG or WG appeal process

An Individual Member of 3GPP who opposes a Chair's ruling on a vote taken within a TSG or WG may submit their case to the PCG for decision. In such cases the Individual Member shall also inform the relevant TSG or WG Chair.

When a TSG or WG Chair has made a ruling, their decision shall be taken as the basis for future operations, unless or until overturned by the PCG.

If an Individual Member in a TSG or WG believes that a Chair or Vice Chair of any such group is acting without impartiality and not in the interests of 3GPP, such Individual Member may object to such actions within the relevant group, and may request that such objection be recorded in the minutes of the applicable group meeting and it shall be so recorded. The objecting Individual Member may ultimately take their objection to the PCG for consideration. In such cases the Individual Member shall also inform the relevant TSG or WG Chair.

top

Article 30: TSG and WG meetings

TSGs and WGs shall meet as necessary to complete their work within the prescribed timeframe. TSGs should endeavour to hold their meetings at the same time and place to assist in the overall co-ordination of the work.

Meeting locations should reflect the geographical diversity of the TSG and WG delegates.

Further information on meetings is given in annex F.

top

Article 30A: TSG and WG participation

IMs wishing to progress work on topics in 3GPP are expected to participate physically in the meetings.

If a 3GPP IM is materially interested in a specific topic but is unable to participate in a meeting by sending a delegate, the IM is urged to engage the support of other IMs whose delegates will be present at the meeting to present its views. If this is not possible for any reason, the IM may advise the Chair of the situation and may provide documents supporting their position. The Chair may facilitate the introduction of these documents during the meeting and the record of the meeting can include the discussion and outcome. Note that physical participation in meetings is considered the norm and the option to engage the Chair is intended for exceptional situations. The Chair has the right to decline the request.

top

Article 31: TSG and WG meeting invitation

The invitation to a TSG or WG meeting and the necessary logistical information should be disseminated as soon as practically possible, taking into account the need to obtain travel documentation. It shall be disseminated at least 28 days before the meeting to all on the TSG or WG membership list.

top

Article 32: TSG and WG meeting agenda

The draft agenda for a TSG or WG meeting shall be disseminated by the responsible Chair to all on the TSG or WG membership list at least 21 days before a meeting. The draft agenda should indicate subject matters where voting may be required. The draft agenda shall indicate elections to be held (including known candidates). The draft agenda shall indicate the deadlines (dates and times) for registration and meeting document submission to the TSG/WG meeting. Other deadlines may also be indicated (whenever required).

top

Article 33: TSG and WG meeting registration

Delegates and officials must register before participating in any 3GPP meeting. Each delegate or official who represents an Individual Member shall declare the precise name of that Individual Member. A delegate or official may only register to represent one Individual Member.

The deadline for registration for all delegates and officials is one week in advance of the start of the meeting. Registrations after this deadline will still be processed, but timely receipt of meeting related information is not guaranteed for late registrants.

To aid in communication, delegates or officials at co-located meetings may briefly visit a meeting they have not registered for. However, any extensive involvement such as presenting a contribution or formally objecting requires prior registration to the meeting.

top

Article 34: TSG and WG meeting document and file naming

Documents for a TSG or WG meeting shall follow a consistent numbering system as shown in the following example:

xminnzzzz

This numbering system has six logical elements:

1) **x**: a single letter corresponding to the TSG;

   where x : **R** (Radio Access Network)

   N (Core Network) [TSG closed March 2005]

   S (Service and System Aspects)

   T (Terminals) [TSG closed March 2005]

   G (GSM/EDGE Radio Access Network)

   C (Core network and Terminals)

2) **m** A single character corresponding to the Working Group identity (typically 1, 2, 3, etc) or, in the case of the TSG itself, the letter "**P**".

3) **i**: Normally the hyphen character "-". May take on other values depending on the nature of the meeting at which the document is presented, eg the identity of a subgroup.

4) **nn**: two digits to indicate the year, i.e. 99, 00, 01, etc;

5) **zzzz**: unique number of the document

No provision is made for the use of revision numbers. Documents which are a revision of a previous version should indicate the document number of that previous version.

The filename of documents shall be the document number. Documents may be compressed to .Zip files (and thus bear a file extension ".zip"). For example, document **S1-060357** will be contained in file **S1-060357.zip**.

top

Article 35: TSG and WG Voting Membership List

35.1 Voting list

Each TSG and WG shall maintain a list of Individual Members eligible to vote in that group.

The voting list shall be used to establish quorum and for determining those eligible to take part in a vote.

NOTE 1: The term "membership list" has no particular significance in the context of TSG and WG meetings. The term "attendance list" is used for a list of individuals who attend a given meeting representing an Individual Member or other entity entitled to participate in meetings – see annex F.

For the determination of the quorum, see annex H.

top

35.2 On creation of new TSG or WG

When a new TSG or WG is formed an Individual Member is added to the voting list at the first meeting at which it is represented, and may vote at the second meeting where it is represented.

Exceptionally, if inadequate notice (less than the period of time given in article 31) had been given for the first meeting of the new group, an Individual Member shall be added to the voting list on its delegate's attending the second meeting (the election meeting) and vote at that meeting even if it had not been represented at the group's first meeting.

Only an Individual Member that had been represented at the group's first meeting may provide a proxy for the second meeting.

top

35.3 Established TSGs and WGs

To qualify for the voting list it is necessary for at least one delegate of an Individual Member to attend at least two meetings of the group concerned, without being removed according to the provisions of article 35.4..

An Individual Member having been represented at at least two ordinary meetings of the group has the right to cast a vote by proxy (see article 26). Thus an Individual Member may not cast a vote by proxy during a meeting at which it is not represented unless it had already been represented at two or more qualifying meetings of the group.

top

35.4 Removal from and reinstatement to voting list

An Individual Member which is not represented at three consecutive meetings of the TSG or WG shall be removed from the voting list.

The right to vote is reinstated at the second meeting which a delegate of the Individual Member attends without missing the number of consecutive meetings mentioned in the previous paragraph (but see article 35.3 for eligibility to cast a proxy vote).

EXAMPLE 1: If Individual Member Z is represented at meeting K and K+3 (and is thus eligible to vote) but is not represented at meetings K+4, K+5 and K+6, it is removed from the voting list.

EXAMPLE 2: If Individual Member X, not previously having been represented at a meeting of the group, is represented at meetings N and N+3, it may cast a vote at meeting N+3.

NOTE: Individual Member X might choose to cast a vote by proxy at meeting N+3, even though its delegate is physically present. This is sometimes useful for coordinating company positions where one large company has several Individual Memberships, possibly via several different Organizational Partners.

EXAMPLE 3: If Individual Member Y, not previously having been represented at a meeting of the group, is represented at meeting N only, it may not cast a vote by proxy at meeting N+2.

top

35.5 Meetings other than ordinary meetings

Any group that wants to call an electronic meeting (audio, video, document distribution by posting or e-mail, etc) may do so, although this works best with smaller groups. Therefore, all electronic meetings are allowed but only ordinary meetings (see annex F) count towards attendance. However, if a meeting is designated as face-to-face, provision of bridge and speakerphone capabilities for those requesting it would be at the discretion of the host. Those participating by speakerphone are not to be counted toward quorum or attendance, and are not allowed to vote.

For the determination of the quorum, see annex H.

top

Article 36: TSG Sub Working Groups

A Working Group may establish a Sub Working Group (SWG) with defined Terms of Reference. The Working Group shall appoint a SWG Chair. The SWG shall work by consensus. The meeting notice requirements for a SWG meeting are the same as for TSGs and WGs.

top

SECTION G: WORK PROGRAMME AND TECHNICAL CO-ORDINATION

Article 37: Work Programme

The 3GPP Work Programme shall consist of Work Items defined by the TSGs.

top

Article 38: Work Items

A 3GPP Work Item is a specification task defined in terms of the following principal parameters:

- title;
- intended output (i.e. Technical Specifications or Technical Reports);
- impact on other Technical Specifications and Technical Reports;
- technical scope, including the field of application of the intended output;
- impact on other 3GPP Work Items;
- the schedule of tasks to be performed;
- the identities of the supporting Individual Members;
- the identity of the Work Item Rapporteurs.

- top

Article 39: Work Item creation

Each proposed new Work Item shall be supported by at least four Individual Members, and their names shall be recorded in the Work Item definition prepared for the TSG approval. One or more persons shall be named as Rapporteur for the proposed Work Item, and the Rapporteur shall act as the prime contact point on technical matters and for information on progress throughout the drafting phases. The supporting Individual Members are expected to contribute to and progress the new work item throughout the drafting phases.

In addition to the above, TSGs shall approve new Work Items, giving all essential parameters. The proposal shall be entered into the 3GPP work programme, clearly marked as a new entry, for which a unique reference identity shall be allocated.

top

Article 40: Work Item adoption by PCG

The 3GPP work programme shall be made available to all Individual Members. A new Work Item shall remain flagged as "new" until the end of the month following the month during which the 3GPP work item was entered into the 3GPP work programme. A new Work Item shall be adopted by the PCG unless a substantial objection is received from an Individual Member or Partner during this period. At the end of the period, the "new" flag shall be removed (even if there is an objection) and it is the responsibility of any objecting Individual Member or Partner to discuss their objections with the TSG Chair. If it is not possible to resolve the objection, it is the responsibility of the Individual Member or Partner to raise the issue with the PCG.

The TSGs shall ensure that the 3GPP Work Item details are maintained at regular intervals.

top

Article 41: Work Item stopping

Prior to completion of the intended 3GPP output, the responsible TSG may conclude that a Work Item is no longer required. Any Work Item shall automatically be considered by a TSG for stopping, if no progress has been achieved in a given period of time, typically six months, e.g. due to a lack of contribution. In such cases, the Work Item shall be flagged as "stopped" in the Work Programme. The proposal to stop a Work Item shall be fully justified.

The Work Programme shall be updated accordingly, and shall show the Work Item as "stopped" until the end of the month following the month during which the Work Item was initially flagged.

The Work Item will be stopped by the PCG unless substantial objection is received from an Individual Member during this period. It is the responsibility of any objecting Individual Member to discuss their objections with the TSG Chair. If it is not possible to resolve the objection, it is the responsibility of the Individual Member to raise the issue with the PCG.

top

Article 42: Technical co-ordination

The PCG shall be responsible for determining the overall time frame and for managing the overall work progress. The System Aspects TSG shall have a particular responsibility for the technical co-ordination of work being undertaken within 3GPP, and for overall system architecture and system integrity. Problems encountered in performing this technical co-ordination role shall be reported immediately to the PCG.

top

SECTION H: DELIVERABLES

Article 43: Deliverable types

3GPP shall prepare, approve and maintain documents known as Technical Specifications and Technical Reports. Such documents shall be drawn up by the TSGs and shall, following approval at that level, be submitted to the participating Organizational Partners to be submitted to their respective standardization processes.

top

Article 44: Approval process

Approval of Technical Specifications and Technical reports by a TSG shall normally be by consensus.

Where consensus cannot be achieved in the TSG a vote may be taken.

When Technical Specifications and Technical Reports become sufficiently stable, they shall be put under change control of the relevant TSG. The further elaboration of these Technical Specifications and Technical Reports shall be achieved by change requests to be approved by the TSG.

top

Article 45: Drafting rules

The Technical Specifications and Technical Reports drafted by the TSGs shall follow the 3GPP drafting rules, using document processing facilities, format, languages and notations agreed by the Organizational Partners, and on a medium suited for electronic document handling and publishing.

top

Article 46: Copyright and ownership

The Organizational Partners will have joint ownership (including copyright) of the Technical Specifications and Technical Reports produced by 3GPP.

top

Article 47: Conversion by Organizational Partners

Organizational Partners shall use their best endeavours to convert the Technical Specifications and Technical Reports approved by the Partnership Project into national/regional deliverables in a timely manner through their normal processes.

The Organizational Partners are urged not to change the technical parts of the Technical Specifications and Technical Reports; they may add non-technical parts required by their own deliverable schemes and they may add descriptions of options selected.

Organizational Partners should ensure that all unresolved comments raised during their public enquiry and approval phases are delivered to the appropriate TSG.

top

SECTION I: REPORTING

Article 48: Chair’s reporting obligations

A report shall be prepared by the Chair following all PCG and TSG meetings.

top

Article 49: Changes to structure and officials

The Chair of each TSG shall inform the PCG of all organizational changes concerning Working Groups and their officials. An up to date record of the 3GPP structure shall be maintained.

top

Article 50: Calendar of meetings

The PCG and TSGs shall maintain an up to date calendar of the dates and venues for future meetings.

top

SECTION J: EXTERNAL RELATIONS

Article 51: Relationship with the ITU

3GPP results should be submitted to the ITU as appropriate.

For working groups, the following handling of communications toward ITU shall apply:

1 Working groups shall send ITU submissions which are destined to become part of ITU deliverables to their parent TSG for review.

2 Working group communications towards the ITU which are NOT destined to become part of an ITU deliverable must be reviewed by the TSG Chair and the appropriate ITU sector convener (if one exists for the given ITU sector). The working group's TSG Chair and ITU sector convener will determine if such a communication should be sent to the parent TSG for review. If for some reason either the TSG Chair or ITU sector convener is not available, then it is sufficient for the remaining person to review the document and determine if it should be escalated to the TSG or not.

3 If the working group communication does not require TSG review, then it shall be conveyed to the ITU from the WG using one of the mechanisms described below.

For TSGs, the following handling of communications toward ITU shall apply:

1 TSGs shall send ITU submissions which are destined to become part of ITU deliverables to the PCG for review.

2 TSGs communications towards the ITU which are deemed sensitive by the TSG shall be sent to the PCG for review.

3 If the TSG does not judge the communication as sensitive, then it shall be conveyed to the ITU from the WG using one of the mechanisms described below.

To convey a communications towards the ITU, one of the following mechanisms shall be used based upon determination of the sending body (a body may determine a default mechanism).

a) The communication shall be sent from the OPs as a deliverable from their organizations (applicable to PCG reviewed communications only)

b) The communication shall be made by Individual Members who are also members of the ITU. In such a circumstance, the appropriate ITU sector convener will coordinate and handle the administrative matters for the submission. 3GPP Technical Specifications and Technical Reports may be taken as the technical content of such contributions (applicable to PCG reviewed communications or TSG reviewed communications).

c) The communication shall be sent directly from the 3GPP liaison coordinator to the appropriate ITU receiver in the ITU (applicable to TSG reviewed communications or WG reviewed communications).

Representatives of ITU-D, ITU-R and ITU-T are invited to participate in the Project Coordination Group for the efficient coordination and exchange of information.

top

Article 52: Relations with other groups

TSGs and WGs are encouraged to liaise directly with the relevant technical bodies within the 3GPP and Partners as appropriate.

A liaison statement shall clearly communicate what is expected from the receiver, i.e., which parts are for information, which questions are expected to be clarified and by whom (especially if there are multiple receivers), and also when an answer is needed, e.g., when is the next meeting of the group sending the liaison statement.

A TSG or any subtending Working Group may send individual liaisons to any external organization (other than ITU) without PCG approval, except if the statement is considered sensitive by the TSG Chair, in which case PCG clearance is needed.

It is not necessary to have all external liaisons copied to the PCG and/or TSG SA. The liaison originating TSG should decide, at its own discretion, which should be copied. External liaisons that may have management implications such as schedules, organization, process, procedures, and policy shall be copied to the PCG, or approved by the PCG if sensitive.

Relations with the ITU are described in article 51.

top

SECTION K: MISCELLANEOUS

Article 53: Resources

The resources for the operation of 3GPP shall be managed by the Organizational Partners. The resources are allocated to the TSGs by the PCG.

top

Article 54: Support Team

The Partners shall provide logistical support to, and assist in the operation of, 3GPP. The support shall be in the form of a Support Team which shall operate under the overall management of the PCG and the day to day management of TSGs.

top

Article 55: Intellectual Property Rights (IPR) Policy

Individual Members shall be bound by the IPR Policy of their respective Organizational Partner.

Individual Members should declare at the earliest opportunity, any IPRs which they believe to be essential, or potentially essential, to any work ongoing within 3GPP. Declarations should be made by Individual Members to their respective Organizational Partners.

Organizational Partners should encourage their respective members to grant licences on fair, reasonable terms and conditions and on a non-discriminatory basis.

top

Article 56: Working language

The working language for 3GPP shall be English.

Meetings of the PCG and TSGs shall be conducted in English.

3GPP Technical Specifications and Technical Reports shall be prepared in English (as defined by the Shorter Oxford English Dictionary).

top

Article 57: Duration

3GPP shall be task oriented and on completion of the tasks the future of 3GPP shall be re-considered. The continuation of 3GPP shall therefore be confirmed by the Organizational Partners on an annual basis.

top

Article 58: Review of activities

An evaluation of the activities of 3GPP should be made by the Organizational Partners at regular intervals.

top

Article 59: Dissolution, winding up

In the event of a voluntary dissolution of 3GPP, the Partners shall determine the terms of liquidation by consensus. All issues shall be documented and distributed at least 30 days prior to decisions being made.

top

Article 59A: Exhaustion of appeal procedures

In connection with any claim or dispute of an Individual Member arising from or relating to any activity of any 3GPP meeting or action, including in connection with a TSG or WG meeting, such Individual Member shall, prior to commencing any such legal proceeding against 3GPP, its leadership, support staff, or one or more Organizational Partners in a court, an arbitral panel or other adjudicatory body, exhaust all appeal procedures provided in the 3GPP Working Procedures. Exhaustion of appeal procedures shall be diligently expedited by both the appealing party and the appeal body.

top

Article 60: Amendments to 3GPP Working Procedures

These Partnership Project Working Procedures may only be amended by decision taken by the PCG.

top

Annex A: Definitions

Consensus:	General agreement, characterized by the absence of sustained opposition to substantial issues by any important part of the concerned interest and by a process that involves seeking to take into account the views of all parties concerned and to reconcile any conflicting arguments. (Note: consensus need not imply unanimity).
Conversion:	The transformation of a 3GPP output document into an Organizational Partners deliverable following the Organizational Partners' recognized processes.
Delegate:	An individual taking part in a TSG/WG meeting physically or by electronic means.
Drafting Rules:	A document approved by the Organizational Partners providing rules for the drafting of 3GPP Technical Specifications and Technical Reports.
Election:	The voting process used to identify an individual from a number of individuals.
Guest:	An entity fulfilling the criteria to become a future Individual Member, which has been granted temporary participation rights in the 3GPP
Individual Member:	A member of an Organizational Partner having participation rights within that Organizational Partner and which has registered to take part in 3GPP.
ITU Representative	Representatives of ITU-D, ITU-R and ITU-T invited to participate in the Project Coordination Group for the efficient coordination and exchange of information.
Leadership:	A Chair, Vice-Chair, or Convenor of an OP/PCG/TSG/WG/SWG/Ad-Hoc or any other 3GPP meeting.
Market Representation Partner:	A Partner invited by the Organizational Partners to participate in 3GPP to offer advice and to bring into 3GPP a consensus view of market requirements.
Observer:	An Organization fulfilling the criteria to become a future Partner which has been granted temporary participation rights in 3GPP.
Organizational Partner:	A recognized Standards Organization which has been accepted as a Partner in 3GPP.
Partner:	An Organizational Partner or a Market Representation Partner of 3GPP.
Partnership Project Agreement:	The document signed by 3GPP Partners defining their rights and obligations.
Partnership Project Description:	A document which describes the overall structure and operation of 3GPP.
Represent:	Attend on behalf of. A person who attends a meeting on behalf of an Individual Member represents that Individual Member. The person is not necessarily employed by that Individual Member, but may be, for example, employed by a subsidiary company in the same group as the represented Individual Member; or the person may be an independent consultant under contract to the Individual Member. "Representation" sometimes influences the eligibility to vote – see article 35 and annexes A and F.
Sub Working Group	A subordinate body of a Working Group.
Support Team:	A number of persons dedicated to support 3GPP.
Technical Report:	A 3GPP output document containing mainly informative elements approved by a Technical Specification Group.
Technical Specification:	A 3GPP output document containing normative provisions approved by a Technical Specification Group.
Voting Member	An Individual Member who has voting rights within a TSG/WG.
Work Item:	The documented record of a specific technical activity of 3GPP.
Work Programme:	The documented record of the all technical activities of 3GPP.
Working Group:	A subordinate body of a Technical Specification Group.

Annex C: Individual member application form

APPLICATION FORM
for INDIVIDUAL MEMBERSHIP
of the THIRD GENERATION PARTNERSHIP PROJECT
Please complete this form and return it to your Organizational Partner

COMPANY NAME .....

Please indicate below which ORGANIZATIONAL PARTNER you are a member of

ARIB	
CCSA	
ETSI	
ATIS	
TSDSI	
TTA	
TTC	

Please indicate below which Technical Specification Groups you wish to participate in:

Radio Access Network	
Core Network and Terminals	
Service and System Aspects	
GSM EDGE Radio Access Network (GERAN)	

Upon your approval as an Individual Member of the Third Generation Partnership Project you agree that you will be bound by the Working Procedures of the Third Generation Partnership Project then in effect and as they may be amended from time to time.

Signed by (Authorized Representative) (See Note 1)	
Print name	
Position	
Date	
Telephone	
Fax	
Email	
Company Website URL	

Contact person's family name (See Note 2)	
Contact person's given name	
Job title	
Mailing address	
Telephone	
Fax	

Email	

Note 1: Is either the official contact person or voting contact of a company.

Note 2: People attending meetings and who can also have signing authority.

Annex D: (Void)

top

Annex E: Guidance for MRP applicants

E.1 Introduction

The conditions for the acceptance of Market Representation Partners (MRPs) in 3GPP are given in article 7 of these Working Procedures. This annex provides additional guidance to MRP Applicants.

top

E.2 Guidance

During the application process, the Organizational Partners will need to be assured that an Applicant:

(a) Has a field of interest directly or indirectly related to the work being undertaken by 3GPP;

(b) Has attained a demonstrable level of recognition within this field of interest;

(c) Has an understanding of the market requirements relevant to 3GPP;

(d) Is willing to actively contribute to the work of 3GPP and has sufficient resources for this purpose;

(e) Fully supports the goals and objectives of 3GPP and does not take part in activities that conflict with these goals and objectives.

In processing an application, the Organizational Partners will peruse openly available documentation published by an Applicant, including material posted on its Website, in order to confirm that the points listed above have been satisfied.

top

Annex F: Guidance on meeting organization

F.1 Meeting classification

TSG and WG Meetings are classified either:

- ordinary; or
- ad hoc.

top

F.2 Ordinary meetings

Ordinary meetings are ones where the regular business of the TSG or WG is conducted. Such meetings are normally chaired by the Group's Chair or, if unavailable, a Vice Chair. Ordinary meeting should be announced at least six months prior to the opening day of the meeting.

TSG and WG ordinary meetings shall follow an incrementing number sequence. If an additional ordinary meeting is required between two ordinary meetings, the sequence may be preserved, even though this means renumbering subsequent meetings, or the additional meeting may be numbered using the 'bis' suffix as a numbering scheme.

Attendance at an ordinary meeting counts towards an Individual Member's eligibility to cast a vote in the Group (see articles 26 and 27). The Support Team shall record the participation in an ordinary meeting (each person and organization represented) and the attendance list shall be included in the meeting report.

top

F.3 Ad hoc meetings

An ad hoc meeting of a WG or a TSG is one called to address one or more particular topics. The ad hoc meeting shall be called by decision of the WG (or its parent TSG) or TSG concerned; the decision to hold any subsequent ad hoc meetings on the same topic may be made by the ad hoc meeting participants themselves without reference to the parent WG or TSG, although the parent WG or TSG shall review any ad hoc activity at every Ordinary meeting and determine to either continue or to close the ad hoc activity, even if the previous ad hoc meeting suggested a further meeting. The scope of each subsequent ad hoc meeting shall be indicated by the Chair at least 21 days before the meeting. The ad hoc meeting shall not expand or change the scope originally determined by the parent group. An ad hoc meeting is allowed to make decisions only within its pre-defined remit, and any such decisions shall be ratified by the parent WG or TSG unless, in the case of a WG, a decision was previously explicitly delegated by the WG to the ad hoc meeting.

An ad hoc meeting may be chaired as described for an ordinary meeting above, or, with the agreement of the WG or TSG concerned, by a Work Item rapporteur, or other appropriate person. Although open to all 3GPP Individual Members, ad hoc meetings may attract only a subset of Individual Member representatives who would normally participate in ordinary meetings.

Ad hoc meetings shall not be considered when calculating voting rights. That is, attendance at (or absence from) an ad hoc meeting shall not influence voting rights, which are determined solely by attendance at "ordinary" meetings.

No voting shall occur at ad hoc meetings.

top

F.4 Attendance register

F.4.1 Face to face meetings

A delegate is deemed to have attended a given meeting if the individual confirms their participation by signing the attendance list made available by the group's secretary during the meeting. If a delegate does not sign the attendance sheet during the meeting, the secretary shall assume that the individual did not attend.

A delegate, having registered and begun to participate in a meeting, is not allowed to change their represented organization during the course of that meeting. An individual delegate is not allowed to simultaneously represent two or more Individual Members at a meeting.

top

F.4.2 Electronic meetings

Electronic meetings such as audio / video conferences, email exchanges considered as meetings, etc, are encouraged where appropriate. For such events, the Secretary will establish the attendance list on the basis of those actually participating in the meeting (those dialling in to the conference bridge, those issuing and responding to emails, etc.) Nevertheless, advance registration is strongly encouraged.

Fully electronic meetings are to be considered as "ad hoc" as defined above.

Participation by Individual Member in fully electronic meetings, or electronic participation in a face to face meeting (eg by phoning in) is not considered for the accrual or loss of voting rights.

top

Annex G: Working agreements

"Working agreements" are tentative decisions reached by 3GPP groups in order to make progress on matters where consensus (as defined in annex A) cannot be reached. It is intended to be used in situations where there is a clear majority in favour of one approach, but a small minority has sustained opposition to that approach.

The working agreement process has the following steps:

- Consensus cannot be reached on an issue. A substantial majority of individual members prefer a given approach, but there is sustained opposition by a small minority of individual members, preventing consensus.
- The Chair declares a working agreement. The working agreement is documented in the meeting report
- The approach agreed to by the majority and documented in the working agreement can continue unimpeded.
- The working agreement is entered into the 3GPP working agreements page on the 3GPP web site. The window for challenging the working agreement is now open.
- Working agreements may be challenged, resulting in a formal vote. This potential vote would be held at the next meeting of the WG or parent TSG (whichever comes first). If the next meeting is less than 14 days after the establishment of the working agreement, then that meeting is skipped in determining the next meeting. The meeting for potential voting is documented on the 3GPP working agreements page of the 3GPP web site (http://www.3gpp.org/TSG-Working-Agreements).
- The challenge cut-off date is established. This is 7 days before the start of the meeting for potential voting. The cut-off date is documented on the 3GPP working agreements page of the 3GPP web site.
- Organizations wishing to challenge the working agreement may do so until the challenge window closes. A challenge may be made by informing the Chair of the group which will do the voting. Any received challenge is documented on 3GPP working agreements page of the 3GPP web site.
- The group which will be voting is informed of the intention to have a working agreement challenge vote and the specific voting question.
- If no challenge is received by the challenge cut-off date, then the working agreement is confirmed. The confirmation of the working agreement is documented on the 3GPP working agreements page of the 3GPP web site. The issue is closed.
- If a challenge is received, then a formal vote on the working agreement will occur at the designated meeting. If the draft agenda for the designated meeting has already been issued, then it will be updated to include the potential for voting on the working agreement. Voting is as described in articles 25, 26 and 32 of the working procedures with the exception that the requirement for quorum is waived.
- If the challenge fails (at least 71% in favour of the working agreement), then the working agreement is confirmed. The confirmation of the working agreement is documented on the 3GPP working agreements page of the 3GPP web site. The issue is closed.
- If the challenge succeeds (less than 71% in favour of the working agreement), then the working agreement fails. All changes which were made based on the working agreement shall be reversed and the group must continue to search for consensus. The overturning of the working agreement is documented on the 3GPP working agreements page of the 3GPP web site.
- Organizations may withdraw a challenge at any time in the process. If the last challenge is withdrawn after the challenge cut-off, then the working agreement is confirmed. The confirmation of the working agreement is documented on the 3GPP working agreements page of the 3GPP web site. The issue is closed.

top

Annex H: Calculation of quorum in TSGs and WGs

Where calculation of a quorum is required in the context of a vote conducted in a TSG or a WG, the quorum shall be deemed to have been met if:

$(B - P) / V >= Q$

Where:

B is the number of ballot papers issued;

P is the number of proxy votes exercised (i.e. the number of ballot papers issued to delegates bearing authorization to cast votes by proxy);

V is the number of Individual Members having the right to vote at the meeting (including those with only the right to vote “in person” and not by proxy);

Q is the required quorum value given in article 26.

top

Annex I: Special procedures for exceptional situations restricting travel

3GPP working procedures are designed around the concept of periodic face to face meetings. This is not always possible. This annex implements modifications to the working procedures intended to allow 3GPP to function in the absence of face to face meetings. The PCG has the responsibility of activating and deactivating this annex.

The following changes in the working procedures are in effect when this annex is activated:

Article 14: PCG tasks

The following item shall be added to the list of PCG tasks:

- *maintenance of the voting and voting rights process integrity, to include disciplinary action if required.*

Article 22: TSG and WG election of Chair and Vice Chairs

The following paragraph is removed from section 22.2

If a WG does not meet physically with enough frequency to maintain an up to date voting list, the working group may elect to escalate the voting for officers to the parent TSG.

Article 26: TSG and WG voting during a meeting

The following additions to article 26 are in effect:

If voting occurs in the context of an Electronic Meeting, then:

- *Proxies are not allowed.*
- *Quorum does not apply.*
- *The voting period shall be a minimum of 18 consecutive hours excluding the period 12:00 UTC Friday to 11:59 UTC Monday which excludes Saturday and Sunday in every time zone. The use of 18:00 UTC to 12:00 UTC the next day is recommended for the voting period.*
- *The voting period shall commence no earlier than the start of the Electronic meeting and complete before the closure of the meeting. Voting for elections may exceptionally extend past the scheduled end of the meeting if additional rounds are required to complete the election of all open positions. Such elections are considered to be part of the meeting in which the elections started.*
- *The starting and closing times of the vote shall be clearly announced and disseminated to all on the principal TSG or WG membership mail exploder lists.*
- *The list of Voting Members (IMs that are eligible to vote) is as defined in article 35. Delegates vote on behalf of the IM under which they have registered, and only delegates checked in to the meeting may vote.*
- *If, in accordance with Article 25, the TSG or WG decides that a secret ballot is required, voting shall preserve the secrecy of the votes cast.*
- *A secure voting tool provided by the MCC shall be used for elections, and is also encouraged for other matters where voting is required.*

Article 28: TSG or WG voting for the election of TSG or WG Chair and Vice Chair

The following new paragraph is added to the end of article 28:

If an election is held during an electronic meeting, the voting shall use the voting procedures described in Article 26 as amended by this Annex.

Article 30: TSG and WG meetings

The following new paragraph is added after the 2nd paragraph of this article:

Electronic meetings are encouraged where appropriate.

Article 30A: TSG and WG participation

The text in article 30A shall be replaced with:

IMs wishing to progress work on topics in 3GPP are expected to participate in both face to face meetings and electronic meetings.

If a 3GPP IM is materially interested in a specific topic but is unable to participate in a meeting by sending a delegate, the IM is urged to engage the support of other IMs whose delegates will be present at the meeting to present its views. If this is not possible for any reason, the IM may advise the Chair of the situation and may provide documents supporting their position. The Chair may facilitate the introduction of these documents during the meeting and the record of the meeting can include the discussion and outcome. The option to engage the Chair is intended for exceptional situations. The Chair has the right to decline the request.

Article 32: TSG and WG meeting agenda

The following paragraph is added:

The draft agenda shall indicate the start and end dates and times of the meeting. The draft agenda shall indicate if the meeting counts toward maintenance of voting rights.

Article 35: TSG and WG Voting Membership List

35.3 Established TSGs and WGs

The text in section 35.3 shall be replaced with:

To qualify for the voting list it is necessary for at least one delegate of an Individual Member to fulfill the voting rights establishment provisions of article 35.4 for the group concerned, without being removed according to the provisions of article 35.4.

An individual member having attained voting rights according to clause 35.4 has the right to cast a vote by proxy (see article 26). Thus, an Individual Member may not cast a vote by proxy during a meeting at which it is not represented unless it had already attained voting rights as described in clause 35.4.

35.4 Removal from and instatement to voting list

The word *reinstatement* in the title of section 35.4 shall be replaced by *instatement*

The text in section 35.4 shall be replaced with:

An Individual Member shall be removed from the voting list when either of the following happens:

1. *The Individual Member is not represented at three consecutive face to face ordinary meetings of the group (TSG or WG),*
2. *The Individual Member is not represented in two consecutive ordinary meetings of the group (TSG or WG) of which at least one is electronic*

The right to vote shall be instated or reinstated for an Individual Member at either of the following events:

1. *the second face to face ordinary meeting which a delegate of the Individual Member attends without missing the number of consecutive face to face ordinary meetings mentioned in the previous paragraph,*
2. *the third consecutive ordinary meeting which a delegate of the Individual Member attends*

Note: See article 35.3 for eligibility to cast a proxy vote.

EXAMPLE 1: *If Individual Member Z is represented at face to face ordinary meeting K and K+3 (and is thus eligible to vote) but is not represented at face to face ordinary meetings K+4, K+5 and K+6, it is removed from the voting list.*

EXAMPLE 2: *If Individual Member X, not previously having been represented at an face to face ordinary meeting of the group, is represented at face to face ordinary meetings N and N+3, it may cast a vote at face to face ordinary meeting N+3.*

NOTE: *Individual Member X might choose to cast a vote by proxy at face to face ordinary meeting N+3, even though its delegate is physically present. This is sometimes useful for coordinating company positions where one large company has several Individual Memberships, possibly via several different Organizational Partners.*

EXAMPLE 3: *If Individual Member Y, not previously having been represented at a meeting of the group, is represented at ordinary meeting N only, it may not cast a vote by proxy at ordinary meeting N+2.*

EXAMPLE 4: *If Individual Member A is represented at electronic ordinary meetings N, N+1, and N+2 (and is thus eligible to vote) but is not represented at electronic ordinary meetings N+3 and N+4, it is removed from the voting list.*

EXAMPLE 5: *If Individual Member B, not previously having been represented at an ordinary meetings of the group, is represented at electronic ordinary meetings N, N+1, and N+2, it may cast a vote at electronic ordinary meeting N+2.*

35.5 (Void)

The contents of this section shall be struck and the heading replaced with VOID.

The following subclause is added to Article 35:

35.6 OP Voting Rights Hardship Exemption

For an IM belonging to an OP that has a voting rights hardship exemption for a given meeting, then missing the meeting is not counted in the voting rights algorithm. (In other words, for that IM, it is treated as though the meeting did not occur). If an IM covered by a voting rights hardship exemption for voting rights does attend the meeting, then it is counted as normal attendance.

If an IM covered by voting rights hardship exemption misses a meeting, there will be a permanent record (e.g., in the relevant meeting report) to note the list of IMs who have the voting rights hardship exemption for that meeting, and the voting rights list will also indicate the voting rights hardship exemption for the relevant meeting.

Voting rights hardship exemptions are granted on a per OP, per meeting basis.

Annex A: Definitions

The following 4 definitions are added:

Ad hoc Meeting	*A meeting called to address one or more particular topics that is not an ordinary meeting (see F.3)*
Electronic meeting:	*A electronic meeting is one where all the participants connect to the meeting using electronic means such as audio/video conference, email, etc.*
Face to face meeting:	*A face to face meeting, also referred to as a physical meeting, is one held at a designated physical location where participants are invited to attend in person.*
Ordinary Meeting	*A meeting where the ordinary business of a group is conducted (see F.2).*

Annex F: Guidance on meeting organization

The title of Annex F shall be changed to Guidance on TSG and WG meeting Organization

F.2 Ordinary meetings

The contents of clause F.2 shall be replaced with the following:

Ordinary meetings are ones where the regular business of the TSG or WG is conducted. Such meetings are normally chaired by the Group's Chair or, if unavailable, a Vice Chair. Ordinary meetings should be announced at least six months prior to the opening day of the meeting. An ordinary meeting may be held as a face to face meeting or as an electronic meeting.

TSG and WG ordinary meetings shall follow an incrementing number sequence. If an additional ordinary meeting is required between two ordinary meetings, the sequence may be preserved, even though this means renumbering subsequent meetings, or the additional meeting may be numbered using the 'bis' suffix as a numbering scheme. Ordinary meetings that are held electronically shall be designated with an 'e' suffix.

Attendance at an ordinary meeting counts towards an Individual Member's eligibility to cast a vote in the Group (see articles 26 and 27). The Support Team shall record the participation in an ordinary meeting (each person and organization represented) and the attendance list shall be included in the meeting report.

If a meeting is designated as face to face, provisions to support remote participation (e.g. by using additional audio/video capabilities) would be at the discretion of the host and leadership. In a meeting designated as face to face, those participating remotely are not to be counted toward quorum or attendance, and are not allowed to vote.

Following each ordinary meeting, the Support Team shall publish a list of IMs that have gained or lost voting rights at that meeting.

F.3 Ad hoc meetings

The contents of clause F.3 shall be replaced with the following:

An ad hoc meeting of a WG or a TSG is one called to address one or more particular topics. An ad hoc meeting may be held as a face to face or as an electronic meeting. The ad hoc meeting shall be called by decision of the WG (or its parent TSG) or TSG concerned; the decision to hold any subsequent ad hoc meetings on the same topic may be made by the ad hoc meeting participants themselves without reference to the parent WG or TSG, although the parent WG or TSG shall review any ad hoc activity at every Ordinary meeting and determine to either continue or to close the ad hoc activity, even if the previous ad hoc meeting suggested a further meeting. The scope of each subsequent ad hoc meeting shall be indicated by the Chair at least 21 days before the meeting. The ad hoc meeting shall not expand or change the scope originally determined by the parent group. An ad hoc meeting is allowed to make decisions only within its pre-defined remit, and any such decisions shall be ratified by the parent WG or TSG unless, in the case of a WG, a decision was previously explicitly delegated by the WG to the ad hoc meeting.

An ad hoc meeting may be chaired as described for an ordinary meeting above, or, with the agreement of the WG or TSG concerned, by a Work Item rapporteur, or other appropriate person. Although open to all 3GPP Individual Members, ad hoc meetings may attract only a subset of Individual Member representatives who would normally participate in ordinary meetings.

Ad hoc meetings shall not be considered when calculating voting rights. That is, attendance at (or absence from) an ad hoc meeting shall not influence voting rights, which are determined solely by attendance at "ordinary" meetings.

No voting shall occur at ad hoc meetings.

F.4 Attendance Register

The contents of clause F.4 (and subclauses) shall be replaced with the following:

A delegate is deemed to have attended a given meeting if the individual confirms their participation by checking in. If a delegate does not check in during the meeting, the secretary shall assume that the individual did not attend. Checking in must be performed between the start and end of the meeting. In addition, the check in process shall clearly inform the delegate that 'Checking in carries the responsibility for participating in relevant parts of the meeting'.

A delegate, having registered and checked in to a meeting, is not allowed to change their represented organization during the course of that meeting. An individual delegate is not allowed to simultaneously represent two or more Individual Members at a meeting.

F.4.1 (void)

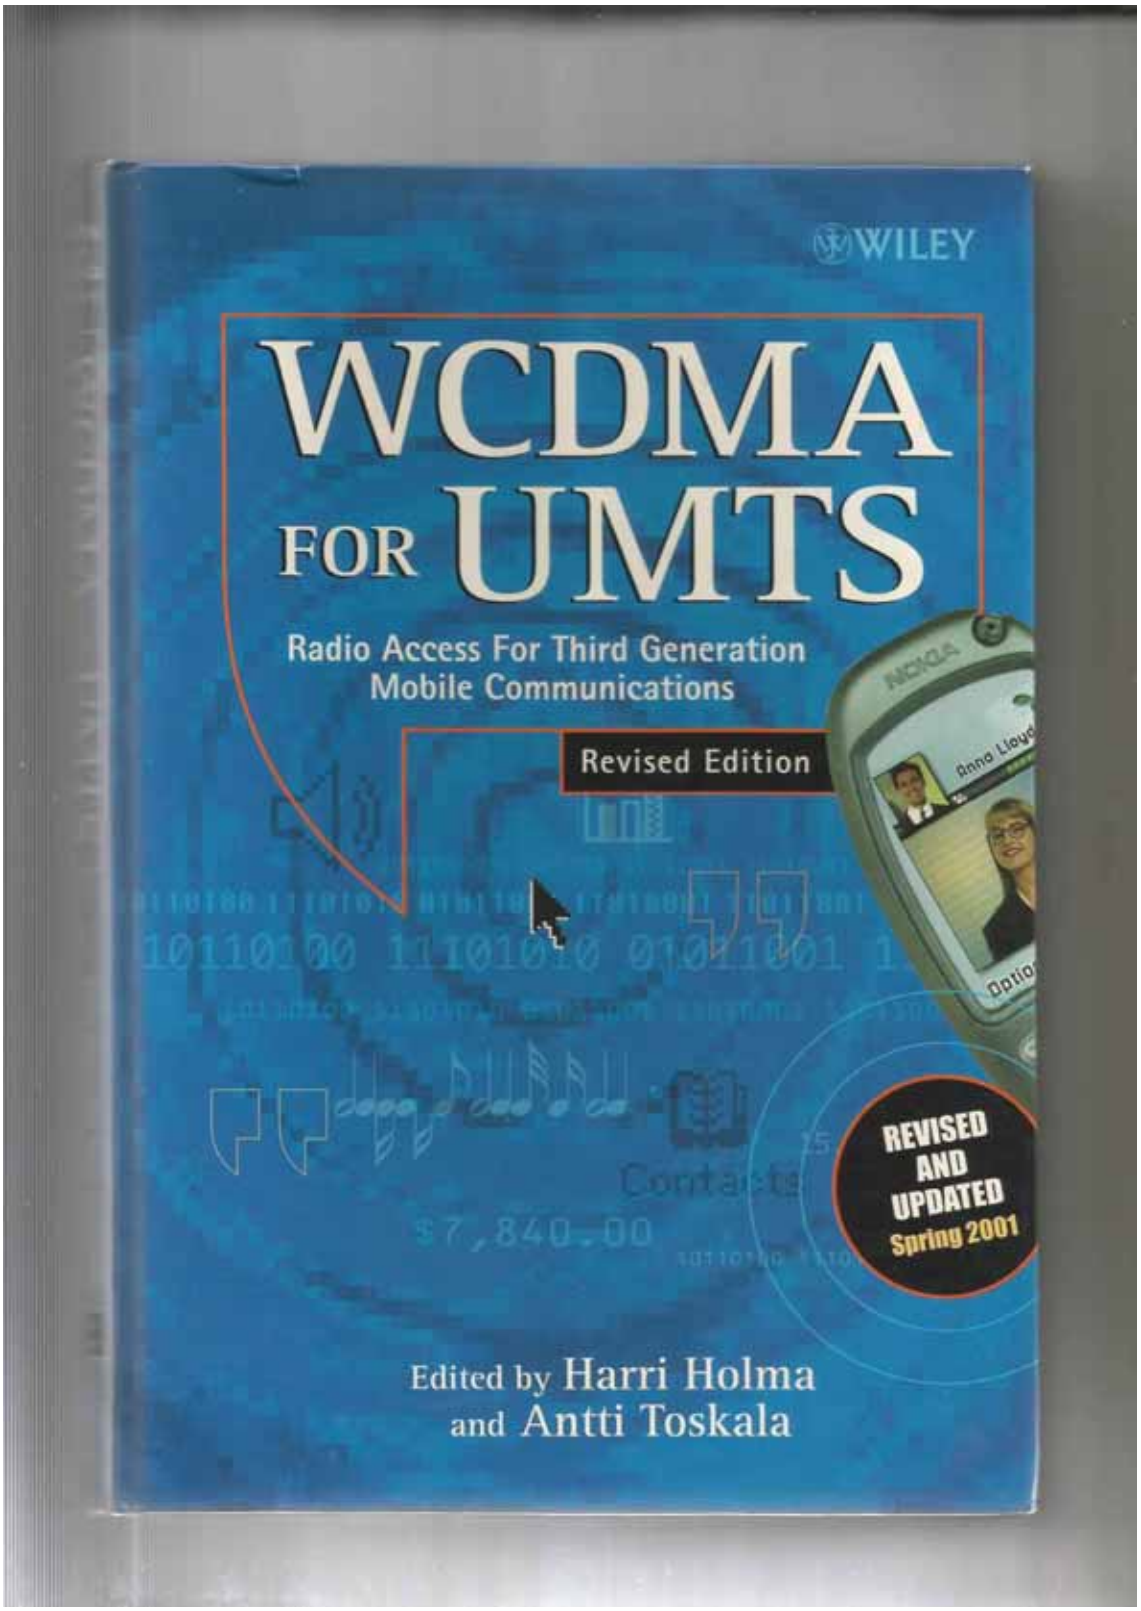
F.4.2 (void)

Annex G: Working agreements

The following changes to Annex G are in effect:

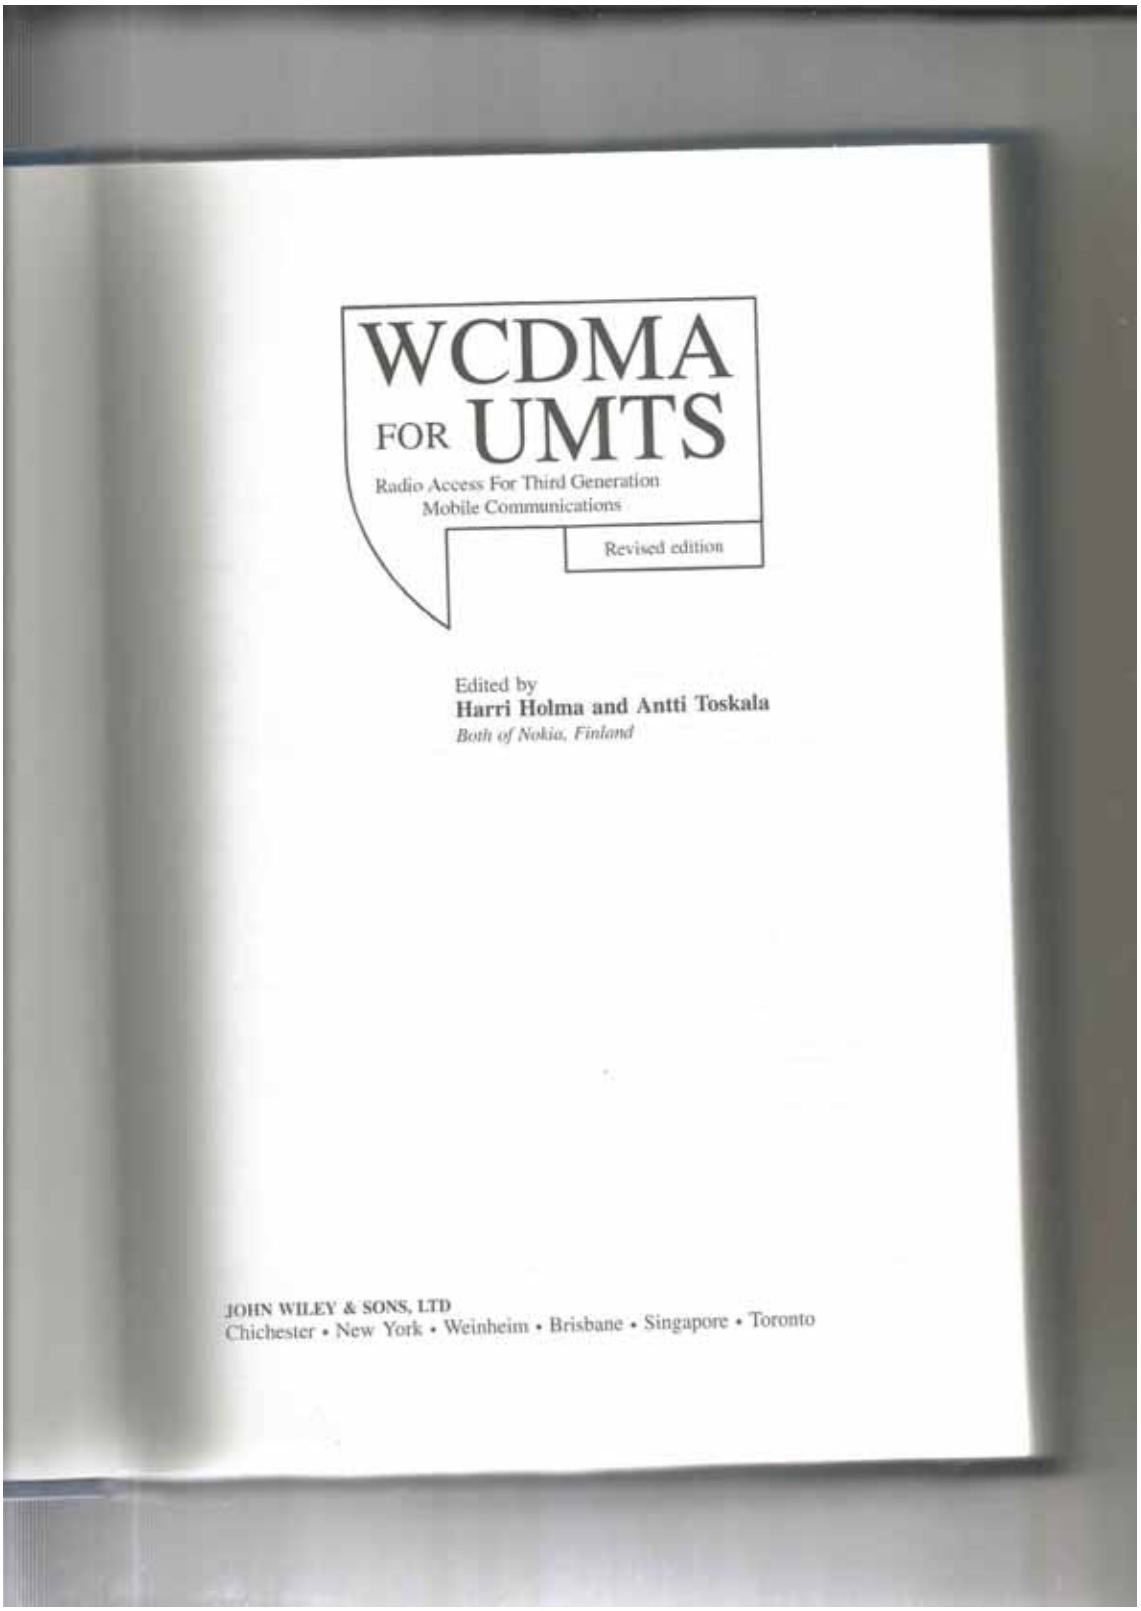
Challenge votes may be conducted at Electronic meetings provided they are Ordinary meetings.

top



Annex J: Change history

Date	PCG #	PCG Doc.	CR	Rev	Subject/Comment
2002-04-25	6				
2005-03-01	13				Changes agreed at PCG meeting incorporated. [No formal change control system yet in place]
2006-04-24	16	PCG16_07	2		ETSI proposal: Article 10 Clarify the rights of observers and guests
			3		ETSI proposal: Article 15 To allow leeway in the number of delegates representing each OP at PCG (To reflect the decision already taken by PCG#14 on PCG participation)
			9		ETSI proposal: Article 34 To cater for current TSG structure and to reflect common practice of Tdoc numbering
			1	1	Article 3 Reflect decision on regional options (To incorporate PCG#7 decision)
			4	1	Article 22 Clarification and codification of the rights to stand for elected positions in TSGs and WGs
			8		Article 30 & annex F Inclusion of an annex giving guidance on meeting organization
2006-10-27	17	PCG17_15 r1	10		Article 35 Clarification of voting rights
2009-05-18	22	PCG22_18	11	5	Changes resulting from the OP ad hoc group on improvements report and conclusions of OP#20. Articles affected: 22 23 31 35 41 52 Annex D plus sundry spelling corrections.
		PCG22_19	12	2	Rules on eligibility to cast votes at TSG and WG level.
		PCG22_20	13		Bring statement of purpose of 3GPP up to date
		PCG22_23	14		Adding Working Agreements to working procedures
		PCG22_30 r3	15	3	Change of ITU liaison process Note: PCG meeting #22 approved contribution PCG22_30r1 but this was subsequently revised to r3 after the meeting with the apparent approval of the PCG.
					Decision PCG22/11: clause 22.1 changed wording from "in the March time frame in" to "in the first semester of".
2009-08-12					Editorial correction to implementation of CR15r3. (article 52).
2010-04-23	24	PCG24_11	16		TSG vs WG election
		PCG24_12	17		Quorum
		PCG24_13	18		Communication with ITU
		PCG24_25	19		Attendance register for meetings
2012-10-24		PCG29_17	20		Update to 3GPP Working Procedures article 22
2014-07-22	33	PCG33_10	21		Anti-trust / competition law requirements articles 12, 17, 22.1, 23, 29, 59A, annex C
2014-12-31	34	PCG34_14	22		Anti-trust recommendations v1.1.
					Addition of TSDSI to list of OPs in annexes B and C. Minor formatting and spelling corrections, consistent capitalization.



2016-11-15	35	PCG37_14	23		Article 22.1 Modification to clarify obligation on elected officials regarding antitrust/competition law training.
2019-08-22	42	(none)	24		Article 55 Correction of text to reflect actual practice. Note: Decision taken by email in response to Action PCG42/7.
2019-08-23	42	PCG42_18	25		Article 22.2 Adds text allowing WGs which meet infrequently to escalate elections of their officials to the parent TSG. Article 25 Adds text allowing WGs which meet infrequently to escalate technical votes to the parent TSG. Article 30A (new) Introduces procedures for situations where an IM is unable to send a delegate in person to a meeting but nevertheless wishes to contribute to the proceedings. Secretary's note 1: Annex B Added abbreviation 'IM', though this was not included in PCG42_18. Secretary's note 2: Corrected the CR numbers in the previous two change history entries.
2020-02-07	43	PCG43_14			Annex G: Removal of the statement that voting on working agreements was to be a standard element of every meeting agenda. Addition of a reference to article 32. Removal of the requirement for a quorum during voting on working agreements.
2020-05-15	44				Addition of "crisis annex"
2020-09-30	45	PCG45_11			Update to 3GPP Working Procedures Annex I ("crisis annex")
2021-04-29	46	PCG46_20			Decision PCG46/09: Gender Neutrality Changes Annex I Change minimum voting window from 24 to 18 hours
2022-03-07	48	PCG48_12			Voting Rights pCR to Annex I
2022-03-07	48	PCG48_13			Hardship Exemption pCR to Annex I

4.5.3 cdma2000

The cdma2000 air interface proposal to ITU is the result of work in TR45.5 on the evolution of IS-95 towards the third generation. The cdma2000 proposal is based partly on IS-95 principles with respect to synchronous network operation, common pilot channels, and so on, but it is a wideband version with three times the bandwidth of IS-95. The ITU proposal contains further bandwidth options as well as the multi-carrier option for downlink. The cdma2000 proposal has a high degree of commonality with the Global CDMA 1 ITU proposal from TTA, Korea.

The cdma2000 multi-carrier option is covered in more detail in Chapter 13, as being currently standardised by 3GPP2.

4.5.4 TR46.1

The WIMS W-CDMA was not based on work derived from an existing second generation technology but was a new third generation technology proposal with no direct link to any second generation standardisation. It was based on the constant processing gain principle with a high number of multicodes in use, thus showing some fundamental differences but also a level of commonality with WCDMA technology in other forums.

4.5.5 WP-CDMA

WP-CDMA (Wideband Packet CDMA) resulted from the convergence between W-CDMA N/A of T1P1 and WIMS W-CDMA of TR46.1 in the US. The main features of the WIMS W-CDMA proposal were merged with the principles of W-CDMA N/A. The merged proposal was submitted to the ITU-R IMT-2000 process towards the end of 1998, and to the 3GPP process at the beginning of 1999. Its the most characteristic feature, compared with the other WCDMA-based proposals, was a common packet mode channel operation for the uplink direction, but there were also a few smaller differences.

4.6 Creation of 3GPP

As similar technologies were being standardised in several regions around the world, it became evident that achieving identical specifications to ensure equipment compatibility globally would be very difficult with work going on in parallel. Also, having to discuss similar issues in several places was naturally a waste of resources for the participating companies. Therefore initiatives were made to create a single forum for WCDMA standardisation for a common WCDMA specification.

The standardisation organisations involved in the creation of the 3rd Generation Partnership Project (3GPP) [9] were ARIB (Japan), ETSI (Europe), TTA (Korea), TTC (Japan) and T1P1 (USA) as shown in Figure 4.2. The partners agreed on joint efforts for the standardisation of UTRA, now standing for Universal Terrestrial Radio Access, as distinct from UTRA (UMTS Terrestrial Radio Access) from ETSI, also submitted to 3GPP. Companies such as manufacturers and operators are members of 3GPP through the respective standardisation organisation to which they belong.

Petitioners' Exhibit 1007, p. 164
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

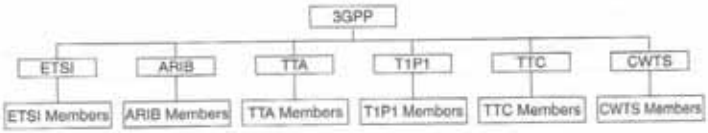

Figure 4.2. 3GPP organisational partners

Later during 1999, CWTS (the China Wireless Telecommunication Standard Group) also joined 3GPP and contributed technology from TD/SCDMA, a TDD-based CDMA third generation technology already submitted to ITU-R earlier.

3GPP also includes market representation partners: GSM Association, UMTS Forum, Global Mobile Suppliers Association, IPv6 Forum and Universal Wireless Communications Consortium (UWCC). In [9] there are up-to-date links to all participating organisations.

The work was initiated formally at the end of 1998 and the detailed technical work was started in early 1999, with the aim of having the first version of the common specification, called Release-99, ready by the end of 1999.

Within 3GPP, four different technical specification groups (TSG) were set up as follows:

- Radio Access Network TSG
- Core Network TSG
- Service and System Aspects TSG
- Terminals TSG

Within these groups the one most relevant to the WCDMA technology is the Radio Access Network TSG (RAN TSG), which has been divided into four different working groups as illustrated in Figure 4.3.

The RAN TSG will produce Release-99 of the UTRA air interface specification. The work done within the 3GPP RAN TSG working groups has been the basis of the technical description of the UTRA air interface covered in this book. Without such a global initiative, this book would have been forced to focus on a single regional specification, though with many similarities to those of other regions. Thus the references throughout this book are to the specification volumes from 3GPP.

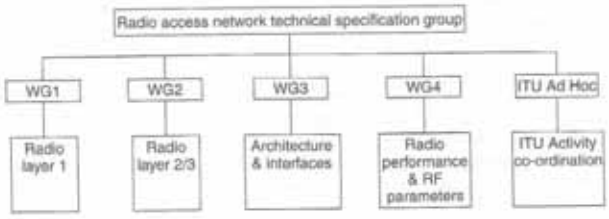

Figure 4.3. 3GPP RAN TSG working groups

Petitioners' Exhibit 1007, p. 165
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

During the first half of 1999 the inputs from the various participating organisations were merged in a single standard, leaving the rest of the year to finalise the detailed parameters for the first full release, Release-99, of UTRA from 3GPP. The member organisations have undertaken individually to produce standard publications based on the 3GPP specification. Thus, for example, the Release-99 UMTS specifications from ETSI are identical to the Release-99 specifications produced by 3GPP. The latest specifications can be obtained from 3GPP [9].

During 2000, further work on GSM evolution was moved from ETSI and other forums to 3GPP, including work on GPRS and EDGE. A new TSG, TSG GERAN was set up for this purpose.

4.7 Creation of 3GPP2

Work done in TR45.5 and TTA was merged to form 3GPP2, focused on the development of cdma2000 Direct-Sequence (DS) and Multi-Carrier (MC) mode for the cdma2000 third generation component. This activity has been running in parallel with the 3GPP project, with participation from ARIB, TTC and CWTS as member organisations. Recently the main concentration has been on the MC mode work, due to decisions resulting from the global harmonisation efforts.

4.8 Harmonisation Phase

During the spring of 1999 several operators and manufacturers held series of meetings to seek further harmonisation and convergence between the CDMA-based third generation solutions, WCDMA and cdma2000. For the 3GPP framework the ETSI, ARIB, TTA and T1P1 concepts had already been merged to a single specification, while cdma2000 was still on its own in TR45.5. As a result of several meetings and telephone conferences, the manufacturers and operators agreed to adopt a harmonised global third generation CDMA standard consisting of three modes: Multi-Carrier (MC), Direct Spread (DS) and Time Division Duplex (TDD). The MC mode was based on the cdma2000 multi-carrier option, the DS mode on WCDMA (UTRA FDD), and the TDD mode on UTRA TDD. The agreement was to phase in a modular approach in which both core networks could be used with all air interface alternatives, as described in Figure 1.4 in Chapter 1.

The main technical impacts of these harmonisation activities were the change of UTRA FDD and TDD mode chip rate from 4.096 Mcps to 3.84 Mcps and the inclusion of a common pilot for UTRA FDD. The work in 3GPP2 focused on the MC mode, and the DS mode from cdma2000 was abandoned. The result is that globally there is only one Direct Spread (DS) wideband CDMA standard, WCDMA.

4.9 IMT2000 Process in ITU

In the ITU, recommendations have been developed for third generation mobile communications systems, the ITU terminology being called IMT-2000 [10], formerly FPLMTS. In the ITU-R, ITU-R TG8/1 has worked on the radio-dependent aspects, while the radio-independent aspects have been covered in ITU-T SG11.

Petitioners' Exhibit 1007, p. 166
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

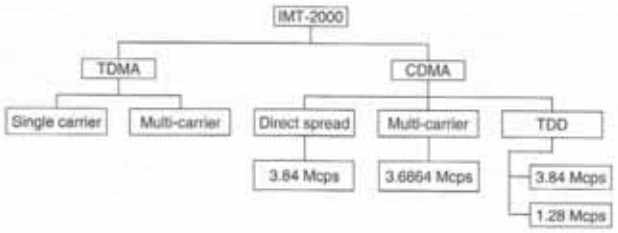

Figure 4.4. ITU-R IMT-2000 grouping

In the radio aspects, ITU-R TG8/1 received a number of different proposals during the IMT-2000 candidate submission process. In the second phase of the process, evaluation results were received from the proponent organisations as well as from the other evaluation groups that studied the technologies. During the first half of 1999 recommendation IMT.RKEY was created which describes the IMT-2000 multimode concept.

The ITU-R IMT-2000 process was finalised at the end of 1999, when the detailed specification (IMT-RSCP) was created and the radio interface specifications were approved by ITU-R [11]. The detailed implementation of IMT-2000 will continue in the regional standards bodies. The ITU-R process has been an important external motivation and timing source for IMT-2000 activities in regional standards bodies. The requirements set by ITU for an IMT-2000 technology have been reflected in the requirements in the regional standards bodies, for example in ETSI UMTS 21.01 [5], in order for the ETSI submission to fulfil the IMT-2000 requirements. The ITU-R interaction between regional standardisation bodies in the IMT-2000 process is reflected in Figure 4.5.

The ITU-R IMT-2000 grouping, with TDMA- and CDMA-based groups, is illustrated in Figure 4.4. The UTRA FDD (WCDMA) and cdma2000 are part of the CDMA interface, as CDMA Direct Spread and CDMA Multi-Carrier respectively. UWC-136 and DECT are part of the TDMA-based interface in the concept, as TDMA Single Carrier and TDMA Multi-Carrier respectively. The TDD part in CDMA consists of UTRA TDD from 3GPP and TD-SCDMA from CWTS. For the FDD part in the CDMA interface, harmonisation has been completed, and the harmonisation process is expected to continue for the CDMA TDD mode within 3GPP during 2000 and 2001.

4.10 Beyond 3GPP Release-99

Upon completion of the Release-99 specifications, work will concentrate on specifying new features as well as making the necessary corrections to Release-99. Typically such corrections arise as implementation proceeds and test systems are updated to include the latest changes in the specifications. As experience in various forums has shown, a major step forward in system capabilities with many new features requires a phasing-in period for the specifications. Fortunately, the main functions have been verified in the various test systems in operation since 1995, but only the actual implementation will reveal any errors and inconsistencies in the fine detail of the specifications.

Petitioners' Exhibit 1007, p. 167
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

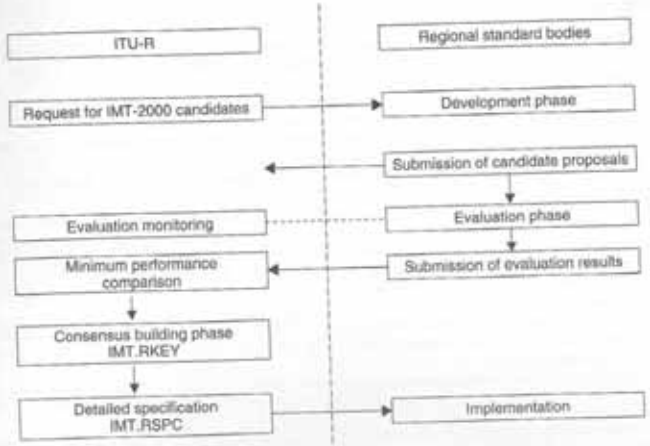

Figure 4.5. Relationship of ITU-R to the regional standards bodies

In 3GPP the next version of the specifications was originally considered as Release 2000, but since that the Release naming was adjusted so that next release is called Release 4 due to the 03/2001. Release 4 will contain only minor adjustment with respect to the Release'99. Bigger items are foreseen for inclusions in Release 5, including reaching for the data rates even up to the 10 Mbps in the downlink direction. Release 5 is due for the end of 2001. Release'99 specifications have a version number starting with 3 while Release 4 and 5 specifications have version number starting logically with 4 and 5 respectively.

During coming years, part of the process is to specify the extensions for connecting UTRA FDD to IS-41 based core networks. Work will be carried out on cdma2000 to allow connection to GSM-based core networks. This development will offer operators some degree of flexibility in selecting their third generation technology, assuming they are not aiming to launch such a service immediately, since Release-99 does not yet contain these options.

On the TDD side, further alignment is expected between the TDD mode in UTRA and the TDD mode from CWTS (China). This process is expected to continue after Release-99 is completed in 3GPP. 3GPP Release-4 is also planned to cover the lower chip rate (1.28 Mcps) TDD.

Other interesting developments are expected in the area of using IP based technology in UTRA. First step is going to be the IP based transport option in Release 4 and further releases are likely to see IP technology shaping the internal architecture of the UTRA Network (UTRAN). Also some of the protocols developed by the Internet Engineering Task Force (IETF) [12], such as robust IP header compression suitable for cellular transmission, are foreseen to be adopted as part the UTRA Rel'4 specifications.

3GPP Ultimate Project (3GU)

3GU (http://portal.3gpp.org) is now in use by all groups (including the PCG!). The current version is 1.2, which went live on schedule in late February 2016.

This version fixes a number of bugs (unfortunately, not all), and provides a much more user friendly interface – for example, a user's search selection in a given tab is persistent and does not have to be typed in afresh each time the user moves to another tab then returns.

MCC is currently writing an on-line help for 3GU.

(You can check the work in progress at http://www.3gpp.org/specifications-groups/3gu-help .)

Petitioners' Exhibit 1007, p. 179
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Antitrust Training

Some delay has been experienced in bringing the training course on Antitrust and Competition Law to conclusion. However, it is hoped that the course material will be available shortly. As promised previously, the material will be circulated to the Organizational Partners so that the regional specifics can be validated before the training courses are put into effect.

Once the material has been validated, a number of online sessions will be planned that are convenient for each of the three regions.

More details will follow in due course.

Petitioners' Exhibit 1007, p. 180
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Support to ad hoc groups

The current MCC service level is based on the assumption that ad hoc meetings will not receive MCC support (unless those meetings are held at the ETSI HQ)

More recently, MCC has provided support to a number of ad hoc meetings (e.g. SA1-Smarter) where these ad hoc meetings have been considered to be of significant importance (based on a rather subjective assessment).

The start of next generation (5G) work is likely to give rise to more ad hoc meetings in the coming years.

The result of the flexible approach outlined above has been to overspend the budget, as these ad hoc meetings have not been taken into account when the annual budget was originally set.

PCG guidance would be appreciated on the approach to be taken in the future for MCC support of ad hoc meetings, e.g.:

- Retain the current approach, at the risk of exceeding the annual budget
- Allocate an annual budget for ad hoc meeting support (with clear criteria)
- Conclude that ad hoc meetings will not receive MCC support

Petitioners' Exhibit 1007, p. 181
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Proposed support to SA3-LI

TSG SA has requested that MCC support be provided to SA3 WG LI in the same manner as regular 3GPP Working Groups (PCG36_13).

SA3-LI meets approximately 4 times per year (2 European, 2 International).

It is estimated that support to SA3-LI would require 0,4 Officer.

The estimated cost of providing this support is as follows:

Loaded manpower cost:	50kEUR
Overhead charge (0.39%):	20kEUR
Travel and subsistence:	10kEUR
Total	80kEUR

This information may be useful in understanding the financial consequences

Petitioners' Exhibit 1007, p. 182
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

3GPP Working Hours

Due to increasing workload, there is a tendency for 3GPP meetings to increase in duration. With the start of work on a next generation system, the workload is likely to increase further.

One noticeable occurrence was the meeting of RAN1#83 (Anaheim) which ran for 8 consecutive days. Moreover, the length of those days exceeded 12 hours duration.

MCC would like to recommend that 3GPP meetings:

- be no longer than 5 consecutive days duration,
- have a minimum of 11 hours break between the close of one meeting day and the start of the next.

If 3GPP Working Groups do wish to work in excess of the recommendations made above, then additional support resources will be required which will have obvious financial consequences

(It maybe noted that the labour laws of many countries in which 3GPP members are based, prohibit delegates from working excessive hours)

Petitioners' Exhibit 1007, p. 183
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Summary and Outlook

3GPP Membership has stabilised at about 470 companies, but the geographical reach is increasing (now at 45 countries).

3GPP faces the daunting task of delivering a set of specifications for a next generation (5G) system by December 2019 (with a preliminary set of specifications being delivered already by 2018). This is very likely to result in more meetings, increasing workload and some difficult discussions.

Improvements in 3GPP tooling are well underway and should hopefully increase the efficiency of 3GPP meetings.

Care is needed to ensure that, despite the increasing workload, 3GPP remains an effective project that continues to deliver a high quality product.

Chapter 2

The History of the IMS Standardization

In Chapter 1 we mentioned that the IMS uses Internet protocols. When the IMS needs a protocol to perform a particular task (e.g., to establish a multimedia session), the standardization bodies standardizing the IMS take the Internet protocol intended for that task and specify its use in the IMS. Still, no matter how simple this may sound the process of choosing protocols to be used in the IMS can sometimes get tricky. Sometimes, the Internet protocol that is chosen lacks some essential functionality, or does not even exist at all. When this happens the IMS standardization bodies contact the standardization body developing Internet protocols to work together on a solution. We will cover this collaboration in Section 2.5. Nevertheless, before jumping into that we will introduce in Section 2.1 all the standardization bodies involved in IMS development. We need to know who is who and which functions of the IMS each of them performs.

2.1 Relations between IMS-related Standardization Bodies

The ITU (International Telecommunication Union) IMT-2000 (International Mobile Telecommunications-2000) is the global standard for 3G (third generation) networks. IMT-2000 is the result of the collaboration between different standards bodies and aims at providing access to telecommunication services using radio links, which include satellite and terrestrial networks.

We will focus on two of the standard bodies involved in IMT-2000: 3GPP (Third Generation Partnership Project) and 3GPP2 (Third Generation Partnership Project 2). Still, they are not the only ones working within IMT-2000. Other bodies, such as the ITU-R (ITU-Radiocommunication Sector), for instance, are also involved in IMT-2000 but on different areas than the IMS.

Both 3GPP and 3GPP2 have standardized their own IMS (IP Multimedia Subsystem). The 3GPP IMS and the 3GPP2 IMS are fairly similar, but, nevertheless, have a few differences (Appendix A lists the most important differences).

Petitioners' Exhibit 1007, p. 188
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

An important similarity between the 3GPP IMS and the 3GPP2 IMS is that both use Internet protocols, which have been traditionally standardized by the IETF (Internet Engineering Task Force). Consequently, both 3GPP and 3GPP2 collaborate with the IETF in developing protocols that fulfill their requirements. The following sections introduce the IETF, 3GPP, and 3GPP2 and provide a brief history of the IETF-3GPP/3GPP2 collaboration.

In addition to the standard bodies we have just mentioned, OMA (Open Mobile Alliance [144]) will play an important role in developing IMS services in the near future. While 3GPP and 3GPP have standardized (or are standardizing) a few IMS services, such as basic video calls or conferencing, from now on OMA will focus on service standardization for the IMS (of course, other standard bodies and third parties besides OMA may also develop services for the IMS).

2.2 Internet Engineering Task Force (IETF)

The Internet Engineering Task Force (IETF) is a loosely self-organized collection of network designers, operators, vendors, and research institutions that work together to develop the architecture, protocols, and operation of the public Internet. The IETF is body that is open to any interested individual. The IETF is not a corporation and, therefore, does not have a board of directors, members, nor dues.

The IETF is the standardization body that has developed most of the protocols that are currently used on the Internet. The IETF does not standardize networks, architectures combining different protocols, the internal behaviour of nodes, nor APIs (Application Programming Interface). The IETF is the protocol factory for IP-related protocols.

2.2.1 Structure of IETF

Work in the IETF is organized in working groups. Each working group is chartered to perform specific tasks, such as the delivery of a precise set of documents. Each working group has from one to three chairs, who take care that the working group completes its chartered tasks in time. Working groups have a temporary lifetime; so, once they have delivered their documents, either they are rechartered or they cease to exist. Figure 2.1 shows a few, but not all, of the working groups in the IETF; there are more than 100 active working groups in the IETF. The complete up-to-date list of active working groups is available at:

`http://www.ietf.org/html.charters/wg-dir.html`

Working groups get an acronym name that identifies the chartered task. For instance, SIPPING is the acronym of "Session Initiation Protocol Investigation", SIMPLE is the acronym of "SIP for Instant Messaging and Presence Leveraging Extensions" or AAA for "Authentication, Authorization and Accounting".

A collection of working groups form an Area Directorate. There are currently eight areas, as illustrated in Figure 2.1.

Each area has one or two area directors who, together with the IETF chairman, form the IESG (Internet Engineering Steering Group). The IESG is the technical

Petitioners' Exhibit 1007, p. 189
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

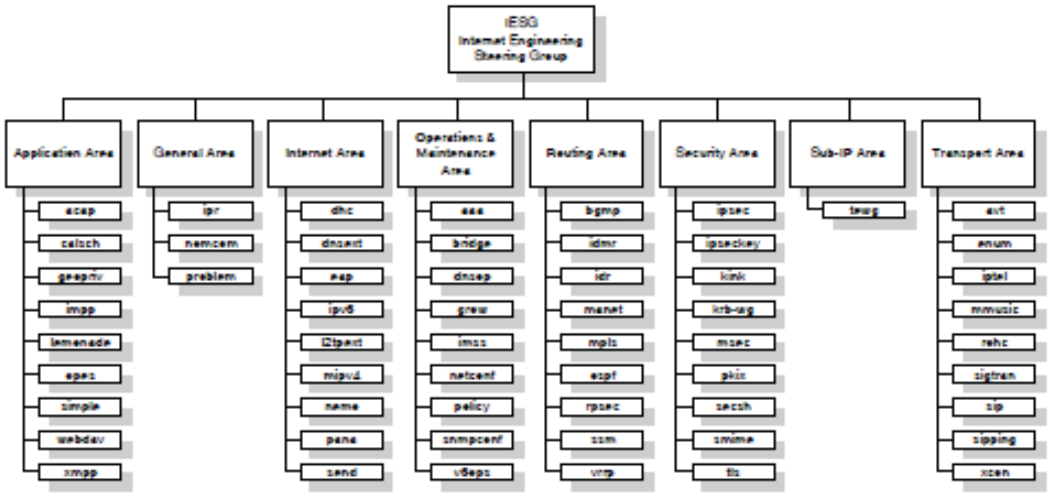

Figure 2.1: The structure of the IETF

management team of the IETF. They decide on which areas the IETF should work and review all the specifications that are produced.

The following web pages contain the complete list of the working groups of all areas and the charter of the SIPPING working group respectively.

`http://www.ietf.org/html.charters/wg-dir.html`
`http://www.ietf.org/html.charters/sipping-charter.html`

The IAB (Internet Architecture Board) is the body that provides technical leadership and handles appeals. Its web page is:

`http://www.iab.org/`

2.2.2 Working Group Operations

The technical work in the IETF is done within the working groups. Working groups do not have any kind of membership; they are formed by a number of volunteers that work as individuals. That is, they do not represent their companies when working for the IETF.

Most of the technical discussions within a working group take place in its mailing list. Even the decisions made at face-to-face meetings (held three times a year) have to be confirmed in the mailing list.

The technical documents used within the working groups are called Internet-Drafts. There are two types of them: individual submissions and working group items. Individual submissions are technical proposals submitted by an individual or individuals. If the working group decides that an individual submission is a good starting point to work on a particular topic, it becomes a working group item.

Petitioners' Exhibit 1007, p. 190
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Individual submissions and working group items can be distinguished by the name of the file where they are stored. Individual submissions start with:

```
draft-author's_name
```

while working group items start with:

```
draft-ietf-name_of_the_working_group
```

A list of all the Internet-Drafts can be found at:

```
http://www.ietf.org/internet-drafts/
```

When a working group feels that a working group item is ready for publication as an RFC the working group chairs send it to the IESG. The IESG may provide feedback to the working group (e.g., ask that working group to change something in the draft) and, eventually, decides whether or not a new RFC is published.

Although most of the Internet-Drafts that the IESG receives come from working groups an individual may also submit an Internet-Draft to the IESG. This usually happens with topics that are not large enough to grant the creation of a working group, but which, nevertheless, are of interest to the Internet community.

It is important to note that Internet-Drafts, even if they are working group items, represent work in progress and should only be referenced as such. Internet-Drafts are temporary documents that expire and cease to exist six months after they are issued. They can change at any time without taking into consideration backward compatibility issues with existing implementations. Only when a particular Internet-Draft becomes an RFC can it be considered a stable specification.

2.2.3 Types of RFCs

The technical documents produced by the IETF are called RFCs (Request For Comments). According to the contents of the document there are three main types of RFCs:

- Standards-track RFCs.
- Non-standards-track RFCs.
- BCP (Best Current Practise) RFCs.

Standards-track RFCs typically define protocols and extensions to protocols. According to the maturity of the protocol there are three levels of standards-track RFCs: proposed standard, draft standard, and Internet standard. Standards-track specifications are supposed to advance from proposed to draft and, finally, to Internet standard as they get more and more mature. An important requirement in this process is that a particular specification is implemented by several people to show that different independently built implementations that follow the same specification can successfully interoperate.

Nevertheless, in practise only a few RFCs reach the draft standard level and even fewer become Internet standards. At present, the specifications of many protocols that are used massively on the Internet are proposed standards.

Petitioners' Exhibit 1007, p. 191
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

There are three types of non-standards-track RFCs: experimental, informational, and historical (which are called *historic* RFCs). Experimental RFCs specify protocols with a very limited use, while informational RFCs provide information for the Internet community about some topic, such as a requirements document or a process. When a standards-track RFC becomes obsolete, it becomes a historic RFC.

BCP RFCs record the best current practise known to the community to perform a particular task. They may deal with protocol issues or with administrative issues.

Figure 2.2 shows the relations between all the RFC types. A list of all the RFCs published so far and their status can be fetched from:

`http://www.ietf.org/iesg/1rfc_index.txt`

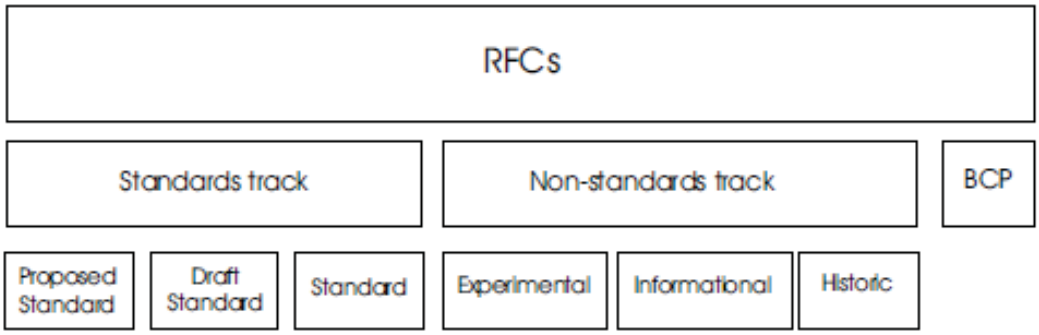

Figure 2.2: RFC types

RFCs can be downloaded from the following web page by just introducing the RFC number:

`http://www.ietf.org/rfc.html`

Additionally, the RFC Editor offers a web page that allows us to search for RFCs by title, number, author and keywords:

`http://www.rfc-editor.org/rfcsearch.html`

2.3 Third Generation Partnership Project (3GPP)

The Third Generation Partnership Project (3GPP) was born in 1998 as a collaboration agreement between a number of regional telecommunication standard bodies, known as *organizational partners*. The current 3GPP organizational partners are:

1. ARIB (Association of Radio Industries and Business) in Japan,

   `http://www.arib.or.jp/english/`

2. CCSA (China Communications Standards Associations) in China,

   `http://www.ccsa.org.cn/english/`

Petitioners' Exhibit 1007, p. 192
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

3. ETSI (European Telecommunications Standards Institute) in Europe,

   `http://www.etsi.org/`

4. Committee T1 in the United States of America,

   `http://www.t1.org/`

5. TTA (Telecommunications Technology Association) of Korea

   `http://www.tta.or.kr/English/`

6. TTC (Telecommunication Technology Committee) in Japan,

   `http://www.ttc.or.jp/e/`

3GPP was originally chartered to develop globally applicable Technical Specifications and Technical Reports for a third-generation mobile system based on GSM. The scope has been reinforced to include maintenance and development of GSM specifications including the supported and evolved radio networks, technologies, and packet access technologies.

Besides the organizational partners, *market representation partners* provide the partnership with market requirements. Market representation partners include, among others, the UMTS Forum, 3G Americas, the GSM Association, the Global mobile Suppliers Association, the TD-SCDMA Forum, and the IPv6 Forum.

3GPP maintains an up-to-date web site at:

`http://www.3gpp.org/`

2.3.1 3GPP Structure

3GPP is organized in a Project Co-ordination Group (PCG) and Technical Specification Groups (TSGs), as illustrated in Figure 2.3. The PCG is responsible for the overall management of 3GPP, time plans, allocation of work, etc. The technical work is produced in the TSGs. At the moment there are five TSGs, responsible for the Core Network (CN), System and Services Aspects (SA), GSM EDGE Radio Access Network (GERAN), Radio Access Network (RAN), and Terminals (T). Each of the TSGs is further divided into Working Groups. Each of the Working Groups is allocated particular tasks. For instance, CN WG1 is responsible for all the detailed design of the usage of SIP and SDP in the IMS, CN WG3 for interworking aspects and CN4 for all the detailed design of the usage of Diameter. SA WG1 is responsible for the requirements, SA2 for the architecture, SA WG3 for the security aspects, SA WG4 for the codecs, and SA WG5 for the operation and maintenance of the network.

Petitioners' Exhibit 1007, p. 193
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

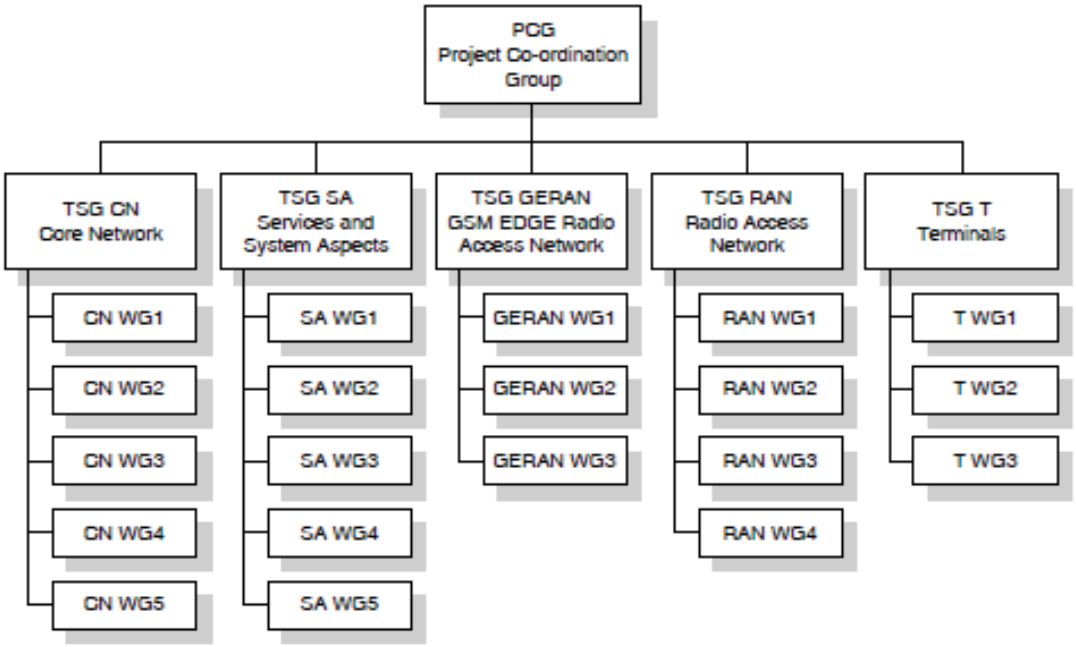

Figure 2.3: The structure of 3GPP

2.3.2 3GPP Deliverables

3GPP working groups do not produce standards. Instead, they produce Technical Specifications (TS) and Technical Reports (TR) that are approved by the TSGs. Once approved they are submitted to the organizational partners to be submitted to their respective standardization processes. The final part of the process is in the organizational partners' hands when they approve the TSs or TRs as part of their standards procedures. As a result, there is a set of globally developed standards that are ready to be used in a particular region.

3GPP TSs and TRs are numbered according to the sequence of four or five digits that follow the pattern "xx.yyy". The first two digits "xx" identify the series number, and the last two or three digits "yy" or "yyy" identify a particular specification within a series. For instance, 3GPP TS 23.228 [21] describes the architectural aspects of the IMS.

3GPP groups its specifications in what is called a *Release*. 3GPP Release 5 contains the first version of the IMS. 3GPP Release 6 contains enhancements to the IMS. The reader must note that the IMS is just a fraction of the 3GPP deliverables in a particular Release, as there are other non-IMS specifications included in a 3GPP Release. 3GPP TSs and TRs include a version number that follows the pattern "x.y.z", where "x" represents the 3GPP Release where the specification is published, "y" is the version number, and "z" is a sub-version number. So, 3GPP TS 23.228 version 5.8.0 means version 8.0 of the Release 5 version of TS 23.228.

Petitioners' Exhibit 1007, p. 194
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

3GPP TSs and TRs are publicly available at the 3GPP web site at either of the following URIs:

`http://www.3gpp.org/specs/specs.htm`

`http://www.3gpp.org/ftp/Specs/archive/`

2.4 Third Generation Partnership Project 2 (3GPP2)

If 3GPP was born to evolve GSM specifications into a third-generation cellular system, the Third Generation Partnership Project 2 (3GPP2) was born to evolve North American and Asian cellular networks based on ANSI/TIA/EIA-41 standards and CDMA2000© radio access into a third-generation system. 3GPP2 like 3GPP is a partnership project whose members are also known as *organizational partners*. The current list of organizational partners include ARIB (Japan), CCSA (China), TIA (Telecommunications Industry Association) (North America), TTA (Korea), and TTC (Japan). Probably, the reader has noticed that most of them are also organizational partners of 3GPP.

Like 3GPP, 3GPP2 gets market requirements and advice from *market representation partners*. At the moment the list includes the IPv6 Forum and the CDMA Development Group.

2.4.1 3GPP2 Structure

The 3GPP2 structure mimics the structure of 3GPP, as illustrated in Figure 2.4. A Steering Committee (SC) is responsible for the overall standardization process and the planning. The technical work is done in Technical Specification Groups (TSGs). TSG-A is focused on the Access Network Interface, TSG-C on CDMA2000© technology, TSG-S on Service and System Aspects, and TSG-X in Intersystems Operations. TGS-X was born as a merger between the former TSG-N (Core Networks) and TSG-P (Packet Data) TSGs. The structure of TSN-X is not completely defined yet.

2.4.2 3GPP2 Deliverables

Like 3GPP, 3GPP2 does not produce standards but, instead, Technical Specifications (TSs) and Technical reports (TRs). The documents are created by the TSGs and approved by the SC. Then, they are submitted to the organizational partners to be submitted to their respective standardization processes.

3GPP2 TSs and TRs are numbered with a sequence of letters and digits that follows the scheme "A.Bxxxx-yyy-R" where "A" is a letter that represents the name of the TSG that delivers the document, "B" can be an "R" letter to indicate a TR or a requirements document, but it can also be an "S" letter to indicate a TS. "xxxx" is a sequential number allocated to the document. An optional "yyy" sequence of digits can further identify the chapter within a specification series. The "R" letter identifies the revision. The version number follows the specification and indicates a major and

Questions about 3GPP Membership

Who can become an Individual Member of 3GPP and how much does it cost?
Who may participate in 3GPP meetings?
Who shall fill in the 3GPP Individual Member Application form?
What shall I do if a 3GPP company or official contact details change?
What are the different membership categories?
Who may become an observer?
Who may become a Guest Member and do guests have to pay any fees?
Who can apply for market representative Partnership?
Can an ETSI Observer become an Individual Member of 3GPP?
Can an ETSI Applicant apply for 3GPP Membership?
Can an ETSI Member apply for 3GPP Guest status?

Questions about 3GPP email exploder lists

Are there discussion archives for the 3GPP exploder lists?
How do I subscribe to the 3GPP exploder lists?

Questions about Legal Matters

What is the 3GPP IPR Policy?
What is the 3GPP policy on licensing?
Who owns the Technical Specifications and the Technical Reports approved by 3GPP?
Are meeting contributions to ETSI TC SMG publically available?
Is permission needed to use the 3GPP logo in marketing collaterals or on a web site?
Can I use computer code included with a 3GPP TS to implement a product?

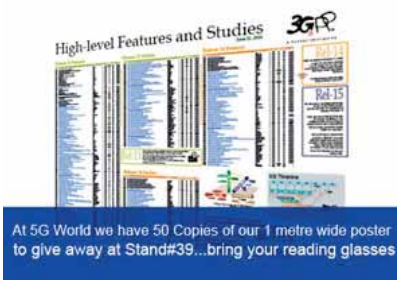
Questions about 3GPP Specifications

How do I create the next Release version of a TS or TR?
Where can the rules, protocols or software needed to develop applications for UMTS be found?
What is the correlation between Stage 1, Stage 2 and Stage 3?
Are the 3GPP specifications produced only in word?
Which group works with specifications covering the use of the GSM codec (either in C or Java based)?
Where can I find documents produced by the GSM MoU Group / GSM Association?
Where would I find a document (e.g. UMTS 30.03 version 3.1.0) which does not appear on the status list?
Where are all the Change Requests (CRs) located?
Where are all the current ETSI SMG specs located?
Which group works on Physical Layer aspects of UMTS/LTE?
Where can I find the list of Abstract syntax notation (ASN.1) object identifiers?
Where can I find the 3GPP Confidentiality and Integrity algorithms?
What is a Release - how does specification version numbering work?
Where can I find information on the current status of 3GPP specifications?
What is the system for numbering specifications?
What is the meaning of the text at the foot of the TS/TR cover page?

Questions about Technical Specification Group/Working Group

Who are the TSG/WG Officials and Support team and where can I find their contact details?
Where can I find the Terms of Reference for my TSG/WG?

Search



3GPP Website: Search for...

Search and download specs, docs, CRs and more from the 3GPP FTP Server:

ADVANCED FTP SEARCH

News Feeds

3GPP News
3GPP tweets

Petitioners' Exhibit 1007, p. 223
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

May I become an Official?
Where are my TSG/WGs documents stored?

Questions about Documents and TSG/WG Meetings

How do I register for a meeting?
Who can submit a change proposal on any 3GPP specifications to 3GPP?
If a change proposal is submitted how long does it take for it to get approved?
How to get a user name and password for "Reserve a Document Number"?
How do I obtain a document number for my contribution?
Where can I download documents for an upcoming meeting?
Where can I find a temporary document template?

Questions about Work Items and Deliverables

What is my role when my TSG/WGs has to approve a deliverable?
What are the different types of deliverables?
Can I write an 3GPP Document myself?
Do I and my company have to support my TSG/WGs Work Items?

Miscellaneous

Do I need a password and user name to access the 3GPP Web site ?
Can you give me information about which companies manufacture particular types of equipment. (...)
How can I determine when a meeting contribution document (TDoc) became publicly available?
Is it possible to determine the date and time of publication of a particular version of a 3GPP specification?

Technical topics

What formalities do I have to go through to get type approval for terminal equipment in Europe? Is there a single point of contact? What standards does my equipment need to conform to in order that I can place it on the market?
Where can I find a list of technical terms and abbreviations used in 3GPP documents?
What is the difference between a SIM and a USIM? What is a UICC?
I have transferred a video file from my phone to my PC. Where can I find a player for 3gp files?
Where can I find the specification of the SIM Lock feature?

Who can become an Individual Member of 3GPP and how much does it cost?

Individual Members are by definition members of the Organizational Partners of 3GPP. This means that members of standardization bodies such as ETSI, ARIB, TTA, TTC, ATIS and CCSA have a right to take part in 3GPP. If your company becomes an ETSI member, please be informed that for participation in 3GPP you need to pay 3 units of contribution as a minimum except SMEs, Users, Universities, Public Research Bodies who should pay 2 units (instead of 1).

ETSI Members' and associate members' fees are calculated by class. The class is derived from the member company's annual ECRT band (Electronics Communications Related Turnover) – see ECRT definition.
Each class corresponds to a number of units. This number determines the contribution payable.

Example: If your organization declares an annual ECRT of up to 135€ million, you would need to pay 2 Units of Contribution (corresponding to 9380€ per year) plus an additional UoC for participation in 3GPP of 3380€ (see fees table). Members joining ETSI during the 2nd half of the year benefit from a 50% rebate on the membership fee of the current year. In this case, you would pay 12760€ minus 50% = 6380€ for yyyy.

Who may participate in 3GPP meetings?

To attend a 3GPP meeting, you must be a 3GPP Individual Member (i.e., you must be a Member of one of the Organizational Partners involved in the project; ARIB, CCSA, ETSI, ATIS, TTA or TTC). A non-member company should seek membership with one of the above partners to be eligible to contribute and participate at 3GPP Meetings.

Who shall fill in the 3GPP Individual Member Application form?

The person legally responsible for the requesting company shall fill in the form.

What shall I do if a 3GPP company or official contact details change?

All changes of correspondence should be notified to ETSI Membership and 3GPPMembership.
In case of change of official contact an ETSI Online (EOL) account will be created for the new contact.
Please note that as official contact person you can view and modify your personal and organization's contact details via the "Manage my membership" web interface.

What are the different membership categories?

The different membership categories of 3GPP are described in Article 4 of the 3GPP Working Procedures.

Who may become an observer?

The status of Observer may be granted by the Organizational Partners to an entity which has the qualifications to become a future Partner (see also 3GPP Working Procedures Article 10)

Petitioners' Exhibit 1007, p. 224
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Who may become a 3GPP Guest Member and do guests have to pay any fees?

The 3GPP Guest status is for potential Individual Members who may be granted permission to participate in 3GPP for a maximum period of 6 months. Guest status is granted on a case-by-case basis by the Organizational Partners (see also 3GPP Working Procedures Article 10). If you like to apply for a Guest status, please complete the on-line 3GPP Application form.

No membership fees are requested for Guest applications. The Guest status is a one time only membership which is used to enable a company to decide whether or not they wish to become a full member (by joining one of the Partners).

Who can apply for market representative Partnership?

Organisation who have the ability to offer market advice to 3GPP and to bring into 3GPP a consensus view of market requirements (e.g., services, features and functionality) falling within the 3GPP scope (see also 3GPP Working Procedures, Article 7).

Can an ETSI Observer become an Individual Member of 3GPP?

An ETSI Observer cannot become an Individual Member of 3GPP. An ETSI Observer may "observe" all activities, but their participation is limited to the ETSI General Assembly only. Therefore, ETSI Observers have no participation rights in 3GPP. ETSI Observers have access to ETSI documentation and of course to 3GPP documentation since that is openly published on the web.

3GPP does have it's own category called "Observer" but that is entirely different and is used for potential Partners.

Can an ETSI Applicant apply for 3GPP Membership?

YES, an ETSI Applicant means that your request to become an ETSI Member will be addressed (and normally approved) at the next General Assembly and that the company has specified they want to participate in 3GPP activities. See also above regarding 3GPP fees.

Can an ETSI Member apply for 3GPP Guest status?

Yes, any ETSI Member can apply for a 3GPP Guest status by filling in the on-line 3GPP Application form.

Are there discussion archives for the 3GPP exploder lists?

Yes! To see the complete list please have a look here: Home page of listserv and scroll down until you find the list you are interested in. For example, the archives for the main RAN email list.

How do I subscribe to the 3GPP exploder lists?

All 3GPP email exploder lists can be found at list.3gpp.org. In order to subscribe to any of the lists, scroll down until you find the list you are interested in, then click on the link and on the right side of the page you will find Subscribe or Unsubscribe. Click on the link and follow the simple instructions. Delegates who already have an ETSI username and password should use the list management application on the ETSI site.

What is the 3GPP IPR Policy?

The 3GPP Organizational Partners have agreed that their IPR policies should be respected and that their respective members should be encouraged to declare "their willingness to grant licenses on fair, reasonable terms and conditions and on non discriminatory basis" (Article 3.1 of the Third Generation Partnership Project). For more information, look here >>>

The above-mentioned principles are further reflected in Article 55 of the 3GPP Working Procedures which request that each Individual Members should declare "at the earliest opportunity, any IPR which they believe to be essential, or potentially essential, to any work ongoing within 3GPP".

What is the 3GPP policy on licensing?

Some aspects of 3GPP systems are covered by essential Intellectual Property Rights (IPR) - that is, patented technologies without which equipment cannot be implemented. The IPR vests in - i.e. the patents are held by - individual companies, and not by 3GPP itself or any of its Organizational Partners (OPs). All Individual Members of 3GPP abide by the IPR policies of the OP to which they belong; all such policies are broadly similar see also "What is the 3GPP IPR Policy", and require IPR holders to make licences available to all third parties, whether or not they are 3GPP Individual Members, under fair, reasonable and non-discriminatory (FRAND) terms.

Neither 3GPP nor its component OPs offer an IPR search service. It is the responsibility of each manufacturer / system implementor to seek and obtain its own licenses from the individual IPR holders. For more information, and a guide to the IPRs declared to each 3GPP OP, look here>>>

Who owns the Technical Specifications and the Technical Reports approved by 3GPP?

According to the Article 3.2.2 of the Third Generation Partnership Project Agreement, the 3GPP Organizational Partners jointly own copyright on the Technical Specifications and the Technical Reports approved by 3GPP.

Are meeting contributions to ETSI TC SMG publically available?

Petitioners' Exhibit 1007, p. 225
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

ETSI TC SMG meeting documents can be found on the ETSI docbox file server. Access is limited to bona fide representatives of ETSI member organizations. These, together with early versions of the GSM specifications, have been gathered together into a set of DVDs "A Technical History of GSM" available to ETSI members via the ETSI WEB store.

The GSM standardization work was transferred from CEPT to ETSI in 1991. TC SMG was closed at meeting #32 and TC SMG created to continue the work. Like almost all ETSI Technical Committees, participation in TC SMG and its working groups was open to all ETSI member organizations. That is, any bona fide representative of an ETSI member was free to participate. Exceptionally, other individuals could participate by express invitation of the chairman. Each meeting report contains a list of participants with their corporate affiliations.

Until the late 1990s, all meeting documents were circulated in paper form. Electronic files started to take over from paper in around 1997. Meeting documents ("TDocs") were distributed by post (later, by fax) in batches prior to the meeting, to those persons registered as regular participants in SMG or the appropriate working group, and many more documents were produced during the course of the meeting itself. Although a provision existed (and still exists) in the context of the IPR Policy for contributors to place restrictions on the distribution of TDocs via a formal notification at the time the document was provided, this was seldom if ever invoked. In the absence of such a condition, all TDocs were free of any restriction on subsequent distribution. Thus no restriction has ever been placed on how meeting participants dispose of the documents subsequent to their distribution before, during, or after the meeting. There were no non-disclosure agreements.

ETSI maintains a paper archive of the SMG TDocs, and bona fide representatives of current ETSI members can, by appointment, make an accompanied search of the archives. This facility extends to members which may not have been members at the time the document was originally produced.

TC-approved versions of ETSI “deliverables” (see ETSI Directives for formal definition of this term) would have been transferred by the support officer of the committee to the secretariat team responsible for publishing ETSI deliverables. That team would have made cosmetic (non-technical) modifications to the draft deliverables before issuing them. Depending on the type of “deliverable”, those documents would have been issued via National Standards Organizations (NSOs) either for immediate publication, or first via either a one-step or two-step national public enquiry and vote process prior to final publication by ETSI. In ETSI parlance, “publication” of a deliverable is the final step in the development cycle of a technical standard, and has a precise meaning. That meaning is not “making publically available”, since draft deliverables released for public enquiry or for vote are "publically available" but not yet "published".

If the confidentiality conditions described above had been imposed on a TDoc by its authors, if the text of that TDoc was in due course incorporated into an ETSI "deliverable", then those conditions are regarded as annulled from the date on which the deliverable is published.

Collections of TDocs / meeting reports have from time to time been made available to ETSI members in CD or DVD form, look here >>>

Is permission needed to use the 3GPP logo in marketing collaterals or on a web site?

ETSI (European Telecommunications Standards Institute) is the sole owner of the following acronyms:

ETSI,
DECT,
UMTS,
3GPP and
TIPHON,

as well as the ETSI, TIPHON, 3GPP and LTE logos. ETSI Members are authorized to use these Trade Marks in accordance with Collective Letter 1943. Authorization is needed to use the above mentioned acronyms and logos.

For further information contact the ETSI Legal Team or see http://www.3gpp.org/about-3gpp/legal-matters/logo-use.

Can I use computer code included with a 3GPP TS to implement a product?

Yes, but read this clause carefully. Some 3GPP Technical Specifications include computer code such as ASN.1 or XML (protocols), ANSI-C language (codecs), ...; and some include test vectors (codecs) for verifying implementations. These are published to allow users of these TSs to implement real-world products. No permission is required from 3GPP or its Organizational Partners (OPs) to use this code in the design of products - e.g. to compile the C to implement a codec in machine code.

Nevertheless, there may be essential IPR involved with such a design, and implementers are obliged to seek licences from IPR owners to use that technology. See also What is the 3GPP policy on licensing?

Moreover, the copyright of all 3GPP TSs and TRs vests jointly by all the 3GPP OPs. Other than for in-house copies for the purpose of further development of the 3GPP standard or for product design purposes, etc. you may not reproduce any part of a 3GPP TS or TR without seeking permission from 3GPP (e.g. from the ETSI Legal Team): use the procedure described on the legal area of this site. This means that you must not provide verbatim copies of source code (or lightly modified copies) without seeking permission from 3GPP.

Finally, you are reminded that 3GPP TSs and TRs have no legal status, and you should not design products directly to them. See the advice notice on the cover page of every 3GPP TS and TR. Instead, use the technically identical publication of one of the OPs.

How do I create the next Release version of a TS or TR?

Petitioners' Exhibit 1007, p. 226
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

There are three ways of upgrading a Release X spec to Release X+1:

1. Write a CR to the latest Release X version to incorporate technical changes to satisfy a Release X+1 work item, and on the cover sheet showing the WI code for that work item and the Release code for Release X+1. If the CR is approved at TSG level, this will automatically create the first instance of the next Release of the spec.
2. Make a specific request to the TSG to upgrade the latest version of the spec from Release X to Release X+1. This might be needed if the functionalities of the two Releases diverge, though backwards-incompatibility is to be avoided if possible.
3. Do nothing. If a spec has survived unchanged throughout the period during which Release X+1 was developed, when Release X+1 is frozen, all such specs will automatically be upgraded from Release X to Release X+1 without technical change.

Where can the rules, protocols or software needed to develop applications for UMTS be found?

A good place to start is on the 3GPP website, and particularly the specifications list.

What is the correlation between Stage 1, Stage 2 and Stage 3?

A three-stage methodology as defined in ITU T Recommendation I.130 is applied in 3GPP according TR 21.900 clause 4.1:

Stage 1 is an overall service description from the user's standpoint.
Stage 2 is an overall description of the organization of the network functions to map service requirements into network capabilities.
Stage 3 is the definition of switching and signalling capabilities needed to support services defined in stage 1.

Are the 3GPP specifications produced only in word?

The 3GPP specs are published as ETSI deliverables, and these are available in PDF form http://www.etsi.org/standards-search. But you can download a free Word viewer (i.e. read only) from the Microsoft web site. PDF is inherently secure (more so than html, in fact), and because WordViewer is very simple (it can not handle macros, for example), it is pretty safe too. ETSI has no plans at present to publish specifications in plain text or in html.

Which group works with specifications covering the use of the GSM codec (either in C or Java based)?

The SMG STC SMG11 and 3GPP SA4 specifications, available from http://www.3gpp.org, respectively deal with this. It gives you a list of specifications via the status list (look for the GSM specs in the MS-Access database at : http://www.3gpp.org/ftp/Information/Databases/Spec_Status/)

and you can then download the specs you need. If you do not have an ETSI EOL account, you can download the ETSI equivalent standards from http://www.etsi.org/standards-search.

Where can I find documents produced by the GSM MoU Group / GSM Association?

These documents are not available via 3GPP or its Organizational Partners. You must address this question to the GSM Association.

Where would I find a document (e.g. UMTS 30.03 version 3.1.0) which does not appear on the 3GPP Status List?

Look at http://www.3gpp.org/DynaReport/3003U.htm. It is a document stemming from the initial TC-SMG studies on UMTS, not a product of 3GPP. It was, in fact, published as an ETSI deliverable, TR 101 112, and this may be downloaded via http://www.etsi.org/standards-search.

Where are all the Change Requests (CRs) located?

The CR database can be downloaded under: http://www.3gpp.org/ftp/Information/Databases/Change_Request/

Or you select the specification under:
http://www.3gpp.org/specifications/79-specification-numbering

The information is classed by series so it is very easy to locate the particular specification which interests you. After selecting a series and a specification you will find a line "Change Requests for this spec: click here." which provides a web list of the CRs for this specification.

If, for example, you are looking for CRs on GSM 08.18 then you would use this link:
http://www.3gpp.org/ftp/Specs/html-info/0818-CRs.htm
http://www.3gpp.org/DynaReport/0818-CRs.htm

Where are all the current ETSI SMG specs located?

All the ETSI SMG specs are located here archives for the GSM documentation. An ETSI On-Line account is needed to access these documents. You can apply for an ETSI online account.
In general, the cross-referencing between GSM and ETSI deliverables, and between 3GPP and ETSI deliverables may be found at http://webapp.etsi.org/key/queryform.asp

Petitioners' Exhibit 1007, p. 227
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Which group works on Physical Layer aspects of UMTS/LTE?

The radio aspects are standardised in TSG-RAN. The technical work is done in the 5 Working Groups of RAN (WG1 radio layer 1, WG2 radio layer 2/3, WG3 interfaces, WG4 RF measurements, WG5 Mobile Terminal Conformance Testing).
So Physical Layer aspects are addressed by TSG RAN WG1. Their UMTS specifications are numbered 25.2xx and their LTE specifications are numbered 36.2xx.
The temporary documents (meeting documents etc.) of WG1 are stored on ftp://ftp.3gpp.org/TSG_RAN/WG1_RL1.

Where can I find the list of Abstract syntax notation (ASN.1) object identifiers?

The expandable list of object identifiers is available here >>>. To see the formal definition of the object identifiers, see the document cited on the right. The tree is not necessarily complete; further extensions may be included in the referenced document. For more information look here >>>.

Where can I find the 3GPP Confidentiality and Integrity algorithms?

The 3GPP Confidentiality and Integrity algorithms F8 & F9 (KASUMI) have been developed through the collaborative efforts of the 3GPP Organizational Partners. For more information and in order to download the algorithms look here >>>.

What is a Release - how does specification version numbering work?

To meet new market requirements, 3GPP specifications are continually being enhanced with new features. In order to provide developers with a stable platform for implementation while at the same time allowing the addition of new features, the 3GPP uses a system of parallel "releases". For more information look here >>>.

Where can I find information on the current status of 3GPP specifications?

New versions of many 3GPP specifications are made available shortly after the 3GPP TSG plenary meetings which take place four times a year (March, June, September and December). In order to identify what the current version is or and how to find information about older versions of specifications look here >>>.

What is the system for numbering specifications?

All 3G and GSM specifications have a 3GPP specification number consisting of 4 or 5 digits. (e.g., 09.02 or 29.002). For a more complete description and examples look here >>>.

Who are the TSG/WG Officials and Support team and where can I find their contact details?

Each TSG/WG has a Chairman, up to two Vice-Chairmen (three Vice-Chairmen) in the case of TSGs and a secretary who is a member of the support team. From the 3GPP structural organization page, click on the TSG or WG of interest to reach its home page. From there, click on the "officials" entry in the table.

Where can I find the Terms of Reference for my TSG/WG?

The current Terms of Reference for each TSG/WG appear on the web pages of each TSG/WG.

May I become an Official?

The TSG Chairman and Vice Chairmen are elected by the Technical Specification Group from amongst the Individual Member representatives. Each TSG can elect a maximum of two Vice Chairmen. Once elected, these candidates are proposed to the PCG for appointment.
The Working Group Chairman and Vice Chairmen are elected by the Working Group from amongst the Individual Member representatives. Each Working Group can elect a maximum of two Vice Chairmen.
A candidate for TSG or Working Group election shall provide a letter of support from his Organization and nominations may be made up to the point when an election takes place.
The TSG Chairman and Vice-Chairmen shall be appointed by the PCG on the proposal of the TSG.
The Chairman and the Vice-Chairmen shall be appointed for a two year term of office. The Chairman and Vice-Chairmen may be appointed for one further consecutive term. If, at the end of a Chairman or Vice Chairmans second term, no other candidates are available, the Chairman or Vice Chairmen may be appointed for a further term.
Chairman and Vice Chairmen should not be from the same region, Organizational Partner, or from the same group of companies, unless no other candidate is available.
Successive Chairmen should not be from the same Organizational Partner, the same region or from the same group of companies, unless no other candidate is available

How do I register for a meeting?

Please note that all registration for 3GPP meetings is carried out on-line (i.e. via the 3GPP website). To register for a meeting just follow the simple steps outlined below:
1) Go to the 3GPP on line registration area http://webapp.etsi.org/3GPPRegistration/fMain.asp?mid
2) Scroll to find the meeting you wish to attend
3) Click on the circle to the left of the meeting title (clicking on the title will provide you with the meeting details)
4) Scroll back up to the top of the page
5) Click on the Register button
6) Fill in the details on the next page, choosing your company from the drop down menu and complete with all your coordinates
NB: Companies are classed by partners so ensure that you have registered under the correct partner.
7) Click on Submit registration

Petitioners' Exhibit 1007, p. 228
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Who can submit a change proposal on any 3GPP specifications to 3GPP?

Any bona fide representative of any 3GPP Individual Member (see list via the first sentence at http://www.3gpp.org/membership) can present a technical contribution - for example, a Change Request - to any 3GPP TSG or WG meeting.

If a change proposal is submitted how long does it take for it to get approved?

The usual procedure is that the responsible Working Group will examine a CR and agree it (or revise it until such time as it be agreeable - or not!). Having been agreed at WG level, it is packaged with related CRs and sent to the TSG plenary, where it will be discussed if necessary and then - if appropriate - formally approved. Within a matter a few weeks at most, a new version of the Specification is produced, which includes the contents of the TSG-approved CR.

TSGs meet every three months, and WGs meet at least once between each TSG meeting (sometimes two or occasionally even more times). Thus from inception of a CR to its approval is normally a matter of a few weeks, depending on the point in the meeting schedule of the WG and TSG concerned.

How to get a user name and password for "Reserve a Document Number"?

You need to request an EOL account via: http://webapp.etsi.org/createaccount/form.asp (username and password will then be sent to you by separate email).

How do I obtain a document number for my contribution?

Delegates wishing to make contributions must first obtain a document number either from the secretary or automatically via an on-line application "Automatic Document Numbering (ADN)" which is used by some groups.

You need a user name and password to "Reserve a Document Number" (see above).

Where can I download documents for an upcoming meeting?

Each TSG/WG has a specific area allocated on the 3GPP ftp server. For example TSG SA look here ftp://ftp.3gpp.org/tsg_sa/TSG_SA/. It is advisable for delegates attending a meeting to download the documents available prior to the meeting from the ftp server and onto their personal computers.

Where can I find a temporary document template?

The document template is made available by each TSG/WG in the meeting respective folder on the ftp server (see above).

What is my role when my TSG/WGs has to approve a deliverable?

Approval of Technical Specifications and Technical reports by a TSG shall normally be by consensus. Where consensus cannot be achieved in the TSG a vote may be taken.
When Technical Specifications and Technical Reports become sufficiently stable, they shall be put under change control of the relevant TSG. The further elaboration of these Technical Specifications and Technical Reports shall be achieved by Change Requests (CRs) to be approved by the TSG.

What are the different types of deliverables?

3GPP shall prepare, approve and maintain documents known as Technical Specifications and Technical Reports. Such documents shall be drawn up by the TSGs and shall, following approval at that level, be submitted to the participating Organizational Partners to be submitted to their respective standardization processes.

Can I write an 3GPP Document myself?

Why not?! If you wish to propose a deliverable then bring it to the attention of your chairman and the other members of the TSG/WG in order to discuss the subject.
Each proposed new Work Item shall be supported by at least four Individual Members, and their names shall be recorded in the Work Item definition prepared for the TSG approval. One or more persons shall be named as Rapporteur for the proposed Work Item, and the Rapporteur shall act as the prime contact point on technical matters and for information on progress throughout the drafting phases. The supporting Individual Members are expected to contribute to and progress the new work item throughout the drafting phases.
In addition to the above, TSGs shall approve new Work Items, giving all essential parameters. The proposal shall be entered into the 3GPP work programme, clearly marked as a new entry, for which a unique reference identity shall be allocated.

Do I and my company have to support my TSG/WGs Work Items?

Neither you or your company is obliged to support the work items of your TSG/WG, however it is normal that if you and your company are supporting members of a Work Item that you be in agreement with their work and will normally support the production of the related deliverable.

Do I need a password and user name to access the 3GPP Web site ?

No password is needed to access any information on the 3GPP Web site, all information is openly published.

Can you give me information about which companies manufacture particular types of equipment. Or about what services are available on particular

Petitioners' Exhibit 1007, p. 229
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

networks?

No. The 3GPP Support Team must remain neutral and must not show bias to any of its Individual Members. Such information may be available from the Global Mobile Suppliers Association (www.gsacom.com) where you will find a statistics area which could be of help.

How can I determine when a meeting contribution document (TDoc) became publicly available?

TDoc numbers start to be allocated some weeks before a 3GPP meeting, and the authors then create them and they or the group's secretary uploads them to the public file server as soon as possible. Some may have been distributed to the group's members in draft form for review, using the email exploder, in advance of the final one becoming available, and for some groups, it is normal to distribute even the final TDoc via the exploder, where the secretary picks it up and copies it to the public server. Typically, at the start of a meeting, around 50% of the TDocs are available.

This distribution on the group's email exploder is important, because once that happens, the document is effectively in the public domain, since membership of the exploder is open to all and is unpoliced.

During the meeting, further TDocs are created, mostly revisions of ones available before the meeting, but probably some brand new ones too – for example, outgoing liaison statements. These are uploaded to the meeting server, but (until recently) may or may not be uploaded to the public server during the meeting. (Since 2014, for most meetings, meeting server contents have been mirrored to a folder on the public server, but these copies are deleted shortly after the end of the meeting.)

Soon after the end of the meeting – same day, or at worst within a few days – the TDocs created during the meeting are uploaded by the secretary to the public server. Occasionally, some matters from the meeting cannot be resolved until maybe one week later, and these might result in some very late TDocs which are produced well after the end of the meeting, and thus uploaded onto the public server correspondingly late.

When the secretary copies from the meeting server (or from his own PC) to the public server, he may opt to only copy the missing files (i.e. the new ones), which is the best approach; or he may decide to overwrite everything and thus do a complete refresh of the files on the public server, which will now get an upload date/time-stamp of the new upload. This latter approach is now deprecated but has sometimes happened; you can detect this most easily when a meeting shows the same date/time-stamp for all TDoc files.

In cases such as this, one has to descend to greater subterfuge to narrow down the likely "public availability" moment. The zip file for a TDoc typically contains a Word file which has a particular date/time-stamp, which puts an absolute limit on the earliest moment that the TDoc could have become available in that form.

Searching the group's email exploder archive (http://list.etsi.org/scripts/wa.exe?INDEX) on or about the suspected production date gleaned from the file date/time-stamp may well reveal the message in which the TDoc was first distributed, or perhaps the message by which the group's secretary announced that it was available on the server. Note however that this technique does not reveal any earlier versions of the TDoc which might have been circulated, either as draft versions of the identified TDoc or as other Tdocs which were ultimately revised into the actual TDoc of interest. In order to identify this latter case, it is necessary to refer to the official secretary's report of the meeting, where the train of revisions will be evident.

Is it possible to determine the date and time of publication of a particular version of a 3GPP Spec?

During the drafting phase (versions lower than 3.0.0), 3GPP TSs and TRs ("Specs") are under the control of their authors ("rapporteurs") and are handled like normal meeting contributions (see above). Revised versions incorporating text agreed by the responsible working group are often made available by the rapporteur via the group's email exploder shortly after the end of the meeting at which such text was discussed. Again, consultation of the exploder archives can reveal this. Alternatively, a revised draft may be sent directly to the 3GPP Support Team, and it will be uploaded to the public file server (specs archive directory) shortly afterwards. Again, the time stamp of the Zip file can be relied upon to indicate when the upload occurred.

After formal approval by the TSG (versions 3.0.0 or greater), Specs are edited only by the Support Team. The first approved version is based upon the draft version formally approved by the TSG, and thereafter versions are generated whenever Change Requests are approved by the TSG. These versions are made available shortly after the TSG meeting at which such approval occurred. The date (year and month) shown at the top of the Spec's cover page indicates either the date of (the last day of) the meeting, or the month in which the new version was prepared. However a more precise indication of the date of availability can be obtained from the Spec's web page (via the table at http://www.3gpp.org/specifications/) where a precise date is shown in the "available" column.

More information on the procedures relating to Spec handing can be found in 3GPP TR 21.900.

Note that, in accordance with the statement at the foot of the cover page of all 3GPP Specs, 3GPP does not "publish" its Specs per se. Formal publication is the responsibility of the individual Standards Development Organizations which comprise the Organizational Partners of 3GPP. For further information, see http://www.3gpp.org/specifications/63-official-publications.

What formalities do I have to go through to get type approval for terminal equipment in Europe? Is there a single point of contact? What standards does my equipment need to conform to in order that I can place it on the market?

The legal requirements for the marketing of electrical products in Europe are governed by various EU Directives, depending on the nature of the equipment. Conformity with any of these Directives can be demonstrated by the use of Harmonized Standards,

Petitioners' Exhibit 1007, p. 230
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

whose title has been cited in the Official Journal of the European Union. The lists of relevant standards can be found on the Commission web site which can be accessed via http://www.newapproach.org/Directives/DirectiveList.asp.

General electrical equipment is covered by the EMC Directive & Low Voltage Directives, see http://ec.europa.eu/enterprise/sectors/electrical/documents/index_en.htm.
The harmonized standards are listed at http://ec.europa.eu/enterprise/policies/european-standards/harmonised-standards/index_en.htm
More general information on procedures to declare conformity and how equipment should be marked are contained on the web sites related to the two Directives.

Radio Equipment and Telecommunications Terminal Equipment is covered by the Radio and Telecommunications Terminal Equipment Directive, see http://ec.europa.eu/enterprise/policies/european-standards/harmonised-standards/rtte/index_en.htm, which also includes a link to the one-stop procedure for "placing on the market" (http://ec.europa.eu/enterprise/sectors/rtte/documents/guidance/one-stop-procedure_en.htm).

Further information on EU harmonized standards relevant to telecommunications can be found on the ETSI site at http://www.etsi.org/standards/looking-for-an-etsi-standard/list-of-harmonized-standards, and the published standards themselves can be downloaded via http://pda.etsi.org/pda/queryform.asp.

Where can I find a list of technical terms and abbreviations used in 3GPP documents?

Individual terms are defined in each 3GPP Technical Specification and Technical Report. A compendium of terms and abbreviations can be found in 3GPP TR 21.905. ETSI maintains a list of all terms and abbreviations defined in its publications in "TEDDI".

What is the difference between a SIM and a USIM? What is a UICC?

The Universal Integrated Circuit Card (UICC) is the removable card bearing a silicon chip which holds 3GPP system subscriber information. The UICC is a general purpose card having both non-volatile memory and a general-purpose processor. Thus while it is used, in a 3GPP terminal, to hold (U)SIM information / applications, it is can also be used for other purposes, possibly unrelated to telecommunications. A common use of UICCs is in the well-known credit card format, and there is no reason why a single card could not hold (U)SIM functionality in addition to electronic purse / credit card functionality, or indeed any other application / data.

The Subscriber Identity Module (SIM) is the collection of functions which personalize a 3GPP terminal. The SIM contains static information about the services subscribed to, the phone number, the identity of the home network, a list of preferred roaming networks, and so on. The SIM also contains storage capacity for the subscriber's contacts' phone numbers. The term "SIM" is often misused for "UICC". The SIM concept was created during the early development of the GSM standards, and second-generation (based on GERAN) terminals up to and including Release 4 use SIM functionality.

For third generation systems (based on UTRAN), more complex functionality was called for, and the SIM evolved into the USIM or Universal Subscriber Identity Module. Release 99 3rd generations onwards use USIMs rather than SIMs. From Release 5 onwards, both second and third generation terminals use USIMs (though to maintain backwards compatibility with older networks and terminals, later Release 2nd generation USIMs are likely to implement Rel-4 SIM functionality in addition to Rel-5 or later USIM functionality).

For further information on the 3GPP Release system, see the Release page.

I have transferred a video file from my phone to my PC. Where can I find a player for 3gp files?

The 3gp file format is defined in 3GPP TS 26.244 and in 3GPP TS 26.412. However, 3GPP has not defined a specific decoder. Your phone manufacturer may have supplied a player (check the CD-ROM which came with your phone) or look on its web site. Alternatively, search the Internet: a number of commercial players exist, and trial versions of some may be downloaded without charge.

Where can I find the specification of the SIM Lock feature?

In clause 8 of 3GPP TS 22.022.

What is the meaning of the text at the foot of the TS/TR cover page?

> The present document has been developed within the 3rd Generation Partnership Project (3GPP TM) and may be further elaborated for the purposes of 3GPP..
> The present document has not been subject to any approval process by the 3GPPOrganizational Partners and shall not be implemented.
> This Specification is provided for future development work within 3GPPonly. The Organizational Partners accept no liability for any use of this Specification.
> Specifications and Reports for implementation of the 3GPP TM system should be obtained via the 3GPP Organizational Partners' Publications Offices.

3GPP is not a legally incorporated body, and its technical work is conducted under the auspices of its Organizational Partners, each of which transposes relevant 3GPP specifications as its own publications. Thus the "raw" 3GPP TSs and TRs have no legal status per se. Under an agreement with the ITU at the time 3GPP was created, the ITU would not publish the output of

Petitioners' Exhibit 1007, p. 231
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

3GPP but would normatively reference the publications of the participating Organizational Partners; this state of affairs accounts for the text found on the cover of each 3GPP TS and TR. More information can be found here.

The Wayback Machine - https://web.archive.org/web/20160714151747/http://www.3gpp.org:80/specifications/specifications

Specifications Home

3GPP specifications are published - free of charge - up to four times a year following the quarterly Technical Specification Group (TSG) plenary meetings. At each TSG round, specs can be

- Newly brought under change control (i.e. at least 80% complete)
- Unchanged from their previous versions
- Revised as a result of incorporating approved Change Requests (either in existing Releases or in the latest Release)
- At Release-freeze time, upgraded to that Release with no technical change

The 3GPP Mobile Competence Centre (MCC) aims to make all Specs available following a TSG round as soon as possible. The target dates are shown in the table below. Where very many CRs have to be implemented, or very many specifications are to be produced, a further week beyond the above deadlines may be required. These dates are agreed by the TSG Chairmen. Over the Christmas and New Year period, when the winter TSG round finishes shortly before the holiday period, an extra week or so is normally added to the final deadlines.

Quick link to the specifications file server area

The link above takes you straight to the specifications, but you need to know what you are looking for.

To find a particular specification by series, look at the Numbering page.

3GPP specifications

The term "3GPP specification" covers all GSM (including GPRS and EDGE), W-CDMA (including HSPA) and LTE (including LTE-Advanced) specifications. The following terms are also used to describe networks using the 3G specifications: UTRAN, UMTS (in Europe) and FOMA (in Japan).

Revised versions of many of these specifications are produced up to four times a year following the quarterly TSG plenary meetings.

The table below leads to information about:

- Specifications arising from each plenary TSG meeting, including the latest versions of each specification that was not changed at that meeting. i.e. each directory holds a complete set of specifications.
- The month of the meeting and the meeting number
- The Status List (ZIPped RTF or Word format) summarizing the current version number for every release of every 3GPP specification following each TSG plenary meeting.
- Details of each specification (working group, rapporteur, the Project Manager in MCC (Mobile Competence Centre), the meeting at which it was, or is expected to be, "frozen" (i.e. the point after which only corrections are allowed) - all are in the Status lists.

Full details of the Specifications, their history and current status can be found in the 3GPP Specifications Status database.

See this link for specs awaited from the most recent Plenary meetings.

If you plan to download a large number of specifications we recommend using an FTP client software tool such as:

- Ipswitch WS_FTP Pro
- FTPSync
- Filezilla

For additional information relating to 3GPP Specifications, their creation and maintenance, etc. go here.

Confidential Algorithms

3GPP confidentiality and integrity algorithms The 3GPP Confidentiality and Integrity algorithms F8 & F9 (KASUMI) have been developed through the collaborative efforts of the 3GPP Organizational Partners. They may be used only for the development and operation of 3G Mobile Communications and services. Every Beneficiary must sign a Restricted Usage Undertaking with a Custodian and (...)

ASN.1

ASN.1 Object Identifiers Abstract syntax notation (ASN.1) object identifiers maintained by ETSI. ETSI is a recognized organization under the ITU-T (formerly CCITT) arc. The formal rules governing assignment of object identifier values are given in ETSI EG 200 351. Since the 3GPP technical specifications are based on GSM specifications, which use object identifiers under the ETSI node, it (...)
more »

Drafting Rules

The Specification drafting rulesTR 21.801 are the rules for the structure and drafting of documents intended to become a 3GPP Technical Specification or Technical Report. These rules are intended to ensure that such documents are drafted in as uniform a manner as is practicable, irrespective of the technical content. 21.801 is based on the ISO/IEC Directives, Part 3, but is a self-contained (...)
more »

Official Publications

The 3GPP Technical Specifications and Technical Reports have, in themselves, no legal standing. They only become "official" when transposed into corresponding publications of the Partner Organizations (or the national / regional standards body acting as publisher for the Partner). At this point, the specifications are referred to as UMTS within ETSI and FOMA within ARIB/TTC. Some TRs (...)

APPENDIX 12

The Wayback Machine - https://web.archive.org/web/20160703090241/http://3gpp.org:80/specifications/79-specification-numbering

Specification Numbering

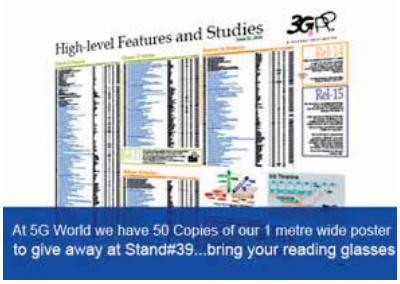
All 3GPP specifications have a specification number consisting of 4 or 5 digits. (e.g. 09.02 or 29.002).

The first two digits define the series, followed by 2 further digits for the 01 to 13 series or 3 further digits for the 21 to 55 series.

The full title, specification number and latest version number for every specification can be found in the current status list (warning: large file!).

An automated list of Specification numbers - with the Title and details of the Specification Group responsible.

Subject of specification series	3G and beyond / GSM (R99 and later)	GSM only (Rel-4 and later)	GSM only (before Rel-4)
General information (long defunct)			00 series
Requirements	21 series	41 series	01 series
Service aspects ("stage 1")	22 series	42 series	02 series
Technical realization ("stage 2")	23 series	43 series	03 series
Signalling protocols ("stage 3") - user equipment to network	24 series	44 series	04 series
Radio aspects	25 series	45 series	05 series
CODECs	26 series	46 series	06 series
Data	27 series	47 series (none exists)	07 series
Signalling protocols ("stage 3") -(RSS-CN) and OAM&P and Charging (overflow from 32.- range)	28 series	48 series	08 series
Signalling protocols ("stage 3") - intra-fixed-network	29 series	49 series	09 series
Programme management	30 series	50 series	10 series
Subscriber Identity Module (SIM / USIM), IC Cards. Test specs.	31 series	51 series	11 series
OAM&P and Charging	32 series	52 series	12 series
Access requirements and test specifications		13 series (1)	13 series (1)
Security aspects	33 series	(2)	(2)
UE and (U)SIM test specifications	34 series	(2)	11 series
Security algorithms (3)	35 series	55 series	(4)
LTE (Evolved UTRA), LTE-Advanced, LTE-Advanced Pro radio technology	36 series	-	-
Multiple radio access technology aspects	37 series	-	-
Radio technology beyond LTE	38 series	-	-



Note (1): The 13 series GSM specifications relate to European-Union-specific regulatory standards. On the closure of ETSI TC SMG, responsibility for these specifications was transferred to ETSI TC MSG, (Mobile Specification Group) and they do not appear on the 3GPP file server.

Note (2): The specifications of these aspects are spread throughout several series.

Note (3): Algorithms may be subject to export licensing conditions. See the relevant 3GPP page. See also the relevant ETSI pages.

3GPP tweets

Petitioners' Exhibit 1007, p. 241
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Note (4): The original GSM algorithms are not published and are controlled by the GSM Association.

Technical Reports are of two classes:

> Those intended to be transposed and issued by the Organizational Partners as their own publications; and
>
> Those not intended for publication but which are simply 3GPP internal working documents, used, for example, for documenting planning and scheduling of work, or for holding the interim results of feasibility studies.

The first category have numbers of the form: xx.9xx

The second category have numbers of the form:
xx.8xx (feasibility study reports, etc) or, more rarely,
30.xxx / 50.xxx (planning and scheduling)
For some spec series, the stock of xx.8xx TRs has been exhausted, and in these cases, further internal TRs are allocated xx.7xx numbers.

Missing Specs: Click here to see those Specs not yet available following the most recent round of TSG meetings.

The 3GPP Specifications are stored on the file server as zipped MS-Word files. The filenames have the following structure:

SM[-P[-Q]]-V.zip

where the character fields have the following significance ...

S = series number - 2 characters (see the table above)
M = mantissa (the part of the spec number after the series number) - 2 or 3 characters (see above)
P = optional part number - 1 or 2 digits if present
Q = optional sub-part number - 1 or 2 digits if present
V = version number, without separating dots - 3 digits

So for example:

> 21900-320.zip is 3GPP TR 21.900 version 3.2.0
> 0408-6g0.zip is 3GPP TS 04.08 version 6.16.0
> 32111-4-410 is 3GPP TS 32.111 part 4 version 4.1.0
> 29998-04-1-100 is 3GPP TS 29.998 part 4 sub-part 1 version 1.0.0

Further information:

Latest version
The latest versions of the approved specifications in the "latest" directory. The latest version of draft specs (i.e. those not yet under change control) are in the "latest-drafts" directory. See also the page on version numbering.

Particular version
All older versions of specifications (where available) are stored in the archive subdirectory. All versions of all releases of a given specification are placed directly under the name of the specification.

Title or subject
If you only know the title or the subject, but not the specification number, the best place to start looking is the complete list of all 3GPP specification numbers and titles. This list also shows the most recent version in each Release.

Specs related to a particular working group
Each 3GPP TSG Working Group has a home page, which lists the specifications under its responsibility. Follow the links from here, or use the main menu item "Specification Groups".

Official versions published by recognized Standards Development Organizations
The 3GPP Technical Specifications (and Technical Reports) which are publicly available from this site have, in themselves, no legal standing. They only become "official" when transposed into corresponding publications of the Partner Organizations. If you are looking for the official versions, see the official publications page.

Yet more information:

Work plan
The 3GPP Work plan describes the new functionality currently being elaborated in the TSG working groups. It also indicates the expected timescales for their finalization.

Releases (and phases, stages)
An introduction to the 3GPP mechanism for specifications releases can be found here.

Historical information
If you need to look for old / superseded specifications or change requests, start here.

TSG working methods
The procedures for creating, enhancing and maintaining specifications are described in TR 21.900. A presentation outlining the release and change request process can be found here.

3GPP Drafting rules
The rules for drafting specifications are described in TR 21.801.

Change Requests
The change request mechanism is used when a correction or new functionality is required for an existing specification.

Petitioners' Exhibit 1007, p. 242
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Version numbering
More information on the version numbering page.

Issuing new TS/TR numbers. More information on this page.

Page updated:

2016-01-12: Mention of TRs numbered xx.7xx as overflow of xx.8xx allocations (JMM)
2015-10-01: Fix broken link to specification groups (JMM)

The Wayback Machine - https://web.archive.org/web/20160714070559/http://www.3gpp.org:80/specifications/releases

Releases

3GPP uses a system of parallel "Releases" which provide developers with a stable platform for the implementation of features at a given point and then allow for the addition of new functionality in subsequent Releases. You can learn more about 3GPP Releases by looking in to the following resources:

- A brief description of each Release can be found in the footer of this page, in the 'About Releases' section.
- Full details of the specifications needed for each 3GPP Release can be found in the "Release Description" folder of the ftp site.
- A table of the features, by Release, can also be found in the 3GPP Work Plan.
- There is also a 3GPP Specification Release version matrix which is a listing (with links) of the Specifications - showing the Release in which each specification was first developed.

Example Timeline for a Release

Start, Freeze and End dates:

The table below is extracted from the data on the 3GPP Ultimate portal at https://portal.3gpp.org/ "Releases" tab. Please refer to that data for the most up-to-date information.

Future dates are proposals, subject to change.

Name	Status [Note 3]	Start date [Note 2a]	End date	Closure date
Release 14	Open	2014-09-17	2017-06-09 (SA#76)	
Release 13	Open	2012-09-30	2016-03-11 (SP-71)

Other associated terms

Stages

The term "Stage" derives from the ITU-T (originally CCITT) method for categorizing specifications (Recommendation I.130).

"Stage 1" refers to the service description from a service-user's point of view.

Petitioners' Exhibit 1007, p. 246
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

"Stage 2" is a logical analysis, devising an abstract architecture of functional elements and the information flows amongst them across reference points between functional entities.
"Stage 3" is the concrete implementation of the functionality and of the protocols appearing at physical interfaces between physical elements onto which the functional elements have been mapped.

In addition, 3GPP often performs feasibility studies the results of which are made available in Technical Reports (normally 3GPP-internal TRs, numbered xx.8xx, not intended for transposition by the Organizational Partner SDOs). The feasibility study might be considered as a sort of "Stage 0". Furthermore, some Stage 3 specifications require test specifications to be prepared: effectively a "Stage 4".

Phases

This term has two distinct usages within the 3GPP:

in reference to GSM specifications, Phase 1, Phase 2 and Phase 2+ referred to releases of specifications (see table above);
some features within GSM/3G specifications have been enhanced over the years. For example, enhancements to the original CAMEL functionality are referred to as CAMEL phase 2, CAMEL phase 3 and CAMEL phase 4.

Further information

The mechanisms for creating and maintaining specifications are described in TR 21.900. A presentation outlining the release and change request process can be found here.

Note 1: The term "Release 2000" was used only temporarily and was eventually replaced by "Release 4" and "Release 5" (most elements originally in Release 2000 were renamed Release 4, but some were deferred until Release 5).

Note 2: A Specification with a version number of 0.x.y, 1.x.y or 2.x.y indicates that it is a new, draft, specification which has not yet been approved. The anticipated release is normally shown on the cover of the document.

Note 2a: The start date for a Release is an indication of when the first work item for that Release was approved at TSG level. In fact, it is somewhat approximate because often work items started in an earlier Release, but not completed, are "promoted" to the next Release. The end date for a Release is an indication of when the detailed protocols become stable. However, see Note 3 below.

Note 3: After "freezing", a Release can have no further additional functions added. However, detailed protocol specifications (stage 3) may not yet be complete. "Freezing" is applied successively for each of the three stages (see below), with stage 3 normally being frozen one or two TSG meetings earlier than the "end" date. The "end" date shown on the 3GU portal is indicative only, since for each Release, a considerable number of refinements and corrections can be expected for at least two years following this date. In addition, OA&M specs and test specs may lag by some considerable time. A "frozen" Technical Specification is one which can have no further category B or C (new or modified functionality) Change Requests, other than to align earlier stages with later stages. The individual stage freeze dates can only be seen by 3GU account holders (delegates, officials, secretariat).

Note 4: In the version number of a 3GPP TS or TR, the first field (before the first dot) indicates the Release number according to the table below. The field "x" is incremented at each change in the spec resulting from one or more Change Requests approved by the responsible TSG. Field "y" is incremented whenever an editorial change is made to a specification; editorial changes are those which cannot in any way change the technical interpretation of the spec, and are introduced at the discretion of the Support Team. Exceptionally, field "y" is incremented when a newly-provided version of a spec is found to be flawed due to, for example, misimplementation of a newly-approved CR; however, this circumstance is only permitted during the three-week period following the end of a TSG plenary round, during which new versions of specs are produced. Every change of version is documented in the "change history" annex of the spec. When "x" is incremented, field "y" is reset to zero. When the Release field (the first digit) is incremented, fields "x" and "y" are reset to zero. Version numbering was unified from Release 4 onwards, regardless of radio access technology. This implied a renumbering of the GSM-only specifications (see the Specification Numbering page).

RAN1 - Radio layer 1

NEW: (2016-04-11) As a result of acquisition of Alcatel-Lucent by Nokia please find here the support letter of Nokia for Matthew Baker to continue as Vice Chairman of 3GPP TSG RAN WG1.

RAN WG1 (Radio layer 1) is responsible for the specification of the physical layer of the radio Interface for UE, UTRAN, Evolved UTRAN, and beyond; covering both FDD and TDD modes of the radio interface.

Terms of reference

The latest terms of reference were approved at RAN#53
in document RP-110963.zip.

Within the scope of TSG RAN, RAN WG1 is responsible for the development of specifications dealing with UTRA, Evolved UTRA, and beyond.
RAN WG1 is responsible for:

Specification of the physical layer of the Uu radio Interface for UE, UTRAN, Evolved UTRAN, and beyond, covering both FDD and TDD modes, as well as the physical layer of the Un Interface for Relay Nodes. The work in RAN WG1 includes especially:

Specification of physical channel structures
Specification of the mapping of the transport channels onto physical channels
Specification of the physical layer multiplexing, and channel coding and error detection
Specification of the spreading and modulation
Specification of the physical layer procedures
Specification of definition of measurements and their provision by the physical layer to the upper layers RAN WG1 also carries out work related to handling of the physical layer related UE capabilities and to physical layer related parameters used in UE tests developed in TSG RAN.

RAN

3G systems should be based on new wide band, multimode, flexible radio access. This approach will ensure that systems based on 3GPP specifications will be capable of rapid development and deployment of competitive service offerings while still enabling global roaming.

TSG Radio Access Network (TSG RAN) is responsible for the definition of the functions, requirements and interfaces of the UTRA/E-UTRA network in its two modes, FDD & TDD. More precisely: radio performance, physical layer, layer 2 and layer 3 RR specification in UTRAN/E-UTRAN; specification of the access network interfaces (Iu, Iub, Iur, S1 and X2); definition of the O&M requirements in UTRAN/E-UTRAN and conformance testing for User Equipment and Base Stations...more

SA

The TSG Service and System Aspects (TSG-SA) is responsible for the overall architecture and service capabilities of systems based on 3GPP specifications and, as such, has a responsibility for cross TSG co-ordination...more

GERAN

Operators of GSM/GPRS systems need a strategy for future growth and interoperability, the evolution of GSM/EDGE radio access technologies offers such a path. TSG GERAN is responsible for the specification of the Radio Access part of GSM/EDGE...more

OMA dependecies and overlaps

The table below shows the 3GPP work items which have some dependency on or overlap with work being carried on within the Open Mobile Alliance. It is intended to help manage the relationship between OMA and 3GPP.

Only areas where 3GPP has agreed to use OMA outputs are included. There may be other areas of dependency and overlap on which 3GPP agreement has not yet been reached.
Only high-level relationships (mainly at the "feature" level) are listed.

Subject: Draft agenda for RAN1 #86bis
From: Satoshi Nagata <nagatas@NTTDOCOMO.COM>
Reply To: Satoshi Nagata <nagatas@NTTDOCOMO.COM>
Date: Tue, 13 Sep 2016 23:23:10 +0900
Content-Type: multipart/mixed
Parts/Attachments: text/plain (618 bytes) , text/html (6 kB) , R1-16xxxx Draft Agenda RAN1_86bis_ver0.doc (77 kB)

Dear all,

Considering the limited time between the next plenary and RAN1 #86bis, I would like to send the first version of draft agenda for RAN1 #86bis before the plenary.

Please note followings
(1) I will update this first version after seeing the plenary outcome
(2) Seeing the current rapporteurs' updated SID/WID, I captured some new sub-agendas with brackets for existing SI/WI. After seeing the results of plenary, I will update these bracket parts.
(3) Patrick will not open 3GU Tdoc allocation before Friday of the plenary's week (23rd Sep.)
It means that you can not request Tdoc for RAN1 #86bis now

Subject: [RAN1#86bis]: Preliminary report
From: Patrick Merias <[log in to unmask]>
Reply To: Patrick Merias <[log in to unmask]>
Date: Thu, 20 Oct 2016 17:22:58 +0000
Content-Type: multipart/mixed
Parts/Attachments: text/plain (2280 bytes) , text/html (11 kB) ,
Draft_Minutes_report_RAN1#86b_v010.zip (881 kB)

Dear all,

A first version of the report is attached…

- All available docs (2431) are now uploaded to 3GPP server as well as a preliminary Tdoc_list made available to the 3GU portal – Tdocs statuses should be ok for LS and CRs, the others still requesting some later updates
- Please check whether Annex B reflects all agreed CRs (hopefully I haven't forgotten any – 66 CRs agreed according to my record)

FYI following add-on was made due to wrong CR number
R1-1609952 Draft CR for RI transmission on PUSCH for LAA Scells Qualcomm Incorporated
Conclusion:

- The CR in R1-1609952 is endorsed in principle, with the following updates:
  - Add change marks to the two new tables
  - Add references to the two new tables
- Final CR to prepared. Agreed as CR0224 to 36.212 (Rel-14) in R1-1610998

Post meeting: MCC to correct CR number by replacing 0777 to 0224 before submission to plenary.

Also note 377 delegates checked-in using the electronic feature – with such figure reflecting the participation to RAN1#86bis, I believe no complain can be raised regarding the size of the main meeting room!!
Remember that once the meeting has closed and local server switched-off, adding manually missing info to the participants list is not possible.

Will keep on-going checking and entering correct contributions' statuses into 3GU and monitoring the current email discussions…

Relax a bit (if possible) after a very busy week!

Table of contents

1 Opening of the meeting 6
1.1 Call for IPR 6
1.2 Competition law statement 6
1.3 Network usage conditions 6
2 Approval of Agenda 6
3 Approval of Minutes from previous meeting 7
4 Highlights from RAN Plenary 7
5 Incoming Liaison Statements 7
6 UTRA 11
6.1 Maintenance of UTRA Releases 4 – 13 11
6.2 Multi-Carrier enhancements for UMTS - WID in RP-161259. 11
6.2.1 TTI switching 11
6.2.2 Power scaling 11
6.2.3 Other 12
6.3 DTX/DRX enhancements in CELL_FACH - WID in RP-160185. 12
6.3.1 DRX improvements 12
6.3.2 DTX improvements 12
7 E-UTRA 12
7.1 Maintenance of E-UTRA Releases 8 – 14 12
7.1.1 Maintenance of E-UTRA Release 8 – 12 12
7.1.2 Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers 12
7.1.3 Maintenance of Release 13 licensed-assisted access to unlicensed spectrum 12
7.1.4 Maintenance of Release 13 elevation beamforming/full-dimension MIMO for LTE 13
7.1.5 Maintenance of Release 13 further LTE physical layer enhancements for MTC 13
7.1.6 Maintenance of Release 13 NB-IoT 15
7.1.7 Maintenance of Release 14 Enhanced Licensed-Assisted Access to Unlicensed Spectrum 16
7.1.8 Maintenance of Release 14 V2V services based on LTE sidelink 18
7.1.9 Other 20
7.2 LTE Release 14 20
7.2.1 LTE-based V2X Services - *WID in RP-161894* 21
7.2.1.1 Enhancement to UL and SL SPS 21
7.2.1.1.1 DCI design to support multiple SPS configurations 21
7.2.1.1.2 Other 22
7.2.1.2 Resource selection for pedestrian UEs 22
7.2.1.2.1 Details of random selection by pedestrian UEs 22
7.2.1.2.2 Details of resource selection using partial sensing by pedestrian Ues 23
7.2.1.2.3 Other 23
7.2.1.3 Long-term basis co-channel coexistence between DSRC/IEEE 802.11p and LTE PC5 for V2V operating over the same frequency channels 23
7.2.1.4 Support of inter-PLMN for Uu and PC5 23
7.2.1.5 Aspects transferred from WI LTE SL_V2V-Core 24
7.2.1.5.1 Congestion control for PC5-based V2X 24
7.2.1.5.2 Simultaneous Uu and PC5 operations in different carriers 24
7.2.1.5.3 Remaining enhancement to sidelink synchronization 24
7.2.1.5.4 Handle multiplexing V2V with other signals/channels 27
7.2.1.5.5 Support for traffic with smaller periodicity on PC5 based V2V using shorter resource reservation period 27
7.2.1.5.6 Prioritization of SL TX for V2X over WAN TX under eNB management 27
7.2.1.5.7 Other 28
7.2.2 Enhancements on Full-Dimension (FD) MIMO for LTE - *WID in RP-160623* 28
7.2.2.1 CSI enhancements 28
7.2.2.1.1 Advanced CSI 28
7.2.2.1.2 Interference measurement 30
7.2.2.1.3 Feedback mechanism enhancement 30
7.2.2.1.4 Non-precoded CSI-RS codebook for 20 – 32 ports 31
7.2.2.2 Open-loop and Semi-open-loop 31
7.2.2.3 UL DMRS 33
7.2.2.4 Non-precoded CSI-RS 34
7.2.2.5 Other remaining issues 36
7.2.2.5.1 Aperiodic and frequency domain reduced overhead CSI-RS 36
7.2.2.5.2 Hybrid CSI 38
7.2.3 Downlink Multiuser Superposition Transmission for LTE - *WID in RP-161019* 39

Petitioners' Exhibit 1007, p. 271
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

7.2.3.1 Superposition transmissions 39
7.2.3.2 Mechanisms for efficient operation 40
7.2.3.3 Evaluation for MUST using up to 8Tx 41
7.2.4 eMBMS enhancements for LTE - *WID in RP-161297* 41
7.2.4.1 Longer cyclic prefix for MBSFN subframe 41
7.2.4.2 MBSFN-RS pattern for longer cyclic prefix 41
7.2.4.3 Synchronization and acquisition of system information 42
7.2.4.4 Other 43
7.2.5 SRS Carrier Based Switching for LTE - *WID in RP-160935* 43
7.2.5.1 Procedures and configurations for SRS/RACH switching and transmission 43
7.2.5.2 DCI design 44
7.2.5.3 Details of collision handling 45
7.2.5.4 Other 45
7.2.6 Further Indoor Positioning enhancements for UTRA and LTE - *WID in RP-161850* 45
7.2.6.1 Remaining issues for OTDOA enhancements 45
7.2.6.2 PRS-based beacons 46
7.2.6.3 E-CID enhancements 47
7.2.6.4 Other 47
7.2.7 Uplink Capacity Enhancements for LTE - *WID in RP-160664* 47
7.2.8 Further Enhanced MTC for LTE - *WID in RP-161464* 48
7.2.8.1 Higher data rates 48
7.2.8.1.1 Larger max PDSCH/PUSCH TBS 49
7.2.8.1.2 Larger max PDSCH/PUSCH channel bandwidth 50
7.2.8.1.3 HARQ-ACK bundling in HD-FDD 51
7.2.8.1.4 Number of DL processes in FD-FDD 51
7.2.8.2 Multicast support 51
7.2.8.3 OTDOA enhancements 52
7.2.8.4 VoLTE enhancements 53
7.2.8.5 Other 53
7.2.9 Enhancements of NB-IoT - *WID in RP-161901.* 53
7.2.9.1 Positioning 54
7.2.9.1.1 Design of narrowband OTDOA positioning 54
7.2.9.1.2 Evaluation of narrowband OTDOA positioning 55
7.2.9.1.3 Evaluation of narrowband UTDOA positioning using an existing NB-IoT transmission 55
7.2.9.2 Multicast support 55
7.2.9.3 Non-anchor PRB enhancements 57
7.2.9.4 Power consumption and latency reduction 57
7.2.9.5 Other 58
7.2.10 Shortened TTI and processing time for LTE - *WID in RP-161922.* 58
7.2.10.1 Shortened processing time for 1ms TTI 58
7.2.10.2 Shortened TTI length together with shortened processing time 59
7.2.10.2.1 Design of sTTI for DL and UL 59
7.2.10.2.2 Processing time 64
7.2.10.3 Other 64
7.2.11 Performance enhancements for high speed scenario - *WID in RP-152263.* 64
7.2.12 Voice and Video enhancement for LTE - *WID in RP-161856* 65
7.2.13 Study on Further enhancements to Coordinated Multi-Point Operation - *SID in RP-160954* 65
7.2.13.1 Initial evaluation results and enhancements for non-coherent joint transmission 65
7.2.13.2 Initial evaluation results and enhancements for coordinated scheduling/beamforming with FD-MIMO 66
8 NR 67
8.1 Study on New Radio Access Technology - SID in RP-161596 67
8.1.1 Waveform and multiple access schemes for new radio interface 67
8.1.1.1 Waveform 67
8.1.1.2 Multiple access scheme 68
8.1.2 Numerology and frame structure for new radio interface 72
8.1.2.1 Numerology 72
8.1.2.2 Frame structure 79
8.1.3 Channel coding and modulation for new radio interface 83
8.1.3.1 Channel coding 83
8.1.3.2 Modulation 90
8.1.4 Multi-antenna scheme for new radio interface 91
8.1.4.1 Beam management 91
8.1.4.2 Multi-antenna scheme 96
8.1.4.3 CSI acquisition 101

Main facts summary

3GPP TSG WG RAN1 #86bisbis meeting, hosted by the European Friends of 3GPP, was held at the ALTIS GRAND HOTEL, Lisbon, Portugal.
The meeting started at 9:05 on Monday 10th October and finished at 17:07 on Friday 14th October 2016.
The number of attending delegates, having confirmed their participation through the electronic check-in application, was **337.**
Note that the number of registered was 511.

The list of action points that required RAN1 close follow-up is listed in Annex F (end of document).

The number of contributions for this meeting was 2438, and those documents were categorized as followed.

Agenda Item	Input Document	Treated Document
All	2438	906

Note: The amount of documents includes those discussed during the email discussion session post meeting.

Note that the number of agreed CRs was 71.

	Contribution is agreed/approved
	Further discussion is required – come-back needed
	Working assumption
	Specific action needed from MCC
	Contribution is for email discussion/approval

Petitioners' Exhibit 1007, p. 274
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

1 Opening of the meeting

Mr Satoshi Nagata (RAN1 Chairman) welcomed the participants of the RAN WG1 86 meeting and opened the meeting at 09:05. Mr Shin Horng Wong from Sony welcomed the delegates on behalf of the European Friends of 3GPP, Alcatel-Lucent, Apple, BlackBerry, Deutsche Telekom, Ericsson, Huawei, Intel, KPN, Motorola, Nokia, Orange, Qualcomm, SIMAlliance, Sony, TeliaSonera, Telefonica, TIM, Telenor, Vodafone and detailed the domestic arrangements for the full week.

1.1 Call for IPR

The attention of the members of this Technical Specification Group was drawn to the fact ***that 3GPP Individual Members have the obligation*** *under the IPR Policies of their respective Organizational Partners to* ***inform their respective*** *Organizational Partners* ***of Essential IPRs they become aware of****.*
The members take note that they are hereby invited:

- *to investigate whether their organization or any other organization owns IPRs which were, or were likely to become Essential in respect of the work of 3GPP.*
- *to notify their respective Organizational Partners of all potential IPRs, e.g., for ETSI, by means of the IPR Information Statement and the Licensing declaration forms (e.g. see the ETSI IPR forms http://webapp.etsi.org/Ipr/).*

1.2 Competition law statement

The Chairman also drew Member's attention to the fact that 3GPP activities are subject to antitrust and competition laws and that compliance with said laws is therefore required of any participant of this WG meeting including the Chairman and Vice Chairmen. In case of question, please contact your legal counsel.
The present meeting will be conducted with strict impartiality and in the interests of 3GPP.
Furthermore, the Chairman reminded Members that timely submission of work items/contributions in advance of WG meetings is important to allow for full and fair consideration of such matters.

1.3 Network usage conditions

The PCG has laid down the following network usage conditions:

Users shall not use the network to engage in illegal activities. This includes activities such as copyright violation, hacking, espionage or any other activity that may be prohibited by local laws.

Users shall not engage in non-work related activities that consume excessive bandwidth or cause significant degradation of the performance of the network.
Since the **network is a shared resource**, users should exercise some basic etiquette when using the 3GPP network at a meeting. It is understood that high bandwidth applications such as downloading large files or video streaming might be required for business purposes, but delegates should be strongly discouraged in performing these activities for personal use. Downloading a movie or doing something in an interactive environment for personal use essentially wastes bandwidth that others need to make the meeting effective. The meeting chairman should remind end users that the network is a shared resource; the more one user grabs, the less there is for another. Email and its attachments already take up significant bandwidth (certain email programs are not very bandwidth efficient). In case of need the chair can ask the delegates to restrict IT usage to things that are essential for the meeting itself.

1. DON'T place your WiFi device in ad-hoc mode
2. DON'T set up a personal hotspot in the meeting room
3. DO try 802.11a if your WiFi device supports it
4. DON'T manually allocate an IP address
5. DON'T be a bandwidth hog by streaming video, playing online games, or downloading huge files
6. DON'T use packet probing software which clogs the local network (e.g., packet sniffers or port scanners)

2 Approval of Agenda

R1-1610440 Draft Agenda of RAN1#86bis meeting RAN1 Chair (R1-1608561)
Satoshi Nagata (Chairman) proposed the agenda for the meeting, as well the schedule of the week.
Discussion: No comment.
Decision: The agenda is approved.

Petitioners' Exhibit 1007, p. 275
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

3 Approval of Minutes from previous meeting

R1-1608562 Final Report of 3GPP TSG RAN1 #86 v1.0.0 ETSI
The document was presented by Patrick Mérias (ETSI Mobile Competence Center) and provides the outcomes of last meeting in Sweden.
Discussion: MCC→ recalled a rather simple working rule when CR needs to be revised (increment revision each time a formal CR is revised)
Decision: The document is approved.

4 Highlights from RAN Plenary

R1-1608563 Selected highlights from RAN#73 of relevance to RAN1 RAN1 Chair
The document was presented by RAN1 Chair and feedbacks the decisions made by RAN#72, relevant to RAN1.
Discussion: Chair → regarding the additional ad-hoc meetings for NR, current view is as follows:

- January 2017 – 5days meeting – in the US (exact location still to be defined)
- June 2017 – 4days meeting – in China (exact location still to be defined)
- September 2017 - 4days meeting – location TBD, likely in Asia (Japan, India)

Decision: The document is noted.

5 Incoming Liaison Statements

R1-1608565 LS on Support of CAT 9/10 and CAT 13 RAN2, Intel
The document was presented by … from Intel. RAN2 agreed to use existing IEs i.e the UE indicates both ue-Category-v1170 (= Category 9/10) and ue-CategoryDL-r12 (= Category 13) when it supports both Category 9/10 and Category 13. RAN2 confirms that there is no backward compatibility issue when the UE sends both UE category IEs.
Decision: The document is noted.

R1-1608571 LS on introduction of new UL categories in Rel-13 RAN2, Qualcomm
The document was presented by … from Qualcomm. Based on the LS from RAN1 on introduction of new UL categories in Rel-13 (R1-168459)., RAN2 endorsed the attached CRs to TS36.306 and TS36.331 to be sent to RAN for decision.
Discussion: No action to RAN1.
Decision: The document is noted.

LAA related
R1-1608572 LS on CSI measurement ambiguity in LAA RAN4, LGE
The document was already treated in RAN1#86 (R1-167928).
Decision: The document is noted.

R1-1609168 Discussion on RAN4 LS on CSI measurement ambiguity in LAA LG Electronics

- Proposal 1. Agree with the proposed text and introduce a corresponding Rel-13 CR (drafted in [R1-1609170]), where it should be decided first whether the yellow-highlighted text should be introduced as well or not. Then, inform RAN4.
- Proposal 2: Agree on the draft CR for Rel-13 LAA in [R1-1609169] which reflects previous RAN1 agreement on the CSI reference resource definition. Then, answer the issue 2 in RAN4 LS with information on the agreed CR.

Discussion: Intel is also supporting the proposal.
Decision: The document is treated under AI 7.1.3.

R1-1609934 Draft LS response to 802.11 regarding LAA Qualcomm Incorporated
Discussion: Chair → already discussed in last meeting, can we agree it as baseline?
Ericsson/Huawei: ok to take it as a baseline but more discussion required for wording improvement
Decision: The document is noted. Continue offline discussion until Friday – (Qualcomm)
Friday: Response LS has been agreed in the CR maintenance session (see R1-1611031 under 7.1.7) – it covers partially the topics of the original LS from IEEE.

R1-1608567 LS on Timing reference for LAA SCell RAN2, LGE
In order to handle the TA of LAA SCells without RA, as one solution, RAN2 suggests configuring a TAG including only LAA SCells and use N_{TA} for that TAG as zero. Considering that a timing reference cell within an sTAG is an activated SCell in that sTAG, if we allow configuring a TAG including only LAA SCells, an LAA SCell should be used as a timing reference cell for that TAG. Question to RAN4 Under which conditions the UE can consider that the LAA SCell is a reliable timing reference cell for UL transmissions?
Discussion: No action to RAN1.
Decision: The document is noted.

R1-1608570 Reply LS on ECID positioning for TDD RAN2, CATT

Petitioners' Exhibit 1007, p. 276
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The document was presented by … from CATT and confirms that RAN1 and RAN4 agreements on ECID TDD related measurements have been taken into account, and based on the assumptions that E-SMLCs will be upgraded to new LPP and new UEs will only use behaviour 1, RAN2 approved three CRs: 36.355 CR (R2-165956), 36.331 CR (R2-165954), 36.306 CR (R2-165955)
Decision: The document is noted.

R1-1608579 LS for definition of SSTD measurement RAN4, CATT
The document was presented by … from CATT and asks RAN1 to modify the definition of SFN and subframe timing difference (SSTD) measurement as proposed.
Decision: The document is noted.

R1-1608580 LS on on UCG parameters for eMTC RAN4, Intel
The document was presented by … from Intel. RAN4 has discussed frequency synchronization during continuous transmissions by HD-FDD eMTC UEs and has concluded the following:

1. Frequency error requirement for Cat-M1 UE is relaxed to 0.2 ppm for f<1 GHz
2. For UEs that need uplink compensation gaps (UCG) the gap period (X) is 256 ms and gap length (Y) is 40 ms
3. The UEs that don't need UCG shall be enabled to operate without UCG implementation
4. UCG is not needed for any PRACH configuration

Decision: The document is noted.

R1-1608581 LS on LTE Rel-13 UE feature list RAN4, Qualcomm, Intel
The document was presented by … from Qualcomm and asks RAN2 to develop the capability signalling for Rel-13 UEs taking this UE feature list into account.
Discussion: No action to RAN1.
Decision: The document is noted.

V2X related
R1-1608564 LS Response on QoS requirements for V2X RAN2, Intel
The document was presented by Alexey Khoryaev from Intel and reports following RAN2 agreements and assumptions.

- RAN2 does not expect V2X PC5 resources to be shared with other non-V2X applications.
- For mode 1, RAN2 agrees that PPPP and other QoS parameters provided by higher layers will be used.
- For mode 2, RAN2 assumes that PPPP can be used to ensure QoS for PC5 V2V.
- For proposed QCI characteristics in S2-162662, RAN2 confirms two new QCIs and observation that two QCI values with different PDB can be assigned with the same priority.

Discussion: No action to RAN1.
Decision: The document is noted.

R1-1608566 LS on Exceptional Pool Handling for V2X RAN2, OPPO
The document was presented by … from OPPO. The RRC specification will include the exceptional pool in SIB21 (for the non-handover cases like idle-to-connected, RLF, RRCReconfiguration, etc.), and pre-sensing on the exceptional pool is used for exceptional pool provided by serving cell. For handover case, an "exceptional" pool is provided by the target cell. The UE uses random selection on this pool based on the concern that sensing may cause latency issue in the transition states.
RAN1 is asked to feedback if there is any concern with this solution, in particular with the use of random selection on the exceptional pool for handover case.
Decision: The document is noted.

R1-1608582 Reply LS on QoS requirements for V2X SA2, LGE
The document was presented by … from LGE and provides the following feedback to RAN2:

A1) SA2 confirms that enforcing UE-PC5-AMBR is not necessary for mode 2 operation. This is because the network is not expected to control the amount of resources consumed when the UE operates in mode 2.
A2) SA2 considers the PDB as the latency requirement from the application layer (i.e. 20ms or 100ms as defined in TS 22.185). The latency can be derived from PPPP by the AS layer, which is based on the mapping between the PPPP and latency provided by configuration to be defined in SA2.
A3) SA2 assumes that the V2X UE in limited service state shall follow the similar principles for the ProSe Direct Communication specified for ProSe-enabled Public Safety UEs set forth in clause 4.5.6 of TS 23.303. However, final confirmation needs to be made by SA1 from service perspective.

Discussion: No action to RAN1.
Decision: The document is noted.

R1-1608569 LS on RAN2 agreements on FeMBMS RAN2, Qualcomm
The document was presented by … from Qualcomm and reports RAN2 conclusions:

- Working Assumption: For non-standalone case, Rel-14 FeMBMS carrier broadcasts MIB and all SI needed to receive FeMBMS transmission in Idle mode. Which of the necessary SI and contents are FFS.

Petitioners' Exhibit 1007, p. 277
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Agreements:
  - The Rel-14 FeMBMS carrier does not support paging functionality for mobile terminating calls.
  - For non-standalone case, from RAN2 point of view, subframes 0, 4, 5, 9 (FS1) and 0, 1, 5, 6 (FS2) can be used as MBSFN subframes for FS1 (FS2) in an eMBMS carrier. It is understood that 100% MBSFN subframe allocation allows for subframes to be set aside, for example, for cell search and broadcasting of necessary system information.

Decision: The document is noted.

R1-1608575 Reply LS on blind detection evaluations RAN4, MediaTek

The document was presented by … from MediaTek and reports RAN4 conclusions:

- MUST Case 1 and Case 2 : For NOMA near UE
  - Blind detection on interference existence is not feasible
    - The degradation due to existence detection error is significant for either OMA to NOMA or NOMA to OMA
    - Practical blind detection algorithms cannot achieve acceptable detection rate for both 1-layer and 2-layer in CRS-based TMs
  - Blind detection on power ratio is not feasible
- MUST Case 3: Unequal power allocation between spatial layers in CRS-based TMs is not feasible in terms of UE blind detection complexity

Decision: The document is noted.

R1-1608577 Reply LS on SRS carrier switching interruption time RAN4, Huawei

The document was presented by Weimin Xiao from Huawei and states:

Given that the RF switching time may have some dependency on the CA scenarios and UE implementation, RAN4 agrees that the RF switching time can be defined in the following values:

- 0 us / 30 us / 100 us / 200 us / 300 us / 500 us / 900 us
- Any values equal to or larger than 1ms are not considered because it may negate the potential gains of enabling SRS switching in the first place. Note that this RF switching time does not include UL transmit timing difference between two TAGs, which is up to 32.47us, or any channel access delay caused by LBT in the case of LAA operation.

Depending on UE implementation, network configuration, CA scenarios, and RAN1 design, DL reception of PCell or SCells may be impacted due to SRS switching.

Decision: The document is noted.

mobility enhancements

R1-1608568 LS on further mobility enhancements RAN2, ZTE

The document was presented by Zhisong Zuo from ZTE. RAN2 agreements regarding

- the RACH-less solution:
  1) The asynchronous RACH-less solution is excluded.
  2) Only the RACH-less solution that the TA value of the source cell is reused for the targeted cell, or TA=0 will be further considered.
  3) The subframe allocation and uplink grant format can be configured by RRC message. If the subframe allocation and uplink grant format is configured, the starting subframe of the configured uplink grant is provided by the target eNB in RRC message. If UE doesn't receive UL grant in RRC message, it will monitor PDCCH of the target eNB for UL grant. UE doesn't need to know the SFN of the target eNB.
  4) RACH-less solution can be used for SCG change and handover scenarios.
- the make-before-break solution:
  1) The "make before break handover solution" means the UE continues downlink and uplink with the source cell until the UE performs the first transmission through PUSCH or PRACH to the target eNB.
  2) The solution is applicable for intra frequency handover and SCG change. Inter frequency case is FFS.
  3) Consider RACH-less solution and "maintaining a connection to the source eNB" as two independent mechanisms, activation of which is up to the network decision. Two solutions can be activated simultaneously.

Discussion: No action to RAN1.

Decision: The document is noted.

R1-1609936 On RAN2 LS on further mobility enhancements Qualcomm Incorporated

- Observation 1: From the LS description, the timing and the duration of the grant provided via RRC are unclear.
- Observation 2: The benefit of defining a new grant type and transmitting via RRC instead of using legacy PDCCH scheduling is not justified.
- Observation 3: Without a power control mechanism for PUSCH transmission when RACH is skipped, the uplink transmissions will fail and UE power and uplink resources will be wasted.
- Observation 4: Using the existing dynamic grant and TPC mechanism, the eNB can control uplink power. If upper layer grant is used, this is not possible.

Petitioners' Exhibit 1007, p. 278
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal: RAN1 to respond to RAN2 LS by recommending not to define a new upper layer grant and instead use the existing PUSCH scheduling procedure when RACH is skipped during E-UTRA handover.

Decision: The document is noted. Continue offline discussion until Friday – Peter (Qualcomm)
Friday: Not much progress achieved. Discussion posponed to next meeting.

R1-1608576 Reply LS on the feasibility of mobility enhancement solutions RAN4, Ericsson, ZTE
The document was presented by … from Ericsson and provides the following clarifications:

- The legacy accuracy requirements for uplink timing alignment, i.e. the accuracy of TA for initial uplink transmission, cannot be met by UE calculated TA scheme in either synchronous or asynchronous network. The TA calculation error comes from TA error of source cell, UE reception time difference, BS transmission time alignment error, and uplink/downlink imbalance.
- If it is feasible to start PUCCH/PUSCH/SRS transmission directly is up to RAN1. RAN4 would like to point out that without PRACH power ramping step the transmission power accuracy could be impacted.
- The feasibility and accuracy of network based timing offset estimation in asynchronous case is within the domain of RAN3 to evaluate. From a RAN4 perspective, any error in the estimated timing offset between source and target eNBs will cause doubled error in the calculated TA value.

Discussion: No action to RAN1.
Decision: The document is noted.

R1-1608578 LS on Measurement gap enhancement RAN4, Ericsson, Intel
The document was presented by … from Ericsson and asks RAN WG2 to start to consider the signalling necessary to introduce the gap enhancements described in the liaison statement.
Discussion: No action to RAN1.
Decision: The document is noted.

NR related
R1-1608573 Response LS on Modelling and simulation of IMT networks for use in sharing and compatibility studies RAN4, Ericsson
The document was presented by … from Ericsson and asks RAN to approve and forward the LS to ITU-R WP5D.
Discussion: No action to RAN1.
Decision: The document is noted.

R1-1608574 LS on Characteristics of terrestrial IMT systems for frequency sharing/interference analysis in the frequency range between 24.25 GHz and 86 GHz RAN4, Nokia
The document was presented by … from Nokia and asks RAN to approve and forward the LS to ITU-R WP5D in advance of the ITU-R WP5D meeting in October 2016.
Decision: The document is noted.

R1-1608583 Reply LS on NR requirements RAN, ZTE
The document was presented by … from ZTE and provides the following guidance:

- There are two types of latency requirements in TR38.913: latency-only (sec. 7.5, where no value for eV2X is defined) and latency + reliability (sec. 7.9, applicable to URLLC and eV2X). Both are to be considered best case targets.
  - There are no exact latency requirements for URLLC and eV2X during successful mobility events, but it can be assumed that in the ideal scenario they are close to the corresponding latency + reliability requirements.
  - For failure cases, RAN2 should aim at minimizing interruption times.
- For the latency-only target (not defined for eV2X), some radio error rate may be considered (e.g. HARQ Retransmission), but likely no UE speed assumption. For the latency + reliability requirement, RAN1 will define separate UE speed and error rate assumptions for URLLC and eV2X as part of their work on the evaluation environments and methodology for URLLC and eV2X services. For eV2X, the maximum UE speed is currently set to 250 km/h but could be further modified after further SA1 input.
- The latency requirements in TR 38.913 apply to the 5G radio network, and there needs to be a way for the 5G radio network to meet the requirements. Not all possible configurations and options need to meet all the requirements. In the context of the NR Study Item, the control plane latency requirement applies for the case when NR is the anchor.
- The latency requirements in TR 38.913 apply to the 5G radio network, and there needs to be a way for the 5G radio network to meet the requirements. Not all possible configurations and options need to meet all the requirements. In the context of the NR Study Item, the user plane latency requirement applies for the cases when NR or LTE is the anchor and user plane data transmission only happens through the NR node.

Discussion: No action to RAN1.
Decision: The document is noted.

The following set of LS was received in the course of the meeting week:
R1-1610565 LS on Multi-carrier enhancements for UMTS RAN2, Ericsson
R1-1610680 LS on TTI switching for MC enhancements RAN2, Huawei

Petitioners' Exhibit 1007, p. 279
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610765 LS on RAN2 agreements on FeMBMS RAN2, Ericsson
Decision: The document is noted. The LS was treated under AI 7.2.4.
R1-1610766 LS to RAN1 on V2V agreements RAN2, LGE

6 UTRA

R1-1610573 Report of the UMTS sessions UMTS Session Chairman's Notes (Carmela Cozzo, Huawei)
The document was presented by Gerardo Medina from Ericsson on behalf of Carmela Cozzo.
Decision: The document is endorsed and content incorporated below.

6.1 Maintenance of UTRA Releases 4 – 13

None.

6.2 Multi-Carrier enhancements for UMTS - WID in RP-161259.

6.2.1 TTI switching

R1-1610194 HS-SCCH order design for TTI switching Huawei, HiSilicon
R1-1610233 On introducing the HS-SCCH orders for enabling TTI Switching in Multicarrier Enhancements in UMTS Ericsson

Agreement on HS-SCCH orders for TTI switching:

Table 14B.3A: Orders for switching the E-DCH TTI for single cell E-DCH

Extended Order Type	Order Type	Order Mapping			Interpretation
$X_{eodt,1}$, $X_{eodt,2}$	$X_{odt,1}$, $X_{odt,2}$, $X_{odt,3}$	$X_{ord,1}$	$X_{ord,2}$	$X_{ord,3}$	
11	011	0	0	0	TTI switch order from 2ms to 10ms
		0	0	1	TTI switch order from 10ms to 2ms
		0	1	0	Unused (Reserved single cell E-DCH)
		0	1	1	Unused (Reserved single cell E-DCH)
		1	0	0	Unused (Reserved single cell E-DCH)
		1	0	1	Unused (Reserved single cell E-DCH)
		1	1	0	Unused (Reserved single cell E-DCH)
		1	1	1	Unused (Reserved single cell E-DCH)

Table 14B.3B: Orders for switching the E-DCH TTI for dual cell E-DCH

Extended Order Type	Order Type	Order Mapping			Interpretation
$X_{eodt,1}$, $X_{eodt,2}$	$X_{odt,1}$, $X_{odt,2}$, $X_{odt,3}$	$X_{ord,1}$	$X_{ord,2}$	$X_{ord,3}$	
11	011	0	0	0	Unused (Reserved dual cell E-DCH)
		0	0	1	Unused (Reserved dual cell E-DCH)
		0	1	0	TTI switch order to 2ms+2ms
		0	1	1	TTI switch order to 2ms+10ms
		1	0	0	TTI switch order to 10ms+2ms
		1	0	1	TTI switch order to 10ms+10ms
		1	1	0	Unused (Reserved dual cell E-DCH)
		1	1	1	Unused (Reserved dual cell E-DCH)

Note 1 (Table 14B.3B): For the TTI switch orders the TTI length displayed on the left hand side applies to the primary uplink frequency, while the TTI length displayed on the right hand side applies to the secondary uplink frequency.

Note 2 (Table 14B.3B): The TTI switch orders also apply if the secondary uplink frequency is deactivated, but it becomes effective on the secondary uplink frequency upon its re-activation.

R1-1610572 LS to RAN2/3 on the agreements on TTI switching RAN1

6.2.2 Power scaling

R1-1610193 Considerations on power scaling rules for 2ms+10ms configurations Huawei, HiSilicon

Petitioners' Exhibit 1007, p. 280
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610234 On Power Scaling and Multicarrier Enhancements for UMTS Ericsson

Conclusion: For proposal in R1-1610193, it is encouraged to show use cases (throughput) for next meeting.

6.2.3 Other

R1-1610195 Response to RAN2 LS on MC enhancements Huawei, HiSilicon
R1-1610196 Configuration of physical layer parameters for MC enhancements Huawei, HiSilicon
R1-1610235 On the "Response LS" related to the configuration of DTX along with the Rel-14 Multicarrier Enhancements for UMTS Ericsson

R1-1610571 LS to RAN2/3 Response LS RAN1

R1-1610236 Primary Carrier Switching for Multicarrier Enhancements in UMTS Ericsson

Conclusion: continue discussing the proposal in R1-1610236

6.3 DTX/DRX enhancements in CELL_FACH - WID in RP-160185.

6.3.1 DRX improvements

R1-1609782 Introduction of HS-SCCH Order for HS-SCCH DRx feature in enhanced Cell Fach Qualcomm Europe Inc.(France)
Decision: CR0344 to 25.2.12 (Rel-14) is agreed.
R1-1609784 UE Procedures for HS-SCCH DRx feature in enhanced Cell Fach Qualcomm Europe Inc.(France)
Decision: CR0758 to 25.2.14 (Rel-14) is agreed.

6.3.2 DTX improvements

R1-1610237 An assessment on the potential gains in cell throughput derived from fully applying DTX on the stand alone UL DPCCH transmissions in CELL_FACH Ericsson

7 E-UTRA

7.1 Maintenance of E-UTRA Releases 8 – 14

Only essential corrections.
Note that individual companies can submit draft CRs to this agenda item for Rel-13 items.

R1-1610882 Chairman's notes of AI 7.1 on CRs Ad-Hoc chair (Qualcomm)
The document was presented by Wanshi Chen from Qualcomm.
Discussion: Ad-hoc chair →Typo needs to be fixed (R1-1609173 should be read as R1-1610773)
Decision: The document is endorsed and content incorporated below.

7.1.1 Maintenance of E-UTRA Release 8 – 12

Friday: Following contribution deals with the benefits of introducing new TBS values for DL 256QAM, and is a follow-up of RAN's decision requesting to discuss further this issue in the Working Groups.
R1-1610413 Introduction of new Transport Block Size for DL 256QAM Qualcomm
Decision: The document is noted for email approval until Oct.27th – (Qualcomm)

7.1.2 Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers

R1-1610094 Clarification on a few PUCCH format 4 and 5 related issues in eCA Qualcomm Incorporated
Conclusion:

- For the 3 issues discussed in R1-1610094,
  - The 1st and 3rd issues are for email discuss till 10/21 (Peter, Qualcomm)
  - The proposals for the 2nd issue is aligned with RAN1 understanding (i.e., $N_{\mathrm{ID}}^{\mathrm{csh\_DMRS}}$, if configured by higher layers for PUSCH, is also applicable to PUCCH format 4 and 5). CR to be prepared for the next RAN1 meeting.

R1-1610852 Correction on PDCCH candidate configuration LG Electronics
Decision: Email approval of R1-1610852 till 10/21 – Seonwook (LG Electronics)

7.1.3 Maintenance of Release 13 licensed-assisted access to unlicensed spectrum

R1-1609168 Discussion on RAN4 LS on CSI measurement ambiguity in LAA LG Electronics
R1-1609169 Correction on CSI reference resource definition in LAA LG Electronics

Petitioners' Exhibit 1007, p. 281
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: Draft CR in R1-1609169 is endorsed. Final CRs to be prepared.
Friday: CR0780 to 36.213 (Rel-13) is agreed in R1-1611027 and shadow CR0781 to 36.213 (Rel-14) is agreed in R1-1611028.
Post-meeting: MCC to change category F to A in R1-1611028.

R1-1610773 Correction on CSI measurement in LAA LG Electronics (R1-1609170)
Decision: Draft CR in R1-1610773~~09173~~ is endorsed. Final CRs to be prepared.
Friday: CR0782 to 36.213 (Rel-13) is agreed in R1-1611029 and shadow CR0783 to 36.213 (Rel-14) is agreed in R1-1611030.
Post-meeting: MCC to change category F to A in R1-1611030.

R1-1610841 [Draft] Reply LS on CSI measurement ambiguity in LAA LGE
Decision: The document is noted and final LS is approved in R1-1611026.

R1-1609937 Discussion on periodic and aperiodic CSI reporting in LAA Qualcomm Incorporated
R1-1609938 Draft CR on aperiodic CSI reporting in LAAQualcomm Incorporated

R1-1609368 Draft CR on energy detection threshold for DL multi-carrier operation for LAA in 36.213 Huawei, HiSilicon
R1-1610462 Draft CR on energy detection threshold for DL multi-carrier operation for LAA in 36.213 Huawei, HiSilicon

R1-1610197 Correction on CWp adjustment on Type B1 multi-carrier access procedure for Rel-13 LAA WILUS Inc.
Decision: CR0754 to 36.213 (Rel-13) is agreed in R1-1610450 .

7.1.4 Maintenance of Release 13 elevation beamforming/full-dimension MIMO for LTE

R1-1609171 Correction on NZP CSI-RS aggregation for Class A LG Electronics
Decision: CR0296 to 36.211 (Rel-13) is agreed in R1-1610451.

R1-1609449 Correction on periodic CSI reporting mode 2-1 for Class B FD-MIMO Intel Corporation, ZTE, ZTE Microelectronics
R1-1610428 Correction on periodic CSI reporting mode 2-1 for Class B FD-MIMO Intel Corporation, ZTE Corporation, ZTE Microelectronics
Decision: CR0755 to 36.213 (Rel-13) is agreed in R1-1610452 **Correction to PUCCH reporting mode 2-1**
Prepare Rel-14 CR within Monday – Alexei (Intel)
Decision: CR0757 to 36.213 (Rel-14) is agreed in R1-1610454

R1-1609450 Correction on periodic CSI reporting mode 1-1 for Class B FD-MIMO Intel Corporation, ZTE, ZTE Microelectronics
Decision: CR0756 to 36.213 (Rel-13) is agreed in R1-1610453 **Correction to PUCCH reporting mode 1-1**
Prepare Rel-14 CR within Monday – Alexei (Intel)
Decision: CR0758 to 36.213 (Rel-14) is agreed in R1-1610455

7.1.5 Maintenance of Release 13 further LTE physical layer enhancements for MTC

R1-1610439 Correction of typos due to wrong implementation of CR0283 "Clarification of valid subframe in eMTC" MCC
Decision: CR0295 to 36.211 (Rel-13) is agreed.
R1-1611020 Correction of typos due to wrong implementation of CR0283 "Clarification of valid subframe in eMTC" MCC
Decision: CR0308 to 36.211 (Rel-14) is agreed.

PRACH
R1-1610447 Correction of PRACH starting subframes for eMTC Intel Corporation (Revision of R1-1609451)
Decision: The CR is endorsed. Final CRs to be prepared.
CR0303 to 36.211 (Rel-13) is agreed in R1-1610914 and shadow CR0304 to 36.211 (Rel-14) is agreed in R1-1610915.

MPDCCH
R1-1609605 Correction to DMRS for MPDCCH associated with P-RNTI Virtuosys Limited, Qualcomm Incorporated, Intel Corporation
Decision: CR0289 to 36.211 (Rel-13) is agreed. Also to prepare a shadow CR for Rel-14 (Mark, Virtuosys).
R1-1610504 Correction to DMRS for MPDCCH associated with P-RNTI Virtuosys Limited, Qualcomm Incorporated, Intel Corporation
Decision: CR0298 to 36.211 (Rel-14) is agreed.

Petitioners' Exhibit 1007, p. 282
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1609941 CR for clarification on i_0 value Qualcomm Incorporated
R1-1610208 Draft CR for correction on MPDCCH hopping Qualcomm Incorporated
R1-1610742 CR for clarification on i_0 value Qualcomm Incorporated
Decision: The CR is endorsed. Final CRs to be prepared.
CR0301 to 36.211 (Rel-13) is agreed in R1-1610911 and shadow CR0302 to 36.211 (Rel-14) is agreed in R1-1610912.

R1-1610474 Correction on equation for MPDCCH search space and starting subframe position NTT DOCOMO, INC., Panasonic (Revision of R1-1610028)
Decision: The draft CR in R1-160474 is endorsed. Prepare final CR, including Rel-14 shadow CR (Naoto, DCM).
CRs are provided in R1-1610497 **and R1-1610501**. Prepare updated CRs with 'ME' box checked (Naoto, DCM).
R1-1610796 Correction on equation for MPDCCH search space and starting subframe position NTT DOCOMO, Panasonic
Decision: CR0767r1 to 36.213 (Rel-13) is agreed.
R1-1610797 Correction on equation for MPDCCH search space and starting subframe position NTT DOCOMO, Panasonic
Decision: CR0768r1 to 36.213 (Rel-14) is agreed.

R1-1610308 DraftCR: 36.213 Clarification on the reference subframe k in ECCE determination in a MPDCCH search space Sony
R1-1610408 DraftCR: 36.213 Clarification on the reference subframe k in ECCE determination in a MPDCCH search space Sony Europe Limited
Decision: The CRs in R1-1610308 and R1-1610408 are not necessary.

R1-1610369 Correction on MPDCCH monitoring in special subframes Huawei, HiSilicon
Decision: The CR in R1-1610369 is not necessary

R1-1610370 Correction on MPDCCH transmission without repetition Huawei, HiSilicon
Decision: Continue discussion offline (Huawei)
R1-1610778 Correction on MPDCCH transmission without repetition Huawei, HiSilicon
Decision: CR0291 to 36.211 (Rel-13) is agreed. Prepare Rel-14 shadow CR (Zheng, Huawei)
R1-1610926 Correction on MPDCCH transmission without repetition Huawei, HiSilicon
Decision: CR0307 to 36.211 (Rel-14) is agreed.

CSI
R1-1609939 Draft CR clarification on spectral efficiency Qualcomm Incorporated
Decision: The draft CR in R1-1609939 is endorsed. Prepare final CR, including Rel-14 shadow CR (Alberto, Qualcomm)
Final decision: CR0763 to 36.213 (Rel-13) is agreed in R1-1610493 and CR0765 to 36.213 (Rel-14) is agreed in R1-1610495

R1-1609942 CR for clarification on A-CSI without hopping Qualcomm Incorporated, Samsung
Decision: The draft CR in R1-1609942 is endorsed (to fix the indentation). Prepare final CR, including Rel-14 shadow CR (Alberto, Qualcomm)
CRs are provided in R1-1610494 **and R1-1610496**. Prepare updated CRs to fix the spacing and the date (Alberto, Qualcomm)
CRs are provided in R1-1610837 **and R1-1610838**. Prepare updated CRs to fix the indentation (Alberto, Qualcomm)
Final decision: CR0764r2 to 36.213 (Rel-13) is agreed in R1-1610944 and CR0766r2 to 36.213 (Rel-14) is agreed in R1-1610945

PUSCH
R1-1609940 Draft CR clarification on PUSCH repetition levels Qualcomm Incorporated
Decision: The CR in R1-1609940 is not necessary

PUCCH/SRS
R1-1609826 Clarification of number of repetitions of PUCCH ZTE
Continue discussion offline (Huiying, ZTE)
Decision: CR0769 to 36.213 (Rel-13) is agreed in R1-1610648 and CR0771 to 36.213 (Rel-14) is agreed in R1-1610656

R1-1610382 Clarification of PUCCH and SRS not belonging to any narrowband for BL/CE UE Ericsson
R1-1610749 WF on PUCCH and SRS not belonging to any narrowband for BL-CE UE Ericsson, Intel, Qualcomm, Sequans, Sony, ZTE

Petitioners' Exhibit 1007, p. 283
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610919 WF on PUCCH and SRS not belonging to any narrowband for BL-CE UE Ericsson, Alcatel-Lucent Shanghai Bell, AT&T, Intel, Nokia, NTT DoCoMo, Orange, Qualcomm, Sequans, Sony, Sierra Wireless, Virtuosys, ZTE, ZTE Microelectronics

- BL/CE UE can transmit PUCCH in any PRB.
- BL/CE UE drops SRS transmission in subframe *n* when PUCCH transmission occurs in subframe *n* or *n+1* in a PRB not belonging to a narrowband.

Note: No specification change is required from the above proposals.

Decision: The document is noted. Also supported by Verizon

Conclusion:

- It is RAN1 understanding that BL/CE UE can transmit PUCCH in any PRB.
- It is RAN1 understanding that BL/CE UE drops SRS transmission in subframe *n* when PUCCH transmission occurs in subframe *n* or *n+1* in a PRB not belonging to a narrowband.
- It is RAN1 understanding that BL/CE UE may need retune to/from transmitting PUCCH in a PRB not belonging to a narrowband when necessary
- Note: No specification change is required from the above proposals.

7.1.6 Maintenance of Release 13 NB-IoT

PDSCH

R1-1608706 CR on 36.211 NB-IoT PDSCH symbol mapping Ericsson
R1-1610409 CR on 36.211 NB-IoT PDSCH symbol mapping Ericsson
Both CRs are not pursued.

NPDCCH

R1-1608707 CR on 36.213 NB-IoT Type1 and Type 2 search space definition Ericsson
Decision: The CR is endorsed in principle.
R1-1610733 CR on 36.213 NB-IoT Type1 and Type 2 search space definition Ericsson
R1-1610734 CR on 36.213 NB-IoT Type1 and Type 2 search space definition Ericsson
Decision: CR0751r1 to 36.213 (Rel-13) is agreed in R1-1610733 and CR0752r1 to 36.213 (Rel-14) is agreed in R1-1610734

R1-1609403 Correction on the determination of NPDCCH candidates ITRI
R1-1609404 Correction on the determination of NPDCCH candidates ITRI
Decision: CR0746 to 36.213 (Rel-13) is agreed in R1-1609403 and CR0747 to 36.213 (Rel-14) is agreed in R1-1609404

NPRACH

R1-1609452 Correction of NPRACH frequency hopping Intel Corporation
Decision: The CR in R1-1609452 is endorsed in principle.
R1-1610756 Correction of NPRACH frequency hopping Intel Corporation
Decision: CR0305 to 36.211 (Rel-13) is agreed in R1-1610916 and CR0306 to 36.211 (Rel-14) is agreed in R1-1610917

R1-1609680 Clarifications about NPRACH configuration parameters Nokia, Alcatel-Lucent Shanghai Bell
R1-1609679 Clarifications about NPRACH configuration parameters Nokia, Alcatel-Lucent Shanghai Bell
R1-1610412 Clarifications about NPRACH configuration parameters Nokia, Alcatel-Lucent Shanghai BellNote: For 240 msec period values, an overlap with the next HSFN occurs for 32 repetitions

R1-1610018 Clarification on power ramping for NPRACH MediaTek Inc.
R1-1610770 WF on Clarification of NPRACH for single/multi-tone MSG 3 Mediatek

- If there is no resource reserved for multi-tone MSG 3 in a coverage level, UE supports multi-tone MSG 3 can use the NPRACH resources for single-tone MSG 3 in the coverage level.
- If there is no resource for single-tone MSG 3 in a coverage level,
  - For Rel-13, no additional CR for current specs. This means,
    - If all the PRACH resources are for multi-tone MSG 3 in a coverage level, multi-tone MSG 3 incapable UE cannot transmit NPRACH if the UE belongs to that coverage level.
    - If there is no NPRACH resources for single-tone MSG 3 in the next coverage level, multi-tone MSG 3 incapable UE stays in current level.
  - Further study for Rel-14 if UE support single tone MSG 3 transmission can use other coverage level and the need of additional power ramping.

Decision: The document is noted

Conclusion:

- RAN1 concludes that random access resource selection procedure in MAC specification may need some clarification at least for multi-tone-message-3 capable UEs. Companies may bring CRs to RAN2

Petitioners' Exhibit 1007, p. 284
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

NRS
R1-1609827 Clarification on nrs-Power related description ZTE
Decision: The CR in R1-1609827 is endorsed in principle.
R1-1610649 Clarification on nrs-Power related description ZTE
R1-1610657 Clarification on nrs-Power related description ZTE
Decision: CR0770 to 36.213 (Rel-13) is agreed in R1-1610649 and CR0772 to 36.213 (Rel-14) is agreed in R1-1610657

Collision Handling
R1-1610471 CR for clarification on NPRACH and NPUSCH collision Qualcomm Incorporated (Revision of R1-1609943)
Decision: The CR in R1-1610471 is endorsed. Final CRs to be prepared (including Rel-14 shadow CR)
Decision: CR0299 to 36.211 (Rel-13) is agreed in R1-1610505 and CR0300 to 36.211 (Rel-14) is agreed in R1-1610506.

7.1.7 Maintenance of Release 14 Enhanced Licensed-Assisted Access to Unlicensed Spectrum

R1-1608980 Draft CR on start timing of PUSCH Samsung
Decision: The CR0297 to 36.211 (Rel-14) is agreed in R1-1610475.

R1-1609174 Correction on UL grant reception in ending partial subframe LG Electronics
Decision: The CR0759 to 36.213 (Rel-14) is agreed in R1-1610456.

R1-1609175 Correction on UL burst scheduling LG Electronics
R1-1610775 Correction on UL burst scheduling LG Electronics
Decision: The CR is endorsed. Final CR to be prepared.
Final decision: The CR0760 to 36.213 (Rel-14) is agreed in R1-1610457

R1-1609367 Draft CR on PHICH operation for eLAA in 36.213 Huawei, HiSilicon
Decision: The CR0761 to 36.213 (Rel-14) is agreed in R1-1610458.

R1-1609569 [Draft 36.212 CR] Corrections to RV in eLAA DCI definitions Nokia, Alcatel-Lucent Shanghai Bell
Decision: The CR0221 to 36.212 (Rel-14) is agreed in R1-1610459.

R1-1609576 Draft CR on DCI formats related with LAA in TS 36.212 ETRI
R1-1610463 Draft CR on DCI formats related with LAA in TS 36.212 ETRI
Decision: The CR0222 to 36.212 (Rel-14) is agreed in R1-1610476 with following update (deletion of text):
Else~~10463(212), 10464(213)~~,

R1-1610464 Draft CR on UL duration and offset field in TS 36.213 ETRI

7.1.8 Maintenance of Release 14 V2V services based on LTE sidelink

CR submission is only allowed by specification editors.
Note that proponent can submit discussion contribution to this A.I. which contains a possible TP.

DMRS randomization
R1-1609453 **Proposal to align DMRS cyclic shift for PSCCH and PSSCH (Correction to V2V CR - 36.211)** **Intel Corporation**
Decision: Agreed proposal 1

- Editors to check whether clarification is needed for MSB and LSB of CRC field in SCI format 1.

R1-1610465 **WF on DMRS randomization** **Samsung**
R1-1608715 **Discussion on randomization on DMRS** **CATT**
Decision:
Agreements:

- DMRS randomization of a PSSCH follows the CRC of the SA in the same subframe as the PSSCH
- Discuss in RAN1#87 whether additional mechanism is needed for PSSCH DM RS randomization focusing on the single-subframe transmission case.

R1-1609455 Clarification on V2V Resource Selection Procedure (Correction to V2V CR - 36.213) Intel Corporation
R1-1608983 Further randomization on DMRS and scrambling code Samsung
R1-1609179 Corrections on randomizing PSSCH DM-RSLG Electronics
R1-1609817 TP on random selection of PSCCH cyclic shift ZTE

Resource size for PSCCH and PSSCH
R1-1609955 **Remaining issues for V2V** **Qualcomm Incorporated**
Proposals 3 and 9 only
Decision: Agreed proposals 3 and 9

R1-1609363 **Discussion on resource pool for PC5 based V2V** **Huawei, HiSilicon**
Proposal 1 only

PSCCH and PSSCH transmission in the same subframe
R1-1609373 **Discussion on the remaining issues for sidelink power control** **Huawei, HiSilicon**
Conclusion:

- P_0 can be preconfigured for out-coverage V2V UEs as in Rel-12 D2D
  - This will not have specification impact

R1-1609812 **Discussion on PSD offset with PSCCH and PSSCH** **ZTE**
R1-1609955 **Remaining issues for V2V** **Qualcomm Incorporated**
Proposals 1, 2, and 4 only
Decision: Agreed proposals 1 and 4

- Proposal 2 in R1-1609955 is agreed in principle.

R1-1609177 Discussion on power offset for PSCCH LG Electronics

Background sensing

R1-1609955 Remaining issues for V2V Qualcomm Incorporated
Proposal 6 only
R1-1609729 Outstanding issues for mode-4 resource allocation Ericsson
R1-1608716 Discussion on details of resource reselection CATT
Decision: Continue discussion of proposal 2 next meeting

R1-1609180 Corrections on the set of reserved subframes in SL TM 4 LG Electronics
R1-1608986 Remaining issues on resource reservation Samsung
Conclusion:

- For clarification of C_resel, FFS till next meeting

UE decoding capability
R1-1609751 Discussion on UE decoding capabilities Ericsson
R1-1609361 Discussion on UE capability in decoding PSSCH and PSCCH Huawei, HiSilicon
Conclusion:

- A UE is not expected to try to decode more than N1 RBs in a subframe
  - Further discussion the value of N1 (e.g., 100, 138 or 150)
- A UE is not expected to try to decode more than N2 PSCCHs in a subframe
  - Further discussion the value of N2 (e.g., 10 or 20)
- Further discussion this week whether or not to introduce the specific rule(s) to ensure that transmissions from a given UE are not systematically dropped, and if so, the rule(s)

For the further discussion parts above, continue discussion next meeting

Others
R1-1610461 PSSCH/PSBCH decoding issue CATT (Revision of R1-1608714)
Continue discussion of proposals 2 and 3 till next meeting

R1-1608985 Remaining issues on resource exclusion in Step 2 Samsung
R1-1609176 Discussion on minimum portion of remaining resources for PSSCH LG Electronics
R1-1609362 Discussion on sensing window range for PC5 based V2V Huawei, HiSilicon
Agreements:

- Change the sensing window range to subframes n-1000, n-999, n-998 …, n-1

R1-1609363 Discussion on resource pool for PC5 based V2V Huawei, HiSilicon
Proposal 2 only
Conclusion:

- No change is needed regarding proposal 2 in R1-1609363

R1-1609454 Clarification on Resource Selection Procedure (Correction to V2V CR - 36.213) Intel Corporation
Conclusion:

- Align the name of the field "Frequency resource location" and "Frequency resource location of the initial transmission and retransmission" across technical specification TS 36.212 and TS 36.213 respectively.

R1-1609811 TP on PSBCH ZTE

Petitioners' Exhibit 1007, p. 288
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1609955 Remaining issues for V2V Qualcomm Incorporated
Proposal 10 only
Agreements:
- Send LS response to R2-165962 with the following contents:
  - RAN1 has not introduced random resource selection for V-UEs and RAN1 has concerns on increased resource collision probability caused by random resource selection. RAN1 notes that random selection for V-UE is not among the list of the objectives transferred from V2V WI.
- LS draft by Ricardo – Ericsson.

R1-1610920 [Draft] LS response on Exceptional Pool Handling for V2X Ericsson
Decision: Final LS is agreed in R1-1610930

R1-1610935 Outcome offline discussion on V2V maintenance LGE

R1-1610977 WF on V2V support for TDD Intel, CATT
Decision: Further discussion next meeting

Not treated.

R1-1609552 Introduction of RACHless handover for Further mobility enhancement in LTE ZTE Corporation
Decision: CR0748 to 36.213 (Rel-14) is for email approval until October 20th – (ZTE)

R1-1608717 Correction on SSTD definition CATT
Decision: CR0039 to 36.214 (Rel-13) is agreed.
R1-1609824 Correction on SSTD definition CATT
Decision: Shadow CR0040 to 36.214 (Rel-14) is agreed.

R1-1610106 Discussion on power allocation for SC-PTM TD Tech, Huawei
R1-1610901 Correction on downlink power allocation for SC-PTM TD Tech, Huawei (R1-1610110)
Further revised in R1-1611045.
R1-1611045 Correction on downlink power allocation for SC-PTM TD Tech, Huawei
Decision: CR0749r2 to 36.213 (Rel-13) is agreed.

Agreement:
- SC-MCCH uses a fixed modulation of QPSK.
  - No signaling of PA and PB for SC-MCCH.
- RAN1 recommends that for each SC-MTCH, there is a higher layer parameter "PA" for configuring ρ_A for the PDSCH carrying the SC-MTCH.
  - If "PA" is not signaled by high layer, the UE may assume that "PA" is equal to 0 dB.
- RAN1 recommends that for each cell supporting SC-PTM, there is a higher layer parameter "PB" for configuring ρ_B/ρ_A for any SC-MTCH in the cell.
  - If "PB" is not signaled by high layer, the UE may assume that $\rho_B/\rho_A = 1$.

R1-1610748 [DRAFT] LS on power allocation for SC-PTM Huawei
Agreed in R1-1610780

7.2 LTE Release 14

Friday
For MUST, Further indoor positioning enh., SRS carrier based switching, Performance enhancements for high speed:
- Rapporteurs will provide list of agreements, including WA until Oct. 17th.
- Spec editors (36.201, 36.211, 36.212, 36.213, 36.214) shall provide draft CRs based on above lists until Nov. 10th
- All proponents are invited checking the draft CRs until next meeting

7.2.1 LTE-based V2X Services - *WID in RP-161894*

R1-1610864 Chairman's notes of AI 7.2.1 on LTE-based V2X Services Ad-Hoc chair (LGE)
The document was presented by Hanbyul Seo from LGE.
Decision: The document is endorsed and content incorporated below.

Friday
R1-1611061 [Draft] LS on RAN1 agreements potentially related to RAN2/4 in LTE-based V2X LG Electronics
Decision: The document is noted and final LS is agreed in R1-1611066.

R1-1610936 Outcome offline discussion on V2X LG Electronics

R1-1609932 SC-PTM Enhancements for V2X MediaTek Inc.
R1-1609933 On suitability of Uu transport and PC5 transport for V2X Solutions MediaTek Inc.

Agreements:
- From RAN1 viewpoint, the following three cases can be supported regarding the capability of LTE V2X devices on the simultaneous transmission of UL and SL.
  - Case 1: UL TX and SL TX use separate TX chains and separate power budget
  - Case 2: UL TX and SL TX use separate TX chains but sharing power budget
  - Case 3: UL TX and SL TX share TX chains and power budget
  - It is noted that the most suitable case may be dependent of the V2X use case.
- RAN WGs to identify solution(s) that takes into account the minimum performance of SL TX at least for some important SL TX. RAN WGs needs to reduce possible degradation of Uu operation performance in identifying such solution(s).
  - For case 1, RAN1 assumes no physical layer solution is needed.
- Send LS to RAN2/4 to inform this understanding and to ask them to reflect this in the UE capability discussion.
  - LS drafted by Yi – Huawei

R1-1610966 [Draft] LS on V2X UE transmission chain Huawei, [RAN1]
Decision: The document is noted and final LS is agreed in R1-1611000.

7.2.1.1 *Enhancement to UL and SL SPS*

7.2.1.1.1 DCI design to support multiple SPS configurations

Including details of SPS RNTI for V2X, indicator(s) in DCI to differentiate SPS configurations

DCI contents
R1-1610556 DCI design to support multiple SPS configurations CATT (R1-1608718)
R1-1610037 Multiple SPS support for sidelink and uplink V2X NTT DOCOMO, INC.

R1-1610776 WF on reliable sidelink SPS NTT DOCOMO, CMCC, LG Electronics
Proposed agreements:
- At least one of the following mechanism is supported for sidelink SPS controlled by eNB
  - A/N feedback mechanism on the reception of DCI indicating SL SPS activation/release
    - FFS on details.
  - Automatic release after a counter is expired
    - Further detail is up to RAN2
  - When a SPS configuration is activated for an SPS process, previously configured SPS process is released
    - UE identifies a SPS process associated to a DCI based on the contents of the DCI, for example,
      - Option 1: One-to-one mapping between SPS configuration index and SPS process
      - Option 2: Semi-static (higher layer configured) association between SPS configuration index and SPS process. Multiple SPS configurations can be associated to a SPS process.
      - Option 3: Dynamic indication (explicitly or implicitly) of SPS process associated to a SPS DCI
    - Further detail is FFS

Agreement: Activation of one SPS configuration releases the previous allocation for the same SPS configuration.

R1-1610813 WF on DCI design for SL SPS LG Electronics, ZTE, Samsung, CATT, Huawei, HiSilicon

Agreements:
- An SL SPS RNTI different from SL dynamic scheduling RNTI is defined.
- The following two fields are additionally included in the existing dynamic scheduling DCI (i.e., DCI 5A).

Petitioners' Exhibit 1007, p. 290
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Working assumption:
  - SL SPS configuration index : 3 bits
  - Activation/release indication : 1 bit
- Each SL SPS DCI contains a single SPS configuration index.
- If the number of information bits in SL SPS DCI format mapped onto a given search space is less than the payload size of DCI format 0 mapped onto the same search space, zeros shall be appended to SL SPS DCI format until the payload size equals that of DCI format 0 including any padding bits appended to DCI format 0.
  - FFS whether the size of SL SPS DCI format can be larger than the size of DCI format 0 on the same search space.

R1-1610812 WF on DCI design for V2X UL SPS LG Electronics, Samsung, ZTE, NTT DOCOMO, Huawei, HiSilicon

Agreements:
- Working assumption: A V2X UL SPS RNTI different from the legacy SPS C-RNTI is defined.
- The following existing field in DCI 0 (for the legacy UL SPS activation/release) is reused to indicate V2X UL SPS configuration index.
  - Working assumption: Cyclic shift DM RS (3bits)
    - TPC command (2 bits) can be considered as an alternative if this working assumption is not confirmed.
- Each UL SPS DCI contains a single SPS configuration index.

Not treated.

7.2.1.2.2 Details of resource selection using partial sensing by pedestrian Ues

R1-1610739 WF on P-UE sensing timeline in partial sensing Huawei, HiSilicon, NTT Docomo
R1-1611016 WF on P-UE sensing timeline in partial sensing Huawei, HiSilicon, Sequans, ZTE, Sony

Agreement:

- The following aspects needs to be addressed to define resource selection based on partial sensing
  - How to determine the subset of subframes in which UE performs sensing
  - How to determine the subset of subframes for the candidates of resource selection
  - How to relate these two subsets
- Study the above aspects in terms of PRR and energy consumption:

Not treated.

R1-1608658 Discussion on the necessity of differentiating P-UE and V-UE Huawei, HiSilicon

7.2.1.3 Long-term basis co-channel coexistence between DSRC/IEEE 802.11p and LTE PC5 for V2V operating over the same frequency channels

Target is to complete this by RAN#74. Solution(s) to be specified should avoid negative impact on the performance of LTE PC5. Possible solutions identified during the study item are "Geo-location and database," "Time sharing between systems based on GNSS timing," and "Sensing-based vacate/switching approaches with or without transmission of a predetermined signal(s)."

R1-1608594 Coexistence of 802.11p and V2V services Huawei, HiSilicon
R1-1609185 Considerations on the co-channel coexistence of multiple RATs for V2X LG Electronics
R1-1610418 Co-channel coexistence for DSRC and LTE-V2V Qualcomm Incorporated (R1-1609958)

R1-1610728 WF on ITS Coexistence Mechanisms Ericsson, Huawei, HiSilicon

Agreements:

- The following two aspects need to be discussed with regard to the usefulness of an detection option
  - Usefulness when IEEE802.11p detects LTE
  - Usefulness when LTE detects IEEE802.11p
- Study until the next meeting on the usefulness of the following options
  - Option 1: Detecting the pattern of LTE CP
  - Option 2: Detecting a sequence of LTE transmitted within the last symbol of a subframe
  - Option 3: Detecting periodically transmitted LTE signal (e.g., SLSS)
  - Option 4: Measuring energy

Not treated.

7.2.1.5 Aspects transferred from WI LTE SL_V2V-Core

7.2.1.5.1 Congestion control for PC5-based V2X

Including load balancing across multiple carriers

Congestion level measurement metric definition
R1-1609709 Radio measurements for congestion control for V2X Ericsson
R1-1608990 Discussion on congestion control Samsung
Section 3

Congestion control mechanism
R1-1609960 Congestion control for V2V Qualcomm Incorporated
R1-1609459 Sidelink congestion control for V2X services Intel Corporation
Sections 3, 5, 6
R1-1609187 Discussion on congestion control for PC5-based V2X LG Electronics
Section 2.2, 2.3

R1-1610753 WF on congestion control Huawei, HiSilicon, Ericsson, OPPO, Nokia
Also supported by NEC

Agreements:
- Channel busy ratio (CBR) is defined for the congestion measurement over PC5 in V-UEs
  - CBR is the portion of sub-channels whose S-RSSI exceed a (pre-)configured threshold observed during (working assumption: 100 ms).
    - Only the sub-channels included in the resource pool are used for the measurement.
    - FFS whether additional separated measurement is needed for SA pool.
  - For a UE in Mode 3, the eNB indicates a set of resources on which the UE perform this measurement
  - For a UE in Mode 4, the measurement is pool-specific.
    - A UE measures at least on its current TX pool(s).
      - FFS whether a UE measures on a pool which is not its current transmission pool.
    - RAN1 will not optimize this measurement to address the case of multiple TX pools
- UE Reporting of CBR to eNB is supported
  - Details up to RAN2 including any possible additional averaging at higher layer
- Send LS to RAN2/4 to inform this agreement.

Not treated.

R1-1609188 Discussion on power cotrol for simultaneous SL TX and WAN TX in different carriers LG Electronics
R1-1609347 Timing alignment for cross-carrier operation Huawei, HiSilicon

7.2.1.5.3 Remaining enhancement to sidelink synchronization

Including SLSS-based synchronization and offset to shift the DFN #0 w.r.t the reference timing derived from GNSS.

LS received during the week:

Petitioners' Exhibit 1007, p. 293
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610798 LS on DFN offset RAN2, Huawei

Agreement: Send an LS response to R1-1610798 with the following starting point:

- RAN1 has no concern because the network configuration for this offset can be aligned with the offset in the pre-configuration.

R1-1610847 [Draft] LS response on DFN offset [RAN WG1], Ericsson
Decision: The document is noted and final LS is agreed in R1-1610929 with correcting the WI code to "LTE_V2X-Core."

R1-1609720 Receiver Timing Assumptions for V2V SL Operation Ericsson

Agreements:

- Reuse Rel-12 D2D mechanism of indicating synchronization of each RX pool with the following change:
  - GNSS can be added or can replace the cell ID.
- It is RAN1's understanding that a single FFT per carrier can be used to receive these Sidelink processes (note that this does not imply anything about whether the UE is expected to receive on more than one carrier simultaneously).
- RAN1 understanding is an IE similar to the current SL-SyncConfig can be reused for the case where GNSS is among the synchronization reference of a pool. Details are up to RAN2.
- UE selects only one transmission synchronization reference at a time based on the synchronization reference selection procedure.
- The TX pool (pre-)configuration includes the type(s) of sync reference that is allowed in using each pool.
  - For a pool, specification supports any combination of the following:
    - SyncRef directly or indirectly derived from eNB
      - This includes UE's own timing and SLSS originated from a stand-alone UE
    - SyncRef directly or indirectly derived from GNSS

R1-1610672 Way Forward on the SLSS Transmission Huawei, HiSilicon, Qualcomm , LG Electronics, Ericsson, Samsung, CATT, ITRI, NTT DOCOMO, OPPO, Nokia, ASB

Agreements:

- If the vehicle UE has selected the GNSS as syncRef,
  - For the OOC case:
    - The UE transmits SLSS and PSBCH every synchronization period when the SLSS resource is pre-configured and the UE is capable of SLSS/PSBCH transmission;
      - FFS whether any SLSS/PSBCH dropping behaviour is specified, e.g., for congestion control.
  - For the InC case:
    - Rel-12 D2D mechanism is reused, i.e.:
      - RSRP threshold or dedicated signaling to determine the SLSS transmission
  - When GNSS is the highest priority, the UE is not expected to read SLSS from other UEs.
- UE capability of SLSS transmission/reception will be discussed later.

Friday:
Ericsson→ comment to the following WA adding the statement "UE indirectly synchronized to GNSS"
LGE (rapporteur)→ suggested to add it as FFS note
Agreement is modified as shown below and RAN1 chair tasked rapporteur to prepare an LS to RAN2/RAN4 (see R1-1611061)

Agreements:

- Rel-12 mechanism is re-used to determine the subframe used for transmissions of SLSS/PSBCH from out-coverage UEs synchronized to SLSS, i.e., two SLSS resources are pre-configured for an out-coverage UE, one is used for SLSS of UE's syncRef and the other is used for SLSS transmission of the UE.
- Working assumption: An out-coverage UE directly synchronized to GNSS transmits SLSS/PSBCH on the pre-configured sync resource which is one of the two preconfigured sync resources.
  - FFS: Out-coverage UE indirectly synchronized to GNSS
  - In the other resource, the UE receives PSBCH potentially transmitted from an in-coverage UE.
- FFS whether a UE that selected SLSS ID = 0 as its sync reference transmits SLSS = X (FFS 0 or 168) and PSBCH in a different resource.
  - FFS PSBCH content if transmits

R1-1610673 Way Forward on Sync Priority for OOC Huawei, HiSilicon, LG Electronics, Qualcomm, ZTE, ITRI, DCM, Xinwei, Samsung, NEC, CATT, Ericsson, Nokia, ASB

Petitioners' Exhibit 1007, p. 294
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreements:

- If the UE detects no eNB in a carrier which is (pre-)configured as the carrier which potentially includes eNBs used as sync reference, the following priority rules should be applied:
  - P1: GNSS
  - P2: the following UE has the same priority:
    - UE directly synchronized to GNSS
    - UE directly synchronized to eNB
  - P3: the following UE has the same priority:
    - UE indirectly synchronized to GNSS (if RAN1 decides to differentiate between direct and indirect synchronization to GNSS)
    - UE indirectly synchronized to eNB
  - P4: the remaining UEs have the lowest priority.
- The priority order between P1 and P2 can be (pre-)configured.
  - Note: It is RAN1 understanding that P1 will be prioritized over P2 if the eNB prioritizes GNSS over eNB timing.

Agreement: If the UE detects an eNB in a carrier which is (pre-)configured as the carrier which potentially includes eNBs used as sync reference,

- If GNSS is prioritized over eNB by eNB configuration, UE directly or indirectly synchronized to GNSS has a higher priority than eNB.

R1-1610711 Way Forward on the pre-defined SLSS IDs for the GNSS timing Huawei, HiSilicon, ZTE, Samsung, ITRI, CATT, LG Electronics, NTT DOCOMO, Qualcomm, Nokia, ASB

Agreement: For the V2V PC5 SLSS

- If the vehicle UE has selected the GNSS as syncRef and acts as a synchronization source, SLSS ID is set to 0 for SLSS transmissions.

R1-1610740 Way Forward on V2V PC5 SLSS transmission Huawei, HiSilicon, OPPO, ITRI

Proposed agreements:

- When a UE loses GNSS, the UE still transmits the synchronization signal based on its previous GNSS timing for a certain time duration (timer definition and duration up to RAN2/RAN4)
- Send LS to RAN2 and RAN4

Agreement:

- PSBCH contains 48 bits
- DM RS OCC of PSBCH

Orthogonal sequence	$\left[w^{\lambda}(\cdot)\right]$	$[+1 \quad +1]$ if $N_{\mathrm{ID}}^{\mathrm{SL}} \bmod 2 = 0$ $[+1 \quad -1]$ if $N_{\mathrm{ID}}^{\mathrm{SL}} \bmod 2 = 1$	$[+1,+1,+1]$ if $N_{\mathrm{ID}}^{\mathrm{SL}} \bmod 2 = 0$ $[+1,-1,+1]$ if $N_{\mathrm{ID}}^{\mathrm{SL}} \bmod 2 = 1$

Not treated.

7.2.1.5.4 Handle multiplexing V2V with other signals/channels

E.g., handling the case where the bitmap for V2V subframes does not repeat an integer number of times within the DFN period

R1-1608722 Multiplexing V2V with other signals/channels CATT
R1-1608992 Remaining details on resource pool configuration Samsung
R1-1609190 Time domain multiplexing of V2V subframes and other signals/channels LG Electronics
R1-1609726 Pool design for V2V Ericsson
R1-1610220 Considerations on handling wrap-around issue in subframe pool configuration for V2V Innovative Technology Lab Co.
R1-1610363 Discussion on subframe bitmap for V2V communication Intel Corporation

R1-1610708 WF on handling multiplexing V2V with other signals/channels LG Electronics, Samsung, Intel

Agreements:

- A pool is configured with a number of reserved subframes such that the bitmap is repeated in an integer number within the DFN range.
  - V2V logical subframe index is not allocated to a reserved subframe.
  - The location of the reserved subframes is indicated by an implicit way (details FFS until next meeting).

7.2.1.5.5 Support for traffic with smaller periodicity on PC5 based V2V using shorter resource reservation period

R1-1609191 Discussion on support of small periodicity resource reservation LG Electronics
R1-1609365 Details for supporting traffic with smaller periodicity on PC5 based V2V Huawei, HiSilicon

R1-1609962 Low latency support for V2V Qualcomm Incorporated

R1-1610713 WF on supporting traffic with small periodicity for LTE-V2X Huawei, HiSilicon, LG Electronics, Qualcomm, Ericsson

Agreements:

- Support i as 1/5, 1/2 (Pstep fixed at 100) with resource-pool specific configuration of the set of allowed i
  - No change to sensing window and selection window
- Use undefined states of the 4-bit resource reservation field in SCI format 1 to indicate shorter periodicity.
- FFS the following aspects till the next meeting
  - Scale the SL_RESOURCE_RESELECTION_COUNTER to 2(for 50ms period) or 5 (for 20 ms period)
  - S-RSSI measurement interval is (select one of the options at the next meeting)
    - 100 ms interval is kept
    - set to the minimum allowed i
    - set to the resource reservation interval used for transmission of the UE
    - Combination of allowed intervals {20, 50, 100} with shortened averaging duration
  - In step2, reselection UE scales the number of reservations of other UE within selection window by 1/i when 0<i<1.

R1-1610913 WF on enhancement in step 2 for supporting shorter periodicity LG Electronics, CATT

R1-1610932 WF on supporting 50ms periodicity CATT

7.2.1.5.6 Prioritization of SL TX for V2X over WAN TX under eNB management

E.g., SL gap

R1-1609718 On the Need for V2V Gaps Ericsson
R1-1609790 On Prioritization of V2V Sidelink TX over WAN UL TX Nokia, Alcatel-Lucent Shanghai Bell
R1-1609963 Sidelink gap for V2V transmission Qualcomm Incorporated
R1-1610036 Discussion on eNB management of prioritizing V2x SL Tx over WAN Tx NTT DOCOMO, INC.

R1-1610709 WF on prioritization of SL TX over UL TX LG Electronics, NTT DOCOMO, ZTE, NOKIA, Alcatel-Lucent Shanghai Bell, CATT, Samsung
Also supported by Qualcomm

Proposed agreements:
- From RAN1 viewpoint, the following three cases can be supported regarding simultaneous operation of UL TX and SL TX.
  - Case 1: UL TX and SL TX use separate TX chains and separate power budget
  - Case 2: UL TX and SL TX use separate TX chains but sharing power budget
  - Case 3: UL TX and SL TX share TX chains and power budget
- Send LS to RAN2/4 to inform this understanding and to ask it to be reflected in the UE capability discussion.
- When UL TX overlaps in time domain with SL TX then SL TX is prioritized over UL TX if the PPPP of SL packet is above a (pre)configured PPPP threshold.
  - In case of overlapping in the same carrier frequency, the UE shall drop the UL TX.
  - In case of overlapping in different carrier frequency, the UE shall allocate power to the SL TX first.
    - UL TX power is up to UE implementation (including dropping UL TX).
- Send LS to RAN2/4.

R1-1610973 Way forward on prioritizing V2x SL Tx over WAN Tx NTT DOCOMO, LGE, ZTE, NOKIA, Alcatel-Lucent Shanghai Bell, CATT, Samsung, Qualcomm

Agreement: When UL TX overlaps in time domain with SL TX in the shared (or same) carrier frequency,
- the UE shall drop the UL TX if the PPPP of SL packet is above a (pre)configured PPPP threshold, otherwise SL TX is dropped

7.2.1.5.7 Other

R1-1609412 Discussion measurement metric and report for zone based resource management in V2V service ITRI
R1-1609730 Resource allocation for exceptional pools Ericsson

Agreement: Include the following previous RAN1 agreement in the LS which will be sent to RAN WGs to inform all the agreements made in RAN1#86bis
- QPSK and 16QAM are supported in SL-based V2X

7.2.2 Enhancements on Full-Dimension (FD) MIMO for LTE - WID in RP-160623

R1-1609964 Discussion on advanced CSI reporting for eFD-MIMO Qualcomm Incorporated

R1-1610761 WF on Number of Ports Supported in Advanced CSI Huawei, HiSilicon, MediaTek, ZTE, ZTE Microelectronics, Nokia, ASB, Deutsche Telekom, Samsung, Intel, CATT, Xinwei, InterDigital, Oppo, AT&T, China Unicom, ITRI

Working Assumption:

- {4,8,12,16,20,24,28,32} CSI-RS ports are supported in advanced CSI
- Aim for a unified structure, with a single common CSI reporting mechanism which is dimensioned or scalable to support all the numbers of ports
- If it turns out that a particular number of ports is not smoothly supportable, then it can be removed from the list

R1-1610636 WF on Advanced CSI Codebook for eFD-MIMO Samsung, NTT DOCOMO, KT Corporation, AT&T, Mitsubishi Electric, Straight Path, NEC

Proposal:
Rank-1

- $\mathbf{W}_1$: Rel. 13 Class A rank 1 $\mathbf{W}_1$ codebook for Codebook-Config = 2, 3, and 4.
- $\mathbf{W}_2$:
  - Beam selection: L out of 4 beam selection, where L = 2,4
  - Co-phasing per beam: from QPSK {1,j,-1,-j} for l =0,1,…,L-1
  - Coefficient: from QPSK {1,j,-1,-j} for l =1,..,L-1
  - Overhead:
  - i1 or ($i_{1,1}$,$i_{1,2}$): Same as Rel. 13 Class A rank 1 codebook
  - FFS: overhead for i2

Rank-2

- $\mathbf{W}_1$: Rel. 13 Class A $\mathbf{W}_1$ codebook for Codebook-Config = 2, 3, and 4.
  - Alt 0: Class A rank 1 $\mathbf{W}_1$ based
  - Alt 1: Class A rank > 2 $\mathbf{W}_1$ based
  - FFS: down selection between Alt 0 and Alt 1 (and which rank(s) are used)
- $\mathbf{W}_2$:
  - Beam selection: L out of 4 beam selection, where L = 2, 4
  - Co-phase: from QPSK {1,j,-1,-j} for l = 0,1,…,L-1 and for layer r = 0,1
  - Coefficient: from QPSK {1,j,-1,-j} for l = 1,..,L-1 and for layer r = 0,1
  - Design goal: i_2 reporting overhead should be at most equal to that for rank 1

R1-1610772 Way Forward for Quantized Advanced CSI Feedback Structure Ericsson, Huawei, HiSilicon, ZTE, ZTE Microelectronics
Also supported by CATT

Proposal:

- Reduced space basis (eigenvectors)/W1 is constructed based on selecting orthogonal 2D DFT beams
  - TBD: if polarization cophasing is in W1
  - Basis has rotation with oversampling corresponding to at least O1=O2=4
  - Downselect from:
    - Unconstrained selection of N beams
    - Constrained selection using a beam group / beam groups
- Phase and amplitude weighting is applied to combine selected beams from W1
  - Phase weighting is subband, downselect from:
    - Separate weighting for each layer, with [2 or 3] bits quantization per beam per layer
    - Joint encoding of weighting across layers, with [3] bits quantization per beam
  - Downselect amplitude quantization from:
    - Frequency granularity:
      - Wideband using [1 - 3] bits
      - Differential using [1] bits / subband
      - Absolute using [1-3] bits / subband
    - Layer granularity:
      - Same amplitude for all layers
      - Different amplitude for each layer
  - TBD: if quantization granularity/bits vary per layer and/or per beam
  - TBD: if amplitude and phase are jointly encoded

Petitioners' Exhibit 1007, p. 298
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Updated version in: R1-1611018 **Way Forward for Quantized Advanced CSI Feedback Structure Ericsson, Huawei, HiSilicon, ZTE, ZTE Microelectronics, CATT, Qualcomm**

Conclusion: More discussion is needed. Email discussion for considering the above two proposals and any possible refinement/updates/merging (including the revised way forward in R1-1611018), Samsung as moderator until October 27th

Not treated.

7.2.2.1.4 Non-precoded CSI-RS codebook for 20 – 32 ports

R1-1609851 Email summary: [86-14] FD-MIMO Port Layouts and Oversampling Factors Ericsson

Strive to conclude on (N1,N2,O1,O2) combinations for Class A reporting in RAN1#86b, starting from the proposal of R1-168511. Further discuss the following, addressing if and how complexity is impacted and considering performance:

1. The necessity of 3 oversampling factors
2. Why we need both N1>=N2 and N2>=N1 combinations

R1-1610560 Way Forward on Antenna Port Layouts and Oversampling Factors Ericsson, Sprint, Verizon, DOCOMO, Deutsche Telekom, ATT, Samsung

Agreement:

- Agree on all (N1, N2) combinations on slide 4 of R1-1010560
- Agree on the following table for (O1, O2) combinations (Alt1 of the left table on slide 4 of R1-1610560)

Number of CSI-RS antenna ports, P	(N_1, N_2)	(O_1, O_2) :
20	(2,5)	(8,4)
	(5,2)	(4,4)
	(10,1)	(4,-)
24	(2,6)	(8,4)
	(3,4)	(8,4)
	(4,3)	(4,4)
	(6,2)	(4,4)
	(12,1)	(4,-)
28	(2,7)	(8,4)
	(7,2)	(4,4)
	(14,1)	(4,-)
32	(2,8)	(8,4)
	(4,4)	(8,4)
	(8,2)	(4,4)
	(16,1)	(4,-)

R1-1610942 WF on A codebook enhancements Qualcomm, LG Electronics, Xinwei
Conclusion: no consensus on WF proposed in R1-1610942

Conclusion: The need for extending design principles of Rel.13 Class A codebooks with {20, 24, 28, 32} ports is to be decided in RAN1#87.

Not treated.

R1-1610592 WF on transmission scheme for semi-open loop CATT, Samsung, Nokia, Alcatel-Lucent Shanghai Bell, Intel

Revised in R1-1610598.

Agreements:

- Denote the modulation symbol index as *i*, RE-level PDSCH processing for semi-open-loop MIMO is based on DMRS ports 7/8
  - Rank-1: Tx diversity
    - $\begin{bmatrix} y^{(7)}(2i) \\ y^{(7)}(2i) \\ y^{(8)}(2i+1) \\ y^{(8)}(2i+1) \end{bmatrix} = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 0 & j & 0 \\ 0 & -1 & 0 & j \\ 0 & 1 & 0 & j \\ 1 & 0 & -j & 0 \end{bmatrix} \begin{bmatrix} \mathrm{Re}(x^{(0)}(i)) \\ \mathrm{Re}(x^{(1)}(i)) \\ \mathrm{Im}(x^{(0)}(i)) \\ \mathrm{Im}(x^{(1)}(i)) \end{bmatrix}$
  - Rank-2: co-phasing cycling
    - $\begin{bmatrix} y^{(7)}(i) \\ y^{(8)}(i) \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ \varphi_n & -\varphi_n \end{bmatrix} \begin{bmatrix} x^{(0)}(i) \\ x^{(1)}(i) \end{bmatrix}, \ \varphi_n = e^{j\pi \bmod(i,2)/2}$
- For the purpose of CSI feedback, UE assumes the following beamforming on port 7/8 (to N CSI-RS ports)
  - Dual-stage codebook: W(j)= W1W2(j)
    - W1: wideband i1 (e.g. grid of beams) of rank-2
    - Rank-1 (options to be downselected at RAN1#87):
      - Option 0: SFBC without defined cycling pattern (e.g. codebook subset restriction applicable to i2, and/or hybrid A+B CSI (with second eMIMO type associated with single-stage codebook), and/or Class B)
      - Option 1: SFBC only + fixed beam selection
      - Option 2: SFBC + per-N-PRB-pair cycling with defined cycling pattern
        - W2(j): pre-determined set of beam selection matrices of rank-2
          - W2(j) cycling per PRG, where PRG comprises N consecutive PRB pairs
          - value of N FFS
          - size/order of beam selection matrices for cycling FFS
    - Rank-2 (options to be downselected at RAN1#87)
      - Option 0: without defined cycling pattern (e.g. codebook subset restriction applicable to i2, and/or hybrid A+B CSI (with second eMIMO type associated with single-stage codebook), and/or Class B)
      - Option 1: fixed beam selection
      - Option 2: per-N-PRB-pair cycling with defined cycling pattern
        - W2(j): pre-determined set of beam selection matrices of rank-2
          - W2(j) cycling per PRG, where PRG comprises N consecutive PRB pairs
          - value of N FFS
          - size/order of beam selection matrices for cycling FFS
  - If the CQI reporting is configured to be based on the Single-stage codebook: W(j)
    - 2 CSI-RS ports: identify matrix (i.e. no PMI feedback)
    - 4 CSI-ports: Per-PRB-pair cycling of W(j), where W(j) = C_k, k=mod(j,4)+12, C_k denotes the rank-2 precoding matrix of index k
  - NOTE: j denotes PRB pair index
  - FFS rank-3/4

R1-1610613 WF on CSI feedback for DMRS open loop transmission Huawei, HiSilicon, CATT

Proposal:

- For Class A in case of semi-open-loop operation, two CSI reporting types for dual stage codebook are supported including
  - Type A: i1, CQI, RI
  - Type B: i1, CQI, RI and subsampled i2,
    - FFS: detailed i2 subsampling
  - Type A or Type B is configured by RRC signalling

Conclusion: No consensus.

Not treated.

7.2.2.3 UL DMRS

R1-1609197 Remaining details on UL DMRS enhancement LG Electronics
R1-1609467 Discussion on UL DM-RS with IFDMA structure Intel Corporation
R1-1609849 On RPF, Control Signalling, and Power Boosting for UL DMRS Ericsson
R1-1608928 Remailing details of UL DMRS Base Sequences with IFDMA Nokia, Alcatel-Lucent Shanghai Bell
R1-1609850 On new UL DMRS sequences of lengths 6, 18 and 30 Ericsson
R1-1609925 Discussion on DMRS sequence design Huawei, HiSilicon

R1-1610591 WF on UL DMRS Nokia, Alcatel-Lucent Shanghai Bell, NEC

Agreements:

- IFDMA details
  - IFDMA DMRS with RPF=2 only will be supported in Rel-14
  - Lengths of 6, 18 and 30 DMRS based sequences are supported for RPF=2
    - Length-30 base sequence is FFS until RAN1#87 (e.g. Table 6 in R1-1609850)
    - Length-18 base sequences design refer Table 3 in R1-1608928
    - Length-6 base sequence design refer to Table 4 in R1-1609850
  - Additional 3dB power boosting is used for IFDMA DMRS with RPF=2
- Cyclic Shift of UL IFDMA DMRS Generation:
  - If IFDMA is activated according to control signaling,
    - reference signal sequence on even subcarriers is $r_{u,v}^{(\alpha)}(n) = e^{j\alpha n}\bar{r}_{u,v}(n), \quad 0 \le n < M_{\text{sc}}^{\text{RS}}$
    - reference signal sequence on odd subcarriers is $r_{u,v}^{(\alpha)}(n) = e^{j\frac{\alpha}{2}} e^{j\alpha n}\bar{r}_{u,v}(n), \quad 0 \le n < M_{\text{sc}}^{\text{RS}}$
      - where $M_{\text{sc}}^{\text{RS}} = mN_{\text{sc}}^{\text{RB}}/2$ is the length of the reference signal sequence, where $1 \le m \le N_{\text{RB}}^{\max,\text{UL}}$ and $n_{\text{cs},\lambda} = \left(n_{\text{DMRS}}^{(1)} + n_{\text{DMRS},\lambda}^{(2)} + 2n_{\text{PN}}(n_{\text{s}})\right) \bmod 12$.

FFS until RAN1#87:

- Comb hopping is supported including inter-slot hopping and inter-subframe hopping
  - Inter-slot comb hopping is dynamically indicated by UL DCI.
    - FFS on details of signalling design.
  - Inter-subframe comb hopping, applying to initial transmissions and retransmissions and SPS, can be semi-statically configured by RRC signalling
  - Support of both inter-slot and inter-subframe comb hopping is not precluded
- Companies are encouraged to bring system level simulations to RAN1#87 to show the gain of comb hopping.

Conclusion: CS/OCC/IFDMA Mapping Table:

- Down-select at RAN1#87 one solution from the two candidates on slides 6 & 7 in R1-1610591, or the table below Proposal 3 in R1-1608603, for joint CS/OCC/IFDMA indication
  - Note: if intra-subframe Comb hopping is supported, comb id or IFDMA configuration in the tables refers to comb id in slot #0 for two slots of a subframe. FFS comb id in the slot #1.

R1-1610611 WF on RPF4 support for UL DMRS Huawei, HiSilicon, Nokia, ASB

R1-1610612 WF on sequence collision for UL DMRS Huawei, HiSilicon

Proposal:

- Root sequence index for DMRS with RPF=2 is determined with 4*q, wherein, q is the root sequence index of legacy DMRS sequence in the cell.

Conclusion: no consensus.

IPR2024-01121

R1-1608687	Discussion on UL DMRS enhancement for eFD-MIMO	ZTE, ZTE Microelectronics
R1-1608729	Consideration on UL DMRS enhancements	CATT
R1-1608929	Control Signaling Design for UL DMRS with IFDMA	Nokia, Alcatel-Lucent Shanghai Bell
R1-1609022	Further discussion on UL DMRS enhancement for eFDMIMO	Samsung
R1-1609148	Discussion on backward compatibility for IFDMA based scheme	NEC
R1-1609848	On Cyclic Shifts for UL DMRS with IFDMA	Ericsson
R1-1609969	Remaining details on uplink DMRS enhancements for FD-MIMO	Qualcomm Incorporated
R1-1610570	Way forward on IFDMA based DMRS	Intel, Qualcomm
R1-1610597	WF on downlink control signaling for IFDMA based DMRS	Huawei, HiSilicon

7.2.2.4 Non-precoded CSI-RS

R1-1609970	**Non-precoded CSI-RS design for up to 32 ports**	**Qualcomm Incorporated**
R1-1608600	**Discussion on non-precoded CSI-RS up to 32 CSI-RS ports**	**Huawei, HiSilicon**
R1-1609842	**Remaining details on aggregation of CSI-RS configurations**	**Ericsson**

R1-1610595 WF on Nk and Mk for 20 and 28 port CSI-RS Samsung, LGE, CATT, Nokia, ASB, InterDigital, Intel

Agreement:
- For {20, 28} ports, $\Sigma_k M_k \in \{20, 28\}$, $M_k = 4$, where M_k is the same for all k
  - At least for CDM-4

Qualcomm and ZTE note that this agreement implies that port sharing with Rel-12/13 UEs is not supported.

R1-1610593 WF on aggregation for non-precoded CSI-RS ZTE, ZTE Microelectronics, Qualcomm

Proposal:
- For {20, 28} ports, $\sum_k M_k \in \{20, 28\}$, $M_k \in \{4, 8\}$, where M_k can be different for different k at least for CDM-4
  - FFS port indexing

R1-1610596 WF on CSI-RS design for CDM 4 and CDM 8 LG Electronics, Ericsson, Qualcomm, CATT

Agreement: Working Assumption is confirmed that CDM8 is supported for {24,32} port CSI-RS

R1-1610741 WF on CSI-RS design for CDM-4 and CDM-8 LG Electronics, Ericsson, Qualcomm, CATT, Samsung

Agreements:
- For 20-, 24-, 28-, and 32-port CSI-RS, when CDM-4 OCC applies in the CDM group comprising 4 REs within k-th CSI-RS configuration, according to the table below.
  - For N_k=4, 4REs mapping to legacy 4-port CSI-RS comprises a CDM group.
  - For N_k=8, 8 REs mapping to legacy 8-port CSI-RS are partitioned into two groups of 4 REs, and each group of 4 REs located adjacently comprises a CDM group:

  - 

OCC index	OCC on REs [a b c d]
0	[1 1 1 1]
1	[1 -1 1 -1]
2	[1 1 -1 -1]
3	[1 -1 -1 1]

- FFS on additional CDM-4 pattern(s) at least for 28- and 32-port to support full power utilization within a single PRB.
- CDM-8 design for {24, 32} ports:
  - At least for 32-port CSI-RS, at least one CDM-8 pattern exists which uses REs from more than 2 OFDM symbols
  - FFS until RAN1#87:

Petitioners' Exhibit 1007, p. 303
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- which CDM-8 patterns are useful, and
- downselection between:
  - Alt 1: CDM-8 patterns are configured by aggregation of CDM-2/4 patterns
  - Alt 2: CDM-8 patterns are defined in the specifications without explicit aggregation

- Overhead reduction for CDM-8 is FFS
- Note: CDM-8 can be supported in both normal and special subframes

R1-1610623 WF on CSI-RS density values for Class A Ericsson, LG

Agreement:

- For Class A eFD-MIMO, a CSI-RS density value of 1/3 is supported in addition to already agreed values of 1 and ½
- No other values of CSI-RS density are supported in this Release.

R1-1610624 WF on CSI-RS overhead reduction for Class A Ericsson, Samsung

Agreement:

- For Class A, CSI-RS overhead reduction is supported by Comb-like transmission, allowing PDSCH transmission in the REs in PRBs with no CSI-RS ports
  - UE measures channel in REs in PRBs with CSI-RS ports and expects PDSCH in PRBs with no CSI-RS ports

R1-1610594 WF on signalling details for CSI-RS overhead reduction Samsung, ZTE, Ericsson, DoCoMo, InterDigital

Revised in R1-1610602

Agreements:

- For Class B NZP CSI-RS:
  - Support CSI-RS density of d ∈ {1,1/2} RE/RB/port
  - Additional values of d=1/3 and/or 1/8 are not precluded for Class B if significant benefit can be shown at RAN1#87.
- Transmission and/or measurement comb offsets are 0..1/d-1
  - For d=1/2 (i.e. for Class A & Class B), comb offsets ∈ {0, 1} can be configured for CSI-RS transmission and/or measurement in the n-th PRB, where n mod 2 = comb offset
  - For d=1/3 (i.e. at least for Class A), comb offsets ∈ {0, 1, 2} can be configured for CSI-RS transmission and/or measurement in the n-th PRB, where n mod 3 = comb offset
- Working Assumption: For Class A NZP CSI-RS with more than 16 CSI-RS port, in a given CSI-RS resource all CSI-RS configurations have the same values of *d*
  - Will be confirmed automatically at RAN1#87 unless there is consensus to support different values of *d* per CSI-RS configuration
- For Class A NZP CSI-RS with more than 16 CSI-RS ports each CSI-RS configuration can have different values of comb offset
- FFS the detailed signalling design

R1-1610718 WF on the overhead reduction for Class B CSI-RS Intel

Proposal:

- For Class-B eMIMO type and CSI-RS resource with two or more antenna ports with *alternativeCodebookEnabledCLASSB_K1=True*, the channel measurements obtained from CSI-RS antenna ports are renumbered for CSI calculation according to the following equation:

$$p = \begin{cases} 15+i & \text{for } p' \in \{15,\ldots,15+2i\} \\ 15+i+\dfrac{N_{\text{ports}}^{\text{CSI}}}{2} & \text{for } p' \in \{16,\ldots,15+2i+1\} \end{cases}$$

$$i = \{0,1,\ldots,\frac{N_{\text{ports}}^{\text{CSI}}}{2}-1\}$$

- CSI-RS antenna ports of CSI-RS resource can be transmitted in different PRBs
- Signalling details of PRB density and PRB offsets for antenna ports are FFS

Petitioners' Exhibit 1007, p. 304
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Not treated.

7.2.2.5 Other remaining issues

7.2.2.5.1 Aperiodic and frequency domain reduced overhead CSI-RS

Activation/release mechanism

R1-1610635 WF on Aperiodic CSI-RS for eFD-MIMO Samsung, CATT, LG Electronics, Nokia, Alcatel-Lucent Shanghai Bell, ZTE, ZTE Microelectronics, InterDigital, Xinwei, Huawei, HiSilicon, KT Corporation, AT&T, Mitsubishi Electric, Straight Path, Qualcomm

Agreements:

- For activation/release mechanism:
  - MAC CE is used to signal the choice of N out of K RRC-configured CSI-RS resources
    - The value of N is configurable via higher-layer signalling and upper bounded by a UE capability parameter Nmax
      - Nmax for aperiodic and multi-shot periodic CSI-RS can be different.
    - When $K \leq 2$, $N=K$; else (when $K > 2$) $N = \{1, 2, \ldots, \min(4,K)\}$
      - Note: If the above value of N exceeds Nmax, N = Nmax is used instead.
      - Note: Activation/release mechanism is skipped for aperiodic CSI-RS when $K = 1$ or N
- The above MAC-CE-based activation/release mechanism is used for both aperiodic and "multi-shot" CSI-RS.

R1-1610941 WF on MAC CE based activation/release mechanism Qualcomm

Agreements:

- Down select the value for X/Y for MAC CE based activation/release mechanism from (RAN1#87)
  - Alt1. X=Y=4 ms
  - Alt2. X=Y=8 ms
  - Note: For both aperiodic and "multi-shot" CSI-RS

R1-1610615 WF on supporting aperiodic CSI-RS with one resource Huawei, HiSilicon

QCL

R1-1610732 WF on QCL issue for aperiodic CSIRS LG Electronics, Samsung

Proposal:

- For QCL indication on DMRS to aperiodic CSIRS or multi-shot CSIRS,
  - UE is not expected that aperiodic CSIRS is indicated in PQI for QCL purpose with DMRS
  - Multi-shot CSIRS can be indicated in PQI for QCL purpose, and follow legacy QCL assumption.

Conclusion: More discussion is needed over email - moderator (LGE) until October 20th

Rate Matching

Petitioners' Exhibit 1007, p. 305
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610924 WF on remaining details on PDSCH rate matching LG Electronics, InterDigital, Qualcomm, ZTE, ZTE Microelectronics

Proposal:

- For PDSCH rate matching on aperiodic CSI-RS and multi-shot CSI-RS, X-bit (X=1 or 2) aperiodic ZP CSI-RS resource signaling field is introduced in DL-related DCIs for all TMs
  - AP ZP CSIRS resource configuration is defined without subframe_config
  - UE conducts PDSCH rate matching on AP ZP CSIRS at the subframe when the DCI is signaled.
  - If X=1 and only AP ZP CSI-RS resource configuration is configured by RRC, AP ZP CSI-RS resource signaling field descriptions are
    - State '0': No configured AP ZP CSIRS is indicated.
    - State '1': The 1st RRC-configured AP ZP CSIRS is indicated to be applied.
  - If X=1 and more than 1 AP ZP CSI-RS resource configurations are configured by RRC, the above State '1' description is given/activated via MAC CE, choosing one out of the configured AP ZP CSI-RS resource configurations.
  - If X=2 and up to 3 AP ZP CSI-RS resource configurations are configured by RRC, AP ZP CSI-RS resource signaling field descriptions are
    - State '0': No configured AP ZP CSIRS is indicated.
    - State '1': The 1st RRC-configured AP ZP CSIRS is indicated to be applied.
    - State '2': The 2nd RRC-configured AP ZP CSIRS is indicated to be applied.
    - State '3': The 3rd RRC-configured AP ZP CSIRS is indicated to be applied.
  - If X=2 and more than 3 AP ZP CSI-RS resource configurations are configured by RRC, the above 3 non-zero state descriptions are given/activated via MAC CE, each choosing one out of the configured AP ZP CSI-RS resource configurations.
- ZP CSI-RS resource configuration with 1ms periodicity is configured for EPDCCH by higher layer, and considered as EPDCCH available REs and punctured.

Conclusion: More discussion is needed over email - moderator (LGE) until October 20th

DCI signalling

R1-1610815 WF on aperiodic CSI-RS selection Ericsson, NTT DOCOMO

Conclusion:

- 3 alternatives are identified:
  - Alt1 Reuse A-CSI request field and add more bit(s) if necessary
  - Alt2 Reuse CS field (see R1-1610815, R1-1610816)
  - Alt3 Add ceil(log2(N))-bit or 2-bit DCI field
- Decide between the above 3 alternatives over email discussion, moderator (Ericsson) until October 27th

Not treated.

7.2.2.5.2 Hybrid CSI

Mechanism "2"?

R1-1610786 Way Forward on Hybrid CSI Mechanism ZTE, ZTE Microelectronics, NTT DOCOMO, Ericsson, Intel

Proposal:

- For hybrid CSI in one CSI process, support CLASS B with K>1 CSI-RS resources for the 1st eMIMO-Type and CLASS B with K=1 CSI-RS resource for the 2nd eMIMO-Type
  - For the 1st eMIMO-Type
    - CRI (without CQI/PMI/RI) is reported
  - For the 2nd eMIMO-Type
    - CQI/PMI/RI are reported
  - Different CSI-RS resources and/or eMIMO-Types can be used for PUCCH and PUSCH
  - UE calculates one CSI report for only one eMIMO-Type of a pair at a time

Conclusion: More discussion is needed over email - moderator (NTT DOCOMO) until October 20th

R1-1611013 WF on Remaining Issues for Hybrid CSI Samsung, Ericsson

Agreements:

- Confirm working assumption for mechanism 1:
  - No inter-dependence between CSI calculations across two eMIMO-Types
  - Note: ZTE has a concern on this.

Conclusion: More discussion is needed on the proposal below. If the use of PF-3 (e.g. the proposal below) cannot be agreed by RAN1#87 (Reno), the use of PF-2 will be agreed.

- Use PUCCH format 3 (PF-3) for CSI reporting of 1st eMIMO-Type
  - A PF-3 resource is allocated for CSI reporting and/or A/N
- PF resource usage follows legacy-like procedures as follows:
  - For N≥1 CC(s):
    - CSI-only reporting: Use PF-3 resource allocated for CSI
    - A/N-only: If A/N is for Pcell only, use PF-1A/1B resource allocated for A/N. Otherwise use PF-3 resource allocated for A/N
    - CSI and A/N collision: multiplex CSI and A/N using PF-3 resource allocated for A/N
      - For TDD scenario, the DAI is set to be 1 (i.e. PF-1A/B is used only if for PCell and DAI in DCI format is the first DAI with value 1 that the UE detects)

R1-1610731 WF on PUSCH CSI reporting for hybrid CSIRS mechanism 1 LG Electronics, Samsung, Qualcomm

Conclusion: More discussion is needed to choose between the following two alternatives. Email discussion – moderator (Samsung) until October 27th

Alt1. Proposal in R1-1610731

- For aperiodic CSI reporting for hybrid CSIRS mechanism 1
  - Either one of CSI for 1st eMIMO-Type (i.e., 1st CSI) and CSI for 2nd eMIMO-Type (i.e., 2nd CSI) is triggered for aperiodic CSI reporting
    - CSI request field in UL grant DCI is used to indicate either one of the two. FFS whether additional bit(s) are needed
  - For 1st eMIMO-Type, encoding mechanism/mapping on PUSCH is FFS.
  - For 2nd eMIMO-Type, legacy CSI encoding/mapping on PUSCH is reused.

Alt2. Report both eMIMO-Types, but the UE is only required to update one of the two eMIMO-Types

- Example a: A method analogous to Rel.13 CSI relaxation
- Example b: cf. R1-1609853 section 2.2.2. For this solution, the reference resource definition for the 1st eMIMO-Type needs to be changed. There might be some impact on UE behaviors.

Petitioners' Exhibit 1007, p. 307
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- [R1-1609853] "When periodic CSI is not configured for the first eMIMO-Type, its reference resource is in the subframe containing its most recent CSI-RS resource
  - Otherwise, the reference resource for the first eMIMO-Type is that set by periodic CSI"

Conclusion: Email discussion on the proposal below, moderator Hao until October 27th

- Regardless of which alternative is chosen, 1st and 2nd eMIMO-Types can be configured for PUCCH and PUSCH, respectively.

Not treated.

7.2.3 Downlink Multiuser Superposition Transmission for LTE - WID in RP-161019

R1-1610866 Chairman's notes of AI 7.2.3 on Downlink Multiuser Superposition Transmission for LTE Ad-Hoc chair (Qualcomm, MediaTek)

The document was presented by Wanshi Chen from Qualcomm.

Decision: The document is endorsed and content incorporated below.

7.2.3.1 Superposition transmissions

Power ratios

R1-1610802	**Discussion on power ratios for MUST Case 1&2 Huawei, HiSilicon**	(Revision of R1-1608604)
R1-1610304	**Super-constellation based power ratios and gray mapping for MUST**	**KT Corp.**
R1-1609615	**On the set of power ratios for MUST Case 1 and 2**	**Nokia, Alcatel-Lucent Shanghai Bell**

R1-1610724 Way Forward on Power Ratio in MUST Cases 1 and 2 MediaTek, ZTE, ZTE Microelectronics

Agreements

- For MUST Cases 1 and 2, the number of power ratios is
  - 3 for MOD combination of QPSK (MUST-near) + QPSK (MUST-far)
  - 3 for MOD combination of 16QAM (MUST-near) + QPSK (MUST-far)

Working assumption

  - 3 for MOD combination of 64QAM (MUST-near) + QPSK (MUST-far)

R1-1610714 Way Forward on Principle Generating Power Ratio ZTE, ZTE Microelectronics, LG Electronics
R1-1610803 Way Forward on downlink power allocation for MUST Case 1&2 Huawei, HiSilicon, NTT DOCOMO

Agreements:

- In case of MUST Case 1 operation, when MUST near UE is rank2 and MUST far UE is rank1 transmission, the two layers of MUST near UE have the same transmission power

R1-1610804 Way Forward on Power Ratios for Case 1 &2 Huawei, HiSilicon, Qualcomm
R1-1610948 Way Forward on Power Ratios for Case 1 &2 Huawei, HiSilicon, Qualcomm, Nokia, ASB

Agreements:

- The power ratios for different modulation combination are
  { 8/10, 50/58, 264.5/289} for QPSK+QPSK
  { 32/42, 144.5/167, 128/138} for 16QAM+QPSK
  {128/170, 40.5/51, 288/330} for 64QAM+QPSK
- Up to editor to how to capture the values in the specification

Petitioners' Exhibit 1007, p. 308
AT&T et al v. Asustek Technology & Celerity

7.2.3.2 Mechanisms for efficient operation

Related RRC signaling, DCI, UE assumptions, etc.

R1-1610725 Way Forward on DMRS based Transmission Scheme of MUST Case 3 MediaTek, ZTE, ZTE Microelectronics, CMCC
Continue offline till next meeting

R1-1610726 Way Forward on PDSCH Starting Symbol in MUST MediaTek, ZTE, ZTE Microelectronics, Nokia, ASB, ITRI, CMCC
Also supported by Huawei

Agreement: To cancel or suppress interfering PDSCH, MUST UE assumes the same starting OFDM symbol of interfering PDSCH as its own PDSCH

R1-1610729 WF on PDSCH starting symbol LG Electronics, Qualcomm
R1-1610830 WF on MUST control operation Nokia, Alcatel-Lucent Shanghai Bell, Qualcomm
R1-1610947 WF on MUST control operation Nokia, Alcatel-Lucent Shanghai Bell, NEC
R1-1610730 WF on new DCI design LG Electronics, LG Uplus, MediaTek, ZTE, ZTE Microelectronics, Huawei, HiSilicon
Also supported by Sharp, Sony

Agreements:
- MUST operation with RA alignment of interference within near-UE allocation is supported for cases 1 and 2
  - single DCI by adding bits of wideband power ratio and interference presence in the self DCI is supported
- FFS case 3
- FFS MUST operation without RA alignment of interference within near-UE allocation is supported
  - two DCIs are supported
    - FFS on content of two DCIs
    - Aim for minimizing specification impact and reducing complexity

R1-1610809 Way Forward on MUST UE multiplexing Huawei, HiSilicon

Petitioners' Exhibit 1007, p. 309
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Further check whether R1-1610809 is already covered by R1-1610723, R1-1610805 and RP-160680 or not till next meeting

R1-1609930	Discussion on power allocation issue for MUST Case 1&2	Huawei, HiSilicon
R1-1609976	Mechanisms for efficient operation	Qualcomm Incorporated
R1-1609977	MUST UE pairing with existing CQI feedback	Qualcomm Incorporated
R1-1610041	Discussion on remaining issues and signaling design for DL MUST	NTT DOCOMO, INC.

7.2.3.3 Evaluation for MUST using up to 8Tx

Focusing on Case 3 using up to 4Tx CRS-based TMs

R1-1608681	**Discussion and evaluation for MUST Case 3**	**ZTE**
R1-1609604	**System-level evaluation and design requirements for MUST Case 3**	**MediaTek Inc.**
R1-1609931	**Simulation results for MUST Case 3**	**Huawei, HiSilicon**

R1-1610806	**Way Forward on CRS-based MUST Case 3**	**Huawei, HiSilicon, LG Electronics**

Conclusion: There is no consensus in RAN1 to support Case 3 for CRS-based TMs

7.2.4 eMBMS enhancements for LTE - WID in RP-161297

R1-1610867 Chairman's notes of AI 7.2.4 on eMBMS enhancements for LTE Ad-Hoc chair (Nokia, Ericsson)

The document was presented by Matthew Baker from Nokia.

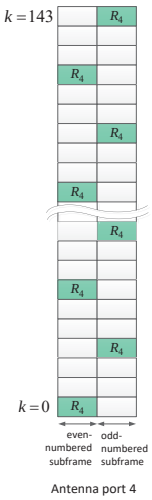
Decision: The document is endorsed and content incorporated below.

LS received in the course of the week:

R1-1610765 LS on RAN2 agreements on FeMBMS

7.2.4.1 Longer cyclic prefix for MBSFN subframe

R1-1609978 Design options for longer cyclic prefix and link level simulation results Qualcomm Incorporated



7.2.4.2 MBSFN-RS pattern for longer cyclic prefix

R1-1609676	**MBSFN reference signal design**	**Ericsson**
R1-1609979	**RS pattern for longer CP**	**Qualcomm Incorporated**
R1-1610310	**eMBMS RS Design Considerations**	**Nokia, Alcatel-Lucent Shanghai Bell**

Agreement:

- Confirm the working assumption from RAN1#86: CP length is 200us and core symbol duration of 800us
- Single RS pattern for this numerology:

Petitioners' Exhibit 1007, p. 310
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Note for minutes: Huawei has a strong concern that this limits flexibility for MBSFN subframe configuration and has poor support for mobility.

Agreement: There is a set of 8 MBSFN RS pseudo-random sequences for the Rel-14 longer-CP subframes.

7.2.4.3 Synchronization and acquisition of system information

R1-1609348 Considerations on increased number of MBSFN subframes Huawei, HiSilicon

R1-1609677 Synchronization and acquisition of system information for FeMBMS carrier Ericsson
R1-1609980 Initial acquisition and system information for eMBMS Qualcomm Incorporated
R1-1610311 eMBMS PSS/SSS/PBCH and SIB1 transmission Nokia, Alcatel-Lucent Shanghai Bell
R1-1610358 System Information modification indication for FeMBMS carrier Ericsson

R1-1610927 Way Forward on eMBMS enhancement Ericsson, Qualcomm, BBC, Nokia, ASB, Intel, EBU, IRT, Dish

Agreements: For synchronization and acquisition of system information on FeMBMS carrier:

- For <100% MBSFN subframes the legacy sync and SI acquisition proceedures are reused based on subframe #0 and #5

Working Assumption: For synchronization and acquisition of system information on FeMBMS carrier:

- For 100% MBSFN subframe allocation FeMBMS carrier transmits a periodic subframe, CAS Cell Acquisition Subframe
  - To be confirmed or revisited at RAN1#87, including:
    - CAS performance (including synchronization performance and link level performance of PDCCH and PDSCH), and capacity analysis, based on the definitions below should be evaluated to the next meeting; details of SI transmission in different system bandwidths should also be provided.
    - Consideration of FDM as an additional mode of operation if all the details (i.e. design, guard band size, specification impact, UE implementation impact analysis) and evaluations showing clear performance benefit (considering the performance targets) are presented at the next meeting
- CAS supports PSS, SSS, CRS, PBCH, PDCCH, PDSCH (SI)
- CAS is always transmitted in subframe #0 with a period of 40ms
- MIB is provided by PBCH in every CAS
- The MIB transmitted in SFN mod 4 = 0 and can change only in SFN mod 16 = 0 and contains systemFrameNumber equal to the 6 most significant bits of the SFN
- SI is provided by PDSCH in CAS
- A first SI that may also contains scheduling of further SI is transmitted in SFN mod 8 = 0 and can change only in SFN mod 16 = 0
- This first SI may be a combination of SIBs, up to RAN2 agreements.
- MCCH change notification and SI modification notification are sent in PDCCH region of the CAS.
- FFS if from RAN1 perspective, it is feasible to transmit muiltiple SI messages in the same subframe by using different RNTIs. RAN2 may consider if this may be used.
- Inform RAN2 that SI modification notification can be conveyed to the UE with Direct Indication signalling.
- FFS enhancements on DCI to indicate larger allocation

Note that this Working Assumption is not based on complete performance evaluations. Complete performance evalutions are to be used in deciding whether to confirm or modify the working assumption at RAN1#87.

LS to be sent to RAN2 to inform them of the above agreements and Working Assumption - R1-1610605 - Alberto

Petitioners' Exhibit 1007, p. 311
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Friday
R1-1610605 [DRAFT] LS regarding agreements for FeMBMS Qualcomm
Decision: The document is noted and final LS is agreed in R1-1611051

R1-1609471 PBCH coverage enhancements for further enhanced MBMS carriers Intel Corporation
R1-1610312 Considerations on PBCH coverage enhancement Nokia, Alcatel-Lucent Shanghai Bell

7.2.4.4 Other

This includes potential CRS reductions in FeMBMS carrier with less than 100% MBSFN subframes

R1-1609981 MBSFN subframes without a unicast control region and cell-specific reference signals Qualcomm Incorporated

Not treated.
R1-1609470 Potential CRS reductions for further enhanced MBMS carriers Intel Corporation
R1-1609678 CRS reductions in FeMBMS carrier with less than 100% MBSFN subframes Ericsson
R1-1609982 Considerations on further CRS reduction Qualcomm Incorporated
R1-1610357 Unicast control region for FeMBMS carrier Ericsson

7.2.5 SRS Carrier Based Switching for LTE - WID in RP-160935

R1-1610868 Chairman's notes of AI 7.2.5 on SRS Carrier Based Switching for LTE Ad-Hoc chair (Huawei)
The document was presented by Weimin Xiao from Huawei.
Decision: The document is endorsed and content incorporated below.

R1-1610647 Way Forward on SRS Carrier-based Switching Huawei, HiSilicon, Softbank

Agreement:
- Send LS with agreements and RRC parameters to RAN2 and RAN4.
  - Content of LS and RRC parameters to be discussed.

Friday
R1-1611009 Draft LS for SRS Carrier-Based Switching Agreements Huawei
Decision: The document is noted and final LS is agreed in R1-1611049
R1-1611042 Draft LS on L1 parameters for SRS Carrier-Based Switching Huawei
Decision: The document is noted and final LS is agreed in R1-1611050

7.2.5.1 Procedures and configurations for SRS/RACH switching and transmission

Including details for selection of switching-from CC, maximum supported RF retuning time, and PHR

R1-1608586 Other considerations on SRS switching Huawei, HiSilicon
R1-1609472 On SRS transmission without PUSCH Intel Corporation
R1-1609683 Parameters for transmission of SRS in carrier based switching Ericsson

Agreement:
- Switching-from CC for a PUSCH-less CC
  - Option 1: rule(s) defined
    - E.g., descending order of CC index, but a CC with higher index may be more tightly coupled with the PCell
  - Option 2: RRC configuration
  - Agreed on option 2.

Note:
- UE is not expected to switch to a deactivated CC.
- For dual connectivity case, only switching within a cell group (MCG or SCG).

Agreement:
- UE may report RF retuning time no longer than X us
  - Option 1: X = 200
  - Option 2: X = 300
  - Option 3: X = 500
  - Option 4: X = 900

Petitioners' Exhibit 1007, p. 312
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Adopt Option 3

Agreement:
- Switching for RACH
  - Switching-from CC: same as SRS and no additional configuration
  - Switching-to CC: based on PDCCH order

Agreement:
- PC parameter further clarifications: (remove subscript of SRS from f(i))
  - $P_{SRS,c}(i) = \min[\ P_{CMAX,c}(i),\ \{10\log_{10}(M_{SRS,c}) + P_{O\_SRS,c}(m) + \alpha_{SRS,c}\cdot PL_c + f_{SRS,c}(i)\}]$ [dB]
  - m=0 for P-SRS and m=1 for A-SRS on a PUSCH-less CC

Agreements:
- PHR
  - If SRS transmitted:
    $PH_{SRS,c}(i) = P_{CMAX,c}(i) - \{10\log_{10}(M_{SRS,c}) + P_{O\_SRS,c}(m) + \alpha_{SRS,c}\cdot PL_c + f_{SRS,c}(i)\}$ [dB]
  - Else:
    $PH_{SRS,c}(i) = \tilde{P}_{CMAX,c}(i) - \{P_{O\_SRS,c}(1) + \alpha_{SRS,c}\cdot PL_c + f_{SRS,c}(i)\}$ [dB]
- SRS
  - Through RRC configuration, allow SRS transmissions on more than 2 UpPTS symbols in the same subframe for the same UE, for A-SRS and P-SRS
    - On the same CC or multiple CCs
  - Allow more than one SRS configurations for the subframe, for A-SRS and P-SRS
    - Reuse existing SRS configurations (1 or 2 UpPTS symbols per SRS configuration)

Agreement:
- PRACH
  - No autonomous Re-Tx of PRACH if UE does not receive RAR
  - Re-transmission is achieved by monitoring PDCCH order
  - Power ramping up follows the current procedure

Not treated.

R1-1608585	Details on SRS switching-from CC and switching-to CC	Huawei, HiSilicon
R1-1608587	Power headroom report for SRS switching	Huawei, HiSilicon
R1-1609029	Configurations for SRS/RACH switching	Samsung
R1-1609344	Details on timing advance for SRS on TDD CCs without PUSCH	Huawei, HiSilicon
R1-1609684	UE reporting of interruption time for SRS in carrier based switching	Ericsson
R1-1609983	Details for SRS and PRACH switching and transmission	Qualcomm Incorporated

7.2.5.2 DCI design

Including details for group DCI design (jointly for TPC and A-SRS trigger), DL DCI design (for A-SRS trigger)

R1-1608588 DCI design for SRS switching Huawei, HiSilicon
R1-1609030 DCI for SRS Triggering and Power Control Samsung

Agreements:
- Group DCI for SRS switching
  - Payload same as 0/1A/3/3A
  - With 1 or more configured group RNTI for the newly introduced group DCI
  - A UE can be triggered for multiple CCs within one group DCI
    - Type A: A single field is used to trigger a group of (one or multiple) CCs if the UE is configured with more than 5 CCs without PUSCH
      - For all the CCs that are triggered by this field, each have a TPC field in this group DCI and the number of bits reserved is decided by the maximum group size among the configured groups
      - Maximum number of CCs of a group: 8
    - Type B: N fields are used to trigger up to N CCs if the UE is configured with less than or equal to 5 CCs without PUSCH
      - TPC field for each of the N CCs is also in this group DCI
  - Number of bits:
    - Trigger field:

Petitioners' Exhibit 1007, p. 313
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- 2 bits for triggering a group of CCs (type A)
- For triggering only single CC (type B),
  - 1 bit for single UL Tx antenna without antenna switching,
  - 2 bits for multiple UL Tx antenna including antenna switching
    - Per UE configured size
  - TPC: UE specifically configured 1 bit or 2 bits
- Search space
  - Common search space in Pcell
- Name of the new group DCI format: leave to the editor
- Also support TPC-only group DCI by not configuring the triggering field
  - UE is not expected to be configured with both TPC-only group DCI and the joint TPC and A-SRS trigger group DCI

- DL DCI formats for trigger
  - Reuse current DL DCI formats with SRS request field (currently 1A/2B/2C/2D)
  - 1 bit in DL DCI for SRS request

R1-1609473	Remaing details of SRS triggering with CC switching	Intel Corporation
R1-1609685	Power control for SRS carrier based switching	Ericsson
R1-1609882	Joint group DCI for SRS switching	Nokia, Alcatel-Lucent Shanghai Bell
R1-1609984	DCI design	Qualcomm Incorporated

7.2.5.3 Details of collision handling

Including details for priority/dropping rules, mechanisms to mitigate the impact of collision (shortened PUSCH), and approaches to help avoid collision

Agreement:

- RRC signalling for HARQ reference configuration same (from RAN1 perspective) as in eIMTA (but not associated with eIMTA)
- Working assumption: RRC configure whether SRS flexible timing applies. No timing ambiguity between eNB and UE for SRS transmission is allowed. Details FFS.

Not treated.

R1-1609985	Collision Handling	Qualcomm Incorporated
R1-1608589	Details on collision handling for SRS switching	Huawei, HiSilicon
R1-1609031	SRS Collisions due to Carrier Switching	Samsung

7.2.6 Further Indoor Positioning enhancements for UTRA and LTE - *WID in RP-161850*

R1-1610869 Chairman's notes of AI 7.2.6 on Further Indoor Positioning enhancements for UTRA and LTE Ad-Hoc chair (Qualcomm)

The document was presented by Wanshi Chen from Qualcomm.

Decision: The document is endorsed and content incorporated below.

7.2.6.1 Remaining issues for OTDOA enhancements

R1-1609475	CRS Usage together with PRS	Intel Corporation
R1-1609987	Introduction of UE inter-frequency RSTD calibration accuracy reporting	Qualcomm Incorporated
R1-1610215	RSTD Reporting Enhancement in OTDOA	Nokia, Alcatel-Lucent Shanghai Bell
R1-1610383	Multipath RSTD reporting per cell for enhanced indoor positioning	Ericsson, Nokia

Petitioners' Exhibit 1007, p. 314
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610384 On combining of CRS and PRS for enhanced indoor positioning Ericsson

R1-1610909 WF on Multipath RSTD Ericsson, Nokia, Qualcomm, Acorn Technology

Agreements:

- RAN1 decides to prioritize the following for the OTDOA enhancement
  - Support Multipath RSTD reporting by UE to E-SMLC
  - Multipath RSTD includes relative timing difference information of up to two additional peaks (i.e., 0, 1 or 2) relative the reference peak for each cell (reference or neighbor).
  - The reference peak of a cell (reference and neighbor) is the peak used for the current RSTD reporting determined by the UE to be the most likely.
  - Based on a maximum relative timing difference of 4μs and a resolution of 0.5Ts, each relative timing difference is represented by an integer in the range [-256…255].
  - TOA reporting and optional uncertainty reporting from UE should be explicitly defined in the LS
  - Note: there will not be new measurement definition intended for 36.214
  - Send LS to RAN2 and cc RAN3 RAN4.

R1-1610527 Way forward on CRS usage together with PRS Intel Corporation, Acorn Technologies, Huawei, HiSilicon, Sony

Agreements:

- Support the use of CRS together with PRS for OTDOA enhancement
  - If CRS usage together with PRS is configured,
    - Signal CP information for CRS if PRS is present.
      - Note: this CP information signaling is additional one to the existing CP signaling for PRS.
    - Quasi-collocation between PRS and CRS is assumed.
    - FFS signaling of CRS presence (e.g., due to MBSFN subframes)
- Send the LS for the above to RAN2 and cc RAN3 RAN4 to be captured for their works.

Friday
R1-1610972 [DRAFT] LS on Multipath RSTD reporting and CRS usage together with PRS Ericsson, Intel
Discussion: Comment that "RAN1 confirms that there is no RAN4 impacts" → no change needed, this is a RAN4 issue.
Decision: The document is noted and final LS is agreed in R1-1611052

7.2.6.2 PRS-based beacons

R1-1609988 Draft CR 36.211: Additional PRS configuration indices for PRS-based Terrestrial Beacon SystemsQualcomm Incorporated
R1-1609989 Draft CR 36.213: Introduction of PRS-only transmission points for PRS-based Terrestrial Beacon Systems Qualcomm Incorporated
R1-1609990 PRS CP length in MBSFN subframes Qualcomm Incorporated
R1-1610427 Discussion of PRS-Based Beacon for Indoor Positioning Nokia, Alcatel-Lucent Shanghai Bell
R1-1610385 PRS patterns for PRS-based TBS for enhanced indoor positioning Ericsson

R1-1610928 WF on PRS-Based RSRP/RSRQ Measurement and Reporting for PRS-Based Beacon Nokia, Alcatel-Lucent Shanghai Bell
Proposals:

- Support PRS-based RSRP/RSRQ measurement and reporting
  - Interface/protocol
    - FFS Alt. 1: PRS-based RSRP/RSRQ measurement configuration and reporting by RRC signalling
    - Alt. 2: PRS-based RSRP/RSRQ measurement configuration and reporting by LPP
  - Number of PRS-based beacons for RSRP/RSRQ measurement and reporting
    - Up to 9 PRS-based beacons per UE for RSRP/RSRQ
  - Value range
    - The value range of PRS-based RSRP: INTEGER (0…97) [Same as RSRP value range in LPP]
    - The value range of PRS-based RSRQ: INTEGER (0…34) [Same as RSRQ value range in LPP]
  - Reporting Mode
    - Alt. 1: Periodic: 120ms, 240ms, 480ms, 640ms, 1024ms, 2048ms, 5120ms, 10240ms, 1min, 6min, 12min, 30min, 60min [Same as E-CID measurement periodicity in LPP]
    - Alt. 2: Aperiodic
    - Alt. 3: Event triggered, for example PRS resource becomes better than absolute threshold

Further discussion until next meeting, especially in relation to an alternative proposal to use CSI-RS for RSRP/RSRQ measurement and reporting in E-CID enhancements

Petitioners' Exhibit 1007, p. 315
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

7.2.6.3 E-CID enhancements

R1-1609351 Further discussion on the same PCI case for E-CID enhancements Huawei, HiSilicon
R1-1609352 Further discussion on the UE Rx-Tx measurement over multiple serving cells Huawei, HiSilicon
R1-1610386 On CSI-RSRP reporting support to E-SMLC for enhanced indoor positioning Ericsson

7.2.6.4 Other

R1-1610387 Defining indoor/outdoor classification for enhanced indoor positioning Ericsson

7.2.7 Uplink Capacity Enhancements for LTE - *WID in RP-160664*

Specification of PUSCH in special subframe, with focus on the design of HARQ timing, TBS determination, UL DM-RS, TTI bundling, related signalling and procedure

R1-1610870 Chairman's notes of AI 7.2.7 on Uplink Capacity Enhancements for LTE Ad-Hoc chair (Ericsson)
The document was presented on behalf of Sorour Falahati from Ericsson.
Decision: The document is endorsed and content incorporated below.

R1-1608607 Further Discussion on Scheduling and HARQ Timing for PUSCH on UpPTS Huawei, HiSilicon
R1-1609297 Discussion on HARQ timing design for PUSCH in UpPTS CMCC
R1-1609883 HARQ timing for PUSCH transmission in special subframe Nokia, Alcatel-Lucent Shanghai Bell

R1-1610695 WF on HARQ timing for PUSCH in UpPTS CMCC
R1-1610696 WF on DMRS for PUSCH in UpPTS CMCC

Agreement:

- For TDD UL/DL configuration 1~5
  - Support adaptive HARQ transmission, and specify the timing from PUSCH to PUSCH retransmission grant according to the following table

TDD DL/UL config.	UL subframe index n									
	0	1	2	3	4	5	6	7	8	9
1		4	4	6			4	4	6	
2		5	6				5	6		
3		6	6	6	6					
4		6	6	6						
5		6	6							

  - Support non-adaptive HARQ transmission

FFS the timing from PUSCH to its ACK/NACK feedback in PHICH

Agreement:

- For TDD UL/DL configuration 6, support the following timing design from UL grant to PUSCH
  - Introduce two bits for UL index field in DCI for UL grant in UE specific search space
  - The UL index is interpreted as
    - When MSB=1 and LSB=0: UE shall upon detection of a PDCCH with DCI format 0/4 in subframe n intended for the UE, adjust the corresponding PUSCH transmission in subframe n+k, with the value of k in the following table
    - When MSB=0 and LSB=1: UE shall adjust the corresponding PUSCH transmission in subframe n+6
    - When MSB=1 and LSB=1: UE shall adjust the corresponding PUSCH transmission in both subframes n+k and n+6, with the value of k in the following table

TDD UL/DL Config	DL subframe index n									
	0	1	2	3	4	5	6	7	8	9
6	7	7				7	7			5

Agreement:

- For TDD UL/DL configuration 0 and 6
  - Support both adaptive and non-adaptive HARQ transmission, and specify the timing from PUSCH to its ACK/NACK feedback in PHICH or UL grant for retransmission according to the following table

Petitioners' Exhibit 1007, p. 316
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

TDD UL/DL Config	subframe index n									
	0	1	2	3	4	5	6	7	8	9
0		5	4	7	6		5	4	7	6
6		4	4	6	6		4	4	7	

Agreement:

- DMRS for PUSCH in UpPTS is transmitted in the UpPTS
  - Working assumption: DMRS is transmitted in the symbol index *l*=3 for normal CP, and the symbol index *l*=2 for extended CP
  - FFS: Support additionally the following alternative by RRC configuration for DMRS transmission for PUSCH in UpPTS:
    - DMRS for PUSCH in UpPTS is transmitted in the following UL subframe, and reuse the legacy DMRS pattern in normal UL subframe

Working assumption:

- For TDD UL/DL configuration 0
  - Support the following for timing from UL grant to PUSCH
    - Change the interpretation of UL index field
      - MSB=1, LSB=0: UE shall upon detection of a PDCCH with DCI format 0 in subframe n intended for the UE, adjust the corresponding PUSCH transmission in subframe n+k, with k given in the following table.
      - MSB=0, LSB=1: UE shall adjust the corresponding PUSCH transmission in subframe n+7
      - MSB=1, LSB=1: UE shall adjust the corresponding PUSCH transmission in both subframes n+ k and n+7, with k in the following table

TDD UL/DL Config	DL subframe index n									
	0	1	2	3	4	5	6	7	8	9
0	4	5				4	5			

Not treated.

R1-1609354 Discussion on UCI in PUSCH on UpPTS Huawei, HiSilicon
R1-1609884 HARQ timing for TTI bundling for PUSCH transmission in special subframe Nokia, Alcatel-Lucent Shanghai Bell
R1-1609991 PUSCH in UpPTS Qualcomm Incorporated
R1-1610697 Way Forward on timing design for TTI bundling CMCC
R1-1610698 Way Forward on TBS scalling design for PUSCH UpPTS CMCC

7.2.8 Further Enhanced MTC for LTE - *WID in RP-161464*

R1-1610871 Chairman's notes of AI 7.2.8 on Further Enhanced MTC for LTE Ad-Hoc chair (Nokia, Ericsson)

The document was presented by Johan Bergman from Ericsson.

Decision: The document is endorsed and content incorporated below.

7.2.8.1 Higher data rates

Contributions relevant for more than one sub-topic (e.g. joint DCI design) are submitted to this agenda item

R1-1608623 Considerations on the control channel of supporting wider bandwidth in FeMTC Huawei, HiSilicon
R1-1608624 DCI design on supporting wider bandwidth in FeMTC Huawei, HiSilicon
R1-1609204 Fallback operation for FeMTC LG Electronics
R1-1609397 Discussion on Higher Data Rate for Further eMTC Lenovo
R1-1609476 Overall DCI design options for higher data rates for FeMTC Intel Corporation

R1-1610661 WF on DCI for higher data rates in FeMTC Ericsson, Qualcomm, Sony, NTT DoCoMo, Intel, Kyocera, KT Corp., Sierra Wireless

Petitioners' Exhibit 1007, p. 317
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreement:
- FeMTC UEs use Rel-13 DCI formats for MPDCCH Type-0/1/2 CSS transmissions.

Proposal:
- FeMTC UEs use Rel-13 or Rel-14 DCI formats for MPDCCH USS transmissions.
  - It is FFS whether the Rel-14 DCI formats are backwards compatible with the same size as the Rel-13 DCI formats or whether they can have a different size.

R1-1610630 WF on RRC reconfiguration for FeMTC features Qualcomm, Ericsson, Sony, Sequans, DOCOMO, Virtuosys, Sierra Wireless, Kyocera
Also supported by Intel and ZTE and Nokia.

Agreement:
- The following FeMTC features:
  1. HARQ-ACK bundling
  2. Larger maximum TBS for 1.4MHz operation
  3. Larger maximum TBS for 5MHz operation
  4. Support of larger bandwidth
  5. 10 HARQ processes for downlink

  are enabled as follows:
  - The UE reports capability to support a given feature
  - FFS: The eNB enables the larger bandwidth and larger TBS by RRC reconfiguration
  - The eNB enables the other features by RRC reconfiguration
- FFS: dependency between different features
  - E.g. a UE that supports 5MHz operation shall support larger maximum TBS.

R1-1609156 Retuning Symbols for FeMTC in Rel-14 NEC
R1-1610662 WF on retuning symbols in FeMTC Ericsson, NEC, Sequans, Sierra Wireless

Agreement:
- Rel-14 UE supporting CE mode A and/or B can indicate how many narrowband retuning symbols it needs.
  - Range: {0, 1, 2} symbols
  - Default value: 2 symbols
- FFS: If the UE indicates it needs 1 symbol for retuning, then:
  - When retuning between two PUSCH narrowbands, the guard period is the last SC-FDMA symbol in the previous UL subframe
  - When retuning between two PUCCH narrowbands, the guard period is the last SC-FDMA symbol in the previous UL subframe
  - When retuning from a PUSCH narrowband to a PUCCH narrowband, the guard period is the last SC-FDMA symbol in the previous UL subframe
  - When retuning from a PUCCH narrowband to a PUSCH narrowband, the guard period is the first SC-FDMA symbol in the next UL subframe
- It is up to eNB whether and how to take the UE capability into account.

7.2.8.1.1 Larger max PDSCH/PUSCH TBS

R1-1608626 On supporting larger TBS for UEs with maximum 1.4 MHz bandwidth in TDD/HD-FDD Huawei, HiSilicon
R1-1608627 On supporting larger TBS for UEs with larger bandwidth Huawei, HiSilicon
R1-1608890 Maximum TBS for FeMTC Nokia, Alcatel-Lucent Shanghai Bell
R1-1609477 Support of larger max TBS for DL and UL Intel Corporation
R1-1609992 Support of higher data rates Qualcomm Incorporated
R1-1610388 Larger max TBS for MTC Ericsson
R1-1610407 Design for larger maximum TBS Kyocera Corporation

R1-1610663 WF on TBS for FeMTC Ericsson, Qualcomm, Sony

Agreement:
- Supported modulation schemes for Rel-14 BL/CE UEs:
  - PDSCH: QPSK, 16QAM
  - PUSCH: QPSK, 16QAM

Agreement:
- Max TBS for 5-MHz Rel-14 BL/CE UEs:
  - PDSCH: 4008 bits

Petitioners' Exhibit 1007, p. 318
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- PUSCH: 4008 bits

Agreement:
- Soft buffer size for 5-MHz Rel-14 BL UEs:
  - Option 1: N·96·⌈(X+28)/32⌉ where N = max number of DL HARQ processes and X = max DL TBS
  - Option 2: a smaller value than in Option 1
- Option 2 is agreed
  - Details are FFS

Agreement:
- Max UL TBS in CE mode A for 1.4-MHz Rel-14 BL FD-FDD UE:
  - Option A: 1000 bits (same as Rel-13 Cat-M1)
  - Option B: 2984 bits (same as 1.4-MHz FeMTC TDD/HD-FDD UE)
- Option B is agreed

R1-1610817 WF on TBS indication for 1.4 MHz feMTC UEs Huawei, HiSilicon, Qualcomm

Agreement:
- TBS for 1.4-MHz UE in CE mode A is indicated by using the existing TBS table
  - Introduce UE capability signaling for the larger TBS
  - The use of larger TBS is RRC configured by eNB

R1-1610861 WF on TBS indication for 1.4 MHz feMTC UEs Huawei, HiSilicon, Nokia, Qualcomm, Sierra Wireless

Agreement: The tables in R1-1610861 are agreed.

7.2.8.1.2 Larger max PDSCH/PUSCH channel bandwidth

R1-1608622	On enabling and disabling of wider bandwidth in FeMTC	Huawei, HiSilicon
R1-1608625	On supporting larger channel bandwidth for Rel-14 non-BL UEs in CE mode A	Huawei, HiSilicon
R1-1608891	Consideration on supporting larger channel bandwidth for FeMTC	Nokia, Alcatel-Lucent Shanghai Bell
R1-1608937	Resource Allocation in wide bandwidth feMTC	Sony
R1-1609154	Larger maximum PDSCH/PUSCH channel bandwidth in CE mode A	NEC
R1-1609205	Larger channel bandwidth for FeMTC	LG Electronics
R1-1609478	Support of larger max channel bandwidth for PDSCH/PUSCH	Intel Corporation
R1-1609828	Discussion on support of larger PDSCH/PUSCH bandwidth for MTC	ZTE
R1-1609829	Resource allocation for larger PDSCH/PUSCH bandwidth for MTC	ZTE
R1-1609993	Support of larger data channel bandwidth	Qualcomm Incorporated
R1-1610389	Larger max channel bandwidth for MTC	Ericsson
R1-1610406	Design for larger max PDSCH/PUSCH channel bandwidth	Kyocera Corporation

R1-1610650 WF on support of larger PDSCH/PUSCH channel bandwidth for MTC ZTE, ZTE Microelectronics

Agreement:
- Rel-14 non-BL UE can support CE mode A in connected mode with a maximum PDSCH/PUSCH channel bandwidth of either 5 or 20 MHz.
  - Rel-14 capability signaling is introduced to differentiate non-BL UEs with respect to maximum UE channel BW support in CE.
- Rel-14 non-BL UE may also support Rel-13 CE mode A and CE mode B.
- A Rel-14 non-BL UE supporting CE mode A operation with 20-MHz maximum PDSCH/PUSCH channel bandwidth also supports CE mode A operation with 5-MHz maximum channel bandwidth.
- Strive for commonality in the DCI design for the 5-MHz and 20-MHz cases without introducing unnecessary overhead for the 5-MHz case.
- FFS whether to support frequency hopping for PDSCH/PUSCH channel bandwidths >5 MHz

R1-1610684 WF on supporting larger channel bandwidth for Rel-14 non-BL UEs Huawei, HiSilicon, Qualcomm

Agreement:
- The larger maximum UE channel BW for PDSCH is supported for both CE mode A and CE mode B.
- The larger maximum UE channel BW for PUSCH is not supported for CE mode B.
- For the 5-MHz BL UE,
  - The maximum reception bandwidth is 25 PRBs.
  - The maximum allocatable PDSCH channel bandwidth is [FFS between 24 or 25] PRBs.
  - The maximum transmission bandwidth is 25 PRBs.

Petitioners' Exhibit 1007, p. 319
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- The maximum allocatable PUSCH channel bandwidth is [FFS between 24 or 25] PRBs.

7.2.8.1.3 HARQ-ACK bundling in HD-FDD

R1-1608630 HARQ-ACK bundling in HD-FDD Huawei, HiSilicon
R1-1608797 Design of HARQ-ACK bundling for HD-FDD Sequans Communications
R1-1608892 ACK/NACK Bundling in FeMTC Nokia, Alcatel-Lucent Shanghai Bell
R1-1608938 Considerations on HARQ-ACK Bundling in HD-FDD Sony
R1-1609155 Different Options for HARQ-ACK bundling in CE mode A for HD-FDD NEC
R1-1609819 Ack Bundling Design Considerations Sierra Wireless, S.A.
R1-1609830 Support of HARQ-ACK bundling for MTC ZTE
R1-1609994 Support of HARQ-ACK bundling in HD-FDD Qualcomm Incorporated
R1-1610025 HARQ bundling design for HD-FDD in Rel-14 MTC NTT DOCOMO, INC.
R1-1610390 HARQ-ACK bundling for MTC Ericsson

R1-1610651 WF on HARQ bundling in HD-FDD for MTC ZTE, ZTE Microelectronics, Sony, Lenovo, NTT Docomo, Sierra Wireless, Sequans

Also supported by Qualcomm

Agreement:

- HARQ-ACK bundling is supported in CE Mode A in HD-FDD.
- HARQ-ACK bundling is not supported in CE Mode B.
- FFS whether HARQ-ACK bundling is supported in CE Mode A in FD-FDD.
- FFS whether HARQ-ACK bundling is supported for PUCCH repetition case.
- FFS whether HARQ-ACK bundling is supported for PDSCH repetition case.
- FFS whether HARQ-ACK bundling is supported for MPDCCH repetition case.

R1-1610824 WF on bundle size and bundle number in HD-FDD for MTC ZTE, ZTE Microelectronics, Sierra Wireless, Ericsson, Lenovo, Sony

Agreement:

- One or multiple HARQ-ACK bundles can be supported for PDSCH scheduling before switching to UL.
  - HARQ-ACK bundle size is defined as the number of PDSCH transmissions (corresponding to different HARQ processes) with a joint HARQ-ACK feedback.
  - The maximum HARQ-ACK bundle size is 4.
  - FFS: maximum number of HARQ-ACK bundles before switching to UL

7.2.8.1.4 Number of DL processes in FD-FDD

R1-1608629 Analysis on increasing DL HARQ processes in CE mode A for FD-FDD Huawei, HiSilicon
R1-1608798 On supporting 10 DL HARQ processes Sequans Communications
R1-1608893 Increasing the number of HARQ processes in FeMTC Nokia, Alcatel-Lucent Shanghai Bell
R1-1608939 Considerations on HARQ Processes in FD-FDD Sony
R1-1609831 Discussion on Number of DL processes in FD-FDD for MTC ZTE
R1-1610026 Indication of up to 10 HARQ process number for FD-FDD in Rel-14 MTC NTT DOCOMO, INC.
R1-1610391 Number of DL HARQ processes for MTC Ericsson

R1-1610670 WF on supporting 10 HARQ processes Sequans, Intel, Sony, Ericsson

Also supported by Sierra Wireless and Qualcomm

Agreement:

- For HD-FDD and FD-FDD,
  - Support for max 10 DL HARQ processes in CE mode A is introduced for Rel-14 BL UEs
  - A 1.4-MHz BL UE supporting max 10 DL HARQ processes has the same required soft buffer size as Rel-13 Cat-M1 UE

7.2.8.2 Multicast support

R1-1608628 Consideration on SC-PTM transmission for FeMTC Huawei, HiSilicon
R1-1608894 SPS Design Considerations Nokia, Alcatel-Lucent Shanghai Bell
R1-1608895 SC-PTM Search Space Considerations Nokia, Alcatel-Lucent Shanghai Bell
R1-1608940 Multicast Support for feMTC Sony
R1-1609206 Multicast support for FeMTC LG Electronics
R1-1609358 Control channel design on supporting SC-PTM in FeMTC Huawei, HiSilicon
R1-1609479 SC-PTM for FeMTC Intel Corporation
R1-1609606 on supporting multicast with large TBS Sequans Communications
R1-1609832 Discussion on multicast support for MTC ZTE
R1-1609867 Further discussion on the change notification of SC-PTM for FeMTC Sharp

Petitioners' Exhibit 1007, p. 320
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1609995 Support of multicast Qualcomm Incorporated
R1-1610392 Collision handling for multicast support for MTC Ericsson
R1-1610393 L1 configuration for multicast support for MTC Ericsson

R1-1610820 WF on FeMTC SC-PTM scheduling Ericsson, ITL, Nokia, ASB

Agreement:

- Max channel bandwidth and max TBS for **SC-MTCH** PDSCH transmission to BL/CE UEs:
  - **Option 1:** According to Rel-13 Cat-M1 limitations (i.e. 6 PRBs and 1000 bits)
  - **Option 2:** Configurable per SC-MTCH (with minimum maximum values of 6 PRBs and 1000 bits)
- Max channel bandwidth and max TBS for **SC-MCCH** PDSCH transmission to BL/CE UEs:
  - **Option A:** According to Rel-13 Cat-M1 limitations (i.e. 6 PRBs and 1000 bits)
  - **Option B:** Configurable per SC-MCCH (with minimum maximum values of 6 PRBs and 1000 bits)
- From physical layer point of view,
  - All four options are feasible.
  - Option 2 may have performance benefits over Option 1.
- Ask RAN2 to confirm feasibility and usefulness from higher layer point of view.

Agreement:

- The maximum number of on-going SC-MTCHs supported by SC-MCCH is reduced compared to LTE.
- Send LS to RAN2 to
  - Inform RAN2 that RAN1 assumes the maximum number of on-going SC-MTCHs supported by SC-MCCH is reduced compared to LTE
  - Request RAN2 to inform RAN1 of the maximum number of on-going SC-MTCHs supported by SC-MCCH in FeMTC.
  - Request RAN2 to inform RAN1 whether and how segmentation of SC-MCCH will be supported in Rel-14.
- For the search space scheduling SC-MCCH
  - UE monitoring of blind decoding candidates is based on FFS: Type1-CSS or Type2-CSS for MPDCCH
  - Rmax, and G values are configured per SC-MCCH by higher layers
    - FFS the configuration of other parameters, e.g., narrowband.

Cover FeMTC and NB-IoT in the same LS to RAN2 (Huawei)

R1-1610666 WF on FeMTC SC-MTCH transmission Ericsson, Nokia, ASB

Agreement:

- Frequency hopping is supported in multicast to BL/CE UEs at least for max PDSCH channel bandwidth of 6 PRBs.
  - FFS whether the frequency hopping is controlled by the same SIB parameters as other DL transmissions or by separate SIB parameters and/or DCI

Proposal:

- The possibility of combining of multicast transmissions of the same UDP/IP packet can be studied till the next meeting.

R1-1610664 Way Forward on FeMTC SC-PTM scheduling Ericsson
R1-1610665 Way Forward on FeMTC multicast collision handling Ericsson
R1-1610706 Way Forward on DCI format for SC-PTM Huawei, HiSilicon
R1-1610707 Way Forward on SC-PTM configuration and scheduling Huawei, HiSilicon

7.2.8.3 OTDOA enhancements

Consider improvements of accuracy, UE complexity and power consumption

R1-1608896 OTDOA enhancements for FeMTC Nokia, Alcatel-Lucent Shanghai Bell
R1-1608950 OTDoA enhancements for feMTC Sony
R1-1609359 Discussion on the OTDOA enhancements for FeMTC Huawei, HiSilicon
R1-1609370 Evaluations of feMTC OTDOA Huawei, HiSilicon
R1-1609839 Discussion on OTDOA support for eMTC ZTE
R1-1609996 OTDOA enhancements Qualcomm Incorporated
R1-1610394 OTDOA enhancements for MTC Ericsson

R1-1610934 WF on OTDOA for feMTC ZTE , ZTE Microelectronics, Ericsson, Qualcomm

Agreement:

- For Rel-14 feMTC OTDOA positioning reference signal, enhancements to the legacy LTE PRS patterns and sequences can be considered but need to be justified by significant performance improvement compared to legacy
  - Strive for the possibility for the legacy PRS REs to overlap with the Rel-14 PRS REs
- Rel-14 PRS configuration includes

Petitioners' Exhibit 1007, p. 321
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- All legacy parameters, i.e., bandwidth, periodicity, subframe offset, number of consecutive subframes, etc.
- FFS transmission in invalid subframes
- Sets of values of the parameters are FFS
- Determination of frequency location remains FFS
- Details of Rel-14 PRS configuration parameter settings are FFS
- Details of Rel-14 PRS muting pattern are FFS
- FFS how many Rel-14 PRS configurations are needed per cell
- FFS how many Rel-14 PRS configurations are needed per UE

- RSTD measurement of PRS in different sets of PRBs in the frequency domain is supported
  - FFS details

R1-1610621 WF on PRS Frequency Hopping for OTDOA Sony, ZTE, Ericsson, Virtuosys

Agreement:

- Frequency hopping of PRS in OTDOA is supported.
  - Configurations and details are FFS

7.2.8.4 VoLTE enhancements

Increase VoLTE coverage for half-duplex FDD/TDD through techniques to reduce DL repetitions, new repetition factors, and adjusted scheduling delays

R1-1608655 SRS enhancement to supporting higher data rates Huawei, HiSilicon
R1-1608897 VoLTE performance for Cat-M1 UE Nokia, Alcatel-Lucent Shanghai Bell
R1-1608898 VoLTE enhancements for FeMTC Nokia, Alcatel-Lucent Shanghai Bell
R1-1609369 On half duplex enhancements for VoLTE Huawei, HiSilicon
R1-1609480 VoLTE enhancements for HD-FDD and TDD UEs Intel Corporation
R1-1609997 VoLTE enhancements for eMTC Qualcomm Incorporated
R1-1610395 VoLTE enhancements for CE mode A Ericsson

R1-1610922 WF on FeMTC eVoLTE Huawei, HiSilicon, Ericsson, Qualcomm, Sequans

Agreement:

- RAN1 design will assume delay budget relaxation for UL voice packets
- Prioritize consideration of the following in VoLTE enhancements in FeMTC for BL/CE UE considering overall system impacts:
  - New number(s) of repetitions for PUSCH
  - Adjusted scheduling relationships between physical channels
  - SRS coverage enhancement
  - Discontinuous PUSCH transmission
- SPS and non-SPS cases should both be considered
- Ask RAN2+RAN4: What can be assumed regarding need for intra- and inter-frequency measurement gaps, in synchronized and non-synchronized networks
- Ask RAN2: For feedback on what delay budget relaxation can be assumed

Provide LS to RAN2 and RAN4 (Matthew, Huawei)

Friday

R1-1611017 [DRAFT]LS on FeMTC VoLTE enhancements Huawei

Decision: The document is noted and final LS agreed in R1-1611053

7.2.8.5 Other

R1-1609998 Paging channel enhancements Qualcomm Incorporated
R1-1609999 Power consumption reduction techniques for eMTC Qualcomm Incorporated

7.2.9 Enhancements of NB-IoT - *WID in RP-161901.*

The objectives apply to the in-band, guard-band, and standalone operation modes and the same coverage enhancement targets as defined in the Rel-13 NB-IoT work item.

R1-1610872 Chairman's notes of AI 7.2.9 on Enhancements of NB-IoT Ad-Hoc chair (Huawei)

The document was presented by Matthew Webb from Huawei.

Discussion: Straightforward approval of already endorsed LSs – just add final Tdoc numbers of R1-1611032/R1-1611033/R1-1611034)

Decision: The document is endorsed and content incorporated below.

Petitioners' Exhibit 1007, p. 322
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

7.2.9.1 Positioning

7.2.9.1.1 Design of narrowband OTDOA positioning

Re-use of existing signals

R1-1608617 On reusing existing downlink signals for NB-IoT downlink positioning Huawei, HiSilicon
R1-1608881 Existing Downlink Signals for OTDOA Positioning in NB-IoT Nokia, Alcatel-Lucent Shanghai Bell
R1-1608698 OTDOA performance for NB-IoT Ericsson

Agreement:

- Introduce a new positioning reference signal for OTDOA in NB-IoT
  - Not based on existing Rel-13 NB-IoT signal and not based on LTE CRS.

R1-1610346 On the use of exising NB-IoT signals for OTDOA Ericsson

New designs for NPRS

R1-1608618 Design of new downlink positioning reference signal for NB-IoT Huawei, HiSilicon
R1-1610000 Downlink-based narrowband positioning Qualcomm Incorporated

Configurations

R1-1608619 Configuration of downlink positioning reference signal for NB-IoT Huawei, HiSilicon

R1-1608882 NPRS Design for OTDOA Positioning in NB-IoT Nokia, Alcatel-Lucent Shanghai Bell
R1-1608697 OTDOA design for NB-IoT Ericsson
R1-1609207 OTDOA design for eNB-IoT LG Electronics

Working assumptions:

- NB-IoT positioning reference signal resource pattern in one subframe is at least LTE PRS in 1 PRB
  - FFS: With additional REs in guard-band and standalone operation modes
  - FFS: Increased density per cell according to coverage
  - NB-IoT PRS do not occur in a subframe containing
    - NPDCCH
    - NPDSCH
    - NPBCH
    - NPSS/NSSS

R1-1609835 OTDOA positioning for NB-IoT ZTE
R1-1610221 Support of OTDOA in NB-IoT Innovative Technology Lab Co.
R1-1609377 RSTD measurement and reporting in NB-IoT Nokia, Alcatel-Lucent Shanghai Bell
R1-1610434 A new system simulator for NB-IoT positioning Ericsson (R1-1608699)

R1-1610639 WF on configurations of time resources for NPRS Huawei, HiSilicon

Agreement:

- The subframes which contain NPRS are configured by higher-layers
  - Per NB-IoT carrier, it is possible to configure the subframes used NPRS transmission such that NPRS do not occur in subframes containing transmissions to Rel-13 UEs in the cell of:
    - NPDCCH
    - NPDSCH
    - NPBCH
    - NPSS/NSSS

Agreement:

- Configuration of time resources for NPRS
  - Indication of exact subframes is by
    - Alt. 4:
      - Part A: A bitmap on subframes which are not NB-IoT DL subframes (i.e. invalid DL subframes)
        - Alt. 4.A1: Bitmap is a fixed length of 10 bits
        - Alt. 4.A2: Bitmap is a the same length as valid subframe configuration, i.e. 10 bits or 40 bits
        - Alt. 4.A3: Bitmap is a fixed length of x bits (e.g., $x = 20$)
        - FFS which until RAN1#87

Petitioners' Exhibit 1007, p. 323
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Part B: Indicated with one start subframe, one periodicity, and one number of repetitions for the occasions
- On an anchor carrier, Part A and/or Part B
- On a non-anchor carrier, Part A and/or Part B

Agreement:

- Indication of NPRS muting patterns is
  - Alt. 2: Indicated with a periodic NPRS muting sequence
    - Details are FFS

R1-1610640 WF on configuration of NPRS transmission on multiple NB-IoT carriers Huawei, HiSilicon
R1-1610641 WF on configuration of NPRS power for NB-IoT downlink positioning Huawei, HiSilicon

- Send LS to RAN4
  - Referencing the 36.104 section on PSD boosting
  - Include the working assumption on NPRS resource pattern
  - Asking if PSD boosting of REs used in NPRS relative to NRS can be supported, for in-band, guard-band and standalone operation, and for anchor and non-anchor carriers where NRS are transmitted.
    - Note that it is FFS in RAN1 if NRS is present on a non-anchor carrier on which NPRS are transmitted
  - Asking if PSD boosting of REs used in NPRS relative to anchor carrier NRS can be supported, for in-band, guard-band and standalone operation, and for non-anchor carriers where NRS are not transmitted.
  - Asking what is an appropriate limit and granularity of PSD boosting in the above cases.

R1-1611006 [DRAFT]LS on on configuration of NPRS power for NB-IoT downlink positioning
The LS is endorsed, with "respectively" replaced by "respectfully". Final LS is agreed in R1-1611032

7.2.9.1.2 Evaluation of narrowband OTDOA positioning

R1-1608620 Evaluation of downlink positioning accuracy for NB-IoT Huawei, HiSilicon
R1-1608621 Analysis of power consumption and complexity for NB-IoT downlink positioning Huawei, HiSilicon

7.2.9.1.3 Evaluation of narrowband UTDOA positioning using an existing NB-IoT transmission

R1-1608647 On reusing existing uplink signals for NB-IoT uplink positioning Huawei, HiSilicon
R1-1609836 UTDOA positioning for NB-IoT ZTE
R1-1608880 UTDOA positioning in NB-IoT Nokia, Alcatel-Lucent Shanghai Bell
R1-1608700 On modelling of NPRACH based UTDOA performance Ericsson
R1-1608701 On NPRACH based UTDOA impact on NB-IOT performance Ericsson
R1-1608702 On NPRACH based UTDOA capacity Ericsson
R1-1610001 Uplink-based narrowband positioning Qualcomm Incorporated

R1-1610905 WF on positioning reference signal design for NB-IoT UTDOA ZTE , ZTE Microelectronics

Conclusions:

- Rel-13 NPRACH preamble is the best candidate and can be used as a signal for NB-IoT UTDOA in some scenarios.
  - Whether it is feasible in a given network deployment depends on issues including network coordination, interference handling, power control, in-band emissions, capacity impacts, etc.
  - Companies are encouraged to identify in RAN1#87 scenarios where it is and is not feasible.

7.2.9.2 Multicast support

Extend Rel-13 SC-PTM to support multicast downlink transmission

SC-MCCH
R1-1608884 SC-MCCH transmission for NB-IoT Nokia, Alcatel-Lucent Shanghai Bell
R1-1608612 Discussion on configuration of SC-MTCH in NB-IoT Huawei, HiSilicon
R1-1608703 L1 configuration for multicast support for NB-IoTEricsson
R1-1610002 Support of multicast Qualcomm Incorporated

R1-1610643 WF on SC-MCCH transmission for NB-IoT SC-PTM Huawei, HiSilicon
Also supported by ITL

Agreements:

- The maximum number of on-going SC-MTCHs supported by SC-MCCH is reduced compared to LTE.
- Send LS to RAN2 to

Petitioners' Exhibit 1007, p. 324
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Inform RAN2 that RAN1 assumes the maximum number of on-going SC-MTCHs supported by SC-MCCH is reduced compared to LTE
- Request RAN2 to inform RAN1 of the maximum number of on-going SC-MTCHs supported by SC-MCCH in NB-IoT.
- Also include the larger maximum TBS value (if agreed this week)
- Request RAN2 to inform RAN1 whether and how segmentation of SC-MCCH will be supported in Rel-14.

R1-1610969 **[DRAFT]LS on SC-MCCH transmission in NB-IoT**
The LS is endorsed, with the following update:
- ~~[~~The larger maximum TBS value in downlink in Rel-14 is 1352 bits~~[x]~~ for NB-IoT, and 4008 bits~~[y]~~ for feMTC.~~]~~

Final LS is agreed in R1-1611033

R1-1610551 **WF on NB IoT SC-PTM scheduling** **Ericsson**

Agreements:
- Transmission of a given SC-MCCH is restricted to one NB-IoT carrier
- Transmission of a given SC-MTCH is restricted to one NB-IoT carrier

SC-MTCH
R1-1610552 **Draft_WF on NB IoT SC-MTCH transmission Ericsson**
R1-1610642 **WF on SC-MTCH transmission for NB-IoT SC-PTM** **Huawei, HiSilicon**

Agreement:
- Different SC-MTCHs can be transmitted over different NB-IoT carriers, while one SC-MTCH is sent on one NB-IoT carrier

Search spaces and DCIs
R1-1610644 **WF on search space design for SC-PTM in NB-IoT** **Huawei, HiSilicon**

Agreements:
- For the search space scheduling SC-MCCH (called Type1-MSS for RAN1 purposes)
  - UE monitoring of blind decoding candidates is based on FFS: Type1-CSS or Type2-CSS
  - α, Rmax, and G values for Type1-MSS are configured per SC-MCCH by higher layers

R1-1610968 **WF on search space for NB-IoT SC-PTM** **Huawei, HiSilicon, ZTE**

Agreements:
- For the search space scheduling SC-MTCH (called Type2-MSS for RAN1 purposes)
  - UE monitoring of blind decoding candidates is based on FFS: Type1-CSS or Type2-CSS
  - α, Rmax, and G values for Type2-MSS are configured per SC-MTCH in SC-MCCH
- UE is not required to simultaneously monitor Type1-MSS and Type2-MSS
- UE is not required to monitor Type2-MSS while receiving NPDSCH carrying SC-MTCH

Collision handling
R1-1610468 WF on collision issue on SC-PTM for eNB-IoT LG Electronics, ITL
R1-1610553 WF on NB IoT multicast collision handling Ericsson

Agreement
- Prepare a LS to RAN2, RAN3, SA2
  - There may be cases where the UE cannot monitor NPDCCH search spaces and/or receive NPDSCH transmissions for both paging and SC-PTM simultaneously

R1-1610970 **[DRAFT]**LS on collisions between SC-PTM and Paging in NB-IoT
The LS is endorsed with the following update:
RAN1 respectfully ask RAN2, RAN3 and SA2 to take the above into consideration in their work.~~ that the reliability of SC-PTM would be impacted if SC-PTM transmissions are dropped when collision happens between SC-PTM and paging.~~
Final LS is agreed in R1-1611034

Petitioners' Exhibit 1007, p. 325
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Not treated.

7.2.9.4 Power consumption and latency reduction

Support in DL and UL for 2 HARQ processes and larger maximum TBS

R1-1608648 On 2 HARQ processes for enhancement of NB-IoT Huawei, HiSilicon
R1-1610020 Discussion on two HARQ process MediaTek Inc.
R1-1610430 Power consumption and latency reduction by increasing the maximum NPDSCH transport block sizes and using two HARQ Ericsson (Revision of R1-1610348)
R1-1610431 Power consumption and latency reduction by increasing the maximum NPUSCH transport block size and using two HARQ Ericsson (Revision of R1-1610349)

R1-1610645 WF on timing relationships of 2 HARQ processes for NB-IoT enhancement Huawei, HiSilicon
Further revised in:
R1-1610994 WF on timing relationships of 2 HARQ processes for NB-IoT enhancement Huawei, HiSilicon, Deutsche Telekom, Vodafone, China Unicom, IITH, CEWIT, IITM, Tejas Networks, Reliance Jio, Ericsson, ITL, Lenovo, Neul, Potevio, u-blox, Sony
Also supported by: Intel

Friday
R1-1611019 WF on timing relationship for 2 HARQ processes for Rel-14 NB-IoT MediaTek, Qualcomm, DoCoMo, AT&T, Softbank, ITRI, Sharp, MTI, APT, Xinwei, ZTE, ZTE Microelectronics, KDDI
Discussion: Concern from Intel/Huawei on the cost impact
Vodafone → support Huawei's view – would like to keep complexity level to the Rel-13 level
RAN1 chair: different views from other operators
MediaTek suggested having an email discussion how to evaluate the cost impact
Huawei: objection
MediaTek → can interested companies bring up analysis related to cost impact for both alternatives on the table (R1-1610994 & R1-1611019)? - Objective: cross compare the results between companies

Petitioners' Exhibit 1007, p. 326
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: Continue discussions about R1-1610994 and R1-1611019 until the next meeting.

Agreement:
- Maximum DL TBS is 1352 bits
- Maximum UL TBS is 1800 bits
- The same values of N_SF and N_RU and I_TBS are used as in Rel-13

Email discussion to agree TBS/N_SF and TBS/N_RU tables until Friday October 21st (Olof, Ericsson).

Not treated.

7.2.10 Shortened TTI and processing time for LTE - *WID in RP-161922.*

R1-1610873 Chairman's notes of AI 7.2.10 on Shortened TTI and processing time for LTE Ad-Hoc chair (Ericsson)
The document was presented by Daniel Larsson from Ericsson.
Decision: The document is endorsed and content incorporated below.

Friday
R1-1610584 [DRAFT] LS on Shortened TTI and processing time for LTE Ericsson
Decision: The document is noted and final LS is agreed in R1-1611055.

7.2.10.1 Shortened processing time for 1ms TTI

R1-1610042 Views on shortened processing time for 1ms TTI NTT DOCOMO, INC.

R1-1610543 WF on not supporting N+2 in 1ms TTI processing time reduction Qualcomm, CATT, Samsung, Huawei, HiSilicon, Intel, MTK, ZTE, ZTE Microelectronics
Also supported by: LGE

R1-1610557 WF on supporting n+2 minimum timing for shortened processing time in 1ms TTI Nokia, Alcatel-Lucent Shanghai Bell, Ericsson, NTT DoComo, Sharp
Also supported by: Spreadtrum, Interdigital
Support a minimum timing of n+2 TTIs for FS1/2/3 for UL grant to UL data and for DL data to DL HARQ as a UE capability
- For n+2 timing, the maximum TA is reduced to 0.33ms
- PDCCH USS scheduling for n+2 timing is supported
  - FSS if EPDCCH scheduling is supported as an additional UE capability
- The supported DL peak data rate with n+2 timing is a UE capability
  - The peak data rate are given by DL UE category is scaled by Z
    - Z = (0.5, 0.75, 1)
- For PUCCH on FS1 cell, support a dynamic indication of n+2 and n+3 timing
  - Signaling details of indicating the different processing time for 1ms TTI is FFS
  - FSS support for PUCCH on FS2 cell
- FFS: For n+2 UL grant to PUSCH timing, the UL-SCH interleaving over all PUSCH SC-OFDMA symbols is removed

Conclusion
No consensus to support a minimum processing time of n+2

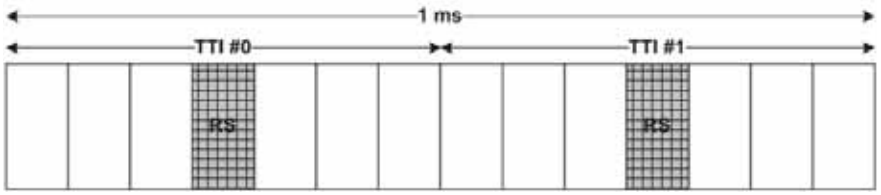
R1-1609161 Considerations on Asymmetric DL&UL sTTI Length Operations Nokia, Alcatel-Lucent Shanghai Bell
R1-1608631 Discussion on sTTI structure Huawei, HiSilicon

Petitioners' Exhibit 1007, p. 328
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Proposed agreements:

- In DL no sTTI spans over slot boundary
- In DL TTI can span over slot boundary
- In UL no sTTI spans over slot boundary
- In UL TTI can span over slot boundary



Agreement:

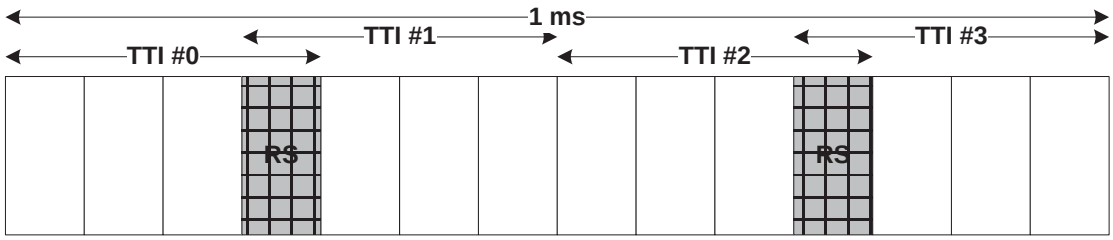
- Short TTI is not configured with extended CP.

R1-1610563 WF on short TTI structure LG Electronics, Huawei, HiSilicon

Agreement:

- For 7-symbol TTI, the following sTTI structure is supported for UL

R1-1610833 WF on UL short TTI structure LG Electronics, Huawei, HiSilicon, Ericsson, Nokia, Alcatel-Lucent Shanghai Bell, Samsung, NTT DOCOMO, Sharp, ZTE, ZTE Microelectronics, Intel, Qualcomm, CATT



Agreement:

- For 2-symbol TTI, RAN1 will down-select UL sTTI structure among the following options:
  - Option 1: fixed sTTI structure
    - The data symbol(s) for sPUSCH are confined within a sTTI. Note that the DMRS for one sTTI may be placed within or outside the sTTI.
    - Option 1a: without spanning over slot boundary
      - The presence (if any) and the position of the UL DMRS is given by the UL grant,
        - If the UL DMRS is present it can be positioned before, within or after the sTTI
      - Considered sTTI patterns in OFDM symbols per subframe
        - Alt1: (2, 2, 3, 2, 2, 3)
        - Alt2: (3, 2, 2, 2, 2, 3)
        - Alt3: (3, 2, 2, 3, 2, 2)
    - Option 1b: a sTTI can span over slot boundary
      - Considered sTTI patterns in OFDM symbols per subframe
        - Alt1: (2, 2, 2, 2, 2, 2, 2)
  - Option 2: fixed nominal sTTI starting points and a possibility to delay the start of the transmission by N symbols with an indication in the UL grant
    - The presence (if any) and the position of the UL DMRS is given by the UL grant,
      - If the UL DMRS is present it can be positioned before, within or after the sTTI
    - The nominal sTTI starting point is determined by n+k processing time and DL sTTI structure

R1-1610834 WF on UL short TTI structure for 4-symbol sTTI LG Electronics, Samsung, Ericsson, CATT, NTT DOCOMO, ZTE, ZTE Microelectronics, Huawei, HiSilicon, Panasonic, Sharp

Agreement:

- If 4-symbol UL sTTI is supported, the following sTTI structure is adopted:

Petitioners' Exhibit 1007, p. 329
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610856 WF on sTTI length for DL Samsung, Ericsson, Sharp, NTT DOCOMO, Huawei, HiSilicon, Intel, CATT, ZTE, ZTE Microelectronics, LG Electronics

Agreement:

- The DL sTTI length of a UE is configured by RRC signaling.
  - FFS on whether different DL sTTI lengths for a given UE can be configured for different serving cells or not.

R1-1610827 WF on DL sTTI pattern Huawei, HiSilicon, NTT DOCOMO, Intel, Qualcomm, Ericsson, LGE, Sharp

Conclusion

- Aspects to consider when downselecting between the 2OS DL sTTI in R1-1610827
  - Orphan symbol sTTI
  - Support of distributed resource block allocation together with sTTI operation
  - Slot based sTTI operation together with 2 symbol sTTI operation
  - CSI-IM
  - Varying number of shortened TTI within a subframe
  - PCFICH detection error
  - HARQ timing
    - Achievable minimum HARQ/scheduling timing with varying sTTI length
  - UL sTTI structure
  - Other aspects can also be considered

R1-1610855 WF on the combination of sTTI length for DL and UL Samsung, Qualcomm

Agreement:

- For the combination of sTTI for DL and UL, RAN1 chooses one to be supported among the following alternatives.
  - Alt 1. {2,2}, {7,7}
  - Alt 2. {2,2}, {2,4}, {7,7}
  - Alt 3. {2,2}, {2,7}, {7,7}
  - Alt 4. {2,2}, {2,4}, {2,7}, {7,7}
  - Note: {a,b} denotes {DL sTTI length, UL sTTI length}.
  - Note: DL sTTI length is used for sPDCCH and sPDSCH.
  - Note: UL sTTI length is used for sPUSCH and sPUCCH corresponding to sPDCCH and sPDSCH, respectively.
- RAN1 study the necessity of {2,14} and/or {7,14}

R1-1610583 Way Forward on sTTI scheduling options Ericsson, Huawei, HiSilicon (Revision of R1-1610582)

Agreement

- Select a sTTI scheduling scheme among the following candidates for each sTTI length
  - Single level DCI
    - RRC configuration of sPDCCH search space and/or sPDCCH frequency region
    - UE-specific information in sDCI related to sPDSCH/sPUSCH
  - Two level DCI
    - RRC configuration may or may not at least partially indicate sPDCCH frequency region/search space for some of the variants described below
    - variant 1
      - Slow DCI: non UE-specific information in PDCCH
      - Fast DCI: UE-specific information in sDCI
    - variant 2
      - Slow DCI: UE-specific information in PDCCH
      - Fast DCI: UE-specific information in sDCI
    - variant 3
      - Slow DCI: UE-specific information in PDCCH and/or sPDCCH
      - Fast DCI: UE-specific information in sDCI
  - Note: the sTTI scheduling scheme may be the same or different for different sTTI length
- FFS how to reduce the payload of sDCI/DCI messages for sTTI operation
- FFS support of multi-sTTI scheduling
- Additional L1 signaling related to sTTI operation can be considered

Petitioners' Exhibit 1007, p. 330
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610787 WF on transmission modes for sTTI Huawei, HiSilicon, CMCC, Softbank, Qualcomm, Intel, CATT

Agreement:

- For DL transmission for sTTI
  - TM1, 2, 3, 4, 6, 9, 10 are supported for FS1.
  - TM1, 2, 3, 4, 6, 8, 9, 10 are supported for slot based sTTI for FS2.
  - Note: For 2 symbol sTTI design TM8 is not supported in this WI
- For UL transmission for sTTI
  - TM1 and TM2 are supported

R1-1610338 Draft LS on UL power control related aspects Ericsson

Friday
R1-1610585 [DRAFT] LS on implication of sTTI operation on UL ON/OFF time mask Ericsson
Decision: The document is noted and final LS is agreed in R1-1611054.

7.2.11 Performance enhancements for high speed scenario - *WID in RP-152263.*

R1-1610874 Chairman's notes of AI 7.2.11 on Performance enhancements for high speed scenario Ad-Hoc chair (Qualcomm)

The document was presented by Wanshi Chen from Qualcomm.
Decision: The document is endorsed and content incorporated below.

R1-1609349 Restricted sets of cyclic shifts for PRACH in high speed scenario Huawei
R1-1609350 On the support for legacy UEs in high speed cells Huawei
R1-1609929 Introduction of PRACH enhancement for high speed scenario Huawei
R1-1610013 PRACH enhancements Qualcomm Incorporated
R1-1610223 PRACH for very high speed scenario Nokia, Alcatel-Lucent Shanghai Bell

R1-1610903 WF on Performance enhancements for high speed scenario Huawei, HiSilicon, Nokia, ASB, NTT DOCOMO

Agreements:

- Set 3 in R1-1609349 is selected as the new restricted set of cyclic shifts for PRACH in the new Rel-14 high speed scenario.
- Two sets of PRACH resources are configured for a cell that supports the new Rel-14 high speed scenario:
  - One set optimized for new Rel-14 high speed scenario and signaled to Rel-14 UEs. RAN1 recommends that this set is configured by the following new RRC parameters:
    - highSpeedFlag-r14
    - zeroCorrelationZoneConfig-r14
    - rootSequenceIndex-r14
  - The other set signaled to Rel-8 – Rel-13 UEs.

IPR2024-01121

R1-1610985 **[DRAFT] Reply LS on A New PRACH Cyclic Shift Restriction Set Huawei**
Decision: The document is noted and final LS is agreed in R1-1611056

7.2.12 Voice and Video enhancement for LTE - *WID in RP-161856*

VoLTE coverage enhancement
R1-1610875 **Chairman's notes of AI 7.2.12 on Study on Enhancement of VoLTEAd-Hoc chair (Qualcomm)**
The document was presented by Wanshi Chen from Qualcomm.
Decision: The document is endorsed and content incorporated below.

R1-1609565 **Specification impact of VoLTE/ViLTE coverage enhancements China Telecommunications**
R1-1610396 **PUSCH coverage enhancement for VoLTE Ericsson**
R1-1608606 **Discussion on VoLTE coverage enhancement Huawei, HiSilicon**
R1-1609723 **VoLTE coverage enhancement Nokia, Alcatel-Lucent Shanghai Bell**

Companies are encouraged to check:
- what aspects of quality are to be enhanced
- what maximum transport block size is envisaged
- why ViLTE is not included in the coverage enhancement part of the WID.

R1-1610921 **WF on VoLTE and ViLTE enhancement Huawei, HiSilicon, China Telecommunications**
Also supported by CMCC

Agreements:
- HARQ process ID of PUSCH is indicated in DCI
- Re-use the eMTC repetition scheme, i.e.:
  - Support numbers of repetitions for PUSCH not larger than X
    - FFS the value of X considering the relaxed delay budget, and X may be different from the largest value in eMTC
  - A set of [4 or 8 (TBD)] numbers of repetitions are configured by RRC signalling of the maximum number of repetitions
  - The number of repetitions of PUSCH is indicated in DCI
- Re-use eMTC frequency hopping scheme, i.e.:
  - The frequency domain hopping offset and the time domain hopping interval are cell specific
  - The time domain hopping interval is configured as one of
    - {1, 2, 4, 8} subframes for FDD
    - {1, 5, 10, Y} subframes for TDD, where Y is TBD after deciding the value of X
  - FFS: values of frequency domain hopping offset

R1-1610606 **Draft LS for Voice and Video enhancement for LTE Huawei**
Decision: The document is noted and final LS is agreed in R1-1611057

R1-1610438 Coverage enhancement techniques Qualcomm Incorporated (R1-1610014)

7.2.13 Study on Further enhancements to Coordinated Multi-Point Operation - *SID in RP-160954*

R1-1610876 **Chairman's notes of AI 7.2.13 on Study on Further enhancements to Coordinated Multi-Point Operation Ad-Hoc chair (Intel)**
The document was presented by Alexey Davydov from Intel.
Decision: The document is endorsed and content incorporated below.

R1-1608609 TP for 36.741 on definition and classification of non-coherent JT Huawei, HiSilicon
R1-1610299 **TP on TR 36.741 Study on FeCoMP ZTE, ZTE Microelectronics**

Agreement:

7.2.13.1 Initial evaluation results and enhancements for non-coherent joint transmission

R1-1608610 **Potential enhancements and specification impact analysis of non-coherent JT Huawei, HiSilicon**
R1-1608692 **Potential Enhancement on the Non-coherent JT ZTE, ZTE Microelectronics**
R1-1608694 Initial evaluation results of non-coherent JT ZTE, ZTE Microelectronics

Petitioners' Exhibit 1007, p. 334
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1608933 Discussion and Preliminary Simulation Results of NCJT Case 1 of FeCoMP Nokia, Alcatel-Lucent Shanghai Bell
R1-1609010 Initial evaluation results and enhancements for non-coherent JT Samsung
R1-1609355 Simulation results of non-coherent JT Huawei, HiSilicon
R1-1609489 CSI feedback enhancements for non coherent JT Intel Corporation
R1-1609490 Control signalling enhancements for non coherent JT Intel Corporation
R1-1609491 System level evaluation results for non coherent JT Intel Corporation
R1-1609715 QCL Issues of Joint Transmission ZTE, ASTRI
R1-1609863 Non-Coherent JT Enhancements Ericsson
R1-1610016 Enhancements for non-coherent JT Qualcomm Incorporated
R1-1610819 WF on potential enhancements for non-coherent joint transmission ZTE, ZTE Microelectronics, Intel, ASTRI, Huawei, HiSilicon, Nokia, ASB

Agreements:

- At least the following enhancements should be studied for NCJT:
  - Enhancement to QCL assumptions for DM-RS antenna ports
    - e.g., non co-located DM-RS antenna ports
  - Control signalling enhancements
    - e.g., One DCI or multiple DCIs to support CW-specific resource allocation / MCS assignment / PDSCH RE mapping, more than one CSI-RS resource for QCL/ CW-to-layer mapping
  - CSI enhancements
    - e.g., CSI calculation for multiple CSI processes with dependency among CSI processes
    - e.g., CSI calculation for single CSI process with codebook enhancement
    - e.g., CSI calculation for single CSI process with dependency among K CSI-RS resource in Class B FD-MIMO
    - e.g., Support of the CSI for advanced receivers
  - Enhancement to channel/interference measurements
    - e.g., interference measurements based on NZP CSI-RS
    - e.g., aperiodic CSI-IM
    - e.g., measurement restriction in the frequency domain

7.2.13.2 Initial evaluation results and enhancements for coordinated scheduling/beamforming with FD-MIMO

R1-1608611 Potential enhancements and specification impacts for CS/CB with FD-MIMO Huawei, HiSilicon
R1-1608695 Initial evaluation results for CS/CB ZTE, ZTE Microelectronics
R1-1608696 Potential enhancements for CS/CB with FD-MIMO ZTE, ZTE Microelectronics
R1-1609011 Initial evaluation results and enhancements for CS/CB with FDMIMO Samsung
R1-1609356 Simulation results of CS/CB with FD-MIMO Huawei, HiSilicon
R1-1609492 Enhancements and system level evaluation of CS/CB CoMP for FD-MIMO Intel Corporation
R1-1609864 Further results on CS/CB in indoor scenario Ericsson
R1-1610017 Enhancements for coordinated scheduling/beamforming with FD-MIMO Qualcomm Incorporated
R1-1610782 WF on enhancement of CS/CB with FD-MIMO Huawei, HiSilicon, Intel, SoftBank Corp, ZTE, ZTE Microelectronics, Samsung

Agreements:

- At least the following enhancements should be studied for CS/CB enhancement:
  - CSI feedback enhancement
    - e.g. CSI feedback reflect different interference beamforming hypothesis from coordinated TPs .
    - e.g. CSI feedback considering power adjustment
    - e.g. only CSIs regarding TPs with strong interference are reported
  - Interference measurement enhancements
    - e.g. NZP CSI-RS used for measuring interference from coordinated TP.
    - e.g. aperiodic CSI-IM
    - e.g. measurement restriction in the frequency domain
  - Enhancement to non ideal backhaul
    - e.g. PMI/CRI signalling between eNBs
  - Enhancement to reference signals
    - e.g. support of orthogonal DM-RS ports for multi-point MU-MIMO
    - e.g. SRS configuration signalling between eNBs
    - e.g. Multiplexing of CSI-RS resources with IC
    - e.g. Resource pool sharing for channel and interference measurement
  - QCL enhancement
    - e.g. non co-located CSI-RS resources in Class B FD-MIMO

Petitioners' Exhibit 1007, p. 335
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Enhancement to SRS:
  - e.g. enable eNB to measure the SRS from interfering UE(s).

8 NR

Friday morning: "Funny" debate on the definition and content of the wording "study"
Background came from Ericsson commenting that they would like to avoid ending-up to a situation where company(ies) say(s) "this topic has not been studied" and consequently SI is not completed and needs to be postponed.
Nokia also agreed to Ericsson's comment
Chair→ Study does not necessarely have to reach a conclusion
RAN1 chair agreed with Ericsson/Nokia views and would like to avoid having the same kind of issue raised at the plenary.

8.1 Study on New Radio Access Technology - SID in RP-161596

Additional RAN guidance in RP-161914

Wednesday
R1-1610053 Draft TR 38.802 Study on New Radio (NR) Access Technology - Physical Layer Aspects NTT DOCOMO, INC.
The document was presented by Kazuaki Takeda from NTT DOCOMO.
Discussion: Huawei couldn't check whether remarks sent on the reflector have been captured
Decision: The document is noted. All proponents are encouraged to check it until Thursday morning.
Thursday
R1-1610843 Draft TR 38.802 Study on New Radio (NR) Access Technology - Physical Layer Aspects NTT DOCOMO, INC.
Decision: The document (TR38.802 v0.2.1) is noted and endorsed as version 0.3.0 in R1-1610848 as basis for future updates.

R1-1610052 Workplan for Study on NR Access Technology NTT DOCOMO, INC.

8.1.1 Waveform and multiple access schemes for new radio interface

R1-1610877 Chairman's notes of AI 8.1.1 on waveform and multiple access schemes for NR Ad-Hoc chair (Qualcomm)
The document was presented by Wanshi Chen from Qualcomm.
Decision: The document is endorsed and content incorporated below.

8.1.1.1 Waveform

Summarize the waveform study including conclusions of Phase I

R1-1608709 Optimized PAPR/CM SC-CPS Waveform and Further Results Idaho National Laboratory
R1-1608829 Uplink coverage performance of OFDM with PAPR reduction for below 6 GHz Huawei, HiSilicon
R1-1609034 Evaluation results of Low PAPR waveform Samsung
R1-1609222 Discussion on DFT-s-OFDM and CP-OFDM for Uplink LG Electronics
R1-1609299 Discussion and evaluation of UL Waveforms CMCC
R1-1609378 A New DFTS-OFDM Compatible Low PAPR Technique for NR Uplink Waveforms MediaTek
R1-1609384 Network Assisted Waveform Selection for NR AT&T GNS Belgium SPRL
R1-1609390 Low PAPR Waveform Design for NR IITH
R1-1609567 On UL Waveforms below 40 GHz Nokia, Alcatel-Lucent Shanghai Bell
R1-1609813 Uplink waveform evaluations and proposals for NR Phase 1 Panasonic Corporation
R1-1610054 Views on UL waveform for NR NTT DOCOMO, INC.
R1-1610113 Coverage analysis of DFT-s-OFDM and OFDM with low PAPR techniques Qualcomm Incorporated
R1-1610224 Coexistence of DFTsOFDM and OFDM in UL below 40GHz Mitsubishi Electric RCE
R1-1610446 OTFS PAPR Analysis Cohere Technologies (Revision of R1-1610397)

R1-1610485 WF on Waveform for NR Uplink Qualcomm, Orange, OPPO, ZTE, ZTE Microelectronics, InterDigital, MediaTek, LGE, IITH, Idaho National Lab, Mitsubishi, Panasonic, Vivo, Tejas Networks, IITM, CEWIT, Straight Path, NTU, Kyocera, Samsung, Spreadtrum, Reliance-jio, Sharp, AT&T, Xiaomi, Sony, NEC, Motorola, Lenovo, National Instrument, Apple
Also supported by Dish Network

Agreement:
- NR Support DFT-S-OFDM based waveform complementary to CP-OFDM waveform, at least for eMBB uplink for up to 40GHz

Petitioners' Exhibit 1007, p. 336
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- FFS additional low PAPR techniques
- CP-OFDM waveform can be used for a single-stream and multi-stream (i.e. MIMO) transmissions, while DFT-S-OFDM based waveform is limited to a single stream transmissions (targeting for link budget limited cases)
- Network can decide and communicate to the UE which one of CP-OFDM and DFT-S-OFDM based waveforms to use
  - Note: both CP-OFDM and DFT-S-OFDM based waveforms are mandatory for UEs

- RAN1 should target for a common framework in designing CP-OFDM and DFT-S-OFDM based waveforms (without compromising CP-OFDM performance/complexity), e.g., control channels, RS, etc.
- Discuss further offline for possible refined evaluation assumptions/methodology for waveform evaluations

Not treated.

R1-1610801 WF on Observation of MA Signature ZTE, ZTE Microelectronics, Huawei, HiSilicon, ETRI
R1-1610956 WF on Common Features and General Framework of MA Schemes Huawei, HiSilicon, CATR, CATT, CMCC, Samsung, ETRI, MediaTek
Also supported by DCM

Agreements:
- Capture the following observations in the TR
  - All proposed non-orthogonal MA schemes for UL transmission share the following common features:
    - At the transmitter side: using MA signature(s)
    - At the receiver side: allowing multi-user detector
  - All proposed non-orthogonal MA schemes for UL transmission on a high level follow the following basic diagram. Note that the basic diagram is not intended to capture all the details or to be a complete diagram.

R1-1610528 WF on support of UL non-orthogonal multiple access Huawei, HiSilicon, Convida Wireless, Interdigital
R1-1610529 WF on support of UL grant-free Huawei, HiSilicon, CATT, Convida Wireless, Interdigital

R1-1610625 WF on TP Structure for NR Multiple Access in TR 38.802 ZTE, ZTE Microelectronics, Qualcomm Inc

Agreements:
- To add Section 8.1.3 for multiple access scheme for UL concept
  - Details subsections/contents/descriptions to be discussed offline

R1-1610626 WF on PHY abstraction method for MMSE-SIC/PIC receiver ZTE, ZTE Microelectronics

Agreements:
- For calibration purpose ONLY, The PHY abstraction method described in slides 5-7 of R1-1610626 can be used for SLS of some MA schemes that use MMSE-SIC/PIC receiver.
  - Companies are encouraged to provide link level simulation results for different combinations of MCS and # of UEs for further verification

R1-1610686 WF on TR Structure for NR Multiple Access Nokia, ASB

Conclusion:
- Rapporteur to propose the detailed subsections for 8.1.3 based on agreements made and to be made in RAN1, e.g.:
  - Agreed observations, agreed PHY abstraction, etc.

R1-1610743 WF on UL grant-free workplan Huawei, HiSilicon, CMCC
R1-1610744 WF on non-orthogonal MA workplan Huawei, HiSilicon, CMCC
R1-1610745 WF on summary of UL non-orthogonal MA progress Huawei, HiSilicon

Petitioners' Exhibit 1007, p. 338
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreements:

- Capture the observations on page 4, and slides 7-10 into TR 38.802, with the following updates:
  - Non-orthogonal MA schemes using an advanced receiver ~~(e.g. SCMA, MUSA, IGMA)~~ have little or no performance loss due to MA signature (except RS) collision.
  - Some ~~N~~non-orthogonal MA results combined with narrowband and/or repetition operations can ~~potentially~~ reach
  - Non-orthogonal MA, in some of the evaluated scenarios, provides significant gain in terms of UL link-level sum throughput and overloading capability with ideal and realistic channel estimation ~~in the evaluated scenarios~~
  - Slides 9-10 are to be updated based on updated simulation results submitted to this meeting

R1-1610793 WF on SLS observations of non-orthogonal MA Huawei, HiSilicon, ZTE

Agreements:

- The observations on slide 3, along with appendix on slides 5 and 6, are agreed, with the following update:
  - All simulated non-orthogonal MA schemes with grant-free with advanced receivers (some with ideal channel estimation while others with realistic channel estimation) provide~~s~~ significant
  - compared to a respective grant-free reference scheme assumed ~~based on OFDMA with grant-free~~ by each company
  - Add a note to the appendix:
    - Note: the empty entries in the table are due to absence of simulation data
  - Add two rows in the tables in the Appendix listing the receive type(s) and HARQ combining used by each company
  - For the columns in the tables in the appendix with both ideal and realistic channel estimation, split each column into two columns capturing results with ideal and realistic channel estimation separately
  - slides 5-6 are to be updated based on updated simulation results submitted within this meeting

R1-1610746 WF on summary of grant-free progress Huawei, HiSilicon
R1-1610794 WF on UL grant-free technical aspects Huawei, HiSilicon
R1-1610818 WF on PHY abstraction method for MA SLS ZTE, ZTE Microelectronics, Huawei, HiSilicon

Agreements:

- The physical layer abstraction methods in *R1-168076* and slides 5-7 of R1-1610626 can be used for MA system-level evaluation with individual verification by each company
- The candidate PHY abstraction methods should be referred in TR 38.802 by using the two reference documents (R1-168076 and R1-1610626)

R1-1610957 WF on Further Summary of LLS Results Huawei, HiSilicon

Agreements:

- Further capture the LLS results in the tables on Page 4, 5, 6, and 7 of R1-1610957 into TR 38.802, with the following updates:
  - The results are to be updated based on updated simulation results submitted to this meeting
  - Note: the empty entries in the table are due to absence of simulation data
  - Change "SE" in the relevant places of the tables to "bits/RE"
    - Add a note whether or not CRC is included in determining "bits/RE" in each result of the corresponding tables
  - Add references to the MA schemes in the tables
- Also add receiver assumptions in the assumption table
- In addition, provide a reference to the spreadsheet capturing all LLS results
  - Note: CRC is excluded in coding rate determination
    - This is only a clarification, not to be captured in the TR

R1-1610826 WF on summary of grant-free progress Huawei, HiSilicon
Also supported by Convida wireless

R1-1610958 WF on Grant-free URRLC Performance Evaluations Huawei, HiSilicon

Friday
R1-1611065 To capture LLS and SLS simulation results for NR MA Huawei, HiSilicon

Petitioners' Exhibit 1007, p. 339
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Email approval for capturing LLS and SLS simulation results for NR MA submitted to RAN1#86bis meeting until 21st October – Wang Yi (Huawei)
- Ccompanies are encouraged to provide input with the following to be captured into TR:
  - For LLS
    - MA signature setting [fixed/random]
    - To replace "overloading" by "number of supported UEs"
  - For SLS
    - BS antenna configuration
    - MA signature setting [fixed/random]
- The results in the attachment are a starting point.

Not treated.

8.1.2 Numerology and frame structure for new radio interface

R1-1611040 Offline outcome of Thursday afternoon on 8.1.2 NTT DOCOMO

Friday

R1-1611060 Offline outcome of Friday morning NTT DOCOMO

8.1.2.1 Numerology

R1-1610125 NR RB Size Design: 12 vs 16 Qualcomm Incorporated

The document was presented by Jing Jiang from Qualcomm.
Proposal: NR adopts 16 REs per PRB for both UL and DL at least for sub-6 eMBB.
Decision: The document is noted.

R1-1608963 About RB grid definition and handling inter-numerology interference in NR ZTE

The document was presented by Thorsten Schier from ZTE.

- Observation 1: The RB grid shall be the same for FDM and TDM
- Observation 2: A nested RB grid structure for FDM ensures RB alignment among different eNBs
- Observation 3: The alternative option to use the RB grid derived from the 15 kHz SCS even for numerologies with wider RBs can lead to RB-misalignment across multiple cells.
- Observation 4: Also for FDM, the nested RB grid does not waste resources
- Proposal 1: Adopt RB grid for FDM as it is agreed in TDM
- Proposal 2: Two methods to handle inter-numerology interference between two adjacent numerologies may be considered. We prefer the first one.
    - A configurable guard band with a granularity in sub-carries. This is especially beneficial when different numerology are multiplexed in a dynamic manner

Petitioners' Exhibit 1007, p. 341
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- In scenarios of lower load or when numerologies are multiplexed semi-statically, a guard band may not be needed. The two numerologies could be placed directly adjacently to each other and different schemes to lower the MCS may be employed.

- Proposal 3: GB configuration mechanisms should be considered, a)semi-static; b)dynamic; c)scheduling; or some combination of above approaches.
- Proposal 4: RAN1 should study the impact of introducing a guard band on the signal design and corresponding techniques to handle it.

Decision: The document is noted.

R1-1610055 Wider BW operation for NR NTT DOCOMO, INC.

The document was presented by Kazuaki Takeda from NTT DOCOMO.

- Proposal: Study an efficient mechanism to achieve a wider BW of around 1GHz and the corresponding feasibilities from both NW and UE perspectives.
- Observation: It would be desired that UE with different BW capability can have flexibility to access to the NR carriers regardless of NW channel BW and the number of NR carriers.

Discussion: Ericsson→Maximum supportable BW is a RAN4 issue and their feedback is needed.

Decision: The document is noted.

R1-1610124 60kHz vs. 120kHz vs. 240kHz performance; impact to PN Qualcomm Incorporated

The document was presented by … from Qualcomm.

- Observation 1: From most artifacts of the millimeter wave link, two are directly affected by tone spacing, if the CP overhead is kept constant. These are the phase noise and intersymbol interference caused by channel delay spread exceeding the CP length.
- Observation 2: Increasing the tonespacing from 60kHz to 120kHz causes a noticeable improvement in many cases and in the worst catgory the performance remains the same.
- Observation3: Increasing the tone spacing to 240kHz is only advantageous for the "normal delay" category and a further increase to 480kHz reduce performance for all categories.
- Proposal 1: Prioritize a tone spacing of 120 kHz for millimeter wave airlinks.

Decision: The document is noted.

R1-1609050 Numerology for URLLC Samsung

The document was presented by Youngbum Kim from Samsung.

- **Error! Reference source not found.**
- **Error! Reference source not found.**
- **Error! Reference source not found.**

Decision: The document is noted.

R1-1609048 Time Alignment Among Different Numerologies for Same CP Overhead Samsung

The document was presented by Youngbum Kim from Samsung.

Proposal: RAN1 should consider the proposed alternatives (summarized in Table 1) for supporting time alignment among different numerologies with same CP overhead.

Decision: The document is noted.

R1-1609232 Details on symbol-level alignmentLG Electronics

The document was presented by Yunjung Yi from LGE.

Proposal 1: There are two cases: inband and outband multiplexing different numerologies defined. If symbol level alignment is considered, it is restricted to inband cases.
Proposal 2: For NCP family, adopt Option 3 for symbol level alignment.

- *Option 3: Reserve 0.51us, and utilize the same CP for all OFDM symbols*

Decision: The document is noted.

R1-1609427 Evaluation and discussion on CP types for above 6GHz Huawei, HiSilicon

The document was presented by … from Huawei.

Proposal 1: NR should support ECP for 120kHz below 40GHz band.
Proposal 2: NR should support ECP for 960kHz above 40GHz band.

Decision: The document is noted.

R1-1609894 System level evaluations for multiple CP lengths InterDigital Communications

The document was presented by Shahrokh Nayeb Nazar from InterDigital.

Proposal: NR design should support Zero-CP length for a given subcarrier spacing.

Decision: The document is noted.

Petitioners' Exhibit 1007, p. 342
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610300 CP length for NR VODAFONE Group Plc

The document was presented by Razieh Razavi from Vodafone.

- Observation 1: The most optimal cyclic prefix to set for the radio interface may depend very much on the specific environment of the UE. Being able to adapt the CP to suit the actual delay spread observed, this could help the link performance, and improve the end user experience.
- Observation 2: Several values of CP per numerology, i.e., Reduced CP, Normal CP and Extended CP, may help to optimize the CP overhead with respect to the UE experienced delay spread and service.
- It is proposed that:
- Proposal 1: NR should support ECP for eMBB and low latency usecases. The representative value of the delay spread related to the aforementioned scenarios should be investigated in order to select the appropriate ECP values per numerology in phase 1.
- Proposal 2: Multiple CP lengths per numerology should be defined for eMBB and URLLC use cases to support different scenarios and delay spread in phase 1 (and later phases).
- Proposal 3: More than one CP lengths can be operated within a cell in both uplink and downlink for eMBB and URLLC use cases in phase 1 (and later phases).

Decision: The document is noted.

R1-1609313 Numerologies for different carrier frequencies KT Corp.

The document was presented by … from KT and provides a study on subcarrier spacing values that are required for each use case in target frequency bands.

Decision: The document is noted.

R1-1610488 Way Forward on wider BW operation for NR NTT DOCOMO, AT&T

The document was presented by Kazuaki Takeda from NTT DOCOMO.

- Study the following mechanisms from RAN1 perspective to support the wider bandwidth of around 1GHz and the corresponding feasibilities from both NW and UE perspectives
  - Carrier Aggregation/Dual Connectivity (Multi-carrier approach)
    - Details are FFS
  - Single carrier operation
    - Details are FFS
    - Maximum channel BW continues to be studied in RAN1/4
- Send an LS to ask RAN4 to take into account the above proposals

Decision: The document is noted, modified and agreed as follows:

Agreements

- At least for Phase 1, study mechanisms to support operation over e.g. around 1GHz contiguous spectrum from both NW and UE perspectives including the maximum single carrier bandwidth of at least 80 MHz
  - Carrier Aggregation/Dual Connectivity (Multi-carrier approach)
    - Details are FFS
    - FFS: non-contiguous spectrum case
  - Single carrier operation
    - Details are FFS
    - Maximum channel bandwidth continues to be studied in RAN1/4
      - Maximum bandwidth supported by some UE capabilities/categories may be less than channel bandwidth of serving single carrier
        - Note that some UE capabilities/categories may support channel bandwidth of serving single carrier
- Send an LS to ask RAN4 to study the feasibility of the above mechanisms from both NW and UE perspectives

Prepare draft LS to RAN4 until Tuesday morning – Kazuaki (DOCOMO)

Tuesday:

R1-1610508 [Draft] LS on wider bandwidth operation for NR NTT DOCOMO

Decision: The document is noted and final LS is approved in R1-1610655, with following update:

RAN1 ~~had discussion~~discussed ~~regarding~~ how to support operation over, e.g., around 1 GHz contiguous spectrum and reached the following agreements.

R1-1610503 Way Forward on Alignments among different numerologies in frequency domain LG Electronics

The document was presented by Yunjung Yi from LGE.

- For a given numerology/subcarrier spacing, a UE is indicated implicitly and/or explicitly on the start and end frequency
  - Start and end frequency location can be aligned with RB boundary based on reference numerology
- A UE forms RB for the given numerology from the starting frequency location per each numerology/subcarrier spacing

Petitioners' Exhibit 1007, p. 343
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Note: Depending on the start/end frequency configuration, RB grid of different numerologies can be formed in a nested manner or RB grid can be formed to maximize resource utilization

Decision: The document is noted. Continue discussion – (LGE)

- The number of subcarriers per PRB is:
  - Alt.1: 12 supported by CATT, Huawei, HiSilicon, Nokia, InterDigital, ETRI, Intel, Ericsson, Panasonic
  - Alt.2: 16 supported by Qualcomm (can agree on Alt 1 but would like to clarify that common understanding is that there are performance issue for small packet size).

Agreement: The number of subcarriers per PRB is 12.

- Adopt RB grid for FDM as it was agreed in TDM (ZTE: similar proposal in R1-1610483) – supported by ZTE, ZTE Microelectronics, Ericsson, Qualcomm, Nokia, Alcatel-Lucent Shanghai Bell, Panasonic, Convida Wireless, Intel, CATT, InterDigital, Samsung, MediaTek, ETRI
- NR carrier shall support UEs with bandwidth support smaller than the carrier bandwidth
- FFS: Fractional RB support

R1-1610483 Way Forward on RB grid definition for mixed numerologies - FDM ZTE, ZTE Microelectronics, Ericsson, Qualcomm, Nokia, Alcatel-Lucent Shanghai Bell, Panasonic, Convida Wireless

Decision: The document is noted.

Working assumption: Adopt RB grid for FDM as it was agreed in TDM

Possible Working assumption:

- In the DL transmission to a UE, the subcarrier overlapping with the DC subcarrier of the receiving UE is modulated in the same way as other subcarriers of the same PRB
  - UE may puncture the DC subcarrier

Continue offline discussion within Monday – (Ericsson)

Possible working assumption (Monday evening):

- For transmitter side, in a DL transmission to a UE, the subcarrier overlapping with the DC subcarrier of the receiving UE is modulated in the same way as other subcarriers of the same PRB
- For receiver side, UE may puncture the DC subcarrier
- DC handling in the receiver side will not be specified

Continue offline discussion until Tuesday – Stefan (Ericsson)

Tuesday

R1-1610622 Way Forward on DC subcarrier Ericsson

- Transmitter side
  - No special handling of the DC subcarrier(s) (if present) on the transmitter side is specified in RAN1
    - Consequence of previous agreement "*No explicit DC subcarrier is reserved both for DL and UL*"
- Receiver side
  - No special handling of the DC subcarrier(s) (if present) on the receiver side is specified in RAN1
    - Behavior left to implementation, the receiver may for example puncture data received on the DC subcarrier

Decision: The document is noted.

Possible working assumption:

- Transmitter side
  - No special handling of the DC subcarrier(s) on the transmitter side is specified in RAN1

Continue offline discussion until Wednesday – Stefan (Ericsson)

Agreements:

- Receiver side
  - No special handling of the DC subcarrier(s) on the receiver side is specified in RAN1
    - Behavior left to implementation, the receiver may for example puncture data received on the DC subcarrier

Wednesday: Qualcomm' comment→ was not present when above agreement has been made, is ok to keep the agreement but would like to understand what transmitter/receiver sides mean? DC subcarriers (if present or not) imply 4 cases being considered.

Petitioners' Exhibit 1007, p. 344
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreements:

- Regarding DC present within the transmitter,
  - DC Handling of DC subcarrier in transmitter side is specified
    - Receiver knows where DC subcarrier is or is informed (e.g., by specification or signaling) of where DC subcarrier is or if DC subcarrier is not present within receiver bandwidth
    - When receiver is informed DC subcarrier is present, FFS: transmitter DC subcarrier is punctured, rate matched, modulated, or EVM is not specified
    - When DC subcarrier is not present, all subcarriers within the receiver bandwidth are transmitted

---

R1-1610521 Way Forward on Subframe duration ZTE, ZTE Microelectronics, Ericsson, NTT Docomo, Nokia, Qualcomm, Panasonic, CATT, Mediatek, Convida Wireless
Decision: The document is noted.

Agreements:

- Sub-frame duration is fixed to 1ms
- Reference numerology for defining subframe duration is 15 kHz

R1-1610540 Way Forward on slot NTT DOCOMO, INC., Ericsson, Panasonic, Nokia, Alcatel-Lucent Shanghai Bell, Qualcomm, Huawei, HiSilicon
Decision: The document is noted.

Agreements:

- For SCS of up to 60kHz with NCP, y = 7 and 14
  - FFS: whether/which to down select for certain SCS(s)
- For SCS of higher than 60kHz with NCP, y = 14

R1-1610500 Way Forward on Numerology for forward compatibility InterDigital, Mitsubishi, Nokia, Alcatel-Lucent Shanghai Bell, Intel

- Numerology and frame structure decisions in NR should consider zero-length CP overhead for above 40 GHz

Decision: The document is noted. Also supported by KDDI. Continue discussion

Agreement: RAN1 has not so far identified any forward compatibility issues for the potential introduction of new waveforms including zero-length CP in the future.

Tuesday
R1-1610652 Way Forward on Symbol Level Alignments LG Electronics, NTT DOCOMO, Ericsson, Panasonic, Qualcomm, ZTE (R1-1610502)

- Confirm WA in the background
- For normal CP family, the following is adopted
  - For F_s = 15 kHz * 2^n (n is a positive integer),
    - Each symbol length (including CP) of 15 kHz equals the sum of the corresponding 2^n symbols of F_s
    - Other than the first OS in every 0.5msec, all OFDM symbols within 0.5msec have the same size
    - The first OS in 0.5msec has longer CP of 16 Ts (assuming 15 kHz and FFT size of 2048) compared to other OSs
  - For F_s = 15 kHz * 2^n (n is a negative integer)
    - Each symbol length (including CP) of F_s equals the sum of the corresponding 2^n symbols of 15 kHz

Decision: The document is noted.

Agreement:

- Alignment within a subframe
  - Symbol level alignment across different subcarrier spacings with the same CP overhead is assumed within a subframe duration in a NR carrier
  - FFS: Unlicensed spectrum case

(Agreement):

- For normal CP family, the following is adopted
  - For F_s = 15 kHz * 2^n (n is non-negative integer),
    - Each symbol length (including CP) of 15 kHz equals the sum of the corresponding 2^n symbols of F_s
    - Other than the first OS in every 0.5msec, all OFDM symbols within 0.5msec have the same size

Petitioners' Exhibit 1007, p. 345
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

        - FFS: The first OS in 0.5msec has longer CP of 16 Ts (assuming 15 kHz and FFT size of 2048) compared to other OSs
    - FFS: For F_s = 15 kHz * 2^n (n is a negative integer)
        - Each symbol length (including CP) of F_s equals the sum of the corresponding 2^{-n} symbols of 15 kHz

Discuss further on above FFS
Wednesday: Above agreement is modified as follows:
Agreement:

- For normal CP family, the following is adopted
    - For F_s = 15 kHz * 2^n (n is non-negative integer),
        - Each symbol length (including CP) of 15 kHz equals the sum of the corresponding 2^n symbols of F_s
        - Other than the first OS in every 0.5msec, all OFDM symbols within 0.5msec have the same size
        - The first OS in 0.5msec is longer by 16 Ts (assuming 15 kHz and FFT size of 2048) compared to other OSs
            - FFS: How to utilize this 16 Ts
    - For F_s = 15 kHz * 2^n (n is a negative integer)
        - Each symbol length (including CP and 16 Ts) of F_s equals the sum of the corresponding 2^{-n} symbols of 15 kHz

Thursday: Above FFS is replaced by:

- 16 Ts is used for CP for the first symbol

Thursday session

R1-1610126 Scaled CP vs ECP: delay spread, Doppler and SNR tradeoff study Qualcomm Incorporated

- Proposal 1: Design of an additional scaled numerology family with ECP (large CP overhead) should happen only if strong use cases or deployments scenarios are identified, where the normal CP scaled numerology family cannot provide an acceptable performance.
- Proposal 2: The NCP scalable numerology family can be adapted for different delay and Doppler scenarios dynamically or semi-statically.
- Proposal 3: Evaluation of different CP families should happen in conjunction with pilot pattern design.

Decision: The document is noted.

R1-1610142 URLLC Channel Coding Qualcomm

R1-1610810 Way forward on CP Huawei, HiSilicon, Sony, OPPO, CATT, Vodafone, Ericsson, ZTE, Intel , Mediatek, NTT DOCOMO, CATR

Agreements:

- From Phase 1, physical layer design should support an extended CP
    - Extended CP will be only one in given subcarrier spacing
- FFS: Exact for the services/scenarios for extended CP

R1-1610791 WF on Fractional RB usage Samsung, ZTE, ZTE Microelectronics, Panasonic, KDDI, IITH, IITM, Tejas Networks, CEWiT, Nokia
Also supported by ASB, Reliance jio
Continue discussions

R1-1610949 WF on forward compatibility for NR Samsung, LG Electronics, Nokia, ASB, Ericsson, Huawei, HiSilicon, Qualcomm, AT&T, Panasonic

Agreements:

- Explicit signaling to NR UEs can indicate reserved resources
    - The details on signaling information and transmission are FFS
        - e.g. granularity for blank resource indication
        - e.g. RRC signaling and/or L1 signaling (including DL control information)
        - e.g. broadcast and/or unicast signaling
        - e.g., whether this signaling is applicable to UE UL operation and/or DL operation and/or sidelink operation
        - FFS: combination of above signaling
        - FFS: time and frequency granularity

Petitioners' Exhibit 1007, p. 346
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610953 WF on carrier aggregation Huawei, HiSilicon, Nokia, Alcatel-Lucent Shanghai Bell, NTT DOCOMO, Qualcomm, ZTE

Agreements:

- Study at least the following aspects for NR carrier aggregation / dual connectivity
  - Intra-TRP and inter-TRP with ideal and non-ideal backhaul scenarios
  - Number of carriers
  - The need for certain channels, e.g. downlink control channel, uplink control channel or PBCH for some carriers
  - Cross-carrier scheduling and joint UCI feedback, e.g. HARQ-ACK feedback
  - TB mapping, i.e., per carrier or across carriers
  - Carrier on/off switching mechanism
  - Power control
  - Different numerologies between different/same carrier(s) for a given UE
    - FFS: whether/if different numerologies are multiplexed on one carrier for one UE is called carrier aggregation / dual connectivity

Not treated.

8.1.2.2 Frame structure

Summarize the frame structure study
Note that detailed signal/channel design can be studied in other sub-agendas

R1-1610129 Summary of [86-19] Discussion on Slot Structure Use Cases Qualcomm Incorporated
The document was presented by Joseph Soriaga from Qualcomm.

Proposal 1: *For the slot duration y, at least the following should be supported*
- *Configurations supporting slot y= 7 and 14 symbols*

Proposal 2: *For transmission durations of EMBB, at least the following should be supported*
- *Ability to define transmission duration through the aggregation of slots*
  - *Configuration may be through semi-static RRC signaling or dynamic L1 indication*
  - *FFS: if any aspects of aggregation or related control should be captured in specification*
- *Ability to configure the minimum transmission duration of more than 14 symbols at higher SCS*
  - *FFS: how to define the minimum*
    - *Option 1. Minimum value of SCS (e.g., 120kHz needs 28 symbols)*
    - *Option 2. Minimum transmission duration of [0.125ms]*
  - *Option 1: Configuration of y to be larger than 14*
  - *Option 2: Aggregation of slots to achieve*

Proposal 3: *The NR frame structure should support both slots and mini-slots.*
- *FFS: Timeline granularity for monitoring control of the mini-slot*

Proposal 4: *The NR frame structure should at least support the following*
- *Periodicities for downlink and uplink control equal to 250us, 500us, and 1m*
- *Longer intervals or aperiodicity resulting from e.g., semistatic or dynamic slot aggregation*

Proposal 5: *Define a subframe duration as 1 ms with a reference numerology 14-symbols at 15 kHz SCS.*

Decision: The document is noted.

Working assumption~~Possible agreements~~:
- The NR frame structure should support both slots and mini-slots
  - FFS: Timeline granularity for monitoring control of the mini-slot
  - FFS: Terminologies of mini-slot

Continue discussion.
Tuesday: Huawei → no progress on mini-slots structure so far, cannot get it agreed – working assumption can be a step forward

Tuesday
Possible agreements:
- Multiple slots can be aggregated in NR
  - Aggregation may be through semi-static RRC signaling and/or dynamic L1 indication and/or pre-determined by specification
  - Multiple-slot aggregation is supported at least for the following use cases in NR
  - One DL/UL assignment over one or multiple slots in the aggregated slots

Agreements:
- Slot aggregation is supported
- Data transmission can be scheduled to span one or multiple slots

Possible agreements:
- For slot based transmission, the NR frame structure should at least support the following

Petitioners' Exhibit 1007, p. 348
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Periodicities for possible downlink and uplink control transmission equal to or approximately 125us, 250us, 500us, and 1ms
- Longer intervals or aperiodicity resulting from e.g., semistatic or dynamic slot aggregation

Continue offline discussion until Wednesday

R1-1609630 On UE-specific DC subcarrier in NR Ericsson

Observation: Ignoring the information transmitted on the DC subcarrier slightly increases the effective code rate. The code rate increase is worst for a single PRB allocation and gets smaller for wider allocation.
Proposal: In a DL transmission to a UE, the subcarrier overlapping with the DC subcarrier of the receiving UE is modulated in the same way as other subcarriers of the same PRB.

Decision: The document is noted.

R1-1609510 Discussion on mini-slot structure for URLLC Intel Corporation

The document was presented by … from Intel.

Proposal 1

- *A set of URLLC transmission durations (mini-slots) is configured to a UE.*
- *The sets of URLLC transmission durations for DL and for UL may be independently configured.*
- *Flexible URLLC transmission durations are realized by aggregation of mini-slots.*

Proposal 2

- *URLLC resource access granularity is equal to or shorter than the minimum configured URLLC TTI duration.*
  - *FFS the performance benefits vs complexity tradeoffs for symbol level resource access granularity for URLLC services.*

Decision: The document is noted.

R1-1608710 Frame Structure for Ultra-Low Latency Scheduled-based UL Access Idaho National Laboratory

The document was presented by Ramon Khalona from INL.

- Observation: To enable a schedule-based UL access with dynamic eMBB/URLCC multiplexing in dynamic TDD deployments requires an ultra-fast scheduling-request signal.
- Observation: Zero-wait-time scheduling request transmitted as an underlay signal reduces the average wait time to almost zero, eliminates the delay uncertainty and provides scheduling flexibility to the eNB to adapt and dynamically allocate resources for UL transmissions meeting the most stringent URLLC latency requirements.
- Observation: Underlay SR signals transmissions have the same numerology as the data channel.
- Proposal: NR should support shorter SR transmissions lasting n symbols located at those regions indicated in Figure 3, where $0 < n < (N - N_{DCI} - N_{UCI} - N_{GP})$ and N, N_{DCI}, N_{UCI}, and N_{GP} are the maximum number of symbols, number of DCI symbols, number of UCI symbols and the switching-gap duration in a subframe, respectively.

Decision: The document is noted.

R1-1608903 Discussion of the UE processing time on the support of multiple numerologies and frame structures Guangdong OPPO Mobile Telecom.

The document was presented by … from OPPO.

- Proposal 1: NR should not assume fixed UE processing time
- Proposal 2: UE processing time is divided into different level/class and UE reports its supported level/class.

Decision: The document is noted.

R1-1609145 Discussion on numerology multiplexing for supporting different service requirements NEC

The document was presented by Rajitha Palipana from NEC.

- Proposal 1: Support configuration of a waveform of a selected numerology that is optimum for one selected service applied for the entire carrier BW and last for a period of time.
- Proposal 2: Support configuration of multiple waveforms of different numerologies frequency multiplexed within the carrier BW to simultaneously and optimally serve different services.
- Proposal 3: Not to support dynamic configuration of multiple numerologies to support fast change of waveform to adapt to instantaneous demand.
- Observation 1: It is observed that UE-specific numerology handling on subframe basis may need further study on resource block and subframe design strategies for seamless co-existence of UEs having different numerologies.

Decision: The document is noted.

R1-1608942 Multiplexing eMBB and URLLC Transmissions Sony

The document was presented by Martin Beale from Sony.

- Observation 1: TDM does not efficiently utilises the resources in multiplexing eMBB and URLLC.
- Observation 2: It may not be beneficial to FDM eMBB and URLLC.

Petitioners' Exhibit 1007, p. 349
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Observation 3: It is beneficial that the UE receiving eMBB transmission is aware that this transmission is corrupted by an overlapping URLLC transmission.
- Proposal 1: Introduce a downlink control channel at the end of an eMBB transmission frame structure to provide repair information on any overlapping URLLC transmission.

Decision: The document is noted.

R1-1609609 Discussion on time domain frame structure for high speed train scenario with relay for NR ETRI

The document was presented by … from ETRI.

- Observation 1: The probability of Random Access (RA) collision is very low in HST scenario with relay, and in most of the cases there is only one active relay sending network access request.
- Observation 2: Because the RA collision in HST scenario with relay is not severe and it can be avoided simply, preamble and TA related transmission/reception and processing are no more necessary.
- Proposal 1: The advanced frame structure, which is applicable for the fixed DL transmission and dynamic UL reception in time domain, should be supported at least for the HST scenario with relay for NR.
- Proposal 2: The methods for finding the boundary of UL part during reception by BBU (BS) is FFS.

Decision: The document is noted.

R1-1609919 Flexible frame structure and control signalling for NR Motorola Mobility

The document was presented by … from MotM and proposes:

- slots and mini-slots
  - Slot duration is y=7 OFDM symbols in the numerology used for transmission.
  - UE can be configured with a mini-slot.
    - mini-slot duration is y'=1 OFDM symbol in the numerology used for transmission.
    - It is preferable to support only 1 OFDM symbol mini-slot length. However, if multiple mini-slot lengths are defined, the UE can be configured with only one mini-slot length at any given time.
    - mini-slot configuration should be supported at least for subcarrier spacing ≤ 30kHz
- DL control signalling
  - DL control signalling can be sent to the UE once every slot duration
  - If the UE is configured with a mini-slot, DL control signalling can be sent to the UE once every mini-slot
    - If start of every slot does not align with a mini-slot (e.g. for 2 symbol mini-slot) DL control signalling can be sent to the UE once every mini-slot and once every slot.
- Resource allocation granularity
  - UE can be assigned DL/UL resources in multiples of Time resource units (TRUs).
    - 1TRU corresponds to all available OFDM symbols within one slot
  - UE can also be configured to receive mini-TRU based DL/UL resource assignments.
    - 1 mini-TRU corresponds to one OFDM symbol in the numerology used for transmission

Decision: The document is noted.

R1-1610546 Way Forward on bandwidth adaptation in NR MediaTek, Acer, CHTTL, III, Panasonic, Ericsson, AT&T, Nokia, ASB, Qualcomm
R1-1611041 Way Forward on bandwidth adaptation in NR MediaTek, Acer, CHTTL, III, Panasonic, Ericsson, Nokia, ASB, Samsung, LG, Intel

Agreements:

- At least for single carrier operation, NR should allow a UE to operate in a way where it receives at least downlink control information in a first RF bandwidth and where the UE is not expected to receive in a second RF bandwidth that is larger than the first RF bandwidth within less than X μs (FFS: value of X)
  - FFS the first RF bandwidth is within the second RF bandwidth
    - FFS the first RF bandwidth is at the center of the second RF bandwidth
  - FFS the maximal ratio of the first RF bandwidth over the second RF bandwidth
  - FFS detailed mechanism
- FFS RF bandwidth adaptation for RRM measurement

R1-1610902 WF on Multiplexing eMBB and URLLC in DL Samsung, Panasonic, ZTE, ZTE Microelectronics, ETRI, Ericsson, CATT, Huawei, NTT DOCOMO, LGE, CMCC, Convida wireless, InterDigital, Sony, Fujitsu

Also supported by Sharp, HiSilicon

Agreements:

- From network perspective, multiplexing of transmissions with different latency and/or reliability requirements for eMBB/URLLC in DL is supported by
  - Using the same sub-carrier spacing with the same CP overhead
    - FFS: different CP overhead

Petitioners' Exhibit 1007, p. 350
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Using different sub-carrier spacing
  - FFS: CP overhead
- NR supports both approaches by specification

- NR should support dynamic resource sharing between different latency and/or reliability requirements for eMBB/URLLC in DL
  ~~FFS: Especially for the case where the NW operates with multiple different scheduling intervals~~

R1-1610995 WF on dynamic resource sharing between eMBB and URLLC in DL Huawei, HiSilicon, CATR, Potevio, Samsung
R1-1610952 Semi-static resource sharing between eMBB and URLLC LG Electronics, Panasonic

Agreements:

- Consider further the tradeoffs for meeting URLLC requirements for the following.
  - Semi-static resource allocation for UL data transmission.
  - Dynamic indication of available resource (e.g., by broadcast DCI) for UL data transmission.
  - Normal SR-based transmission
  - Other solutions are not precluded

Not treated.

8.1.3 Channel coding and modulation for new radio interface

R1-1610878 Chairman's notes of AI 8.1.3 on channel coding and modulation for NR Ad-Hoc chair (Nokia)
The document was presented by Matthew Baker from Nokia.
Discussion: Rapporteur (Nokia)→ very tough sessions with both Wednesday & Thursday night sessions (finished around 1:00AM)
Huawei→ no issues to be reported but the notes are going to be endorsed without having all relevant delegates being present due to late ending time.
RAN1 Chair: agreed to come-back before meeting is over.
Decision: The document is finally endorsed and content incorporated below.

8.1.3.1 Channel coding

Includes choosing at least eMBB data channel coding scheme(s) and summarize observations that lead to the selection

Comparisons

R1-1608584 Complementary turbo and LDPC codes for NR, motivated by a survey of over 100 ASICs AccelerComm Ltd
R1-1609070 Analysis on Trade-off between Performance and Complexity Samsung

R1-1610544 Observations on channel codes for NR eMBB data AccelerComm, Ericsson, Orange, IMT, LG, NEC, Sony
Proposed observations:

- LDPC codes are **proven, mature and capable**, at least when focusing on achieving **high throughputs**
- LDPC codes can deliver acceptable ~~meet the~~ BLER, **throughput**, latency, area-efficiency and energy-efficiency ~~requirements of~~ for NR, at least at **medium to high coding rates**
- Turbo codes are **proven, mature and capable**, at least when focusing on achieving **flexibility and HARQ**
- The LTE turbo code and enhanced LTE turbo codes can ~~meet~~ deliver acceptable ~~the~~ BLER, **flexibility, HARQ**, latency, area-efficiency and energy-efficiency ~~requirements~~ ~~of~~ for NR, at least at **medium to low coding rates.**
- Polar codes are ~~**not**~~ **less mature, at least for larger list sizes**.
- Polar....?
- Polar codes require **list decoding** to meet the BLER requirements of NR, which degrades the throughput, latency, area-efficiency and energy-efficiency of polar decoders.
- Turbo codes will be a **necessary part** of NR devices supporting non-standalone operation and/or legacy LTE connectivity ~~– efficiency improvements can be achieved by reusing the associated turbo code hardware for NR~~
- In some circumstances LDPC codes are more favourable than turbo codes. In other circumstances, turbo codes are more favourable than LDPC codes.
- LDPC and turbo codes are complementary, since they have different advantages and disadvantages.

R1-1610667 Way Forward on Channel Coding Observations Huawei, HiSilicon
Proposed observations:
Performance:

- Polar vs. LDPC
  - For list 32 decoder for Polar, Polar has better BLER performance compared to LDPC for the evaluated info block lengths [Huawei R1-1608864, ZTE R1-166411, Spreadtrum R1-1608922]
  - For list 8 decoder for Polar, Polar has better BLER performance compared to LDPC for the evaluated info block lengths/code rates except for high coding rates and large info block size [Huawei R1-1608864]
  - For list 4 decoder for Polar, Polar has better BLER performance compared to LDPC for small info block [Nokia R1-1609583]
- Polar vs. LTE Turbo
  - For list 32 decoder for Polar, Polar has better BLER performance compared to Turbo for the evaluated info block lengths [Huawei R1-1608864, Huawei R1-164377, QC R1-164700, ZTE R1-166411, Spreadtrum R1-1608922, DCM R1-1610060, CATR R1-1609578]
  - For list 8 decoder for Polar, Polar has better BLER performance compared to Turbo for the evaluated info block lengths and coding rates except rate 1/3 [Huawei R1-1608864, DCM R1-1610060]
  - For list 4 decoder for Polar, Polar has better BLER performance compared to Turbo for small info block [Nokia R1-1609583]
- Polar vs. TBCC
  - For list 32 decoder for Polar, Polar has better BLER performance compared to TBCC for info block lengths up to 200 bits [Huawei R1-1608863, ZTE R1-1608973, CATT R1-1608771, Intel R1-167703, CATR R1-1609579]
  - For list 4 decoder for Polar, Polar has better BLER performance compared to TBCC for info block [Nokia R1-1609589, Nokia R1-1609594]

Flexibility:

- For Polar, 1-bit granularity can be achieved for all coding rates and for full range of block size
  - [Huawei R1-167209],[Intel R1-164184]
- For LDPC, 1-bit granularity cannot be achieved with reasonable implementation complexity, due to multiple PCMs needed to support all coding rates with a complex switch network
  - [Samsung R1-166771],[Qualcomm R1-1610137],[Nokia R1-1609584],[Samsung R1-1609067]
- For Turbo, 1-bit granularity is feasible for all coding rates and for full range of block size

Implementation complexity:

- For polar, list 8 decoder is deemed implementable for all info block size and list 32 is deemed implementable for small info block size
  - [Huawei R1-1608865] [MediaTek R1-1609336]
- For LDPC, LOMS/LNMS decoder with iterations up to 25 is deemed implementable for info block granularity coarser than LTE

Petitioners' Exhibit 1007, p. 353
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - [Qualcomm R1-1610139],[MediaTek R1-1609337],[Nokia R1-1609584],[Samsung R1-1609067]
- For Turbo, decoder complexity is impractical for large info block size

Latency:
- For Polar
  - with list 8 decoder, a decoding latency of 16us can be met for all info block length
    - [Huawei R1-1608865]
  - with list 32 decoder, a decoding latency of 1.7us can be met for small info block length (80bit)
    - [Huawei R1-1608865]
- For LDPC, a latency of 16us can be met for all info block length
  - [Qualcomm R1-166372]
- For Turbo, a latency of 16us can be met for small info block length

R1-1610690 Way forward on observations for eMBB data channel coding Samsung, Qualcomm Incorporated, Nokia, ASB, KT Corporation, Intel Corporation

Proposed observations:
Summary:
- LDPC codes can efficiently support the whole range of eMBB data channel rates, block lengths, and IR HARQ with fine granularity
- LDPC codes can provide better area and energy efficiency than other coding schemes, especially for high throughput
- LDPC codes are amenable to parallelization and can provide better decoding latency

Rate flexibility:
- LDPC code can support multiple codes rates, and HARQ, including IR-HARQ by extension of parity check matrix
  - Multiple LDPC code families can be compactly and efficiently described
  - Decoder does not need to carry complexity of mother code on early transmissions, and performance is comparable to Turbo codes

Length flexibility:
- Shortening together with lifting and rate-matching allows LDPC code support information block size and codeword length flexibility with 1-bit granularity
  - The additional HW complexity for supporting a flexible LDPC code with arbitrary sub-block size is not a problem, as compared with that of inflexible LDPC codes.

Implementation:
- LDPC implementation complexity can be better than other codes when LDPC can support flexibility
  - The energy and area efficiencies of a flexible LDPC decoder is better than those of LTE turbo codes.
- Implementation complexity point of view, LDPC is better than other coding schemes especially for high throughput

Performance:
- LDPC codes can support stable performance for various MCS with fine granularity, comparable or better to other codes with similar decoding complexity

- Observations:
- Performance
  - The performance of LDPC, Polar and Turbo codes is captured in R1-1610600 (update of R1-1610423).
    - It has not yet been possible to draw conclusions directly from these captured results, owing to different views on the implementation complexities and possible enhancements which are discussed in more detail below.
- Flexibility for code rate and code block size support
  - LDPC, Polar and Turbo codes can all deliver acceptable flexibility.
- Chase- and IR-HARQ support
  - The proponents of LDPC and Polar have shown schemes for support of both CC- and IR-HARQ in their respective codes
    - Some companies have concerns on the incremental freezing method of HARQ support for Polar codes
    - One company has concerns on the complexity of IR-HARQ for LDPC codes
  - The ability of Turbo codes to support both CC- and IR-HARQ is well known
- Implementation complexity
  - LDPC:

Petitioners' Exhibit 1007, p. 354
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- LDPC codes are widely implemented in commercial hardware supporting several Gbps throughput and attractive area and energy efficiency with some flexibility, but with flexibility and features that are more limited than required for NR; in relation to NR, there are concerns summarised below.
- The area efficiency reduces for lower coding rates
- The complexity of LDPC increases with increasing flexibility
- Proponents consider LDPC codes with limited flexibility to provide the most attractive area and energy efficiency, and that the characteristics of LDPC codes in area and energy efficiency remain advantageous even when supporting full flexibility, while some other companies consider the applicable flexibility to be limited, for example because a flexible switched network (if used) has an impact on increasing the power, area and latency
- LDPC codes are amenable to parallelisation which can provide better decoding latency
  - Depending on the parity check matrix design, some of this parallelism may not be exploited for all code block lengths for NR, and some companies have a concern with this and its impact on energy and area efficiency
- Some variants of min-sum based iterative decoders are considered implementable, and allow a trade-off between complexity and performance
- Two proponents consider quasi-ML decoders (e.g. list 32, ordered stochastic decoding) implementable for codeword sizes up to 1k
- BP and sum-product decoders are not considered implementable for NR by some companies
- For LDPC there are concerns that implementation with attractive area and energy efficiency may be challenging when simultaneously targeting the peak throughput and flexibility requirements of NR

o Polar:
- Polar codes are implementable, although there are currently no commercial implementations, and in relation to NR, there are some concerns as summarised below.
- The area efficiency reduces for shorter block lengths and lower coding rates
- For list decoders, the implementation complexity increases with increasing list size, especially with larger block sizes
  - Some companies consider that a List 32 decoder is implementable up to a codeword size N of at least 1k (with larger codeword sizes requiring a segmented design), although some other companies have concerns on the achievable performance (including area efficiency, hardware throughput)
  - Some companies consider that a List 8 decoder is implementable for codeword sizes N up to 4k (with larger codeword sizes requiring a segmented design)
  - List 4 decoder is considered implementable for codeword sizes N up to at least 2k, with some companies considering it implementable up to 8k (with larger codeword sizes requiring a segmented design)
  - List 1 is considered implementable
- For decoding hardware that can achieve acceptable latency, performance and flexibility, there are some concerns about the area efficiency and energy efficiency that are achievable with polar codes

o Turbo:
- Turbo codes are widely implemented in commercial hardware, supporting HARQ and flexibility similar to what is required for NR, but not at the high data rates or low latencies required for NR; in relation to NR, there are concerns summarised below.
- Proponents consider some implementations of turbo codes to meet the flexibility requirements of NR with the most attractive area and energy efficiency except at higher throughputs, and particularly at lower code rates and lower block lengths
  - Other companies consider that the latency and area and energy efficiency are not adequate for NR, and that the area and energy efficiency reduces at lower block lengths
  - Only two of the proponents of turbo codes propose turbo codes for the higher throughputs for NR
- In some implementations suitable for lower throughputs, the area and energy efficiency is constant when varying the puncturing and repetition rate.
  - Otherwise, this is not the case, e.g. in some implementations designed for higher data rates
- The decoding complexity increases linearly with the information block size for a given mother code rate
- The decoding complexity increases as the contraint length increases, and to a lesser extent as the mother code rate reduces
- For turbo codes, there are concerns that implementation with attractive area and energy efficiency is challenging when targeting the higher throughput requirements of NR
- Some advanced turbo decoders are considered implementable, and allow a tradeoff between complexity and performance.
- Some companies consider quasi-ML decoders are implementable for shorter information block lengths and codeword sizes up to 1k

Petitioners' Exhibit 1007, p. 355
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

        - The proponents consider that a turbo decoder could be designed that would be capable of decoding both LTE and at least small information block sizes (K<=6144) of NR
            - Other companies consider that such reuse would be subject to multiple concerns or would not be possible
- Latency
    - The proponents of all three coding families consider that their respective codes can fulfil the NR latency requirements
        - Latency-wise, highly-parallelised decoders, as applicable for LDPC, and turbo according to some proponents, can help to reduce latency
        - Although polar codes are not highly parallelisable, proponents consider that there are other design techniques that can help to reduce latency for polar decoders
        - Some companies consider that polar codes may be able to achieve lower latency for decoding of small (around 1000 bits) blocks if capability of decoding large blocks is not considered; however, some other companies consider that polar decoders incurs longer latency than turbo decoders
- Other considerations
    - Turbo and LDPC are similarly well established, while Polar is less well established, being the newest among the three. All of the code families require effort at least in specification design, in order to meet the NR requirements. Some companies consider that less well established technologies require more effort.

R1-1610981 WF on observations of eMBB data channel coding for short block length InterDigital
Further revised in R1-1610993
R1-1610931 WF on channel coding observations for short block size IMT, Orange, AccelerComm, Ericsson, LG, NEC

R1-1610604 WF on channel codes for NR eMBB data AccelerComm, Ericsson, Orange, IMT, LG, NEC, Sony
Revision of R1-1610545
Proposal:
- Adopt LDPC code and turbo code, to mitigate the concerns associated with the implementation of flexible LDPC

R1-1610767 Way forward on eMBB data channel coding Samsung, Qualcomm Incorporated, Nokia, Alcatel-Lucent Shanghai Bell, Verizon Wireless, KT Corporation, KDDI, ETRI, IITH, IITM, CEWiT, Reliance Jio, Tejas Network, Xilinx, Sony, SK Telecom, Intel Corporation, Sharp, MTI, National Instrument, Motorola Mobility, Lenovo, Cohere Technologies, Acorn Technologies, CableLabs, WILUS Inc, NextNav, ASUSTEK, ITL
Revision of R1-1610689
Also acceptable to Ericsson
Proposal:
- Adopt LDPC code for eMBB data channel as single coding scheme

R1-1610850 WF on channel codes Huawei, HiSilicon, Acer, Bell, CATR, China Unicom, China Telecom, CHTTL, Coolpad, Deutsche Telekom, Etisalat, InterDigital, III, ITRI, MediaTek, Nubia Technology, Nuel, OPPO, Potevio, Spreadtrum, TD Tech, Telus, Vivo, Xiaomi, Xinwei, ZTE, ZTE Microelectronics
Revision of R1-1610668
Also acceptable to CATT
Proposal:
- Polar code is supported as a channel coding scheme for NR eMBB data channel

R1-1610607 Way Forward on Channel Coding ZTE, ZTE Microelectronics, Acer, Bell, CATR, China Unicom, China Telecom, CHTTL, Coolpad, Deutsche Telekom, Etisalat, Huawei, HiSilicon, InterDigital, III, ITRI, MediaTek, Nubia Technology, Neul, OPPO, Potevio, Shanghai Tejet, Spreadtrum, TD Tech, Telus, Vivo, Xiaomi, Xinwei, IITH, IITM, CEWiT, Reliance Jio, Tejas Network

Question: How many channel coding schemes should be specified for the NR eMBB data channel:
- 1:
    - LDPC: Ericsson, Sony, Sharp, Nokia, ASB, Samsung, Intel, QC, VzW, KT, IITH, IITM, Fujitsu, MotM, Lenovo, KDDI
    - Polar: HW
- >1:
    - T+L Accelercomm, IMT, LG, NEC, Fujitsu, Orange
    - L+P ZTE, Etisalat, Mediatek, Nubia, Xiaomi, Coolpad, Neul, HW devices, OPPO, CATR, TDTech, Spreadtrum, Potevio, ITRI, IDC, DT, NTU

Note that the above questions give an approximate picture, though not necessarily complete.

Petitioners' Exhibit 1007, p. 356
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Possible Agreements:
Alt 1:
- The channel coding scheme for eMBB data is LDPC

No: HW, IDC, HiSi, DT, NEC, CMCC, LG, Spreadtrum, Neul, CATR, Xinwei, TDTech, OPPO, Coolpad, Xiaomi, HW Devices, ITRI, Mediatek, Accelercom, Nubia, IMT, Orange, ZTE, ZTE Microelectronics

Alt 2:
- The channel coding scheme for eMBB data is LDPC, at least for blocks larger than X
- Polar coding is supported for eMBB data for blocks smaller than X

No: Sams, NEC, Intel, QC, LG, Nokia, ASB, MotM, Lenovo, KT, Ericsson, CableLabs, ITL, Sequans, Acorn, Asustek, Mitsubishi, KDDI, Wilus, Accelercom, IMT, Orange, Sony, Sharp, Fujitsu, VzW, Docomo

Alt 3:
- The channel coding scheme for eMBB data is LDPC, at least for blocks larger than X
- Turbo coding is supported for eMBB data for blocks smaller than X

No: HW, IDC, HiSi, Sams, Nok, ASB, KT, QC, Asustek, Spreadtrum, Mitusbishi, CATR, Xinwei, TDTech, OPPO, Intel, Coolpad, Neul, Wilus, Xiaomi, ITRI, Mediatek, Nubia, ZTE, ZTE Microelectronics, HW Devices, CableLabs, ITL, DT, VzW, KDDI, Acorn, Docomo

Agreement:
- The channel coding scheme for eMBB data is LDPC, at least for information block size > X
- FFS until RAN1#87 one of Polar, LDPC, Turbo is supported for information block size of eMBB data <= X
  - The selection will focus on all categories of observation, including overall implementation complexity, regardless of the number of coding schemes in the resulting solution (except if other factors are generally roughly equal)
- The value of X is FFS until RAN1#87, 128 <= X <= 1024 bits, taking complexity into account
- The channel coding scheme(s) for URLLC, mMTC and control channels are FFS

~~Huawei has a concern on the upper value of the range of X to be considered.~~

Friday:

Huawei asked adding a note "RAN1 needs to conclude on performance observations of channel coding"
Samsung: why are we re-opening an already endorsed report of the session
Intel: same view – object touching the conclusions again
Sharp: there is no reason to formalize this – there are already a lot of results provided by companies
Ericsson/Fujitsu: RAN1 knows what to do till the next meeting, just let's do it – all we have is sufficient to let the work continue and progress
ZTE support Huawei's view
Qualcomm: a lot of time was spent during the long sessions on channel coding w.r.t performance analysis – there is still time for contributions to be proposed
Nokia: clearly drawing conclusion on the observations was very difficult – let's now focus on the technical work & design
CATT: would like not to forget about the conclusion – support Huawei
Nokia (rapporteur of the session): suggested adding the following sentence "RAN1 is still encouraged to strive to draw additional conclusions on the performance of channel coding"
Samsung; OK with the above statement but recalled that companies had a lot of time to comment during the online session
Fujitsu: also Ok but suggested that such statement should be included in the overall agreement

Ericsson: "conclusions" means all characteristics including complexity/ latency/… - would like to replace that wording by "observations" only
Finally the note "Huawei has a concern on the upper value of the range of X to be considered." is withdrawn and RAN1 chair concluded as follows:

Conclusion: RAN1 is still encouraged to strive to draw additional observations and conclusions on the performance of channel coding

R1-1609248 On the impact of UE rotation LG Electronics

The document was presented by … from LGE.

Proposal 1: UE triggering based beam management should be supported in NR.
Proposal 2: Consider omni-directional single or cross-pol antenna for UE above 6 GHz.
Proposal 3: (Semi) OL MIMO techniques can be taken into consideration when UE rotates.
Proposal 4: UE centric MCS back-off mechanisms should be studied for NR.

Decision: The document is noted.

R1-1609395 Discussion of DL hybrid beamforming procedure Lenovo

The document was presented by … from Lenovo.

Proposal 1: RSRP-based beam measurement and feedback scheme should be considered for beam selection and refinement.
Proposal 2: Spatial multiplexing at the TRP should be supported by the beam measurement and feedback scheme.
Proposal 3: The standard impact of UE RX beam selection and refinement should be minimized, provided a UE is provided sufficient RS resource to tune its RX beam.
Proposal 4: CSI-RS and feedback can be used for CSI acquisition for given analog beams.
Proposal 5: The interaction between analog beaming and digital beamforming should be studied.

Decision: The document is noted.

R1-1609754 Beam management principles Ericsson

Petitioners' Exhibit 1007, p. 360
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The document was presented by Mattias Frenne from Ericsson.

- Proposal 1: Handle beam management within the CSI framework in NR (i.e. the framework used for link adaptation of data transmission).
- Proposal 2: Use CSI-RS for beam management measurements
- Proposal 3: In the beam management procedures, one or multiple beam pair links (BPLs) are monitored by the network using uplink measurements by the TRPs and/or downlink measurements from the UE.
- Proposal 4: Support a configurable (time multiplexed, frequency multiplexed or both) sweepof CSI-RS in a slot or subframe for beam management measurements
- Proposal 5: Study which different types of frequency allocations that should be supported for CSI-RS used for beam management measurements
- Proposal 6: When triggering a sweep of K CSI-RS transmissions (K beams), it is also indicated to the UE whether it may assume that the same beam is used for the K transmissions or not as to distinguish between P-1/P-2 and P-3 procedure.

Decision: The document is noted.

R1-1610487 Way Forward on beam management Ericsson, Intel, CATT, InterDigital Communications

The document was presented by Mattias Frenne from Ericsson.

- At least CSI-RS can be used for measurements to support the beam management processes P1, P2, P3
  - When used for P1/P2/P3, the CSI-RS signal structure can be specifically optimized for this purpose (as opposed to e.g. link adaptation)
  - Additional RS could also be considered such as DMRS and synchronization signals

Decision: The document is noted.

Possible agreements:

- At least CSI-RS can be used for measurements to support the beam management processes P1, P2, P3
  - When used for P1/P2/P3, optimization of the CSI-RS signal structure can be considered for this purpose (as opposed to e.g. link adaptation)
  - Additional RS could also be considered such as DMRS and synchronization signals

R1-1610516 Way Forward on Beam management RS Samsung, Intel, Verizon Wireless

The document was presented by Young Han Nam from Samsung.

- NR supports two types of RS for beam management procedures (P-1, P-2 and P-3) :
  - Beam reference signals (BRS):
    - BRS is cell-specifically configured and periodically transmitted.
    - FFS: BRS is also used for L3 mobility
  - CSI-RS:
    - CSI-RS is UE-specifically configured.
    - The signal structure for CSI-RS can be specifically optimized based on whether -the CSI-RS is used for P1, P2 or P3
    - Note: CSI-RS is also used for CSI acquisition

Decision: The document is noted.

Possible agreements:

- NR supports two types of RS for beam management procedures :
  - Beam reference signals (BRS) at least in P-1:
    - BRS is periodically transmitted
      - FFS: Cell-specific configuration or UE-specific configuration
    - FFS: BRS is also used for L3 mobility
  - CSI-RS in P-2, and P-3:
    - CSI-RS is UE-specifically configured.
    - The signal structure for CSI-RS can be specifically optimized based on whether the CSI-RS is used for P1, P2 or P3
    - Note: CSI-RS is also used for CSI acquisition
  - Additional RS could also be considered such as DMRS and synchronization signals

Possible agreements:

- NR supports at least CSI-RS for beam management procedures (P-1, P-2 and P-3) :
  - CSI-RS is UE-specifically configured.
  - The signal structure for CSI-RS can be specifically optimized based on whether the CSI-RS is used for P1, P2 or P3
  - Note: CSI-RS is also used for CSI acquisition

Continue offline discussions about the necessity to support Beam reference signals (BRS) – Young Han (Samsung)
Continue offline discussion until Tuesday – Mattias (Ericsson), Young Han (Samsung)

Petitioners' Exhibit 1007, p. 361
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Tuesday

R1-1610658 Way Forward on beam management Ericsson, Samsung, Intel

- Beam management procedures can utilize at least the following two RS types:
  - RS used for mobility, at least for P-1:
    - Note: This RS can be used for P-1 when beam sweeping of mobility signal is used
  - CSI-RS, for P-1, P-2, and P-3:
    - CSI-RS is UE-specifically configured.
      - Multiple UE may be configured with the same CSI-RS
    - The signal structure for CSI-RS can be specifically optimized based on whether the CSI-RS is used for P1, P2 or P3
    - Note: CSI-RS can also be used for CSI acquisition
    - Note: The CSI-RS can be used for P-1 in case mobility signal is single beam or when SFN transmission is used, e.g. across multi-TRP/Panel
- Additional RS could also be considered such as DMRS and synchronization signals

Decision: The document is noted. Also supported by Interdigital, CATT.

Working assumptions:

- Beam management procedures can utilize at least the following RS type(s):
  - RS defined for mobility purpose at least in connected mode
    - FFS: RS can be NR-SS or CSI-RS or newly designed RS
      - Others are not precluded
  - CSI-RS:
    - CSI-RS is UE-specifically configured
      - Multiple UE may be configured with the same CSI-RS
    - The signal structure for CSI-RS can be specifically optimized for the particular procedure
    - Note: CSI-RS can also be used for CSI acquisition
- Other RS could also be considered for beam management such as DMRS and synchronization signals

---

Wednesday session

R1-1610512 Way Forward on Group-based beam managementZTE, ZTE Microelectronics

- Definition of beam grouping:
  - Beam grouping = for TRP(s) or UE to group multiple Tx/Rx beam(s) or beam pair(s) into one subset of beams sharing similar channel properties
- Group based beam management is supported at least in the following aspects:
  - Beam-group based RSRP/CSI reporting
    - e.g. Beam grouping is done on Tx beams sharing similar channel properties, like angles of arrival and departure, QCL and TA. UE reports RSRP/CSI with the best beam in each of the M beam groups
  - Beam-group based indication for beam measurement, beam-based transmission or beam switching
    - e.g. TRP indicates beam group which conveys the information on how UE should receive the beam e.g. which Rx beam is used
    - e.g. TRP/UE indicates intra-group beam measurement. Beam switching on one side within a group, if any, is agnostic to the other side.
    - e.g. TRP/UE indicates inter-group beam measurement. Beam group switching on one side, if any, is informed to the other side.

Decision: The document is noted. Revised in:

R1-1610891 WF on Group-based Beam Management ZTE, ZTE Microelectronics, ASTRI, Nokia, ASB, CATT

Decision: The document is noted. Continue offline.

Agreements:

- Group based beam management is to be further studied:
  - Definition of beam grouping:
    - Beam grouping = for TRP(s) or UE to group multiple Tx and/or Rx beam(s) and/or beam pair(s) into one subset of beams
  - FFS detailed mechanisms for beam grouping, reporting, beam-group based indication for beam measurement, beam-based transmission or beam switching, etc.
    - Some examples can be found in R1-1610891 and R1-1609414

R1-1610825 WF on Beam management CATT, CATR, CMCC, Xinwei

Decision: The document is noted. Continue offline.

Petitioners' Exhibit 1007, p. 362
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreements:

- For downlink, NR supports beam management with and without beam-related indication
  - When beam-related indication is provided, information pertaining to UE-side beamforming/receiving procedure used for data reception can be indicated through QCL to UE
    - FFS: Information other than QCL
  - FFS: When beam-related indication is provided, information pertaining to the Tx beam used for data transmission is indicated to UE
- For downlink, based on RS (used for beam management) transmitted by TRP, UE reports information associated with N selected Tx beams
  - Study how the N Tx beams can be selected
  - Study the case where N comprises of all Tx beams
  - Study UE reporting information
  - Note: N can be equal to 1

R1-1610510 Way Forward on Beam reporting for NR LG Electronics, Intel

- Support both network initiated and UE initiated aperiodic beam reporting.
  - Aperiodic beam reporting can be associated with P-1, P-2, and P-3.
  - UE request message can be transmitted on a reserved/dedicated uplink channel (e.g. physical random access channel, physical uplink control channel).
- Further study is needed whether network/UE initiated semi-persistent/periodic beam reporting is needed.

Decision: The document is noted.

Possible agreements:

- Support at least network initiated aperiodic beam reporting
  - Aperiodic beam reporting can be associated with P-1, P-2, and P-3.
  - FFS: UE request message can be transmitted on a reserved/dedicated uplink channel (e.g. physical random access channel, physical uplink control channel)
  - FFS: UE initiated aperiodic beam reporting case
- Further study is needed whether network/UE initiated semi-persistent/periodic beam reporting is needed.

Continue offline.

R1-1610923 WF on Beam Reporting for NR LG Electronics, Intel, NTT DOCOMO, MediaTek

Agreements:

- Support at least network triggered aperiodic beam reporting:
  - Aperiodic beam reporting is supported under P-1, P-2, and P-3 related operations
  - FFS beam reporting details
  - FFS: UE assisted/initiated aperiodic beam reporting
  - FFS: In case of UE assisted/initiated aperiodic beam reporting, UE request message can be transmitted on a reserved/dedicated/common uplink channel (e.g. physical random access channel, physical uplink control channel).
- Further study is needed whether semi-persistent/periodic/event-triggered beam (network triggered or UE assisted/initiated) reporting is needed

R1-1610511 WF on Beam Management for DL Control Channel ZTE, ZTE Microelectronics , Intel, Xinwei

Agreements:

- Support using same or different beams on control channel and the corresponding data channel transmissions
  - FFS the antenna ports for control channel and the corresponding data channel (e.g., sharing some ports or not)
- Study detailed aspects related to beams/beam pairs indication/reporting involving usage of control and data channels and involving one or more TRPs

R1-1610971 WF on definition of Beam reciprocity Samsung, Qualcomm, InterDigital, Intel, IITM, IITH, CeWIT, Tejas Networks, KT, MediaTek, AT&T, Verizon, Motorola Mobility, Reliance Jio

Working assumption:

- The followings are defined as Tx/Rx beam correspondence at TRP and UE :
- Tx/Rx beam correspondence at TRP holds if at least one of the following is satisfied:
  - TRP is able to determine a TRP Rx beam for the uplink reception based on UE's downlink measurement on TRP's one or more Tx beams.

Petitioners' Exhibit 1007, p. 363
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

        - TRP is able to determine a TRP Tx beam for the downlink transmission based on TRP's uplink measurement on TRP's one or more Rx beams
    - Tx/Rx beam correspondence at UE holds if at least one of the following is satisfied:
        - UE is able to determine a UE Tx beam for the uplink transmission based on UE's downlink measurement on UE's one or more Rx beams.
        - UE is able to determine a UE Rx beam for the downlink reception based on TRP's indication based on uplink measurement on UE's one or more Tx beams.
    - More refined definition can still be discussed

R1-1610894 UL beam management Samsung, Huawei, Intel

Agreements:

- UL beam management is to be further studied in NR
    - Similar procedures can be defined as DL beam management with details FFS, e.g.:
        - U-1: is used to enable TRP measurement on different UE Tx beams to support selection of UE Tx beams/TRP Rx beam(s)
            - Note: this is not necessarily useful in all cases
        - U-2: is used to enable TRP measurement on different TRP Rx beams to possibly change/select inter/intra-TRP Rx beam(s)
        - U-3: is used to enable TRP measurement on the same TRP Rx beam to change UE Tx beam in the case UE uses beamforming
- FFS Indication of information related to Tx/Rx beam correspondence is supported
- Study UL beam management based on:
    - PRACH
    - SRS
    - DM-RS
    - Other channels and reference signals are not precluded
- Study uplink beam management procedure by considering the Tx/Rx beam correspondence
    - For the case of TRP and UE have Tx/Rx beam correspondence
    - For the case of TRP has no Tx/Rx beam correspondence and/or UE has no Tx/Rx beam correspondence

R1-1610964 WF on Beam recovery Samsung, Qualcomm, Intel, KT, LGE, Ericsson
Also supported by Nokia

Agreements:

- NR supports mechanism(s) in the case of link failure and/or blockage for NR
    - Whether to use new procedure is FFS
- Study at least the following aspects:
    - Whether or not an DL or UL signal transmission for this mechanism is needed
        - E.g., RACH preamble sequence, DL/UL reference signal, control channel, etc.
    - If needed, resource allocation for this mechanisms
        - E.g., RACH resource corresponding mechanism, etc.

R1-1611014 WF on Beam management CATT, CATR, CMCC, Xinwei, Samsung

Not treated.

8.1.4.2 Multi-antenna scheme

High-level MIMO design including Open-loop/Close-loop MIMO, Transmission diversity, SU/MU-MIMO, Multi-TRP transmission

R1-1608809 Over the air calibration for channel reciprocity in NR MIMO Fujitsu

The document was presented by Tsuyoshi Shimomura from Fujitsu.

- Observation 1: Performance of DL multi-point MU-MIMO degrades due to Tx/Rx RF circuit response mismatch at BS in TDD.
- Observation 2: Over the air calibration is necessary to calibrate spatially distributed antennas/TRPs.
- Proposal: Clarify whether intra-BS over the air calibration can be implemented without RAN1 specification.

Decision: The document is noted.

R1-1609519 Discussion on Beamforming for NR PDCCH Intel Corporation

The document was presented by Alexey Khoryaev from Intel.

- Observation 1. Different resource allocation for data and control may cause different beamforming for data and control. In this case, the beamwidth of control channel may be broader than that of data channel. The broad beam is not limited to a physical broad beam but it covers logical broad beam (e.g. multiple beams with different beam pointing angles).
- Observation 2. Different transmission strategy of data and control channel may require different beamforming strategy including different beam directions (or different number of beams).
- Observation 3. At least one beam may be shared by data and control or same beam for data and control may be used.
- Observation 4: A single beam performs better when there is no blockage.
- Observation 5: Multiple beams shows more robust performance when there is blockage on the main path.
- Observation 6: Using multiple beams in control channel provides more flexible beam operation.
- Proposal 1. A default assumption is that data and control channel beamforming is different while using same beam for data and control (at least one beam) is also allowed.
- Proposal 2: Study multiple beam operation in control channel.

Decision: The document is noted.

R1-1609903 Partial reciprocity based UL MIMO schemes InterDigital Communications

The document was presented by … from InterDigital.

- Proposal 1: RAN1 considers study on the effect of interference asymmetry on the use of channel reciprocity for uplink MIMO.
- Proposal 2: RAN1 considers further study on dual precoder design based on combined use of reported- and reciprocity-based CSI for uplink MIMO.

Petitioners' Exhibit 1007, p. 365
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal 3: RAN1 considers enhanced uplink MU-MIMO operation by relying on reciprocity-based CSI and intereference feedback.
- Observation 1: Reciprocity-based precoding even with significant calibration errors outperforms codebook based precoding.
- Observation 2: As the dimension of the system grows the gap between the reciprocity-based and ideal CSI-based precoding widens.

Decision: The document is noted.

R1-1610229 Performance comparison of nonlinear precoding schemes for NR MU-MIMO Mitsubishi Electric Co.

The document was presented by … from Mitsubishi.

- Observation 1: Link level evaluation is used to evaluate performance of the nonlinear precoding schemes
- Observation 2: The nonlinear precoding scheme exhibits clear throughput performance gain compared to the linear precoding scheme in crowded environments
- Observation 3: From the CDF of throughput, NLP offers stable throughput in both case A and B, where case A and B are illustrated in Figure 5 and 6, respectively.
- Proposal: Consider nonlinear precoding as a potential spatial multiplexing candidate technology

Decision: The document is noted.

R1-1610484 Way Forward on coordinated transmission schemes in NR LG Electronics, Intel Corporation, Samsung

- At least, followings are supported for coordinated transmission schemes for NR
  - Tx schemes for a single site
    - Intra-site (e.g., across TRPs) coordinated transmission schemes including DPS, CS/CB, and JT
  - Tx schemes for multiple sites with ideal backhaul
    - Inter-site coordinated transmission schemes including DPS, CS/CB, and JT, assuming ideal backhaul links among the coordinating TRPs

Decision: The document is noted. Continue the discussion.

R1-1610380 Discussion on Dynamic Switching of Transmission Modes Convida Wireless LLC

Proposal 1: The NR system should support dynamic switching between transmission modes that does not rely on RRC signaling, and the number of transmission modes should be less than the number of transmission modes in LTE.
Proposal 2: The NR system may support transmission mode configuration through the downlink control channel.
Proposal 3: Beam based transmit diversity should be supported in the NR system, and the single/multiple TRP transmit diversity scheme may be transparent to the UE.
Proposal 4: NR need to evaluate the redundancy caused by designing a unified DCI format to support all transmission modes. The design of UE's search space need to be studied.

Decision: The document is noted.

Wednesday session

R1-1610523 Way Forward on coordination schemes in NR Huawei

R1-1610537 Way Forward on Network Coordination Framework Samsung

- NR network coordination should support different types of network coordination within a common CSI framework
- For NR network coordination, study sufficient level of flexibility in 'reference signal', 'measurement', and 'reporting' settings
  - Allow a network to configure multiple combinations of 'reference signal', 'measurement', and 'reporting' settings
  - Allow a network to independently configure 'reference signal', 'measurement', and 'reporting' settings
  - Allow a network to dynamically and/or semi-statically choose between multiple combinations of 'reference signal', 'measurement', and 'reporting' settings
  - Allow 'reporting' based on actual interference measurement and emulated interference assessment
- Support signaling of QCL information which is linked to 'reference signal' and 'measurement' setting
  - For QCL parameter estimation at least CSI-RS, beam RS, phase noise RS can be considered
    - Other RSs or signals are not precluded
  - The QCL information should support signaling of RS for QCL parameter estimation and the DMRS ports scheduled to a UE where each RS for QCL parameter estimation is mapped to a non-overlapping subset of DMRS ports
- Study the need of information exchanges between gNB-UE for different types of interference suppression (e.g. inter user, inter cell interference) and cancellation based on advanced receivers
  - If needed, the information at least includes side information on interfering UE(s) for efficient interference suppression and cancelation at UE side
  - As a baseline, consider the receivers structures studied in LTE

Petitioners' Exhibit 1007, p. 366
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted.

R1-1610898 WF on coordinated transmission in NR LG Electronics, Huawei, HiSilicon, Samsung

- At least, followings are supported for coordinated transmission schemes for NR
  - Tx schemes for a single site
    - Intra-site (e.g., across TRPs) coordinated transmission schemes including DPS, CS/CB, and JT
  - Tx schemes for multiple sites with ideal backhaul
    - Inter-site coordinated transmission schemes including DPS, CS/CB, and JT, assuming ideal backhaul links among the coordinating TRPs
  - Semi-dynamic configuration of UE-transparent TRP cooperation sets
    - FFS other configurations
    - Study coordination techniques with non-ideal backhaul
  - Note: Non-ideal backhaul has less stringent requirements on synchronization and/or coordination information exchange between geographically separated antenna panels.

Decision: The document is noted.

Agreements:

- For coordinated transmission schemes for NR, both the case of co-located TRPs and the case of non-co-located TRPs are considered
  - FFS the assumptions about latency/bandwidth
  - FFS detailed schemes
  - Note: the classification of co-located vs. non-co-located may not capture all aspects, e.g., synchronization among TRPs, etc.

Agreements:

- For coordinated transmission schemes for NR:
  - Support different types of coordinated transmission schemes for NR
  - Strive for commonality in supporting the different types of coordinated transmission schemes for NR
- Study the need of network assistance and coordination for different types of interference suppression (e.g. inter user, inter-TRP interference) and cancellation based on advanced receivers
  - Consider information related to interfering signals for interference suppression and cancelation at UE side
  - As a baseline, consider NAICs receivers structures in LTE

R1-1610536 Evaluation Assumptions for NR Network Coordination Samsung, Intel, ZTE, ZTE Microelectronics
Further revised in:
R1-1611010 Evaluation Assumptions for NR Network Coordination Samsung, Intel, ZTE, ZTE Microelectronics, Huawei
Decision: R1-1611010 is agreed.
Friday: Huawei commented that the definition of fronthaul remains unclear at this stage – previously agreed R1-1611010 was modified as follows:

Agreements:

- For NR network coordination schemes, following three deployment scenarios are encouraged to be evaluated in phase 1
  - Indoor hotspot, dense urban, urban macro
- Use the simulation assumptions in TR 38.802 as baseline
  - Adopt at least the FeCoMP (TR 36.741) methodology in terms of coordination
    - E.g. Coordination cluster size, backhaul latencies, traffic loads, etc.
  - The parameterization from the agreements on email discussion for NR MIMO calibration [86-20] could be considered

R1-1610893 MIMO transmission based on multiple antenna panels Huawei, HiSilicon, Xinwei, NEC (R1-1610519)
Ericsson→ non-coherent scenario is not needed, nevertheless ok to keep it in the study phase

Agreements:

- Study at least the following different multi-panel structures at both TRP and UE
  - Uniform array: antenna elements with the same polarization from multiple panels are uniformly distributed in horizontal and vertical dimensions respectively (see Fig.1(a) in R1-1610893 as an example)
  - Non-uniform array: antenna elements with same polarization from multiple panels are not uniformly distributed in horizontal or vertical dimension (see Fig.1(b) in R1-1610893 as an example)
- Study the coherent/non-coherent MIMO transmission based on uniform/non-uniform array structure at TRP or UE

Petitioners' Exhibit 1007, p. 367
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- E.g., Codebook design, calibration accuracy, interference measurement, advanced receiver design, interference hypothesis

R1-1610685 WF on NR UL MIMO CATT, Samsung, LG, InterDigital

Agreements:

- If UE capabilities are known, FFS UL SU-MIMO schemes should be designed agnostic to UE antenna configuration or not
- Support at least a maximum of 4 layers uplink SU-MIMO transmission
  - FFS whether or not to support 5-8 layers

R1-1610983 WF on SRS-based UL link adaptation LG Electronics, CATT, Huawei, HiSilicon, Samsung

Agreements:

- At least one of precoded and non-precoded SRS based UL link adaptation procedure should be supported in NR, with at least following different procedures:
  - UL data scheduling (MCS/precoder/rank) is based on non-precoded SRS transmission by UE
    - Configurable number of SRS ports are 1, 2, 4, or [8]. Other possible numbers FFS.
    - FFS on precoder/codebook
  - UL data scheduling (MCS/precoder/rank) is based on precoded SRS(s) transmission by UE
    - Configurable number of SRS ports are 1, 2, or 4. Other possible numbers FFS.
    - Multiple precoded SRS resources (if supported) can be configured.
    - At least one of the following is supported
      - Precoder for SRS can be determined by UE based on measurement on DL RS and
      - Precoder for SRS can be indicated by gNB
    - FFS on precoder/codebook
  - UL data scheduling (MCS/precoder/rank) is based on a combination of non-precoded and precoded SRS transmission by UE
  - Note: Some parts of above procedures might be transparent to UE
  - FFS: UE may select a subset of SRS ports for SRS transmission

R1-1610694 WF on NR UL MIMO precoding Intel Corporation, NTT DoCoMo, Fujitsu, Samsung
Companies are encouraged to check the examples in R1-1610694, further discussion next meeting

R1-1610486 WF on Spatial Multiplexing Schemes for MU-MIMO Mitsubishi Electric, InterDigital, Samsung
R1-1610831 WF on Spatial Multiplexing Schemes for MU-MIMO Mitsubishi Electric, InterDigital, Samsung, NTT DOCOMO, IITH, IITM, Tejas Networks, CEWIT, KDDI
Also supported by AT&T, Reliance jio, Huawei, HiSilicon

R1-1610895 WF on DL MIMO Transmission Huawei, HiSilicon, CATT

R1-1610633 WF on phase continuity of DL precoding Qualcomm, InterDigital, Xinwei, Huawei, HiSilicon
R1-1611037 WF on phase continuity of DL/UL precoding Qualcomm, Huawei, HiSilicon, Xinwei, Ericsson, ZTE, ZTE Microelectronics, Intel
Also supported by Interdigital

Agreements:

- At least for DL, study PRB bundling with configurable PRG sizes, at least including following aspects
  - The size of PRG may or may not be fixed
  - The size of PRG may or may not be system bandwidth dependent
  - PRG may consist of all scheduled PRBs

R1-1610735 Way Forward on Network Coordination for Advanced Receivers Samsung, Intel, MediaTek, Orange, Vodafone, IITH, Tejas Networks, IITM, KDDI, CeWiT, Reliance Jio
R1-1611047 Way Forward on Network Coordination for Advanced Receivers Samsung, Intel, MediaTek, Orange, Vodafone, IITH, Tejas Networks, IITM, KDDI, CeWiT, Reliance Jio
R1-1611064 Way Forward on Network Coordination for Advanced Receivers Samsung, Intel, MediaTek, AT&T, Orange, Vodafone, IITH, Tejas Networks, IITM, KDDI, CeWiT, Reliance Jio

Agreements:

Petitioners' Exhibit 1007, p. 368
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- RAN1 to study the following aspects :
  - Codeword-to-layer mapping
  - Number of codewords on a "NR-PDSCH"
  - Other techniques not precluded
- This RAN1 study should consider advanced receivers for interference mitigation
  - In the case of network coordination: the following can also be studied
    - Rank and modulation order
    - Modulation mapping
    - Other techniques not precluded
- FFS: For this RAN1 study, the following performance metrics for non-full-buffer system level evaluation can be considered:
  - Average UPT
  - [5%,50%,95%]-tile UPT

R1-1610967 WF on MIMO transmission techniques in NR LG Electronics, Qualcomm, KT

Agreements:

- DL and UL transmission techniques should be studied to provide robustness against imperfect CSI and mobility
  - e.g.) The techniques using a subset of beams/precoders may include beam cycling, beam broadening, etc.
  - e.g.) In case of DL and FDD, this technical scope may include semi-open-loop MIMO technique being discussed in LTE eFD-MIMO.

R1-1611044 WF on DL MIMO Transmission Huawei, HiSilicon, Ericsson, CATT

Agreements:

- Support downlink transmission scheme(s) achieving diversity gain at least for some control information transmission
  - Exact scheme is for further study.
  - Specification support for such transmission schemes, i.e., the scheme(s) may or may not be implemented in spec-transparent manner
  - Note: The data/control channel transmission is at least based on DM-RS for demodulation.

Not treated.

8.1.4.3 CSI acquisition

R1-1609254 Discussion on interference measurement for NR LG Electronics

The document was presented by … from LGE.

- Observation 1: IMR based interference power measurement seems to be still preferable in NR. Interference channel estimation approach can also be considered and may have benefit in the case of large number of interference hypotheses but with small number of antenna ports.
- Observation 2: Interference feedback methods seems to be needed for multiple interference hypotheses in NR. Required amount of feedback and CSI computation should however be taken into account.
- Proposal 1: Inter-beam, MU, and inter-TRP interference should be considered in NR
- Proposal 2: Interference measurement structure is desired to be agnostic to interference type.
- Proposal 3: Consider aperiodic/periodic/semi-persistent resource for interference measurement.
- Proposal 4: Consider independent configuration of resources/signals for interference measurement and CSI measurement.

Decision: The document is noted.

R1-1609694 Views on NR CSI Acquisition and Report Beijing Xinwei Telecom Techn.

The document was presented by Peng Sun from Xinwei.

- Proposal 1: NR MIMO CSI measurement and report framework could be based on the framework of FD-MIMO CSI measurement and report, with refinement on beam combination codebook design, CoMP and streamlining of transmission modes and CSI report classes.
- Proposal 2:CSI report in NR MIMO framework mainly consists of beam index,PMI, RI, CQI and a novel index indicating whether or which TRPs could be used for simultaneous transmission .
- Proposal 3: Without legacy design, with fewer reporting modes, and with higher uplink control payload ability, NR should avoid the many kinds of UCI reports in LTE.
- Proposal 4: Nested property and constant modulus is still the design principle of beam combination codebook. Householder codebook is a good starting point.
- Proposal 5: NR MIMO supports in UCI novel index of whether or which TRPs in the large amount of candidates could be selected for simultaneous transmission.
- Proposal 6: For NR TDD, beam information related to analog beam selection is still acquired from DL beam training reference signal. For beam combination and multiple TRP cooperation, channel reciprocity could be triggered.
- Proposal 7: All UL CSI is acquired through measurement of dynamically configured and triggered SRS. It is possible for UE to transmit multiple SRS simultaneously through different panels/TxRUs. Multiple TRPs should be able to receive the same SRS simultaneously.

Decision: The document is noted.

R1-1610265 Explicit feedback options in NR Nokia, Alcatel-Lucent Shanghai Bell

The document was presented by Mihai Enescu from Nokia.

Petitioners' Exhibit 1007, p. 370
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal 1: Study the use of high resolution CSI feedback for operation with a hybrid array (i.e., a relatively few ports used in the data transmission) and for operation with a full digital array (i.e., relatively large number of ports used in the data transmission).
- Proposal 2: Study the various mechanisms for high resolution CSI feedback and explore the tradeoffs in performance and required level of feedback.

Decision: The document is noted.

R1-1610517 Way Forward on CSI measurement and reporting Huawei, HiSilicon, Ericsson, Qualcomm

- Support explicit CSI feedback in NR
  - e.g. channel covariance matrix feedback, eigenvector feedback, etc.
- Support the following schemes of NR CSI reporting
  - Semi-persistent CSI reporting
  - Aperiodic CSI reporting
  - FFS: Periodic CSI reporting
- The feasibility of CSI-RS transmission and CSI reporting in a self-contained structure (e.g., subframe) should be studied, considering UE implementation complexity.
  - Possible constraints: CSI reporting includes CQI and/or interference level only
- Interference measurement under different interference hypothesis should be supported in NR.
  - Note: analogous to CSI-IM and interference hypothesis in LTE
- Interference measurement based on a hybrid of ZP CSI-RS and NZP CSI-RS should be studied.

Decision: The document is noted.

R1-1610509 Way Forward on CSI-RS and CSI reporting in NR LG Electronics, Ericsson, Intel

- NR supports CSI-RS at least for CSI measurement and reporting.
  - FFS: Use of DL DMRS for CSI measurement and reporting
- NR supports both aperiodic and semi-persistent transmission of CSI-RS.
  - FFS: periodic transmission of CSI-RS
    - Note: periodic RS means 'always-on' RS analogous to LTE CRS
  - FFS: mechanisms (e.g. protocol layer) for dynamic control of activation/deactivation for semi-persistent CSI-RS
  - FFS: mechanisms to provide reliable activation/deactivation for semi-persistent CSI-RS
- With regard to relating CSI-RS transmission and CSI reporting, following combinations are supported at least.
  - Aperiodic CSI reporting with aperiodic CSI-RS
  - Aperiodic CSI reporting with semi-persistent CSI-RS
  - Semi-persistent CSI reporting with semi-persistent CSI-RS
- To support combinations above more flexibly, NR should allow independent control of CSI-RS indication and CSI reporting indication.
  - 'indication' above may refer to triggering, activation, and deactivation depending on type of RS/reporting.
  - Further study is needed how to guarantee appropriate time gap between CSI-RS and CSI reporting.
  - Note: This does not preclude joint control of CSI-RS indication and CSI reporting indication.

Decision: The document is noted.

R1-1610515 Way Forward on CSI reporting for NR Samsung, Intel, Ericsson, Xinwei

- Support aperiodic CSI reporting for NR
- Support at least one of following CSI reporting schemes for NR:
  - Periodic CSI reporting
  - Semi-persistent CSI reporting
- Study periodic/semi-persistent CSI reporting by using other signals than CSI-RS
  - FFS on necessary configurations, conditions, situations and use cases

Decision: The document is noted.

Tuesday session

R1-1610716 Way Forward on CSI-RS and CSI reporting in NR LG Electronics, Ericsson, Intel, Samsung

Decision: The document is noted, modified and agreed as follows:

Agreements:

- At least for CSI acquisition, NR supports CSI-RS, SRS
  - FFS: Use of DL DMRS for CSI measurement
- NR supports aperiodic transmission of CSI-RS
- For CSI-RS transmission, NR supports at least one of following:
  - Semi-persistent transmission

Petitioners' Exhibit 1007, p. 371
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

        - Preconfigured CSI-RS resources can be activated or de-activated
        - FFS: Activation/De-activation mechanism
    - Periodic transmission
        - Periodic CSI-RS can be configured by higher layer
    - FFS: mechanisms (e.g. protocol layer) for dynamic control of activation/deactivation for semi-persistent CSI-RS
    - FFS: mechanisms to provide reliable activation/deactivation for semi-persistent CSI-RS
- NR supports aperiodic CSI reporting
- NR supports at least one of following:
    - Periodic CSI reporting
        - It can be configured by higher layer
    - Semi-persistent CSI reporting
        - Configuration of CSI reporting can be activated or de-activated
        - FFS: Activation and de-activation mechanism
- Study periodic/aperiodic/semi-persistent CSI reporting by using CSI-RS
    - FFS using other RSs
    - FFS on necessary configurations, conditions, situations and use cases
- With regard to relating CSI-RS transmission and CSI reporting, following combinations are supported at least
    - Aperiodic CSI reporting with aperiodic CSI-RS
    - Aperiodic CSI reporting with semi-persistent/periodic CSI-RS
    - Semi-persistent/periodic CSI reporting with semi-persistent/periodic CSI-RS
- To support combinations above more flexibly, NR should allow independent control of CSI-RS indication and CSI reporting indication timings.
    - 'indication' above may refer to triggering, activation, and deactivation depending on type of RS/reporting.
    - Further study is needed how to guarantee appropriate time gap between indication of CSI-RS transmission and CSI-RS
    - Further study is needed how to guarantee appropriate time gap between CSI-RS and CSI reporting
    - Note: This does not preclude joint control of CSI-RS indication and CSI reporting indication.

Wednesday session

R1-1610637 Way Forward on CSI Framework for NR Samsung, Ericsson, AT&T, KT Corporation, CATT (R1-1610533)

- CSI-related settings consisting of:
    - CSI reporting settings
        - Each CSI parameter is independently configured, e.g. time and/or frequency granularity, ON/OFF
            - FFS: Details of configurability
        - CSI parameters include at least RI, PMI, CQI, and CSI-RS resource indicator (CRI)
    - RS (at least for CSI measurement) settings, e.g. CSI-RS (CSI-IM as a special case)
        - FFS: Other RS for CSI measurement
    - CSI measurement settings
        - To configure which RS setting is used for a particular CSI reporting setting
- A UE can be configured with:
    - *N* CSI reporting settings
    - *M* RS (for CSI measurement) settings
    - CSI measurement setting configures mapping/linkage between *N* CSI reporting and *M* RS settings
- Transmission scheme is configured separately
    - Examples of transmission scheme: DMRS-based precoding, Tx diversity, …
    - Examples of use case for study:
    - Linking/combining multiple PMI components (e.g. i1, i2 in LTE) with multiple RS settings

Decision: The document is noted, modified as follows:

Agreements:

- CSI-related settings consisting of:
    - CSI reporting settings
        - CSI parameter can be independently configured, e.g. time and/or frequency granularity, FFS: ON/OFF
            - FFS: Details of configurability
        - Definition of CSI parameters (e.g., CQI, PMI, RI) is FFS
    - RS (at least for CSI measurement) settings, e.g. CSI-RS (CSI-IM as a special case)
        - FFS: Other RS for CSI measurement
    - CSI measurement settings
        - To configure which RS setting is used for a particular CSI reporting setting
- Study the case where a UE can be configured with:

Petitioners' Exhibit 1007, p. 372
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- *N* CSI reporting settings
- *M* RS (for CSI measurement) settings
- CSI measurement setting configures mapping/linkage between *N* CSI reporting and *M* RS settings

R1-1610638 Way Forward on PMI Reporting for NR Samsung, AT&T, Ericsson, NTT DOCOMO (R1-1610534)

- NR CSI reporting supports PMI with two levels of spatial resolution:
  - Normal-resolution, e.g. analogous to LTE PMI ("implicit" feedback)
  - High-resolution, e.g. quantized channel, eigenvector, or covariance matrix
  - PMI per subband as well as wideband PMI is supported
- The supported PMI associated with each of the two levels is derived from a codebook
  - Working assumption: The codebook is scalable with different numbers of CSI-RS ports (including at least the ones supported in LTE Rel.14)
- Study at least the following codebook design aspects:
  - "Dual-stage" PMI definition analogous to i1 and i2 in LTE, e.g.
    - Precoder basis associated with i1
    - Precoder selection and/or combining associated with i2
    - Frequency granularity of i1 and i2 (e.g. wideband, subband, subband size)
  - "Multi-stage" feedback analogous to i1 and i2 in LTE but with more stages
    - The overall precoder being a function of the feedback for each of these stages
  - Unified and scalable design for both normal- and high-resolutions

Decision: The document is noted, modified as follows:

Possible agreements:

- NR supports CSI reporting with two types of spatial information feedback
  - Type I feedback
  - Type II feedback
    - Note: Type II feedback is higher resolution compared to Type I feedback
- For Type I and II, CSI feedback per subband as well as wideband feedback are supported
- Type I and II are designed for different use cases and/or functionalities
  - Only one scheme is supported for Type I
  - Only one scheme is supported for Type II
- Study following design examples as candidates for Type I
  - PMI-based scheme analogous to LTE Rel-13/14 beam selection codebook ("implicit" feedback) including CRI based feedback
  - Other schemes are not precluded
- Study following design examples as candidates for Type II:
  - PMI-based scheme using beam combination codebook
  - "Explicit" feedback such as quantized channel, channel eigenvector(s) or channel covariance matrix, analog feedback
  - Other schemes are not precluded
- Also study the following design examples:
  - "Dual-stage" PMI definition analogous to i1 and i2 in LTE, e.g.
    - Precoder basis associated with i1
    - Precoder selection and/or combining associated with i2
    - Frequency granularity of i1 and i2 (e.g. wideband, subband, subband size)
  - "Multi-stage" feedback analogous to i1 and i2 in LTE but with more stages
    - The overall precoder being a function of the feedback for each of these stages
  - Beam broadening function
  - Hermitian matrix based covariance matrix codebook
  - Downloadable codebook
  - Other designs are not precluded

Agreements:

- NR supports CSI reporting with two types of spatial information feedback
  - Type I feedback: Normal
  - Codebook-based PMI feedback with normal spatial resolution
  - Type II feedback: Enhanced
  - "Explicit" feedback and/or codebook-based feedback with higher spatial resolution

Petitioners' Exhibit 1007, p. 373
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- For Type I and II, CSI feedback per subband as well as wideband feedback are supported
- For Type I and II, beam-related feedback can be included

R1-1610907 WF on CSI-RS resource pooling Ericsson, Samsung, LG, Nokia (R1-1610705)

- A CSI-RS resource set should be supported whereby CSI-RS resources within the set may be dynamically shared amongst users
- CSI-RS resources are configured in 2 steps
  - Step 1: Pre-configure a set of K CSI-RS resources for a group of users through RRC configuration
  - Step 2: For a given user, dynamically indicate N out of K (where N >= 1) of the CSI-RS resources from the set to enable CSI measurement in a given time window
    - Study the following alternatives
      - Alt 1: Dynamic signaling through DCI
      - Alt 2: Dynamic signaling through MAC CE
  - The CSI-RS transmissions can be dynamically indicated as one shot or multi-shot within the window

Decision: The document is noted, modified as follows:

Agreements:

- A CSI-RS resource set should be studied whereby CSI-RS resources within the set may be dynamically shared amongst users
- Study CSI-RS resources configuration in 2 steps
  - Step 1: Pre-configure a set of K CSI-RS resources for one or more users through UE-specific RRC configuration
  - Step 2: For a given user, dynamically indicate N out of K (where N >= 1) of the CSI-RS resources from the set to enable CSI measurement in a given time window
    - Study the following alternatives
      - Alt 1: Dynamic signaling through DCI
      - Alt 2: Dynamic signaling through MAC CE
  - The CSI-RS transmissions can be dynamically indicated as one shot or multi-shot within the window
  - The configured CSI-RS resource pool can be used for channel/interference measurement
  - Configure multi sets of CSI-RS resources for one UE

R1-1610517 Way Forward on CSI measurement and reporting Huawei, HiSilicon, Ericsson, Qualcomm

Agreements:

- The feasibility of CSI-RS transmission and CSI reporting in a self-contained structure (e.g., subframe) should be studied, considering UE implementation complexity
  - FFS: DM-RS based CSI reporting
- Interference measurement under different interference hypothesis should be supported in NR
  - Definition of interference hypothesis and mechanism of interference measurement is FFS

R1-1610899 Way Forward on CSI feedback framework for hybrid beamforming in NR CMCC, CATT, Xinwei, Samsung, Ericsson, Huawei, HiSilicon, Qualcomm (R1-1610727)

- For hybrid beamforming, at least the following steps for CSI/RSRP acquisition should be studied:
  - Step 1: Beam-based CSI/ and/or RSRP (e.g., based on beam management procedures)
    - To determine at least analog beam
    - Using UE feedback and/or beam-based reciprocity
      - With beam-based reciprocity, TRP/UE can obtain DL/UL Tx beam from its Rx beam by multi-beam reception
  - Step 2: Port-based CSI
    - To determine the precoder for all or part of TXRUs (narrow digital beam) given the reported analog beam
    - Using UE feedback and/or port-based reciprocity
      - With port-based reciprocity, TRP/UE can obtain DL/UL CSI based on UL SRS/DL RS
  - Step 3: CQI
    - To determine CQI for data transmission given the reported analog and digital beam
    - Based on UE-specific beamformed CSI-RS transmission
  - Further optimization of the procedure for reciprocity/non-reciprocity can be considered
  - Note: Certain steps may be merged/reordered/repeated
- Study the association between UL and DL RS in/among the above steps:
  - E.g. When channel reciprocity holds, UL/DL RS port/resource may be selected/precoded based on DL/UL RS measurement results

Petitioners' Exhibit 1007, p. 374
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- CSI/RSRP acquisition or full digital or full analog beamforming can be a special case of the above framework
  - For single-beam based approach, step 1 doesn't apply

Decision: The document is noted, modified as follows:

Agreements:

- For hybrid beamforming, at least the following steps for CSI/RSRP acquisition should be studied:
  - Step 1: Beam-based CSI/ and/or RSRP (e.g., based on beam management procedures)
    - To determine at least analog beam
      - Using UE feedback and/or beam-based reciprocity
      - With beam-based reciprocity, TRP/UE can obtain DL/UL Tx beam from its Rx beam by multi-beam reception
  - Step 2: Port-based CSI
    - To determine the precoder for digital beam based on the reported analog beam(s)
      - Using UE feedback and/or port-based reciprocity
      - With port-based reciprocity, TRP/UE can obtain DL/UL CSI based on UL SRS/DL RS
  - Step 3: CQI
    - To determine CQI for data transmission given the reported analog and digital beam
    - Based on UE-specific CSI-RS transmission
  - Further optimization of the procedure for reciprocity/non-reciprocity can be considered
  - Note: Certain steps may be merged/reordered/repeated
- Study the association between UL and DL RS in/among the above steps
- Note: CSI/RSRP acquisition for full digital or full analog beamforming can be a special case of the above framework
  - For single-beam based approach, step 1 may not apply

R1-1610906 WF on channel and interference measurements for NR Samsung, Intel, Qualcomm

Agreements:

- For channel and interference measurement in NR,
  - For interference measurement, support at least one of following schemes:
    - Measurement subsets in both time and frequency domain
    - Interference measurement restriction in both time and frequency domain
    - FFS on channel measurement
    - FFS on the details (including whether measurement subset is equivalent to measurement restriction in the freq. domain)
  - Study CSI reporting which is optimized for each use case
    - E.g. CQI which is targeted to high reliability

R1-1610950 WF on interference measurement for CSI acquisition Qualcomm, Huawei, HiSilicon, Samsung

Agreements:

- For DL data transmission, study following interference measurement options for CSI acquisition.
  - Dynamically assigned (e.g., pre-committed/pre-scheduled) interference measurement resource
  - In-scheduled interference measurement resource
  - NZP CSI-RS based interference measurement
  - DM-RS based interference measurement
  - Combination of above options
  - Other options are not precluded
- Above study should assume non-full buffer traffic model assumption

R1-1610937 WF on CSI Parameters for NR Samsung, Nokia, ASB, AT&T, CATT, NTT DOCOMO, Ericsson, Intel, LG Electronics, InterDigital

Agreements:

- For Type I feedback, NR supports at least the following (DL) CSI reporting parameters
  - Resource selection indicator (Examples for further study are reference signal resource, port, reference signal sequence, beam)
  - RI (rank indicator)
  - PMI (precoding matrix indicator)
  - Channel quality feedback

Petitioners' Exhibit 1007, p. 375

8.1.4.4 Reference signal design and QCL

R1-1608675 On Quasi-Co-Location/Beam for NR MIMO ZTE, ZTE Microelectronics

The document was presented by Ruyue Li from ZTE.

- Observation 1: Delay offset among different beam-based channel is significant.
- Observation 2: Similar channel properties can be observed when the beam-pairs point to the adjacent direction.
- Proposal 1: Introducing a new set of "Qusai-Co-beam" parameters e.g. angle of arrival, angular spread to QCL parameters. Grouping of antenna ports according to quasi-co-beam properties is fed back by the UE.
- Proposal 2: Support flexible configuration of the QCL parameters for different applications
- Proposal 3: Support QCL association of UL ports to DL ports considering channel reciprocity

Decision: The document is noted.

R1-1608822 Reference signal design for phase noise compensation in HF Huawei, HiSilicon

The document was presented by … from Huawei.

Observation 1: Phase noise compensation is needed in certain scenarios, depending on at least the scheduled MCS and number of RBs.

Observation 2: Whether the reference signal carrying phase noise compensation functionality is UE-specific or non-UE-specific needs to be studied.

Observation 3: The methods of multiplexing multiple reference signals enabling phase noise compensation for multiple users/streams needs to be studied, including at least FDM and CDM methods.

Observation 4: To reduce overhead and complexity, potential sharing of reference signal for phase noise compensation across streams should be studied.

Proposal 1: The reference signal design in NR should facilitate phase noise compensation when it is needed, especially for frequency bands above 6 GHz.

Petitioners' Exhibit 1007, p. 376
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Proposal 2: The reference signal in NR carrying the phase noise compensation functionality should be continuously mapped in the time domain, i.e., on each data symbol.
Proposal 3: NR should be able to configure the reference signal carrying phase noise compensation functionality (e.g., to map or not), independent of front-loaded RS.

Decision: The document is noted.

R1-1609261 Discussion on Common Phase Error Compensation for Above 6GHz LG Electronics

The document was presented by … from LGE.

- Observation 1: BLER performance gap according to PTRS frequency density is much higher as TRB size is larger.
- Observation 2: 4 or 8 PTRS is enough for CPE estimation regardless of # of TRB.
- Observation 3: BLER performance gap according to PTRS time density is much higher as TRB size is larger.
- Observation 4: For 4 TRBs, non CPE compensation has better spectral efficiency than CPE compensation.
- Observation 5: For 64 TRBs, CPE compensation except for 1 PTRS has better spectral efficiency than non CPE compensation.
- Observation 6: For 4 TRBs, PTRS time interval 2 achieves higher spectral efficiency than time interval 1. In contrast, for 64 TRBs, PTRS time interval 1 achieves higher spectral efficiency than time interval 2.
- Observation 7: Codeblock spreading in the time domain reduces phase noise impact even for CPE compensation.
- Proposal 1: The trade-off between performance gain from CPE compensation and PTRS overhead should be considered.
- Proposal 2: PTRS time interval should be designed flexibly according to TRB size.
- Proposal 3: Codeblock spreading in the time domain would be considered.

Decision: The document is noted.

R1-1609388 Generalized CSI feedback framework for NR MIMO AT&T GNS Belgium SPRL

The document was presented by Arun Ghosh from AT&T.

- Proposal 1: No need to define transmission mode in NR MIMO. Instead, allow configuration on transmission scheme, RS and CSI measurement/report and downlink control format separately.
- Proposal 2: If needed, dependency or coupling between functions can be introduced during the configurations procedure.
- Proposal 3: The NR CSI feedback framework should support codebook based CSI plus at least one advanced CSI feedback scheme.
- Proposal 4: The NR CSI feedback framework should describe MIMO channel by multiple CSI components, we suggest to describe channel using components in Horizontal, Vertical and Uncorrelated domain separately.
- Proposal 5: The CSI measurement for each CSI component can be based on independent configured CSI-RS.
- Proposal 6: Both network and UE should be involved in deciding the feedback payload bits and CSI granularity (frequency, time, spatial domain) for each CSI component.
- Proposal 7: Study the need of CSI feedback for control channel, and if needed, strive for one generic CSI feedback framework to support both data and control channel.

Decision: The document is noted.

R1-1610524 Way Forward on NR RS definition Huawei, HiSilicon

- The following RSs are supported for NR downlink
  - NR DL CSI-RS: a family of reference signals with main functionalities of CSI acquisition, beam management, and RRM measurement
  - NR DL DM-RS: a family of reference signals with main functionalities of data and control demodulation;
    - FFS: additional reference signal for phase tracking;
- The following RSs are introduced for NR uplink
  - NR UL SRS: a family of reference signals with main functionalities of CSI acquisition, beam management, and RRM measurement;
  - NR UL DM-RS: a family of reference signals with main functionalities of data and control demodulation;
    - FFS: additional reference signal for phase tracking;

Decision: The document is noted. Continue offline.

Agreements:

- At least the following RSs are supported for NR downlink
  - CSI-RS: Reference signal with main functionalities of CSI acquisition, beam management
    - FFS: RRM measurement
  - DM-RS: Reference signal with main functionalities of data and control demodulation
    - FFS: channel state information estimation and interference estimation
    - FFS: beam management
  - Reference signal for phase tracking
    - FFS: Whether DM-RS extension can be applied or not
    - FFS whether new RS or RS for other functionalities can be used
  - Reference signal for time/freq. tracking

Petitioners' Exhibit 1007, p. 377
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

        - FFS whether new RS or RS for other functionalities can be used
    - Reference signal for Radio link monitoring
        - FFS whether new RS or RS for other functionalities can be used
    - RS for RRM measurement
        - FFS whether new RS or RS for other functionalities can be used
- At least the following RSs are supported for NR uplink
    - SRS: Reference signal with main functionalities of CSI acquisition, beam management
        - FFS: RRM measurement
    - DM-RS: Reference signal with main functionalities of data and control demodulation
        - FFS: beam management
    - Reference signal for phase tracking
        - FFS: Whether DM-RS extension can be applied or not
        - FFS whether new RS or RS for other functionalities can be used
    - FFS: Reference signal for RRM measurement
        - FFS whether new RS or RS for other functionalities can be used

R1-1610490 Way Forward on NR CSI-RS Huawei, HiSilicon

- Support the following functionalities in NR CSI-RS design
    - CSI measurement
    - Beam measurement
    - RRM measurement
- Support NR CSI-RS pattern with at least the following properties:
    - CSI-RS mapped in one or multiple consecutive symbols
    - At least CSI-RS located at the earlier part of a slot
        - FFS: before or after the DM RS agreed to study in RAN1#85
    - FFS: CSI-RS located at other part of a slot
    - Configurable density of CSI-RS in frequency domain
    - FFS: CSI-RS for NR should support up to at least 32 ports
- Support at least following configurations of NR CSI-RS
    - UE-specific configuration to support
        - Wideband CSI-RS, i.e. the full bandwidth the UE is configured to operate with
        - Subband CSI-RS, i.e. part of the bandwidth the UE is configured to operate with

Decision: The document is noted, modified as follows:

Agreements:

- Support NR CSI-RS pattern with at least the following properties:
    - CSI-RS mapped in one or multiple [consecutive] symbols
    - FFS: At least CSI-RS located at the earlier part of a slot in some cases
        - FFS: before or after the DM-RS agreed to study in RAN1#85
    - FFS: CSI-RS located at other part of a slot
    - Working assumption: Configurable density of CSI-RS in frequency and/or time domain by UE-specific manner
    - Working assumption: CSI-RS for NR should support up to 32 ports
        - FFS: whether or not to have 32 ports codebook
- Support at least following configurations of NR CSI-RS
    - UE-specific configuration to support
        - Wideband CSI-RS, i.e. from UE perspective, the full bandwidth the UE is configured to operate with
        - Partial-band CSI-RS, i.e. from UE perspective, part of the bandwidth the UE is configured to operate with
        - FFS: Different patterns may be used for wideband and subband CSI-RSs

R1-1610492 Way Forward on the CSI-RS configuration for NR Intel, Samsung, Ericsson

- CSI-RS configuration for NR includes at least 'number of antenna ports'
- The number of CSI-RS antenna ports can be differently configured for periodic/semi-persistent CSI reporting and aperiodic CSI reporting
- The number of antenna ports supported for CSI-RS configuration includes at least the following values
    - 1,2,4,8,12,16,20,24,28,32

Decision: The document is noted.

Agreements:

- CSI-RS configuration for NR includes at least 'number of antenna ports'
    - Configuration can be explicit or impliit

Petitioners' Exhibit 1007, p. 378
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- The number of CSI-RS antenna ports can be independently configured for periodic/semi-persistent CSI reporting and aperiodic CSI reporting

Possible working assumption:
- The number of antenna ports supported for CSI-RS configuration includes at least the following values
  - 1,2,4,8,12,16,20,24,28,32

Continue offline discussion until Thursday

Thursday

Working assumption:
- The number of antenna ports supported for CSI-RS configuration includes at least the following values
  - 1,2,4,8,[12],16,[20],[24],[28],32
- RAN1 will update/remove above bracket parts in the next meeting
  - Study e.g., performance, scenario, RS overhead, RS pattern considering the frame structure, reuse of hardware between NR and LTE

R1-1610514 Way Forward on Reference Signal for Demodulation ZTE Corporation, ZTE Microelectronics
- Support variable/configurable RS pattern for demodulation
  - For both control and data channel
- Study multi-level RS for demodulation
  - The first level is front-loaded (i.e. loaded in the front of RB) which meets minimum requirements for demodulation
  - Other level(s) can be configured for different motivations, e.g. higher frequency/time density, Rx beam detection, RSRP/CSI-reporting, phase noise compensation

Decision: The document is noted. Also supported by Ericsson, Samsung

Possible agreements:
- Support variable/configurable RS pattern for demodulation
  - For data channel
  - FFS for control channel
  - At least density can be configured
    - FFS: other configurability
- Support multi-level RS for demodulation
  - The first level is front-loaded (i.e. loaded in the front of RB) which meets minimum requirements for demodulation
  - Other level(s) can be configured for different motivations, e.g. higher frequency/time density, Rx beam detection, RSRP/CSI-reporting, phase noise compensation

Continue offline discussion until Wednesday

Agreements:
- Study variable/configurable DL/UL RS pattern for demodulation
  - For data channel and control channel
  - At least density can be configurable
    - FFS: other configurability
  - The applicable scenarios need to be studied
- Study multi-set DL/UL RS for control and/or data demodulation
  - The first set is front-loaded (i.e. loaded in the front of RB)
  - Other set(s) can be configured for different purposes
    - Details FFS (e.g. higher frequency/time density, Rx beam detection, RSRP/CSI-reporting, phase noise compensation)

R1-1610491 Way Forward on NR DMRS Huawei, HiSilicon
- Separate design of demodulation RS for broadcast channel, control channel and data channel
- Studies on design of demodulation RS for data channel at least include
  - The same principle for UL and DL RS pattern design
  - DM RS mapped in one or a few consecutive symbols
  - Additional RS located at middle part of a slot
  - Up to 16 orthogonal DL DMRS ports for MU-MIMO scheduling

Discussion: Chair→ strive for more supporting companies

Decision: The document is noted.

Agreements:
- Study design of demodulation RS for broadcast channel, control channel and data channel

Petitioners' Exhibit 1007, p. 379
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - Separate vs. joint design
- Study on design of demodulation RS for data channel
  - Whether or not the same principle for UL and DL RS pattern design
  - How to map DM RS in symbols of a slot
  - Max # of orthogonal DL DMRS ports for SU/MU-MIMO scheduling

R1-1610520 Way Forward on the QCL for NR Intel, LGE, Ericsson, NTT DOCOMO, Samsung

- QCL framework in NR is extended with new spatial QCL parameter(s) to support UE side beamforming
  - FFS channel parameters for QCL
    - Option A: Receive angle of arrival (exact wording is FFS)
    - Option B: Spatial correlation
- NR supports at least two QCL assumptions for DM-RS antenna ports
  - All ports are QCL-ed
  - Not all ports are QCL-ed
  - FFS on details
- FFS
  - QCL between antenna ports transmitted on different CCs
  - QCL between CSI-RS antenna ports within one CSI-RS resource
    - All ports are QCL-ed
    - Not all ports are QCL-ed
  - QCL of a DM-RS antenna port with other RS types

Decision: The document is noted. Continue offline discussion until Wednesday

Agreements:

- QCL framework in NR is extended with new spatial QCL parameter(s) to support UE side beamforming/receiving procedure
  - FFS details (e.g., receive angle of arrival, transmit angle of departure, spatial correlation of receiver antennas, Rx/Tx beamforming, etc.)
- For DM-RS antenna ports, NR supports:
  - All ports are QCL-ed
  - Not all ports are QCL-ed
    - FFS on details
- FFS, e.g.:
  - QCL between antenna ports transmitted on different CCs
  - QCL between CSI-RS antenna ports within one CSI-RS resource
    - All ports are QCL-ed
    - Not all ports are QCL-ed
  - QCL between CSI-RS antenna ports within two or more CSI-RS resources
    - All ports are QCL-ed
    - Not all ports are QCL-ed
  - QCL of a DM-RS antenna port with other RS types
  - QCL considering channel reciprocity

R1-1610513 Way Forward on QCL for NR ZTE Corporation, ZTE Microelectronics

- Additional parameters should be included into the definition of QCL in NR:
  - Angle of arrival/departure, angular spread
- Flexible configuration/indication of the QCL assumption should be studied in NR:
  - Possible grouping of the QCL parameters should be studied:
    - e.g., average gain, average delay
    - e.g., angle of arrival/ departure, delay spread, Doppler spread
  - The configurations of QCL assumption could be conducted in two ways:
    - TRP centric
      - e.g., according to transmission mode
      - e.g., according to antenna structure
      - e.g., according to channel reciprocity
      - e.g., according to UE feedback
    - UE centric
      - e.g., according to UE measurement
      - e.g., according to channel reciprocity

Decision: The document is noted. Also supported by Qualcomm

Agreements:

Petitioners' Exhibit 1007, p. 380
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Flexible configuration/indication of the QCL assumption should be studied in NR:
  - Possible grouping of the QCL parameters should be studied:
    - e.g., average gain, average delay
    - e.g., angle of arrival/ departure, delay spread, Doppler spread

R1-1610747 Way Forward on RS for Phase Tracking for CP-OFDM Huawei, HiSilicon, LG Electronics, Samsung, NTT DOCOMO, INC., Intel

- For CP-OFDM waveform, for the RS enabling phase tracking, the following should be studied:
  - Time domain pattern
    - Alt-1: Continuous mapping, i.e., on every OFDM symbol
    - Alt-2: Non-continuous mapping, e.g., every other OFDM symbol
    - Switching between Alt-1 and Alt-2 can also be considered
  - Frequency domain pattern
    - Alt-A: Shared and across full carrier bandwidth with fixed density/spacing
    - Alt-B: Within each UE's scheduled bandwidth and with configurable density/spacing
    - Other patterns are not precluded
  - Other properties
    - UE-specific and/or non-UE-specific
    - Port multiplexing such as FDM/TDM/CDM
    - Potential sharing across users/streams
    - On-off configuration

Decision: The document is agreed.

R1-1610719 Way Forward on evaluation assumptions for Compensation of Phase Rotation and Frequency Offset LG Electronics, InterDigital, KT, Huawei

Decision: The document is noted. Continue offline discussion until Wednesday

R1-1610829 WF on evaluation assumptions for tracking of phase rotation and/or frequency offset LG Electronics, Nokia, Huawei, Samsung, Qualcomm, InterDigital, KT
R1-1611012 WF on evaluation assumptions for tracking of phase rotation and/or frequency offset LG Electronics, Nokia, Huawei, Samsung, Qualcomm, InterDigital, KT, ZTE

R1-1611046 WF on SRS transmission CATT, Nokia, ASB

Agreements:

- NR supports configurable SRS bandwidth
  - Partial-band size can be configured
    - Partial-band is smaller than the largest transmission bandwidth supported by the UE
    - Within a partial-band the PRBs for SRS transmission can at least be consecutive in the freq. domain
      - FFS: Size of partial band
      - FFS: Non-consecutive within partial band
    - FFS: Multiple partial-bands transmitted simultaneously considering impact with OFDM and DFT-S-OFDM waveforms
      - FFS: Simultaneous transmission can be from multiple panels.
    - FFS: Frequency hopping of partial bands
  - Full band size can be configured
    - Equal to the largest transmission bandwidth supported by the UE
- NR supports aperiodic SRS transmission triggered by the network
  - FFS on other trigger mechanism, e.g. event triggered
  - FFS on multi-shot SRS transmission, e.g. the UE transmits SRS multiple times with single trigger from network
- FFS: NR supports at least one of followings
  - Periodic SRS transmission
  - Semi-persistent SRS transmission
- FFS: NR supports multiple numerologies for SRS transmission from one UE

Not treated.

8.1.4.5 Other

Including phase 1 calibration results and MIMO calibration related assumptions

R1-1608661 Summary of [86-20] email discussion on MIMO calibration for NR ZTE, ZTE Microelectronics
Continue offline discussion about MIMO calibration until Thursday – Ruyue (ZTE)

Petitioners' Exhibit 1007, p. 382
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610888 WF on NR MIMO calibration ZTE, ZTE Microelectronics, Nokia, ASB, CATT, MediaTek, Xinwei, Huawei, Hisilicon, Intel, Ericsson, Mitsubishi Electric, Samsung

- Companies are encouraged to provide/update results for Phase 1 NR MIMO calibration in RAN1#87, including link level and system level simulations
  - Extend the email discussion for further clarification on simulation assumptions and metrics, if needed
- Start the email discussion on simulation assumptions and metrics for Phase 2 NR MIMO calibration, including link level and system level simulations

Decision: The document is agreed. Further revised as follows:

Agreements:

- Companies are encouraged to provide/update results for Phase 1 NR MIMO calibration in RAN1#87, including link level and system level simulations
  - Extend the email discussion for further clarification on simulation assumptions and metrics, if needed
- Email discussion about the calibration work until 28th October – Ruyue (ZTE)
- Including discussions on simulation assumptions and metrics for Phase 2 NR MIMO calibration, including link level and system level simulations

R1-1610889 WF on Phase 1 link-level calibration for NR-MIMO with simplified antenna configuration ZTE, ZTE Microelectronics, CATT, MediaTek, Xinwei, Huawei, Hisilicon, Intel, Ericsson, Nokia, ASB, Mitsubishi Electric, NTT DOCOMO, Samsung

R1-1610890 Further clarification on assumptions for Phase 1 NR-MIMO calibration ZTE

All proponents are recommended to have calibration work considering clarifications in R1-1610890

R1-1610999 WF on UL Power Control Huawei, HiSilicon, Intel

Agreements:

- The following aspects should be considered for UL PC design:
  - No LTE-like cell-specific reference signal for path loss estimate
  - Beam-based transmissions/receptions
  - Analog beamforming at eNB/UE
  - Multi-beam / multi-stream transmissions
  - Multiple numerologies
  - Inter-TRP information exchange
  - FFS: Dynamic TDD
  - Other aspects are not precluded
- The following design of UL PC as starting point for study:
  - Fractional power control in LTE as framework
  - DL RS for path loss measurement
    - e.g. RS in DL beam management P-1, P-2 and P-3 for multi-beam scenario or single-beam scenario
  - Separate PC settings for UL control and data channel
- FFS: the following design of UL PC
  - Numerology-specific parameter setting
  - Separate PC settings for multi-beam / multi-stream UL

8.1.5.1 Synchronization signal and DL broadcast signal/channel

R1-1608924 Discussion on Synchronization signal design Spreadtrum Communications

The document was presented by Arto Lehti from Spreadtrum.

Observation 1: A truncated sequence from a pseudo-random sequence could keep the auto-/cross-correlation properties, while the one from a ZC sequence would lose the auto-/cross-correlation properties thereof.
Proposal 1: The pseudo-random sequence could be as the base sequence for NR synchronization signal or broadcasted signal.
Proposal 2: To enable narrowband UEs and wideband UEs to decode the same synchronization signal or broadcasted signal with no prior knowledge about wideband UEs at narrowband UEs, the base sequence could be shifted circularly to guarantee the narrowband UEs' synchronization signal or broadcasted signal to start from the front part of the base sequence.

Decision: The document is noted.

R1-1610435 Link level simulation results for NR initial synchronization and cell search MediaTek Inc. (R1-1609330)

The document was presented by … from MediaTek.

Proposal: The NR downlink synchronization signals should be transmitted less frequently than LTE to minimize the transmission of always-on signals for better forward compatibility. To reduce initial access latency, the signals should be designed in a way such that it can be detected and accurately synchronized to in a single observation with high probability.

Decision: The document is noted.

R1-1609436 Support of multiple numerologies in synchronization signal design Huawei, HiSilicon

The document was presented by David Mazzarese from Huawei.

Observation 1: It is implementation efficient that NR synchronization signal is based on subcarrier spacing(s) supported for a given frequency band.
Observation 2: Single subcarrier spacing for all frequency ranges is not implementation efficient.
Proposal 1: The synchronization signal is common at the receiver side regardless of the subcarrier spacing used in a NR carrier for a given frequency range.
Proposal 2: The common synchronization signal is defined using a pre-defined subcarrier spacing for a given frequency range.
Proposal 3: The common synchronization signal has X repetitions. The repetition factor X is the ratio of two subcarrier spacing values defined for synchronization signals.

Decision: The document is noted.

R1-1610156 Single beam SYNC design Qualcomm Incorporated

The document was presented by Tingfang Ji from Qualcomm.

- *Observation 1: An efficient frequency scan procedure should be investigated for NR*

Petitioners' Exhibit 1007, p. 384
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- *Observation 2: Designing NR synchronization signals should take into account the known issues in LTE synchronization signals*
- *Proposal 1: NR synchronization raster is a multiple of least common multiples of channel raster and reference NR subcarrier spacing.*
- *Proposal 2: NR synchronization signal bandwidth should depend on the synchronization raster and the minimum channel bandwidth.*
- *Proposal 3: NR Sub6 synchronization signal bandwidth is at most 5MHz.*
- *Proposal 4: RAN1 should consider the Alt 1 for selecting synchronization numerology and use 30kHz as synchronization signal numerology for Sub6.*
- *Proposal 5: The periodicity of the synchronization signals is proposed to be 5ms.*
- *Proposal 6: The synchronization signals are mapped into the downlink regular burst of the downlink-centric subframe.*
- *Proposal 7: Consider the single synchronization channel and dual synchronization channel design options to support both uplink-based and downlink-based mobility when designing the synchronization signals*

Decision: The document is noted.

R1-1610159 Multi-beam SYNC design Qualcomm Incorporated

Proposal 1: The design should allow base stations to sweep beams during synchronization and random access period.
Proposal 2: The transmission of sync signals is limited to the minimum supportable bandwidth. The value of the minimum supportable bandwidth is FFS (example: 40MHz).
Proposal 3: No data/control channel is frequency-multiplexed with the sync transmission.
Proposal 4: Every X msec, Y msec worth of resources are allocated for the transmission of a synchronization burst. Each synchronization burst consists of N nominal sync signals. The exact values of X, Y and N are FFS (example: X=5, Y=0.25, N=14).
Proposal 5: The max sync (beam sweep) periodicity Z is known by the UEs. The exact value of Z is FFS (example: sync periodicity = sync resource periodicity: Z=X=5 [msec]).
Proposal 6: BS needs to convey alongside the sync signals the OFDM symbol index (or another suitable notion of transmission time) of the transmission.
Proposal 7: The directional PSS, SSS and PBCH signals are TDMed within a nominal sync symbol, and are transmitted using the same beam.
Proposal 8: The design of the primary sync signal is based on a Zadoff-Chu sequence with a prime length L, and three different root indices. L is proposed to be 127, and exact choice of the root indices is FFS.
Proposal 9: The design of the secondary sync signal is based on a base m-sequence, repeated and interleaved in frequency domain. The transmission of SSS signal from different antenna ports may be pre-coded to provide channel estimation for 2-layer PBCH decoding.
Proposal 10: The design should support PBCH transmit diversity with upto P ports. P=2 is supported. Whether P>2 is FFS.
Proposal 11: The design should permit combining of PBCH from multiple transmissions within a burst.

Decision: The document is noted.

R1-1610498 Way Forward on NR initial access signals/channels NTT DOCOMO, Intel Corporation, Ericsson, Qualcomm, InterDigital

The document was presented by Hiroki Harada from NTT DOCOMO.
Decision: The document is noted and modified as follows:

Agreements:

- NR defines at least two types of synchronization signals
  - NR-PSS at least for initial symbol boundary synchronization to the NR cell
    - FFS other functionality provided by NR-PSS, e.g., part of NR cell ID, serving as DMRS for NR-SSS, detection of subcarrier spacing
  - NR-SSS for detection of NR cell ID or at least part of NR cell ID
    - Number of NR cell IDs is targeted to be at least 504
      - FFS: larger than that in LTE
      - FFS number of NR cell IDs
    - NR-SSS detection is based on the fixed time/freq. relationship with NR-PSS resource position irrespective of duplex mode and beam operation type at least within a given frequency range and CP overhead
      - FFS FDM or TDM
    - FFS other functionality provided by NR-SSS, e.g., demodulation of broadcast channel, RRM measurement, deriving subframe index, deriving symbol index
- NR defines at least one broadcast channel: NR-PBCH
  - NR-PBCH decoding is based on the fixed relationship with NR-PSS and/or NR-SSS resource position irrespective of duplex mode and beam operation type at least within a given frequency range and CP overhead

Petitioners' Exhibit 1007, p. 385
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

        - FFS: Unlicensed spectrum case
    - FFS relationship between NR-PBCH subcarrier spacing and NR-PSS and/or SSS subcarrier spacing
    - Following broadcasting schemes to carry essential system information can be considered
        - Option 1: NR-PBCH carries a part of essential system information for initial access including information necessary for UE to receive channel carrying remaining essential system information
        - Option 2: NR-PBCH carries minimum information necessary for UE to perform initial UL transmission (not limited to NR-PRACH) in addition to information in Option 1
        - Option 3: NR-PBCH carries all essential system information for initial access
        - Other options are not precluded

Possible agreements:
- Wider transmission bandwidth for NR-PSS/SSS/PBCH than that for LTE-PSS/SSS/PBCH is supported at least for a subcarrier spacing larger than 15kHz
    - Below 6 GHz, transmission bandwidth containing NR-PSS/SSS/PBCH is not more than [5] MHz
    - Below 40 GHz, transmission bandwidth containing NR-PSS/SSS/PBCH is not more than [40] MHz

Continue offline discussion until Tuesday – Hiroki (NTT DOCOMO)

Tuesday

Working assumption:
- Wider transmission bandwidth for NR-PSS/SSS and/or PBCH than that for LTE-PSS/SSS/PBCH is supported at least for a subcarrier spacing larger than 15kHz
    - Below 6 GHz, transmission bandwidth containing NR-PSS/SSS/PBCH is not more than [5 or 20] MHz
    - Below 40 GHz, transmission bandwidth containing NR-PSS/SSS/PBCH is not more than [40 or 80] MHz

---

Tuesday session

R1-1610522 Way Forward on unified structure of DL sync signal Intel Corporation, NTT DOCOMO, ZTE, ZTE Microelectronics, ETRI, InterDigital
- PSS, SSS and/or PBCH can be transmitted within a 'SS block'
    - FFS: details how to compose PSS, SSS and/or PBCH
- One or multiple 'SS block(s)' compose an 'SS burst'
    - FFS: Number of 'SS block(s)' (defined as duration of 'SS burst')
    - FFS: whether or not 'SS block(s)' are consecutive
- One or multiple 'SS burst(s)' compose an 'SS burst series'
    - FFS: Periodicity and number of 'SS burst'
    - FFS: Transmission instances of 'SS burst series'

Decision: The document is noted and modified as follows:

(Agreements):
- PSS, SSS and/or PBCH can be transmitted within a 'SS block'
    - FFS: details how to compose PSS, SSS and/or PBCH
    - Multiplexing other signals are not precluded within a 'SS block'
- One or multiple 'SS block(s)' compose an 'SS burst'
    - FFS: Number of 'SS block(s)' (defined as duration of 'SS burst')
    - FFS: whether or not 'SS block(s)' are consecutive
    - FFS: whether or not 'SS block(s)' within a 'SS burst' are the same
- FFS: One or multiple 'SS burst(s)' compose a 'SS burst series'
    - FFS: Periodicity and number of 'SS burst'
    - FFS: Transmission instances of 'SS burst series' and number of ' SS burst series'

Continue discussion on FFS until Wednesday – Seunghee (Intel)
Wednesday: Above agreement is modified as follows:

Agreements:
- PSS, SSS and/or PBCH can be transmitted within a 'SS block'
    - FFS: details how to compose PSS, SSS and/or PBCH
    - Multiplexing other signals are not precluded within a 'SS block'
- One or multiple 'SS block(s)' compose an 'SS burst'
    - FFS: Number of 'SS block(s)' (defined as duration of 'SS burst')
    - FFS: whether or not 'SS block(s)' are consecutive
    - FFS: whether or not 'SS block(s)' within a 'SS burst' are the same
- One or multiple 'SS burst(s)' compose a 'SS burst set'
    - FFS: Periodicity and the number of 'SS burst' within a SS burst set
    - Number of SS bursts within a SS burst set is finite.

Petitioners' Exhibit 1007, p. 386
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- FFS: Transmission instances of 'SS burst set'
  - E.g., periodic/aperiodic transmission of SS burst sets.

R1-1610538 Way forward on SYNC periodicity Qualcomm Incorporated

- Proposal:
  - Network should have the flexibility of configuring different SYNC periodicity
  - UE should assume 5ms SYNC periodicity for acquisition unless assisted by network
- Expected UE behavior
  - Assisted search: Deployment with network assistance on frequency and timing could be configured with large SYNC periodicity and maintain high detection probability with low latency
  - Blind search:
    - Frequency layers with 5ms SYNC leads to high detection probability with low latency;
    - Frequency layers with long SYNC periodicity will have reduced UE detection probability
    - Network could configure some layers/cells to have

Discussion: Ericsson would like to see more analysis done, at this point in time could not agree the 5ms Sync figure
Decision: The document is noted. Continue discussion until Thursday – Tingfang (Qualcomm)

R1-1610722 WF on SYNC Periodicity Qualcomm Incorporated

Agreements:

- From RAN1 specification perspective, NR air interface defines at least one periodicity of SS burst set
  - FFS: whether or not to define common periodicity range for SS burst set across NR carriers
  - Values of the periodicities of SS burst set is for further study
    - E.g., 5ms, 40ms, 100ms
  - The lowest value of the periodicity of SS burst set is X ms, e.g., 5ms, 40ms, 80ms
  - Note: Interval of SS burst can be the same as interval of SS burst set in some cases, e.g., single beam operation
  - Note: the main bullet can be applied to PSS, SSS and/or PBCH
- FFS: networks is allowed to transmit SS burst set at least at the defined periodicities
- FFS: UE is allowed or informed to adapt acquisition procedure based on periodicities of SS burst set
- FFS: For example, if multiple periodicities of SS burst set are defined for initial blind acquisition, UE assumes X ms of an NR carrier as periodicity of SS burst set for dwell time on a freq

R1-1610567 Way Forward on multiplexing of sync signal Samsung

- NR supports the following multiplexing methods for nrSS and nrPBCH.
  - TDM at least for below 6 GHz with single-beam and multi-beam SFN transmissions of these signals
  - FDM at least for above 6 GHz with multi-beam sweeping transmissions of these signals

Decision: The document is noted.

R1-1610550 Way Forward on multiplexing of Sync and Broadcast signals Qualcomm Incorporated, CATT

- NR supports the time division multiplexing of PSSS, SSS and PBCH signals in both sub-6 GHz and over-6 GHz band

Decision: The document is noted. Continue study until the next meeting.

R1-1610558 WF on Synchronization Signal for NR Initial Access Huawei, HiSilicon

- SS for initial access is a predefined subcarrier spacing according to the spectrum range
- SS for initial access can be transmitted in predefined frequency locations other than the centre of a carrier
- For SS with multiple beams, at least TDM of the SS over different beams is supported;
  - FDM and CDM in addition to TDM of the SS are not precluded

Decision: The document is noted.

Agreements:

- At least one subcarrier spacing for each synchronization signal (e.g. NR PSS,SSS, PBCH) is predefined in the specification for a given frequency range
  - FFS: Subcarrier spacings for NR PSS, SSS and PBCH can be same or different.
  - Note that there are more than one frequency ranges
  - FFS: for the case when the frequency ranges are overlapped.
  - FFS: whether or not to define a single numerology or multiple numerology for frequency range
  - RAN1 should study the number of subcarrier spacings in a given frequency range and strive for minimizing the number of subcarrier spacings

Petitioners' Exhibit 1007, p. 387
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610844 Offline discussion summary of initial access for NR NTT DOCOMO
R1-1610839 WF on Updated Link Level Evaluation Assumptions for Initial Access in NR Qualcomm
Continue offline discussion until Thursday

R1-1611015 WF on Assumptions for Comparing Different SYNC Multiplexing Techniques Qualcomm

Agreements:
- Companies are encourage to provide evaluations for different multiplexing techniques for initial access
  - Use the link level parameters that got agreed in R1-1610987 and R1-1610991

R1-1610991 WF on Updated System Level Evaluation Assumptions for Initial Access in NR Qualcomm

Agreements:
- Agree on R1-1610991 with the following modification and note in R1-1611038
  - "seven sites" should be modified as "one or two cellular tiers"
  - Note: Company reports which value for the number (i.e., 1 or 2) of cellular tiers to choose for the evaluation

R1-1610959 WF on Updated Link Level Evaluation Assumptions for Initial Access in NR Qualcomm, NTT Docomo, Samsung, Intel
R1-1610987 WF on Updated Link Level Evaluation Assumptions for Initial Access in NR Qualcomm, NTT Docomo, Samsung, Intel

R1-1610954 WF on synchronization and carrier rasters Huawei, HiSilicon, Ericsson, NTT Docomo, Fujitsu
R1-1611035 WF on synchronization and carrier rasters Huawei, HiSilicon
- Email discussion on whether there is a need to support scenarios where synchronization signal(s) of neighbour cells may not be on the same center frequency
- For intra/inter frequency DL measurement, the two options below are discussed:
  - The network can signal a reduced set of frequency locations of the sync signal(s)
    - including the case where synchronizations signal(s) of neighbour cells are at the same frequency location as the synchronizations signal(s) of the UE's serving cell
  - The UE may always assume the same frequency location of the synchronization signal(s) among neighbour cells
- Email discussion on the proposal,
  - The candidate frequency locations of synchronization signal(s) are sparser than the possible frequency locations of the center of NR carrier bandwidth.
    - The spacing (Hz) between the candidate frequency locations of synchronization signal(s) may depends on the frequency bands.
    - This does not preclude that for certain bands, the candidate frequency locations of synchronization signals and the possible frequency locations of center of NR carrier bandwidth may be the same
  - A UE should not assume a fixed frequency separation between the frequency location of synchronization signal(s) and the center of NR carrier bandwidth.
- Above email discussion deadline is until 7th November – David (Huawei)
  - All proponents should focus on at least the above 3rd main bullet ant potential standard impact

8.1.5.2 RACH procedure

R1-1608968 Unified Random Access in NR ZTE

The document was presented by … from ZTE.

Proposal 1: NR random access makes use of Rx/Tx reciprocity, when available at TRP and/or UE, to reduce the need for beam sweeping.
Proposal 2: NR initial access should support random access also without Tx/Rx reciprocity within the same framework as with Tx/Rx reciprocity.
Proposal 3: TRP should provide information to assist UE to determine UL SB(s) for preamble transmission, e.g. in SI.
Proposal 4: NR should support multiple preamble transmission before RAR is received
Proposal 5: Open loop, closed loop and hybrid schemes for RAR transmission should be studied by RAN1.
Proposal 6: The RAR should indicate to which UL SB and UL STI it corresponds.
Proposal 7: RAN1 should study random access for connected mode UEs, based on RS for connected mode mobility.
Proposal 8: The group of preambles available to idle mode UEs should be configurable, with at least the same level of flexibility as in LTE.

Decision: The document is noted.

R1-1609672 NR PRACH preamble evaluations Ericsson

The document was presented by Asbjorn Grovlen from Ericsson.

- Observation 1: The PRACH preamble detector can be configured with varying number of non-coherent intervals (Nnc) when the preamble is constructed by repeating one short sequence
- Observation 2: The PRACH preamble detection performance can improved as compared to LTE release 8, with a PRACH preamble format which enables non-coherent accumulations in the detector.

Decision: The document is noted.

R1-1609735 Zero-Header Zero-Tail Random Access Preambles for New Radio Nokia, Alcatel-Lucent Shanghai Bell

The document was presented by … from Nokia.

Proposal 1: ZHZT PRACH preambles should be further studied as an option for the random access of 5G New Radio.

Decision: The document is noted.

R1-1609533 Time Advance derivation for non-reciprocal UE Intel Corporation

The document was presented by Yuan Zhu from Intel.

- Observation 1: UE beamforming gain can be leveraged to improve the coverage of downlink beam management P-1 and PRACH transmission.
- Observation 2: Independent downlink/uplink beam sweep may result in large TA range.
- Observation 3: The additional TA range Δt caused by independent DL/UL beam sweep can be comparable to CP length.

Decision: The document is noted.

R1-1610056 Design for RACH preamble for NR NTT DOCOMO, INC.

The document was presented by Kazuaki Takeda from NTT DOCOMO.

- Proposal 1: The RACH preamble format(s) in LTE should be considered as the basic RACH preamble.
- Proposal 2:
- Scalable numerologies are applied to the basic RACH preamble.
  - Scaling factor of 2^n is considered.
- Observation:
- The MCL for RACH preamble is degraded when larger subcarrier spacing/BW. However, larger subcarrier spacing is robust against higher Doppler frequency.
- Scalable RACH preamble would be applicable to higher carrier frequency and multi-beam operation.

Decision: The document is noted.

Tuesday session

R1-1610489 Way Forward on RACH procedure for multi-beam operation NTT DOCOMO, ETRI, Qualcomm, Nokia, Alcatel-Lucent Shanghai-Bell, ZTE

When Tx/Rx reciprocity is available at both gNB and UE, the following RACH procedure is considered for at least UE in idle mode

- Association between one or multiple occasions for DL broadcast channel/signal and a subset of RACH occasions is partially or fully informed by broadcast system information (e.g., PBCH)
  - Signaling of "non-association" can be also included
  - Detailed design for RACH preamble should be further studied
- Based on the DL Tx beam measurement and the corresponding association, UE selects the subset of RACH occasions
- At gNB, the DL Tx beam for the UE is obtained based on the detected RACH preamble and would be also applied to Message 2

Petitioners' Exhibit 1007, p. 390
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- UL grant in message 2 may indicate the transmission timing of message 3.

For the cases with and without Tx/Rx reciprocity, the common random access procedure should be strived.
When Tx/Rx reciprocity is not available, the the following could be further considered for at least UE in idle mode

- Whether or how to report DL Tx beam to gNB, e.g.,
  - RACH preamble
  - Msg. 3
- Whether or how to indicate UL Tx beam to the UE, e.g.,
  - RAR

Decision: The document is noted, modified and agreed as follows:

Agreements:

- When Tx/Rx reciprocity is available at gNB at least for multiple beams operation, the following RACH procedure is considered for at least UE in idle mode
  - Association between one or multiple occasions for DL broadcast channel/signal and a subset of RACH occasions is informed to UE by broadcast system information or known to UE
    - FFS: Signaling of "non-association"
    - Detailed design for RACH preamble should be further studied
  - Based on the DL measurement and the corresponding association, UE selects the subset of RACH occasions
    - FFS: Tx beam selection for RACH preamble transmission
  - At gNB, the DL Tx beam for the UE can be obtained based on the detected RACH preamble and would be also applied to Message 2
    - UL grant in message 2 may indicate the transmission timing of message 3
- For the cases with and without Tx/Rx reciprocity, the common random access procedure should be strived
- When Tx/Rx reciprocity is not available, the the following could be further considered for at least UE in idle mode
  - Whether or how to report DL Tx beam to gNB, e.g.,
    - RACH preamble/resource
    - Msg. 3
  - Whether or how to indicate UL Tx beam to the UE, e.g.,
    - RAR

R1-1610854 WF on NR RACH Procedure Huawei, HiSilicon, Qualcomm, ETRI (R1-1610846)

- RAN1 is currently studying to see potential benefits of a simplified RA procedure consisting of two main steps (Msg1 and Msg2) for UEs
  - Use of a UE identity in Msg 1
  - Msg 2: RA response is addressed to the UE identity in Msg 1
  - FFS on the definition and choice of the UE identity

Decision: The document is noted. Continue offline discussion until Thursday

R1-1610978 WF on NR RACH Procedure Huawei, HiSilicon, NTT Docomo, Qualcomm, ETRI, Intel, Nokia

Agreements:

- RAN1 is studying and some companies see potential benefits of a simplified RACH procedure consisting of two main steps (Msg1 and Msg2) for UEs
- RAN1 has discussed the following:
  - The use of a UE identity in Msg 1
  - Msg 2: RA response that is addressed to the UE identity in Msg 1
  - FFS on the definition and choice of the UE identity
  - FFS on the applicability scenarios of simplified RACH procedure
- RAN1 to send LS to RAN2
- RAN1 is aware that RAN2 is also studying the RACH procedure and RAN1 would like to inform RAN2 to take the above into considerations and would like to request any feedback on UE identities and associated procedure and also ask the corresponding applicable scenarios

R1-1610990 [Draft] LS on NR RACH Procedure Huawei

Decision: The document is noted and final LS is agreed in R1-1610992

R1-1610783 WF on RACH Procedure for Multi-beam without gNB reciprocity ZTE, ZTE Microelectronics, Nokia, NTT DOCOMO

- RACH occasion:
  - A time-frequency resource and a subset of preambles.

Petitioners' Exhibit 1007, p. 391
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Subset of RACH occasions:
  - One or more RACH occasions
- Multiple/repeated UE preamble transmission within a subset of RACH occasions is informed by broadcast system information
  - To cover gNB RX beam sweeping in case of NO Tx/Rx reciprocity at the gNB

Decision: The document is noted and modified as follows:

Agreements:

- RACH resource:
  - A time-frequency resource to send RACH preamble
- Whether UE needs to transmit one or multiple/repeated preamble within a subset of RACH resoueces can be informed by broadcast system information
  - For example, to cover gNB RX beam sweeping in case of NO Tx/Rx reciprocity at the gNB

R1-1610849 WF on definition of Beam reciprocity Samsung

- The followings are defined for Tx/Rx beam reciprocity at TRP and UE :
  - **Tx/Rx beam reciprocity at TRP:**
    - TRP is able to determine a TRP Rx beam for the uplink reception based on UE's downlink measurement report on TRP's Tx beam.
    - TRP is able to determine a TRP Tx beam for the downlink transmission based on TRPs uplink measurement on TRP's Rx beams
  - **Tx/Rx beam reciprocity at UE:**
    - UE is able to determine a UE Tx beam for the uplink transmission based on UE's downlink measurement on UE's Rx beams.
    - UE is able to determine a UE Rx beam for the downlink reception based TRP uplink measurement on UE's Tx beam.

Decision: The document is noted. Also supported by Qualcomm. Continue offline discussion until Thursday.

R1-1610962 WF on Unified RACH Procedure ZTE, ZTE Microelectronics, NTT DOCOMO, Nokia, Alcatel-Lucent Shanghai Bell, Sharp, Intel

R1-1610960 WF on RACH Preamble NTT DOCOMO, Intel, Sharp, ZTE

Agreements:

- NR supports multiple RACH preamble formats, including at least
  - RACH preamble format with longer preamble length
  - RACH preamble format with shorter preamble length
  - FFS how many signatures (e.g. number of RACH sequences, payload size, etc.)
- Multiple/repeated RACH preambles in a RACH resource is supported
  - FFS: How to support single-beam and/or multi-beam operation
  - FFS: Preamble could be the same or different
- Numerology for RACH preamble can be different depending on frequency ranges
  - FFS: How many numerologies will be supported per frequency range
- ~~FFS:~~ Numerology for RACH preamble can be different or the same from that for the other UL data/control channels

R1-1610976 WF on Updated Link Level Evaluation Assumptions for RACH Preamble Qualcomm
R1-1610986 WF on Updated Link Level Evaluation Assumptions for RACH Preamble Qualcomm

R1-1611011 WF on RACH Preamble Evaluation Assumption Nokia, Alcatel-Lucent Shanghai Bell, NTT DOCOMO

Agreements:

- In the evaluation for RACH preamble transmission and RACH resource selection, companies report the following assumptions
  - Support of Rx beam sweeping at the base station
  - Support of coverage, e.g., the values defined in TR38.913

Not treated.

8.1.5.3 Mobility

R1-1610828 Way Forward on DL measurement for L3 mobility LG Electronics, Samsung, NTT DOCOMO

- NR supports cell-level mobility based on DL cell-level measurement (e.g. RSRP for each cell) in IDLE mode UE.
  - Study the following DL signals for IDLE mode RRM measurement
    - Option 1: Synchronization signal (i.e. NR-SSS)
    - Option 2: DM-RS for broadcast channel.
    - Option 3: (Beam) Measurement RS which is carrying cell-ID.
    - Other options are not precluded
- For L3 mobility based on DL measurement in CONNECTED mode UE:
  - Non-UE-specific DL signals are used for CONNECTED mode RRM measurement
  - Study the following DL signals for CONNECTED mode RRM measurement
    - Option 1: Cell related RS which is carrying Cell-ID (e.g. NR-SSS)
    - Option 2: (Beam) Measurement RS which is carrying beam-ID and/or Cell-ID
    - Option 3: both option 1 and 2
    - Other options are not precluded
  - At least one of cell-level and beam-level measurement quantities (e.g. RSRP/RSRQ for each cell and/or each beams) is supported for RRM reporting.
  - Study the following options for RSRP/RSRQ to be reported for L3 mobility
    - Option 1: RSRP/RSRQ is derived per cell with averaging multiple beam measurements
    - Option 2: RSRP/RSRQ is derived per beam
    - Option 3: both option 1 and 2
    - Other options are not precluded

Decision: The document is noted. Continue offline discussion until Thursday

R1-1610975 WF on DL measurement for L3 mobility Samsung, LG Electronics, NTT DOCOMO, AT&T, Ericsson, Intel

Agreements:

- Note: In this WF, IDLE mode refers to a UE state similar to LTE IDLE state, whose exact definition is up to RAN2
- Note: In this WF, CONNECTED mode refers to a UE state similar to LTE CONNECTED state, whose exact definition is up to RAN2
- Note: In this WF, cell refers to NR cell which is tied to a same ID carried by NR-SS.

Petitioners' Exhibit 1007, p. 393
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - Detailed definition of NR cell FFS
- NR supports cell-level mobility based on DL cell-level measurement (e.g. RSRP for each cell) in IDLE mode UE
  - Study the following DL signals for IDLE mode RRM measurement
    - Option 1: Synchronization signal (e.g., NR-PSS, NR-SSS)
    - Option 2: RS for demodulating broadcast channel
    - Option 3: RS for mobility
      - FFS if and how to associate the cell ID with this RS
      - FFS this RS is for multi-beam and/or single-beam
    - Option 4: Any combinations of above
    - Other options are not precluded
  - FFS: QCL definition for DL signal for IDLE mode RRM measurement
- FFS whether NR cell is defined only for "IDLE mode" or for both IDLE and CONNECTED mode

Agreements:
- For L3 mobility based on DL measurement in CONNECTED mode UE:
  - At least non-UE-specific DL signals can be used for CONNECTED mode RRM measurement
    - FFS UE-specific DL signals for this purpose
  - Study the following DL signals for CONNECTED mode RRM measurement
    - Option 1: Cell related RS which is carrying Cell-ID (e.g. NR-PSS, NR-SSS)
    - Option 2: RS for mobility
      - FFS how to associate it with beam-ID and/or Cell-ID
    - Option 3: RS for demodulating broadcast channel
    - Option 4: A combination of option 1 and 2
    - Other options are not precluded
  - At least one of cell-level and beam-level measurement quantities is supported for RRM reporting.
    - FFS which RRM measurement quantities to define, e.g., RSRP, RSRQ
  - Study the following options for RRM measurement quantities to be reported for L3 mobility:
    - Option 1: derived per cell (e.g., if multi-beam, as a function of multi-beam measurements)
    - Option 2: derived per beam
    - Option 3: A combination of option 1 and 2
    - Other options are not precluded
- FFS for other UE states (if introduced by RAN2)

R1-1610845 Way Forward on NR UL-based RRM measurement Huawei, HiSilicon, Qualcomm
- NR shall target to support UL-based RRM measurement and mobility at least in the following cases:
  - New RAN Controlled State with low activity
  - Active state L3 based NR handover
  - Active state L1/2 based NR mobility

Decision: The document is noted. Continue offline discussion until Thursday.
Thursday: Continue until next meeting

R1-1609437 Scenarios and initial evaluation for UL-based RRM measurement and mobility Huawei, HiSilicon

Observation 1: UL based measurements enable the TRP(s) selection within the NR cell.
Observation 2: Configuring UL based measurement in dense network deployment result in efficient reduction on signalling overhead and UE power consumption.
Observation 3: UL based measurement can alleviate the mobility interruption time and reduce the paging signalling overhead and HO failure rate, especially for high speed mobility and beam based operation scenarios.
Observation 4: In RAN controlled state of low-frequency dense urban scenario, UL based RRM has better or close paging performance than DL based RRM with dynamic tracking area.
Observation 5: DL based measurement should be support for L1/L2 beam management, and NR cell reselection for idle UE.
Proposal 1: NR shall support UL based RRM measurement and mobility at least in dense urban, high speed mobility and beam based scenarios.

Decision: The document is noted.

R1-1609167 Evaluation scenarios and assumptions for DL mobility at above 6GHz Samsung Electronics Co., Ltd

Observation 1: UL based mobility is not feasible at higher carrier frequencies where UE/TRX uses directional transmission/reception instead of omni-directional.

Proposal 1: Only DL based mobility is assumed for the evaluation of mobility at higher carrier frequencies (e.g. 30GHz).

Proposal 2: Evaluation for mobility like SLS should be performed in RAN2 for at least higher carrier frequencies.

Petitioners' Exhibit 1007, p. 394
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Proposal 3: For LLS evaluation assumptions, adopt the Table 1. And the performance metrics for link-level simulations are given by

- *Signal detection error performance (misdetection, false alarm)*
- *Measurement accuracy (signal level)*
- *Other metrics (e.g., PAPR) are not precluded*

Decision: The document is noted.

R1-1610167 Comparative Power Analysis between UL and DL-based Mobility Qualcomm Incorporated

Observation: In mobility challenging scenario, to achieve the same paging reliability, UL based mobility can reduce the UE power consumption compared to DL based mobility
Proposal: NR should study supporting both DL and UL based mobility

Decision: The document is noted. Further revised in R1-1610414.

R1-1610590 WF on Evaluation scenarios and assumptions for DL mobility at above-6GHz Samsung, Intel, Qualcomm

Agreements:

- Companies are encouraged to provide link simulation results for DL based mobility at above-6GHz
  - Evaluation assumptions are used in Table A.1.5-1 (TR38.802 V0.2.1)
  - LLS performance metrics to be considered
    - Measurement accuracy (signal level)
      - Difference between actual received power and estimated received power
    - Temporal tracking of beam strength

Not treated.

R1-1610480 Dynamic TDD in dense urban scenario NTT DOCOMO, INC. (R1-1610086)

8.1.7 Scheduling/HARQ aspects

R1-1611039 Offline outcome of Thursday afternoon on 8.1.7 NTT DOCOMO

Agreements:

- For UL control channel in short duration,
  - 1 symbol duration of a slot is supported.
  - FFS: a few symbol duration of a slot is supported.
- Mechanism enabling frequency-diversity is supported.

Agreement: In frequency-domain, a PRB (or multiple PRBs) is the minimum resource unit size for UL control channel.

Agreement: UE-specific RS is used for PUCCH transmission

R1-1610946 **WF on URLLC HARQ Intel**

Agreements:

- Study how to meet RAN requirements on latency and reliability using at least one HARQ retransmission for DL data and UL data
  - Further study TTI duration and achievable latency based on at least one retransmission
  - Further study details of HARQ operation in DL and UL taking into account reliability of overall HARQ signaling procedure (control, data and feedback channels)
- This does not preclude studying single transmission to meet the RAN requirements on latency and reliability

Email discussion about DL L1/L2 control channel design until 7th November (including R1-1610671) – Stefan (Ericsson)
Email discussion about UL L1/L2 control channel design until 7th November – Stefan (Ericsson)

8.1.7.1 L1/L2 control channel design

Including DL/UL control channel structures and DCI/UCI contents

R1-1609741 **Input to control channel design from a scheduler perspective** **Nokia, Alcatel-Lucent Shanghai Bell**

The document was presented by Sigen Ye from Nokia.

- Proposal #1: Adopt a user-centric design principle, where the downlink control channel and data channel are time multiplexed on a per user basis while still limited to distinct physical resource sets. For downlink data transmissions, the downlink control channel transmission only appears in the start of the TTI.
- Proposal #2: It should be possible to configure UEs with a time-frequency domain control channel monitoring pattern, such that UEs arenot mandated to always monitor for control chanel grants over the full bandwidth at all possible time occasions, say at the start of every slot, mini-slot, or subframe.

Decision: The document is noted.

R1-1609539 **On the NR physical control channel** **Intel Corporation**

The document was presented by … from Intel.

- Proposal 1: NR PDCCH should support the scheduling of common and dedicated data transmissions.
- Proposal 2: NR PDCCH should support in-carrier scheduling of common data transmission in low frequency band as well as dedicated data transmissions in both low and high frequency band.
- Proposal 3: NR PDCCH should support variable TTIs, and blind decoding computation burden thereof shall be kept in a reasonable level.
- Proposal 4: NR should support localized control and data transmission, a.k.a. in-resource control scheduling, whereby control signaling and scheduled data are transmitted in a confined time-frequency resource grid, and can be multiplexed in hybrid time-frequency domain.
- Proposal 5: NR PDCCH should support distributed transmission in frequency domain to benefit from frequency diversity, especially when localized beamforming transmission is not possible or feasible.
- Proposal 6: The coverage of NR PDCCH at low and high frequency should be further studied by taking into account relevant deployment scenarios and appropriate beamforming gain assumption.
- Proposal 7: Both DMRS and shared reference signal should be studied for NR PDCCH demodulation.

Decision: The document is noted.

R1-1609128 **DL Control Channel Design** **Samsung**

The document was presented by Aris Papasakellariou from Samsung.

Petitioners' Exhibit 1007, p. 397
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Proposal 1: A resource block is the frequency resource unit for both PDCCH and PDSCH transmissions.
Proposal 2: A CCE includes a predetermined number of RBs. The RB interleaving is based on the REG interleaving in LTE.
Proposal 3: The duration of PDCCH transmissions is determined per transmission slot.
Proposal 4: A PDCCH transmission can span multiple symbols.
Proposal 5: A UE is signaled RBs of a system bandwidth and the transmission slots for monitoring PDCCH transmissions.

Decision: The document is noted.

R1-1610177 DL control channels overview Qualcomm Incorporated

The document was presented by Jing Jiang from Qualcomm.

Proposal 1: Agree on the need of PSFICH for NR.
Proposal 2: RS for PDCCH is transmitted on the 1st symbol in DL control region in each slot.
Proposal 3: Consider the multi-part PDCCH structure.
Proposal 4: Consider 2 symbol DL control region or 1 symbol DL control region with additional control channel in the data region.
Proposal 5: Do not consider dynamically configurable number of control symbols.
Proposal 6: Consider 2 port SFBC and CDD as a candidate diversity scheme for PDCCH.
Proposal 7: NR shall allow a smaller BW UE to operate in the system. Minimum UE BW can be [5] MHz.
Proposal 8: Introduce the subband concept for PDCCH search space with the above attributes per subband:

- UE specific search space / Common search space
  - CCE can be localized/distributed within a subband.
- Omni / Beamformed
  - For omni subband, UE can have a wideband RS processing over the subband.
  - For beamformed subband, UE should have per REG/CCE level RS processing.
- Single / Multi-part control

Proposal 9: Consider fewer hypotheses for PDCCH blind decoding based on the presented ways.

- Limit the DCI length options via quantized DCI length
- Use nested search space for each subband (example shown in Figure 1)
- Reduce the number of options for each aggregation level compared to LTE

Proposal 10: Consider flexible DCI multiplexing PDCCH for multiple UEs.
Proposal 11: Introduce pre-indication / cross slot scheduling (UL/DL) PDCCH.
Proposal 12: Introduce dynamic BW switching.

Decision: The document is noted.

R1-1609273 Overall structure of DL control transmission for NR LG Electronics

The document was presented by … from LGE.

Proposal #1: In NR system, the following two types of DL control region are to be considered.

- DL control region A
  - Non-configurable in terms of time/frequency resource and numerology
- DL control region B
  - Configurable in terms of time/frequency resource and numerology

Proposal #2: In NR system, the following two types of search space are to be considered.

- Search space A
  - DCI monitoring for broadcast data and unicast data associated with fall back operation
  - Non-configurable in terms of CCE mapping, TX scheme, and DM-RS scrambling
- Search space B
  - DCI monitoring for normal unicast data
  - Configurable in terms of CCE mapping, TX scheme, and DM-RS scrambling

Proposal #3: In DL control design for NR system, the following options need to be studied.

- Option 1
  - Search space A is located in DL control region A
  - Search space B is located in DL control region B
- Option 2
  - Search space A is located in both DL control region A and B
  - Search space B is located in DL control region B

Decision: The document is noted.

R1-1609435 Control channel design for URLLC Huawei, HiSilicon

The document was presented by David Mazzarese from Huawei.

Observation 1: The DL assignment is needed for URLLC DL transmission considering the UE complexity, power consumption and processing delay due to data channel blind detection.
Observation 2: Both A/N-based and A/N-less operation can be considered for URLLC DL transmission.

Petitioners' Exhibit 1007, p. 398
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Observation 3: CSI reporting should be studied for URLLC DL transmission considering the sporadic traffic characteristics and latency requirement.
Observation 4: The scheduling request and UL grant are not needed for URLLC UL transmission if grant-free based scheme is adopted.
Observation 5: Both A/N-based and A/N-less operation can be considered for URLLC UL transmission.
Observation 6: The DL control channel reliability requirement depends on the number of possible transmissions within the latency bound, which is determined by the scheduling interval and interval between initial transmission and retransmission.
Observation 7: With a limited number of possible transmissions, the DL control channel reliability needs to be increased compared to LTE requirement (1%).
Observation 8: The NACK to ACK error for control channel carrying HARQ-ACK feedback should be studied for URLLC in order to guarantee the overall reliability requirement.
Proposal 1: A compact DCI format can be considered targeting URLLC where only limited scheduling information is conveyed.

Discussion: Qualcomm→ overhead issue to be considered
Decision: The document is noted.

R1-1610083 Initial views on UL control channel design NTT DOCOMO, INC.

The document was presented by Fred Takeda from NTT DOCOMO.
Proposal 1:

- *NR UL control channel(s) should support at least scheduling request, HARQ-ACK feedback, and CSI feedback.*
- *NR UL control channel(s) should be designed with the following high-level requirements:*
  - *High reliability*
    - *At least for lower carrier frequencies (e.g., below 6GHz), NR UL control channel(s) should be comparable with PUCCH for LTE, in terms of BLER/coverage performances.*
    - *For higher carrier frequencies (e.g., above 6GHz), NR UL control channel(s) have sufficient BLER/coverage performances, which could overcome the high carrier frequency specific problems.*
  - *High efficiency*
    - *NR UL control channel(s) should be efficiently multiplexed with DL data and/or UL data.*
  - *High flexibility*
    - *NR UL control channel(s) should be friendly to flexible dynamic TDD operation.*
  - *Scalability*
    - *NR UL control channel(s) should be designed for various SCSs and scheduling unit duration.*

Proposal 2: *NR UL control channel(s) should be designed such that required reliability can be properly achieved.*

- *Both BER/BLER performance evaluation and link-budget analysis would be essential.*

Decision: The document is noted.

R1-1610683 Discussion points on Downlink Control Signaling Ericsson

The document was presented by Stefan Parkvall from Ericsson. Comprehensive list (non exhaustive) of questions for RAN1 to look at.
Discussion: Chair→ intention is not trying to answer them right now but more to clarifiy the questions and revisit later in the week.
Decision: The document is noted. Continue offline discussion until Wednesday.

Wednesday

R1-1610736 Summary of offline discussion on downlink control channels Ericsson

Agreements: NR should support

- UE/PDCCH-specific DM-RS for PDCCH reception. At least for beamforming, UE may assume same precoding operation for PDCCH and associated DM-RS for PDCCH.
  - FFS: DM-RS is PDCCH-specific and/or UE-specific
- Shared/Common RS for PDCCH reception
  - Whether this sharing will be transparent to UE is FFS
  - FFS: Whether UE may assume the same precoding operation between RS and PDCCH
- FFS: QCL between antenna ports for PDCCH demodulation
- Tx diversity supported. Which scheme/how FFS

Agreements: For the frequency-domain aspects:

- A UE monitors for downlink control information in one or more "control subband"
  - This does not preclude that UE may receive additional control information elsewhere within or outside the control subband in the same or different OFDM symbol(s)
  - FFS: One DCI message is transmitted within one control subband.
- A "control subband" is smaller than or equal to the carrier bandwidth (up to a certain limit)

Petitioners' Exhibit 1007, p. 399
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- FFS if a "control subband" is non-contiguous and/or contiguous in the frequency domain.
- A "control subband" consists of an integer number of RBs/PRBs in the frequency domain
- FFS: multiplexing of multiple control channels in a subband

Agreements:
- From gNB perspective, DL control signalling can be located at the first OFDM symbol(s) in a slot and/or mini-slot
- FFS: From gNB perspective, DL control signalling can be located over the slot and/or mini-slot

Possible agreements:
- NR supports same-slot and/or same-mini-slot scheduling for both DL and UL
- NR supports cross-slot and/or cross-mini-slot scheduling for both DL and UL

Agreement:
- NR supports at least same-slot and cross-slot scheduling for DL.
    - Note: it is already agreed that NR supports same-slot and cross-slot scheduling for UL.

R1-1610566 Way Forward on NR UL control channel Samsung, Qualcomm, Intel, Panasonic, InterDigital, Sony, Ericsson, NTT DOCOMO, Fujitsu
- At least two formats are supported for NR UL control channel assuming "slot" is defined
    - Short UL control channel can be
        - transmitted in the last UL symbol(s) of a slot
        - FFS: transmitted in the first UL symbol(s) of a slot
        - TDMed and/or FDMed with UL data channel within a slot
        - TDMed with DL data/control channel within a slot
    - Long UL control channel can be
        - transmitted over multiple UL symbols to improve coverage
        - FDMed with UL data channel within a slot
        - TDMed with DL control channel within a slot
    - FFS how to multiplex with SRS
    - The frequency resource and hopping, if hopping is used, should not spread over whole bandwidth for a given UL control channel

Decision: The document is noted. Continue discussion.

Wednesday session

R1-1610808 Way Forward on NR UL control channel Samsung, Qualcomm, Intel, Panasonic, InterDigital, Sony, Ericsson, NTT DOCOMO, Fujitsu, OPPO, CATT, CMCC
- At least two ways of transmissions are supported for NR UL control channel
    - UL control channel can be transmitted in short duration
        - around the last UL symbol(s) of a slot
        - FFS: in the other positions, e.g., the first UL symbol(s) of a slot
        - TDMed and/or FDMed with UL data channel within a slot
    - UL control channel can be transmitted in long duration
        - over multiple UL symbols to improve coverage
        - FDMed with UL data channel within a slot
    - FFS how to multiplex with SRS
    - The frequency resource and hopping, if hopping is used, may not spread over the carrier bandwidth

Decision: The document is noted, modified as follows:

Agreements:
- At least two ways of transmissions are supported for NR UL control channel
    - UL control channel can be transmitted in short duration
        - around the last transmitted UL symbol(s) of a slot
            - FFS: How to define and treat the potential gap at the end of the slot
        - FFS: in the other positions, e.g., the first UL symbol(s) of a slot
        - TDMed and/or FDMed with UL data channel within a slot
    - UL control channel can be transmitted in long duration
        - over multiple UL symbols to improve coverage
        - FDMed with UL data channel within a slot
    - FFS how to multiplex with SRS
    - The frequency resource and hopping, if hopping is used, may not spread over the carrier bandwidth

Petitioners' Exhibit 1007, p. 400
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1610671 Way Forward on NR DL Control ZTE, ZTE Microelectronics, Ericsson, Qualcomm, InterDigital

- For PDCCH with UE/PDCCH-specific DM-RS
  - UE/PDCCH-specific DM-RS should be mapped within the resources for each PDCCH transmission
    - A PDCCH transmission should be able to demodulated by DM-RS within its resource

Decision: The document is noted. Continue discussion.

R1-1610789 Scale numerology for DL control Qualcomm ZTE

- Study the slot structure with scaled numerology for DL control portion, relative to data portion
  - Split a control OFDM symbol to half/quarter symbols
  - FFS: Control channel performance under different numerologies, Overhead saving, Control channel capacity; Quantify timeline saving.

Decision: The document is noted.

R1-1610883 WF on Using Scaled Numerology for Control Transmission Qualcomm, ZTE, Ericsson

- Study impact and benefits of allowing the transmission of DL control information and data transmission to a UE within the same slot interval using different numerologies
- Study impact and benefits of allowing the transmission of uplink control information and data transmission from a UE within the same slot interval using different numerologies
  - The associated DMRS for data transmission still uses the same numerology as the data transmission
  - Eg. Split a control OFDM symbol to half/quarter symbols with 2/4 times SCS
  - FFS: Control channel performance under different numerologies, Overhead saving, Control channel capacity; Quantify timeline saving.

Decision: The document is noted.

Agreements:

- NR should support both data and control with the same numerology
- Study impact and benefits of allowing the transmission of DL control information and data transmission to a UE within the same slot interval using different numerologies in TDM or FDM manner
  - Above may apply both slot and mini-slot
- Study impact and benefits of allowing the transmission of uplink control information and data transmission from a UE within the same slot interval using different numerologies in TDM or FDM manner
  - Above may apply both slot and mini-slot
- Followings applies both DL and UL
  - The associated DM-RS for data/control transmission still uses the same numerology as the data/control transmission
  - FFS: Control channel performance under different numerologies, Overhead saving, Control channel capacity; Quantify timeline saving, UE complexity

---

Thursday session

R1-1610943 Offline outcome of Wednesday evening on 8.1.7.1 NTT DOCOMO

Decision: The document is noted. The following offline consensus are agreed:

Agreements:

- NR should support at least the following.
  - In frequency-domain, a PRB (or a multiple of PRBs) is the resource unit size (may or may not including DM-RS) for control channel
    - This is at least for the case where the DL control region consists of one or a few OFDM symbol(s) of a slot or a mini-slot
    - FFS: whether a PRB or a multiple PRBs is the resource unit size
      - FFS: If multiple PRBs is the resource unit size, the multiple PRBs are contiguous
  - FFS: whether the resource unit size for a DL control channel is called as NR-REG or not

Agreements:

- NR should support at least the following
  - A DL control channel can be mapped on one or more NR-CCEs
    - This is at least for the case where the DL control region consists of one or a few OFDM symbol(s) of a slot or a mini-slot
    - A NR-CCE includes ~~an FFS~~ a positive integer number of PRBs (FFS: exact value)
      - FFS: whether a NR-CCE contains contiguous PRBs
      - FFS: whether multiple NR-CCEs may share one or more PRBs

Petitioners' Exhibit 1007, p. 401
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- FFS: whether NR-CCE is mapped on frequency-domain only or on both frequency and time-domain.

R1-1610784 DL control channel Huawei, HiSilicon, Qualcomm, ZTE, InterDigital, Convida Wireless

- Study one step and two (or multiple) steps control channel designs
  - One step control channel design
    - DL control channel located at the first OFDM symbol(s) in a slot
  - Two (or multiple) steps control channel design
    - A first level DL control channel located at the first OFDM symbol in a slot, which can indicate at least the time and frequency resource for the data channel
    - The second level control channel has two options
      - Opt 1: The second level control channel embedded in the associated downlink data region
        - » FFS if the demodulation RS for the second level control can be shared with the associated data channel
      - Opt 2: The second level control channel located in the later OFDM symbol(s) of the control region (not later than starting of the data region)
    - FFS: Support for first level and second level DL control channel in different slots/mini-slots

Decision: The document is noted. Continue discussion.

R1-1611036 WF on DL control channel design Huawei, HiSilicon (R1-1610784)

Email discussion until 7th November – David (Huawei)

R1-1610676 Way Forward on UCI transmission for NR LG Electronics, Intel

- For NR system, it is supported that UCI feedback is transmitted via UL data channel.
  - The UCI feedback in above at least includes the HARQ-ACK response corresponding to DL data reception
  - FFS on the details (e.g., how to enable this operation, how to map the UCI on UL data channel)

Decision: The document is noted. Continue discussion.

R1-1611005 Way forward on UCI transmission for NR LG Electronics, Intel, Panasonic

Agreements:

- Study at least the following operations to be supported in NR, from a single UE perspective
  - Case 1: UL data and UCI are FDMed where the resource for UCI is not a part of the resource allocated for UL data
  - Case 2: UL data and UCI are TDMed where the resource for UCI is not a part of the resource allocated for UL data
  - Case 3: UL data and UCI are multiplexed where the resource for UCI is a part of the resource allocated for UL data
- FFS: how different types of UCI are handled
- Further study on other possibilities is not precluded

R1-1610677 Way forward on common control channel for NR LG Electronics, Nokia

- Should be discussed as part of initial access at the next meeting.

R1-1609913 On Non-orthogonal Control Channel Design for NR InterDigital Communications

Not treated.

8.1.7.2 Scheduling/HARQ mechanism

Including procedures for scheduling/HARQ operation

R1-1609431 Discussion on short processing delay Huawei, HiSilicon

The document was presented by David Mazzarese from Huawei.

Proposal 1: NR should evaluate the potential performance loss due to applying the processing time reduction methods and identify the use case of these methods.

Decision: The document is noted.

R1-1610180 Number of HARQ processes Qualcomm Incorporated

The document was presented by Jing Jiang from Qualcomm.

- Proposal 1: NR should target to single interlace self-contained HARQ process at least for some UEs and base stations in TDD mode.
- Proposal 2: NR should also target to support one (more than one FFS) multiple HARQ process mode for UE and eNBs in TDD mode.
- Proposal 3: The need of fully dynamic HARQ Ack timeline need to be investigated very carefully and justified by sufficient performance benefit.

Decision: The document is noted.

R1-1609744 HARQ operation for large transport block sizes Nokia, Alcatel-Lucent Shanghai Bell

The document was presented by Sigen Ye from Nokia.

- Observation 1: 5G new radio is expected to support increasingly larger transport block sizes as compared to LTE. This will result in a larger number of code block segments per transport block.

Petitioners' Exhibit 1007, p. 403
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Observation 2: Using a configurable multi-bit feedback, HARQ process can perform more efficiently by skipping the correctly decoded segments of the transport block in the retransmission.
- Observation 3: Depending on the CRC check of the code blocks the most useful information to be reported back to the transmitter may include e.g., index(es) of failed code block(s), index(es) of failed PRB('s), decoder state information, etc.
- Observation 4: The number of available bits for HARQ feedback is expected to increase by increasing carrier bandwidth. Moreover, multi-bit HARQ feedback can potentially use more bits by transport block size increasing, in order to report e.g. indexes of the failed CB's.
- Proposal 1: Requirements and benefits of configurable multi-bit HARQ feedback shall be investigated for 5G new radio.
- Proposal 2: 5G new radio shall enable partly-retransmission of transport blocks through skipping the successfully decoded segments of the transport block. Furthermore, it should allow for multiplexing of initial transmission and/or HARQ retransmission of two –or more— transport blocks.
- Proposal 3: The content of a multi-bit feedback shall be configurable in order to capture the most useful information that can fit the limited available number of feedback bits.
- Proposal 4: The size of a multi-bit HARQ feedback shall be configurable e.g., semi-statically for each UE or dynamically based on transport block size, available control signaling resources, etc.

Decision: The document is noted.

R1-1609543 On HARQ support for URLLC Intel Corporation

The document was presented by … from Intel.

- The HARQ support is considered for URLLC services.
- Further study impact from different error sources on URLLC UEs with enabled HARQ operation.

Decision: The document is noted.

Wednesday session

R1-1610631 Way forward on NR HARQ Intel, Nokia, ASB, AT&T, OPPO, MediaTek

- Timing relationship between DL data reception and corresponding acknowledgement can be dynamically indicated in the DCI
  - FFS: minimum interval
- Timing relationship between UL assignment and corresponding UL data transmission can be dynamically indicated in the DCI
  - FFS: minimum interval
- Timing relationship between DL data reception and corresponding acknowledgement can be semi-statically indicated to a UE via higher layer signaling.
  - FFS: minimum interval
- Timing relationship between UL assignment and corresponding UL data transmission can be semi-statically indicated to a UE via higher layer signaling.
  - FFS: minimum interval
- Support at least multiple DL HARQ processes to support consecutive DL transmissions for eMBB.
- Support at least multiple UL HARQ processes to support consecutive UL transmissions for eMBB.

Decision: The document is noted.

Agreements:

- NR supports operation of more than one DL HARQ processes for a given UE
- NR supports operation of more than one UL HARQ processes for a given UE
- FFS: URLLC case

Agreements:

- NR supports operation of one DL HARQ process for some UEs
- NR supports operation of one UL HARQ process for some UEs
- FFS: Conditions on supporting above 2 bullets
- Note: This does not mean the gNB has to schedule back-to-back
- Note: This does not mean the UE has to support K1=0 and/or K2 = 0

Thursday

Agreements:

- Timing relationship between DL data reception and corresponding acknowledgement can be (one or more of, FFS which ones)
  - dynamically indicated by L1 signaling (e.g., DCI)
  - semi-statically indicated to a UE via higher layer
  - a combination of indication by higher layers and dynamic L1 signaling (e.g., DCI)
- FFS: minimum interval between DL data reception and corresponding acknowledgement

Petitioners' Exhibit 1007, p. 404
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- FFS: common channels (e.g. random access)

Agreements:
- Timing relationship between UL assignment and corresponding UL data transmission can be (one or more of, FFS which ones)
  - dynamically indicated by L1 signaling (e.g., DCI)
  - semi-statically indicated to a UE via higher layer
  - a combination of indication by higher layers and dynamic L1 signaling (e.g., DCI)
- FFS: minimum interval between UL assignment and corresponding UL data transmission
- FFS: common channels (e.g. random access)

R1-1610760 Clarification on timing relationship in NR HARQ Qualcomm

R1-1610547 Way Forward on timing relationship for NR MediaTek, III, Samsung, NTT Docomo, Nokia, ASB, Qualcomm, Ericsson, Huawei, HiSilicon, Sony
- For per-slot scheduling, NR specification should support the following
  - DL data reception in slot N and corresponding acknowledgment in slot N+K1
    - All UEs should support K1≥1 with exact values for K1 FFS
    - Some UEs may support K1=0 (FFS conditions)
  - UL assignment in slot N and corresponding uplink data transmission in slot N+K2
    - All UEs should support K2≥1 with exact values for K2 FFS
    - Some UEs may support K2=0 (FFS conditions)

Decision: The document is noted and modified as follows:

Agreements:
- For slot-based scheduling, NR specification should support the following
  - DL data reception in slot N and corresponding acknowledgment in slot N+K1
    - All UEs should support K1≥1 with exact values for K1 FFS
    - Some UEs may support K1=0 (FFS conditions)
  - UL assignment in slot N and corresponding uplink data transmission in slot N+K2
    - All UEs should support K2≥1 with exact values for K2 FFS
    - Some UEs may support K2=0 (FFS conditions)

R1-1610752 Way forward on NR DCI monitoring Intel, CATT, Ericsson, Panasonic, ETRI
- DCI monitoring occasions can be configured by higher layers

Decision: The document is noted, modified and agreed as follows:

Agreement: UE-specific DL control information monitoring occasions at least in time domain can be configured

R1-1610750 WF on HARQ feedback for eMBB MediaTek

Concern under what AI this should be discussed – some would like to see it under channel coding AI

Agreements:
- At least asynchronous and adaptive HARQ is supported for eMBB.
- NR supports at least UL transmission of at least single HARQ-ACK bit.
- Consider whether/how to support more than one HARQ-ACK bits per TB.
- Consider whether/how to support single HARQ-ACK bit per multiple TBs, e.g., HARQ-ACK bundling.

Not treated.

R1-1610880 Chairman's notes of AI 8.1.8 Ad-Hoc chair (Qualcomm)

The document was presented by Wanshi Chen from Qualcomm.
Decision: The document is endorsed and content incorporated below.

R1-1608857 Remaining issues on panel modeling Huawei, HiSilicon

Agreements:

- Phase offset of non-calibrated panel (either TRP or UE side) is modeled as a uniform distributed random variable between (-π, π).
- Adopt the accumulated phase offset of non-calibrated panel pair in channel coefficients equation (7.21) and (7.26) in TR 38.900.

R1-1608965 Initial Link Level Simulation Results for URLLC ZTE
R1-1609140 Remaining evaluation assumption for dense urban macro with 30GHz frequency Samsung

Agreements:

- When deploying macro TRP at above 6GHz in dense urban scenario,
  - 40dBm PA scaled down with simulation BW when system BW is higher than simulation BW.

R1-1609312 Remaining evaluation details of High Speed Train Scenario CMCC

Agreements:

- For High speed train scenario
  - The baseline BS antenna configuration at 4GHz in high speed train scenario is (M,N,P,Mg,Ng) =(8,8,2,1,1), where the radiation pattern of antenna elements follows TR 36.873 according to the current agreements. Other antenna configurations are not precluded.
  - For geometry evaluation, the users are uniformly distributed along the railway track. Companies provide geometry results to determine the azimuth beam direction using the beam formed by two elements with

Petitioners' Exhibit 1007, p. 406
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

weighting values [1, 1] assuming no power loss and elevation downtilt angle using the DFT beam formed by all vertical elements for cell association.
  - Adopt the penetration loss model in Table 1 of R1-1609312 for high speed train scenario.

R1-1609545 Remaining details of URLLC system level evaluation assumptions Intel Corporation
R1-1610720 WF on URLLC System Level Evaluation Methodology Intel, Qualcomm, ZTE, ZTE Microelectronics

Agreements:
- Slide 3 and slide 4 in R1-1610720 are agreed with the following updates:
  - Option 1 for UE distribution on slide 4 is for DL only, optional, and 1 eMBB UE in the other 56 sectors is of the same traffic model as the eMBB UEs in the center sector
  - ~~o~~ Unidirectional and bidirectional (DL or UL) ~~is evaluated as baseline. Bidirectional DL and UL traffic is evaluated as a second priority.~~
  - URLLC: Both FTP Model 3 (with Poisson arrival) and periodic packet arrivals with packet size 32, 50, 200 bytes.
  - URLLC: P~~oisson p~~acket arrival ~~with arrival rate λ~~ to achieve URLLC capacity
  - For "Simulation bandwidth"
    - Add "other bandwidths are not precluded"
  - For eMBB UE of FTP model 3, add that the packet size is 0.1Mbytes and 0.5Mbytes
  - Companies are encouraged to report the power control parameters (e.g., open-loop, etc.) for UL URLLC evaluations

R1-1609546 On eMBB and URLLC multiplexing Intel Corporation
R1-1610436 Path loss model for evaluation of mMTC Ericsson (Revision of R1-1609775)
R1-1610183 Updated mMTC battery life evaluation assumptions Qualcomm Incorporated

R1-1610681 WF on coexistence between NR and LTE LG Electronics, AT&T
R1-1610800 WF on coexistence between NR and LTE LG Electronics, AT&T, Ericsson

Agreements:
- To support the efficient coexistence between NR and LTE operating in the same licensed frequency band,
  - At least legacy LTE features should be considered in the NR study, e.g.:
    - MBSFN configuration (for LTE Rel-8 and beyond)
    - TDD UL subframe (for LTE Rel-8 and beyond)
    - SCell activation/deactivation (for LTE Rel-10 and beyond)
    - TDD UL subframe configured by eIMTA feature (for LTE Rel-12 and beyond)
  - NR should study the following candidate mechanisms for coexistence:
    - Resource indication (e.g., blank resources, available resources, etc.) of time/frequency resources
    - Reconfiguring channel bandwidth/carriers monitored by UEs
    - Any other mechanisms are not precluded.
  - For non co-located LTE/NR case, backhaul signaling between LTE and NR can be studied to mitigate inter-cell interference.
    - FFS on which information can be conveyed on the backhaul signaling
    - Over-the-air listening at the gNB can also be considered
  - Note: Dynamic switch between NR and LTE can be studied from the perspective of network for co-located LTE/NR case.

R1-1610951 Way Forward on LLS evaluation assumption for control channel evaluation in URLLC Huawei, HiSilicon
The evaluation assumptions for control channel in URLLC are to be discussed under control channel design for URLLC

Decision: CR0007 to 36.873 (Rel-12) is postponed to next meeting.
R1-1610703 TR36.814_CR_Section_B.1.2.2.1 Fraunhofer HHI
Decision: CR0002 to 36.814 (Rel-9) is postponed to next meeting.
R1-1610704 TR36.814_CR_LOS_Probability Fraunhofer HHI
Decision: CR0003 to 36.814 (Rel-9) is postponed to next meeting.

9 Closing of the meeting

Mr Chair thanked all for the hard work during the week. Special thanks to Channel coding for NR team who finished Wednesday/Thursday sessions very late (01:30AM).
Thanks also to the European Friends of 3GPP for hosting and organizing meeting room facilities for such big meeting.
Mr Chair thanked Vice chairs and all the rapporteurs who help managing the number of parallel sessions during the course of the week.
Question was raised by Cohere Technologies regarding how Phase 2 for NR will be taken into account.
Mr Chair emphasized that the details remain a RAN plenary decision, and if clarification is needed, this should be discussed by December 2016.
Agenda to next upcoming meetings shall slightly changed compare to the one of RAN1#86bis.
Huawei commented that reviewing the NR TR content during the meeting was made very difficult due to the work load all week long – better to update between meetings – NTT DOCOMO responded that the draft TR was distributed and available one week prior to RAN1#86bis.
Meeting was closed at 17:07.
See you all in Reno.

Petitioners' Exhibit 1007, p. 409

IPR2024-01121

Annex F: List of actions

- **Outgoing LS.**

None

- **CR approval**

[86b-04] Zhisong (ZTE)
R1-1609552 **Introduction of RACHless handover for Further mobility enhancement in LTE** **ZTE Corporation**
CR0748 to 36.213 (Rel-14) is for email approval until October 20th
Done: According to Mr Chair's decision posted on October 21st, CR0748 to 36.213 (Rel-14) is agreed.

[86b-03] Seonwook (LGE)
R1-1610852 **Correction on PDCCH candidate configuration** **LG Electronics** **36.213 (Rel-13)**
R1-1610853 **Correction on PDCCH candidate configuration** **LG Electronics** **36.213 (Rel-14)**
Email approval for R1-1610852 and R1-1610853 till 21st Oct.
Done: According to Mr Chair's decision posted on October 26th (resp. November 1st), CRs to 36.213 are agreed as follows:
R1-1611072 **Correction on PDCCH candidate configuration** **LG Electronics** **Rel-14** **LTE_eLAA-Core** **CR0784 F**
R1-1611074 **Correction on PDCCH candidate configuration** **Nokia, Alcatel-Lucent Shanghai Bell** **Rel-13** **LTE_CA_enh_b5c-Core** **CR0753 F**

[86b-05] Editors
MUST CRs
Editors (36.201, 211, 212, 213, 214) will provide draft CRs including agreements and WA until 10th Nov. (Thu)
Rapporteur will provide agreements list until 17th Oct.
All proponents are recommended to check the CRs until the next meeting
Done: List of agreements provided by rapporteur as
R1-1611070 **Summary of RAN1 Agreements for Rel-14 DL MUST** **MediaTek**

[86b-06] Editors
Further indoor positioning enh. CRs
Editors (36.201, 211, 212, 213, 214) will provide draft CRs including agreements and WA until 10th Nov. (Thu)
Rapporteur will provide agreements list until 17th Oct.
All proponents are recommended to check the CRs until the next meeting
Done: List of agreements provided by rapporteur as
R1-1611069 **Summary of RAN1 agreements for Rel-14 Further Indoor Positioning** **Huawei, HiSilicon, NextNav**

[86b-07] Editors

Petitioners' Exhibit 1007, p. 422
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

SRS carrier based switching CRs
Editors (36.201, 211, 212, 213, 214) will provide draft CRs including agreements and WA until 10th Nov. (Thu)
Rapporteur will provide agreements list until 17th Oct.
All proponents are recommended to check the CRs until the next meeting
Done: List of agreements provided by rapporteur as
R1-1611067 List of agreements for "SRS Carrier-Based Switching" Huawei

[86b-08] Editors
High speed CRs
Editors (36.201, 211, 212, 213, 214) will provide draft CRs including agreements and WA until 10th Nov. (Thu)
Rapporteur will provide agreements list until 17th Oct.
All proponents are recommended to check the CRs until the next meeting
Done: List of agreements provided by rapporteur as
R1-1611068 Summary of RAN1 agreements for Rel-14 work item on 'Performance enhancements for high speed scenario' Huawei, HiSilicon, NTT DOCOMO

- **Text proposal for TS and TR**

None

- **Miscellaneous**

[86b-01] Peter (Qualcomm)
R1-1610413 Introduction of new Transport Block Size for DL 256QAM Qualcomm
Email approval until Oct. 27th.
Done: As a conclusion of this email thread, Mr Chair asked for a discussion summary being submitted at next RAN1#87 meeting.

[86b-02] Peter (Qualcomm)
R1-1610094 Clarification on a few PUCCH format 4 and 5 related issues in eCA Qualcomm Incorporated
The 1st and 3rd issues are for email discuss till Oct. 21st
Done: As a conclusion of this email thread, Mr Chair asked for a discussion summary being submitted at next RAN1#87 meeting.

[86b-09] Hoondong (Samsung)
Quantized Advanced CSI Feedback Structure for eFD-MIMO for email discussion considering the two proposals and any possible refinement/updates/merging (including R1-1611018), until 27th October
Done: According to Mr Chair's email posted on October 28th, the following is agreed:
- **For advanced CSI feedback, at least one of the following types of beam group is supported**
  - **Type 1: Class A based W1 (non-orthogonal)**
  - **Type 2: Unrestricted orthogonal W1**

Petitioners' Exhibit 1007, p. 423
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - **Type 3: Orthogonal beams with restricted beam pattern**
- **For advanced CSI feedback, RAN1 will specify only rank-1 and rank-2 codebooks**
  - **FFS, rank 3-4**
  - **Note: For rank 5-8, Rel.13 codebooks, as well as the extension and/or enhancement to more than 16 ports, can be reused**

[86b-10] Jonghyun (LGE)
QCL issue for aperiodic CSI-RS for eFD-MIMO for email discussion until Oct. 20th
Done: According to Mr Chair's email posted on October 28th, the following is agreed:

- **For QCL indication on DMRS to aperiodic NZP CSIRS, until RAN1#87 decide first in TM10 whether aperiodic NZP CSIRS can be configured with UEs configured with QCL Type B. Note aperiodic NZP CSIRS can be configured with UEs configured with QCL Type A. For UEs configured with QCL Type B (if supported), down-select between**
  - **Alt.1: UE is not expected that aperiodic NZP CSIRS is indicated in PQI for QCL purpose with DMRS**
  - **Alt.2: Aperiodic NZP CSIRS can be indicated in PQI for QCL purpose, and follow legacy QCL assumption. Note: Periodic NZP CSI-RS can also be indicated for QCL purpose.**
- **For QCL indication on DMRS to 'multi-shot' NZP CSIRS, until RAN1#87 decide first in TM10 whether NZP CSI-RS activation/deactivation can be configured with UEs configured with QCL Type B. Note NZP CSI-RS activation/deactivation can be configured with UEs configured with QCL Type A. For UEs configured with QCL Type B (if supported), down-select between**
  - **Alt.1: UEs configured with NZP CSI-RS activation/deactivation do not expect that NZP CSIRS that is activated/deactivated is indicated in PQI for QCL purpose with DMRS**
  - **Alt.2: NZP CSIRS configured for activation/deactivation can be indicated in PQI for QCL purpose, and follow legacy QCL assumption. Note: NZP CSI-RS not configured for activation/deactivation can also be indicated for QCL purpose.**

[86b-11] Jonghyun (LGE)
Remaining details on PDSCH rate matching for eFD-MIMO for email discussion until Oct. 20th
Done: Summary document describing the following three rate matching alternatives identified for down-selection or merging until next meeting shall be submitted as input to RAN1#87:

Alt.1: Common-DCI based
Alt.3: 2-bit UE-specific DCI based
Alt.3': 2-bit UE-specific DCI based with MAC CE activation

[86b-12] Siva (Ericsson)
Aperiodic CSI-RS selection for eFD-MIMO for email discussion until Oct. 27th
Done: The following alternatives for Aperiodic CSI-RS resource selection are to be further discussed for down-selection until RAN1#87:

Alternative 1: Reuse A-CSI request field and add more bit(s) if necessary
Alternative 2: Reuse CS field
Alternative 3a: Introduce a new DCI field with ceil(log2(N)) additional bits

Petitioners' Exhibit 1007, p. 424
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Alternative 3b: Introduce a new DCI field with 2 additional bits
Summary document shall be submitted to next meeting.

[86b-13] Yuichi (DOCOMO)
Hybrid CSI Mechanism for eFD-MIMO for email discussion until Oct. 20th
Done: No conclusion according to Chair's email on Oct 25th – Continue discussion @RAN1#87.

[86b-14] Youngwoo (Samsung)
PUSCH CSI reporting for hybrid CSIRS mechanism 1 for eFD-MIMO for email discussion until Oct. 27th
Done: Following Chair's email posted on October 28th, the conclusion is:
Two alternatives to be down-selected in RAN1#87:

- **Alt1.: Proposal in R1-1610731**
  - **For aperiodic CSI reporting for hybrid CSI-RS mechanism 1**
    - **Either one of CSI for 1st eMIMO-Type (i.e., 1st CSI) and CSI for 2nd eMIMO-Type (i.e., 2nd CSI) is triggered for aperiodic CSI reporting**
  - **CSI request field in UL grant DCI is used to indicate either one of the two. FFS on number of bits**
    - **For 1st eMIMO-Type, encoding mechanism/mapping on PUSCH is FFS.**
    - **For 2nd eMIMO-Type, legacy CSI encoding/mapping on PUSCH is reused.**
    - **FFS: support of eCA**
- **Alt2.: Report both eMIMO-Types, but the UE is only required to update one of the two eMIMO-Types**
  - **Example a: A method analogous to Rel.13 CSI relaxation**
  - **Example b: cf. R1-1609853 section 2.2.2. For this solution, the reference resource definition for the 1st eMIMO-Type needs to be changed.**
  - **[R1-1609853] "When periodic CSI is not configured for the first eMIMO-Type, its reference resource is in the subframe containing its most recent CSI-RS resource**
  - **Otherwise, the reference resource for the first eMIMO-Type is that set by periodic CSI"**
  - **Note: This alternative does not preclude UE's CSI updates on both eMIMO-Types**

[86b-15] Hao (ZTE)
eMIMO-Types for eFD-MIMO for email discussion until 27th Oct.
Done: Following Chair's email posted on October 28th, the following is agreed:
Agreement for mechanism 1:

- **A UE can be simultaneously configured with both A-CSI and P-CSI**
- **For both A-CSI and P-CSI reporting, UE calculates CSI for only one eMIMO-Type of a pair at a time**
- **Support A-CSI (PUSCH-based) reporting for both 1st and 2nd eMIMO-Typesbased on the following joint configuration approach**
  - **Only the A-CSI reporting mode of the 2nd eMIMO-Type is configured, whereas the reporting content of the 1st eMIMO-Type (i1 and RI) is fixed**
    - **A-CSI configuration does not apply to the content of the 1st eMIMO-Type**
  - **Details about triggering to be decided in RAN1#87 (discussed in Youngwoo's [86b-14])**

Petitioners' Exhibit 1007, p. 425
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- **In RAN1#87, decide the need for supporting (and, if supported, the details of) at least one of the following combinations where CSI reporting modes for 1st and 2nd eMIMO-Types are independently configured.**
  - **'P' and 'A' refers to periodic and aperiodic CSI reporting for an eMIMO-Type**

Combination	1	2	3
1st eMIMO-Type	P	A	P and/or A
2nd eMIMO-Type	A	P	P and/or A

- **If combination 1 is supported, down-select from the following options**
  - **Opt-1: Use legacy CSI reporting configuration for the 1st eMIMO-Type**
  - **Opt-2: Both the A-CSI and P-CSI parameters are configured for the 2nd eMIMO-Type, and UE only reports A-CSI.**

[86b-16] Olof (Ericsson)
TBS/N_SF and TBS/N_RU tables for eNB-IoT for email discussion until 21st October
Done: New TBS tables for NB-IoT are agreed, according to Mr Chair's email decision posted on October 22nd. The tables are in:
R1-1611073 New Transport Block Size (TBS) tables for Rel-14 NB-IoT Ericsson

[86b-17] Wang Yi (Huawei)
LLS and SLS simulation results for NR MA
Email approval until 21st Oct.
Done: All results provided in this thread shall be sumarized and presented to RAN1#87 meeting.

[86b-18] Joseph (Qualcomm)
R1-1611059 Way Forward on Data Sharing Qualcomm
Email discussion until October 20th
Done: According to Mr Chair's email (October 29th), it is agreed that no central location is needed for sharing simulation results on channel coding. Based on data provided by intrested companies, moderator (InterDigital) should submit all data by Nov. 13th together with the summary in the same tdoc, with the rule of attaching an excel sheet in the same contribution. The summary shall only contain the collected data from all relevant contributions.
It was also suggested that companies should use CRC overhead (equivalent FAR as LTE. Turbo uses 24 CRC bits) and provide a fair comparison between all codes when false alarm rates are the same for all codes. This is critical at short block region.

[86b-19] Ruyue (ZTE)
NR MIMO calibration for email discussion until Oct. 28th
Done: As a conclusion of this email thread, Mr Chair asked for a discussion summary being submitted at next RAN1#87 meeting.

[86b-20] David (Huawei)
Synchronization and carrier rasters for NR for email discussion until Nov. 7th
Done: Status to be checked in RAN1#87.

Petitioners' Exhibit 1007, p. 426
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

[86b-21] Stefan (Ericsson)
DL L1/L2 cont. channel design for NR for email discussion until Nov. 7th
Done: Status to be checked in RAN1#87.

[86b-22] Stefan (Ericsson)
UL L1/L2 cont. channel design for NR for email discussion until Nov. 7th
Done: Status to be checked in RAN1#87.

[86b-23] David (Huawei)
R1-1611036 **WF on DL control channel design** **Huawei, HiSilicon**
Email discussion until Nov. 7th
Done: Status to be checked in RAN1#87.

[86b-24] Kazuaki (DOCOMO)
Channel model for NR
Email discussion/approval until 21th Oct..
Done: No conclusion according to Chair's email on Nov 1st – Continue discussion @RAN1#87.

Petitioners' Exhibit 1007, p. 427
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1608561	Draft Agenda of RAN1#86bis meeting	RAN1 Chair	Patrick Merias	52292	agenda		Approval
R1-1608562	Final Report of 3GPP TSG RAN1 #86 v1.0.0	ETSI	Patrick Merias	52292	report		Approval
R1-1608563	Selected highlights from RAN#73 of relevance to RAN1	RAN1 Chair	Patrick Merias	52292	other		Information
R1-1608564	LS Response on QoS requirements for V2X	RAN2, Intel	Patrick Merias	52292	LS in		
R1-1608565	LS on Support of CAT 9/10 and CAT 13	RAN2, Intel	Patrick Merias	52292	LS in		
R1-1608566	LS on Exceptional Pool Handling for V2X	RAN2, OPPO	Patrick Merias	52292	LS in		
R1-1608567	LS on Timing reference for LAA SCell	RAN2, LGE	Patrick Merias	52292	LS in		
R1-1608568	LS on further mobility enhancements	RAN2, ZTE	Patrick Merias	52292	LS in		
R1-1608569	LS on RAN2 agreements on FeMBMS	RAN2, Qualcomm	Patrick Merias	52292	LS in		
R1-1608570	Reply LS on ECID positioning for TDD	RAN2, CATT	Patrick Merias	52292	LS in		
R1-1608571	LS on introduction of new UL categories in Rel-13	RAN2, Qualcomm	Patrick Merias	52292	LS in		
R1-1608572	LS on CSI measurement ambiguity in LAA	RAN4, LGE	Patrick Merias	52292	LS in		
R1-1608573	Response LS on Modelling and simulation of IMT networks for use in sharing and compatibility studies	RAN4, Ericsson	Patrick Merias	52292	LS in		
R1-1608574	LS on Characteristics of terrestrial IMT systems for frequency sharing/interference analysis in the frequency range between 24.25 GHz and 86 GHz	RAN4, Nokia	Patrick Merias	52292	LS in		
R1-1608575	Reply LS on blind detection evaluations	RAN4, MediaTek	Patrick Merias	52292	LS in		
R1-1608576	Reply LS on the feasibility of mobility enhancement solutions	RAN4, Ericsson, ZTE	Patrick Merias	52292	LS in		
R1-1608577	Reply LS on SRS carrier switching interruption time	RAN4, Huawei	Patrick Merias	52292	LS in		
R1-1608578	LS on Measurement gap enhancement	RAN4, Ericsson, Intel	Patrick Merias	52292	LS in		
R1-1608579	LS for definition of SSTD measurement	RAN4, CATT	Patrick Merias	52292	LS in		

R1-1608580	LS on on UCG parameters for eMTC	RAN4, Intel	Patrick Merias	52292	LS in		
R1-1608581	LS on LTE Rel-13 UE feature list	RAN4, Qualcomm, Intel	Patrick Merias	52292	LS in		
R1-1608582	Reply LS on QoS requirements for V2X	SA2, LGE	Patrick Merias	52292	LS in		
R1-1608583	Reply LS on NR requirements	RAN, ZTE	Patrick Merias	52292	LS in		
R1-1608584	Complementary turbo and LDPC codes for NR, motivated by a survey of over 100 ASICs	AccelerComm Ltd	Rob Maunder	67229	discussion		Discussion
R1-1608585	Details on SRS switching-from CC and switching-to CC	Huawei, HiSilicon	Brian Classon	45750	other		

R1-1608586	Other considerations on SRS switching	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608587	Power headroom report for SRS switching	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608588	DCI design for SRS switching	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608589	Details on collision handling for SRS switching	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608590	Details on SRS switching for UEs with multiple antennas	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608591	Resource allocation in partial coverage	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608592	Congestion control for V2V	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608593	Coexistence of cellular and V2V services	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608594	Coexistence of 802.11p and V2V services	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608595	SPS enhancement for V2V mode 1	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608596	SPS enhancement for V2X on Uu interface	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608597	Overview of advanced CSI feedback for LTE	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608598	Interference measurement enhancement in LTE Rel-14	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608599	Uplink channel design for quantized/un-quantized channel representation	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608600	Discussion on non-precoded CSI-RS up to 32 CSI-RS ports	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608601	Enhancement on rate matching for different transmission modes	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608602	On IFDMA based DMRS design	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608603	Downlink control signaling design to support IFDMA based DMRS	Huawei, HiSilicon	Brian Classon	45750	other		

R1-1608604	Discussion on power ratios for MUST Case 1&2	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608605	DCI design for MUST Case 1&2	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608606	Discussion on VoLTE coverage enhancement	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608607	Further Discussion on Scheduling and HARQ Timing for PUSCH on UpPTS	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608608	Transmission of PUSCH on UpPTS	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608609	TP for 36.741 on definition and classification of non-coherent JT	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608610	Potential enhancements and specification impact analysis of non-coherent JT	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608611	Potential enhancements and specification impacts for CS/CB with FD-MIMO	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608612	Discussion on configuration of SC-MTCH in NB-IoT	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608613	Discussion on SC-MTCH transmission in NB-IoT	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608614	Discussion on NPDCCH search space for multicast in NB-IoT	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608615	Discussion on collision handling for multicast in NB-IoT	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608616	Discussion on acknowledgement of SC-MTCH transmission in NB-IoT	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608617	On reusing existing downlink signals for NB-IoT downlink positioning	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608618	Design of new downlink positioning reference signal for NB-IoT	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608619	Configuration of downlink positioning reference signal for NB-IoT	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608620	Evaluation of downlink positioning accuracy for NB-IoT	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608621	Analysis of power consumption and complexity for NB-IoT downlink positioning	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608622	On enabling and disabling of wider bandwidth in FeMTC	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608623	Considerations on the control channel of supporting wider bandwidth in FeMTC	Huawei, HiSilicon	Brian Classon	45750	other		

R1-1608624	DCI design on supporting wider bandwidth in FeMTC	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608625	On supporting larger channel bandwidth for Rel-14 non-BL UEs in CE mode A	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608626	On supporting larger TBS for UEs with maximum 1.4 MHz bandwidth in TDD/HD-FDD	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608627	On supporting larger TBS for UEs with larger bandwidth	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608628	Consideration on SC-PTM transmission for FeMTC	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608629	Analysis on increasing DL HARQ processes in CE mode A for FD-FDD	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608630	HARQ-ACK bundling in HD-FDD	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608631	Discussion on sTTI structure	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608632	Discussion on CRS based sPDCCH	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608633	Discussion on DMRS-based sPDCCH	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608634	Details of two-level DCI schemes for short TTI	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608635	Discussion on DCI design for short TTI	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608636	Discussion on sPDSCH design	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608637	Discussion on sPUCCH design	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608638	Discussion on sPUSCH design	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608639	UCI on sPUSCH	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608640	Handling collision between sTTI and 1ms TTI	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608641	Discussion on UL RS for short TTI	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608642	Discussion on CSI feedback for short TTI	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608643	Processing time reduction and related procedures for short TTI	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608644	Design on shortened processing time for 1ms TTI	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608645	Performance evaluation of short TTI vs. 1ms TTI with processing time reduction	Huawei, HiSilicon	Brian Classon	45750	other		

R1-1608646	TDD-specific design for short TTI	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608647	On reusing existing uplink signals for NB-IoT uplink positioning	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608648	On 2 HARQ processes for enhancement of NB-IoT	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608649	Discussion on the P-UE resource selection	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608650	DCI design for sidelink SPS scheduling	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608651	Discussion on sync priority and SLSS ID set definition	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608652	Discussion on PSBCH contents and SLSS transmission procedure	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608653	Discussion on CA issues for shortened TTI operation	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608654	Processing time reduction and related HARQ timings with 1ms TTI for FS2	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608655	SRS enhancement to supporting higher data rates	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608656	Discussion on sPUCCH resource for shortened TTI	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608657	Sidelink synchronization enhancement for V2X communication	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608658	Discussion on the necessity of differentiating P-UE and V-UE	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608659	Discussion on UL CWS adjustment for eLAA	Huawei, HiSilicon	Brian Classon	45750	other		
R1-1608660	Unified MIMO framework for NR above and below 6GHz	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608661	Summary of [86-20] email discussion on MIMO calibration for NR	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608662	Phase 1 calibration results for NR MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608663	Calibration and evaluation assumptions for NR MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608664	High level views on beam management for NR MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608665	Beam grouping for beam management	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		

R1-1608666	Discussion on beamforming procedure considering high frequency channel characteristics	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608667	Discussion on methods of determining Tx and Rx beams for NR MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608668	Discussion on interference issues in NR	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608669	Discussion on UL MIMO transmission for NR	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608670	Discussion on DL MIMO transmission for NR	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608671	Beam selection and CSI acquisition for NR MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608672	Advanced CSI measurement and reporting framework for NR MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608673	Discussion on demodulation reference signal for NR MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608674	Discussion on measurement related reference signal for NR-MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608675	On Quasi-Co-Location/Beam for NR MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608676	Discussion on Control Channel Design for NR	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608677	Discussion on Common Control Channel for NR	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608678	MUST system performances with different power ratio choices	ZTE	Yifei Yuan	58525	discussion		
R1-1608679	Specification for Gray mapped composite constellation for MUST	ZTE	Yifei Yuan	58525	discussion		
R1-1608680	Signaling design for MUST	ZTE	Yifei Yuan	58525	discussion		
R1-1608681	Discussion and evaluation for MUST Case 3	ZTE	Yifei Yuan	58525	discussion		
R1-1608682	Discussion on design of linear combination codebook	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608683	Discussion on interference measurement for MU-CSI	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608684	Feedback mechanism for linear combination based CSI	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608685	Port layout and Class A codebook design for 20-32 ports	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608686	Enhancements for DMRS-based Semi-Open-Loop Transmission	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		

R1-1608687	Discussion on UL DMRS enhancement for eFD-MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608688	Further discussion on non-precoded CSI-RS design for eFD-MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608689	Aperiodic CSI-RS for non-precoded CSI-RS	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608690	Remaining issues on aperiodic CSI-RS	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608691	Remaining issues on Hybrid CSI	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608692	Potential Enhancement on the Non-coherent JT	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608693	Aperiodic CSI for NR MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608694	Initial evaluation results of non-coherent JT	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608695	Initial evaluation results for CS/CB	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608696	Potential enhancements for CS/CB with FD-MIMO	ZTE, ZTE Microelectronics	Ruyue Yu-Ngok Li	43128	other		
R1-1608697	OTDOA design for NB-IoT	Ericsson	Yutao Sui	61418	discussion		Decision
R1-1608698	OTDOA performance for NB-IoT	Ericsson	Yutao Sui	61418	discussion		Decision
R1-1608699	A new system simulator for NB-IoT positioning	Ericsson	Yutao Sui	61418	discussion		Decision
R1-1608700	On modelling of NPRACH based UTDOA performance	Ericsson	Yutao Sui	61418	discussion		Decision
R1-1608701	On NPRACH based UTDOA impact on NB-IOT performance	Ericsson	Yutao Sui	61418	discussion		Decision
R1-1608702	On NPRACH based UTDOA capacity	Ericsson	Yutao Sui	61418	discussion		Decision
R1-1608703	L1 configuration for multicast support for NB-IoT	Ericsson	Yutao Sui	61418	discussion		Decision

R1-1608704	NB-IoT Paging on non-anchor PRBs	Ericsson	Yutao Sui	61418	discussion		Decision
R1-1608705	NB-IoT Paging Capacity	Ericsson	Yutao Sui	61418	discussion		Decision
R1-1608706	CR on 36.211 NB-IoT PDSCH symbol mapping	Ericsson	Yutao Sui	61418	CR		Decision
R1-1608707	CR on 36.213 NB-IoT Type1 and Type 2 search space definition	Ericsson	Yutao Sui	61418	CR		Decision
R1-1608708	Optimized PAPR/CM SC-CPS Waveform and Further Results	Idaho National Laboratory	Ramon Khalona	19055	other		Discussion
R1-1608709	Optimized PAPR/CM SC-CPS Waveform and Further Results	Idaho National Laboratory	Ramon Khalona	19055	other		Discussion
R1-1608710	Frame Structure for Ultra-Low Latency Scheduled-based UL Access	Idaho National Laboratory	Ramon Khalona	19055	other		Discussion
R1-1608711	Common signal/information allocation for initial access and mobility	Mitsubishi Electric Corp	Noriyuki Fukui	23665	discussion		
R1-1608712	RACH preamble transmission	Mitsubishi Electric Corp	Noriyuki Fukui	23665	discussion		
R1-1608713	Correction to DMRS for MPDCCH associated with P-RNTI	Virtuosys Limited	Mark Cannon	64651	draftCR		Discussion
R1-1608714	PSSCH/PSBCH decoding issue	CATT	Yanping Xing	57090	discussion		Decision
R1-1608715	Discussion on randomization on DMRS	CATT	Yanping Xing	57090	discussion		Decision
R1-1608716	Discussion on details of resource reselection	CATT	Yanping Xing	57090	discussion		Decision
R1-1608717	Correction on SSTD definition	CATT	Yanping Xing	57090	CR		Decision
R1-1608718	DCI design to support multiple SPS configurations	CATT	Yanping Xing	57090	discussion		Decision
R1-1608719	Discussion on P-UE resource selection	CATT	Yanping Xing	57090	discussion		Decision
R1-1608720	Measurement metric for the congestion level in V2X	CATT	Yanping Xing	57090	discussion		Decision
R1-1608721	Synchronization enhancements in PC5-based V2V	CATT	Yanping Xing	57090	discussion		Decision
R1-1608722	Multiplexing V2V with other signals/channels	CATT	Yanping Xing	57090	discussion		Decision
R1-1608723	On Prioritization of SL TX for V2X under eNB management	CATT	Yanping Xing	57090	discussion		Decision

R1-1608724	Considerations on advanced CSI reporting	CATT	Yanping Xing	57090	discussion		Decision
R1-1608725	Aperiodic CSI-IM for interference measurement enhancement	CATT	Yanping Xing	57090	discussion		Decision
R1-1608726	Codebook design for advanced CSI reporting	CATT	Yanping Xing	57090	discussion		Decision
R1-1608727	Non-precoded CSI-RS codebook for 20-32 ports	CATT	Yanping Xing	57090	discussion		Decision
R1-1608728	CSI feedback and PDSCH transmission for open-loop MIMO	CATT	Yanping Xing	57090	discussion		Decision
R1-1608729	Consideration on UL DMRS enhancements	CATT	Yanping Xing	57090	discussion		Decision
R1-1608730	Enhanced non-precoded CSI-RS with CDM-8	CATT	Yanping Xing	57090	discussion		Decision
R1-1608731	Enhanced non-precoded CSI-RS with CDM-2/4	CATT	Yanping Xing	57090	discussion		Decision
R1-1608732	Density reduction for class A CSI-RS with 20-32 ports	CATT	Yanping Xing	57090	discussion		Decision
R1-1608733	Remaining issues on aperiodic CSI-RS	CATT	Yanping Xing	57090	discussion		Decision
R1-1608734	PDSCH rate-matching for aperiodic CSI-RS	CATT	Yanping Xing	57090	discussion		Decision
R1-1608735	Density reduction for beamformed CSI-RS	CATT	Yanping Xing	57090	discussion		Decision
R1-1608736	On QCL for aperiodic CSI-RS	CATT	Yanping Xing	57090	discussion		Decision
R1-1608737	On remaining issues on hybrid CSI-RS	CATT	Yanping Xing	57090	discussion		Decision
R1-1608738	Support of downlink superposition transmission	CATT	Yanping Xing	57090	discussion		Decision
R1-1608739	On SRS carrier switching with antenna switching	CATT	Yanping Xing	57090	discussion		Decision
R1-1608740	Remaining issues for PUSCH support in UpPTS	CATT	Yanping Xing	57090	discussion		Decision
R1-1608741	HARQ and scheduling timing design for LTE processing timing reduction with 1ms TTI	CATT	Yanping Xing	57090	discussion		Decision
R1-1608742	On sDCI design	CATT	Yanping Xing	57090	discussion		Decision
R1-1608743	Design of sPDCCH structure	CATT	Yanping Xing	57090	discussion		Decision
R1-1608744	Other issues for sPDCCH design	CATT	Yanping Xing	57090	discussion		Decision
R1-1608745	DL/UL sTTI partition	CATT	Yanping Xing	57090	discussion		Decision

R1-1608746	DMRS design for sPUSCH	CATT	Yanping Xing	57090	discussion		Decision
R1-1608747	DMRS design for DL sTTI	CATT	Yanping Xing	57090	discussion		Decision
R1-1608748	On efficient multiplexing of normal TTI and sTTI	CATT	Yanping Xing	57090	discussion		Decision
R1-1608749	Discussion on UL sTTI operation	CATT	Yanping Xing	57090	discussion		Decision
R1-1608750	sPUCCH design for sTTI	CATT	Yanping Xing	57090	discussion		Decision
R1-1608751	Discussion on the simultaneous transmissions of (s)PUCCH and (s)PUSCH	CATT	Yanping Xing	57090	discussion		Decision
R1-1608752	UCI transmission for LTE sTTI	CATT	Yanping Xing	57090	discussion		Decision
R1-1608753	Implicit HARQ and scheduling timing design for LTE sTTI	CATT	Yanping Xing	57090	discussion		Decision

R1-1610532	Way Forward on compensation of phase rotation and frequency offset	Huawei	Patrick Merias	52292	discussion		Decision
R1-1610533	Way Forward on CSI framework for NR	Samsung, Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610534	Way Forward on PMI reporting for NR	Samsung, AT&T, Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610535	Way Forward on CSI feedback framework for hybrid beamforming in NR	CMCC	Patrick Merias	52292	discussion		Decision
R1-1610536	Evaluation Assumptions for NR Network Coordination	Samsung, Intel, ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610537	Way Forward on Network Coordination Framework	Samsung	Patrick Merias	52292	discussion		Decision
R1-1610538	Way forward on SYNC periodicity	Qualcomm Incorporated	Patrick Merias	52292	discussion		Decision
R1-1610539	Way Forward on Beam management	CATT	Patrick Merias	52292	discussion		Decision
R1-1610540	Way Forward on slot	NTT DOCOMO, INC., Ericsson, Panasonic, Nokia, Alcatel-Lucent Shanghai Bell, Qualcomm, Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision

R1-1610541	Performance Evaluation for NR Channel Coding	Huawei, HiSilicon	Patrick Merias	52292	other		
R1-1610542	Way Forward on maximum TA restriction for 1ms TTI processing time reduction	Qualcomm Incorporated	Patrick Merias	52292	discussion		Decision
R1-1610543	Way Forward on not supporting N+2 in 1ms TTI processing time reduction	Qualcomm, CATT, Samsung, Huawei, HiSilicon, Intel, MTK, ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610544	Observations on channel codes for NR eMBB data	AccelerComm	Patrick Merias	52292	discussion		Decision
R1-1610545	Way Forward on channel codes for NR eMBB data	AccelerComm	Patrick Merias	52292	discussion		Decision
R1-1610546	Way Forward on bandwidth adapatation in NR	MediaTek, Acer, CHTTL, III, Panasonic, Ericsson, AT&T, Nokia, ASB, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610547	Way Forward on timing relationship for NR	MediaTek, III, Samsung, NTT Docomo, Nokia, ASB, Qualcomm, Ericsson, Huawei, HiSilicon, Sony	Patrick Merias	52292	discussion		Decision
R1-1610548	Way Forward on sTTI scheduling options	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610549	Way Forward on handling of overlapping PDSCH/sPDSCH and PUSCH/sPUSCH	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610550	Way Forward on multiplexing of Sync and Broadcast signals	Qualcomm Incorporated, CATT	Patrick Merias	52292	discussion		Decision
R1-1610551	Way Forward on NB IoT SC-PTM scheduling	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610552	Way Forward on NB IoT SC-MTCH transmission	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610553	Way Forward on NB IoT multicast collision handling	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610554	Way Forward on the Presence of NRS on Non-anchor PRBs	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610555	Way Forward on Paging in non-anchor PRBs	Ericsson	Patrick Merias	52292	discussion		Decision

R1-1610556	DCI design to support multiple SPS configurations	CATT	Patrick Merias	52292	discussion		Decision
R1-1610557	Way Forward on supporting n+2 minimum timing for shortened processing time in 1ms TTI	Nokia, Alcatel-Lucent Shanghai Bell, Ericsson, NTT DoCoMo, Sharp	Patrick Merias	52292	discussion		Decision
R1-1610558	Way Forward on Synchronization signal for NR initial access	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610559	Way Forward on NR RACH design	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610560	Way Forward on Antenna Port Layouts and Oversampling Factors	Ericsson, Sprint, Verizon, DOCOMO, Deutsche Telekom, ATT, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610561	Way Forward on fallback mechanisms for shortened processing time in 1ms TTI	LG Electronics, Ericsson, Intel, Qualcomm, Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610562	Way Forward on UL scheduling timing for FS2 with shortened processing time in 1ms TTI	LG Electronics, NTT DOCOMO, Ericsson, ZTE Corp, ZTE Microelectronics, Intel	Patrick Merias	52292	discussion		Decision
R1-1610563	Way Forward on short TTI structure	LG Electronics, Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610564	Way Forward on sPUCCH design	LG Electronics, ZTE Corp, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610565	LS on Multi-carrier enhancements for UMTS	RAN2, Ericsson	Patrick Merias	52292	LS in		
R1-1610566	Way Forward on NR UL control channel	Samsung, Qualcomm, Intel, Panasonic, InterDigital, Sony, Ericsson, NTT DOCOMO, Fujitsu	Patrick Merias	52292	discussion		Decision
R1-1610567	Way Forward on multiplexing of sync signal	Samsung	Patrick Merias	52292	discussion		Decision
R1-1610568	Way Forward on DL HARQ-ACK timing for FS2	Samsung	Patrick Merias	52292	discussion		Decision

R1-1610569	Way Forward on sTTI length	Samsung, Panasonic, Qualcomm, Sharp, ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610570	Way forward on IFDMA based DMRS	Intel, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610571	LS reply on Multi-carrier enhancements for UMTS	RAN1, Ericsson	Patrick Merias	52292	LS out		Decision
R1-1610572	LS to RAN2/3 on RAN1 progress on MC enhancements	RAN1, Huawei	Patrick Merias	52292	LS out		Decision
R1-1610573	Report of the UMTS sessions	UMTS Session Chairman's Notes (Huawei)	Patrick Merias	52292	other		Endorsement

R1-1610609	Chairman's Notes of Agenda Item 7.2.2 Enhancements on Full-Dimension (FD) MIMO for LTE	Session Chairmen (Samsung, Nokia)	Patrick Merias	52292	discussion		Endorsement
R1-1610610	Chairman's Notes of Agenda Item 7.2.2 Enhancements on Full-Dimension (FD) MIMO for LTE	Session Chairmen (Samsung, Nokia)	Patrick Merias	52292	discussion		Endorsement
R1-1610611	Way Forward on RPF-4 support in uplink DMRS	Huawei, HiSilicon, Nokia, ASB	Patrick Merias	52292	discussion		Decision

R1-1610612	Way Forward on sequence collision handling in uplink DMRS	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610613	Way Forward on CSI feedback for DMRS based open loop transmission	Huawei, HiSilicon, CATT	Patrick Merias	52292	discussion		Decision
R1-1610614	Way Forward on downlink control signaling for PDSCH rate matching	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610615	Way Forward on supporting aperiodic CSI-RS with one resource	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610616	Way Forward on DL DMRS for sTTI	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610617	Way Forward on UL DMRS indication for sTTI	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610618	Way Forward on sDCI	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610619	Way Forward on sPUCCH formats	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610620	Way Forward on sPUCCH patterns	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610621	Way Forward on PRS Frequency Hopping for OTDOA	Sony, ZTE	Patrick Merias	52292	discussion		Decision
R1-1610622	Way Forward on DC subcarrier	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610623	Way Forward on CSI-RS Density Values for Class A	Ericsson, LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610624	Way Forward on CSI-RS Overhead Reduction for Class A	Ericsson, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610625	Way Forward on TP Structure for NR Multiple Access in TR 38.802	ZTE, ZTE Microelectronics, Qualcomm Inc	Patrick Merias	52292	discussion		Decision
R1-1610626	Way Forward on Physical layer abstraction method for MMSE-SIC/PIC receiver	ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610627	Way Forward on technique(s) to handle cross-link interference in flexible duplex	LG Electronics, Panasonic, Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610628	Long Network DTX in NR	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610629	Way Forward on aggregation for NP CSI-RS	ZTE, ZTE Microelectronics, Qualcomm	Patrick Merias	52292	discussion		Decision

R1-1610630	Way Forward on RRC reconfiguration for FeMTC features	Qualcomm, Ericsson, Sony, Sequans, DOCOMO, Virtuosys, Sierra Wireless, Kyocera	Patrick Merias	52292	discussion		Decision
R1-1610631	Way forward on NR HARQ	Intel, Nokia, ASB, AT&T, OPPO, MediaTek	Patrick Merias	52292	discussion		Decision
R1-1610632	Way Forward on PDSCH rate matching for supporting aperiodic CSIRS	LGE	Patrick Merias	52292	discussion		Decision
R1-1610633	Way Forward on phase continuity of DL precodong	Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610634	Evaluation of flexible duplex in dense urban scenario	Huawei, HiSilicon	Patrick Merias	52292	other		
R1-1610635	Way Forward on Aperiodic CSI-RS for eFD-MIMO	Samsung, CATT, LG Electronics, Nokia, Alcatel-Lucent Shanghai Bell, ZTE, ZTE Microelectronics, InterDigital, Xinwei, Huawei, HiSilicon, KT Corporation, AT&T, Mitsubishi Electric, Straight Path, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610636	Way Forward on Advanced CSI Codebook for eFD-MIMO	Samsung, NTT DOCOMO, KT Corporation, AT&T, Mitsubishi Electric, Straight Path, NEC	Patrick Merias	52292	discussion		Decision
R1-1610637	Way Forward on CSI Framework for NR	Samsung, Ericsson, AT&T, KT Corporation, CATT	Patrick Merias	52292	discussion		Decision
R1-1610638	Way Forward on PMI Reporting for NR	Samsung, AT&T, Ericsson, NTT DOCOMO	Patrick Merias	52292	discussion		Decision
R1-1610639	Way Forward on configurations of time resources for NPRS	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision

R1-1610640	Way Forward on configuration of NPRS transmission on multiple NB-IoT carriers	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610641	Way Forward on configuration of NPRS power for NB-IoT downlink positioning	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610642	Way Forward on SC-MTCH transmission for NB-IoT SC-PTM	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610643	Way Forward on SC-MCCH transmission for NB-IoT SC-PTM	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610644	Way Forward on search space design for SC-PTM in NB-IoT	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610645	Way Forward on timing relationships of 2 HARQ processes for NB-IoT enhancement	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610646	Way Forward on subcarrier spacing selection and switching	ETRI	Patrick Merias	52292	discussion		Decision
R1-1610647	Way Forward on SRS Carrier-based Switching	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610648	Clarification of number of repetitions of PUCCH	ZTE, Rohde & Schwarz	Patrick Merias	52292	CR		Decision
R1-1610649	Clarification on nrs-Power related description	ZTE	Patrick Merias	52292	CR		Decision
R1-1610650	Way Forward on larger PDSCH/PUSCH channel bandwidth for MTC	ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610651	Way Forward on HARQ bundling in HD-FDD for MTC	ZTE, ZTE Microelectronics, Sony, Lenovo, NTT Docomo, Sierra Wireless, Sequans	Patrick Merias	52292	discussion		Decision
R1-1610652	Way Forward on symbol level alignments	LG Electronics, NTT DOCOMO, Ericsson, Panasonic, Qualcomm, ZTE	Patrick Merias	52292	discussion		Decision
R1-1610653	Correction on channel access priority class according to UL LBT type indication in eLAA	WILUS Inc.	Patrick Merias	52292	draftCR		Decision
R1-1610654	Way Forward on OTDOA for eMTC	ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610655	LS on wider bandwidth operation for NR	RAN1, NTT DOCOMO	Patrick Merias	52292	LS out		Decision
R1-1610656	Clarification of number of repetitions of PUCCH	ZTE, Rohde & Schwarz	Patrick Merias	52292	CR		Decision

R1-1610657	Clarification on nrs-Power related description	ZTE	Patrick Merias	52292	CR		Decision
R1-1610658	Way Forward on beam management	Ericsson, Samsung, Intel	Patrick Merias	52292	discussion		Decision
R1-1610659	Evaluation on channel coding candidates for eMBB control channel_Figures	ZTE	Patrick Merias	52292	discussion		Decision
R1-1610660	Evaluation on channel coding candidates for uRLLC and mMTC	ZTE	Patrick Merias	52292	discussion		
R1-1610661	Way Forward on DCI for higher data rates in FeMTC	Ericsson, Qualcomm, Sony, NTT DoCoMo, Intel, Kyocera, KT Corp., Sierra Wireless	Patrick Merias	52292	discussion		Decision
R1-1610662	Way Forward on retuning symbols in FeMTC	Ericsson, NEC, Sequans, Sierra Wireless	Patrick Merias	52292	discussion		Decision
R1-1610663	Way Forward on TBS for FeMTC	Ericsson, Qualcomm, Sony	Patrick Merias	52292	discussion		Decision
R1-1610664	Way Forward on FeMTC SC-PTM scheduling	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610665	Way Forward on FeMTC multicast collision handling	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610666	Way Forward on FeMTC SC-MTCH transmission	Ericsson, Nokia, ASB	Patrick Merias	52292	discussion		Decision
R1-1610667	Channel Coding Observations	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610668	Way Forward on Channel Coding	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610669	Way Forward on flexible duplex	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610670	Way Forward on supporting 10 HARQ processes	Sequans, Intel, Sony, Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610671	Way Forward on NR DL Control	ZTE, ZTE Microelectronics, Ericsson, Qualcomm, InterDigital	Patrick Merias	52292	discussion		Decision

R1-1610672	Way Forward on the SLSS Transmission	Huawei, HiSilicon, Qualcomm , LG Electronics, Ericsson, Samsung, CATT, ITRI, NTT DOCOMO, OPPO, Nokia, ASB	Patrick Merias	52292	discussion		Decision
R1-1610673	Way Forward on Sync Priority for OOC	Huawei, HiSilicon, LG Electronics, Qualcomm, ZTE, ITRI, DCM, Xinwei, Samsung, NEC, CATT, Ericsson, Nokia, ASB	Patrick Merias	52292	discussion		Decision
R1-1610674	Way Forward on UL beam management	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610675	Way Forward on UL MIMO transmission	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610676	Way Forward on UCI transmission for NR	LG Electronics, Intel	Patrick Merias	52292	discussion		Decision
R1-1610677	Way Forward on common control channel for NR	LG Electronics, Nokia	Patrick Merias	52292	discussion		Decision
R1-1610678	Efficient Channel Coding Implementations for EMBB	Qualcomm Incorporated	Patrick Merias	52292	discussion		Discussion
R1-1610679	CR to capture additional feature calibration results	Samsung	Patrick Merias	52292	CR		Decision
R1-1610680	LS on TTI switching for MC enhancements	RAN2, Huawei	Patrick Merias	52292	LS in		
R1-1610681	Way Forward on coexistence between NR and LTE	LG Electronics, AT&T	Patrick Merias	52292	discussion		Decision
R1-1610682	Channel Coding scheme for EMBB	Intel Corporation	Patrick Merias	52292	discussion		Decision
R1-1610683	Discussion points on DL control signaling	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610684	Way Forward on supporting larger channel bandwidth for Rel-14 non-BL UEs	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610685	Way Forward on UL MIMO	CATT, Samsung, LG, InterDigital	Patrick Merias	52292	discussion		Decision
R1-1610686	Way Forward on TR structure for NR multiple access	Nokia, Alcatel-Lucent Shanghai Bell	Patrick Merias	52292	discussion		Decision
R1-1610687	Clarification on IF-HARQ for PC-Polar	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision

R1-1610688	Full calibration results for channel model above 6GHz	Lenovo, Motorola Mobility	Patrick Merias	52292	discussion		Decision
R1-1610689	Way forward on eMBB data channel coding	Samsung	Patrick Merias	52292	discussion		Decision
R1-1610690	Way forward on observations for eMBB data channel coding	Samsung, Qualcomm Incorporated, Nokia, ASB, KT Corporation, Intel Corporation	Patrick Merias	52292	discussion		Decision
R1-1610691	Way Forward on Channel Coding Design for NR	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610692	Way Forward on Further Evaluation Assumptions of Control Channel	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610693	Way Forward on Basics of LDPC Design	Ericsson, Intel, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610694	Way Forward on NR UL MIMO precoding	Intel Corporation, NTT DoCoMo, Fujitsu, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610695	Way Forward on HARQ timing for PUSCH UpPTS	CMCC	Patrick Merias	52292	discussion		Decision
R1-1610696	Way Forward on DMRSfor PUSCH UpPTS	CMCC	Patrick Merias	52292	discussion		Decision
R1-1610697	Way Forward on timing design for TTI bundling	CMCC	Patrick Merias	52292	discussion		Decision
R1-1610698	Way Forward on TBS scalling design for PUSCH UpPTS	CMCC	Patrick Merias	52292	discussion		Decision
R1-1610699	TR38.900_CR_Azimuthal_Angle_Notation	Fraunhofer HHI	Patrick Merias	52292	CR		Decision

R1-1610709	Way Forward on prioritization of SL TX over UL TX	LG Electronics, NTT DOCOMO, ZTE, NOKIA, Alcatel-Lucent Shanghai Bell, CATT, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610710	Discussion on DL control channels	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610711	Way Forward on the pre-defined SLSS IDs for the GNSS timing	Huawei, HiSilicon, ZTE, Samsung, ITRI, CATT, LG Electronics, NTT DOCOMO, Qualcomm, Nokia, ASB	Patrick Merias	52292	discussion		Decision
R1-1610712	Way Forward on dynamic resource sharing between eMBB and URLLC in DL	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610713	Way Forward on supporting traffic with small periodicity for LTE-V2X	Huawei, HiSilicon, LG Electronics, Qualcomm, Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610714	Way Forward on Principle of Generating Power Ratio	ZTE, ZTE Microelectronics, LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610715	Way Forward on the Gray conversion	LG Electronics, ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610716	Way Forward on CSI-RS and CSI reporting in NR	LG Electronics, Ericsson, Intel, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610717	Way Forward on additional offset in path-loss model for flexible duplex	LG Electronics, Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610718	Way Forward on the overhead reduction for Class B CSI-RS	Intel Corporation	Patrick Merias	52292	discussion		Decision
R1-1610719	Way Forward on evaluation assumptions for compensation of phase rotation and frequency offset	LG Electronics, InterDigital, KT, Huawei	Patrick Merias	52292	discussion		Decision
R1-1610720	Way Forward on URLLC System Level Evaluation Methodology	Intel, Qualcomm, ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision

R1-1610721	Way Forward on UL link adaptation procedures in NR	LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610722	Way forward on SYNC periodicity	Qualcomm Incorporated	Patrick Merias	52292	discussion		Decision
R1-1610723	Way Forward on Gray Mapped Composite Constellation in MUST	MediaTek, Qualcomm, Nokia, ASB, ITRI	Patrick Merias	52292	discussion		Decision
R1-1610724	Way Forward on Power Ratio in MUST Cases 1 and 2	MediaTek, ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610725	Way Forward on DMRS based Transmission Scheme of MUST Case 3	MediaTek, ZTE, ZTE Microelectronics, CMCC	Patrick Merias	52292	discussion		Decision
R1-1610726	Way Forward on PDSCH Starting Symbol in MUST	MediaTek, ZTE, ZTE Microelectronics, Nokia, ASB, ITRI, CMCC	Patrick Merias	52292	discussion		Decision
R1-1610727	Way Forward on CSI feedback framework for hybrid beamforming in NR	CMCC, ZTE, ZTE Microelectronics, CATT, Xinwei	Patrick Merias	52292	discussion		Decision
R1-1610728	Way Forward on ITS Coexistence Mechanisms	Ericsson, Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610729	Way Forward on PDSCH starting symbol	LG Electronics, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610730	Way Forward on new DCI design	LG Electronics, LG Uplus, MediaTek, ZTE, ZTE Microelectronics, Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610731	Way Forward on PUSCH CSI reporting for hybrid CSIRS mechanism	LG Electronics, Samsung, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610732	Way Forward on QCL issue for aperiodic CSIRS	LG Electronics, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610733	CR on 36.213 NB-IoT Type1 and Type 2 search space definition	Ericsson	Patrick Merias	52292	CR		Decision
R1-1610734	CR on 36.213 NB-IoT Type1 and Type 2 search space definition	Ericsson	Patrick Merias	52292	CR		Decision

R1-1610735	Way Forward on Network Coordination for Advanced Receivers	Samsung, Intel, MediaTek, Orange, Vodafone, IITH, Tejas Networks, IITM, KDDI, CeWiT, Reliance Jio	Patrick Merias	52292	discussion		Decision
R1-1610736	Summary of offline discussion on downlink control channels	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610737	Support of URLLC in UL	Huawei, HiSilicon	Patrick Merias	52292	other		
R1-1610738	Way Forward on compensation of phase rotation and frequency offset for CP-OFDM	Huawei	Patrick Merias	52292	discussion		Decision
R1-1610739	Way Forward on P-UE sensing timeline in partial sensing	Huawei, HiSilicon, NTT Docomo	Patrick Merias	52292	discussion		Decision
R1-1610740	Way Forward on V2V PC5 SLSS transmission	Huawei	Patrick Merias	52292	discussion		Decision
R1-1610741	Way Forward on CSI-RS design for CDM-4 and CDM-8	LG Electronics, Ericsson, Qualcomm, CATT, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610742	Clarification on i_0 value	Qualcomm Incorporated	Patrick Merias	52292	draftCR		Discussion
R1-1610743	Way Forward on UL grant-free workplan	Huawei, HiSilicon, CMCC	Patrick Merias	52292	discussion		Decision
R1-1610744	Way Forward on non-orthogonal MA workplan	Huawei, HiSilicon, CMCC	Patrick Merias	52292	discussion		Decision
R1-1610745	Way Forward on summary of UL non-orthogonal MA progress	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610746	Way Forward on summary of grant-free progress	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610747	Way Forward on RS for Phase Tracking for CP-OFDM	Huawei, HiSilicon, LG Electronics, Samsung, NTT DOCOMO, INC., Intel	Patrick Merias	52292	discussion		Decision
R1-1610748	Draft LS on power allocation for SC-PTM	Huawei	Patrick Merias	52292	LS out		Decision
R1-1610749	Way Forward on PUCCH and SRS not belonging to any narrowband for BL/CE UE	Ericsson, Intel, Qualcomm, Sequans, Sony, ZTE	Patrick Merias	52292	discussion		Decision

R1-1610750	Way Forward on HARQ feedback for eMBB	MediaTek	Patrick Merias	52292	discussion		Decision
R1-1610751	Way Forward on Symbol Index indication in NR-SS	Samsung	Patrick Merias	52292	discussion		Decision
R1-1610752	Way forward on NR DCI monitoring	Intel, CATT, Ericsson, Panasonic, ETRI	Patrick Merias	52292	discussion		Decision
R1-1610753	Way Forward on congestion control	Huawei, HiSilicon, Ericsson, OPPO, Nokia	Patrick Merias	52292	discussion		Decision
R1-1610754	Way Forward on Definition of Gray Mapped Composite Constellation	ZTE, ZTE Microelectronics, LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610755	Correction of PRACH starting subframes for eMTC	Intel Corporation	Patrick Merias	52292	draftCR		Discussion
R1-1610756	Correction of NPRACH frequency hopping	Intel Corporation	Patrick Merias	52292	draftCR		Discussion
R1-1610757	Observations on hardware implementations of flexible channel decoders	AccelerComm	Patrick Merias	52292	discussion		
R1-1610758	Overhead Comparison Between Class-A-Based and Unrestricted Orthogonal Designs	Samsung	Patrick Merias	52292	discussion		Decision
R1-1610759	Way Forward on Remaining Issues on Hybrid CSI	Samsung	Patrick Merias	52292	discussion		Decision
R1-1610760	Clarification on NR HARQ UL/DL timing relationships	Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610761	Way Forward on number of ports supported in advanced CSI	Huawei, HiSilicon, MediaTek, ZTE, ZTE Microelectronics, Nokia, ASB, Deutsche Telekom, Samsung, Intel, CATT, Xinwei, InterDigital, Oppo, AT&T, China Unicom, ITRI	Patrick Merias	52292	discussion		Decision
R1-1610762	Way Forward on further details in Advanced CSI	Huawei	Patrick Merias	52292	discussion		Decision
R1-1610763	Way Forward on NZP CSI-RS based interference measurement	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610764	Way Forward on extra scheme supported in hybrid CSI	Huawei	Patrick Merias	52292	discussion		Decision

R1-1610765	LS on RAN2 agreements on FeMBMS	RAN2, Ericsson	Patrick Merias	52292	LS in		
R1-1610766	LS to RAN1 on V2V agreements	RAN2, LGE	Patrick Merias	52292	LS in		
R1-1610767	Way forward on eMBB data channel coding	Samsung, Qualcomm Incorporated, Nokia, Alcatel-Lucent Shanghai Bell, Verizon Wireless, KT Corporation, KDDI, ETRI, IITH, IITM, CEWiT, Reliance Jio, Tejas Network, Xilinx, Sony, SK Telecom, Intel Corporation, Sharp, MTI, National Instrument, Motorola Mobility, Lenovo, Cohere Technologies, Acorn Technologies, CableLabs, WILUS Inc, NextNav, ASUSTEK, ITL	Patrick Merias	52292	discussion		Decision
R1-1610768	Way Forward on dynamic TDD opreration for NR	ZTE	Patrick Merias	52292	discussion		Decision
R1-1610769	Way Forward on resource reselection	Samsung, CATT, Huawei, HiSilicon, ZTE	Patrick Merias	52292	discussion		Decision
R1-1610770	Way Forward on Clarification of NPRACH for single/multi-tone MSG 3	MediaTek	Patrick Merias	52292	discussion		Decision
R1-1610771	Way Forward on interference measurement enhancement	CATT, Samsung, CATR, ITRI, InterDigital, KT, KDDI, LG Electronics, ZTE, Xinwei	Patrick Merias	52292	discussion		Decision

R1-1610772	Way Forward for Quantized Advanced CSI Feedback Structure	Ericsson, Huawei, HiSilicon, ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610773	Correction on CSI measurement in LAA	LG Electronics	Patrick Merias	52292	draftCR		Discussion
R1-1610774	Correction on periodic CSI transmission	LG Electronics	Patrick Merias	52292	draftCR		Discussion
R1-1610775	Correction on UL burst scheduling	LG Electronics	Patrick Merias	52292	draftCR		Discussion
R1-1610776	Way Forward on reliable sidelink SPS	NTT DOCOMO	Patrick Merias	52292	discussion		Decision
R1-1610777	Way Forward on NR modulation for high spectral efficency	Samsung, Qualcomm, Intel, IITH, Tejas Networks, IITM, CeWiT, Reliance Jio, KDDI	Patrick Merias	52292	discussion		Decision
R1-1610778	Correction on MPDCCH transmission without repetition	Huawei, HiSilicon	Patrick Merias	52292	CR		Decision
R1-1610779	Discussion on DL control channels	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610780	LS on power allocation for SC-PTM	RAN1, Huawei	Patrick Merias	52292	LS out		Decision
R1-1610781	Performance of Advanced CSI with 4 and 8 TX antennas	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610782	Way Forward on enhancement of CS/CB with FD-MIMO	Huawei, HiSilicon, Intel, SoftBank Corp, ZTE, ZTE Microelectronics, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610783	Way Forward on RACH Procedure for Multi-beam without gNB reciprocity	ZTE, ZTE Microelectronics, Nokia, NTT DOCOMO	Patrick Merias	52292	discussion		Decision
R1-1610784	Way Forward on DL control channel design	Huawei, HiSilicon, Qualcomm, ZTE, InterDigital, Convida Wireless	Patrick Merias	52292	discussion		Decision

R1-1610785	Way Forward on rate matching for aperiodic CSI-RS	ZTE, ZTE Microelectronics, Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610786	Way Forward on hybrid CSI mechanism	ZTE, ZTE Microelectronics, NTT DOCOMO, Ericsson, Intel	Patrick Merias	52292	discussion		Decision
R1-1610787	Way Forward on transmission modes for sTTI	Huawei, HiSilicon, CMCC, Softbank, Qualcomm, Intel, CATT	Patrick Merias	52292	discussion		Decision
R1-1610788	Way Forward on supporting multiplxing sDCI with different AL in one sPDCCH	Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610789	Way Forward on Using Scaled Numerology for DL Control	Qualcomm, ZTE	Patrick Merias	52292	discussion		Decision
R1-1610790	Way Forward on Multiplexing eMBB and URLLC in DL	Samsung	Patrick Merias	52292	discussion		Decision
R1-1610791	Way Forward on Fractional RB usage	Samsung, ZTE, ZTE Microelectronics, Panasonic, KDDI, IITH, IITM, Tejas Networks, CEWiT, Nokia	Patrick Merias	52292	discussion		Decision
R1-1610792	Way Forward on coexistence between NR and LTE	LGE	Patrick Merias	52292	discussion		Decision
R1-1610793	Way Forward on SLS observations of non-orthogonal MA	Huawei, HiSilicon, ZTE	Patrick Merias	52292	discussion		Decision
R1-1610794	Way Forward on UL grant-free technical aspects	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610795	Way Forward on non-orthogonal multiple access for non-mMTC scenarios	Huawei, HiSilicon, CATT, Convida Wireless, Interdigital	Patrick Merias	52292	discussion		Decision
R1-1610796	Correction on equation for MPDCCH search space and starting subframe position	NTT DOCOMO, INC., Panasonic	Patrick Merias	52292	CR		Decision
R1-1610797	Correction on equation for MPDCCH search space and starting subframe position	NTT DOCOMO, INC., Panasonic	Patrick Merias	52292	CR		Decision
R1-1610798	LS on DFN offset	RAN2, Huawei	Patrick Merias	52292	LS in		Decision

R1-1610799	Way Forward on Modulation for NR	InterDigital, Qualcomm, Mediatek, Sony, Orange, Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610800	Way Forward on coexistence between NR and LTE	LG Electronics, AT&T, Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610801	Way Forward on Categorization of MA Signature	ZTE, ZTE Microelectronics, Huawei, HiSilicon, ETRI	Patrick Merias	52292	discussion		Decision
R1-1610802	Discussion on power ratios for MUST Case 1&2	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610803	Way Forward on downlink power allocation for MUST Case 1&2	Huawei, HiSilicon, NTT DOCOMO	Patrick Merias	52292	discussion		Decision
R1-1610804	Way Forward on power ratios for MUST Case 1&2	Huawei, HiSilicon, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610805	Way Forward on Gray Conversion for MUST Case 1&2	Huawei, HiSilicon, ZTE, ZTE Microelctronics	Patrick Merias	52292	discussion		Decision
R1-1610806	Way Forward on CRS-based MUST Case 3	Huawei, HiSilicon, LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610807	Clarification on IF-HARQ for PC-Polar	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610808	Way Forward on NR UL control channel	Samsung, Qualcomm, Intel, Panasonic, InterDigital, Sony, Ericsson, NTT DOCOMO, Fujitsu, OPPO, CATT, CMCC Samsung, Qualcomm, Intel, Panasonic, InterDigital, Sony, Ericsson, NTT DOCOMO, Fujitsu, OPPO, CATT, CMCC	Patrick Merias	52292	discussion		Decision
R1-1610809	Way Forward on MUST UE multiplexing	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision

R1-1610810	Way Forward on CP	Huawei, HiSilicon, Sony, OPPO, CATT, Vodafone, Ericsson, ZTE, Intel , Mediatek, NTT DOCOMO, CATR	Patrick Merias	52292	discussion		Decision
R1-1610811	Way Forward on NR DL Control Channel Structure	Samsung	Patrick Merias	52292	discussion		Decision
R1-1610812	Way Forward on DCI design for V2X UL SPS	LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610813	Way Forward on DCI design for SL SPS	LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610814	DMRS-based sPDCCH	ZTE	Patrick Merias	52292	discussion		Decision
R1-1610815	Way Forward on aperiodic CSI-RS selection	Ericsson, NTT DoCoMo	Patrick Merias	52292	discussion		Decision
R1-1610816	On PHICH collision analysis	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610817	Way Forward on TBS indication for 1.4MHz feMTC UEs	Huawei, HiSilicon, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610818	Way Forward on PHY abstraction method for MA SLS	ZTE, ZTE Microelectronics, Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610819	Way Forward on potential enhancements for Non Coherent Joint Transmission	ZTE, ZTE Microelectronics, Intel, ASTRI, Huawei, HiSilicon, Nokia, ASB	Patrick Merias	52292	discussion		Decision
R1-1610820	Way Forward on FeMTC multicast scheduling	Ericsson, ITL, Nokia, ASB	Patrick Merias	52292	discussion		Decision
R1-1610821	Observations on hardware implementations of flexible LDPC decoders	AccelerComm	Patrick Merias	52292	discussion		Decision
R1-1610822	Observations on hardware implementations of flexible polar decoders	AccelerComm	Patrick Merias	52292	discussion		Decision
R1-1610823	Way Forward on Network Assistance for NR Uplink Waveform	AT&T, Huawei	Patrick Merias	52292	discussion		Decision
R1-1610824	Way Forward on bundle size and bundle number in HD-FDD for MTC	ZTE, ZTE Microelectronics, Sierra Wireless, Ericsson, Lenovo, Sony	Patrick Merias	52292	discussion		Decision
R1-1610825	Way Forward on Beam management	CATT, CATR, CMCC, Xinwei	Patrick Merias	52292	discussion		Decision

R1-1610826	Way Forward on summary of grant-free progress	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610827	Way Forward on DL sTTI pattern	Huawei, HiSilicon, NTT DOCOMO, Intel, Qualcomm, Ericsson, LGE, Sharp	Patrick Merias	52292	discussion		Decision
R1-1610828	Way Forward on DL measurement for L3 mobility	LG Electronics, Samsung, NTT DOCOMO	Patrick Merias	52292	discussion		Decision
R1-1610829	Way Forward on evaluation assumptions for tracking of phase rotation and/or frequency offset	LG Electronics, Nokia, Huawei, Samsung, Qualcomm, InterDigital, KT	Patrick Merias	52292	discussion		Decision
R1-1610830	Way Forward on MUST control operation	Nokia, Alcatel-Lucent Shanghai Bell, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610831	Way Forward on Spatial Multiplexing Schemes for MU-MIMO	Mitsubishi Electric, InterDigital, Samsung, NTT DOCOMO, IITH, IITM, Tejas Networks, CEWIT, KDDI	Patrick Merias	52292	discussion		Decision
R1-1610832	Way Forward on asynchronous UL HARQ in 1ms TTI	LG Electronics, NTT DOCOMO	Patrick Merias	52292	discussion		Decision
R1-1610833	Way Forward on UL short TTI structure	LG Electronics, Huawei, HiSilicon, Ericsson, Nokia, Alcatel-Lucent Shanghai Bell, Samsung, NTT DOCOMO, Sharp, Intel, Qualcomm, CATT	Patrick Merias	52292	discussion		Decision
R1-1610834	Way Forward on UL short TTI structure for 4-symbol sTTI	LG Electronics, Samsung, Ericsson, CATT, NTT DOCOMO, ZTE, ZTE Microelectronics, Huawei, HiSilicon, Panasonic, Sharp	Patrick Merias	52292	discussion		Decision

R1-1610835	Way Forward on sTTI scheduling options	Ericsson, Panasonic, Samsung, Nokia, ASB, ZTE, ZTE Microelectronics, CATT, LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610836	Way Forward on handling of PDSCH/sPDSCH assignments for the same subframe and carrier	Ericsson, Huawei, HiSilicon, Qualcomm, NTT DOCOMO, LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610837	CR for clarification on A-CSI without hopping	Qualcomm Incorporated, Samsung	Patrick Merias	52292	CR		Decision
R1-1610838	CR for clarification on A-CSI without hopping	Qualcomm Incorporated, Samsung	Patrick Merias	52292	CR		Decision
R1-1610839	Way Forward on Updated Link Level Evaluation Assumptions for Initial Access in NR	Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610840	Way Forward on Multiplexing of SYNC and Broadcast Signals	Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610841	[Draft] Reply LS on CSI measurement ambiguity in LAA	LG Electronics	Patrick Merias	52292	LS out		Decision
R1-1610842	Implementation considerations on flexible and efficient LDPC decoders	MediaTek Inc.	Patrick Merias	52292	discussion		
R1-1610843	Draft TR 38.802 Study on New Radio (NR) Access Technology - Physical Layer Aspects	NTT DOCOMO, INC.	Patrick Merias	52292	draft TR		Decision
R1-1610844	Offline discussion summary of initial access for NR	NTT DOCOMO	Patrick Merias	52292	discussion		Decision
R1-1610845	Way Forward on NR UL-based RRM measurement	Huawei, HiSilicon, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610846	Way Forward on NR RACH procedure	Huawei, HiSilicon, Qualcomm, ETRI	Patrick Merias	52292	discussion		Decision
R1-1610847	[Draft] LS response on DFN offset	Ericsson	Patrick Merias	52292	LS out		Decision
R1-1610848	TR 38.802 v0.3.0 Study on New Radio (NR) Access Technology - Physical Layer Aspects	NTT DOCOMO, INC.	Patrick Merias	52292	draft TR		Decision
R1-1610849	Way Forward on the definition of beam reciporcity	Samsung	Patrick Merias	52292	discussion		Decision

R1-1610850	Way Forward on Channel Coding	Huawei, HiSilicon, Acer, Bell, CATR, China Unicom, China Telecom, CHTTL, Coolpad, Deutsche Telekom, Etisalat, InterDigital, III, ITRI, MediaTek, Nubia Technology, Nuel, OPPO, Potevio, Spreadtrum, TD Tech, Telus, Vivo, Xiaomi, Xinwei, ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610851	Reply LS on CSI measurement ambiguity in LAA	RAN1, LGE	Patrick Merias	52292	discussion		Decision
R1-1610852	Correction on PDCCH candidate configuration	LG Electronics	Patrick Merias	52292	draftCR		Decision
R1-1610853	Correction on PDCCH candidate configuration	LG Electronics	Patrick Merias	52292	draftCR		Decision
R1-1610854	Way Forward on NR RACH procedure	Huawei, HiSilicon, Qualcomm, ETRI	Patrick Merias	52292	discussion		Decision
R1-1610855	Way Forward on the combination of sTTI length for DL and UL	Samsung, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610856	Way Forward on sTTI length for DL	Samsung Ericsson Sharp NTT DOCOMO ;Huawei HiSilicon Intel CATT ;ZTE ZTE Microelectronics LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610857	Observations on Performance and Implementation Issues of AdjMS decoders	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610858	Draft CR on using 25us LBT for UEs on carriers without eNB Cat 4 LBT foe eLAA	Qualcomm	Patrick Merias	52292	draftCR		Discussion
R1-1610859	Draft CR on clarification of PUSCH start position for eLAA	Panasonic, Qualcomm Incorporated	Patrick Merias	52292	draftCR		Decision

R1-1610860	Way Forward on Basics of LDPC Design	Ericsson, Intel, Qualcomm, MediaTek	Patrick Merias	52292	discussion		Decision
R1-1610861	Way Forward on TBS indication for 1.4MHz feMTC UEs	Huawei, HiSilicon, Nokia, Qualcomm, Sierra Wireless	Patrick Merias	52292	discussion		Decision
R1-1610862	void	ETSI	Patrick Merias	52292	other		
R1-1610863	void	ETSI	Patrick Merias	52292	other		
R1-1610864	Chairman's notes of AI 7.2.1 on LTE-based V2X Services	Ad-Hoc chair (LGE)	Patrick Merias	52292	discussion		Endorsement
R1-1610865	Chairman's notes of AI 7.2.2 on Enhancements on Full-Dimension (FD) MIMO for LTE	Ad-Hoc chair (Nokia)	Patrick Merias	52292	discussion		Endorsement
R1-1610866	Chairman's notes of AI 7.2.3 on Downlink Multiuser Superposition Transmission for LTE	Ad-Hoc chair (Qualcomm, MediaTek)	Patrick Merias	52292	discussion		Endorsement
R1-1610867	Chairman's notes of AI 7.2.4 on eMBMS enhancements for LTE	Ad-Hoc chair (Nokia, Ericsson)	Patrick Merias	52292	discussion		Endorsement
R1-1610868	Chairman's notes of AI 7.2.5 on SRS Carrier Based Switching for LTE	Ad-Hoc chair (Huawei)	Patrick Merias	52292	discussion		Endorsement
R1-1610869	Chairman's notes of AI 7.2.6 on Further Indoor Positioning enhancements for UTRA and LTE	Ad-Hoc chair (Qualcomm)	Patrick Merias	52292	discussion		Endorsement
R1-1610870	Chairman's notes of AI 7.2.7 on Uplink Capacity Enhancements for LTE	Ad-Hoc chair (Ericsson)	Patrick Merias	52292	discussion		Endorsement
R1-1610871	Chairman's notes of AI 7.2.8 on Further Enhanced MTC for LTE	Ad-Hoc chair (Nokia, Ericsson)	Patrick Merias	52292	discussion		Endorsement
R1-1610872	Chairman's notes of AI 7.2.9 on Enhancements of NB-IoT	Ad-Hoc chair (Huawei)	Patrick Merias	52292	discussion		Endorsement
R1-1610873	Chairman's notes of AI 7.2.10 on Shortened TTI and processing time for LTE	Ad-Hoc chair (Ericsson)	Patrick Merias	52292	discussion		Endorsement
R1-1610874	Chairman's notes of AI 7.2.11 on Performance enhancements for high speed scenario	Ad-Hoc chair (Qualcomm)	Patrick Merias	52292	discussion		Endorsement
R1-1610875	Chairman's notes of AI 7.2.12 on Study on Enhancement of VoLTE	Ad-Hoc chair (Qualcomm)	Patrick Merias	52292	discussion		Endorsement
R1-1610876	Chairman's notes of AI 7.2.13 on Study on Further enhancements to Coordinated Multi-Point Operation	Ad-Hoc chair (Intel)	Patrick Merias	52292	discussion		Endorsement
R1-1610877	Chairman's notes of AI 8.1.1 on waveform and multiple access schemes for NR	Ad-Hoc chair (Qualcomm)	Patrick Merias	52292	discussion		Endorsement

R1-1610878	Chairman's notes of AI 8.1.3 on channel coding and modulation for NR	Ad-Hoc chair (Nokia)	Patrick Merias	52292	discussion		Endorsement
R1-1610879	Chairman's notes of AI 8.1.6 on duplexing for NR	Ad-Hoc chair (Qualcomm)	Patrick Merias	52292	discussion		Endorsement
R1-1610880	Chairman's notes of AI 8.1.8	Ad-Hoc chair (Qualcomm)	Patrick Merias	52292	discussion		Endorsement
R1-1610881	Chairman's notes of AI 8.2	Ad-Hoc chair (Nokia)	Patrick Merias	52292	discussion		Endorsement
R1-1610882	Chairman's notes of AI 7.1 on CRs	Ad-Hoc chair (Qualcomm)	Patrick Merias	52292	discussion		Endorsement
R1-1610883	Way Forward on Using Scaled Numerology for Control Transmission	Qualcomm, ZTE, Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610884	Removal of LAA DRS channel access from UL Type 2 Channel Access description	Nokia, Alcatel-Lucent Shanghai Bell	Patrick Merias	52292	CR		Decision
R1-1610885	Observations on Area	Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610886	Clarification of PUSCH start position for eLAA	Panasonic, Qualcomm Incorporated	Patrick Merias	52292	CR		Decision
R1-1610887	Notes from offline discussion on ulplink control channels	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610888	Way Forward on NR MIMO calibration	ZTE, ZTE Microelectronics, Nokia, ASB, CATT, MediaTek, Xinwei, Huawei, Hisilicon, Intel, Ericsson, Mitsubishi Electric, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610889	Way Forward on Phase 1 link-level calibration for NR-MIMO with simplified antenna configuration	ZTE, ZTE Microelectronics, CATT, MediaTek, Xinwei, Huawei, Hisilicon, Intel, Ericsson, Nokia, ASB, Mitsubishi Electric, NTT DOCOMO, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610890	Clarification on assumptions for Phase 1 link-level calibration for NR-MIMO	ZTE	Patrick Merias	52292	discussion		Decision

R1-1610891	Way Forward on group-based beam management	ZTE, ZTE Microelectronics, ASTRI, Nokia, ASB, CATT	Patrick Merias	52292	discussion		Decision
R1-1610892	Way Forward on reference signal for demodulation	ZTE	Patrick Merias	52292	discussion		Decision
R1-1610893	Way Forward on MIMO transmission based on multiple antenna panels	Huawei, HiSilicon, Xinwei, NEC	Patrick Merias	52292	discussion		Decision
R1-1610894	Way Forward on UL beam management	Samsung, Huawei, Intel	Patrick Merias	52292	discussion		Decision
R1-1610895	Way Forward on DL MIMO transmission	Huawei, HiSilicon, CATT	Patrick Merias	52292	discussion		Decision
R1-1610896	CR on UL duration and offset field in TS 36.213	ETRI	Patrick Merias	52292	CR		Decision
R1-1610897	Observations on Area	Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610898	Way Forward on coordinated transmission in NR	LG Electronics, Huawei, HiSilicon, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610899	Way Forward on CSI feedback framework for hybrid beamforming in NR	CMCC, CATT, Xinwei, Samsung, Ericsson, Huawei, HiSilicon, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610900	Correction on channel access priority class according to UL LBT type indication in eLAA	WILUS Inc.	Patrick Merias	52292	CR		Decision
R1-1610901	Correction on downlink power allocation for SC-PTM	TD Tech, Huawei	Patrick Merias	52292	CR		Decision
R1-1610902	Way Forward on Multiplexing eMBB and URLLC in DL	Samsung, Panasonic, ZTE, ZTE Microelectronics, ETRI, Ericsson, CATT, Huawei, NTT DOCOMO, LGE, CMCC, Convida wireless, InterDigital, Sony, Fujitsu	Patrick Merias	52292	discussion		Decision
R1-1610903	Way Forward on Performance enhancements for high speed scenario	Huawei, HiSilicon, Nokia, ASB, NTT DOCOMO	Patrick Merias	52292	discussion		Decision

R1-1610904	Way Forward on Low PAPR Modulation in NR	Samsung, Qualcomm, Intel, Vodafone, AT&T, MediaTek, KDDI, InterDigital, IITH, IITM, Tejas Networks, Reliance-Jio, CEWiT, National Instruments	Patrick Merias	52292	discussion		Decision
R1-1610905	Way Forward on UTDOA for NB-IoT	ZTE , ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610906	Way Forward on channel and interference measurements for NR	Samsung, Intel, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610907	Way Forward on CSI-RS resource pooling	Ericsson, Samsung, LG, Nokia	Patrick Merias	52292	discussion		Decision
R1-1610908	Correction on periodic CSI transmission	LG Electronics	Patrick Merias	52292	CR		Decision
R1-1610909	Way Forward on Multipath RSTD	Ericsson, Nokia, Qualcomm, Acorn Technology	Patrick Merias	52292	discussion		Decision
R1-1610910	Draft LS on Multipath RSTD report	Ericsson	Patrick Merias	52292	LS out		Decision
R1-1610911	Clarification on i_0 value	Qualcomm Incorporated	Patrick Merias	52292	CR		Decision
R1-1610912	Clarification on i_0 value	Qualcomm Incorporated	Patrick Merias	52292	CR		Decision
R1-1610913	Way Forward on enhancement in step 2 for supporting shorter periodicity	LG Electronics, CATT	Patrick Merias	52292	discussion		Decision
R1-1610914	Correction of PRACH starting subframes for eMTC	Intel Corporation	Patrick Merias	52292	CR		Decision
R1-1610915	Correction of PRACH starting subframes for eMTC	Intel Corporation	Patrick Merias	52292	CR		Decision
R1-1610916	Correction of NPRACH frequency hopping	Intel Corporation	Patrick Merias	52292	CR		Decision

R1-1610917	Correction of NPRACH frequency hopping	Intel Corporation	Patrick Merias	52292	CR		Decision
R1-1610918	Link-level evaluation results of UL NOMA schemes	Intel Corporation	Patrick Merias	52292	discussion		Decision
R1-1610919	Way Forward on PUCCH and SRS not belonging to any narrowband for BL/CE UE	Ericsson, Alcatel-Lucent Shanghai Bell, Intel, Nokia, NTT DoCoMo, Qualcomm, Sequans, Sony, Sierra Wireless, Virtuosys, ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610920	[Draft] LS response on Exceptional Pool Handling for V2X	Ericsson	Patrick Merias	52292	LS out		Decision
R1-1610921	Way Forward on VoLTE and ViLTE enhancement	Huawei, HiSilicon, China Telecommunications	Patrick Merias	52292	discussion		Decision
R1-1610922	Way Forward on FeMTC eVoLTE	Huawei, HiSilicon, Ericsson, Qualcomm, Sequans	Patrick Merias	52292	discussion		Decision
R1-1610923	Way Forward on Beam reporting for NR	LG Electronics, Intel, NTT DOCOMO, MediaTek	Patrick Merias	52292	discussion		Decision
R1-1610924	Way Forward on remaining details on PDSCH rate matching	LG Electronics, InterDigital, Qualcomm, ZTE, ZTE Microelectronics	Patrick Merias	52292	discussion		Decision
R1-1610925	Way Forward on dynamic resource sharing between eMBB and URLLC in DL	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610926	Correction on MPDCCH transmission without repetition	Huawei, HiSilicon	Patrick Merias	52292	CR		Decision
R1-1610927	Way Forward on eMBMS enhancements	Ericsson, Qualcomm, Intel, Nokia, ASB, BBC, IRT, EBU	Patrick Merias	52292	discussion		Decision

R1-1610928	Way Forward on PRS-Based RSRP/RSRQ Measurement and Reporting for PRS-Based Beacon	Nokia, Alcatel-Lucent Shanghai Bell	Patrick Merias	52292	discussion		Decision
R1-1610929	LS response on DFN offset	RAN1, Ericsson	Patrick Merias	52292	LS out		Decision
R1-1610930	LS response on Exceptional Pool Handling for V2X	RAN1, Ericsson	Patrick Merias	52292	LS out		Decision
R1-1610931	WF on channel coding observations for short block size	IMT, Orange, AccelerComm, Ericsson, LG, NEC	Patrick Merias	52292	discussion		Decision
R1-1610932	Way Forward on supporting 50 ms periodicity	CATT	Patrick Merias	52292	discussion		Decision
R1-1610933	Way Forward on longer CP	Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610934	Way Forward on OTDOA for eMTC	ZTE, ZTE Microelectronics, Ericsson, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610935	Outcome offline discussion on V2V maintenance	LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610936	Outcome offline discussion on V2X	LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610937	Way Forward on CSI parameters for NR	Samsung, Nokia, ASB, AT&T, CATT, NTT DOCOMO, Ericsson, Intel, LG Electronics, InterDigital	Patrick Merias	52292	discussion		Decision
R1-1610938	Outcome of Friday Offline Session on eFD-MIMO	Samsung	Patrick Merias	52292	discussion		Decision
R1-1610939	Phase 1 link level calibration results for NR MIMO	LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610940	Codebook design for up to 32 CSI-RS ports	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610941	Way Forward on MAC CE based activation/release mechanism	Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610942	Way Forward on Class A codebook enhancements	Qualcomm, LG Electronics, Xinwei	Patrick Merias	52292	discussion		Decision

R1-1610943	Offline outcome of Wednesday evening on 8.1.7.1	NTT DOCOMO	Patrick Merias	52292	discussion		
R1-1610944	CR for clarification on A-CSI without hopping	Qualcomm Incorporated, Samsung	Patrick Merias	52292	CR		Decision
R1-1610945	CR for clarification on A-CSI without hopping	Qualcomm Incorporated, Samsung	Patrick Merias	52292	CR		Decision
R1-1610946	Way Forward on URLLC HARQ	Intel	Patrick Merias	52292	discussion		Decision
R1-1610947	Way Forward on MUST control operation	Nokia, Alcatel-Lucent Shanghai Bell, NEC	Patrick Merias	52292	discussion		Decision
R1-1610948	Way Forward on power ratios for Case 1 and 2	Huawei, HiSilicon, Qualcomm, Nokia, ASB	Patrick Merias	52292	discussion		Decision
R1-1610949	Way Forward on forward compatibility for NR	Samsung, LG Electronics, Nokia, ASB, Ericsson, Huawei, HiSilicon, Qualcomm, AT&T, Panasonic	Patrick Merias	52292	discussion		Decision
R1-1610950	WF on interference measurement for CSI acquisition	Qualcomm, Huawei, HiSilicon, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610951	Way Forward on LLS evaluation assumption for control channel evaluation in URLLC	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610952	Way Forward on Semi-static resource sharing between URLLC and eMBB	LG Electronics, Panasonic	Patrick Merias	52292	discussion		Decision
R1-1610953	Way Forward on carrier aggregation	Huawei, HiSilicon, Nokia, Alcatel-Lucent Shanghai Bell, NTT DOCOMO, Qualcomm, ZTE	Patrick Merias	52292	discussion		Decision
R1-1610954	WF on synchronization and carrier rasters	Huawei, HiSilicon, Ericsson, NTT Docomo, Fujitsu	Patrick Merias	52292	discussion		Decision
R1-1610955	WF on channel model for Rural macro scenario	Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610956	WF on Common Features and General Framework of MA Schemes	Huawei, HiSilicon, CATR, CATT, CMCC, Samsung, ETRI, MediaTek	Patrick Merias	52292	discussion		Decision

R1-1610957	WF on Further Summary of LLS Results	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610958	WF on Grant-free URRLC Performance Evaluations	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1610959	WF on Updated Link Level Evaluation Assumptions for Initial Access in NR	Qualcomm, NTT DOCOMO, Samsung, Intel	Patrick Merias	52292	discussion		Decision
R1-1610960	Way Forward on RACH preamble	NTT DOCOMO, Intel, Sharp, ZTE	Patrick Merias	52292	discussion		Decision
R1-1610961	Way Forward on O2I model for rural scenario	Huawei, HiSilicon, CATT, CATR, CMCC	Patrick Merias	52292	discussion		Decision
R1-1610962	Way Forward on Unified RACH Procedure	ZTE, ZTE Microelectronics, NTT DOCOMO, Nokia, Alcatel-Lucent Shanghai Bell, Sharp, Intel	Patrick Merias	52292	discussion		Decision
R1-1610963	Way Forward on Group-based beam management	ZTE	Patrick Merias	52292	discussion		Decision
R1-1610964	WF on Beam Recovery	Samsung, Qualcomm, Intel, KT, LGE, Ericsson	Patrick Merias	52292	discussion		Decision
R1-1610965	WF on SLS/LLS results summary	LG Electronics	Patrick Merias	52292	discussion		Decision
R1-1610966	Draft LS on V2X UE transmission chain	Huawei	Patrick Merias	52292	LS out		Decision
R1-1610967	WF on MIMO transmisison techniques in NR	LG Electronics, Qualcomm, KT	Patrick Merias	52292	discussion		Decision
R1-1610968	Way Forward on search space of NB-IoT SC-PTM	Huawei, HiSilicon, ZTE	Patrick Merias	52292	discussion		Decision
R1-1610969	Draft LS on SC-MCCH transmission in NB-IoT	HiSilicon	Patrick Merias	52292	LS out		Decision
R1-1610970	Draft LS on collisions between SC-PTM and Paging in NB-IoT	HiSilicon	Patrick Merias	52292	LS out		Decision
R1-1610971	Way Forward on the definition of beam reciporcity	Samsung, Qualcomm, InterDigital, Intel, IITM, IITH, CeWIT, Tejas Networks, KT, MediaTek, AT&T, Verizon, Motorola Mobility, Reliance Jio	Patrick Merias	52292	discussion		Decision

R1-1610972	[DRAFT] LS on Multipath RSTD reporting and CRS usage together with PRS	Ericsson, Intel	Patrick Merias	52292	LS out		Decision
R1-1610973	WF on prioritizing V2X SL TX over WAN TX	NTT DOCOMO, LGE, ZTE, NOKIA, Alcatel-Lucent Shanghai Bell, CATT, Samsung, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610974	Outcomes of Thursday offline session on NR MIMO	Samsung	Patrick Merias	52292	discussion		Decision
R1-1610975	WF on DL measurement for L3 mobility	Samsung, LG Electronics, NTT DOCOMO, AT&T, Ericsson, Intel	Patrick Merias	52292	discussion		Decision
R1-1610976	WF on Updated Link Level Evaluation Assumptions for RACH Preamble	Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610977	WF on V2V support for TDD	Intel, CATT	Patrick Merias	52292	discussion		Decision
R1-1610978	Way Forward on NR RACH procedure	Huawei, HiSilicon, NTT Docomo, Qualcomm, ETRI, Intel, Nokia	Patrick Merias	52292	discussion		Decision
R1-1610979	[DRAFT] LS on NR RACH procedure	Huawei	Patrick Merias	52292	LS out		Decision
R1-1610980	Way Forward on Beam management	CATT	Patrick Merias	52292	discussion		Decision
R1-1610981	Way forward on observations of eMBB data channel coding for short block length	InterDigital	Patrick Merias	52292	discussion		Decision
R1-1610982	WF on NR channel coding selection	CMCC	Patrick Merias	52292	discussion		Decision
R1-1610983	WF on SRS-based UL link adaptation	LG Electronics, CATT, Huawei, HiSilicon, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610984	Way Forward on Basics of LDPC Design	Ericsson, Intel, Qualcomm, NTU, Nokia, ASB, LG, Samsung	Patrick Merias	52292	discussion		Decision
R1-1610985	[DRAFT] Reply LS on A New PRACH Cyclic Shift Restriction Set	Huawei	Patrick Merias	52292	LS out		Decision
R1-1610986	WF on Updated Link Level Evaluation Assumptions for RACH Preamble	Qualcomm	Patrick Merias	52292	discussion		Decision

R1-1610987	WF on Updated Link Level Evaluation Assumptions for Initial Access in NR	Qualcomm, NTT DOCOMO, Samsung, Intel	Patrick Merias	52292	discussion		Decision
R1-1610988	[Draft] LS on supported modulations for Sidelink V2X	Ericsson	Patrick Merias	52292	LS out		Decision
R1-1610989	LS on supported modulations for Sidelink V2X	RAN1, Ericsson	Patrick Merias	52292	LS out		Decision
R1-1610990	[Draft] LS on NR RACH Procedure	Huawei	Patrick Merias	52292	LS out		Decision
R1-1610991	WF on Updated System Level Evaluation Assumptions for Initial Access in NR	Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1610992	LS on NR RACH Procedure	RAN1, Huawei	Patrick Merias	52292	LS out		Decision
R1-1610993	Way forward on observations of eMBB data channel coding for large block length	InterDigital	Patrick Merias	52292	discussion		Decision
R1-1610994	Way Forward on timing relationships of 2 HARQ processes for NB-IoT enhancement	Huawei, HiSilicon, Deutsche Telekom, Vodafone, China Unicom, IITH, CEWIT, IITM, Tejas Networks, Reliance Jio, Ericsson, ITL, Lenovo, Neul, Potevio, u-blox, Sony	Patrick Merias	52292	discussion		Decision
R1-1610995	Way Forward on dynamic resource sharing between eMBB and URLLC in DL	Huawei, HiSilicon, CATR,Potevio,Samsung	Patrick Merias	52292	discussion		Decision
R1-1610996	Draft CR on UL CWS adjustment for eLAA in 36.213	Huawei, HiSilicon, Qualcomm, Broadcom, LGE, Ericsson, Intel	Patrick Merias	52292	draftCR		Discussion
R1-1610997	WF on Channel Coding Design for NR	Ericsson, LG	Patrick Merias	52292	discussion		Decision
R1-1610998	CR for RI transmission on PUSCH for LAA Scells	Qualcomm	Patrick Merias	52292	CR		Decision
R1-1610999	WF on UL Power Control	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1611000	LS on V2X UE transmission chain	RAN1, Huawei	Patrick Merias	52292	LS out		Decision

R1-1611001	void	ETSI	Patrick Merias	52292	other		
R1-1611002	void	ETSI	Patrick Merias	52292	other		
R1-1611003	void	ETSI	Patrick Merias	52292	other		
R1-1611004	void	ETSI	Patrick Merias	52292	other		
R1-1611005	Way Forward on UCI transmission for NR	LG Electronics, Intel, Panasonic	Patrick Merias	52292	discussion		Decision
R1-1611006	Draft LS on configuration of NPRS power for NB-IoT downlink positioning	Huawei	Patrick Merias	52292	LS out		Decision
R1-1611007	Correction on periodic CSI transmission	LG Electronics	Patrick Merias	52292	CR		Decision
R1-1611008	System-level analysis of UL NOMA schemes	Intel Corporation	Patrick Merias	52292	discussion		
R1-1611009	Draft LS for SRS Carrier-Based Switching Agreements	Huawei	Patrick Merias	52292	LS out		Decision
R1-1611010	Evaluation Assumptions for NR Network Coordination	Samsung, Intel, ZTE, ZTE Microelectronics, Huawei	Patrick Merias	52292	discussion		Decision
R1-1611011	WF on RACH preamble evaluation assumptions	Nokia, Alcatel-Lucent Shanghai Bell, NTT DOCOMO	Patrick Merias	52292	discussion		Decision
R1-1611012	Way Forward on evaluation assumptions for tracking of phase rotation and/or frequency offset	LG Electronics, Nokia, Huawei, Samsung, Qualcomm, InterDigital, KT, ZTE	Patrick Merias	52292	discussion		Decision
R1-1611013	Way Forward on Remaining Issues on Hybrid CSI	Samsung, Ericsson	Patrick Merias	52292	discussion		Decision
R1-1611014	Way Forward on Beam management	CATT, CATR, CMCC, Xinwei, Samsung	Patrick Merias	52292	discussion		Decision
R1-1611015	WF on Assumptions for Comparing Different SYNC Multiplexing Techniques	Qualcomm	Patrick Merias	52292	discussion		Decision

R1-1611016	Way Forward on P-UE sensing timeline in partial sensing	Huawei, HiSilicon, Sequans, ZTE, Sony	Patrick Merias	52292	discussion		Decision
R1-1611017	[DRAFT]LS on FeMTC VoLTE enhancements	Huawei	Patrick Merias	52292	LS out		Decision
R1-1611018	Way Forward for Quantized Advanced CSI Feedback Structure	Ericsson, Huawei, HiSilicon, ZTE, ZTE Microelectronics, CATT, Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1611019	WF on timing relationship for 2 HARQ processes for Rel-14 NB-IoT	MediaTek, Qualcomm, DoCoMo, AT&T, Softbank, ITRI, Sharp, MTI, APT, Xinwei, ZTE, ZTE Microelectronics, KDDI	Patrick Merias	52292	discussion		Decision
R1-1611020	Correction of typos due to wrong implementation of CR0283 “Clarification of valid subframe in eMTC”	MCC, Qualcomm	Patrick Merias	52292	CR		Decision
R1-1611021	Draft CR on trigger monitoring timeline for triggered grants in eLAA	Qualcomm Incorporated	Patrick Merias	52292	draftCR		Discussion
R1-1611022	Draft CR on UL CWS adjustment for eLAA in 36.213	Huawei, HiSilicon, Qualcomm, Broadcom, LGE, Ericsson, Intel	Patrick Merias	52292	CR		Decision
R1-1611023	Comparison of OFDMA vs LSSA system level UL performance	ETRI	Chanho Yoon	60029	other		
R1-1611024	Offline Thursday discussion summary of initial access for NR	NTT DOCOMO	Patrick Merias	52292	discussion		Decision
R1-1611025	CR on trigger monitoring timeline for triggered grants in eLAA	Qualcomm Incorporated	Patrick Merias	52292	CR		Decision
R1-1611026	Reply LS on CSI measurement ambiguity in LAA	RAN1, LG Electronics	Patrick Merias	52292	LS out		Decision
R1-1611027	Correction on CSI reference resource definition in LAA	LG Electronics	Patrick Merias	52292	CR		Decision
R1-1611028	Correction on CSI reference resource definition in LAA	LG Electronics	Patrick Merias	52292	CR		Decision

R1-1611029	Correction on CSI measurement in LAA	LG Electronics	Patrick Merias	52292	CR		Decision
R1-1611030	Correction on CSI measurement in LAA	LG Electronics	Patrick Merias	52292	CR		Decision
R1-1611031	Response LS to IEEE 802.11 regarding LAA	RAN1, Qualcomm	Patrick Merias	52292	LS out		Decision
R1-1611032	LS on configuration of NPRS power for NB-IoT downlink positioning	RAN1, Huawei	Patrick Merias	52292	LS out		Decision
R1-1611033	LS on SC-MCCH transmission in NB-IoT	RAN1, HiSilicon	Patrick Merias	52292	LS out		Decision
R1-1611034	LS on collisions between SC-PTM and Paging in NB-IoT	RAN1, HiSilicon	Patrick Merias	52292	LS out		Decision
R1-1611035	WF on synchronization and carrier rasters	Huawei, HiSilicon	Patrick Merias	52292	discussion		Decision
R1-1611036	WF on DL control channel design	Huawei, HiSilicon, Qualcomm, ZTE	Patrick Merias	52292	discussion		Decision
R1-1611037	Way Forward on phase continuity of DL precodong	Qualcomm, Huawei, HiSilicon, Xinwei, Ericsson, ZTE, ZTE Microelectronics, Intel	Patrick Merias	52292	discussion		Decision
R1-1611038	WF on Updated System Level Evaluation Assumptions for Initial Access in NR	Qualcomm	Patrick Merias	52292	discussion		Decision
R1-1611039	Offline outcome of Thursday afternoon on 8.1.7	NTT DOCOMO	Patrick Merias	52292	discussion		
R1-1611040	Offline outcome of Thursday afternoon on 8.1.2	NTT DOCOMO	Patrick Merias	52292	discussion		
R1-1611041	Way Forward on bandwidth adapatation in NR	MediaTek, Acer, CHTTL, III, Panasonic, Ericsson, Nokia, ASB, Samsung, LG, Intel	Patrick Merias	52292	discussion		Decision
R1-1611042	Draft LS on L1 parameters for Carrier-Based Switching	Huawei	Patrick Merias	52292	LS out		Decision
R1-1611043	Discussion about Mini-slots	ZTE	Patrick Merias	52292	discussion		
R1-1611044	Way Forward on DL MIMO Transmission	Huawei, HiSilicon, Ericsson, CATT	Patrick Merias	52292	discussion		Decision

R1-1611045	Correction on downlink power allocation for SC-PTM	TD Tech, Huawei	Patrick Merias	52292	CR		Decision
R1-1611046	Way Forward on SRS transmission	CATT, Nokia, ASB	Patrick Merias	52292	discussion		Decision
R1-1611047	Way Forward on Network Coordination for Advanced Receivers	Samsung, Intel, MediaTek, Orange, Vodafone, IITH, Tejas Networks, IITM, KDDI, CeWiT, Reliance Jio	Patrick Merias	52292	discussion		Decision
R1-1611048	Summary of RAN1 agreements for Rel-14 FeMTC	Ericsson	Patrick Merias	52292	other		Information
R1-1611049	LS for SRS Carrier-Based Switching Agreements	RAN1, Huawei	Patrick Merias	52292	LS out		Decision
R1-1611050	LS on L1 parameters for Carrier-Based Switching	RAN1, Huawei	Patrick Merias	52292	LS out		Decision
R1-1611051	LS regarding agreements for FeMBMS	RAN1, Qualcomm	Patrick Merias	52292	LS out		Decision

This paper shows that LDPC (and polar) decoders have a fundamental drawback, which results in poor information throughput, latency, hardware efficiency and area efficiency at low and medium coding rates. A comprehensive survey of 100 ASICs is used to show that compared to flexible LDPC decoders, flexible turbo decoders offer very significant improvements in these four hardware characteristics at low and medium coding rates. This motivates the selection of flexible turbo codes for low and medium coding rates and inflexible 20 Gbps LDPC decoders for high coding rates.		126	8.1.3.1	Channel coding	0	**noted**

This paper shows that polar (and LDPC) decoders have a fundamental drawback, which results in poor information throughput, latency, hardware efficiency and area efficiency at low and medium coding rates. A comprehensive survey of 150 hardware implementations is used to evaluate the maturity of polar decoders and show that compared to flexible polar decoders, flexible turbo decoders offer very significant improvements in these four hardware characteristics at low and medium coding rates.		126	8.1.3.1	Channel coding	0	**noted**

In this contribution, we provide the summary of link level simulation results of candidate waveforms for NR. We analyze and summarize the results for various cases.		120	8.1.1.1	Waveform	0	**available**
In this contribution, we describe the role of network in choosing the waveform with simulation results.		120	8.1.1.1	Waveform	0	**noted**
In this contribution, we provide our link level simulation results for channel coding schemes for control channel.		126	8.1.3.1	Channel coding	0	**available**
The contribution discusses frame structure design aspects considering key requirements for supporting for eMBB, URLLC, and forward compatibility for wireless data/control backhaul and relays for NR.		124	8.1.2.2	Frame structure	0	**available**

The contribution discusses PHY layer aspects related to initial access and mobility, considering key design requirements for supporting for eMBB, URLLC, and forward compatibility for wireless data/control backhaul and relays for NR.		134	8.1.5	Aspects related to initial access and mobility	0	**available**
In this contribution, we share our view on the NR MIMO CSI feedback framework, which we believe should be generic and adapt to channel environment, including different types of CSI feedback and MIMO transmission schemes. In particular, we view the total MIMO channel as having multiple components from a feedback perspective, where the CSI feedback granularity for each component can be dynamically adjusted by the UE.		132	8.1.4.4	Reference signal design and QCL	0	**noted**

This is a discussion paper on the basic time domain structure, analyze motivation and key points of the unified NR frame structure, then give our views on the unified NR frame structure design for grant-based and grant-free access, and at last provide proposals.		124	8.1.2.2	Frame structure	0	**available**
In this paper we discuss the different design aspect of grant-free transmission and make some proposals.		145	8.1.7.2	Scheduling/HARQ mechanism	0	**available**
This is a discussion paper on where we present our views on high frequency band of unlicensed spectrum in NR and make some proposals.		147	8.1.8	Other	0	**available**
This is a discussion paper on requirements, usage scenarios, operation modes and some design considerations for NR operation in unlicensed spectrum and also provide some observations and proposals.		147	8.1.8	Other	0	**available**
This is a discussion paper on we discuss details of V2X SPS resource configuration and trigger/release indication on Sidelink and Uu, and made some proposals.		33	7.2.1.1.1	DCI design to support multiple SPS configurations	0	**available**

This is a discussion paper on the details of random selection by P-UEs and proposals are made.		36	7.2.1.2.1	Details of random selection by pedestrian UEs	0	**available**
This discussion paper focused on partial sensing for P-UEs and includes the some proposals.		37	7.2.1.2.2	Details of resource selection using partial sensing by pedestrian UEs	0	**available**
In this contribution, we discussed some schemes for coexistence between DSRC and LTE-based V2V on the same channel and provide some proposals.		39	7.2.1.3	Long-term basis co-channel coexistence between DSRC/IEEE 802.11p and LTE PC5 for V2V operating over the same frequency channels	0	**available**
In this paper, we discuss measurement metric of congestion and present some schemes for congestion control and make some proposals.		42	7.2.1.5.1	Congestion control for PC5-based V2X	0	**available**
In this paper, we discuss the remaining details of sidelink synchronization and make some proposals.		44	7.2.1.5.3	Remaining enhancement to sidelink synchronization	0	**available**
In this contribution, we discuss some aspects about support traffic with smaller periodicity, the contents include existing technical analysis and necessary enhancement and made some proposals.		46	7.2.1.5.5	Support for traffic with smaller periodicity on PC5 based V2V using shorter resource reservation period	0	**available**
This is a TP on PSBCH		28	7.1.8	Maintenance of Release 14 V2V services based on LTE sidelink	0	**available**

This is a discussion paper on discussion on [3] dB offset with PSCCH and PSSCH.		28	7.1.8	Maintenance of Release 14 V2V services based on LTE sidelink	0	**noted**
		120	8.1.1.1	Waveform	0	**noted**

Dear all,

Please enclosed is a preliminary version of the report from the biggest little city in the world… ☺
Congratulations→ 75% of the registered delegates have signed in to the meeting – it's a sort of record since the electronic check-in tool is in place.
The last minute debate raised in RAN1#87 regarding the number of contributions was somehow justified…
2613 contributions are uploaded to 3GPP server
Unfortunately, 3GU Tdoc list is not yet fully reflecting the status of all these documents – more effort required here!
Please check the list of agreed CRs listed in the annex B – and the minutes under AI 6.1 and 7.2 – where I noted the different corrections I made further to the checking of all CRs going to plenary…
BR
P

Table of contents

1 Opening of the meeting ... 97
1.1 Call for IPR ... 97
1.2 Competition law statement ... 97
1.3 Network usage conditions ... 97
2 Approval of Agenda ... 97
3 Approval of Minutes from previous meeting ... 108
4 Incoming Liaison Statements ... 108
5 UTRA ... 1412
5.1 Maintenance of UTRA Releases 4 – 13 ... 1412
5.2 Multi-Carrier enhancements for UMTS - WID in RP-161259. ... 1412
5.2.1 Remaining issues for the introduction of the new configurations ... 1412
5.2.2 CRs review ... 1412
5.2.3 Other ... 1412
5.3 DTX/DRX enhancements in CELL_FACH - WID in RP-160185. ... 1513
6 E-UTRA ... 1513
6.1 Maintenance of E-UTRA Releases 8 – 14 ... 1513
6.1.1 Maintenance of E-UTRA Release 8 – 12 ... 1513
6.1.2 Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers ... 1513
6.1.3 Maintenance of Release 13 licensed-assisted access to unlicensed spectrum ... 1513
6.1.4 Maintenance of Release 13 elevation beamforming/full-dimension MIMO for LTE ... 1614
6.1.5 Maintenance of Release 13 further LTE physical layer enhancements for MTC ... 1614
6.1.6 Maintenance of Release 13 NB-IoT ... 1614
6.1.7 Maintenance of Release 14 Enhanced Licensed-Assisted Access to Unlicensed Spectrum ... 1816
6.1.8 Maintenance of Release 14 V2V services based on LTE sidelink ... 2018
6.1.9 Other ... 2321
6.2 LTE Release 14 ... 2321
6.2.1 LTE-based V2X Services - WID in RP-161894 ... 2321

3GPP TSG RAN WG1 Meeting #88 **R1-17xxxxx**
Athens, Greece, 13th – 17th February 2017

Main facts summary

3GPP TSG WG RAN1 #87 meeting, hosted by the North American Friends of 3GPP, was held at the Peppermill Resort Hotel, Reno, USA.
The meeting started at 9:03 on Monday 14th November and finished at 17:17 on Friday 18th November 2016.
The number of attending delegates, having confirmed their participation through the electronic check-in application, was **491.**
Note that the number of registered was 663.

The schedule of the week was as follows:

- Monday morning: Common session on Agenda items 1, 2, 3, 4 and 6.1 (Maintenance)
- Monday afternoon:
  - Session on NB-IoT (AI 7.2.1) chaired by Matthew Baker.

- Tuesday (NR): chaired by Satoshi Nagata
- Tuesday (LTE session1): chaired by Matthew Baker
  - eMBMS enhancements for LTE (AI 7.3.5), SRS Carrier Based Switching for LTE (AI 7.3.6) and Enhancements on Full-Dimension (FD) MIMO for LTE (AI 7.3.3).
- Tuesday (LTE session2): chaired by Wanshi Chen
  - Rel-13 eMTC CRs (and possibly other CRs (e.g., LAA, MIMO, eCA), Further Indoor Positioning enhancements for UTRA and LTE (AI 7.3.7), Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1) and Support for V2V services based on LTE sidelink (AI 7.3.2).
- Tuesday (LTE session3):
  - Study on channel model for frequency spectrum above 6 GHz (AI 8.2) chaired by Tuomo Säynäjäkangas from Nokia followed by session on NB-IoT (AI 7.2.1) chaired by Brian Classon from Huawei.
- Tuesday (HSPA): Multi-Carrier enhancements for UMTS (AI 6.2) chaired by Carmela Cozzo from Huawei.

- Wednesday (NR): chaired by Satoshi Nagata
- Wednesday (LTE session1): chaired by Matthew Baker
  - Rel-13 CRs Maintenance (AI 7.1), Uplink Capacity Enhancements for LTE (AI 7.3.8), Study on Latency reduction techniques (AI 7.3.10) and Enhancements on Full-Dimension (FD) MIMO for LTE (AI 7.3.3).
- Wednesday (LTE session2): chaired by Wanshi Chen
  - Support for V2V services based on LTE sidelink (AI 7.3.2), Study on LTE-based V2X Services (AI 7.3.9) and Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1).
- Wednesday (LTE session3):
  - Study on channel model for frequency spectrum above 6 GHz (AI 8.2) chaired by Tuomo Säynäjäkangas from Nokia followed by session on NB-IoT (AI 7.2.1) chaired by Brian Classon from Huawei.
- Wednesday (HSPA): DTX/DRX enhancements in CELL_FACH (AI 6.3) chaired by Florent Munier from Ericsson followed by Maintenance.

- Thursday (NR): chaired by Satoshi Nagata
- Thursday (LTE session1): chaired by Matthew Baker
  - Rel-13 CRs Maintenance (AI 7.1), Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1), Study on Latency reduction techniques (AI 7.3.10), Enhancements on Full-Dimension (FD) MIMO for LTE (AI 7.3.3) and Downlink Multiuser Superposition Transmission for LTE (AI 7.3.4).
- Thursday (LTE session2): chaired by Wanshi Chen
  - Rel-13 eMTC CRs (AI 7.1.5), Downlink Multiuser Superposition Transmission for LTE (AI 7.3.4), Study on LTE-based V2X Services (AI 7.3.9), Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1) and Support for V2V services based on LTE sidelink (AI 7.3.2).
- Thursday (LTE session3):
  - Study on channel model for frequency spectrum above 6 GHz (AI 8.2) chaired by Tuomo Säynäjäkangas from Nokia and session on NB-IoT (AI 7.2.1) chaired by Brian Classon from Huawei.

- Friday: Revisions. Continued offline in the morning (eLAA,…).

The list of action points that required RAN1 close follow-up is listed in Annex F (end of document).

The number of contributions for this meeting was xxxx, and those documents were categorized as followed.

Agenda Item	Input Document	Treated Document
All

3GPP TSG RAN WG1 Meeting #88 **R1-17xxxxx**
Athens, Greece, 13th – 17th February 2017

1 Opening of the meeting

Mr Satoshi Nagata (RAN1 Chairman) welcomed the participants of the RAN WG1 87 meeting and opened the meeting at 09:03. Mr Gary Jones from T-Mobile USA welcomed the delegates on behalf of the North American Friends of 3GPP, Alcatel Lucent, AT&T, BlackBerry, Cisco, DISH, Ericsson, Intel, InterDigital Communications, Motorola Solutions, NextNav, QUALCOMM, Sprint, T-Mobile USA and Verizon Wireless, and detailed the domestic arrangements for the full week.

1.1 Call for IPR

The attention of the members of this Technical Specification Group was drawn to the fact ***that 3GPP Individual Members have the obligation*** *under the IPR Policies of their respective Organizational Partners to* ***inform their respective*** *Organizational Partners* ***of Essential IPRs they become aware of****.*
The members take note that they are hereby invited:

- *to investigate whether their organization or any other organization owns IPRs which were, or were likely to become Essential in respect of the work of 3GPP.*
- *to notify their respective Organizational Partners of all potential IPRs, e.g., for ETSI, by means of the IPR Information Statement and the Licensing declaration forms (e.g. see the ETSI IPR forms http://webapp.etsi.org/Ipr/).*

1.2 Competition law statement

The Chairman also drew Member's attention to the fact that 3GPP activities are subject to antitrust and competition laws and that compliance with said laws is therefore required of any participant of this WG meeting including the Chairman and Vice Chairmen.
In case of question, please contact your legal counsel.
The present meeting will be conducted with strict impartiality and in the interests of 3GPP.
Furthermore, the Chairman reminded Members that timely submission of work items/contributions in advance of WG meetings is important to allow for full and fair consideration of such matters.

1.3 Network usage conditions

The PCG has laid down the following network usage conditions:

Users shall not use the network to engage in illegal activities. This includes activities such as copyright violation, hacking, espionage or any other activity that may be prohibited by local laws.

Users shall not engage in non-work related activities that consume excessive bandwidth or cause significant degradation of the performance of the network.
Since the **network is a shared resource**, users should exercise some basic etiquette when using the 3GPP network at a meeting. It is understood that high bandwidth applications such as downloading large files or video streaming might be required for business purposes, but delegates should be strongly discouraged in performing these activities for personal use. Downloading a movie or doing something in an interactive environment for personal use essentially wastes bandwidth that others need to make the meeting effective. The meeting chairman should remind end users that the network is a shared resource; the more one user grabs, the less there is for another. Email and its attachments already take up significant bandwidth (certain email programs are not very bandwidth efficient). In case of need the chair can ask the delegates to restrict IT usage to things that are essential for the meeting itself.

1. DON'T place your WiFi device in ad-hoc mode
2. DON'T set up a personal hotspot in the meeting room
3. DO try 802.11a if your WiFi device supports it
4. DON'T manually allocate an IP address
5. DON'T be a bandwidth hog by streaming video, playing online games, or downloading huge files
6. DON'T use packet probing software which clogs the local network (e.g., packet sniffers or port scanners)

2 Approval of Agenda

R1-1611453 **Draft Agenda of RAN1#87 meeting** **RAN1 Chair**
Satoshi Nagata (Chairman) proposed the agenda for the meeting, as well the schedule of the week.
Discussion: Swap of meeting rooms in order to allow Channel Coding session in a larger room that originally planned.
Ericsson's comment→ make sure interested companies in eMTC and VoLTE can join both sessions (Thursday sessions) as there will likely be potential agreements that may have impacts to both WIs.

Petitioners' Exhibit 1007, p. 1183
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The agenda is approved.

3 Approval of Minutes from previous meeting

R1-1611081 **Final Report of 3GPP TSG RAN1 #86bis v1.0.0 ETSI**

The document was presented by Patrick Mérias (ETSI Mobile Competence Center) and provides the outcomes of last meeting in Portugal.

Discussion: MCC→ recalled a few rather simple working rules:

- when requesting Tdoc numbers during online sessions – keep MCC aware of any changes affecting the Tdoc information (title, agenda item, tdoc type) versus to the one used while requesting for the numbers
- electronic check-in is important for host to plan and prepare good meeting facilitites
- avoid attaching uncompressed and large documents to email(s) when sharing information in offline discussions → to ease the use of email reflectors and avoid traffic issues during 3GPP mega-meeting.

Decision: The document is approved.

4 Incoming Liaison Statements

LAA related

R1-1611553 **Draft LS response to 802.11 regarding LAA Qualcomm Incorporated**

The document (reply to R1-167908) was presented by Srinivas Yerramalli from Qualcomm.

Discussion: Broadcom has sent comments → will be discussed off line with Qualcomm.

Decision: The document is noted. Continue offline discussions until Friday – (Qualcomm)

LS response to IEEE

Thursday

R1-1613531 **Draft LS response to 802.11 regarding LAA Qualcomm Incorporated**

Decision: The document is noted - revisit on Friday.

Friday: Revised draft LS response in R1-1613694 is endorsed and final LS is approved in R1-1613770.

VoLTE

R1-1611449 **LS on Category M1 UE and VoLTE RAN5, Ericsson**

The document was presented by Johan Bergman from Ericsson and informs about RAN5 WA that a conformant Rel-13 Category M1 UE (operating in CE Mode A or CE Mode B) can be capable of supporting IMS including VoLTE service.

Discussion: No action for RAN1.

Decision: The document is noted.

R1-1611089 **Response LS on Category M1 UE and VoLTE RAN2, Ericsson**

The document was presented by Johan Bergman from Ericsson and RAN2 confirms that:

- a conformant Rel-13 Category M1 UE can be capable of supporting IMS including VoLTE service when operating in coverage requiring CE Mode A. When operating in coverage requiring high number of repetitions, VoLTE latency requirements might not be met.
- It is not likely that a Cat M1 UE (that supports optional capability for CE mode B) can support IMS including VoLTE service when operating in coverage requiring CE Mode B. CE mode B has not been designed with delay-sensitive services such as VoLTE in mind.

Discussion: No action for RAN1.

Decision: The document is noted.

NB-IoT related

R1-1611083 **LS on coverage enhancement in SC-PTM for FeMTC and eNB-IoT RAN2, Ericsson**

The document was presented by Yutao Sui from Ericsson and asks RAN WG1 to discuss whether CE levels are defined for SC-PTM and define how physical layer coverage enhancement pointers are mapped to multicast channels, e.g. CE levels similar to PRACH, repetitions similar to unicast etc.

Discussion: Draft liaison was posted on the reflector in early morning – not submitted yet

Decision: The document is noted. Continue offline discussion w.r.t the reply LS until Wednesday – (Ericsson).

See AI 6.2.9.2

R1-1611084 **LS on NB-IoT Rel-14 RACH and Paging on non-anchor carrier RAN2, Ericsson**

The document was presented by Yutao Sui from Ericsson and asks RAN1 to take the non-anchor paging agreements into account and confirm the understanding regarding the PDCCH order, namely:

> For random access triggered by PDCCH order, RAN2 assumes that carrier, preamble/subcarrier index and the NPRACH repetition level can be explicitly indicated in the DCI format.

Decision: The document is noted. Continue offline discussion w.r.t the reply LS until Wednesday – (Ericsson)

See AI 6.2.9.3

Petitioners' Exhibit 1007, p. 1184
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

LAA related: PHR for two-stage scheduling

R1-1611085 LS on supporting PHR for two-stage scheduling RAN2, Huawei
The document was presented by Xia Yuan from Huawei. RAN2 concluded that MAC will generate a MAC PDU, including any MAC CEs upon receiving the first UL grant and submit this to lower layers. In this case, if PHR MAC CE is to be included in the MAC PDU, RAN2 agrees that PHY shall provide the PH value before completing MAC PDU construction.
Decision: The document is noted.

R1-1612381 Discussion on PHR transmission on two-step scheduled PUSCH Samsung
The document was presented by … from Samsung and suggests replying to RAN2 that RAN1 does not support PHR transmission on two-step scheduled PUSCH.
Decision: The document is noted.

R1-1612821 Discussion on PHR for two-stage scheduling Huawei, HiSilicon
The document was presented by Xia Yuan from Huawei and considers how to calculate PHR for 2-stage scheduling:

Observation 1: for legacy system, the subframe for calculation of PHR is the scheduled subframe.
Observation 2: for two-stage scheduling, if the subframe for calculation of PHR is based on a reference subframe, more accurate PHR information can be provided to eNB.
Proposal 1: For two-stage scheduling, the subframe for calculation of PHR is based on a reference subframe, i.e. 4 ms after the subframe when the first UL grant was received.

Decision: The document is noted.
R1-1612822 Draft LS reply on PHR for two-stage scheduling Huawei, HiSilicon
Continue offline discussion until Friday – (Huawei, Samsung, Qualcomm)
See AI 6.1.7

R1-1611086 LS on capabilities for 2-step scheduling for eLAA RAN2, Ericsson
The document was presented by Havish Koorapaty from Ericsson and informs about RAN2 agreement to have a capability bit for the 2-step scheduling framework.
Decision: The document is noted.

Miscellaneous

R1-1611087 LS on RAN2 agreements for mobility enhancement RAN2, Intel
The document was presented by Seunghee Han from Intel and ask RAN3 to introduce the following solutions (if found to be feasible):

1. For makeBeforeBreak: from RAN2 point of view, it is recommended to introduce X2 signaling for the target eNB to indicate to the source eNB that the UE has successfully completed the handover and as a result the source eNB can stop the data exchange with the UE. RAN3 can make the final decision.
2. Regarding to item 2, it is RAN2 understanding that the make-before-break indication should be included in the RRC container. RAN3 is kindly asked to verify if there is any issue with such approach.

Discussion: No action to RAN1.
Decision: The document is noted.

R1-1611090 Response LS on Measurement gap enhancement RAN2, Ericsson
The document was presented by Asbjorn Grovlen from Ericsoon and RAN2 agrees that UE support for the short gap is a per UE capability (not per band or per band combination). RAN2 asked RAN4 feedback on:

- In a per CC configuration of gaps, is it possible to mix Measurement Gaps (ether legacy 6ms gaps, or short 3(4) ms gaps), and Network Controlled Short Gaps (interruption gaps) on different carriers?

Discussion: No action to RAN1.
Decision: The document is noted.

R1-1611448 Response LS on the Make Before Break solution RAN3, ZTE
The document was presented by RAN1 chair on behalf of ZTE and the following two major options have been selected for further evaluation for data forwarding for handover (similar principles can be applied for DC case accordingly).

- Option 1: The source eNB starts data forwarding when it decides to stop exchanging data with the UE. The timing for starting data forwarding is determined by an implementation dependent method. The source eNB sends legacy SN Status Transfer message to the target eNB.
- Option 2: After sending RRC message triggering the handover procedure, the source eNB can continue transmitting data over the air, and forwarding the data over X2-U towards the target eNB concurrently. RAN3 is still evaluating the impact on legacy SN Status Transfer procedure related to this option 2.

RAN3 will further proceed with evaluation on the option(s) by taking RAN2 feedback into account.
Discussion: No action to RAN1.
Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1185
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1611091 Reply LS on blind detection evaluations RAN4, MediaTek
The document was presented by Peikai Liao from MediaTek and list the following RAN4 conclusions for MUST Case 3

- In DMRS-based TMs,
  - Without sufficient spatial separation of 2 co-scheduled UEs, the performance loss brought by scheduling interference through non-orthogonal DMRS port is significant, even complete interference information is available for interference cancellation.
  - The throughput degradation due to interference existence blind detection is trivial at the cost of additional UE complexity.
  - When R-ML receiver is considered, assistance information for interference modulation order is recommended for better throughput performance as well as reducing the blind detection complexity of UE.
  - When enhanced IRC receiver is considered, information on interference modulation order is not required.
  - RAN4 will further discuss if enhanced IRC or R-ML will be used for minimum performance requirement definition.
  - Summaries of the performance of R-ML and enhanced IRC receiver can be referred in R4-167245 and R4-168049.

Decision: The document is noted.

R1-1611092 LS on SRS switching time reporting RAN4, Huawei
The document was presented by Weimin Xiao from Huawei.

- For switching between carriers/aggregated carriers in the same band for a specific band, only single value is needed to be reported with the candidate values of 0us, 30us, 100us and 200us depending on UE capability.
- For switching between carriers/aggregated carriers in different bands when the switching-to band is not transmitting for a specific band pair, only single value is needed to be reported with the candidate values of 0us, 30us, 100us, 200us, 300us, 500us and 900us depending on UE capability.

Decision: The document is noted.

R1-1611093 LS on SSTD report mapping RAN4, CATT
The document was presented by Fang Chen Cheng from CATT and asks RAN2 to modify the reporting range and report mapping of SFN and subframe timing difference (SSTD) measurement as proposed.
Discussion: No action to RAN1.
Decision: The document is noted.

R1-1611094 LS response on Network Assistance for Network Synchronization in LTE RAN4, Huawei
The document was presented by RAN1 chair on behalf of Huawei.
Discussion: No action to RAN1.
Decision: The document is noted.

R1-1611444 LS on Multi-carrier enhancements for UMTS RAN2, Ericsson
The document was presented by Gerardo Medina from Ericsson and asks RAN4 to verify the following agreements for MC Enhancement

- On the common TTI boundary the legacy formula is applied.
- On non-common TTI boundary, the power allocation for the carrier configured with 2ms TTI is updated accounting for a reserved power associated to the carrier transmitting on a 10ms TTI basis which is updated only at common TTI boundaries.

Discussion: No action to RAN1.
Decision: The document is noted.

R1-1611445 LS on TTI switching for MC enhancements RAN2, Huawei
The document was presented by Carmela Cozzo from Huawei and informs both RAN1 and RAN3 of the following agreements which were made with regard to TTI switching:

- It is RAN2 working assumption that TTI switching cases between two Dual Cell E-DCH combinations can be considered
- The filtered UPH report for TTI switching can be sent on any of the carriers. The scope of the filtered UPH report is primary carrier or secondary carrier or both

Discussion: Will be treated in the UMTS session.
Decision: The document is noted.

R1-1611446 LS to RAN1 on V2V agreements RAN2, LGE
The document was presented by Hanbyul Seo from LGE and informs about V2X sidelink communication agreements made in RAN2#95bis.

- Change name of SL-D-RNTI to SL-V-RNTI.
- The UE makes the decision of whether to keep the resource or not before transmitting the last MAC PDU of a multi-transmission grant. If the UE decides to keep the resource, the reservation field in SA should be set to a non-zero value.

Petitioners' Exhibit 1007, p. 1186
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Introduce a configurable resource reservation period, other than 100ms. The values are FFS.
- The maximum value of offset of synchronisation resources relative to SFN/DFN 0 (i.e. SL-OffsetIndicator) should be changed to 159. A new Rel-14 IE is introduced in the synchronization configuration.

Discussion: Will be taken into account in V2V session.
Qualcomm → "Introduce a configurable resource reservation period, other than 100ms" need to discussed – common understanding is to stick to what we already have.
Decision: The document is noted.

R1-1611452 **Reply LS on QoS requirements for V2X SA1, Qualcomm**
The document was presented by … from Qualcomm and confirms the assumption of SA2; i.e. a V2X UE shall be able to perform ProSe Direct Communication when it cannot find a suitable cell of the selected PLMN or has received a specific reject response as per clause 4.5.6 of TS 23.303.
Discussion: No action to RAN1.
Decision: The document is noted.

R1-1611447 **LS Response on introducing a new special subframe configuration RAN3, CATT**
The document was presented by Xueming Pan from CATT. RAN3 agrees to transfer the new defined special subframe configuration 10 (from Rel-14 to enable PUSCH transmission in UpPTS) to the neighbour eNBs via X2 interface.
Decision: The document is noted.

NR related
R1-1611082 **Characteristics of terrestrial IMT systems for frequency sharing / interference analysis in the frequency range** between 24.25 GHz and 86 GHz ITU-R WP 5D
The document was presented by RAN1 chair on behalf of ITU-R and welcomes further input on the parameters, according to the deadline for contributions to the February 2017 WP 5D meeting 26.
Decision: The document is noted.

R1-1611088 **LS on RAN2 agreements for NR DL-based mobility and Cell definition RAN2, Ericsson**
The document was presented by Asbjorn Grovlen from Ericsson and provides RAN2 agreements w.r t DL-based mobility in RRC_CONNECTED mode. As it can be seen from the RAN2 agreements, one of the open issues was how the cell in connected relates to the cell in Idle:

- What are the RAN1 assumptions on whether the signals (e.g. reference and/or synchronisation signals) supporting idle or connected mode operations are transmitted in the same manner or not such as in terms of beamforming configuration (e.g. single beam, multi-beam)?

Decision: The document is noted. Continue offline discussion until Tuesday trying to draw a reply LS to RAN2 – (Samsung, Ericsson)
R1-1612385 [Draft] Reply LS on RAN2 agreements for NR DL-based mobility and cell definition Samsung
R1-1612386 Discussion on NR DL-based mobility and cell definition Samsung
Tuesday
R1-1613348 **Reply LS on RAN2 agreements for NR DL-based mobility and cell definition RAN1**

R1-1611450 **LS on NextGen QoS interim agreements SA2, Intel**
The document was presented by Seunghee Han from Intel and lists topics that SA2 considers to be outside of SA2 scope and within the RAN scope:

1. Any definition of AS-level QoS of DRBs and how uplink and downlink packets (with the associated NAS-level QoS profile and PDU Session information) are mapped to DRBs.
2. When and how DRBs are established for pre-authorised QoS rules.
3. Any multiplexing of QoS Flows (e.g. with the same or different QoS profile(s) belonging to the same or different PDU Session(s)) onto DRBs.

With respect to some of the QoS parameters in TR 23.799 clause 8.2 (e.g. packet delay budget, packet error rate) SA2 would like to point out that SA2 has not yet studied any values.
Discussion: No action for RAN1.
Decision: The document is noted.

R1-1611451 **Requirements for mobile backhaul/fronthaul in a G.fast Deployment Environment ITU-T Study Group 15**
The document was presented by RAN1 chair on behalf of ITU-T and raises questions on the requirements to ensure a backhaul link is useable, including those on latency, jitter and packet loss.
Decision: The document is noted.

R1-1613098 **Reply LS on Requirements for mobile backhaul/fronthaul in a G.fast Deployment Environment Nokia**
The document was presented by Karri Ranta=aho from Nokia.

Discussion: Huawei→ don't thing RAN1 needs to address all topics, would like more time trying to simplify the reply. RAN3 should be one targetted WG.
Decision: The document is noted. Continue offline discussion until Wednesday morning – (Nokia)
Friday:
R1-1613773 **[DRAFT] Reply LS on Requirements for mobile backhaul/fronthaul in a G.fast Deployment Environment Nokia**
Discussion: Shouldn't the reply be reviewed by RAN before forwarding it to ITU-T?
Decision: The document is noted, for email approval until Nov.24th – (Nokia)

The following incoming LS were received during the week:
R1-1613126 **IEEE 802 LMSC response LS on energy detection threshold in future 802.11 technologies IEEE 802** LMSC
The document was presented by RAN1 chair on behalf of IEEE and informs that IEEE 802 LMSC considers there would be significant system harm in modifying the ED threshold used by 802.11ax devices in 5 GHz band when operating at higher transmit power (>+13 dBm), and therefore the ED threshold defined for HE PHY in the 11ax amendment remains the same as that of deployed generations (i.e -62 dBm).
It requests RAN1 to consider the following:
- Indicating its interest in a continued dialog towards a future framework for efficient sharing of the 5 GHz band
- Explicitly defining support for PD-based channel access in a future release of LAA specification.
  - o IEEE 802 notes that support for both preamble detection and preamble transmission (e.g. using CTS-to-Self frames) by LAA devices, together with an alignment of the PD and ED thresholds used by LAA devices with those of 802.11 technologies, would be mutually beneficial for coexistence between deployed 802.11, 802.11ax and LAA devices. This approach would form the basis for the most efficient and fair spectrum sharing between IEEE 802 and 3GPP technologies.

Discussion: Ericsson→ might be more efficient to include any response in the existing reply LS (drafted in R1-1611553)
Decision: The document is noted.

R1-1613316 **Response LS on Use of Exceptional Pool RAN2, LGE**
Decision: The document is treated under AI 6.1.8.
R1-1613317 **LS to RAN1 on resource reservation issues RAN2, LGE**
Decision: The document is treated under AI 6.1.8.
R1-1613446 Reply LS for Voice and Video enhancement for LTE RAN2, Huawei
R1-1613592 LS on RAN2 agreements on FeMBMS RAN2, Ericsson

5 UTRA

R1-1613210 **Report of the UMTS sessions UMTS Session Chairman's Notes (Huawei)**
The document was presented by Carmela Cozzo from Huawei.
Decision: The document is endorsed and content incorporated below.

5.1 Maintenance of UTRA Releases 4 – 13

None.

5.2 Multi-Carrier enhancements for UMTS - WID in RP-161259.

5.2.1 Remaining issues for the introduction of the new configurations

R1-1612761 **Further considerations on power scaling rules for 2ms+10ms configurations Huawei, HiSilicon**
R1-1612985 **Power scaling in DC HSUPA scenarios with mixed TTI configurations Ericsson**

Conclusion: To re-use the legacy power scaling rules for DB-DC/DC HSUPA scenarios with mixed TTI configurations (10ms+2ms TTI & 2ms+10ms TTI).

5.2.2 CRs review

R1-1612760 Introduction of Multi-Carrier Enhancements for UMTS Huawei (Revised in R1-1613207)
R1-1613207 **Introduction of Multi-Carrier Enhancements for UMTS Huawei, HiSilicon, Ericsson, Qualcomm**
Decision: The document is noted and CR0345r1 to 25.212 (rel-13, B) is agreed.

5.2.3 Other

R1-1612984 **On the importance of switching the primary carrier in Multicarrier Enhancements for UMTS Ericsson**
R1-1612762 **Considerations on fast primary carrier switching Huawei, HiSilicon**

Petitioners' Exhibit 1007, p. 1188
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1612983 **L1 parameters within the scope of Multicarrier Enhancements for UMTS Ericsson**

Conclusion: L1 parameters associated with higher order modulation are TTI duration dependent (as in legacy HSUPA 4PAM will not be used in 10ms TTI).

R1-1613208 **LS to RAN2/3 on RAN1 progress on MC enhancements RAN1, Huawei**
Decision: The document is noted and LS is agreed.

5.3 DTX/DRX enhancements in CELL_FACH - WID in RP-160185.

No contributions as RAN1 is done with all the work related to the WI on "DTX/DRX enhancements in CELL_FACH", remaining is being performed in RAN2/3.

6 E-UTRA

6.1 Maintenance of E-UTRA Releases 8 – 14

Only essential corrections.
Note that individual companies can submit draft CRs to this agenda item for Rel-13 items.

R1-1613775 **Chairman's notes of AI 6.1 on CRs Ad-Hoc chair (Qualcomm) (R1-1613713)**
The document was presented by Wanshi Chen from Qualcomm.
Decision: The document is noted.

6.1.1 Maintenance of E-UTRA Release 8 – 12

R1-1611554 **Summary of email discussion on new TBS for DL 256QAM Qualcomm Incorporated**
R1-1612649 **Introduction of new Transport Block Size for DL 256QAM Qualcomm Incorporated**

Conclusion:
- There was no consensus on the usefulness of the new TBS.
  - Exemplary specification changes are shown in R1-1611554
  - The changes are intended for CRS based DL transmissions
  - There are concerns regarding which release the changes should apply
  - There are concerns how the impact on UE category should be specified

6.1.2 Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers

R1-1611555 **Summary of email discussion on eCA issues Qualcomm Incorporated**
R1-1611556 Draft CR on minimum payload size for PUCCH format 4 and PUCCH format 5 Qualcomm Incorporated

Conclusion:
- The 2nd change in R1-1611555 is endorsed
- Further discussion offline regarding the 1st change at least to aim for reaching a common understanding in RAN1, also taking into account the coding scheme if <=22 bits are supported for PUCCH formats 4/5

R1-1611557 **Draft CR on pseudo-random sequence generator for PUCCH format 4 and PUCCH format 5 and sequence group hopping for PUCCH format 4 Qualcomm Incorporated**
Decision: The CR is endorsed. Final CR to be prepared as CR0321 to 36.211 (Rel-13, F), agreed in R1-1613643.
Shadow CR is agreed as CR0322 to 36.211 (Rel-14, A) in /R1-1613644

R1-1612203 **Correction on EPDCCH candidate configuration Nokia, Alcatel-Lucent Shanghai Bell, LG Electronics**
Decision: The CR is endorsed. Final CR to be prepared as CR0808 to 36.213 (Rel-13, F), agreed in R1-1613338.

6.1.3 Maintenance of Release 13 licensed-assisted access to unlicensed spectrum

R1-1611558 **Draft Rel-13 CR on MCOT limits on carriers on which eNB performs Type B LBT Qualcomm Incorporated**
Decision: The CR is agreed as CR0800 to 36.213 (Rel-13, F) in R1-1613101.

R1-1611729 **Correction on DL CWS adjustment for LAA LG Electronics**
R1-1613117 **Correction on DL CWS adjustment for LAA LG Electronics**
R1-1613125 **Correction on DL CWS adjustment for LAA LG Electronics**
Decision: The CR is agreed as CR0801 to 36.213 (Rel-13, F) in R1-1613128 .
R1-1613149 **Correction on DL CWS adjustment for LAA LG Electronics, Intel**
Decision: The shadow CR is endorsed. Final CR to be prepared as CR0804 to 36.213 (Rel-14, A), agreed in R1-1613181.

Petitioners' Exhibit 1007, p. 1189
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

6.1.4 Maintenance of Release 13 elevation beamforming/full-dimension MIMO for LTE

R1-1611917 **Correction on NZP CSI-RS aggregation for Class A** **Intel Corporation, LG Electronics, Samsung**
Decision: CR0309 to 36.211 (Rel-14, A) is agreed.
R1-1612012 **Correction on NZP CSI-RS aggregation for Class A** **Intel Corporation, LG Electronics, Samsung**
Decision: CR0296r1 to 36.211 (Rel-13, F) is agreed, and supersedes the previous version agreed in R1-1610451 (RAN1#86bis).

6.1.5 Maintenance of Release 13 further LTE physical layer enhancements for MTC

R1-1611559 **DCI for SPS** **Qualcomm Incorporated**
Continue discussion offline – Alberto (Qualcomm)
Decision: Agreed as CR0817 to 36.213 (Rel-13, F) in R1-1613252 and shadow CR0818 to 36.213 (Rel-14, A) in R1-1613253.

R1-1613070 **Clarification on i_0 value** **Qualcomm Incorporated**
The second change is for further discussion offline, while the other 3 are endorsed. Alberto (Qualcomm)
Decision: Agreed as CR0301r2 to 36.211 (Rel-13, F) in R1-1613148 and shadow CR0302r1 to 36.211 (Rel-14, A) in R1-1613251. Note both CRs supersede the versions agreed in RAN1#86bis in R1-1610911/R1-1610912.

R1-1611561 **Number of MPDCCH-PRB-sets** **Qualcomm Incorporated**
Continue discussion offline – Alberto (Qualcomm)
Further revised in R1-1613388
Decision: Agreed as CR0819 to 36.213 (Rel-13, F) in R1-1613254 and shadow CR0820 to 36.213 (Rel-14, A) in R1-1613255.

R1-1611562 **UL gap applicability for CE mode A** **Qualcomm Incorporated**
Conclusion:
- The change in R1-1611562 is endorsed (summary of change, Mode A to Mode B). Final CR to be prepared as CR0319 to 36.211 (Rel-13, F), agreed in R1-1613146. Shadow CR in R1-1613147 agreed CR0320r1 to 36.211 (Rel-14, A), agreed in R1-1613256

MCC to correct revision of agreed shadow CR to rev 1

R1-1612812 **PDSCH transmission on special subframe for eMTC** **Nokia, Alcatel-Lucent Shanghai Bell**
Conclusion:
- The change in R1-1612812 is endorsed in principle. Further discussion offline which section to have the change. Final CR to be prepared as CR0812 to 36.213 (Rel-13, F), agreed in R1-1613559. Shadow CR agreed as CR0814 to 36.213 (Rel-14, A), in R1-1613258

R1-1612833 **Draft CR on RV Cycling for PUSCH and PDSCH** **Huawei, HiSilicon**
Conclusion:
- The change in R1-1612833 regarding PDSCH is endorsed. Final CR to be prepared as CR0806 to 36.213 (Rel-13, F), in R1-1613198. Shadow CR agreed as CR0807 to 36.213 (Rel-14, A), agreed in R1-1613199

R1-1613024 **SRS transmission and UL retuning for BL/CE UE** **Ericsson**
Conclusion:
- For the issue raised in R1-1613024, it is understood in RAN1 that PUSCH rate matches around the last SRS symbol, but still mapped to the 2nd last symbol (which got punctured)
  - No CR is necessary

R1-1613025 **Starting PRACH CE level selection for BL/CE UE** **Ericsson**
Continue discussion offline – Johan (Ericsson)
Decision: No further consideration needed in RAN1.

R1-1612359 **Mapping of MPDCCH and PDSCH** **Sequans Communications**
Late submission
Continue discussion offline
Decision: Agreed as CR0314r1 to 36.211 (Rel-13, F) in R1-1613137 and shadow CR0327 to 36.211 (Rel-14, A) in R1-1613257.
MCC: To correct typo in the release field of cover sheet.

6.1.6 Maintenance of Release 13 NB-IoT

R1-1611564 **Clarification on vShift value for CRS** **Qualcomm Incorporated**
Decision: Agreed as CR0323 to 36.211 (Rel-13, F) in R1-1613261 and shadow CR0324 to 36.211 (Rel-14, A) in R1-1613762 with space moved from beginning of line to middle of "cell-specificreference"

R1-1613051 **Correction on narrowband physical-layer cell identities definition in 36.211** **Ericsson** (Revision of R1-1613003)

Petitioners' Exhibit 1007, p. 1190
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: CR is superseded by R1-1613261.
R1-1613052 Correction on narrowband physical-layer cell identities definition in 36.211 Ericsson (Revision of R1-1613004)

R1-1612994 Correction on NPDSCH Mapping to resource elements in 36.211 Ericsson
R1-1612995 Correction on NPDSCH Mapping to resource elements in 36.211 Ericsson
Continue discussion offline (Qualcomm & Ericsson)
- The CR in R1-1612994 is endorsed

Decision: Agreed as CR0315r1 to 36.211 (Rel-13, F) in R1-1613202 and shadow CR0316r1 to 36.211 (Rel-14, A) in R1-1613203

R1-1611726 Baseband signal generation for in-band samePCI non-anchor NEC
Continue discussion offline (Sasaki, NEC)
R1-1613715 Offline discussion summary on NB-IoT baseband signal generation NEC
R1-1613565 Correction to OFDM baseband signal generation of NB-IoT NEC
Further revised in:
R1-1613714 Correction to OFDM baseband signal generation of NB-IoT NEC, NTT DOCOMO, Huawei, HiSilicon, Nokia, Alcatel-Lucent Shanghai Bell, Ericsson
Decision: The CR is endorsed. Final CR to be prepared and agreed as CR0325 to 36.211 in R1-1613768
R1-1613566 Correction to OFDM baseband signal generation of NB-IoT NEC, NTT DOCOMO, Huawei, HiSilicon, Nokia, Alcatel-Lucent Shanghai Bell, Ericsson
Decision: The CR is endorsed. Final CR to be prepared and agreed as CR0326 to 36.211 in R1-1613769

R1-1612829 Corrections on the description of carrier for NB-IoT in TS 36.213 Huawei, HiSilicon
Decision: CR0789 to 36.213 (Rel-13, F) is agreed.
R1-1612830 Corrections on the description of carrier for NB-IoT in TS 36.213 Huawei, HiSilicon
Decision: CR0790 to 36.213 (Rel-14, A) is agreed.
R1-1612831 Corrections on the Table 16.6-2: Type 1- NPDCCH common search space candidates for NB-IoT in TS 36.213 Huawei, HiSilicon
R1-1612832 Corrections on the Table 16.6-2: Type 1- NPDCCH common search space candidates for NB-IoT in TS 36.213 Huawei, HiSilicon
Conclusion:
- The CRs in R1-1612831 and R1-1612832 are agreed in principle, change the cover page "Table 16.6-2 and Table 16.6-~~2~~3". Prepare final CR in R1-1613212 and R1-1613213. Final CR is agreed as CR0791r2 to 36.213 (Rel-13, F), in R1-1613259. Shadow CR agreed as CR0792r2 to 36.213 (Rel-14, A), in R1-1613260
  - The previously agreed CR in R1-1610733 (CR 0751) and R1-1610734 (CR 0752) are superseded by those CRs

R1-1612996 Control information inconsistent handling for NB-IoT in 36.213 Ericsson
Decision: CR0796 to 36.213 (Rel-13, F) is agreed.
R1-1612997 Control information inconsistent handling for NB-IoT in 36.213 Ericsson
Decision: CR0797 to 36.213 (Rel-14, A) is agreed.

R1-1613038 Correction on DCI Format N2 in 36.212 Ericsson
R1-1613039 Correction on DCI Format N2 in 36.212 Ericsson (Revision of R1-1612998)
Conclusion:
- The CRs in R1-1613038 and R1-1613039 are agreed in principle. Update the cover page to include more details including adding the clause affected. Final CR to be prepared and agreed as CR0230r1 to 36.212 (Rel-13, F) in R1-1613204. Shadow CR0231r1 to 36.212 (Rel-14, A) is agreed in R1-1613205.

R1-1612981 BCH transport block size in NB-IOT Nokia
Late submission
Continue offline discussion especially considering RAN2's discussion on the same topic
Decision: Nokia intends to provide a CR in RAN2 to capture higher-layer truncation from 40 bits to 34 bits.

R1-1613071 NRSRP and NRSRQ measurement in NB-IoT Ericsson
Late submission
Continue offline discussion
Revised in R1-1613450 **[DRAFT] WF on NB-IoT Rel-13 NRSRP, NRSRQ & RLM measurements Ericsson**

R1-1613756 Correction on NPDCCH and NPDSCH start symbol Huawei, HiSilicon
Also supported by Ericsson

Petitioners' Exhibit 1007, p. 1191
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The CR is endorsed. Final CR to be prepared and agreed as CR0825 to 36.213 (Rel-13, F) in R1-1613776. Shadow CR0826 to 36.213 (Rel-14, A) is agreed in R1-1613777.

6.1.7 Maintenance of Release 14 Enhanced Licensed-Assisted Access to Unlicensed Spectrum

Channel access

R1-1611732 Correction on continuous transmission after the successful LBT LG Electronics
Continue offline discussion until Wednesday
Revised in R1-1613451
Decision: The CR is endorsed. Final CR agreed as CR0810 to 36.213 (Rel-14, F) in R1-1613528

R1-1611918 Correction on the UL Type 1 channel access description Intel Corporation
Decision: CR0786 to 36.213 (Rel-14, F) is agreed.

R1-1612769 Draft CR on Multi-carrier LBT for Uplink Transmission Ericsson
Agreed in R1-1613133 (CR802 to 36.213 (Rel-14, F)) by following update

> C, and if the carrier frequencies of set of carriers C is a subset of one of the sets of carrier frequencies defined in subclause 5.7.4 in [7],

Decision: Further updated to R1-1613510 (CR0802R1) (removing "draft" from the title)

R1-1611584 Draft CR on using 25us LBT for UEs on carriers without eNB Cat 4 LBT Qualcomm Incorporated
Continue offline discussion until Wednesday
Decision: Further revised in R1-1613166 – and agreed as CR0815 to 36.213 (Rel-14, F) in R1-1613482
Further offline discussion can take place as necessary for any further clarification.

R1-1611585 Draft Rel-14 CR on MCOT limits on carriers on which eNB performs Type B LBT Qualcomm Incorporated
Continue offline discussion until Wednesday
Decision: The CR is endorsed. Final CR prepared and agreed as CR0811 to 36.213 (Rel-14, A) in R1-1613506 (corresponding to R1-1613101 Cat-F)

R1-1612835 Discussion on CWS adjustment for UL Multi-carrier Transmission WILUS Inc.
Continue offline discussion until Wednesday
Conclusion:

- The following two proposals for UL CWS adjustment are aligned with RAN1 understanding
  - Proposal 1: For UL multi-carrier transmission, the UE does not adjust CWS on those carrier(s) when the UE has received UL grant(s) with Type 2 channel access signaling for one or more of the multiple carriers.
  - Proposal 2: For UL multi-carrier transmission, only carriers performing Type 1 channel access are considered.
  - No CR is necessary

PUSCH

R1-1611576 Discussion on UL resource allocation for 10MHz eLAA Qualcomm Incorporated
R1-1611577 Draft 212 CR on UL resource allocation for 10MHz eLAA Qualcomm Incorporated
R1-1611578 Draft 213 CR on UL resource allocation for 10MHz eLAA Qualcomm Incorporated
Continue offline discussion until Wednesday
Decision: Agreed as CR0235 to 36.212 (Rel-14, F) in R1-1613484.

Agreements:

- 10MHz LAA SCell uses 5 bits for resource allocation for PUSCH.
- Resource allocation is bitmap based.

Formatted: Bulleted + Level: 1 + Aligned at: 1.27 cm + Indent at: 1.9 cm

CR to be prepared in R1-1613529
Decision: Agreed as CR0816 to 36.213 (Rel-14, F) in R1-1613483.

R1-1611567 Draft CR on correction to the PUSCH start position reference and relative timing offset in UL DCI for LAA Qualcomm Incorporated
Decision: Agreed as CR0233 to 36.212 (Rel-14, F) in R1-1613134.

SRS

R1-1611582 Dicussion on simultanoeus transmission on the non-LAA and LAA Scells Qualcomm Incorporated
R1-1611583 Draft CR on SRS dropping rules for eLAA Qualcomm Incorporated
Continue offline discussion until Wednesday
Decision: Revisit next meeting

UL grant

R1-1612384 Correction on PDCCH candidate adjustments Samsung
Decision: Agreed in R1-1613136 (CR824 to 36.213) by changing the category to "F"
MCC to correct a typo in CR number – CR0804 should be read as CR0824

R1-1612613 [Draft] Corrections to EPDCCH candidate derivation procedure for eLAA in TS36.213 Sharp
Decision: Agreed as CR0803 to 36.213 (Rel-14, F) in R1-1613135.

R1-1611573 Draft CR on EPDCCH search space for LAA Qualcomm Incorporated
R1-1611730 Correction on EPDCCH candidate configuration LG Electronics
Continue offline discussion until Wednesday
Decision: The CR is endorsed. Final CR to be prepared and agreed as CR0821 to 36.213 (Rel-14, F) in R1-1613766.

R1-1612611 [Draft] Corrections to bit padding of DCI format 1A for eLAA in TS36.212 Sharp
Decision: The CR is endorsed. Prepare final CR, agreed as CR0234 to 36.212 (Rel-14, F) in R1-1613283.

R1-1612612 [Draft] Corrections to bit padding of DCI format 0B for eLAA in TS36.212 Sharp
Continue offline discussion until Wednesday
Decision: The CR is revised in **R1-1613520** and endorsed. Prepare final CR, agreed as CR0236 to 36.212 (Rel-14, F) in R1-1613485.

R1-1611588 Discussion on UE assumptions on the minimum size of ending partial subframe for receiving UL grants Qualcomm Incorporated
R1-1611589 Draft CR on UE assumptions on the minimum size of ending partial subframe for receiving UL grants Qualcomm Incorporated
Continue offline discussion until Wednesday
Decision: Revisit next meeting

R1-1612290 UL Grant Conflict Handling Panasonic
Continue offline discussion until Wednesday
Related CR is provided in:
R1-1613606 CR on the UE assumption on multiple UL grant indicating a same subframe Intel Corporation, Nokia, Alcatel-Lucent Shanghai Bell, Qualcomm, Samsung, Ericsson, LG Electronics, Huawei, HiSilicon
Decision: CR is agreed as CR0813 to 36.213 (Rel-14, F) in R1-1613486
MCC to remove "draft" from the title

R1-1612291 Maximum Usability of Two-Stage Grants Panasonic
Continue offline discussion until Wednesday
Decision: Continue offline discussion on the remaining aspects until RAN1#88

R1-1612292 CR on trigger monitoring timeline for triggered grants in eLAA Panasonic
R1-1612294 CR on validation for triggered grants in eLAA Panasonic

R1-1613443 CR on trigger monitoring timeline for triggered grants in eLAA Panasonic
Decision: The CR is endorsed. Final CR is agreed as CR0779r1 to 36.213 (Rel-14, F) in R1-1613509**.** It supersedes CR agreed in RAN1#86bis - R1-1611025.

CSI

R1-1611565 Discussion on aperiodic CSI triggering for triggered UL grants in LAA Qualcomm Incorporated
R1-1611566 Draft CR for aperiodic CSI triggering for triggered UL grants in LAA Qualcomm Incorporated
R1-1612293 Virtual CRC for Two-Stage Grants Panasonic
Continue offline discussion until Wednesday

Agreement:

- The reference subframe for trigger based UL grants is the latest valid subframe up to the subframe in which UE received PUSCH trigger A.

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm

CR to be prepared in R1-1613722 as CR0781r1. ~~Further revised in R1-1613772 by removing the word "and"~~.
Friday: It is noted that R1-1613722 may need some further revision and it is decided to withdraw R1-1613772.
R1-1613782 CR on aperiodic CSI reporting for triggered UL grants in LAA Qualcomm
Decision: CR0781r2 to 36.213 (Rel-14, F) is agreed.

Petitioners' Exhibit 1007, p. 1193
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1611574 **On simultaneous transmission of periodic and aperiodic CSI in eLAA** **Qualcomm Incorporated**
R1-1611575 Draft CR on simultaneous transmission of periodic and aperiodic CSI in eLAA Qualcomm Incorporated
R1-1611586 **Draft CR on UE assumption of LBT success for determining periodic CSI reporting Qualcomm** Incorporated
Conclusion:

- The same Rel-13 CA principle of handling collision of periodic CSI vs. aperiodic CSI across CCs in the same subframe is still applicable to CA involving LAA Scell(s).
  - The condition for determining aperiodic CSI occurrence is that LBT is assumed to be always cleared for the aperiodic CSI

Decision: The CR in R1-1611586 is endorsed. Final CR to be prepared in R1-1613476, revised and agreed in R1-1613530 (removing "draft" in title), as revision 1 of CR0809 to 36.213 (Rel-14, F).

R1-1611731 Correction on aperiodic CSI only transmission for LAA SCell LG Electronics
The CR in is endorsed. Final CR to be prepared and agreed as CR0805 to 36.213 (Rel-14, F) in R1-1613182.

PHR
R1-1611569 **Discussion on PHR reporting for triggered UL grants in LAA** **Qualcomm Incorporated**
R1-1611570 Draft CR on the PHR reporting for triggered UL grants in LAA Qualcomm Incorporated
R1-1612382 Discussion on PH value of two-step scheduling LAA SCell Samsung
R1-1612383 Draft CR on PH value of two-step scheduling LAA SCell Samsung
Continue offline discussion until Wednesday
Update in R1-1613609
R1-1613609 **Draft CR on the PHR reporting for triggered UL grants in LAA** **Qualcomm Incorporated, Samsung, LG Electronics**
Decision: Final version in R1-1613487, revised in R1-1613753, which is endorsed. Final CR to be prepared and agreed as CR0823 to 36.213 (Rel-14, F) in R1-1613771.
LS to RAN2 in:
R1-1613750 **[DRAFT] LS reply on PHR for two-stage scheduling** **Huawei, HiSilicon**
Decision: The document is noted and final LS is approved in R1-1613765.

R1-1611571 **Discussion on computing virtual PHR for LAA Scells** **Qualcomm Incorporated**
R1-1611572 Draft CR on computing virtual PHR for LAA Scells Qualcomm Incorporated
Continue offline discussion until Wednesday

TA
R1-1611579 **Maximum timing advance assumption for LAA and relation to UL grants** **Qualcomm Incorporated**
R1-1611580 Draft CR for maximum timing advance assumptions for LAA and relation to UL grants Qualcomm Incorporated
Continue offline discussion until Wednesday
Decision: Continue discussion by email until RAN1#88 (Qualcomm).

R1-1611581 **N_TA offset for LAA Scells** **Qualcomm Incorporated**
Continue offline discussion until Wednesday

TPC
R1-1612614 **Discussion on a timing issue on UL TPC for LAA Scell** **Sharp**
R1-1611568 **Draft CR for applying TPC commands for UL grants in LAA** **Qualcomm Incorporated**
Continue offline discussion until Wednesday
Revised in R1-1613598, further revised in:
R1-1613751 **Draft CR on applying TPC commands for UL grants in LAA** **Qualcomm Incorporated, Sharp**
Decision: The CR is endorsed. Final CR to be prepared and agreed as CR0822 to 36.213 (Rel-14, F) in R1-1613767.

R1-1613752 WF on TPC accumulated mode for eLAA Sharp, Huawei, HiSilicon, Intel, Kyocera, Nokia, Alcatel-Lucent Shanghai Bell, NTT DOCOMO, Qualcomm, Samsung, WILUS Inc.

6.1.8 Maintenance of Release 14 V2V services based on LTE sidelink

CR submission is only allowed by specification editors.
Note that proponent can submit discussion contribution to this A.I. which contains a possible TP.

UE decoding capability/UE category
R1-1612970 **Discussion on UE decoding capabilities** **Ericsson**

Petitioners' Exhibit 1007, p. 1194
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Proposal 1: The minimum requirements on UE decoding capabilities are sufficient to ensure decoding of all PSCCHs in a subframe and a full bandwidth data transmission in the same subframe:
- *A UE is not expected to try to decode more than 138 RBs in a subframe.*
- *A UE is not expected to try to decode more than 20 PSCCHs in a subframe.*

Proposal 2: Decoding rules are introduced to ensure that transmissions from a given UE are not systematically dropped.

Decision: The document is noted.

R1-1612577 UE Decoding Capabilities for LTE-V2V Communication Intel Corporation

Continue offline discussion until Wednesday – Ericsson, Intel, Qualcomm

R1-1613392 Summary of Offline Discussion on UE Decoding Capabilities for LTE-V2V Communication Intel Corporation

Agreements:

- For UE capability on PSCCH/PSSCH decoding,
  - UE is not expected to attempt to decode more than X PSCCHs in a subframe. UE is able to decode up to X PSCCH in a subframe.
  - UE is expected to attempt to decode at least Y RBs per subframe counting both PSCCH and PSSCH decoding RBs.
  - Two types of UE capability are defined
    - One with (X=10, Y=100), the other with (X=20, Y=136)
- FFS on avoiding systematic dropping of SA candidates
- An additional UE decoding capabilities are defined for LTE V2V sidelink communication
  - Soft buffer size for SL reception is X bits.
    - The value of X is FFS
  - The maximum number of sidelink transport block bits received within a TTI is set to [31704].
  - The maximum number of bits of a single sidelink transport block is [31704].

R1-1611734 Discussion on UE category for PC5 based V2V LG Electronics

Possible agreements:
- The maximum number of sidelink transport block bits received within a TTI is set to 40576
- The maximum number of bits of a single sidelink transport block is 40576

Continue offline discussion until Wednesday

R1-1611132 Discussion on UE decoding capability Huawei, HiSilicon
R1-1611331 Discussion on UE decoding capabilities CATT
R1-1611733 Remaining issues for PC5 based V2V LG Electronics
Proposal 3 only
R1-1613168 WF on V2V Decoding Capabilities Ericsson, Huawei, HiSilicon
R1-1613391 WF on V2V Decoding Capabilities Intel Corporation

DMRS

R1-1611329 Discussion on additional randomization on DMRS for single-subframe transmission case CATT
R1-1612387 Further randomization on DMRS and scrambling code Samsung

Proposal: No specification needed for further DMRS randomization.

Decision: The document is noted. Continue offline discussion until Wednesday

R1-1613112 WF on PSSCH DMRS randomization CATT, LGE

Proposals:
- For the single-subframe transmission, the following Tx UE behavior shall be explicitly specified:
  - Value of frequency resource location field is randomly selected among all the possible code points corresponding to the same subchannel number chosen by the Tx UE.
  - Value of retransmission index field is randomly selected between 0 and 1.

Continue discussion till next meeting
- Companies are encouraged to check whether there is an issue and if so, how to solve it

R1-1611919 PSSCH DMRS generation for sidelink V2V communication Intel Corporation
R1-1611590 Remaining issues for V2V Qualcomm Incorporated
Proposal 3 only
R1-1611733 Remaining issues for PC5 based V2V LG Electronics
Proposal 1 only

Reselection in mode 4

Petitioners' Exhibit 1007, p. 1195
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1611130 **Discussion on reselection counter in sensing** **Huawei, HiSilicon**

Observation 1: Scaling the reselection counter degrades system PRR performance for highway 70km/h scenario.
Observation 2: Scaling the counter would result in a number of UEs that experience large number of consecutive packet losses, which is not desirable for road safety applications.
Proposal 1: Keep the current SL_RESOURCE_RESELECTION_COUNTER and no scaling operation is applied.

Decision: The document is noted.

R1-1611921 **Remaining sensing and resource selection issues for sidelink V2V communication** **Intel Corporation**

Proposal 4: The resource reselection is triggered under the following conditions:

- *The time of resource reservation since the last resource reselection is expired.*
- *UE does not transmit on reserved resources for more than one second.*
  - *Note: the 2nd condition is needed only if UE transmission period can exceed 1000 ms.*

Proposal 5: Update TS 36.212 and TS 36.321 to align in time resource reselection decision and resource release indication.

- *Resource reselection probability is checked in advance when SL_RESOURCE_RESELECTION_COUNTER is equal to 1.*

Decision: The document (Proposal 4, 5 only) is noted.

R1-1612964 **Outstanding issues for mode-4 resource allocation** **Ericsson**

Observation: In current specification, in case of no MAC PDU transmission, the SL reselection counter might never reach 0. This would lead to a deadlock since the UE would not be able to perform again resource reselection.
Proposal: The UE performs resource reselection, i.e., it re-initializes the SL reselection counter and books another set of resources, whenever a configured sidelink grant is left empty.

Decision: The document is noted.

Possible agreement:

- The UE performs resource reselection, i.e., it re-initializes the SL reselection counter and books another set of resources, when the UE skips transmitting on selected subframe in x times

R1-1613316 **Response LS on Use of Exceptional Pool** **RAN2, LGE**
R1-1613317 **LS to RAN1 on resource reservation issues** **RAN2, LGE**
R1-1613472 **WF on sensing operation** **LG Electronics, CATT**

Agreements:

- Proposal on R1-1613317
  - RAN1 agrees that the issues can be solved under the current RAN1 specifications if resource reselection is triggered if any of the following three conditions is met:
    - There is no more resources in the configured sidelink grant and there is new MAC PDU to be transmitted.
    - UE does not transmit on consecutive transmission opportunities ~~reserved resources~~ for one second.
    - UE skips N consecutive transmission opportunities where N is (pre)configured from [1, 2, 3, 4, 5, 6, 7, 8, 9] and it is (pre)configured if this condition is used.

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm

Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm

Formatted: Bulleted + Level: 3 + Aligned at: 3.17 cm + Indent at: 3.81 cm

Prepare a draft LS in:

R1-1613614 **[DRAFT] Response LS on resource reservation issues** **LG Electronics**

Decision: The document is noted and final LS is approved in R1-1613778.

6.1.9 Other

R1-1612214 Correction on downlink power allocation for SC-PTM TD Tech, Huawei
Decision: CR0787 to 36.213 (Rel-14, A) is agreed.

R1-1612878 New UL/DL UE Category Combination MediaTek, CMCC
Same contribution being disucssed in RAN2.

6.2 LTE Release 14

Friday

Based on the list of agreements provided by the rapporteurs, specs editors will provide updated draft CRs for MUST, SRS, V2V, High speed that include and reflect the agreements and WA from RAN1#87. Due by Tuesday 22nd November and for email approval by Monday 28th November.

Rapporteurs for UL enhancements and eMBMS will provide their list of agreement until Monday 21st November.
Spec editors will provide draft CRs for UL enhancements and eMBMS that include and reflect the agreements and WA from RAN1#87. Due by 9th December and for email approval by Thursday 15th December.

Rapporteurs for V2X, FD-MIMO, FeMTC, NB-IoT enh., eVoLTE will provide their list of agreements until Thursday 15th December.
Specs editors will provide draft CRs for V2X, FD-MIMO, FeMTC, NB-IoT enh., eVoLTE that include and reflect the agreements and WA from RAN1#87. Due by Friday 27th January 2017.
Editors may update the draft CRs for comments received until RAN1#88 (Athens).

6.2.1 LTE-based V2X Services - WID in RP-161894

R1-1613698 Chairman's notes of AI 6.2.1 on LTE-based V2X Services Ad-Hoc chair (LGE)
The document was presented by Hanbyul Seo from LG Electronics.
Discussion:
Decision: The document is endorsed and content incorporated below.

R1-1611869 Introduction of V2X into 36.212 Huawei

Petitioners' Exhibit 1007, p. 1197
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Email approval until 8th Dec on the LS to RAN2/4 capturing all the agreements and working assumptions – Hanbyul (LGE)

Email approval until 8th Dec on the LS to RAN2 including RRC parameters – Hanbyul (LGE)

6.2.1.1 Enhancement to UL and SL SPS

6.2.1.1.1 Remaining details of DCI design

R1-1611191 Remaining issues for SPS DCI design Huawei, HiSilicon
R1-1611332 Remaining details of DCI design CATT
R1-1611591 SPS enhancements for V2X Qualcomm Incorporated
R1-1611735 Remaining details of DCI design for SL and UL SPS LG Electronics
R1-1612100 DCI format of V2X SPS resources ZTE
R1-1612112 Discussion on size alignment between SL SPS DCI and DCI format 0 Panasonic
R1-1612171 Remaining details of DCI design CMCC
R1-1612389 Support of multiple SL/UL SPS configurations Samsung

R1-1612939 DCI design for SL SPS Ericsson

R1-1613200 WF on DCI design in TDD CATT, LGE, CMCC, Huawei, HiSilicon, Samsung, Xinwei

Agreements:

~~1.~~● If the DCI for SL SPS or dynamic scheduling is transmitted in subframe n and the offset value (in two-bit field) is set to m, the time location of initial transmission is the first subframe included in the resource pool that occurs at or after subframe n+4+m.
  ~~1.~~■ Offset value is one of {0, 1, 2, 3}.
  ~~2.~~■ Applicable to both SL SPS and dynamic scheduling.
  ~~3.~~■ Subframe n can be any of DL subframes or special subframes in TDD Uu carrier.

R1-1613183 WF on remaining details of V2X UL DCI LG Electronics, ZTE, NTT DOCOMO, Samsung, Panasonic

Agreements:

~~2.~~● Confirm the following working assumptions:
  ~~1.~~■ A V2X UL SPS RNTI different from the legacy SPS C-RNTI is defined.

R1-1613184 WF on remaining details of SL DCILG Electronics, Samsung, NTT DOCOMO, Nokia, ASB, CATT, Panasonic
Continue discussion in RAN1#88.

6.2.1.1.2 Others

Including explicit release and implicit release mechanism

Petitioners' Exhibit 1007, p. 1199
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1612103 Coexistence between DSRC and LTE V2V ZTE
R1-1612930 Discussion on Coexistence Between Different Technologies for ITS Services Ericsson

Agreement:
1. Send LS to RAN to inform that RAN1 has identified the following with regard to long-term basis co-channel coexistence between DSRC/IEEE 802.11p and LTE PC5 for V2V operating over the same frequency channels:
   1. LTE PC5 for V2V can be detected by DSRC devices if DSRC devices are equipped with necessary functionalities.
      1. This detection is possible with the existing physical layer structure of LTE PC5 for V2V.
      2. If further RAN1 specification work is done to allow transmission of some sequence in the last symbol of a subframe, it might further help DSRC receivers in detecting LTE PC5.
   2. RAN can communicate with other organization to determine the need of further RAN1 specification work. RAN1 assumes that the objective is fulfilled without further RAN1 specification work if RAN provides no guidance.

Agreement:
2. Add the following to the above LS:
   1. UEs operating LTE PC5 for V2V can detect DSRC if the UEs are equipped with necessary functionalities.
      1. There is no RAN1 consensus on whether further RAN1 specification work is needed for potential benefit in detecting DSRC.
   2. RAN1 assumes that the objective is fulfilled without further RAN1 specification work if RAN provides no guidance.

R1-1613573 [Draft] LS on long-term basis co-channel coexistence between DSRC/IEEE 802.11p and LTE PC5 for V2V operating over the same frequency channels [RAN WG1], Ericsson
R1-1613735 [Draft] LS on long-term basis co-channel coexistence between DSRC/IEEE 802.11p and LTE PC5 for V2V operating over the same frequency channels Ericsson
Agreed in R1-1613574 by changing WI code to "LTE_V2X_Core"

Conclusion:
3. If RAN1 is tasked to specify a solution to further help LTE UEs to detect DSRC, a solution using transmission of some sequence in the last symbol of a subframe should be the starting point.
   1. Qualcomm thinks that the starting point can provide performance gain according to R1-1611593.

6.2.1.4 Congestion control for PC5-based V2X

R1-1611696 Discuss on the UE behaviors when congestion is observed on the UE side Guangdong OPPO Mobile Telecom.

6.2.1.4.1 Remaining details of CBR measurement

R1-1612883 On congestion control for PC5-based V2X Nokia, Alcatel-Lucent Shanghai Bell
R1-1612884 On CBR Measurement Nokia, Alcatel-Lucent Shanghai Bell
R1-1612392 Discussion on congestion control Samsung

R1-1613274 WF on congestion control Huawei, HiSilicon, NEC, OPPO
Agreement:
1. Confirm the WA (100ms in absolute time) of CBR measurement duration:
   1. RAN2 can discuss whether any high layer operation is needed on CBR measurement.
2. Additional measurement for SA pool is supported for SA-data non-adjacent case.
3. A V-UE measures all the resource pools configured as transmission pools.
   1. FFS measurement on exceptional pools.
   2. It is up to RAN2 how to report multiple measurements.
4. Adaptation of the allowed set of values of radio-layer parameters is supported for congestion control.
   1. Both eNB-assisted and UE autonomous transmission parameter (re)configuration are supported
   2. Transmission parameter (re)configuration based on CBR and priority are supported
      1. FFS which transmission parameters are (re)configured.
   3. FFS whether resource reselection is immediately triggered in the event of parameter adaptation

R1-1613642 WF on remaining issues of congestion control Huawei, HiSilicon, LGE, Ericsson, Qualcomm, Samsung, Intel
Agreement:
- An occupancy ratio metric is defined
  - CR is defined as the total number of sub-channels used by the UE for its transmissions divided by the total number of configured sub-channels over a measurement period of [1000]ms

Petitioners' Exhibit 1007, p. 1200
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Working assumption: The set of radio-layer parameters whose allowed values can be restricted by congestion control are the following:
  - Maximum transmit power (including zero power transmission)
  - Range on number of retransmissions per TB
  - Range of PSSCH RB number (according to subchannel size)
  - Range of MCS
  - Maximum limit on occupancy ratio (CR_limit)
  - FFS whether resource reservation interval needs to be included.
- Lookup table links CBR range with values of the transmission parameters for each PPPP
  - Can be configured or preconfigured. Details up to RAN2.
  - Up to 16 CBR ranges are supported
- FFS details of UE behavior, e.g.,
  - When the UE transmits MAC PDUs with different priorities.
  - When and how the UE drops packet transmissions
  - Any possible impact on sensing and resource selection procedure (e.g., caused by CR_limit)

Email approval until 1st Dec on the working assumption and [1000]ms – Yi (Huawei):
Email discussion until RAN1#88 on the FFS points in the congestion control – Hanbyul (LGE):

Conclusion:

- Note: CR is a metric calculated by the transmitter UE and the parameters in the working assumption are adjusted within the range to meet the CR_limit.

Petitioners' Exhibit 1007, p. 1201
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Working assumption:

1. When UL TX overlaps in time domain with SL TX in different carrier frequency,
    1. The UE may drop UL TX or reduce UL TX power if the PPPP of SL packet is above a (pre)configured PPPP threshold, otherwise the UE may drop SL TX or reduce SL TX power.
1. Note that UL TX power is always prioritized if PPPP threshold is set to the highest value.

1. SLSS/PSBCH transmission and reception is up to UE capability.
2. Preconfiguration for out-coverage UEs can include zero, two, or three sync resources.
    1. No SLSS/PSBCH transmission/reception when zero resource is preconfigured.
    2. Note that this reverts the RAN1#86bis agreement "Rel-12 mechanism is re-used to determine the subframe used for transmissions of SLSS/PSBCH from out-coverage UEs synchronized to SLSS, i.e., two SLSS resources are pre-configured for an out-coverage UE, one is used for SLSS of UE's syncRef and the other is used for SLSS transmission of the UE."
3. Email approval until 1st Dec on the UE behaviour with the following starting points – Yi (Huawei):

Formatted: Bulleted + Level: 1 + Aligned at: 0 cm + Indent at: 0.71 cm, Tab stops: Not at 1.27 cm

Formatted: Bulleted + Level: 2 + Aligned at: 0.71 cm + Indent at: 1.41 cm, Tab stops: Not at 2.54 cm

Formatted: Bulleted + Level: 1 + Aligned at: 0 cm + Indent at: 0.71 cm, Tab stops: Not at 1.27 cm

Petitioners' Exhibit 1007, p. 1202
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

1. Strive for an agreement that is as similar as possible to the starting points.
2. When two resources are included, the following behaviour is used.
    1. The same sync resource is used for UEs directly synchronized with GNSS.
        1. UE directly synchronized to GNSS is not required to monitor PSBCH in the other resource.
    2. A UE that selecting SLSS ID = 0 with coverage indicator = 1 as its sync reference transmits SLSS = 0 with in-coverage indicator = 0.
        1. In-coverage indicator is used to differentiate direct GNSS and in-direct GNSS.
        2. SLSS ID 0 or 168 is used to differentiate 1 hop sync. or more hops for GNSS based synchronization
3. When three resources are included, the behaviour in the following table is used (from R1-1609717).

UE synchronization state:	Resource 1 (“InC resource” or “1st OoC resource”)	Resource 2 (“2nd OoC resource”)	Resource 3 (“GNSS resource”)	Notes
UE is InC, sync to eNB	SS from SS_net, PSBCH			R12/13 solution
UE is InC, sync to GNSS	Reserved SLSS ID, PSBCH			PSBCH used to protect cell-edge UEs. Note that PSBCH should be transmitted on the first resource to avoid interference with OoC GNSS UEs PSBCH.
UE is OoC, synchronized to InC UE with/without GNSS		SS from SS_net PSBCH with InC_flag=0		R12/13 solution
UE is OoC, synchronized to OoC UE with SS_net with/without GNSS	SS from SS_oon PSBCH with InC_flag=0			R12/13 solution
UE is OoC, synchronized to OoC UE with SS_oon and with/without GNSS	SS from SS_oon PSBCH with InC_flag=0 (The sync resource is selected depending on the resource of the incoming sync source)			R12/13 solution
UE is isolated and without GNSS	SS from SS_oon PSBCH with InC_flag=0 (Random sync resource)			R12/13 solution
UE is OoC, synchronized to GNSS	SS from SS_oon PSBCH with InC_flag=0 (Random sync resource)		Reserved SLSS ID, PSBCH	PSBCH only includes DFN-related fields. The third resource is needed to avoid interference to cell-edge UEs.

R1-1613516 WF on remaining issues for V2V synchronization Huawei, HiSilicon, ITRI

Agreements:

1. PSBCH content for Rel-14 V2X is the same as what is in Rel-12 spec.

Formatted: Bulleted + Level: 2 + Aligned at: 0.71 cm + Indent at: 1.41 cm, Tab stops: Not at 2.54 cm

Petitioners' Exhibit 1007, p. 1203
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Proposal:
2.● When the pre-configured information indicates GNSS (P1) has lower priority, P2 only applies to the UE directly synchronized to eNB.
    1.■ UE directly synchronized to GNSS has the same priority as UE indirectly synchronized to GNSS (P3)
        1.◆ Note that this complements the RAN1#86bis agreement.
    2.■ UE indirectly synchronized to eNB has higher priority than GNSS
Email approval until 1st Dec on this proposal – Seungmin (LGE):

6.2.2.1 CSI enhancements

6.2.2.1.1 Advanced CSI

R1-1612660 Smoothly Supportable Numbers of CSI-RS Ports for Advanced CSI Ericsson

Agreement:
- {4,8,12,16,20,24,28,32} CSI-RS ports are supported in advanced CSI
- Aim for a unified structure, with a single common CSI reporting mechanism which is dimensioned or scalable to support all the numbers of ports

Note that this does not imply a single solution for classes A and B

R1-1613275 WF on advanced CSI codebook Ericsson, Samsung, CATT, NTT DOCOMO, Kathrein Werke, Mitsubishi, Verizon, KT Corporation, LG Electronics
Proposed Working Assumption:
- Adopt the proposal in R1-163275
- Reduce the options in both Config 1 and Config 2
  - Support at least PUSCH CSI feedback
  - FFS whether/how PUCCH CSI feedback is supported

R1-1613226 WF on quantised CSI reporting based on orthogonal basis Huawei, HiSilicon, ZTE, ZTE Microelectronics

R1-1613246 WF on advanced CSI codebook Ericsson, Samsung, CATT, NTT DOCOMO, Kathrein Werke, Mitsubishi, Verizon, KT Corporation, LG Electronics

- Alt 1: Config 1 from R1-1613246
  - Support: E///, HW+HiSi (if power scaling is sub-band), ZTE (if number of beams is constrained), QC (if rank 1 is only reported on PUCCH)
  - Object: Sams, ZTE (if number of beams is not constrained), LG
- Alt 1a: Config 1 from R1-1613246 with 2 beams and only QPSK
  - Nok, ASB, E///, QC
- Alt 2: Config 2 from R1-1613246
  - Support: Sams, Intel, LG, AT&T (if both PUSCH & PUCCH), Docomo, Nokia, ASB
  - Object: E///, HW, HiSi
- Alt 2a: Config 2 from R1-1613246 with 2 beams
  - Sams, LG, ZTE (if the 2 beams in W1 are selected by the UE)
- Alt 3: Config 1 + Config 2 from R1-1613246
  - Support: E///, Sams, CATT, LG, Docomo, HW+HiSi (if power scaling is sub-band)
  - Object: Intel, QC
- Alt 4: R1-1613226
  - Support: HW, HiSi, ZTE
  - Object: Sams, LG

R1-1613647 WF on Advanced CSI Codebook Ericsson, Samsung, Huawei, HiSilicon, CATT, NTT DOCOMO, Kathrein Werke, Sprint, Deutsche Telekom, Vodafone, ZTE, ZTE Microelectronics, Xinwei, Mitsubishi, China Unicom, OPPO, Verizon, KT Corporation, ASTRI

Working Assumption:
To be confirmed automatically at RAN1#88 if no significant issues are identified with UE complexity.
Precoders are to be normalized in the equations below.

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm

Petitioners' Exhibit 1007, p. 1205
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- $W_1 = \begin{bmatrix} B & 0 \\ 0 & B \end{bmatrix}$, $B = [p_0 b_{k_1^{(0)},k_2^{(0)}} \cdots p_{L-1} b_{k_1^{(L-1)},k_2^{(L-1)}}]$
  - For rank 1: $W = \begin{bmatrix} \tilde{w}_{0,0} \\ \tilde{w}_{1,1} \end{bmatrix} = W_1 W_2$, and $W_2 = \begin{bmatrix} c_{0,0} \\ c_{1,0} \end{bmatrix}$
  - For rank 2: $W = \begin{bmatrix} \tilde{w}_{0,0} & \tilde{w}_{0,1} \\ \tilde{w}_{1,0} & \tilde{w}_{1,1} \end{bmatrix} = W_1 W_2$, and $W_2 = \begin{bmatrix} c_{0,0} & c_{0,1} \\ c_{1,0} & c_{1,1} \end{bmatrix}$
  - $c_{r,l} = [c_{r,l,0} \cdots c_{r,l,L-1}]^T$, $r = 0,1$, $l = 0,1$
    - $\tilde{w}_{r,l} = \sum_{i=0}^{L-1} b_{k_1^{(i)},k_2^{(i)}} \cdot p_i \cdot c_{r,l,i}$; $r = 0,1$, $l = 0,1$
- $L = 2$ is the number of beams
- b_{k_1,k_2} is a 2D DFT beam from oversampled grid
  - $k_1 = 0,1, \ldots N_1 O_1 - 1$
  - $k_2 = 0,1, \ldots N_2 O_2 - 1$
- $0 \le p_i \le 1$ beam power scaling factor for beam i
- $c_{r,l,i}$ beam combining coefficient for beam i and on polarization r and layer l

W1 Beam selection

- $O_1 = O_2 = 4$
  - $\#N_1 = 1$, $O_1 = 1$
- $2N_1N_2 \in \{4,8,12,16,20,24,28,32\}$
- The leading (stronger) beam index:
  - $k_1^{(0)} = 0,1, \ldots N_1 O_1 - 1$
  - $k_2^{(0)} = 0,1, \ldots N_2 O_2 - 1$
- The second (weaker) beam index:
  - $k_1^{(1)} = k_1^{(0)} + O_1 d_1$
  - $k_2^{(1)} = k_2^{(0)} + O_2 d_2$
    - $d_1 \in \{0, \ldots, \min(N_1, L_1) - 1\}$
    - $d_2 \in \{0, \ldots, \min(N_2, L_2) - 1\}$
    - $(d_1, d_2) \neq (0,0)$
    - Where L_1, L_2 are defined as:
      - If $N_1 \geq N_2$ and $N_1 \neq 1$
        - $L_1 = 4, L_2 = 2$
      - If $N_1 < N_2$ and $N_1 \neq 1$
        - $L_1 = 4, L_2 = 2$
      - If $N_2 = 1$
        - $L_1 = 8, L_2 = 1$

W1 Beam power

- Second beam power quantized with 2 bits
  - $p_0 = 1$, $p_1 \in \{1, \sqrt{0.5}, \sqrt{0.25}, 0\}$

W2

- $c_{0,0,0} = c_{0,1,0} = 1$ always
- $c_{r,l,i} \in \{1, j, -1, -j\}, \forall i, r, l$

- W1 overhead for $N_1 = N_2 = 4$
  - Indicate leading beam: $\lceil \log_2(N_1 N_2 O_1 O_2) \rceil = \lceil \log_2(16 N_1 N_2) \rceil = 8$ bits
  - Indicate second beam: $\lceil \binom{7}{1} \rceil = 3$ bits
  - Relative power of weaker beam: 2 bits

Rank	W1 (bits)	W2 (bits)
1	13	6
2	13	12

- Feedback on PUSCH is supported
- Feedback on PUCCH is supported
  - Details FFS until RAN1#88.

AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1613224 WF on CSI feedback for DMRS based semi-open-loop transmission Huawei, HiSilicon, Qualcomm
Proposals:
- For Class B K>1, N CRIs can be reported. N is configured by RRC signalling.
  - Down select from
    - Reported by PUSCH
    - Alternatively reported by PUCCH
  - FFS: N

R1-1613276 WF on CSI feedback for semi-open-loop CATT, Samsung, Nokia, Alcatel-Lucent Shanghai Bell
Proposal:
- For the purpose of CSI feedback, adopt option 2 with pre-determined cycling pattern of beamforming on DMRS
  - For Rel.12 dual-stage codebook (4Tx/8Tx) and Rel.13 class A codebook, per-PRB-cycling within V1, V2, … V_N where

$$W_1 = \begin{bmatrix} B & 0 \\ 0 & B \end{bmatrix}, B = [V_1, \quad V_2 \quad \ldots \quad V_N]$$

  - FFS: Rel.14 class A codebooks (pending design details)

Agreement:
- For the purpose of CSI derivation, the UE assumes option 1 with a single DMRS beam semi-statically configured by codebook subset restriction
  - The single DMRS beam, which is the same for both ports 7&8, is indicated in the i2 field of codebook subset restriction

R1-1613223 WF on transmission mode and signalling for semi-open-loop transmission Huawei, HiSilicon, CATT, Ericsson, LGE, Nokia, ASB, ZTE, ZTE Microelectronics, Samsung
Agreement:
- DMRS based semi-open-loop transmission is introduced within existing transmission mode, i.e. TM9/10
  - Configured by RRC signalling
  - Semi-open-loop PDSCH transmissions are scheduled only using existing DCI formats 2C/2D with a new DMRS port indication table
  - FFS whether semi-open-loop transmission is only with C-RNTI or also with SPS-C-RNTI
- Working assumption: Semi-open-loop is only specified for rank-1/2, unless there is quick consensus on an extension to rank 3/4 in RAN1#88.

R1-1613277 WF on orphan RE CATT, Samsung, Nokia, Alcatel-Lucent Shanghai Bell
FFS until RAN1#88:
- For DMRS-based semi-open-loop,
  - Orphan RE due to 2 ports CSI-RS:
    - Same procedure as in Rel.10
  - Orphan RE due to DMRS : down-select from
    - Option A: 1 orphan RE *per allocated RB*
    - Option B: 1 orphan RE *in the last allocated RB (if number of allocated RB is odd)*
    - Option C: 1 orphan RE *in the last allocated RB of every block of continuous RB allocation with an odd RB number*
    - *Other options not precluded*
  - Location of orphan RE: corresponding to DMRS ports 9/10 of the last DMRS CDM group (see next slide)

Petitioners' Exhibit 1007, p. 1208
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1613179 WF on CSI-RS design for CDM4 LG Electronics, Ericsson, Qualcomm, Intel, Huawei, HiSilicon, CATT

Agreement:

- No additional CDM-4 pattern is supported in Rel-14.

Samsung: note that this means that there is no explicit support for up to 6dB CSI-RS power boosting in the CDM-4 case .

R1-1613229 WF on CDM aggregation for non-precoded CSI-RS Samsung, LGE, Ericsson
Also supported by Docomo, Sony
R1-1613206 WF on CDM aggregation for 32 and 24 CSI-RS ports ZTE, ZTE Microelectronics, Qualcomm, Intel
Also supported by Huawei, CATT, Xinwei

Agreement:

- CDM-8 patterns for {24, 32} ports can be configured by aggregation of CDM-2/4 patterns from different CSI-RS configurations
  - For each CSI-RS resource (i.e. RE configuration), at least one aggregated pattern that supports full power utilization is supported
    - FFS until RAN1#88:
      - Whether more than one aggregated pattern supporting full power utilization per CSI-RS resource (i.e. RE configuration) is supported
      - Whether any patterns which do not support full power utilization are supported (subject to performance benefit being shown)
      - How to specify which aggregated patterns are not supported (if any)
  - Working assumption: No additional RRC parameters will be specified for indication of the CDM-8 patterns
    - Can be revisited if benefit from additional RRC parameter is shown
    - RRC signaling details are FFS
  - A CDM-8 pattern is contained within 1 PRB

R1-1613180 WF on port indexing for CDM4 LG Electronics, Qualcomm
R1-1613389 WF on port indexing for CDM-4 LG Electronics, Qualcomm, Ericsson, CATT, Samsung

Conclusion:

- Companies are encouraged to study the port indexing of CDM-4 considering CSI-RS port sharing including examples R1-1611752 and R1-1611600 until RAN1#88.
  - Other examples are not precluded.

Petitioners' Exhibit 1007, p. 1209
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreement:
- RAN1 recommends X=Y=8ms for activation/release
  - RAN1 to send an LS to RAN2. Chao to prepare a draft LS today, to be endorsed on Friday
- For the activation/release mechanism
  - Simultaneous activation/release of the CSI-RS resources for multiple CSI processes and/or DL CCs can be supported
  - Detailed MAC CE signalling design & payload size & maximum #CC in one MAC CE is up to RAN2
  - Note: maximum 7 bits required for each CSI process (e.g, K=8, N=4, 70 codepoints)

R1-1613697 [Draft] LS on MAC CE based activation/release mechanism for aperiodic and multi-shot CSI-RS Qualcomm
Modify the action to ask RAN2 to confirm the proposal.
Approved with this modification in R1-1613494.

- *EPDCCH vs. AP-CSI-RS collision*

Agreement: Handle EPDCCH vs. AP-CSI-RS collision as eNB implementation issue

R1-1612676 On Collision Issue between EPDCCH and Aperiodic NZP CSI-RS Ericsson

- *Rate matching for AP-CSI*

R1-1611753 Summary of email discussion [86b-11] on PDSCH rate matching LG Electronics
R1-1613243 WF on PDSCH rate matching for supporting aperiodic CSI-RS Samsung, AT&T, CATT, Ericsson, Huawei, HiSilicon, ITL, ITRI, KDDI, LGE, NTT DOCOMO, Qualcomm

Agreement:
- For PDSCH rate matching, 2-bit aperiodic ZP CSI-RS resource signaling field is introduced in DL-related DCIs for all TMs.
  - AP ZP CSIRS resource configuration is defined without subframe_config
  - UE conducts PDSCH rate matching on AP ZP CSIRS at the subframe when the DCI is signaled.
  - AP ZP CSI-RS resource signaling field descriptions are
  - State '0': The 1st RRC-configured AP ZP CSIRS is indicated to be applied.
  - State '1': The 2nd RRC-configured AP ZP CSIRS is indicated to be applied.
  - State '2': The 3rd RRC-configured AP ZP CSIRS is indicated to be applied.
  - State '3': The 4th RRC-configured AP ZP CSIRS is indicated to be applied.
- This applies only to the DCIs used for non-fallback mode

- *QCL for AP-CSI-RS and multi-shot (MS)-CSI-RS*

R1-1613645 WF on remaining issues on QCL for eFD-MIMO LG Electronics, AT&T, CATT, ITL, KT Corporation, Mitsubishi Electric, Nokia, Alcatel-Lucent Shanghai Bell, NTT DOCOMO, Samsung, Xinwei
Proposal:
- For QCL indication on DMRS to multi-shot NZP CSIRS, in TM10, NZP CSI-RS activation/deactivation can be configured with UEs configured with QCL Type B, where
  - NZP CSIRS configured for activation/deactivation can be indicated in PQI for QCL purpose, and follow legacy QCL assumption.
    - UE is not expected to receive PQI indication regarding the multi-shot NZP CSIRS within X(ms) from the NZP CSIRS activation. FFS on X.
    - Note: NZP CSI-RS not configured for activation/deactivation can also be indicated for QCL purpose.
- In TM10, aperiodic NZP CSIRS can be configured with UEs configured with QCL Type B, where
  - UE is not expected that aperiodic NZP CSIRS is indicated in PQI for QCL purpose with DMRS.

R1-1613734 WF on QCL issues for eFD-MIMO LG Electronics, CATT, Ericsson, NTT DOCOMO, Qualcomm, Samsung
Working Assumption:

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm

Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Tab after: 2.54 cm + Indent at: 2.54 cm

Petitioners' Exhibit 1007, p. 1210
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Working Assumption will be confirmed in RAN1#88 if benefit is confirmed compared to using periodic NZP CSI-RS and significant problems are not identified.

- In TM10, activation/deactivation of an NZP CSI-RS with *subframe_config* can be configured with UEs configured with QCL Type B, where
  - NZP CSI-RS configured for activation/deactivation can be indicated in PQI for QCL purposes, and follow legacy QCL assumption.
    - UE does not expect to receive PQI indication before receiving Ω (>1) activated NZP CSI-RSs from an NZP CSIRS activation. FFS on Ω – send an LS to RAN4 to ask for their advice – Jonghyun (LG) R1-1613495 – for email approval until Wed 23rd Nov.
    - UE does not expect that a PQI indication is received which indicates a deactivated NZP CSI-RS. FFS the spec impact.
    - Note: NZP CSI-RS not configured for activation/deactivation can also be indicated for QCL purpose.

- *DCI signalling for AP-CSI-RS resource selection*

IPR2024-01121

R1-1613236 WF on CSI relaxation for aperiodic CSI-RS Qualcomm

6.2.2.4.2 Remaining details of Hybrid CSI

List of open issues:

- *PUCCH format for 1st eMIMO-Type*

From RAN1#86bis:

Conclusions: More discussion is needed on the proposal below. If the use of PF-3 (e.g. the proposal below) cannot be agreed by RAN1#87 (Reno), the use of PF-3 will be agreed.

- Use PUCCH format 3 (PF-3) for CSI reporting of 1st eMIMO-Type
  - A PF-3 resource is allocated for CSI reporting and/or A/N
- PF resource usage follows legacy-like procedures as follows:
  - For N≥1 CC(s):
    - CSI-only reporting: Use PF-3 resource allocated for CSI
    - A/N-only: If A/N is for Pcell only, use PF-1A/1B resource allocated for A/N. Otherwise use PF-3 resource allocated for A/N
    - CSI and A/N collision: multiplex CSI and A/N using PF-3 resource allocated for A/N
      - For TDD scenario, the DAI is set to be 1 (i.e. PF-1A/B is used only if for PCell and DAI in DCI format is the first DAI with value 1 that the UE detects)

Agreement: PF-2 is used for the 1st eMIMO-Type

- *A-CSI triggering*

R1-1613239 WF on PUSCH CSI feedback LG Electronics, Samsung, Qualcomm, Huawei, HiSilicon, ZTE, ZTE Microelectronics

Agreement:

- For aperiodic CSI reporting for hybrid CSI mechanism 1
  - Either one of CSI for 1st eMIMO-Type (i.e., CSI(1)) and CSI for 2nd eMIMO-Type (i.e., CSI(2)) is triggered for aperiodic CSI reporting.
- The CSI request field of the same size as the legacy CSI request field is used to jointly indicate the triggered eMIMO-Type and CSI process.
  - Reuse the legacy RRC approach for configuration of the trigger

- *Additional scheme(s) for hybrid CSI? 1) Independent PUCCH-PUSCH config, 2) CRI-only reporting for 1st eMIMO-Type*

  R1-1613282 WF on Hybrid CSI Reporting NTT DOCOMO, LG Electronics, Nokia, Alcatel-lucent Shanghai Bell, Qualcomm, Samsung, Xinwei, ZTE, ZTE Microelectronics

Note: Huawei has some concern on the benefit of this mechanism

Agreement:

- Hybrid mechanism 2:
  - Hybrid CSI reporting with one CSI process, support Class B with K>1 CSI-RS resources for the 1st eMIMO-Type and Class B with K=1 CSI-RS resources for the 2nd eMIMO-Type
    - For the 1st eMIMO-Type, CRI is reported
    - For the 2nd eMIMO-Type, CQI/PMI/RI are reported
    - Total number of CSI-RS resources across 2 eMIMO-Types is limited by Rel. 13 UE capability Kmax.
    - Total number of CSI-RS APs across 2 eMIMO-Types is limited by Rel. 13 UE capability Nmax.

R1-1613238 WF on PUCCH CSI feedback LG Electronics, Samsung, ZTE, ZTE Microelectronics, CATT

Agreement:

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Tab after: 2.54 cm + Indent at: 2.54 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Tab after: 2.54 cm + Indent at: 2.54 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Tab after: 2.54 cm + Indent at: 2.54 cm
Formatted: Bulleted + Level: 3 + Aligned at: 3.17 cm + Tab after: 3.81 cm + Indent at: 3.81 cm

- For periodic CSI reporting for hybrid CSIRS mechanism 1
  - Subframe offset of CSI(1) can be configured.
    - The following table is used to configure periodicity and offset of CSI(1):
      - Note that this table is the same as legacy CRI table

$I_{CSI}^{(1)}$	Value of $M_{CSI}^{(1)}$	Value of $N_{OFFSET,CSI}^{(1)}$
$0 \le I_{CSI}^{(1)} \le 160$	1	$-I_{CSI}^{(1)}$
$161 \le I_{CSI}^{(1)} \le 321$	2	$-(I_{CSI}^{(1)}-161)$
$322 \le I_{CSI}^{(1)} \le 482$	4	$-(I_{CSI}^{(1)}-322)$
$483 \le I_{CSI}^{(1)} \le 643$	8	$-(I_{CSI}^{(1)}-483)$
$644 \le I_{CSI}^{(1)} \le 804$	16	$-(I_{CSI}^{(1)}-644)$
$805 \le I_{CSI}^{(1)} \le 965$	32	$-(I_{CSI}^{(1)}-805)$
$966 \le I_{CSI}^{(1)} \le 1023$	Reserved	

- For periodic CSI reporting for hybrid CSIRS mechanism 2, reuse the legacy CRI configuration table for the 1st eMIMO-Type
- For periodic CSI reporting for hybrid CSIRS mechanism 1
  - Collision handling: CSI of 1st eMIMO has the same priority as legacy CRI.

R1-1613178 WF on CSI reporting configuration for hybrid CSI ZTE, ZTE Microelectronics, Intel, NTT DOCOMO
Also supported by: LG, Xinwei

Combination	1	2	3
1st eMIMO-Type	P	A	P and/or A
2nd eMIMO-Type	A	P	P and/or A

Proposal:
- Support combination 1 for hybrid CSI mechanism 1
  - P-CSI is configured for the 1st eMIMO-Type and A-CSI is configured for the 2nd eMIMO-Type
  - Use legacy P-CSI configuration for the 1st eMIMO-Type and A-CSI configuration for the 2nd eMIMO-Type

Proposal:

- FFS: Additional one DCI bit is introduced to switch between new and legacy table.
- new CS/OCC/IFDMA mapping table is shown as below.

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm

Cyclic Shift Field in uplink-related DCI format [3]					OCC				IFDMA configuration
000	0	6	3	9	[1 1]	[1 1]	[1 -1]	[1 -1]	odd subcarriers
001	6	0	9	3	[1 -1]	[1 -1]	[1 1]	[1 1]	odd subcarriers
010	3	9	6	0	[1 -1]	[1 -1]	[1 1]	[1 1]	odd subcarriers
011	4	10	7	1	[1 1]	[1 1]	[1 1]	[1 1]	even subcarriers
100	2	8	5	11	[1 1]	[1 1]	[1 1]	[1 1]	even subcarriers
101	8	2	11	5	[1 -1]	[1 -1]	[1 -1]	[1 -1]	even subcarriers
110	10	4	1	7	[1 -1]	[1 -1]	[1 -1]	[1 -1]	even subcarriers
111	9	3	0	6	[1 1]	[1 1]	[1 -1]	[1 -1]	odd subcarriers

R1-1613242 WF on DL control signalling for IFDMA based DMRS Huawei, HiSi, Qualcomm

Proposal:

- The table below Proposal 3 in R1-1608603 is used for new CS/OCC/IFDMA mapping table.
- Additional one bit in DCI is introduced to indicate one of the CSF mapping tables.

Formatted: Indent: Left: 0.47 ch, Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm

Working assumption:

- Table 1 with an additional one bit in DCI format 0 and 4 to indicate one of the CSF mapping tables in UE specific search space
  - FFS: Whether this is also applicable to SPS-RNTI
  - Note: In common search space the legacy table will be used

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm

Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm

Table 1

Petitioners' Exhibit 1007, p. 1214
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Cyclic Shift Field in uplink-related DCI format [3]					OCC				IFDMA configuration
000	0	6	3	9	[1 1]	[1 1]	[1 -1]	[1 -1]	odd subcarriers
001	6	0	9	3	[1 -1]	[1 -1]	[1 1]	[1 1]	odd subcarriers
010	3	9	6	0	[1 -1]	[1 -1]	[1 1]	[1 1]	odd subcarriers
011	4	10	7	1	[1 1]	[1 1]	[1 1]	[1 1]	even subcarriers
100	2	8	5	11	[1 1]	[1 1]	[1 1]	[1 1]	even subcarriers
101	8	2	11	5	[1 -1]	[1 -1]	[1 -1]	[1 -1]	even subcarriers
110	10	4	1	7	[1 -1]	[1 -1]	[1 -1]	[1 -1]	even subcarriers
111	9	3	0	6	[1 1]	[1 1]	[1 -1]	[1 -1]	odd subcarriers

- *Support for comb hopping*

R1-1612682 On Inter-Slot or Inter-Subframe Comb Hopping for UL DMRS with IFDMA Ericsson
R1-1611280 Remaining Details on UL DMRS Design Nokia, Alcatel-Lucent Shanghai Bell

R1-1613107 WF on comb hopping for UL DMRS Intel, Qualcomm

Proposal:
- Inter-slot and inter-subframe comb hopping is supported.
  - Inter-slot comb hopping is dynamically indicated by the CS/OCC table in UL DCI
    - FFS details of hopping pattern indication
  - Inter-subframe comb hopping can be semi-statically configured by RRC signaling
  - Both inter-slot and inter-subframe comb hopping can be enabled simultaneously

Conclusion:
- There is no consensus in supporting inter-slot hopping in Rel.14.
- Offline discussion on the need for supporting inter-subframe hopping in Rel.14, Continue discussion until RAN1#88.

R1-1613608 Way Forward on text proposal for gray mapping and power allocation Huawei, HiSilicon, SONY

To update the CR regarding spatial layer power allocation and/or Gray mapping for email approval till 11/22 (Mark, Ericsson)

6.2.3.1 *Superposition transmissions*

Related to transmission power ratios for case 3, power allocation for case 1/2 etc.

R1-1611189 On power allocation for MUST Case 1&2 Huawei, HiSilicon
R1-1611606 EPRE computation for MUST case 1 and case 2 Qualcomm Incorporated
R1-1612751 Power Allocation in MUST MediaTek Inc.
R1-1612791 On remaining details of MUST Case 1 and 2 Nokia, Alcatel-Lucent Shanghai Bell

R1-1613455 Way Forward on Power Allocation in MUST Cases 1 and 2 MediaTek, Huawei, HiSilicon, Nokia, ASB, ITRI

Agreements:

~~1.~~ For MUST Case 1, when both MUST-near UE and MUST-far UE have Rank=2, the total Tx power is split equally between two spatial layers

R1-1613222 Way Forward on downlink power allocation for MUST Case 1&2 Huawei, HiSilicon, NTT DOCOMO, LG Electronics, LG Uplus, ZTE, ZTE Microelectronics
R1-1613610 Way Forward on downlink power allocation for MUST Case 1&2 Nokia, Alcatel-Lucent Shanghai Bell
Agreements:

~~1.~~ A new higher layer parameter PA_MUST is introduced for UEs with MUST Case1&2 configuration
  ~~1.~~ If existence of MUST interference is indicated by eNB, the power of MUST near UE's PDSCH is derived from PA_MUST, where PA_MUST corresponds to the total EPRE to the CRS EPRE ratio of the PDSCHs for MUST-far and MUST-near UE in OFDM symbols without CRS. PA_MUST candidates are the same as the legacy PA.
  ~~2.~~ Otherwise, legacy PA is applied to derive the MUST near UE's PDSCH power
~~2.~~ If the new higher layer parameter PA_MUST is not configured for a MUST near UE with MUST Case1&2 configuration, legacy PA replaces PA_MUST

R1-1613513 WF on MUST EVM requirements Nokia, Alcatel-Lucent Shanghai Bell, Ericsson, Qualcomm, Huawei, LG
Agreements:

~~1.~~ Inform RAN4 that
  ~~1.~~ In RAN1 MUST Case 1/2 performance evaluations, the existing 8% Tx EVM has been assumed for macro (c.f. TR 36.859)
~~2.~~ LS to be drafted

R1-1613680 [Draft] LS on EVM assumption in MUST Case1/2 performance evaluations Nokia
Agreed in R1-1613757

R1-1611297 Discussion on Power Allocation for MUST ZTE, ZTE Microelectronics
R1-1611605 Superposition transmission for MUST Qualcomm Incorporated
R1-1612980 Some further details of MUST Gray mapping with spatial precoding Huawei, HiSilicon

6.2.3.2 *Mechanisms for efficient operation*

Related to RRC signaling, DCI, UE assumptions, fallback etc.

R1-1612172 Remaining issues for MUST Case 3 CMCC
R1-1612753 DCI design for MUST MediaTek Inc.
R1-1611759 Discussion on Signaling Assistance Information and remaining issues LG Electronics
R1-1612792 On Signaling for MUST CASE 1/2/3 Nokia, Alcatel-Lucent Shanghai Bell

R1-1613284 Way Forward on Assistance Information for MUST Case 3 ZTE, ZTE Microelectronics, LG electronics

R1-1613457 Way Forward on Assistance Information in MUST Case 3 MediaTek, ZTE, ZTE Microelectronics, Huawei, HiSilicon, ITRI, III

Agreements:

~~1.~~ For MUST Case 3, the assistance information about the interfering UE(s) consists of
  ~~1.~~ Interference existence
  ~~1.~~ Modulation order

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Tab after: 2.54 cm + Indent at: 2.54 cm

Petitioners' Exhibit 1007, p. 1216
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1613456 Way Forward on Antenna Ports of MUST Case 3 MediaTek, ZTE, ZTE Microelectronics, Huawei, HiSilicon, Nokia, ASB, ITRI, CMCC

Agreements:

- In DMRS based transmission scheme of MUST Case 3, the following assumptions are made by UE for co-scheduled DMRS ports
  - Same n_{SCID}
  - Same $n_{ID}^{(n_{SCID})}$
  - Same OCC length

R1-1613459 Way Forward on Number of Spatial Layers in MUST Case 3 MediaTek, Huawei, HiSilicon, ITRI, III

Agreements:

- For MUST Case 3
  - Assistance information for up to k_max interfering spatial layers is provided
    - k_max = 1 or 3, which is configured by RRC-layer signaling
    - Note: k_max doesn't imply the number of interfering spatial layers UE should cancel

R1-1613453 WF on DCI design for Case 1 and 2 LG Electronics, LG Uplus, ZTE, ZTE Microelectronics, Huawei, HiSilicon, NTT DOCOMO

Agreements:

- The following field are additionally defined in the following legacy DCIs
  - For DCI format 1: the 2bit field for MUST interference existence and power ratio.
  - For DCI format 2A: the 2bit field for MUST interference existence and power ratio.
  - For DCI format 2: the 2bit field per layer for MUST interference existence and power ratio.

Table 1. 2bits field for MUST interference existence and power ratio

Value	Description
0	No MUST interference present
1	First power ratio is used
2	Second power ratio is used
3	Third power ratio is used

R1-1613460 Way Forward on Resource Allocation Alignment in MUST Case 3 MediaTek, ZTE, ZTE Microelectronics, Huawei, HiSilicon, ITRI
R1-1613523 WF on signaling for MUST Case 1/2/3 NEC, Nokia, Alcatel-Lucent Shanghai Bell, Qualcomm
R1-1613514 WF on signaling details for MUST Case 1/2 Nokia, Alcatel-Lucent Shanghai Bell, Qualcomm
R1-1613355 WF on signaling details for MUST Case 3 Qualcomm, Nokia, ASB, NEC

Agreements:

- MUST operation with RA alignment of paired UEs is supported for case 3
- For MUST Case 3, the following operation is supported
  - Within the allocated resource, MOD and existence status of interference on an antenna port with signaled assistance information is consistent
  - Single DCI by adding bits of signaled assistance information in the self DCI is supported

R1-1613616 WF on Signaling Design for MUST Case 3 MediaTek, CMCC, III, ITRI, Huawei, HiSilicon
R1-1613285 Way Forward on DCI for MUST Case 3 ZTE, ZTE Microelectronics, Huawei, HiSilicon

Agreements:

- For DCI formats 2C and 2D and *Rel-13-DMRS-table*=1
  - When k_max=1, total 4 bits are added to carry assistance information
    - 2 bits (denoted as B) with the message provided in Table 2 in R1-1613616
    - 2 bits for MOD of the single interfering layer
      - 00: QPSK
      - 01: 16QAM
      - 10: 64QAM

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Tab after: 2.54 cm + Indent at: 2.54 cm
Formatted: Bulleted + Level: 3 + Aligned at: 3.17 cm + Tab after: 3.81 cm + Indent at: 3.81 cm
Formatted: Bulleted + Level: 4 + Aligned at: 4.44 cm + Tab after: 5.08 cm + Indent at: 5.08 cm

Petitioners' Exhibit 1007, p. 1217
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

4. 11: 256QAM

2. When k_max=3, total 6 bits are added to carry assistance information for predefined ordered antenna ports of interfering layers provided in Table 3 in R1-1613616
    1. The assistance information for each port is represented with 4 states
        1. State 1: no interference presence
        2. State 2: interference present with QPSK
        3. State 3: interference present with 16QAM
        4. State 4: interference present with 64QAM or 256QAM
    2. Total 64 states are required when number of layers of desired signal=1 and OCC length=4
    3. Total 16 states are required when number of layers of desired signal=2 and OCC length=4
    4. Total 4 states are required when number of layers of desired signal=1 and OCC length=2

Agreements:

1. For DCI format 2B or *Rel-13-DMRS-table* not configured or *Rel-13-DMRS-table*=0
    1. UE expects k_max = 1 in this case
    2. 2 bits are added to carry assistance information for predefined antenna port of interfering layer provided in Table 1 in R1-1613616
        1. 00: No interference presence
        2. 01: MUST interference is present with QPSK
        3. 10: MUST interference is present with 16QAM
        4. 11: MUST interference is present with 64QAM or 256QAM

6.2.4 eMBMS enhancements for LTE - WID in RP-161297

R1-1613701 Chairman's Notes of Agenda Item 6.2.4 eMBMS enhancements for LTE Session Chairman (Nokia)
Contents incorporated below
Endorsed with following updates

6.2.4.1 Means of using subframes 0, 4, 5, 9 (FS1) and 0, 1, 5, 6 (FS2) for MBSFN

6.2.4.1.1 Synchronization and acquisition of system information for 100% MBSFN subframe carriers

R1-1612823	Design of FDM for carrier with 100% MBSFN subframe allocation	Huawei, HiSilicon
R1-1612826	Evaluation of FDM for carrier with 100% MBSFN subframe allocation	Huawei, HiSilicon
R1-1611609	Initial acquisition and system information for eMBMS for 100% MBSFN subframe allocation	Qualcomm Incorporated
R1-1611493	Performance results for cell acquisition subframe	Nokia, Alcatel-Lucent Shanghai Bell
R1-1611495	Performance comparison of FeMBMS using TDM vs FDM	Nokia, Alcatel-Lucent Shanghai Bell
R1-1612824	Consideration on CAS for carrier with 100% MBSFN subframe allocation	Huawei, HiSilicon
R1-1612992	Synchronization and SI acquisition performance using Cell Acquisition Subframe	Ericsson

Proposal: Confirm the RAN1#86bis Working Assumption on CAS

R1-1613227 Frequency tracking performance for FeMBMS Huawei, HiSilicon

R1-1613599 WF on the proposed conclusion on FDM Intel, Qualcomm, BBC, EBU

R1-1613580 Way Forward on eMBMS enhancements Ericsson, Intel, Qualcomm, EBU, IRT, BBC, DISH

Agreement (supersedes the Working Assumption made in RAN1#86bis):

- For 100% MBSFN subframe allocation FeMBMS carrier transmits a periodic subframe, CAS Cell Acquisition Subframe

Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Tab after: 2.54 cm + Indent at: 2.54 cm

Formatted: Bulleted + Level: 3 + Aligned at: 3.17 cm + Tab after: 3.81 cm + Indent at: 3.81 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm, Tab stops: Not at 1.27 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm, Tab stops: Not at 2.54 cm
Formatted: Bulleted + Level: 3 + Aligned at: 3.17 cm + Indent at: 3.81 cm, Tab stops: Not at 3.81 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0 cm + Tab after: 0.63 cm + Indent at: 0.63 cm

Petitioners' Exhibit 1007, p. 1218
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- CAS supports PSS, SSS, CRS, PBCH, PDCCH, PDSCH (SI)
- CAS is always transmitted in subframe #0 with a period of 40ms
- MIB is provided by PBCH in every CAS
- The MIB is transmitted in SFN mod 4 = 0 and can change only in SFN mod 16 = 0 and contains systemFrameNumber equal to the 6 most significant bits of the SFN
- SI can be provided by PDSCH in CAS
- A first SI that may also contain scheduling of further SI can be transmitted in SFN mod 8 = 0 and can change only in SFN mod 16 = 0
- This first SI may be a combination of SIBs, up to RAN2 agreements.
- MCCH change notification and SI modification notification are sent in PDCCH region of the CAS.
- From RAN1 perspective, it is feasible to transmit multiple SI messages in the same subframe by using different RNTIs. RAN2 may consider if this may be used.
- Inform RAN2 that SI modification notification can be conveyed to the UE with Direct Indication signalling.

Note that the following concerns were raised regarding FDM:

- FDM may suffer from channel estimation edge effects due to non-contiguous allocation of PMCH.
- From a UE implementation perspective, parallel FFT processing and the implementation of filter are required.

Agreements:

- For a Rel-14 FeMBMS carrier, the current DCI format 1-C used to indicate MCCH change, is extended to also indicate SI change.
- PBCH in the CAS uses a different scrambling sequence initialization than for legacy PBCH.
- Cross-carrier scheduling is always supported (regardless of presence of unicast control region)
  - PHICH on the scheduling cell is used
- If a UE is configured with self-carrier scheduling, the UE shall assume that unicast control region (including CRS) is always present in all MBSFN subframes.
- For an FeMBMS carrier
  - A UE shall not assume that unicast control region (including CRS) is always present in an MBSFN subframe not assumed to be used for PMCH.
  - A UE can assume that unicast control region (including CRS) is always present in an MBSFN subframe assumed to be used for PMCH with 15kHz numerology.
  - A UE can assume that unicast control region (including CRS) is never present in an MBSFN subframe assumed to be used for PMCH with 1.25kHz numerology.
- Subframes using the new numerology do not need to be allocated in pairs
  - The RS pattern is defined for even and odd subframes independently

R1-1612989 System Information capacity using Cell Acquisition Subframe Ericsson
R1-1611494 SI transmission for FeMBMS Nokia, Alcatel-Lucent Shanghai Bell
R1-1611496 MIB content for FeMBMSNokia, Alcatel-Lucent Shanghai Bell
R1-1611932 Potential enhancements for the reception of Cell Acquisiton Subframes Intel Corporation

R1-1613600 Way forward on the configuration of additional non-MBSFN subframe for SI transmission Intel, Qualcomm, BBC, EBU

Agreements:

- In MIB, two reserved bits are used to signal additional subframes other than CAS which follow CAS immediately for SI transmission. The values are 0, 1, 2, 3.
  - From RAN1 perspective, 1.4MHz does not support a value of 0.
  - Note: The exact signaling for such indication is up to RAN2.
  - Note: It is up to RAN 2 if the first SI for dedicated FeMBMS carrier needs to indicate the presence of a further set of additional non-MBSFN subframes.
- Send LS to RAN 2 about the above agreements - R1-1613490 – JJ, Intel (including all RAN1 agreements made during this meeting)

R1-1613118 Text Proposal for TS 36.300 for SRS carrier based switching Huawei, HiSilicon
R1-1613629 LS on Text Proposal for TS 36.300 for SRS Carrier-Based Switching RAN1

6.2.5.1 Remaining details of SRS switching and transmission

Including at least details of priority/dropping rules for collision handling

R1-1611128 Remaining details on collision handling Huawei, HiSilicon
R1-1611612 Collision Handling Qualcomm Incorporated
R1-1612432 Priority Dropping Rules for Collision Handling Samsung
R1-1612433 SRS Timing Adjustments Samsung

Agreements:

rity list:

- A/N, SR, RI/PTI/CRI, PRACH > Rel-14 A-SRS > other A-periodic CSI > Rel-14 P-SRS > other CSI > Legacy SRS
- UE is not expected to monitor PDCCH or to receive PDSCH when it collides with SRS switching and transmission time according to the UE's capability
- For a UE for which SRS switching interrupts downlink reception, the UE is not expected to be configured with SRS resource(s) such that SRS switching and transmission time may collide with its PDCCH monitoring in subframe 0 or 5.

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm

Petitioners' Exhibit 1007, p. 1220
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

:turing:

- Support puncturing the first or last symbol of PUSCH when it collides with SRS switching and transmission time according to the UE's capability

flexible timing (if configured), for A-SRS triggered by DL grant:

- If colliding with A/N, postpone once to the next configured SRS transmission opportunity

:: Interruption interval on applicable CC due to SRS carrier based switching includes RF retuning time (to and from the switching to CC) and the SRS or RACH preamble transmission time. How to capture in the specifications is up to the editor.

R1-1611613 Triggering and power control of multiple CC Qualcomm Incorporated
R1-1612434 Initial SRS Transmission Power Samsung

Agreements:

he triggering of multiple CC from a same DCI, the ordering of SRS transmission is as follows:

- For Type A DCI, it follows the order in the RRC configuration
- For Type B DCI, it follows the order in the DCI.

resources used for SRS transmissions when multiple SRS are triggered by the same DCI are obtained as follows:

1. The timing of the first SRS transmission (*n=1)* follows legacy timing.
2. For the *n*-th SRS transmissions, determine the first SRS resource after or at the same time as the *(n-1)*-th that does not collide with the *1, …, n-1* SRS transmissions (including retuning times)

Note: The SRS resources are obtained as in legacy LTE (i.e. based on A-SRS configuration).

SRS request, the UE does not expect to receive multiple triggers in the same subframe that results in uplink transmission beyond its UL CA capability including switching time after applying priority rule

For power control:

- TPC for SRS switching-to CC supports both accumulative and absolute mode configured by RRC
  - TPC command bit interpretation: same as for PUSCH
- Revoke the agreement that: "UE is not expected to be configured with both TPC-only group DCI and the joint TPC and A-SRS trigger group DCI"
- In the case that multiple TPC applied in the same subframe for the same CC, the UE expects the values of TPCs are the same.
- Clarification: initialization of f_c(i) after PRACH on the CC follows the existing procedure but with the new power control formula for SRS.

R1-1612767 Finalization of SRS switching SoftBank Corp.

Agreements:

- RAN1 agree that the UE capability signaling indicating the switching time of {0, 0.5, 1, 1.5, 2, 2.5, 3, 3.5, 4, 5, 5.5, 6, 6.5, 7} OFDM symbol is useful from RAN1 point of view. It is up to RAN2 to define the set of values based on inputs from RAN1 and RAN4.

R1-1613119 Way Forward on SRS carrier based switching Huawei, HiSilicon

Agreement:

- Type A TPC-only group DCI
  - A CC group is configured via RRC signalling for Type A TPC-only group DCI
  - Maximum number of CCs of a group: 8
- Type A TPC group DCI with SRS request field
  - 2 bit SRS request can trigger 1 out 3 CC groups, and the TPC commands are applied to the triggered CC group
  - If no CC group is triggered, the TPC commands are applied to a CC group configured via RRC signalling
    - The number of CCs in this group is no more than the maximal group size among the configured groups associated with trigger
    - Totally 4 groups per DCI; update the RRC parameter list as follows

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Tab after: 2.54 cm + Indent at: 2.54 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Tab after: 2.54 cm + Indent at: 2.54 cm
Formatted: Bulleted + Level: 3 + Aligned at: 3.17 cm + Tab after: 3.81 cm + Indent at: 3.81 cm

- A UE shall ignore UL grant in the random access response, when configured for the PRACH transmission in a TDD CC without PUSCH. It is up to the editor to decide whether this is specification impact.

Agreement in RAN1#86bis:

- Through RRC configuration, allow SRS transmissions on more than 2 UpPTS symbols in the same subframe for the same UE, for A-SRS and P-SRS
  - On the same CC or multiple CCs
- Allow more than one SRS configurations for the subframe, for A-SRS and P-SRS
  - Reuse existing SRS configurations (1 or 2 UpPTS symbols per SRS configuration)

Clarification:

- Up to 6 symbols can be used for SRS on the same CC in one UpPTS according to RRC configuration

l LS to RAN2 and RAN4 with the new agreements.

R1-1612814 HARQ timing for TTI bundling for PUSCH transmission in special subframe Nokia, Alcatel-Lucent Shanghai Bell

R1-1613359 Offline discussion on remaining issues for PUSCH in UpPTS CMCC

Agreements

- Support both adaptive and non-adaptive HARQ for TTI bundling considering PUSCH in UpPTS
- Specify the PHICH timing for TTI bundling as follows
  - For scheduled PUSCH transmissions in subframe n, which corresponds to the last TTI in the bundle, a UE shall determine the corresponding PHICH resource in subframe n+k_phich, with k_phich in the following table

TDD UL/DL Config	DL subframe number *n*									
	0	1	2	3	4	5	6	7	8	9
2		7	6				7	6		
3		7	6	6	6					

  - The UE shall upon detection of a PHICH transmission intended for the UE in subframe *n-l*, adjust the corresponding first PUSCH transmission in the bundle in subframe *n+k,* with l in the following table

TDD UL/DL Configuration	DL subframe number *n*									
	0	1	2	3	4	5	6	7	8	9
2		1					1			
3	1							0	1	

  - Note: The value k refers to the previous agreement from RAN1 #86, as follows below
    - The UE shall upon detection of a PDCCH with DCI format 0 in subframe n intended for the UE, adjust the corresponding PUSCH transmission in subframe n+k, with k in the following table

TDD UL/DL Configuration	DL subframe number *n*									
	0	1	2	3	4	5	6	7	8	9
2		4			4			4		
3	4							4	4	4

  - The number of HARQ processes for subframe bundling operation under TDD configuration 2 and 3 is two.

- The power control timing for PUSCH in UpPTS for TDD configuration 0-6 follows the following Table

TDD UL/DL Configuration	subframe number *i*									
	0	1	2	3	4	5	6	7	8	9
0	-	5	7	7	4	-	5	7	7	4
1	-	6	6	4	-	-	6	6	4	-
2	-	5	4	-	-	-	5	4	-	-
3	-	4	4	4	4	-	-	-	-	-
4	-	4	4	4	-	-	-	-	-	-
5	-	4	4	-	-	-	-	-	-	-
6(LSB of UL index=0 for subframe 2/7)	-	6	7	7	5	-	6	7	7	-
6(LSB of UL index=1 for subframe 2/7)	-	-	6	-	-	-	-	6	-	-

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm

Petitioners' Exhibit 1007, p. 1223
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- For TDD UL/DL configuration 0
  - Support the following for timing from UL grant to PUSCH
    - Change the interpretation of UL index field
      - 1)MSB=1, LSB=0: UE shall upon detection of a PDCCH with DCI format 0/4 in subframe n intended for the UE, adjust the corresponding PUSCH transmission in subframe n+k, with k given in the following table.
      - 2)MSB=0, LSB=1: UE shall adjust the corresponding PUSCH transmission in subframe n+7
      - 3)MSB=1, LSB=1: UE shall adjust the corresponding PUSCH transmission in both subframes n+ k and n+7, with k in the following table

TDD UL/DL Config	DL subframe index n									
	0	1	2	3	4	5	6	7	8	9
0	4	5				4	5			

  - For UL grant to PUSCH timing in TDD UL/DL configuration 6, the LSB=1 in UL index is not allowed for the subframe #9

- If PUSCH transmission in UpPTS is configured, the number of HARQ processes when subframe bundling is not configured follows the following table
  - Note: Compared with the case for existing number of HARQ processes, the modifications are:
    - For TDD UL/DL configuration 0, 1, 2 and 6, two more HARQ processes are added,
    - For TDD UL/DL configuration 3-5, one more HARQ process is added

TDD UL/DL configuration	Number of HARQ processes
0	9
1	6
2	4
3	4
4	3
5	2
6	8

- DMRS for PUSCH in UpPTS is transmitted in the UpPTS,
  - DMRS is transmitted in the symbol index *l*=3 for normal CP, and the symbol index *l*=2 for extended CP.

Conclusion
No consensus to introduce the following:
- The UE can be configured by RRC not to transmit DMRS for PUSCH in UpPTS per carrier
  - This configuration is a UE capability
  - Note 1: RAN1 assumes that the power and phase of the PA is not changed between PUSCH in UpPTS and PUSCH in the following UL subframe
  - Note 2: RAN1 assumes for the above configurations that the UE is configured with Ks=0, is scheduled with the same PRBs in both UpPTS and the following UL subframe on all UL carriers, open loop component in the power control is the same in PUSCH in UpPTS and the following UL subframe, TPC command should not be updated between the UpPTS PUSCH and PUSCH in the following UL subframe, simultaneous PUSCH and PUCCH is not configured, the phase in the PA is kept in the case that there is an empty OFDM(s) between the PUSCH in UpPTS and PUSCH in the following UL subframe, SRS is not transmitted in the PUSCH in UpPTS, UL extended CP is not configured, no collision with PRACH format 4 with PUSCH in UpPTS

R1-1613674 WF on DMRS for PUSCH in UpPTS CMCC, Huawei, HiSilicon, CATT

Agreements
- The number of data symbols for PUSCH in UpPTS is configured per carrier for a given UE by RRC
  - For NCP, the number of data symbols for PUSCH in UpPTS can be 2,3,4,5;
  - For ECP, the number of data symbols for PUSCH in UpPTS can be 1,2,3,4;
- For TBS selection for PUSCH in UpPTS, the PRB scaling factor are chosen based on the following table

6.2.8 Further Enhanced MTC for LTE- WID in RP-161464

R1-1613704 Chairman's notes of AI 6.2.8 on Further Enhanced MTC for LTE Ad-Hoc chair (Ericsson)
The document was presented by Johan Bergman from Ericsson.
Discussion: Ad-hoc chair (Ericsson) indicated that the FFS under DCI design for multicast topic can be unlighted, and requested the need for an email thread regarding RRC parameters.
Decision: The document is endorsed and content incorporated below.

Email approval of RRC parameter lists until 24th Nov. – Johan (Ericsson)

6.2.8.1 Higher data rates

Contributions relevant for more than one sub-topic (e.g. joint DCI design) are submitted to this agenda item

R1-1611181 On enabling and disabling of feMTC sub-features Huawei, HiSilicon
R1-1611620 Support of higher data rates Qualcomm Incorporated
R1-1611717 Details of Retuning Symbols for FeMTC in Rel-14 NEC
R1-1612607 Design of DCI and scheduling for higher data rate Kyocera Corporation

Petitioners' Exhibit 1007, p. 1225
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

6.2.8.1.1 Larger max PDSCH/PUSCH channel bandwidth

Narrowband/wideband definition, frequency hopping, etc. (for BL and non-BL UEs)

R1-1613339 WF on WF on PDSCH/PUSCH channel bandwidth allocation for FeMTC UEs Apple, Ericsson, Intel, XiaoMi, OPPO, Vivo, NEC, Sony, ZTE, LG Electronics, Qualcomm, Sierra Wireless

Agreement:

1. Rel-14 BL/non-BL UE in CE Mode A support independent max PDSCH/PUSCH channel bandwidth configurations.
2. Rel-14 BL/non-BL UE max PDSCH and PUSCH channel bandwidths are configured semi-statically through RRC signaling.
    1. This does not have an impact on whether the Rel-14 DCI formats should be same size or not as Rel-13 DCI formats.

R1-1613358 WF on max channel BW for non-BL UEs Intel

Agreement:

1. The following RAN1 agreement is modified for max channel BW for PUSCH for non-BL UEs
    1. From
        1. Rel-14 non-BL UE can support CE mode A in connected mode with a maximum PDSCH/PUSCH channel bandwidth of either 5 or 20 MHz
    2. To
        1. Rel-14 non-BL UE can support CE mode A in connected mode with a maximum PDSCH channel bandwidth of either 5 or 20 MHz
        2. Rel-14 non-BL UE can support CE mode A in connected mode with a maximum PUSCH channel bandwidth of 5 MHz
2. Rel-14 non-BL UEs can support CE mode B in connected mode with a maximum PDSCH channel bandwidth of either 1.4, 5 or 20 MHz.
3. Rel-14 non-BL UEs can support CE mode B in connected mode with a maximum PUSCH channel bandwidth of 1.4 MHz.

R1-1613293 WF on resource allocation for larger PDSCH/PUSCH channel bandwidth ZTE, ZTE Microelectronics, Sequans, Qualcomm

Proposal:

- Resource allocation is supported for PDSCH with 5 MHz larger channel bandwidth in CE mode A:
    - Distributed/localized
        - Alt 1: Starting narrowband index (or wideband index) + NB bitmap + Resource allocation within existing narrowband
        - Alt 2: Starting narrowband index (or wideband index) + bitmap of RBG within 5-MHz wideband
        - Alt 3: Wideband index + distributed allocation based on Resource allocation type 2 within wideband (including localized/distributed flag)
    - Localized
        - Alt 4: Starting narrowband index + number of PRBs
        - Alt 5: Starting narrowband index + number of NBs
        - Alt 6: Starting RB index + number of RBs
- Continuous resource allocation is supported for PUSCH with 5 MHz larger channel bandwidth in CE mode A:
    - Alt A: Starting narrowband index (or wideband index) + existing PUSCH type 0 within 5-MHz wideband
    - Alt B: Existing PUSCH type 0 (RIV limited)
    - Alt C: Starting RB index + number of RBs
    - Alt D: Starting narrowband index + number of NBs
    - Alt E: Starting NB index + number of RBs

R1-1613656 Draft WF on PDSCH Allocation for FeMTC UEs with Larger BW Qualcomm, ZTE, ZTE Microelectronics, Intel, Ericsson

Agreements:

1. The PDSCH Allocation for FeMTC UEs supporting larger BW is limited to resource blocks that are part of narrow bands defined in LTE Release 13 for UEs configured with 5 MHz max PDSCH channel bandwidth
    1. 24 PRBs is the maximum number of PRBs that can be allocated
2. The PDSCH Allocation for FeMTC UEs supporting larger BW is limited to resource blocks that are part of narrow bands defined in LTE Release 13 for UEs configured with 20MHz max PDSCH channel bandwidth
    1. 96 PRBs is the maximum number of PRBs that can be allocated
3. The PUSCH allocation for FeMTC UEs with larger BW can include at least certain PRBs that are not part of narrow bands defined in LTE Release 13
    1. This includes at least the central PRB in case of odd system bandwidth
    2. FFS: PRBs at the band edges that do not belong to any narrowband

Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Tab after: 2.54 cm + Indent at: 2.54 cm

Formatted: Bulleted + Level: 3 + Aligned at: 3.17 cm + Tab after: 3.81 cm + Indent at: 3.81 cm

Petitioners' Exhibit 1007, p. 1226
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1613537 WF on resource allocation for PDSCH with 5 MHz channel bandwidth ZTE, ZTE Microelectronics, Sequans, Qualcomm, Ericsson, Sony

Agreement:

1. For Rel-14 BL/CE UE configured with max 5 MHz PDSCH channel bandwidth, contiguous and non-contiguous resource allocation is supported
1. For Rel-14 non-BL UEs configured with max 20 MHz PDSCH channel bandwidth, contiguous and non-contiguous resource allocation is supported

R1-1613673 WF on Rel-14 resource allocation NEC, Huawei, HiSilicon, Lenovo, MotoM

Proposal:

- Resource allocation for CE Mode A:
  - First narrow band is always allocated and it is indicated by $\left\lceil \log_2 \left\lfloor \frac{N_{RB}^{XL}}{6} \right\rfloor \right\rceil$ (note X stands for D or U)
  - The remaining 3 bits (11**xxx**) are used as a bit map for the remaining 3 narrowbands
- Resource allocation for DL CE Mode B is FFS

Conclusion: Continue discussion at RAN1#88.

R1-1611481 Frequency hopping support for FeMTC Nokia, Alcatel-Lucent Shanghai Bell

Agreement:

- PDSCH/PUSCH frequency hopping is supported for BL/CE UE operating 5 MHz maximum PDSCH/PUSCH channel bandwidth.
  - Reuse Rel-13 frequency hopping RRC parameters.
  - FFS how to handle center PRB in odd system bandwidths
  - FFS whether wrap-around can occur
- It is up to eNB implementation to ensure that frequency hopping error cases with wrap-around (e.g. for PUSCH or for PDSCH with UE bandwidth smaller than system bandwidth) do not occur.
  - This does not preclude specifying a UE behavior for these cases.
- PDSCH/PUSCH frequency hopping can be dynamically enabled and disabled via DCI in CE Mode A.

6.2.8.1.2 Larger max PDSCH/PUSCH TBS

TBS/MCS table, soft buffer size, etc. (for BL and non-BL UEs)

R1-1613356 WF on TBS for Rel-14 BL/CE UEs Intel Corporation, Nokia, ASB, Ericsson, ZTE, Qualcomm

Agreement:

1. Use 4-bit MCS field for PDSCH/PUSCH for BL/CE UE configured with larger max PDSCH/PUSCH channel bandwidth.
2. For BL/non-BL UE configured with max 5 MHz PDSCH/PUSCH channel bandwidth in CE mode A, adopt TBS table for PDSCH/PUSCH in R1-1613356.
3. For BL/non-BL UE configured with max 5 MHz PDSCH/PUSCH channel bandwidth in CE mode B, adopt TBS table for PDSCH/PUSCH in R1-1613356 with $I_{TBS} \leq 9$.
4. For non-BL UE configured with max 20 MHz PDSCH channel bandwidth, max DL TBS is 31704 bits.

R1-1613357 WF on soft buffer size for 5MHz Rel-14 BL UEs Intel, Qualcomm

Agreement:

1. Soft buffer size for 5-MHz BL UE is 73152 bits (75% of full buffer size corresponding to a max TBS of 4008 bits and 8 DL HARQ processes).

6.2.8.1.3 HARQ-ACK bundling in HD-FDD

HARQ-ACK bundling scheme, potential FD-FDD applicability, etc.

R1-1613292 WF on HARQ-ACK bundling in HD-FDD ZTE, ZTE Microelectronics, Ericsson, Sierra Wireless, Sony, Huawei, HiSilicon
Agreement:
1. When HARQ-ACK bundling is RRC configured, non-bundled transmission is still possible, where the repetition numbers of the different channels are used in the same way as in Rel-13 eMTC.
2. At least in non-repetition case, the maximum number of HARQ-ACK bundles before switching to UL is 3.
    1. FFS whether repetition case is supported
3. The maximum number of PDSCH TBs in all bundles before switching to UL is 10.
4. The switch time between DL and UL is FFS between:
    1. Indicated in the DCI
    2. Implicitly based on the specification

R1-1613648 WF on repetition for HARQ-ACK bundling Huawei, HiSilicon, Ericsson, NTT DOCOMO, NEC, ZTE, Intel, Qualcomm
Agreement:
1. If repetition is used for M-PDCCH or PDSCH, HARQ-ACK bundling is not used
Continue discussion at RAN1#88.

R1-1612597 Considerations on DCI design for higher data rate ZTE

6.2.8.1.5 Others

R1-1613335 WF on remaining issues for Retuning NEC, Ericsson, Intel

Agreement:

1. If the UE indicates it needs one symbol for retuning, then:
    1. When retuning between two PUSCH narrowbands, the guard period is the last SC-FDMA symbol in the previous UL subframe
    2. When retuning between two PUCCH resources, the guard period is the last SC-FDMA symbol in the previous UL subframe
    3. When retuning from a PUSCH narrowband to a PUCCH resource, the guard period is the last SC-FDMA symbol in the previous UL subframe
    4. When retuning from a PUCCH resource to a PUSCH narrowband,
        1. If the PUCCH uses a shortened PUCCH format, the guard period is the last SC-FDMA symbol in the previous UL subframe and any potential SRS transmission is dropped.
        2. Otherwise, the guard period is the first SC-FDMA symbol in the next UL subframe.

R1-1611485 Remaining details of retuning gaps Nokia, Alcatel-Lucent Shanghai Bell
R1-1611938 Support of enhanceed retuning for BL UEs Intel Corporation

6.2.8.2 Multicast support

SC-MTCH and SC-MCCH transmission/configuration, DCI formats, remaining details of search spaces, change notification

R1-1613129 WF on search space design for multicast in FeMTC Ericsson, Nokia, ASB, ZTE, Intel

Agreement:

1. MPDCCH search space configuration for SC-MCCH consists of {narrowband, Rmax, G}.
2. MPDCCH search space configuration for SC-MTCH consists of {narrowband, Rmax, G}.
3. For the MPDCCH search space scheduling SC-MCCH, UE monitoring of blind decoding candidates is reused from Type1-CSS.
4. For the MPDCCH search space scheduling SC-MTCH, UE monitoring of blind decoding candidates is reused from Type2-CSS.

R1-1613131 WF on DCI design for multicast in FeMTC ZTE, Nokia, ASB, Ericsson

Agreement:

1. DCIs for scheduling SC-MCCH is based on DCI format 6-2 with at least the following fields:
    1. Resource assignment
    2. Number of PDSCH repetitions
    3. MCS
    4. Number of MPDCCH repetitions
2. DCIs for scheduling SC-MTCH include at least the following fields:
    1. Frequency-hopping flag
    2. Resource assignment
    3. Number of PDSCH repetitions
    4. MCS
    5. Number of MPDCCH repetitions
3. The sizes of the DCI fields are FFS.
4. Other DCI fields than the ones listed above are not precluded.

R1-1613132 WF L1 configurations for multicast in FeMTC Ericsson

Agreement:

1. PDSCH carrying SC-MCCH supports up to 1000 bits TBS and up to 6 PRBs channel bandwidth.
1. PDSCH carrying SC-MTCH is configurable in SC-MCCH, and supports up to [4008] bits TBS and [24 or 25] PRBs channel bandwidth.
2. For MPDCCH scheduling SC-MCCH or SC-MTCH, the frequency hopping and its configuration follow the Rel-13 eMTC design.
3. For PDSCH carrying SC-MCCH or SC-MTCH, the frequency hopping and its configuration follow the Rel-13 eMTC design.
4. The frequency hopping activation (ON/OFF) for MPDCCH/PDSCH for SC-MCCH is configured by a new 1-bit parameter.
5. The frequency hopping activation (ON/OFF) for MPDCCH/PDSCH for SC-MTCH is configured by a new 1-bit parameter per SC-MTCH.
6. Coverage enhancement related settings (CE mode A / CE mode B) for MPDCCH/PDSCH for SC-MCCH are configured by a new 1-bit parameter.

7. Coverage enhancement related settings (CE mode A / CE mode B) for MPDCCH/PDSCH for SC-MTCH is configured by a new 1-bit parameter per SC-MTCH.

R1-1613130 WF on FeMTC multicast collision handling Ericsson, Nokia, ASB, Intel

Working assumption:

1. When a UE is monitoring Type1-CSS for paging at its Paging Occasion, it is not required to simultaneously monitor MPDCCH search spaces for SC-MCCH or SC-MTCH or receive PDSCH for SC-MCCH or SC-MTCH.
2. This working assumption is automatically confirmed/abandoned if the corresponding RAN2 working assumption is confirmed/abandoned.

Agreement:

3. Collision between SC-PTM related transmissions and PSS/SSS, PBCH, and SIBs, is handled in the same way as Rel-13 eMTC.
1. The UE is not required to simultaneously monitor the MPDCCH search spaces for SC-MCCH and SC-MTCH.
2. When a UE is monitoring MPDCCH search space for SC-MCCH or receiving PDSCH carrying SC-MCCH, it is not required to simultaneously monitor MPDCCH search space for SC-MTCH or receive PDSCH carrying SC-MTCH.

6.2.8.3 OTDOA enhancements

Consider improvements of accuracy, UE complexity and power consumption

R1-1613541 WF on OTDOA enhancements for FeMTC Ericsson, Sony, Qualcomm, ZTE, ZTE Microelectronics, Nokia, ASB, Verizon
Also supported by Acorn Technologies

Agreement:

- PRS bandwidths include {1.4, 3, 5, 10, 15, 20} MHz
  - No change w.r.t. legacy LTE PRS bandwidths
  - One cell can transmit multiple PRS time-frequency configurations with possibly up to [3] different PRS bandwidths
  - Configuration information multiple PRS time-frequency configurations with possibly up to [3] different PRS bandwidths per cell can be signaled to the UE, each information associated with a set of configuration parameters including PRS configuration index, number of PRS subframes per occasion, muting pattern, and new optional parameters
- Supported legacy PRS periodicities are {160, 320, 640, 1280} subframes that are jointly signaled with starting subframe offsets in PRS configuration indices
  - No change w.r.t. legacy LTE PRS indices
- Supported number of PRS subframes per PRS occasion are {1, 2, 4, 6, 10, 20, 40, 80, 160} subframes
- Reuse LTE PRS muting mechanism with a bit string of {2, 4, 8, 16} bits, with each bit applied to one legacy PRS period
  - No change w.r.t. legacy LTE PRS muting pattern
- Add additional configuration parameters to support more frequent PRS transmissions and PRS frequency hopping
- Legacy PRS configuration (including R14 enhancements) can also be delivered to (F)eMTC UEs
- To support more frequent PRS transmission in time, add the following parameters to support multiple PRS occasions in a legacy PRS period
  - PRS occasion interval in a PRS period: {10, 20, 40, 80} subframes
    - If this is not configured, there is only one PRS occasion in a legacy PRS period.

Proposal:

- FFS: An optional finer muting pattern can be applied to PRS occasions in a legacy PRS period
  - The muting of the first PRS occasion in a legacy PRS period follows the existing PRS muting

Agreement:

- If activated, PRS frequency hopping is configured with the following parameters (similar to Rel-13 eMTC FH):

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm

Petitioners' Exhibit 1007, p. 1230
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Number of bands for frequency hopping X: {2, 4}
  - The first band is in the center
- The positions of the remaining X-1 bands:
  - The starting position of each of X-1 bands is indicated separately: narrowband {0,1,…,max-1}

Proposal:

- Frequency hopping interval: FFS between the two following options:
  - Option 1: {1, 2, 4, 8} SFs for FDD and {1, 5, 10, 20} SFs for TDD
  - Option 2: one PRS occasion
- FFS: The hopping pattern starts in every radio frame fulfilling SFN mod 8 = 0
- FFS: When frequency hopping is enabled, the UE can assume that the same precoder is used within one frequency hopping interval

R1-1613625 WF on UE Capability Indication Enhancement for OTDOA Positioning in FeMTC Nokia, Alcatel-Lucent Shanghai Bell, Ericsson, Qualcomm, Verizon

Friday

R1-1613493 **[DRAFT] LS on Rel-14 FeMTC OTDOA enhancements** **Ericsson**

Decision: The document is noted and final LS is approved in R1-1613760.

6.2.8.4 VoLTE enhancements

Increase VoLTE coverage for half-duplex FDD/TDD through techniques to reduce DL repetitions, new repetition factors, and adjusted scheduling delays

R1-1613381 WF on VoLTE enhancements for FeMTC Ericsson, Huawei, HiSilicon, Sequans, Sierra Wireless, Sony

Agreements:

1. On 'new number(s) of repetitions for PUSCH':
   1. Define a new set of repetition factors for PUSCH which overrides the SIB parameter for the maximum number of PUSCH repetitions
   2. At least for the non-SPS case, the new set of repetition factors is {1, 2, 4, 8, 12, 16, 24, 32}
   3. The new set of repetition factors is enabled by a new optional 1-bit UE-specific RRC configuration parameter
2. On 'adjusted scheduling relationships between physical channels':
   1. Introduce a dynamic timing relationship between PDSCH and HARQ-ACK controlled by the DCI
      1. This adjusted timing relationship is enabled by a new optional 1-bit UE-specific RRC configuration parameter
   2. FFS whether to introduce a dynamic timing relationship between UL grant and PUSCH
      1. If introduced, this will not require the introduction of any additional RRC parameters.
   3. FFS whether to introduce a dynamic timing relationship between DL assignment and PDSCH
      1. If introduced, FFS whether the modified scheduling delay is implicitly detected based on guard-subframe timing
3. On 'SRS coverage enhancement':
   1. P-SRS can be transmitted on at most 6 UpPTS symbols in the same subframe for the same FeMTC UE
   2. A-SRS can be transmitted on at most 6 UpPTS symbols in the same subframe for the same FeMTC UE
   3. Use similar RRC signalling as introduced for the corresponding functionality in the Rel-14 WI for SRS-based carrier switching
   4. This is an optional UE capability

6.2.9 Enhancements of NB-IoT - *WID in RP-161901.*

The objectives apply to the in-band, guard-band, and standalone operation modes and the same coverage enhancement targets as defined in the Rel-13 NB-IoT work item.

R1-1613705 **Chairman's notes of AI 6.2.9 on Enhancements of NB-IoT Ad-Hoc chair (Huawei)**
The document was presented by Matthew Webb from Huawei.
Discussion: Ad-Hoc chair (Huawei) indicated the following two corrections from the notes:
1/ Statement "of neighboring cell" can be deleted from the agreements of NPRS pattern for standalone and guard-band scenario (AI 6.2.9.1.1)
2/ Statement "FFS: Part B on its own, and Part B when used together with Part A" can be deleted from the agreements on NPRS subframe configuration (AI 6.2.9.1.2)
Decision: The document is endorsed and content incorporated below.

R1-1611873 Draft RRC parameter list for NB-IoT enhancements Huawei
R1-1612377 RAN1 agreements for Rel-14 NB-IoT Ericsson

Email approval for the higher layer parameters list and send to RAN2 until November 25 (Matthew, Huawei)

Petitioners' Exhibit 1007, p. 1232
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

$$k = 6\left(m + 2\cdot n_{\text{PRB}}\right) + \left(6 - l + v_{\text{shift}}\right) \bmod 6$$

$$l = \begin{cases} 3,5,6 & \text{if } n_s \bmod 2 = 0 \\ 1,2,3,5,6 & \text{if } n_s \bmod 2 = 1 \text{ and } (1 \text{ or } 2 \text{ PBCH antenna ports}) \\ 2,3,5,6 & \text{if } n_s \bmod 2 = 1 \text{ and } (4 \text{ PBCH antenna ports}) \end{cases}$$

$$m = 0,1$$

where n_s is the slot number within a radio frame; l is the OFDM symbol number within slot n_s ; k is the subcarrier index within LTE bandwidth which is used for NB-IoT NPRS transmission; n_{PRB} is the PRB index within LTE bandwidth which is used as NB-IoT NPRS PRB; v_{shift} is the cell-specific frequency shift generated by $v_{\text{shift}} = N_{\text{ID}}^{\text{PRS}} \bmod 6$,where $N_{\text{ID}}^{\text{PRS}}$ equals $N_{\text{ID}}^{\text{Ncell}}$ unless configured by higher layers.

- Note: It is assumed v_{shift} , $N_{\text{ID}}^{\text{PRS}}$, $N_{\text{ID}}^{\text{Ncell}}$, and PBCH antenna ports number will be signaled by higher layers.
- If NPRS subframe configuration is part B only, NPRS is punctured in OFDM symbols 5 and 6 in each slot

Agreements:
For standalone and guard-band scenario

- If NPRS subframe configuration is part A or Part A+ Part B, the pattern in the figure below is adopted
- The NPRS location in slot is generated by the formula list below:

$$k = 6m + \left(6 - l + v_{\text{shift}}\right) \bmod 6$$

$$l = 0,1,2,3,5,6$$

$$m = 0,1$$

where l is the OFDM symbol number within slot ; k is the subcarrier index within LTE bandwidth which is used for NB-IoT NPRS transmission; v_{shift} is the cell-specific frequency shift generated by $v_{\text{shift}} = N_{\text{ID}}^{\text{PRS}} \bmod 6$,where $N_{\text{ID}}^{\text{PRS}}$ equals $N_{\text{ID}}^{\text{Ncell}}$ unless configured by higher layers.

- Note: It is assumed v_{shift} , $N_{\text{ID}}^{\text{PRS}}$, $N_{\text{ID}}^{\text{Ncell}}$ ~~of neighboring cell~~ will be signaled by higher layers.
- If NPRS subframe configuration is part B, NPRS is punctured in OFDM symbols 5 and 6 in each slot

IPR2024-01121

– ~~FFS: Part B on its own, and Part B when used together with Part A~~

R1-1613444 WF on PRS configuration for NB-IoT UEs Qualcomm, Huawei, HiSilicon, ITL, Acorn Technologies, Nokia, Alcatel-Lucent Shanghai Bell

Agreements:

- Signalling is provided for the UE to indicate its capability of maximal bandwidth for RSTD measurement for OTDOA positioning to the E-SMLC in LPP
- An NB-IoT UE can receive assistance information regarding LTE PRS.
  - ~~o~~ This includes additional PRS configurations introduced in Rel-14 Indoor Positioning and FeMTC work items (if any).
- UE is not required to receive any reference signal not within the bandwidth of one NB-IoT carrier containing NPRS at a time.
- RAN4 are requested to set requirements for NB-IoT positioning assuming UE uses only NPRS within one carrier.
  - ~~o~~ Additionally or alternatively, an NB-IoT UE can receive assistance information regarding 1-PRB NPRS
  - ~~o~~ For Part-B NB-IoT specific assistance information:
    - Number of subframes of NPRS in one occasion is N_{PRS} {10, 20, 40, 80, 160, 320, 640, 1280}
    - Periodicity of NPRS occasion T_{PRS}: 160ms, 320ms, 640ms, 1280ms.
    - Valid configurations are those satisfying $N_{PRS} <= T_{PRS}$
    - For a given periodicity of NPRS occasion, the starting subframe offset of NPRS occasion = $\alpha T_{PRS}, \alpha \in \{0, \frac{1}{8}, \frac{2}{8}, \frac{3}{8}, \frac{4}{8}, \frac{5}{8}, \frac{6}{8}, \frac{7}{8}\}$

R1-1613526 Way forward on NPRS sequence generation Huawei, HiSilicon, Ericsson, Nokia, ZTE, ZTE Microelectronics

Agreements

- NPRS sequence is determined based on a subsequence of length-2 truncated from PRS sequence introduced in Rel-14 for further indoor positioning enhancements.
  - For stand-alone and guard band operations, the length-2 NPRS sequence is the central 2 elements of Rel-14 PRS sequence.
  - For in-band operation, the length-2 NPRS sequence is truncated from Rel-14 PRS sequence corresponding to the LTE PRB of the NB-IoT carrier.

R1-1613215 Way forward on NPRS muting pattern Huawei, HiSilicon

Agreements:

- Muting pattern
  - Support 2, 4, 8, and 16 bit bitstring
  - Each bit in a muting pattern corresponds to:
    - For Part A, consecutive 10 subframes
    - For Part B, one NPRS occasion
  - Per NB-IoT carrier, one muting pattern is signaled associated with Part A (if configured) and one muting pattern is signaled associated with Part B (if configured)

Agreement:

- If part A and part B are both configured then a subframe contains NPRS if both configurations indicate it contains NPRS

Proposal

- Send LS to RAN2,3,4 containing the agreements on narrowband OTDOA positioning reference signal and Remaining details of narrowband OTDOA positioning configuration (Alberto, Qualcomm)

Friday

R1-1613739 **[DRAFT] LS on OTDOA agreements for NB-IoT Qualcomm**

Decision: The document is noted and final LS is approved in R1-1613761 with following update (first correction indicated by Ad-Hoc chair from his notes)

- Note: It is assumed v_{shift}, N_{ID}^{PRS}, N_{ID}^{Ncell} ~~of neighboring cell~~ will be signaled by higher layers.

R1-1612795 On OTDOA framework for NB-IoT Ericsson
R1-1611304 UE Capability Indication Enhancement for OTDOA Positioning in NB-IoT Nokia, Alcatel-Lucent Shanghai Bell

6.2.9.1.3 Narrowband UTDOA positioning using an existing NB-IoT transmission

R1-1611140 On reusing NPRACH for NB-IoT uplink positioning Huawei, HiSilicon
R1-1611119 NPRACH based UTDOA impact on NB-IoT availability Ericsson
R1-1611305 UTDOA Positioning in NB-IoT Nokia, Alcatel-Lucent Shanghai Bell
R1-1611631 Uplink-based narrowband positioning Qualcomm Incorporated
R1-1612603 UTDOA for NB-IoT ZTE
R1-1611120 NPRACH based UTDOA performance Ericsson

Proposed observations on use of Rel-13 NPRACH for UTDOA:
- It is possible to configure NPRACH resources such that the eNB can provide a dedicated resource for UTDOA positioning
  - In these configurations, in scenarios where there is mixed use of NPRACH for positioning and normal purposes there would be impact to
    - System capacity
    - NPRACH intra-cell and inter-cell interference
    - Battery life and latency of UEs in other NPRACH resources
- RAN1 concludes its verification of UTDOA in Rel-13.
- Inform RAN3, RAN4 of the above.

Friday
R1-1613564 **WF on UTDOA positioning in NB-IoT Ericsson, Nokia, ASB, Qualcomm, Verizon, Sony, Samsung**
The way forward is proposed to solve the above yellow "proposed observations:
- RAN1 understands the limitations and difficulties of using Rel-13 NPRACH signal for UTDOA based positioning.
- The use of Rel-13 NPRACH signal for UTDOA based positioning is not practically feasible due to significant instability caused by interference when using Rel-13 NPRACH signal for UTDOA based positioning as well as excess UL resource consumption.
- It is proposed RAN1 does not further evaluate UTDOA based position for NB-IoT for Rel-14.
  - This does not preclude the study of UTDOA based positioning for NB-IoT in future releases.

Discussion: ZTE, Huawei do not agree – have a concern with the second bullet
Vodafone: RAN1 WG cannot decide to stop UTDOA on its own – this should be a plenary's decision
Qualcomm: according to the WID, RAN1 has missed to confirm something – accuracy requirements should be confirmed
Intel: Let's RAN decide whether WID needs modification or not
Huawei: the method works – the matter is regarding the achievable accuracy – RAN1 should provide RAN with the current results and let RAN decide
CMCC: suggests drafting an LS to RAN stating that RAN1 could not decide – it is up to the operators to decide whether the achievable accuracy is an issue
Huawei: wants the above proposed observations highlighted in yellow to remain in the minutes

Collision handling
R1-1611122 NB-IoT L1 configuration of multicast service Ericsson
R1-1611308 SC-PTM collision handling Nokia, Alcatel-Lucent Shanghai Bell
R1-1611153 Collision handling for multicast in NB-IoT Huawei, HiSilicon

R1-1613345 WF on collision handling in NB-IoT SC-PTM Huawei, HiSilicon

Agreements:

- In case of collision between NPDSCH carrying SC-MTCH/SC-MCCH and NPSS/NSSS, NPBCH, and SIBs, the NPDSCH carrying SC-MTCH/SC-MCCH is postponed.
- In case of collision between Type1-MSS or Type2-MSS and NPSS/NSSS, NPBCH, and SIBs, the NPDCCH is postponed.
- There is at least 4 ms from the end of one Type1-MSS or Type2-MSS to the start of the next Type1-MSS or Type2-MSS
  - This also applies to partial search spaces
- UE is not required to monitor Type1-MSS while receiving NPDSCH carrying SC-MCCH;

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Tab after: 2.54 cm + Indent at: 2.54 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm

Petitioners' Exhibit 1007, p. 1237
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- When a UE is monitoring Type1-MSS or receiving NPDSCH carrying SC-MCCH, it is not required to simultaneously monitor Type2-MSS nor receive NPDSCH carrying SC-MTCH.

Working assumptions, to be confirmed or abandoned after RAN2 decision on their related working assumption:

- NB-IoT UE is not required to monitor Type1-MSS or receive NPDSCHs carrying SC-MCCH when the UE is monitoring its Type1-CSS on paging occasions or receiving NPDSCHs carrying paging.
- NB-IoT UE is not required to monitor Type2-MSS or receive NPDSCHs carrying SC-MTCH when the UE is monitoring its Type1-CSS on paging occasions or receiving NPDSCHs carrying paging message.
- NB-IoT UE is not required to monitor Type1-MSS or Type2-MSS nor receive NPDSCH carrying SC-MCCH/SC-MTCH when UE is receiving/sending messages during a random access procedure.

R1-1613370 WF on larger TBS support issue on SC-PTM for eNB-IoT LG Electronics

Agreements

- Maximum TBS value for NPDSCH carrying SC-MCCH or SC-MTCH is 2536 bits
  - Cat NB-1 UE does not need to receive the NPDSCH if the DCI indicates a TBS larger than 680 bits

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm

Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Tab after: 2.54 cm + Indent at: 2.54 cm

6.2.9.3 Non-anchor PRB enhancements

Transmission of paging on non-anchor PRBs

R1-1611084 LS on NB-IoT Rel-14 RACH and Paging on non-anchor carrier RAN2, Ericsson
R1-1613054 [draft] LS reply on LS on NB-IoT Rel-14 RACH and Paging on non-anchor carrier Ericsson

Agreement:

- An additional DCI field is introduced in DL grant DCI format(s) for carrier indication for PDCCH ordered NPRACH.
- The size of the field is FFS pending RAN2 decision on the maximum number of UL non-anchor carriers configured for NPRACH per CE level
- Send LS to RAN2 informing them of this agreement, and note that in DCI format N1 there are 8 reserved bits in case of NPDCCH order, and note that RAN1 have not yet decided if there are new DCI formats introduced in Rel-14.

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm

R1-1613511 [draft] LS reply on LS on NB-IoT Rel-14 RACH and Paging on non-anchor carrier Ericsson

The draft LS in R1-1613511 is endorsed, final version in R1-16xxxx (Yutao, Ericsson)

R1-1611867 NPDCCH Monitoring and new DCI format for 2 HARQ processes MediaTek
R1-1611314 DCI formats to support 2 HARQ processes Nokia, Alcatel-Lucent Shanghai Bell

R1-1613508 WF to achieve NB-IoT power consumption and latency reduction Ericsson, Intel, Huawei, Sierra Wireless, Nokia/Alcatel-Lucent Shanghai Bell
Also supported by: HiSilicon, Neul, Deustche Telekom, u-blox

R1-1613351 WF on 2 HARQ processes for NB-IoT MediaTek, Qualcomm, AT&T, DoCoMo, NEC, Nokia, Alcatel-Lucent Shanghai Bell, KDDI, Samsung, Softbank, Sony, Sharp, MTI, APT, Xinwei, ZTE
Also support by: ZTE Microelectronics, LG

Agreements
- There is a new NB-IoT UE category with max UL and max DL TBS of 2536 bits
- Introduce the {1 HARQ + 2536 bits UL/DL TBS} TBS tables in R1-1613508
- Introduce the {2 HARQ + [1352] bits DL TBS, [1800] bits UL TBS and no change to any Rel-13 specification for NPUSCH}
  - After receiving one DL grant, Rel-14 UE is required to continue monitoring any NPDCCH search spaces containing candidates ending at least 2 ms (i.e., $x_1 \geq 2$ ms) before the start of the first NPDSCH.
  - The gap between NPUSCH to any DL reception is ≥ 1ms.
  - Reuse Rel-13 timing relationship and scheduling delay values for each of the 2 HARQ processes
  - HARQ process ID is indicated DL grant DCI with one bit
    - Monitored only in USS
  - FFS TBS table details.
- Soft buffer size is FFS until next RAN1#88
- The support of 2 HARQ by UE is an optional capability, signalling is left to RAN2

Agreement
- Inform RAN2 in an LS of the above agreements (Wuyiling, Huawei)

R1-1613733 [DRAFT] LS on power consumption and latency reduction in NB-IoT Huawei
Agreed in R1-1613764

6.2.10.1 Shortened processing time for 1ms TTI

R1-1611168 Remaining issues on shortened processing time for 1ms TTI Huawei, HiSilicon

Agreement

- For 1 ms TTI shortened processing, support fallback to legacy processing timing n+4 by the search space, i.e. DCI for processing time n+3 are carried in USS of PDCCH and DCI for processing time n+4 are carried in CSS of PDCCH.
  - For PDSCH the HARQ processes of n+3 1ms TTI and n+4 1ms TTI are shared
  - FFS: Possible PUSCH HARQ processes sharing between n+3 1ms TTI and n+4 1ms TTI
  - FFS: UE behaviour in case of n+3 and n+4 collision
  - Note: It is not expected that the eNB will often change between n+3 and n+4 scheduling timing
