R1-1612690 Views on shortened processing time for 1ms TTI NTT DOCOMO, INC.
R1-1612691 HARQ/Scheduling for shortened processing time for 1ms TTI NTT DOCOMO, INC.

R1-1613375 WF on maximum Timing Advance for LTE reduced processing time operation Nokia, Ericsson, AT&T, CMCC, China Telecom, Deutsche Telekom, KDDI, KT Corporation, NTT DOCOMO Inc., Softbank, T-Mobile USA, Verizon, Alcatel-Lucent Shanghai Bell

Proposed agreement

1. Support a maximum timing advance of x=0.33ms for n+3 processing timing for 1ms TTI.
2. Support a maximum timing advance of 0.33ms for sTTI operation for all UL/DL sTTI lengths.

R1-1613400 WF on support shortened processing time for 1ms TTI Mediatek, Qualcomm, Intel, Samsung, LGE

Proposed agreement

- A minimum timing n+3 is supported for UL grant to UL data and for DL data to DL HARQ for UEs capable of operating with reduced processing time only with the following conditions:
  - a maximum allowable TA is reduced to 67us;
  - only when scheduled by PDCCH

Proposed agreement

- Same maximum timing advance is specified for both sTTI and 1 ms TTI

R1-1613325 Way Forward on 2os sPDSCH structure Ericsson, Huawei, HiSilicon
Revision of R1-1613395

Agreements:
- The sTTI design is not optimized for N_PRB <= 10.
- Clarification: the DL sTTI length in R1-168500 refers to the RRC configured DL sTTI length

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Tab after: 1.27 cm + Indent at: 1.27 cm

Proposed agreement:
For 2-symbol DL sTTI, the option 1-1 is supported.
Supported by: LG Electronics, Intel, KT Corporation, NTT DOCOMO, Samsung, Sharp (6)
For 2-symbol DL sTTI, the option 2-1 is supported.
Supported by: Ericsson, Huawei, HiSilicon, Nokia, ASB, Qualcomm, CATT (7)

Agreement:
For 2-symbol DL sTTI, consider further only options 1-1 and 2-1

Revision of R1-1613405
Agreement:
- For a given UE, the same DL sTTI length is configured for the serving cells within the same PUCCH group for which sTTI operation is configured
  - FFS on across two PUCCH groups

R1-1613374 WF on the combination of DL and UL sTTI length Huawei, HiSilicon, LGE, ZTE, ZTE Microelectronics
Supported also by: NTT DOCOMO
Proposal:
- Alt.4 is supported for sTTI WI
  - i.e, UE supports the {DL, UL} sTTI length combination of {2,2}, {2,4}, {2,7}, {7,7}

R1-1613549 WF on the Combination of DL-UL sTTI lengths Qualcomm, Nokia, Alcatel-Lucent Shanghai Bell, Mediatek, Intel

Agreement:
- For a user capable of supporting sTTI, the following {DL,UL} configurations are supported:
  - {2,2} and {7,7}
  - Working assumption on support of {2,7}.
    - The working assumption is to be confirmed in RAN1 #88 if no significant issues (including no obvious performance gain) are identified.

Proposed agreement:
- For a user capable of supporting sTTI, the following {DL,UL} configurations are not supported:
  - {7, 14}
  - {2, 14}
  - {2, 4}

R1-1612208 On simultaneous unicast PDSCH and sPDSCH operation Nokia, Alcatel-Lucent Shanghai Bell
Agreement:
Revised agreement from RAN1 #84bis according to the below (revisions are marked in red)

- A UE is expected to handle the following cases in the same carrier in a subframe
  - Receiving legacy TTI non-unicast PDSCH (except FFS for SC-PTM) and short TTI unicast PDSCH(s)
  - Receiving legacy TTI non-unicast PDSCH (except FFS for SC-PTM) and legacy TTI unicast PDSCH~~(s)~~

R1-1613324 Way Forward on handling of PDSCH/sPDSCH assignments for the same subframe and carrier Ericsson, LG Electronics, Huawei, HiSilicon, Nokia, ASB, ZTE, ZTE Microelectronic, Intel, NTT DOCOMO, Qualcomm
Revision of R1-1613397

Agreements:

- A UE can be dynamically (with a subframe to subframe granularity) scheduled with legacy TTI unicast PDSCH and/or short TTI unicast PDSCH

~~•~~ If the UE is indicating the capability of decoding PDSCH and sPDSCH assigned with C-RNTI/SPS C-RNTI in the same subframe for a given carrier
  ~~o~~ If valid DL assignments are detected based on C-RNTI/SPS C-RNTI in PDCCH/EPDCCH for PDSCH and PDCCH/sPDCCH for sPDSCH in the same subframe for a given carrier, the UE should decode the PDSCH in addition to sPDSCH
    ~~•~~ UE shall provide HARQ-ACK feedback for both PDSCH and sPDSCH
    ~~•~~ No special consideration is specified for overlapping of sPDSCH and PDSCH
~~•~~ Otherwise
  ~~o~~ If valid DL assignments are detected based on C-RNTI/SPS C-RNTI in PDCCH/EPDCCH for PDSCH and PDCCH/sPDCCH for sPDSCH in the same subframe for a given carrier, the UE should decode the sPDSCH and is not required to decode PDSCH
    ~~•~~ UE shall provide HARQ-ACK feedback for both PDSCH and sPDSCH

Revision of R1-1613376

Agreements:

- At least the following formats should be designed for sPUCCH:
  - For sPUCCH supporting up to 2-bit HARQ-ACK and/or SR (if any)
    - DMRS based demodulation for 7-symbol sTTI
    - FFS on the formats and DMRS design for 2-symbol sTTI
  - For sPUCCH supporting more than 2-bit HARQ-ACK and SR (if any)
    - DMRS based demodulation for all sTTI lengths
- FFS on encoding methods
- FFS on sPUCCH with channel selection for up to 4-bit HARQ-ACK.
- FFS on support of frequency hopping

6.2.12 Voice and Video enhancement for LTE - *WID in RP-161856*

VoLTE coverage enhancement

R1-1613708 Chairman's Notes of Agenda Item 6.2.12 Voice and Video enhancement for LTE Session Chairman (Nokia)
Contents incorporated below
Endorsed with following updates

R1-1611950 On coverage and quality enhancements for VoLTE Intel Corporation
R1-1611106 PUSCH coverage enhancement for VoLTE Ericsson
R1-1611170 Remaining issues on VoLTE coverage enhancement Huawei, HiSilicon

Petitioners' Exhibit 1007, p. 1246
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1612099 Remaining issues of VoLTE/ViLTE coverage enhancements China Telecommunications
R1-1611442 Further details on PUSCH enhancement for VoLTE Nokia, Alcatel-Lucent Shanghai Bell

R1-1611646 Coverage enhancement techniques Qualcomm Incorporated

Agreement:

- When configured in the new PUSCH enhancement mode, in the common search space the UE monitors DCI0 (without HARQ process ID) and DCI1A. These two grants have the same size.

R1-1613675 WF on bandwidth for VoLTE and ViLTE enhancement CMCC, Huawei, HiSilicon, Qualcomm, China Telecom
R1-1613671 WF on eVoLTE Huawei, HiSilicon, Ericsson, QualComm

Agreements:

- Support maximum PUSCH bandwidth of 20MHz for the new PUSCH enhancement mode
- The maximum number of repetitions for PUSCH in the new PUSCH enhancement mode is 32
- Number of PUSCH repetitions in the new PUSCH enhancement mode:
  - Number of repetitions {1, 2, 4, 8, 12, 16, 24, 32} indicated by a 3-bit DCI field
  - 12 and 24 are new values compared to Rel-13 CE mode A, as agreed for FeMTC
- The TBS restriction of CE Mode A does not apply in the new PUSCH enhancement mode
- UE is RRC reconfigured to switch between normal mode and the new PUSCH enhancement mode
- Reuse the resource assignment field of DCI Format 0 for the new PUSCH enhancement mode

Email approval of RRC parameter lists until 1st Dec. - Yu Bo (Huawei)

6.2.13 Study on Further enhancements to Coordinated Multi-Point Operation

R1-1612017 Tone spacing and CP type for mmW Qualcomm Incorporated
R1-1611458 Proposal for supported subslot durations Fujitsu
R1-1612262 On the mini-slot structures in NR Nokia, Alcatel-Lucent Shanghai Bell
R1-1612263 Comparison of slot and mini-slot based approaches for URLLC Nokia, Alcatel-Lucent Shanghai Bell
R1-1612744 Flexible frame structure and control signalling for NR Motorola Mobility
R1-1612904 On mini-slots Ericsson
R1-1612906 On carrier aggregation Ericsson

Agreement: NR should provide support for carrier aggregation, including different carriers having same or different numerologies.

Petitioners' Exhibit 1007, p. 1248
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Wednesday session

R1-1613447 WF on Fractional PRB ZTE, Samsung, Panasonic, Docomo, Deutsche Telekom, ETRI

- Fractional PRB, less than 12 subcarriers, is supported for NR at least for data
- Fractional PRB is only used when an adjacent full PRB is used with the same numerology.
- No special handling of DMRS (like DMRS location) due to the presence of fractional PRB. To use the closest RS in adjacent full PRB for demodulation should be possible.
- Fractional PRB is applied to OFDM, FFS if DFT-s-OFDM is supported
- For other topics, RAN1 shall strive for keeping the design of the fractional PRB simple and to minimize the standardization impact, e.g.:
  - Transport block size handling in the same manner as it would be done for the flexible slot/subslot length
  - Transmit power control handling in the same manner as it would be done for flexible scheduling in the number of PRBs

Discussion: several believe that this is optimization – should be postponed to the standardization phase
Decision: The document is noted.

Mini-slots

R1-1613160 WF on mini-slots ZTE, ZTE Microelectronics, Qualcomm, Ericsson, Nokia

- Mini-slots have the following properties
  - Length
    - From 1 to "slotlength-1"
    - FFS whether and how to downselect
  - Aggregation
    - FFS: Possible to aggregate several mini-slots
    - Possible to aggregate mini-slots and slot
  - Alignment
    - Mini-slots align at least on 1ms boundaries
    - FFS: the necessity to align on a smaller granularity (e.g. slot boundary)
    - When aggregated with a slot, mini-slots do not exceed slot boundaries
  - NR-PDCCH monitoring
    - Shall be possible to monitor NR-PDCCH on mini-slots boundary
    - To reduce power consumption, longer configurable monitoring intervals shall be possible

Discussion: Proposal to modify mini-slots length as "From 1 to "slotlength-1" OFDM symbols in the slot numerology"
Decision: The document is noted.

Possible agreements:

- Mini-slots have the following properties
  - Aggregation
    - FFS: Possible to aggregate several mini-slots
    - Possible to aggregate mini-slots and slot
  - Alignment
    - Mini-slots align at least on 1ms boundaries
    - FFS: the necessity to align on a smaller granularity (e.g. slot boundary)
    - When aggregated with a slot, mini-slots do not exceed slot boundaries
  - NR-PDCCH monitoring
    - Shall be possible to monitor NR-PDCCH on mini-slots boundary
    - To reduce power consumption, longer configurable monitoring intervals shall be possible

R1-1613736 Summary from offline discussion remaining issues on mini-slots ZTE
Discussion: The note "already agreed every symbol is starting symbol above 6 GHz, except URLLC" was not agreed by Huawei.
Decision: The document is noted.

R1-1613779 Summary of offline discussion about mini-slots ZTE

Agreements:

1. NR-PDCCH monitoring at least for single-stage DCI design,
   1. NR supports the following minimum granularity of the DCI monitoring occasion:
      1. For slots: once per slot
      2. When mini-slots are used: FFS if every symbol or every second symbol
         1. FFS with respect to which numerology if slot and mini-slot have different numerology (e.g. SCS, CP overhead)
         1. Note: slot/mini-slot alignment is not assumed here

AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

2. Note: This may not apply in all cases

Extended CP

R1-1613478 WF on extended CP Huawei, HiSilicon, CATT, Sony, Mediatek, OPPO

- *Slot boundary with different CP overhead with the same or different subcarrier spacing should be aligned at subframe boundary at least.*
- *NR should at least support 60kHz with extended CP for URLLC Service*
  - *48 FDM symbols in one subframe*
- *For eMBB service*
  - *NR should at least support 60kHz with extended CP for high speed scenarios*
  - *NR should at least support ECP for 120kHz below 40GHz band*
    - *FFS between 96 or 104 OFDM symbols in one subframe*
  - *NR should at least support ECP for 960kHz above 40GHz band*
- *For multiplexing of transmissions for eMBB/URLLC is supported by*
  - *Using different sub-carrier spacing*
    - *Both same and different CP overhead are supported*
- *For the scenario required relaxing uplink timing synchronization*
  - *Support 15/30/60kHz SCS with ECP for uplink transmission*

Decision: The document is noted. Continue offline.

R1-1613382 WF on ECP use case for 60 kHz ZTE, ZTE Microelectronics, Samsung, Qualcomm

- ***Assumptions:***
  - Multiplexing by puncturing eMBB is supported
  - URLLC transmission bursts align with eMBB symbol boundaries
- ***Proposal 1****: Use case for the extended CP*
  - *Multiplexing of eMBB and URLLC deployed below 6 GHz*
  - *SCS for eMBB 15/30 kHz, SCS for URLLC = 60 kHz*
    - *Support extended CP for URLLC = 60 kHz*
- ***Proposal 2:***
  - *Study 2 solutions to support URLLC ECP @ 60 kHz SCS*
    - *3symb-ECP symbol aligned with eMBB @15 kHz*
    - *7symb-ECP bi-symbol aligned with eMBB@15 kHz*
  - *Compare above ECP approached with scaled NCP for URLLC*

Decision: The document is noted.

Possible agreement:

- Possible use case for the extended CP
  - Multiplexing of eMBB and URLLC deployed below 6 GHz
  - SCS for eMBB 15(NCP)/30/60 kHz, SCS for URLLC = 60 kHz
- Support extended CP for 60 kHz SCC at least for URLLC

Thursday

R1-1613658 WF on extended CP Huawei, HiSilicon, CATT, Sony, Mediatek, OPPO, Vodafone, Orange, Nokia, ASB, Ericsson, ZTE

Agreements:

- Possible use cases for the extended CP include
  - Multiplexing of eMBB and URLLC deployed below 6 GHz
    - SCS for eMBB 15(NCP)/30/60kHz, SCS for URLLC = 60 kHz
  - Transmission of URLLC with 60 kHz SCS
  - High speed scenarios for 30kHz and 60kHz
- Support extended CP at least for 60 kHz SCS
  - UE support for ECP may depend on UE type/capability
  - FFS how to configure UE using different CP overhead
  - FFS the length of ECP
- FFS extended CP for other scenarios/numerologies

R1-1613364 WF on Spectrum Partitioning with Mixed Numerology AT&T, Ericsson, Huawei, HiSilicon, CATT

- UEs can be at least semi-statically configured to transmit and/or receive data with different numerologies within a cell
  - FFS: if the numerology, from a UE point-of-view can be dynamically varied
- The network can simultaneously configure different UEs within a cell with different numerologies

- UEs configured with different numerologies may not be restricted to be scheduled in different non-overlapping parts of a carrier
  - Implying that, from a network point of view, the numerology of a certain frequency-part of a carrier can be dynamically varied
  - Does not mean that different UEs with different numerologies may be *simultaneously* scheduled in overlapping parts of a carrier
  - FFS: If spectrum confinement (filtering, windowing, …) can be dynamically varied or not
- UEs configured with different numerologies may not be restricted to be scheduled in different non-overlapping times

Decision: The document is noted. Continue offline.

Thursday

R1-1613521 WF on Spectrum Partitioning with Mixed Numerology AT&T, Ericsson, Huawei, HiSilicon, CATT, Samsung, Panasonic, National Instruments, NTT DOCOMO

Agreements:

- NR strives for efficient support of dynamic resource allocation of different numerologies in FDM/TDM fashion.
  - Potential specification impact includes but is not limited to:
    - FFS:CSI-RS measurement
  - FFS: the time and frequency granularity of dynamic resource allocation
    - FFS: If spectrum confinement (filtering, windowing, …) can be dynamically varied or not

---

R1-1613161 WF on URLLC/eMBB multiplexing ZTE, ZTE Microelectronics, Qualcomm, Ericsson, Nokia, Samsung, Sharp

- Dynamic resource sharing between URLLC and eMBB is supported by
  - Puncturing eMBB symbols
  - URLLC transmission bursts align with symbol boundaries of eMBB numerology

Decision: The document is noted. Continue offline.

Thursday

R1-1613507 Multiplexing of eMBB and URLLC Samsung

R1-1613352 WF on DL dynamic resource sharing between eMBB and URLLC Huawei, HiSilicon, CATR, MediaTek, Intel

- NR should at least support orthogonal multiplexing of different DL data transmissions for dynamic resource sharing between eMBB and URLLC
  - By pre-empting part of eMBB resources and re-assigning to URLLC
  - FFS whether indication is required for informing the eMBB UEs about the resources reassigned to URLLC transmission or not
  - FFS whether and/or how to transmit suspended eMBB data

Decision: The document is noted. Continue offline.

R1-1613657 WF on Multiplexing eMBB and URLLC in DL Samsung, Huawei, HiSilicon

Also supported by ZTE, ZTE Microelectronics

Possible agreements:

- NR supports URLLC transmission by preemption on eMBB transmission resources.
  - Support indication of preempted or impacted eMBB resources to respective eMBB UE(s)
  - FFS: Indication can be implicit/explicit
- Study how to handle preempted/impacted eMBB data by URLLC
  - HARQ retransmission with indication to eMBB UE of symbols and/or PRBs of the previous transmission for the same HARQ process that were preempted/impacted by the URLLC transmission
  - Transmission of eMBB data preempted or retransmission of eMBB data impacted by the URLLC UE without HARQ-ACK feedback for previous transmission of eMBB data

Friday

Email discussion until Dec.8th to list the potential solution – (Samsung)

R1-1613099 WF on the terminology of NR Panasonic, Fujitsu, CATT, OPPO

- To replace "mini-slot" by "subslot".
  - For the time being, both terms can be used.
  - Need to be clarified whether "minimum scheduling unit" means minimum periodicity of control and/or minimum duration of data allocation.
- Resource defined by one subcarrier and one symbol is called as resource element (RE).

Petitioners' Exhibit 1007, p. 1251
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- "RE" should be always capitalized expression.
- RAN1 assumes frame length is 10 msec. To be confirmed by RAN2.
- The need of the term PRB or RB can be discussed in future. If it is used, it is two dimensions of time and frequency.
- To discuss the terminology corresponding to 12 subcarrier of the frequency domain only.
  - subcarrier group
  - subcarrier set
  - subcarrier unit

Decision: The document is noted. Continue offline.

Agreements:

- Resource defined by one subcarrier and one symbol is called as resource element (RE).
  - "RE" should be always capitalized expression.
- RAN1 assumes frame length is 10 msec. To be confirmed by RAN2.

R1-1613479 WF on CA and DC Huawei, HiSilicon, NTT DoCoMo

- *For phase 1, carrier aggregation/dual connectivity operation over e.g. around 1GHz contiguous and non- contiguous spectrum from both NW and UE perspectives is supported*
  - *32 or large than 32 is considered as the baseline of the maximum number of carrier for further study*
  - *Cross-carrier scheduling and joint UCI feedback are supported*
  - *Different numerologies between different/same carrier(s) for a given UE is supported*
  - *Per-carrier TB mapping is supported*
    - *FFS TB mapping across multiple carriers*
  - *Fast carrier access for efficient CA operations and limited UE capability is for further study*
  - *A framework for UL power control mechanism for both CA and DC should be considered.*

Decision: The document is noted, modified as follows:

Agreements:

- For phase 1, carrier aggregation/dual connectivity operation within NR carriers over e.g. around 1GHz contiguous and non- contiguous spectrum from both NW and UE perspectives is supported
  - [4 - 32] should be assumed for further study of the maximum number of NR carriers
    - RAN1 will try to decide the exact number in this week
  - Cross-carrier scheduling and joint UCI feedback are supported
  - Per-carrier TB mapping is supported
    - FFS TB mapping across multiple carriers

R1-1613505 WF on URLLC/eMBB multiplexing support LG Electronics

R1-1613527 Summary of offline discussion on multiplexing of eMBB and URLLC trafficEricsson

- For DL, dynamic resource sharing between URLLC and eMBB is supported by transmitting URLLC traffic scheduled using DCI
  - URLLC transmission may occur in resources used for ongoing eMBB traffic
- Means to handle of impact to eMBB traffic discussed include (note, no agreement which to support)
  - HARQ retransmission of eMBB traffic
  - Explicit indication to eMBB UE that URLLC traffic is occuring or has occured, the eMBB UE takes this into account in the receiver
  - Blind detection in the eMBB UE that URLLC traffic is interfering
  - eMBB transmission is suspended, gNB transmits the suspended data at a later point in time
  - Outer coding
  - CB interleaving

Discussion: LGE→ concern with the statement "…used for ongoing..."
Decision: The document is noted.

Agreement:

- For DL, dynamic resource sharing between URLLC and eMBB is supported by transmitting URLLC scheduled traffic
  - URLLC transmission may occur in resources scheduled for ongoing eMBB traffic

Petitioners' Exhibit 1007, p. 1252
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1613630 **Outcome from offline discussion about mini slots ZTE, ZTE Microelectronics, Intel, Interdigital, Ericsson, Motorola, Nokia, ASB, Samsung, Panasonic, LGE, Huawei, Hi Silicon, CATT, Docomo**

- Mini-slots have the following lengths
  - At least above 6 GHz, mini-slot with length 1 symbol supported
    - FFS below 6 GHz including unlicensed band
    - FFS for URLLC use case regardless frequency band
  - FFS whether DL control can be supported within one mini-slot of length 1
  - Lengths from 2 to slot length -1
    - FFS on restrictions of mini-slot length based on restrictions on starting position
    - For URLLC, 2 is supported, FFS other values
  - Note: Some UEs targeting certain use cases may not support all mini-slot lengths and all starting positions
  - Can start at any OFDM symbol, at least above 6 GHz
    - FFS below 6 GHz including unlicensed band
    - FFS for URLLC use case regardless frequency band
  - A mini-slot contains DMRS at position(s) relative to the start of the mini-slot

Decision: The document is agreed. Also supported by Cohere.

R1-1613652 **[DRAFT] LS on subcarrier spacing and carrier frequencies Ericsson**

Decision: The document is noted and final LS is approved in R1-1613748 with the following updates

RAN1 has agreeds on a subcarrier spacing $f_c=15\cdot 2^n$ as the subcarrier spacing for NR. RAN1 has also discussed the possible values of the integer n and at RAN1~~#86~~ currently discuss ~~agreed~~ to support of at least 15, 30, 60, 120, 240, and 480 kHz while the need for smaller subcarrier spacings of e.g., 3.75 ~~and 7.5~~ kHz isare for further study according to the decision at RAN1 ~~#86RAN1 chairman minutes~~:

- *NR numerology scalability should allow at least from [3.75 kHz] to 480 kHz subcarrier spacing*
- *Necessity of support for less than 15 kHz subcarrier spacing (e.g., 3.75 kHz) should be studied*

The feasibility of a certain subcarrier spacing may depend on e.g. implementation imperfections such as phase noise at different carrier frequencies. The feasibility may also depend on the deployment scenario. RAN1 would therefore ask RAN4 for feedback which subcarrier spacings that are feasible at different carrier frequencies. ~~Furthermore, as the RAN1 specifications are carrier-frequency agnostic, it is RAN1's understanding that any limitation in the supported combinations of subcarrier spacing and carrier frequency will be captured in the RAN4 specifications.~~

RAN1 is currently studying the design and performance of phase noise tracking reference signal.

ACTION: RAN1 would like to ask RAN4 to provide feedback on feasible ~~combinations of~~ subcarrier spacings ~~and carrier frequencies~~ per frequency band

7.1.2 Initial access and mobility

R1-1612228 Proposal of subcell Panasonic Corporation
The document was presented by Hidetoshi Suzuki from Panasonic and introduces subcell which is proposed as the grouping method to realize group common search space. The grouping realized by subcells can be used as 1) spatial cell split, 2) beam split, 3) frequency/numerology resource split and 4) coverage split.
Discussion: Ericsson→ first discuss separetaly and then decide whether a grouping is required.
Decision: The document is noted.

R1-1612651 Discussion on initial access based on multi-beam for NR Potevio

R1-1613538 Offline discussion summary (Day 3) of initial access for NRNTT DOCOMO
The document was presented by Kazuaki Takeda from NTT DOCOMO.
Decision: The document is noted.
R1-1613567 Additional offline discussion summary (Day 3) of initial access for NR NTT DOCOMO

7.1.2.1 Synchronization signal

R1-1611267 Issues related to NR-SS ZTE, ZTE Microelectronics
- *Proposal 1: Specify one SCS for NR-SS in a given frequency range*
- *Proposal 2: Using identical bandwidth for NR-PSS and NR-SSS.*
- *Proposal 3:*
  - *NR-SS is optimized for SS-related requirements, e.g. cell search, synchronization, cell IDs, but not for RRM measurements.*
  - *NR-SS is used for idle-mode RRM measurement if NR-SS/DMRS of NR-PBCH can also meet the requirements for idle-mode RRM measurements.*
  - *RAN1 should send LS to RAN4 to evaluate the corresponding impact if only NR-SS/DMRS of NR-PBCH is used for RRM measurement of idle mode.*

Decision: The document is noted.

R1-1612128 Performance Analysis of PSS in Initial Time-Frequency Uncertainty MediaTek Inc.
- *Observation 1: The performance of Zadoff-Chu based PSS suffers from the ambiguity image at ±2 sub-carrier spacing as evidenced by the knees at the corresponding locations in the CDF of the residual frequency error.*
- *Proposal 1: NR should study new PSS candidates that does not have the ambiguity images exhibited in the Zadoff-Chu sequence.*
- *Observation 2: The detection error rate for Zadoff-Chu based PSS decreases much more slowly as SNR increases comparing to LDPB based signal due to the dominance of the ambiguous image. The gap is 3 dB at 10% error rate and widens as SNR increases.*
- *Proposal 2: NR should study new PSS candidates that can improve the detection error rate of Zadoff-Chu based design.*
- *Observation 3: Larger initial frequency uncertainty leads to higher detection error rate due to the increase in the number of hypotheses and the chances in capturing the ambiguity image in the case of Zadoff-Chu sequence. However, the degradation doesn't increase significantly. More cost-effective components can be used in the UE if complexity is reasonably maintained.*
- *Proposal 3: NR should study new PSS candidates that can relax the initial frequency accuracy of the UE without increasing the initial acquisition complexity.*
- *Observation 4: Longer synchronization periodicity leads to higher detection error rate due to the increase in the number of hypotheses. For Zadoff-Chu sequence, longer periodicity leads to negligible performance loss, especially at high SNR, due to the dominance of errors coming from the false detection of the ambiguity image.*
- *Observation 5: For LDPB sequence which has no ambiguity image, shorter sequence length is less resilient to increased periodicity. For length-42 LDPB, the performance loss is 2 dB when the periodicity increases from 5 sub-frames to 160 sub-frames.*
- *Proposal 4: Longer PSS should be adopted for longer synchronization periodicity.*
- *Observation 5: The LDPB sequence has a 3 dB advantage over Zadoff-Chu sequence in flat fading channel at high error rate (20%). The gap is expected to widen at higher SNR as in the AWGN case.*

Decision: The document is noted.

R1-1612451 Discussion on multiplexing initial access signals Samsung

- *Observation 1: FDM of the sync signals (NR-PSS/NR-SSS/NR-PBCH) with smaller subcarrier spacing provides better CFO estimation than TDM of the sync signals with larger subcarrier spacing.*
- *Proposal 1: NR supports FDM to multiplex NR-PSS, NR-SSS and NR-PBCH in high frequency band (e.g., > 6GHz).*

Decision: The document is noted.

R1-1612721 Discussion and evaluation on NR-PSS/SSS design NTT DOCOMO, INC.

- *Observation 1: NR-PSS detection would be the most complexity centric and RAN1 should carefully design NR-PSS to achieve acceptable complexity.*
- *Observation 2: Under a certain transmission bandwidth for NR-PSS, there would be a trade-off between subcarrier spacing and sequence length in terms of detection performance in presence of frequency offset.*
- *Observation 3: It is beneficial to minimize number of hypotheses for NR-PSS/SSS detection to improve the detection performance and to minimize UE burden.*
- *Observation 4: If frequency offset compensation based on NR-PSS works well, shorter subcarrier spacing and longer sequence length can be applied to NR-SSS under the same transmission bandwidth with NR-PSS.*
- *Observation 5: Frequency offset up to 1.5 subcarrier spacing would be acceptable in terms of detection performance and computational complexity especially for PSS detection.*
- *Observation 6: Repeated NR-PSS structure based on comb mapping would be helpful to mitigate residual frequency offset after NR-PSS detection and would provide flexibility for various NR-SS design.*
- *Proposal 1: Subcarrier spacing of NR-PSS/SSS should be decided according to target frequency offset with considering detection performance and computational complexity.*
- *Proposal 2: At least one baseline sequence length is defined for each of NR-PSS/SSS and transmission bandwidth of NR-PSS/SSS is linearly scaled according to subcarrier spacing value except for some possible special cases where different (e.g., longer) sequence length design provides reasonable benefit.*
- *Proposal 3: Repeated NR-PSS structure based on comb mapping should be considered.*
- *Proposal 4: Removing local ID detection from NR-PSS detection functionalities should be considered.*
- *Proposal 5: RAN1 should consider TDM of NR-PSS/SSS/PBCH in different subframe or slot with same symbol index.*
  - *Relative resource position among NR-PSS, NR-SSS and NR-PBCH with same TRP TX beam is fixed irrespective of CP overhead.*
  - *Detailed resource mapping for this approach should be further studied with considering maximum number of beam patterns for NR-PSS/SSS/PBCH transmission within a periodicity of SS burst set.*

Decision: The document is noted.

R1-1613154 WF on Synch signal structure Qualcomm, NTT DOCOMO

- NR-PSS/SSS/PBCH are transmitted from the same set of ports/same beam
- SS-block index indicated to the UE, using E.g.
  - PBCH
  - Sync Signal
  - Other signal

Decision: The document is noted, further modified as:

- NR-PSS/SSS/PBCH can be transmitted using the same set of ports/same beam
  - FFS other cases

Possible agreement:

- NR-PSS/SSS/PBCH can be transmitted using the same set of port number[/same beam]
  - FFS: Other cases

R1-1613153 WF on numerology signal structure Qualcomm, NTT DOCOMO

- Single subcarrier spacing for PSS/SSS in a given frequency band is supported from UE perspective

Decision: The document is noted.

Agreements:

- At least for multi-beams case, at least the time index of SS-block is indicated to the UE
  - FFS: single-beam case
  - FFS: whether SS-block is transmitted by single-beam or multi-beams

Agreements:

- For initial access, UE can assume a signal corresponding to a specific subcarrier spacing of NR-PSS/SSS in a given frequency band given by specification

- FFS: Definition of frequency band
- FFS: Subcarrier spacing of NR-PSS and NR-SSS is the same or not
- FFS: CP length

Agreements:

- For RAN1 evaluation purposes, it is assumed that the SSS and PBCH (if present) ports within an SS-block are constructed with applying same or different weights on a common pool of beams
  - The common pool of beams are constructed by applying beam steering weights on physical antennas on each of a common set of TXRUs
  - *Note: SSS and PBCH may or may not share the same ports.*

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm, Tab stops: Not at 1.27 cm

Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm, Tab stops: Not at 2.54 cm

Possible agreement:

- SS burst set transmission is periodic
  - In case of "blind" initial search, UE may assume a fixed periodicity of SS burst set transmission for a given carrier frequency
  - After initial access UE may be provided with updated information regarding the SS burst set periodicity by the network

Decision: The document is noted. Continue offline discussion until Tuesday.

R1-1613155 **WF on Synch signal periodicity Qualcomm, NTT DoCoMo**

Wednesday

Agreements:

- From UE perspective, SS burst set transmission is periodic
  - At least for initial cell selection, UE may assume a default periodicity of SS burst set transmission for a given carrier frequency
    - Exact value of default periodicity of SS burst set transmission for a given carrier frequency needs to be studied
  - FFS: UE in CONNECTED or IDLE mode may be provided with updated information regarding the SS burst set periodicity of serving cell and/or neighbor cells by the network
    - FFS: Validity duration of information
    - Note: Updated periodicity may be shorter or longer than default periodicity assumed by UE
    - FFS: Note: This does not imply SS-burst set needs to be always on with the updated periodicity
    - FFS: SS burst periodicity assumed by UE if information of neighbor cells is not available
    - FFS: Consider idle mode operation performance
    - Note: Companies can also consider to support functionality related to LTE DRS and LTE IDLE mode
  - Companies are encouraged to investigate the tradeoff between network flexibility/power consumption and UE complexity/power consumption

R1-1613196 WF on NR-SS Sequence Design Samsung, NTT DOCOMO, Intel

Further revised in **R1-1613417**.

Agreements:

- For NR-PSS
  - ZC-sequence can be used as the baseline sequence for NR-PSS for study.
    - Other type of sequences are not excluded, e.g. low density power boosted sequence.
  - Study the following alternatives on the NR-PSS sequence length
    - Alt 1: using sequence whose length is longer than LTE.
      - Whether one longer sequence is used or whether the longer sequence is constructed by concatenating multiple sequences which may be same or different sequence and/or length.
    - Alt 2: using sequence whose length is shorter than LTE.
    - Alt 3: using sequence whose length is the same LTE.
  - Study the following alternatives on the sequence repetition
    - Alt 1: no repetition.
    - Alt 2: time-repetitive signal of NR-PSS across OFDM symbols
    - Alt 3: time-repetitive signal of NR-PSS within an OFDM symbol
    - Alt 4: frequency-repetitive NR-PSS sequences within an OFDM symbol (element-wise or sequence-wise).
- For NR-SSS
  - Study the following alternatives for NR-SSS sequence design:
    - Alt 1: interleaving two M-sequences without scrambling using ID in PSS (no cell ID in NR-PSS).
    - Alt 2: interleaving two M-sequences with scrambling using ID in PSS as in LTE.
    - Alt 3: a root sequence cyclically shifted in time and/or frequency domain.
      - E.g. ZC-sequence or M-sequence with cyclic shifts.

Petitioners' Exhibit 1007, p. 1257
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Alt 4: message-based transmission (CRC and/or channel coding based).
- Alt 5: element-wise multiplication of the ZC-sequence and PN-sequence with cyclic shifts.
- Other alternatives are not excluded.

- Study the following alternatives on the NR-SSS sequence length:
  - Alt 1: using sequence whose length is longer than LTE.
    - Whether one longer sequence is used or whether the longer sequence is constructed by concatenating multiple sequences which may be same or different sequence and/or length.
  - Alt 2: using the same NR-SSS sequence length as in LTE.
- Study the following alternatives on the sequence repetition/interleaving:
  - Alt 1: no repetition.
  - Alt 2: time-repetitive signal of NR-SSS within or across OFDM symbols.
  - Alt 3: frequency-repetitive sequences of NR-SSS within an OFDM symbol (element-wise or sequence-wise).
  - Alt 4: frequency interleaved sequence of NR-SSS using comb structure within a OFDM symbol.

R1-1613273 WF on Periodicity for SS Burst Set Huawei, HiSilicon, InterDigital
Continue offline discussion until Wednesday – (Huawei)

R1-1613197 WF on NR synchronization signals design NTT DOCOMO, Intel, LG Electronics, Samsung, Ericsson

Agreements:

- Companies are encouraged to propose and evaluate following design parameters of NR-PSS/SSS until next meeting
  - SS burst set periodicity
  - Subcarrier spacing
  - Sequence length
  - Sequence type
  - Number of IDs provided by NR-PSS/SSS
  - Resource mapping/multiplexing
- Following target requirements should be taken into account in NR-PSS/SSS design
  - Robustness against initial frequency offset up to 5 ppm
    - 10 ppm as optional requirement
  - Reasonable complexity for NR-PSS/SSS detection
  - Good one-shot detection probability at -6 dB received baseband SNR condition with less than 1% false alarm rate
    - Companies report detection probability, the residual timing error and frequency error
  - Good detection performance in multi-cell scenario
  - Note: for mMTC, different target requirements may be considered
- Following aspects can be considered (not an exhaustive list)
  - Low system overhead due to NR-PSS/SSS transmission
  - Low PAPR of waveform for possible power boosting transmission
  - Multiplexing with other signal/channel for efficient operation
  - Utility of NR-PSS/SSS as reference signal for other channels, e.g., PBCH

7.1.2.2 Broadcast signal/channel

R1-1612807 PBCH design Nokia, Alcatel-Lucent Shanghai Bell

- *Proposal 1: 2-port SFBC as baseline for NR-PBCH transmission method.*
- *Observation 1: TDM between NR synchronization signals and NR-PBCH is needed for 5 MHz transmission bandwidth option.*
- *Proposal 2: Support TDM between NR synchronization signals and NR-PBCH for 5 MHz minimum transmission bandwidth option.*
- *Observation 2: 2 symbol allocation provides around 2 dB better demodulation performance but increases SS block size by 50 %.*
- *Proposal 3: Support FDM multiplexing between synchronization signals and PBCH for 80 MHz minimum transmission bandwidth option.*
- *Proposal 4: Support FDM multiplexing beam reference signals in the same symbol with SS block.*
- *Proposal 5: Support number of BRS antenna ports at least up to 8 within an SS block.*
- *Proposal 6: SS block should support transmitting from more than two beams at a time.*

Petitioners' Exhibit 1007, p. 1259
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- *Proposal 7: Study enabling UE to combine NR-PBCHs transmitted in different SS blocks within the same and in different SS burst within an NR-PBCH transmission interval.*

Decision: The document is noted.

R1-1612028 **Multi-beam PBCH design** **Qualcomm Incorporated**

- *Shortest periodicity for PBCH transmission is every SS block of a burst every 5ms.*
- *However, this high periodicity is not needed in all scenarios. Hence, the BS may not transmit PBCH in some SS blocks and instead transmit MRS.*
- *Two PBCH OFDM symbols sandwiching PSS/SSS are proposed that permit finer CFO estimation.*
- *SSS can be repurposed to form reference for PBCH for upto 2 ports. PBCH transmission scheme is FFS.*
- *SS block index is conveyed in PBCH while still permitting the UE to easily combine PBCH from different SS blocks*
- *Option 2 (NR-PBCH carries minimum information necessary for UE to perform initial UL transmission (not limited to NR-PRACH)) regarding PBCH content is realizable. Moreover, due to high available periodicity of PBCH, the essential information can be split over two messages.*

Decision: The document is noted.

R1-1612630 **Performance Evaluation for Beam Centric Design for Broadcast Channel** **InterDigital Communications**

- *Observation 1: SINR can be improved when some allowable beams are turned off during beam sweep processing.*
- *Observation 2: Higher SINR improvement is achieveable for small UE population than large UE population since more allowable beams may be turned off in case of small UE population.*
- *Observation 3: Higher SINR improvement is obtainable for non-uniform UE distribution than uniform UE distribution since more allowable beams may be turned off in case of non-uniform UE distribution.*
- *Observation 4: More interfering TRPs can be reduced for non-uniform UE distribution than uniform UE distribution since more allowable TRP beams may be turned off in case of non-uniform UE distribution, particularly the higher percentage of interfering TRPs can be significant reduced when UE population is large.*
- *Proposal 1: PBCH transmission based on all or a subset of beams in a beam sweep should be considered.*
- *Proposal 2: Association of SYNC and PBCH should be considered to reduce the beam sweep overhead in NR.*

Decision: The document is noted.

Wednesday session

R1-1613271 **WF on Multi-Beam Paging** **Huawei, HiSilicon, Samsung, MediaTek**

Also supported by LG Electronics

Agreements:

- For paging in multi-beam operation, support beam sweeping for paging, and study the following methods:
  - Alt-1: Multiplexing paging with SS blocks
    - FFS: Details of paging
  - Alt-2: Adding another round of beam sweeping for paging
    - Note: Another round of beam sweeping is different from the beam sweeping of SS burst set
  - Other alternatives are not precluded
  - Companies report their assumption for paging

R1-1613480 **WF on NR-PBCH evaluation** **NTT DOCOMO**

Agreements:

- Companies are encouraged to report, propose and evaluate following design parameters of NR-PBCH until next meeting
  - Payload size
  - Overhead of PBCH including dedicated DMRS (time/frequency/port resource amount)
  - RS for demodulation, e.g., NR-PSS, NR-SSS or dedicated DMRS or mobility RS
  - Transmission scheme, e.g., MCS, transmit diversity
  - Periodicity
  - Resource mapping/multiplexing within SS block(s)
- Companies are encouraged to report their own evaluation assumptions
- Following target requirements should be taken into account in the NR-PBCH design
  - Detectable at low received baseband SNR condition such as [-6] dB
    - Note: it does not mean NR-PBCH should be detectable by one-shot
    - Companies report the BLER used, timing assumption used and frequency offset used.
- Following can be considered for study purpose, e.g.,
  - Combining NR-PBCH across SS blocks within X ms
    - FFS: Value of X ms
  - Use of PBCH for frequency offset estimation and necessity of use of the PBCH for frequency offset estimation is also a part of the study

Petitioners' Exhibit 1007, p. 1260
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Thursday session

R1-1613591 **WF on System Information Delivery** **LG Electronics, NTT DOCOMO, Inter Digital, Qualcomm,**

Agreements:

- For study of the cases where NR-PBCH carries a part of minimum system information, consider the following alternatives (or combinations) for the minimum system information other than those included in NR-PBCH :
  - Alt. 1: NR defines the additional channel as secondary broadcast channel
    - Secondary broadcast channel may be different design from NR-PBCH, e.g. payload size, resource mapping, periodicity and etc.
    - FFS on transmission: beam-specific, cell-specific, and/or TRP-specific, etc.
  - Alt. 2: The remaining information is transmitted in shared downlink channel similar to ,e.g. NR-PDSCH
    - FFS on transmission: UE-specific, UE group-specific, beam-specific, cell-specific, and/or TRP-specific, etc.
- Note: This does not preclude defining of other mechanisms transmitting Other SI

R1-1613590 **WF on further clarifications on NR-PBCH** **LG Electronics, SONY, InterDigital**

Agreements:

- Consider followings for minimum system information transmission:
  - NR-PBCH is a non-scheduled broadcast channel carrying at least a part of minimum system information with fixed payload size and periodicity predefined in the specification depending on carrier frequency range
  - Alt. 1: NR-PBCH carries a part of minimum system information
    - Alt 1-1 : remaining minimum system information is transmitted via other channel at least partially indicated by NR-PBCH
    - Alt 1-2: Remaining minimum system information is transmitted via other channel not indicated in NR-PBCH
  - Alt. 2: NR-PBCH carries all of minimum system information
- Study further NR-PBCH design examples with the following clarification of the agreements
  - Example 1 for Alt. 1-1: NR-PBCH carries a part of minimum system information including information necessary for the UE to receive channel carrying remaining minimum system information
  - Example 2 for Alt. 1-1: NR-PBCH carries information necessary for the UE to perform initial UL transmission (not limited to NR-PRACH, e.g. PRACH msg. 1) and possibly information necessary to receive the response to initial UL transmission (e.g., PRACH msg. 2) in addition to information in Example 1
  - Example 3 for Alt. 2: NR-PBCH carries all minimum system information
  - Example 4 for Alt. 1-2: NR-PBCH carries information necessary for the UE to perform initial UL transmission (not limited to NR-PRACH, e.g. PRACH msg. 1) and information necessary to receive the response to initial UL transmission (e.g. PRACH msg. 2)
    - Information necessary to receive remaining minimum system information is provided after initial UL transmission
  - Other examples are not precluded
  - Prepare draft LS to RAN2 to clarify the contents and RAN2 preferred size of minimum system information and whether it can be delivered by on demand – Eunsun (LG)

R1-1613686 **draft LS on minimum system information LG**

Agreed in R1-1613692 with following updates

- Consider followings for minimum system information transmission:
  - NR-PBCH is a non-scheduled broadcast channel carrying at least a part of minimum system information with fixed payload size and periodicity predefined in the specification depending on carrier frequency range

7.1.2.3 Physical random access channel

R1-1611904 NR PRACH preamble design Ericsson

- *Observation 1: For digital beamforming, a large number of FFTs are required in both transmitters and receivers*
- *Observation 2 For analog beamforming, a beam sweeping might be needed during one or several PRACH preambles*
- *Observation 3 The PRACH preamble can be designed such that the time interval to include in each beamforming can be selected in gNB without configuring the UE*
- *Proposal 1 The PRACH preamble should enable the use of the same receiver FFT as for other reference signals, user data and control channels.*
- *Proposal 2 The PRACH preamble is based upon repetition of one OFDM symbol of the same length as other frequency multiplexed user data or control OFDM symbols*

Decision: The document is noted.

R1-1612031 Multi-beam RACH design and evaluation Qualcomm Incorporated

- *Observation 1: The UE could sweep its receiver beams and subarrays while receiving synchronization signals to find the best subarray and UL transmit beam combination before transmitting random access signals.*
- *Observation 2: For CDL-C models at 30 GHz, our design meets 0.1% false alarm and 1% probability of missed detection at approximately -19 dB pre-beamforming per tone SNR where SNR also included antenna element gain.*
- *Observation 3: For CDL-C model, the timing error of our design is distributed between -12 to +12 sample shifts.*
- *Proposal 1: The design should allow base stations to sweep beams during synchronization and random access period.*
- *Proposal 2: Base station should use beam reciprocity to the extent possible between transmitting DL synchronization signals and receiving UL random access signals.*
- *Proposal 3: If beam reciprocity at BS holds, UE can select a subset of symbols of the random access subframe based on the signal strengths of DL synchronization beams to transmit RACH signal.*
- *Proposal 4: Every X msec, Y msec worth of resources are allocated for the transmission of a random access burst. Each random access burst consists of N nominal random access symbols. The exact values of X, Y and N are FFS (example: X=20, Y=0.625, N=14). The values of X, Y and N should be known to the UE.*

Decision: The document is noted.

R1-1612462 Preamble design aspects for NR RACH without beam correspondence Samsung

- *Proposal 1: for multi-beam operations without beam correspondence, NR preamble design should additionally consider facilitating beam alignment at gNB, i.e. estimation of preferred beam, on top of LTE preamble design principles.*
- *Proposal 2: for multi-beam operations without beam correspondence, Tx beam for msg 3 should be measured from preamble and indicated to UE. Differential beamforming based preamble structure can be considered as a candidate.*

Decision: The document is noted.

R1-1612708 Views on random access channel for NR NTT DOCOMO, INC.

Proposal 1: The RACH preamble format(s) in LTE should be considered as the basic RACH preamble.
Proposal 2: For each subcarrier spacing of the RACH preamble, length of the slot containing only uplink channel/signal is considered as the reference to the preamble length.
Proposal 3

- *Scalable numerologies are applied to the basic RACH preamble*
  - *Preamble formats 0, 1, 2 and 3 with a subcarrier spacing of 1.25kHz are the reference formats.*
    - *FFS: support for preamble format 4*

- *Based on reference formats, the subcarrier spacings of 2.5kHz, 5kHz, 10kHz and 20kHz are supported.*
  - *FFS: other subcarrier spacings, e.g., 0.725kHz, 40kHz*

Observation:

- *The MCL for RACH preamble is degraded when larger subcarrier spacing/BW. However, larger subcarrier spacing is robust against higher Doppler frequency.*
- *Scalable RACH preamble would be applicable to higher carrier frequency and multi-beam operation.*
- *Shorter sequence length for RACH preamble compared to LTE can be considered for larger subcarrier spacing depending on the required timing estimation accuracy.*

Decision: The document is noted.

Tuesday session

R1-1613169 **WF on Preamble format design** **NTT DOCOMO, ETRI, ZTE**

The document was presented by Kazuaki Takeda from NTT DOCOMO.

- For the consecutive multiple/repeated RACH preambles,
  - Option 1: CP is inserted at the beginning of the consecutive multiple/repeated RACH sequences, CP/GT between RACH sequences is omitted and GT is reserved at the end of the consecutive multiple/repeated RACH sequences
  - Option 2: The same RACH sequences with CP is repeated and GT is reserved at the end of the consecutive multiple/repeated RACH sequences
  - Option 3: The same RACH sequences with CP/GT is repeated
  - For options 2 and 3, the same RACH sequences with and without CP/GT can be further multiplied with different orthogonal cover codes and transmitted.
  - For example, the consecutive multiple/repeated RACH preambles would be used when Tx/Rx beam correspondence does not hold at either TRP or UE
- For a single RACH preamble, CP/GT are required for each RACH preamble
  - For example, the single RACH preamble would be used when Tx/Rx beam correspondence held at both TRP or UE for multi-beam operation
- The BW for a RACH preamble transmission is targeted to not be wider than 5 MHz for a carrier frequency of below 6 GHz and not wider than X MHz for a carrier frequency ranging from 6GHz to 52.6 GHz
  - X could be, e.g., 5, 10, and 20MHz
- At least, one reference numerology for RACH preamble is defined, e.g.,
  - 1.25 x 2^n kHz
  - 15 x 2^n kHz
    - Integer value of n is FFS
  - Other values are not precluded
- Based on the reference numerology for RACH preamble, multiple RACH preambles with scalable numerologies are supported depending on the carrier frequency
- The following sequences can be considered for the evaluation
  - ZC sequence
  - m-sequence
- Companies are encouraged to provided their proposed sequence length

Decision: The document is noted, modified and agreed as follows:

Agreements:

- Following options can be further considered for the consecutive multiple/repeated RACH preambles,
  - Option 1: CP is inserted at the beginning of the consecutive multiple/repeated RACH sequences, CP/GT between RACH sequences is omitted and GT is reserved at the end of the consecutive multiple/repeated RACH sequences
  - Option 2: The same RACH sequences with CP is used and GT is reserved at the end of the consecutive multiple/repeated RACH sequences
  - Option 3: The same RACH sequences with CP/GT is used
  - Option 4: Different RACH sequences with CP is used and GT is reserved at the end of the consecutive multiple/repeated RACH sequences
  - Option 5: Different RACH sequences with CP/GT is used
  - For options 2 and 3, study further that the same RACH sequences with and without GT can be further multiplied with different orthogonal cover codes and transmitted.
  - For example, the consecutive multiple/repeated RACH preambles would be used when Tx/Rx beam correspondence does not hold at TRP
  - Other options are not precluded
- For a single RACH preamble transmission, CP/GT are required
  - For example, the single RACH preamble would be used when Tx/Rx beam correspondence held at both TRP or UE for multi-beam operation

Agreements:

- The maximum bandwidth for a RACH preamble transmission is not wider than 5 MHz for a carrier frequency of below 6 GHz and not wider than X MHz for a carrier frequency ranging from 6 GHz to 52.6 GHz
  - X will be down selected from 5, 10, and 20MHz
- At least, one reference numerology for RACH preamble is defined,
  - 1.25 x n kHz
  - 15 x n kHz
    - Integer value of n is FFS
  - Other values are not precluded
- Based on the reference numerology for RACH preamble, multiple RACH preambles with scalable numerologies are supported depending on the carrier frequency

Agreements:

- The following sequences can be considered for the evaluation
  - ZC sequence
  - m-sequence
  - Other sequences are not precluded
- Companies are encouraged to provided their proposed sequence length

7.1.2.4 Initial access procedure

R1-1611684 Summary of email discussion [86b-20] on synchronization and carrier rasters for NR Huawei, HiSilicon

The document was presented by David Mazzarese from Huawei.

Proposal 1: The raster for NR synchronization signals can be different per frequency range. At least for frequency ranges where NR supports a wider carrier bandwidth and operation in a wider frequency spectrum (e.g. above 6 GHz), the NR synchronization signals raster can be larger than the 100 kHz raster of LTE.

Proposal 2:

- The candidate frequency locations of synchronization signals for NR should not be restricted to be located at the center of NR carrier.
- The candidate frequency locations of synchronization signals for NR should support the 100 kHz raster in existing bands.

Proposal 3: RAN1 should first decide the supported minimum and maximum carrier bandwidths for NR, and the supported bandwidths of synchronization signals for NR, before further details of the frequency rasters for synchronization signals and center of NR carrier are determined.

Observation: The scenarios where synchronization signal(s) of neighbour cells may not be on the same center frequency require further study, taking into consideration network deployment (HetNet or macrocells), potential benefits of inter-cell interference coordination on the synchronization signals, and UE complexity.

Decision: The document is noted. Continue offline

Petitioners' Exhibit 1007, p. 1264
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreements:

- The raster for NR synchronization signals can be different per frequency range. At least for frequency ranges where NR supports a wider carrier bandwidth and operation in a wider frequency spectrum (e.g. above 6 GHz), the NR synchronization signals raster can be larger than the 100 kHz raster of LTE.
- A joint decision should be made on:
  - the supported minimum carrier bandwidth for a NR carrier
  - the supported bandwidths of synchronization signals for NR
  - the frequency raster for synchronization signals for NR
  - the frequency raster for the center of NR carrier (if applicable)

Possible agreement: Synchronization signal(s) of neighbour cells are on the same center frequency for intra-frequency measurements
Further revised as:

Possible agreement:

- From UE perspective,
  - synchronization signal(s) of neighbour cells can be measured on the same frequency location for intra-frequency measurements
  - synchronization signal(s) that are on different frequency locations belongs to inter-frequency measurements can be measured

Possible agreement: NR design should strive to allow that the candidate frequency locations of synchronization signals for NR should not be restricted to be located at the center of NR carrier, considering the overall UE detection complexity of synchronization signals for cell search and RRM measurements
Continue offline discussion

R1-1613563 **WF on Synchronization Raster Qualcomm**

Working assumptions:

1. For a NR cell, the center frequency for the synchronization signal can be different from the center frequency of the NR carrier
   1. FFS: Relationship between the center frequency of the NR carrier and the center frequency of synchronization signals and investigate tradeoff between UE complexity and flexibility

7.1.2.5 Random access procedure

R1-1611273 Unified RACH procedure ZTE, ZTE Microelectronics

Proposal 1: A RACH group is a combination of
- *A subset of RACH resources and*
- *A subset of PRACH preambles.*

Proposal 2: RACH groups are disjoint if (and only if) any combination of RACH resource and preamble is contained in at most one RACH group.
Proposal 3: The following RACH procedure is considered
- *Association(s) between one or multiple occasions of DL channel(s)/signal(s) and disjoint RACH group(s) is informed to UE by broadcast system information or dedicated configuration or is known to the UE.*
- *Based on the DL measurement and the corresponding association, UE selects the RACH group.*

Proposal 4: RACH procedure for connected mode UEs supports the selection of RACH group based on measurements on UE-specific signals defined for connected mode mobility.
Proposal 5: A partial indication of the best measurement result by RACH group selection can be considered, e.g. for cases where the number of measurement results is greater than the number of disjoint RACH groups that can be selected. Using MSG3 to complete the indication can be considered.
Proposal 6: Which beam a UE selects for RACH preamble transmission is up to the UE.
Proposal 7: A UE should be allowed to perform UE Tx beam sweeping of preambles, in the selected RACH group.
Proposal 8: Fixed or configurable limitations to the amount or rate of preamble transmissions for UE Tx beam sweeping should be considered.
Proposal 9: If a UE is informed that it should perform multiple repeated preamble transmission, then it should use the same UE Tx beam for those preamble transmissions.

Decision: The document is noted.

R1-1611687 NR RACH evaluation Huawei, HiSilicon

- *Observation 1: In LLS for below 6GHz, multi-TRP independent reception shows better detection error probability compared with single TRP reception. The SNR of multi-TRP independent achieves -16dB and -11dB in AWGN and CDL-C channel respectively, compared with the single TRP case of -9dB and -5dB.*
- *Observation 2: In LLS for below 6GHz, multi-TRP joint reception shows better detection error probability compared with multi-TRP independent reception in low SNR. The SNR of multi-TRP achieves -20dB and -11dB in AWGN and CDL-C channel respectively, compared with the single TRP case of -16dB and -11dB.*
- *Observation 3: In SLS for below 6GHz, lower miss detection rate can be achieved by multi-TRP joint detection compared to single-TRP detection. Based on multi-TRP joint detection, miss detection rate of contention-free UE-dedicated preamble transmission can be kept close to zero for up to 200 simultaneously preamble transmissions in SLS evaluation.*
- *Observation 4: In LLS for above 6GHz, multi-TRP joint reception improves the performance significantly.*
- *Observation 5: In SLS for above 6GHz, multi-TRP joint reception improves the performance.*
- *Proposal 1: NR should support the multi-TRP reception to enhance the PRACH detection performance, for below 6GHz.*
- *Proposal 2: NR should support the multi-TRP reception to enhance the PRACH detection performance, for above 6GHz.*

Decision: The document is noted.

R1-1613120 RACH Procedure Considering Multi-TRP Operation LG Electronics (revision of R1-1611795)

- *Observation 1: Multiple RACH resources can be configured due to multiple beam/TRP operation.*
- *Proposal 1: In terms of association with DL broadcast channel/signal and RACH resource, it should be studied whether the DL broadcast channel/signal is cell-specifically transmitted signal with SFN manner from multiple TRPs or TRP specific channel/signal.*
- *Proposal 2: Study whether/how to support multiple RACH procedure per UE.*
- *Proposal 3: For the retrial of RACH preamble, it should be UE choice whether the UE transmits PRACH preamble on the same RACH resource (retransmission) or UE transmits PRACH preamble on the different RACH resource targeting different TRP/beam (retrial).*

Decision: The document is noted.

Tuesday session

R1-1613138 WF on NR RACH procedure for multi-beam operation without beam correspondance Samsung

The document was presented by … from Samsung.

- Regardless of beam correspondence is available or not at UE, in RACH procedure at least for multiple beam operation, the followings are supported at least for UE in idle mode:
  - UE reports TRP Tx beam for Msg. 2 transmission in Msg. 1
    - FFS: through preamble sequence ID, and/or RACH resource selection
  - UL Tx beam for Msg. 3 transmission is determined
    - Opt 1, gNB indicates UE Tx beam for Msg. 3 in Msg. 2
      - Further consider how to facilitate determination of UE Tx beam from Msg. 1:
        - Searching via beam sweeping;
        - Probing via Differential beamforming;
        - Others are not precluded.
    - Opt 2, UE selects UL Tx beam used for Msg. 3 transmission, e.g.,
      - Reuse the UL Tx beam used for Msg. 1 transmission
      - Selects a Tx beam different from that used for Msg. 1 transmission
      - Others are not precluded.
    - Others are not precluded.

Decision: The document is noted.

R1-1613281 WF on RACH procedure ZTE, ZTE Microelectronics, NTT DOCOMO

The document was presented by Patrick Svedman from ZTE.

- The following RACH procedure is considered:
  - UE beam correspondence (Tx/Rx reciprocity) is transparent to TRP
  - UE Tx beam(s) for preamble transmission(s) is selected by the UE.
  - Multiple/repeated preambles are transmitted with the same UE Tx beam.
    - Note: Multiple/repeated preambles corresponds to multiple/repeated preambles informed by broadcast system information.
  - UE may switch UE Tx beam between re-transmissions of multiple/repeated preambles
  - Study further the options:
    - Option 1: UE may transmit preamble with different UE Tx beam before receiving Message 2
    - Option 2: UE may not transmit preamble with different UE Tx beam before receiving Message 2
  - Message 2 indicates time, frequency and sequence of detected preamble to indicate detected UE Tx beam.
    - FFS whether UE is mandated to use the indicated UE Tx beam for Message 3.
  - At TRP, the DL Tx beam for the UE can be obtained based on the time, frequency and sequence of the detected RACH preamble and would be also applied to Message 2

Decision: The document is noted.

Possible agreements:

- NR supports the following procedure(s) for msg1 re-transmission
  - Power ramping for NR < 6GHz
  - Power ramping, UE beam switching, and RACH resource switching for NR > 6GHz
    - FFS: Down-selection or combination of the above mechanisms
    - FFS: How to combine power ramping, UE beam switching, and RACH resource switching depending on number of TRP Rx beams, UE Tx beams, number of RACH resources

Agreements:

- NR supports the following procedure(s) for msg1 re-transmission
  - Down selection or combination of power ramping, UE beam switching, and RACH resource switching
    - FFS: How to combine power ramping, UE beam switching, and RACH resource switching depending on number of TRP Rx beams, UE Tx beams, number of RACH resources
    - FFS: Whether to consider different procedures depending on the single-TRP/beam or multi-TRPs/beams
  - Other options for all frequency ranges are not precluded.

Continue offline discussion until Wednesday – (ZTE, Samsung)

Wednesday session

R1-1613543 WF on UE beam switching ZTE, ZTE Microelectronics

Agreements:

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm

Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm

Formatted: Bulleted + Level: 3 + Aligned at: 3.17 cm + Indent at: 3.81 cm

Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm

Petitioners' Exhibit 1007, p. 1267
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- UE Tx beam(s) for preamble transmission(s) is selected by the UE.
  - During a RACH transmission occasion of single or multiple/repeated preamble(s) as informed by broadcast system information, UE uses the same UE Tx beam.

R1-1613539 **WF on Remaining Issues on RACH Procedures** **NTT DOCOMO, CATT, Mitsubishi Electric**

Agreements:

- Regardless of whether Tx/Rx reciprocity is available or not at gNB at least for multiple beams operation,
  - At gNB, the DL Tx beam for message 2 can be obtained based on the detected RACH preamble/resource and the corresponding association
    - UL grant in message 2 may indicate the transmission timing of message 3
- NR will support different PRACH configurations, e.g., considering different numerologies case and whether Tx/Rx reciprocity is available or not at gNB

Possible agreements from Samsung:

Regardless of beam correspondence is available or not at UE, in RACH procedure at least for multiple beam operation, the followings are supported at least for UE in idle mode:

- UL Tx beam for Msg. 3 transmission is determined
  - Opt 1: UE Tx beam for Msg. 3 is determined by gNB in Msg. 2
    - Further consider how to facilitate determination of UE Tx beam from Msg. 1:
      - Searching via beam sweeping;
      - Probing via differential beamforming;
      - Others are not precluded.
  - Opt 2: UE Tx beam for Msg. 3 is determined by UE, e.g.,
    - Selects the same UL Tx beam used for Msg. 1 transmission
    - Selects a different UL Tx beam from that used for Msg. 1 transmission
    - Others are not precluded.
    - Note: the determination can be done by adjustment based on the feedback from gNB in Msg. 2.
  - Others are not precluded.

Note: the further down selection/conclusion (if needed) should consider the outcome of beam correspondence discussion.

Agreements:

1. In RACH procedure, the followings are considered at least for UE in idle mode:
   1. UL Tx beam for Msg. 3 transmission is determined by UE,
      1. UE may use the same UL Tx beam used for Msg. 1 transmission.
      2. FFS: if determination can be assisted by additional signaling from gNB if necessary and how to determine UL Tx beam for Msg. 3
   2. Others are not precluded

R1-1613545 **WF on load balancing across PRACH resources** **Intel**

Agreements:

- RAN1 studies further on
  - the support of different RACH resource subset size that is associated with one or multiple occasions for DL broadcast channel/signal
    - FFS: whether other parameters of each RACH resource subset can be different
    - FFS: How the different RACH resource subset size information is conveyed to UE
  - the support of same RACH resource subset size that is associated with one or multiple occasions for DL broadcast channel/signal and non-uniform transmission of DL broadcast channel/signal across different directions in a multi-beam scenario
  - Other mechanisms to load balance RACH resource subset is not precluded

7.1.2.6 Mobility procedure

R1-1611916 Inclusion of cell ID in MRS Ericsson

- Observation 1: Supporting both IDLE cell signals and ACTIVE mobility RS with an optional possibility to identify the originating cell for ACTIVE mode mobility allows a range of network solutions to match particular deployment conditions and operator preferences.
- Observation 2: In case the UE knows that a set of away MRSs belong to the same node it may e.g. use this knowledge when deciding if the time-to-trigger (TTT) have to be reset or not.
- Observation 3: In case the UE knows that a set of away MRSs belong to the same node it may e.g. use this knowledge to generate a composite estimate that may better reflect the quality the UE can expect after a handover.
- Observation 4: The cost of providing the UE with information related to grouping of MRSs may be significant.
- Observation 5: To enable non-serving cell MRS grouping, cell identifier (CID) info may need to be associated with the MRS transmissions.
- Observation 6: It is preferable to associate the local CID info in the MRS due to lower resource usage impact.
- Observation 7: In wider-band MRS configurations, the inclusion of CID may not imply a significant resource usage increase.
- Observation 8: CID information transmission in MRS consumes system resources.
- Proposal 1: The inclusion CID info in MRS, or other grouping support features, should be configurable by the NW.

Decision: The document is noted.

R1-1611971 Mobility for NR Intel Corporation

- Proposal 1: Mobility in RAN1 should be defined as handover from one NR cell to another NR cell, and TRP/Beam switching/selection procedure should be defined as beam management.

Petitioners' Exhibit 1007, p. 1269
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal 2: RAN1 assumes RRM measurements can be performed as part of Beam management during RRC_CONNECTED mode
- Proposal 3: Mobility during IDLE mode is provided by RRM measurements based on NR SS
- Proposal 4: Benefits of UL based mobility, compared to DL based mobility, should be studied with performance analysis, including consideration of UE power consumption, signal overhead, and uplink resource utilization.
- Proposal 5: RAN1 should study whether uplink control signals and measurement reporting can perform the functionalities of uplink based mobility during RRC_CONNECTED mode.
- Proposal 6: Implications to RAN1 and RAN2 should be studies further for supporting uplink based mobility for IDLE mode.

Decision: The document is noted.

R1-1612183 **On separating mobility and data transmission CMCC**

- Proposal 1: Broadcast beam is configured, where synchronization signals, broadcast signals, randon access related signals, as well as other initial access related signals are configured using the same analog beam pattern, specifically, these beams are formed using the same predefined set of beamforming weights. The broadcast beam function at transmission/reception of NR-PSS/SSS/broadcast signals/random access related signals/on-demand SIB/paging signals etc.

- Proposal 2: Mobility management is based on broadcast beams, that is RRM measurement is also on broadcast beams.
- Proposal 3: L1/L2 mobility measurement for the broadcast beams can be based on cell related RS which is carrying Cell-ID (e.g. NR-PSS, NR-SSS) or RS for mobility or RS for demodulating broadcast channel or RS for beam management or a combination of them. The broadcast beam set used for L1/L2 mobility measurement can be a subset of the broadcast beams used for L3 mobility.
- Proposal 4: From spec perspective, the following two alternatives or a combination of them for associating RRM measurement in L3 and L1/L2 mobility needs to be considered
  - Alt 1: Same or partially same RS ports for RRM measurement are configured for L3 and L1/L2 mobility.
  - Alt 2: Different RS ports for RRM measurement are configured for L3 and L1/L2 mobility, but linkage such as QCL is specified between these ports.
- Proposal 5: Self-contained data-related is configured, where data related control channel, shared channel as well as CSI measurement RSs are configured using the same analog beam pattern. The data-related beams function at transmission/reception of PDCCH/ PDSCH/ PUCCH/ PUSCH/ SRS/ CSI-RS/ DMRS.
- Proposal 6: Data-related beam is decoupled from broadcast beam and TRP/cell concept. In such a way, dynamic switching or joint transmission between multiple beams/TRPs may be done in a spec transparent manner.Proposal 7: From specification perspective, there is no linkage between the beamforming weights for broadcast beam and data-related self-contained beam. In other words, the channels in broadcast beam and the channels in data-related self-contained beam cannot share reference signals.

Decision: The document is noted.

Tuesday session

R1-1613140 **WF on NR RRM Measurements AT&T, Ericsson**

- NR should support adaptation and UE-specific configuration of the timing for RRM measurements and reports.
- NR should support dynamic or semi-static (e.g. RRC configured) adaptation/configuration of the RRM measurement bandwidth.
- RAN1 should study mechanisms to support adaptation and configuration of the time/frequency resources used for RRM measurements for both 'CONNECTED' and non-'CONNECTED' mode UEs.
- It is up to RAN4 for determining requirements regarding the extent the UE can restrict its measurement to a subband of the configured bandwidth

Decision: The document is noted. Continue offline discussion until Wednesday – Thomas (AT&T)

Wednesday session

R1-1613554 **WF on NR RRM Measurements AT&T, NTT DOCOMO, Orange**

Agreements:

- NR should support adaptation and network indication of the valid time and frequency resources which may be used for inter-/intra-frequency RRM measurements and reports for 'CONNECTED' mode UEs
  - FFS: UE-specific and/or cell-specific indication
  - FFS: dynamic adaptation/configuration
  - FFS: idle and possibly new state modesz
  - FFS: whether to support aperiodic
- It is up to RAN4 for determining requirements regarding the extent the UE can restrict its measurement to a subband of the configured bandwidth

R1-1613568 **WF on DL signal for CONNECTED mode RRM measurement LG Electronics, Samsung, ~~CMCC~~**

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm

Petitioners' Exhibit 1007, p. 1270
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Not co-sourced by CMCC, but by Mediatek
R1-1613569 **WF on RRM measurement quantity in CONNECTED mode** **LG Electronics, Samsung, ~~CMCC~~**
Not co-sourced by CMCC, but by Mediatek

Agreements:

- For cell level measurement in multiple beam operation scenario, following examples for RRM measurement quantity in connected mode can be considered for evaluations
  - Example 1: The quantity is measured on the best received DL signal resource for RRM measurement
  - Example 2: The quantity is a function of quantities measured on best received "N" DL signal resources for RRM measurement
  - FFS : value of N,
  - FFS: N is fixed in the specification; or can be signaled via RRC signaling on the RRM measurement configuration
  - Other options are not precluded.

R1-1613678 **WF on Mobility RS** **Samsung, MediaTek, NTT DOCOMO, CATT, Qualcomm, Huawei, LGE, Ericsson, Intel**

Agreements:

- Consider the following signal combinations for inter-cell RRM measurements for CONNECTED and IDLE until RAN1-NR:
  - Option 1: Same RS
    - Option 1-1: NR-SSS and/or NR-PSS
    - Option 1-2: MRS-1 (Multi-port multi-beam reference signal multiplexed in a SS block)
    - Option 1-3: MRS-2 (Multi-port multi-beam reference signal not multiplexed in a SS block)
    - Option 1-4: MRS-3 (Single/Multi-port single-beam reference signal)
    - Option 1-5: NR-SSS and DM-RS for PBCH if DM-RS is supported for PBCH
  - Option 2: Not same RS
    - Option 2-1: NR-SSS in IDLE; MRS-{1,2} in CONNECTED
    - Option 2-2: NR-SSS in IDLE; NR-SSS and MRS-{1,2} in CONNECTED
    - Option 2-3: NR-PSS and/or NR-SSS in IDLE; NR-PSS and/or NR-SSS and CSI-RS in CONNECTED
    - Option 2-4: For CONNECTED, RS for IDLE and MRS-{1,2,3}
- Companies are encouraged to bring results and analysis until RAN1-NR considering at least the following aspects:
  - Cell coverage in CONNECTED and IDLE
  - Overhead of RS resources (e.g. Number of resource elements, BW used for RS mapping, Resource usage in time)
  - Accuracy of the RS measurement quantity
- The following impacts resulting from selecting IDLE mode RS option can also be considered for multi-beam case:
  - Performance in DL/UL signal reception after RACH before RRC connection, in relation to the associated beams obtained during RACH procedure

R1-1613603 **WF on RRM measurement in IDLE mode MediaTek, Intel, Samsung, NTT DoCoMo**

Agreements:

- ~~1.~~• For RAN1 evaluations for IDLE mode, the default bandwidth for DL RRM measurement assumed by UE is not larger than the minimum carrier bandwidth which may depend on the frequency band
  - ~~1.~~o FFS: mMTC case

R1-1613449 WF on RRM measurement in CONNECTED mode LG Electronics

- FFS on the detailed CSI contents and reporting
  - E.g partial PMI or resource indicator with CQI feedback
- FFS on the selection of transparent and/or non-transparent DMRS
  - Transparent DMRS: DMRS and data precoded identically
  - Non-transparent DMRS: DMRS and data precoded differently

R1-1613650 WF on DL MIMO transmission schemes for data transmission Huawei, HiSilicon, NTT DOCOMO, Ericsson, MTK, China Unicom, Intel, Samsung, Qualcomm, LGE, Xinwei

Agreements:

1. Support at least the following DMRS based DL MIMO transmissions for data in NR,
   1. Scheme 1: Closed-loop transmission where data and DMRS are transmitted with the same precoding matrix
      1. Demodulation of data at the UE does not require knowledge of the precoding matrix used at the transmitter
      2. Note: spatial multiplexing and rank-1 are included
   2. Scheme 2: Open loop and Semi-open loop transmissions where data and DMRS may or may not be restricted to be transmitted with the same precoding matrix
      1. Demodulation of data at the UE may or may not require knowledge of the relation between DMRS ports and data layers
      2. Note: DMRS can be precoded or not precoded
      3. Study the transmission schemes, e.g., SFBC, Large delay CDD, Layer shifting, small delay CDD
      4. Study the selection of transparent and/or non-transparent DMRS
         1. Transparent DMRS: DMRS and data precoded identically
         2. Non-transparent DMRS: DMRS and data precoded differently

R1-1613109 WF on number of CW(s) for NR Intel, Ericsson, Qualcomm, Panasonic

Agreements:

1. The number of codeword(s) per one scheduled physical data channel in NR both for DL and UL
   1. For 1-2 MIMO layers – FFS between 1 codeword and 2 codewords
   2. For 3-8 MIMO layers FFS among
      1. Alt 1: 1 codeword
      2. Alt 2: 2 codewords
      3. Alt 3: >= 3 codewords
   3. Study the above alternatives taking into account performance of NC-JT transmission from two or more beams/TRPs, overhead in DCI/UCI (ACK/NACK, CQI)
   4. Study support of overhead reduction schemes such indication for the maximum number of MIMO layers from TRP, ACK/NACK spatial bundling, etc.
   - Study possible use of different modulations in single codeword
   5. Study the possibility of configurable number of codewords per UE by NW

Wednesday session

R1-1613174 WF on UL MIMO Waveform for NR Samsung, Ericsson, Nokia, Alcatel-Lucent Shanghai Bell, AT&T, CATT

1. When a UE is configured with UL SU-MIMO transmission with rank adaptation from rank-1 to rank-L_{MAX}, CP-OFDM waveform is used for L-layer transmission where L=1, 2, …, L_{MAX}
   - L_{MAX} is the maximum number of layers

Decision: The document is noted.

Possible working assumption:

- UL transmission with rank adaptation always uses CP-OFDM waveform
- FFS: Support fall back mode using DFT-S-OFDM waveform indicated by dynamic signalling in rank = 1

Thursday session

R1-1613672 WF on the frequency selective precoding for UL MIMO Samsung, Xinwei, NTT DOCOMO, ZTE, ZTE Microelectronics, Huawei, HiSilicon

Agreements:

2. For the purpose of discussions, replace the classifications 'closed-loop'/'open-loop' with method-based classification of 'precoding' and 'precoder cycling'
   1. Signalling and UL-CSI measurement support are to be addressed separately
   2. Both precoding and precoder cycling can be considered for UL DMRS-based spatial multiplexing (SM)

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm, Tab stops: Not at 1.27 cm

Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm, Tab stops: Not at 2.54 cm

- 3. Note: For only CP-OFDM waveform, SFBC is covered by this clarification
- 3. Frequency selective precoding is supported for UL MIMO with CP-OFDM waveform when the transmission ports is greater than X
  - 1. Following examples can be studied
    - 1. Example 1: Precoding information for a given partial BW is explicitly indicated by gNB
      - 1. The precoding information can be indicated through a hierarchical indication manner with wideband W1 and subband W2
        - 1. W1 and W2 can be signaled in one DCI or two separate DCIs
    - 2. Example 2: A single beam group in UL codebook is indicated by BS for UL transmission in perspective of the system bandwidth
      - 1. Example 2a: Precoder cycling is adopted within the beam group
      - 2. Example 2b: The UE has certain flexibility to decide which particular beam/precoder in the beam group for actual transmission.
    - 3. Example 3: Reciprocity based precoding
    - 4. Other examples are not precluded
  - 2. FFS: X value

R1-1613754 **WF on UL-MIMO Terminology Nokia, ASB, Interdigital, Mitsubishi, Huawei, HiSilicon**

Conclusion:

- 1. RAN1 can still continue discussion in the next meeting regarding how to refine the terminology related "closed-loop/precoding" and "open-loop/precoder cycling (including transmit diversity)"

R1-1613583 **WF on NR Transmission Mode Intel Corporation, AT&T, Samsung, LG, Huawei**

Agreements:

- 1. Define at least two sets of transmission parameters, where
  - 1. Transmission parameter set 1: parameters configured (FFS: L1 or L2 or L3)
    - 1. For default transmission scheme, specify default values of parameters in the Transmission parameter set 1
      - 1. FFS: Whether default value can be derived implicitly
    - 2. Note that depending on parameter settings in transmission parameter set 1, the size of transmission parameter set 2, i.e. DCI size, may vary.
  - 2. Transmission parameter set 2: parameters indicated by physical layer (e.g. NR PDCCH channel)
    - 1. FFS whether multiple subsets is supported and how to simplify DCI format
  - 3. Note: some transmission parameter may belong to both set-1 and set-2
  - 4. Detail parameters and usage condition are TBD

R1-1613440 **WF on multi-panel based MIMO for DL and UL transmissions Huawei, HiSilicon, Xinwei**

Agreements:

- 1. For multi-panel based downlink transmission
  - 1. Should consider both uniform and non-uniform array
  - 2. Should consider both coherent and non-coherent MIMO transmission for multi-panel antenna array
  - 3. Should consider different inter-panel phase calibration cases
  - 4. FFS QCL related aspects
- 2. For multi-panel based uplink transmission
  - 1. Study way(s) to improve both reliability and capacity, e.g., non-coherent transmission, etc.
  - 2. Study practical issues including multiple timing advances, power control, beam procedure with/without the help of existing well paired beams and so on
  - 3. Should consider different inter-panel phase calibration cases

R1-1613413 **Way Forward – WF on PRG size Qualcomm, Intel, Ericsson, Interdigital**

Agreements:

- 1. For DL data, support at least a PRB bundling size for precoding equal to a specified value
  - 1. FFS whether specified value is system BW dependent
  - 2. FFS: Supported values
- 2. Study further including at least the following:
  - 1. FFS PRB bundling size linked to resource allocation granularity (e.g. RBG, etc.)
  - 2. FFS whether or not a PRB bundling size equals to all the contiguous scheduled PRBs
  - 3. FFS the case of reciprocity based operation

Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm, Tab stops: Not at 2.54 cm

4. FFS whether or not a PRB bundling size equals to a configured value(s) irrespective of scheduled PRBs

R1-1613156 WF on CSI-RS configuration for coordinated transmission LG Electronics, Intel Corporation, NTT DOCOMO

Agreements:

1. NZP CSI-RS resource is defined in NR, as a set of NZP CSI-RS port(s) mapped to a set of REs within a frequency span/a time duration (details FFS) which can be measured at least to derive a CSI
    1. Multiple NZP CSI-RS resources can be configured to UE at least for supporting CoMP and multiple beamformed CSI-RS based operations, where
        1. Each NZP CSI-RS resource at least for CoMP can have different number of CSI-RS ports.
2. Further study at least the following aspects:
    1. FFS QCL aspects
        1. E.g., set of QCL parameters
        2. E.g., QCL assumptions within a NZP CSI-RS resource, among two or more resources, etc.
    2. FFS whether or not a single NZP CSI-RS resource can be used to derive two or more CSIs
    3. FFS whether or not many NZP CSI-RS resources can be used to derive a single CSI

R1-1613676 Way Forward – WF on UL PRG size Qualcomm, InterDigital

Agreements:

1. Study further the PRB bundling size for precoding for UL data
    1. DFT-S-OFDM based transmissions
        1. Consider the case of contiguous scheduled PRBs and non-contiguous scheduled PRBs (if supported)
        2. Consider the impact due to UL DM-RS design
    2. CP-OFDM based transmissions
        1. Considering aspects related to non-reciprocity based CP-OFDM transmission (if supported) and reciprocity based CP-OFDM transmission (if supported)

R1-1613533 WF on Evaluation Assumptions for Advanced Receivers based on Network Coordination Samsung, Ericsson, Nokia, Intel, MediaTek, Orange, CeWiT, IITH, IITM, Tejas Networks (Revision of R1-1613297)

Agreements:

2. For advanced receivers based on network coordination, system-level simulation are encouraged to be evaluated in NR study item
3. For system-level simulations, urban macro scenario, dense urban scenario excluding small cells, indoor hotspot scenario, and dense urban scenario including small cells with the same carrier frequency are encouraged to be evaluated in NR study item
4. Simulation assumptions of TR 38.802 can be a starting point
    1. FFS whether or not to further update the simulation assumptions
5. Details on additional information assumed in evaluations should be provided by each company

R1-1613681 WF on Evaluation Assumptions for Advanced Receivers based on Network Coordination Samsung, Ericsson, Nokia, Huawei Intel, MediaTek, ZTE, Orange, CeWiT, IITH, IITM, Tejas Networks

R1-1613230 WF on NR Network Coordination Samsung, Xinwei, NTT DOCOMO, Huawei, HiSilicon

Agreements:

1. NR supports both semi-static and dynamic network coordination schemes
    1. Study interference measurement details
        1. Including aspects related to measurement sets
    2. The network coordination schemes should consider at least the following schemes:
        1. DPS/DPB
        2. CS/CB
        3. Non-coherent JT
        4. Coherent JT
        5. eICIC
        6. Whether each scheme requires specification support or not is FFS

Petitioners' Exhibit 1007, p. 1275
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1613144 WF on NR Multi-Point Transmission AT&T, Huawei, HiSilicon, Ericsson

Agreements:

- In supporting semi-static and dynamic network coordination schemes in NR, different coordination levels should be considered.
  - E.g., centralized and distributed scheduling, the delay assumption used for coordination schemes, etc.

R1-1613435 WF on transparent coordinated transmission set Huawei, HiSilicon, Ericsson, Samsung
R1-1613434 WF on CSI measurement reporting for coordinated transmission Huawei, HiSilicon, AT&T

Agreements:

- Aim for a common framework for CSI measurement and reporting for different types of coordinated transmission schemes
- Study whether or not to have the assumption/indication of interference hypothesis

R1-1613439 WF on advanced receiver for coordinated transmission Huawei, HiSilicon, Cohere, AT&T, DT, Orange

Agreements:

- NR should consider advanced receiver at the UE, by studying:
  - Joint reception of multiple data streams from one or more TRPs/panels
  - Interference cancellation/suppression
    - One or more data stream(s)
    - Reference signal(s)
  - Potential notification the UE of the information related to interfering signals, e.g., MCS, CSI-RS ports, DM-RS pattern and transport block size, # of layers, MIMO mode, etc.
  - Potential blind detection of information regarding interference
  - Potential joint channel estimation and reception of data
  - Potentially different numerologies (e.g., tone spacing, etc.)

R1-1613436 WF on coordinated transmission Huawei, HiSilicon, AT&T
R1-1613429 WF on channel reciprocity calibration in NR MIMO Fujitsu, National instruments, Cohere Technologies, Interdigital, Indian Institute of Technology

Agreements:

- Study network side calibration to assist cross-TRP and cross-panel operation, e.g.:
  - Necessity of same-panel calibration and specification impact, if any
  - Potential UE-aided calibration: transmit/receive calibration signaling between gNB and UE(s)
    - E.g., UE-aided calibration may use feedback from UE to gNB
  - Other methods to assist cross-TRP and cross-panel operation are not precluded

Continue discussion offline

Tuesday session
Agreements:
- NR supports semi-persistent CSI-RS transmissions
  - Activation(s)/de-activation(s) of CSI-RS resource is triggered dynamically
    - Note: "dynamically" here can be DCI and/or MAC CE based. FFS details.
- NR supports semi-statically configured/re-configured periodic CSI-RS transmissions
- FFS: Details on signaling mechanisms

R1-1613367 WF on QCL for NR ZTE, ZTE Microelectronics, ASTRI, Nokia, ASB, Samsung, AT&T
Possible agreements:
- Support UE feedback to assist QCL association between reference signal resources/ports with respect to UE spatial QCL parameter(s) to support UE side beamforming/receiving procedure.

R1-1613719 WF on QCL for NR ZTE, ZTE Microelectronics, ASTRI, Nokia, ASB, Samsung
Also supported by AT&T

Agreements:
1. Study the need of supporting UE feedback and contents if needed to assist QCL association between reference signal resources/ports with respect to UE spatial QCL parameter(s) to support UE side beamforming/receiving procedure
2. Companies are encouraged to provide details of beamforming/receiving procedures and evaluate performance in terms of at least following metrics:
   1. RS overhead
   1. Overhead of UE feedback
   2. Spectral efficiency

R1-1613368 WF on Reference Signal for Demodulation ZTE, ZTE Microelectronics, ASTRI, Samsung, Ericsson, Qualcomm

Agreement:
- Support variable/configurable DMRS pattern for data demodulation
  - FFS: Time and/or frequency domain density can be configured
  - FFS: RE location can be configured

Possible agreements:
- For low latency application, support multi-set DL DMRS for data demodulation
  - One set at least contains ~~is~~ front-loaded at least for demodulation
    - FFS: other motivations

Petitioners' Exhibit 1007, p. 1278
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Other set(s) can be configured for different motivations
  - e.g. higher frequency/time density, Rx beam detection, phase noise compensation
- Note: DMRS pattern design is based on the basic scheduling unit
- FFS: URLLC DMRS design
- FFS: multi-set UL DMRS for data demodulation

Agreement:

- Support variable/configurable DMRS pattern for data demodulation
  - At least one configuration supports front-loaded DMRS pattern

---

Wednesday session

R1-1613369 WF on NR SRS Huawei, HiSilicon, Xinwei

Agreements:

- In NR, SRS can be configurable w.r.t. density in frequency domain (e.g., comb levels) and/or in time domain (including multi-symbol SRS transmissions)
  - Details FFS
- FFS details on how the set of port(s) and resources for SRS can be indicated by gNB

R1-1613470 WF on SRS transmission for NR CATT, CATR, Xinwei, Spreadtrum Communications (Revision of R1-1613424)

Agreements:

- For SRS transmission for NR,
  - The size of partial-band is configurable and smallest size can be N PRB(s).
    - FFS the value of N
  - FFS simultaneous multiple partial-bands transmission is supported depending on UE capability
- NR to support SRS transmission where the numerology(ies) can be configurable for a UE.
  - FFS details (e.g., a single vs. multi-numerology by configuration, a single numerology SRS transmission at a time vs. simultaneous multi-numerology SRS transmission, etc.)

R1-1613570 WF on CSI-RS for beam management Samsung, NTT DOCOMO, Ericsson, MediaTek (Revision of R1-1613350)

- CSI-RS supports the TRP Tx beam sweeping and UE Rx beam sweeping
- The following parameters for CSI-RS transmission can be configured to the UE
  - Alt 1:
    - N_T = 1, 2, ..., $N_{T,Max}$: Number of time blocks for TRP Tx beam sweeping
    - N_R = 1, 2, …, $N_{R,Max}$: Number of time units within each time block for supporting UE Rx beam sweeping
  - Alt 2:
    - N_R = 1, 2, …, $N_{R,Max}$: Number of time blocks for UE Rx beam sweeping
    - N_T = 1, 2, ..., $N_{T,Max}$: Number of time units within each time block for TRP Tx beam sweeping
  - N_P = 1, 2, …, $N_{P,max}$: Total number of CSI-RS ports per time unit
    - Different CSI-RS ports can correspond to differently steered beams
  - For periodic and semi-persistent CSI-RS transmission, periodicity and offset (in terms of slots or subframes).
  - Other parameters are not precluded
  - FFS:
    - Whether explicit or implicit configuration of N_T, N_R, and N_P is supported
    - Whether above parameters are configured with one or multiple CSI-RS resource configurations
    - CSI-RS resource configuration(s) mechanism, e.g. RRC vs dynamic (L1/L2)
  - NOTE: CSI-RS can be used in P1, P2, P3

Decision: The document is noted.

R1-1613669 WF on CSI-RS for beam management Samsung, NTT DOCOMO, Ericsson, MediaTek, Intel, CATT, AT&T, InterDigital

Agreements:

1. CSI-RS supports the DL Tx beam sweeping and UE Rx beam sweeping
2. NOTE: CSI-RS can be used in P1, P2, P3
3. NR CSI-RS supports the following mapping structure
   1. N_P CSI-RS port(s) can be mapped per (sub)time unit
      1. Across (sub)time units, same CSI-RS antenna ports can be mapped

Petitioners' Exhibit 1007, p. 1279
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- 2. Values of N_P is FFS
- 3. Here, "time unit" refers to $n>=1$ OFDM symbols in a configured/reference numerology, where the value of n is FFS
  - 1. FFS whether OFDM symbols comprising a time unit is consecutive or not
- 4. FFS Port multiplexing method, e.g., FDM, TDM, CDM, any combinations

2. Each time unit can be partitioned into sub-time units
   - 1. FFS Partitioning method, e.g., TDM, IFDMA, OFDM symbol-level partition with same/shorter OFDM symbol length(i.e. larger subcarrier spacing) as/than the reference OFDM symbol length (subcarrier spacing), and other methods are not precluded
3. This mapping structure can be used for supporting multiple panels/Tx chains
4. Options to map CSI-RS for Tx and Rx beam sweeping for further study
   - 1. Option 1:
     - 1. Tx beam(s) are same across sub-time units within each time unit
     - 2. Tx beam(s) are different across time units
   - 2. Option 2:
     - 1. Tx beam(s) are different across sub-time units within each time unit
     - 2. Tx beam(s) are same across time units
   - 3. Option 3: combination of Alt1 and Alt2:
     - 1. Within one time unit, Tx beam(s) are same across sub-time units.
     - 2. Within another time unit, Tx beam(s) are different across sub-time units.
     - 3. FFS combination of the different time units in terms of e.g., number and periodicity
   - 4. Note that only Tx sweeping or Rx sweeping is also a possibility
   - 5. Other options are not precluded.
   - 6. FFS: how to capture "same beam" and "different beam" in spec
- 4. FFS: Whether the above mapping structure is configured with one or multiple CSI-RS resource configurations

R1-1613553 WF on RS for phase tracking Huawei, HiSilicon, Intel, National Instruments, ETRI, Samsung, LG Electronics, Ericsson, NTT DOCOMO, CMCC, InterDigital, Nokia, Alcatel-Lucent Shanghai Bell, Mitsubishi Electric, CATT, MediaTek

- Phase tracking RS is denoted as PT-RS
- PT-RS supports the following for CP-OFDM:
  - Time-domain density of mapped on every other symbol and/or every symbol
    - FFS: Whether/how to down-select the time-domain density
    - Note: Other time-domain densities of PT-RS are not precluded
  - At least for UL
    - The presence of PT-RS is UE-specifically configured
      - FFS: Whether implicit and/or explicit UE-specific configuration is supported
    - PT-RS is confined in the scheduled time/frequency duration for a UE
  - FFS: UE-specific and/or non-UE-specific and/or cell-specific for DL

Discussion: Also supported by Convida Wireless
Concern from ZTE with the naming "PT-RS" – why use the purpose of RS for phase tracking only?
Chair→ let's make it as a Working Assumption – objected by ZTE
Clarification requested by ZTE: FFS whether new RS is introduced or extended DMRS is used for phase tracking.
Decision: The document is noted.

Agreements:

- RS for Phase tracking is denoted as PT-RS
  - FFS: Naming of RS
- PT-RS supports the following for CP-OFDM:
  - Time-domain density of mapped on every other symbol and/or every symbol and/or every 4-th symbol
    - FFS: Whether/how to down-select the time-domain density
    - Note: Other time-domain densities of PT-RS are not precluded
  - At least for UL
    - The presence of PT-RS is UE-specifically configured
      - FFS: Whether implicit and/or explicit UE-specific configuration is supported
    - PT-RS is confined in the scheduled time/frequency duration for a UE
  - FFS: UE-specific and/or non-UE-specific and/or cell-specific for DL
- The following are to be studied for PT-RS:
  - Number of PT-RS ports to be supported
  - Use of precoding
  - QCL relationship with other RS, e.g., DM-RS

- Details on frequency domain pattern(s) and/or variable frequency domain densities
- Whether PT-RS is necessary for DFT-s-OFDM waveform
- Sharing of time/frequency resource between PT-RS among UEs and/or among layers of a single UE
- Additional usage for estimating residual frequency offset and/or high-speed channel
- Possible method(s) to improve phase estimation performance from PT-RS
  - E.g., using ZP/NZP PT-RS to reduce interference
- Details of UE-specific configuration, e.g., associated with the scheduled MCS and/or BW, the number of scheduled layers, or use dedicated signaling
- Others are not precluded

FFS whether new RS is introduced or extended DMRS is used for phase tracking

Thursday session

R1-1613108 WF on spatial QCL parameter for NR Intel (4)

Working assumption:

1. Spatial parameter(s) for QCL in NR describes the spatial channel properties of the RS antenna ports observed at the receiver.
2. FFS: Spatial parameter(s) in NR also describes the spatial channel properties of the antenna ports at transmitter(s).
3. Support UE reporting for related information, if necessary.

R1-1613152 WF on QCL assumptions in NR LG Electronics, Intel Corporation, KT Corporation
R1-1613660 WF on number of orthogonal DMRS ports Mitsubishi Mitsubishi Electric, Huawei, Samsung, Ericsson, CATT, Softbank, KDDI
Also supported by Fujitsu
Conclusion: Study necessity of supporting 16 orthogonal DMRS ports in DL and UL considering symmetric design both for DL and UL

R1-1613601 WF on RS for common control resource set Qualcomm, ZTE
R1-1613111 WF on RS for beam management Intel
R1-1613430 WF on DMRS design for different channels Samsung, ZTE, ZTE Microelectronics, Qualcomm Incorporated
R1-1613164 Way Forward on DL DMRS Qualcomm, Ericsson, ZTE, ZTE Microelectronics
Also supported by Samsung
R1-1613588 WF on DMRS pattern evaluation LG Electronics, NTT DOCOMO, Samsung
R1-1613651 WF on DMRS Pattern Evaluation LG Electronics, NTT DOCOMO, Samsung, Intel, MediaTek

Agreements:

1. Organize two email discussions i) to collect companies proposals on DMRS design for DL data channel for NR to facilitate evaluation for the next RAN1 meetings till 8th Dec. and ii) to discussion/agree on simulation assumptions till 15th Dec. – Hyunsoo (LGE)
   1. The companies are encouraged to provide DM-RS patterns including DM-RS design details such as
      1. Time domain density (per antenna port) for different ranks (e.g., number of DMRS symbols in slot, symbol position, etc.)
      2. Frequency domain density (per antenna port) for different ranks
      3. The number of maximum orthogonal ports
      4. Multiplexing of DMRS ports (e.g., TDM, FDM, CDM, etc.)
      5. DM-RS sequence (e.g., PN, Zadoff-Chu, etc.)
2. For the RAN1 NR Ad-hoc meeting, companies are encouraged to provide performance evaluation and to clarify the following aspects used for evaluation:
   1. Channel estimation method (e.g. IFFT type, MMSE type and LS type including assumptions on pipe-line or interpolation/extrapolation for data demodulation, etc.)
   2. PRB bundling assumption
   3. Considering of noise limited and interference limited scenarios
   4. Companies to state phase noise assumptions

R1-1613621 WF on unified CSI-RS framework Huawei, HiSilicon, ZTE, ZTE Microelectronics
R1-1613746 WF on Type I & Type II CSI Feedback Huawei, HiSilicon, China Unicom, Intel, Samsung, Ericsson, CATT, LGE
Also supported by Nokia, Alcatel-Lucent Shanghai Bell

Agreements:

Petitioners' Exhibit 1007, p. 1281
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- For Type I CSI, PMI codebook has at least two stages W = W1W2
  - W1 codebook comprises of beam groups/vectors
  - FFS structure and configuration of W1 codebook, e.g. number of ports, grid of beams, orthogonal, non-orthogonal, beam broadening, etc
  - FFS frequency granularity of W1 and W2 reporting
  - FFS on additional support of W3 (location of W3 matrix is FFS), e.g. multi-panel support, analog beam selection
  - Note multi-panel support may be captured in W1, W2 and/or W3
- For Type II CSI,
  - Study the following CSI feedback schemes
    - Analog CSI feedback
    - Linear combination based CSI feedback
      - For example
        - Projection of channel and/or covariance matrix and/or eigenvectors onto a basis
        - Linear combination of a basis
        - Schemes may have orthogonal and/or non-orthogonal basis
      - Quantization examples
        - Magnitude and phase
        - Real and imaginary
        - Vector quantization
    - Precoder / Precoding Matrix
    - Downloadable codebook
    - Contents for Quantized or Unquantized CSI feedback
      - Channel covariance matrix feedback
        - e.g. Hermitian-form codebook, analog CSI feedback, linear combination codebook
      - Channel Approximation and/or Measurement
        - e.g. analog CSI feedback, linear combination codebook
      - Channel Eigen vectors
        - e.g. analog CSI feedback, linear combination codebook
      - Other forms of channel representation are not excluded.

R1-1613173 WF on SRS for NR Samsung, Ericsson, LG Electronics, CATT, AT&T, Xinwei, NTT DOCOMO, ZTE, ZTE Microelectronics

Agreements:

- An NR-SRS resource comprises of a set of resource elements (RE) within a time duration/frequency span and N antenna ports (N ≥ 1)
  - FFS on the time duration/frequency span
- A UE can be configured with K ≥ 1 NR-SRS resources
  - Consider the maximum value of K to be a UE capability to avoid mandatory support for large values of K

Tuesday session

R1-1613362 WF on CSI-RS and Codebook Size for NR Ericsson, NTT DOCOMO, Huawei, LG Electronics, Nokia, ASB

- In NR, a UE can be configured with a CSI-RS resource configuration with X ports
  - Supported values of X are up to at least 32
- NR supports up to at least 32 port codebook
  - FFS: Codebook design
- Study the potential benefits of 64 ports

Decision: The document is agreed.

R1-1613176 WF on frequency granularity for CSI reporting in NR LG Electronics, NTT DOCOMO, Samsung, Intel, Nokia, Ericsson

Agreements:

- For CSI reporting for a component carrier, at least three different frequency granularities should be considered in the study
  - Wideband CSI
    - Wideband size is determined by UE RF capability of receiving DL signal.
      - Location of wideband could be configurable by network.
    - For example, used for analog beam management at least.
  - Partial band CSI
    - Alt1. UE-specifically configurable bandwidth

Formatted: Indent: Hanging: 0.63 cm, Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Indent: Hanging: 0.63 cm, Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm

Formatted: Indent: Hanging: 0.63 cm, Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm
Formatted: Indent: Hanging: 0.63 cm, Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm
Formatted: Bulleted + Level: 3 + Aligned at: 3.17 cm + Indent at: 3.81 cm
Formatted: Bulleted + Level: 4 + Aligned at: 4.44 cm + Indent at: 5.08 cm
Formatted: Bulleted + Level: 3 + Aligned at: 3.17 cm + Indent at: 3.81 cm
Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm
Formatted: Bulleted + Level: 3 + Aligned at: 3.17 cm + Indent at: 3.81 cm

- Alt2. The size is determined by the composition of numerologies or scheduling time units within the UE-specific wideband.
  - Applicable only when different numerology or scheduling time unit are multiplexed within wideband.
- For example, used for analogue beam management
- For example, used for managing CSI per service at least
- Subband CSI
  - The band size is determined by dividing wideband or partial band to multiple bands.
  - For example, used for frequency selective scheduling and subband precoding at least
- Possible down selection and/or merge of above granularities can be studied
- Combination of above frequency band CSI also needs to be studied

R1-1613143 **WF on NR CSI Acquisition** **AT&T, Samsung, NTT Docomo, Intel, Qualcomm, ZTE**
Further revised in:
R1-1613560 **WF on NR CSI Acquisition** **AT&T, Samsung, NTT Docomo, Intel, Qualcomm, ZTE, Nokia, ASB**

Agreements:

- Study the benefit of involving UE in selecting CSI report setting based on its measurement.
  - CSI report setting may include the granularity of spatial domain (e.g. rank and beam(s) selection) and frequency/time domain (e.g. wideband/subband or subband size).
    - Including of other domains are not precluded.
  - UE selection is under certain constraint configured by network. (same as LTE)
- Study UE assisted/selected CSI report setting, with the following use cases:
  - Example-1: UE may recommend the best CSI report setting/s to help network configure CSI feedback. (Network can overwrite UE's recommendation)
  - Example-2: Network can configure multiple candidate CSI report settings for UE to select, and UE indicates its selection along with CSI report (e.g. "Enhanced" RI can be used for UE to indicate its selection)
  - Others are no precluded
- Note: LTE actually support multiple types of UE selected feedback "format":
  - RI (may change the payload of the CSI)
  - CRI (may change the payload of the CSI)
  - Orthogonal beam pattern for Rel. 13 Rank 3-4 codebook (no impact on the payload of the CSI)

R1-1613445 **WF on CSI-RS and Codebook Size for NR** **Ericsson, Intel, Samsung, NTT DOCOMO, Nokia, ASB, CATT**
Wednesday: Further revised in:
R1-1613575 **WF on CSI-RS and Codebook Size for NR** **Ericsson, Intel, Samsung, Nokia, ASB, CATT, Kathrein-Werke KG, NTT DOCOMO, AT&T, Verizon Wireless, Sprint, Deutsche Telekom, Xilinx**

- For both Type I and II CSI feedback, a CSI-RS resource configuration has X ports
- For Type I, CSI feedback using a PMI codebook for X CSI-RS ports is supported
- For Type II, CSI feedback using X CSI-RS ports is supported
- Supported values of X are at least 1,2,4,8,12,16,20,24,28,32
  - Note: For X=1, Type I does not have PMI feedback
- Support for other values of X is not precluded

Discussion: Also supported by KT, Orange, Mitsubishi
ZTE→ don't believe such granulariry is needed – no need for supporting more than 8 CSI-RS ports in NR. Hybrid CSI based feedback with up to 8 CSI-RS ports is another option.
Decision: The document is noted.

Possible agreement:

- For Type I, CSI feedback using a PMI codebook for X CSI-RS ports is supported
- Supported values of X are at least 1,2,4,8,12,16,20,24,28,32
  - Note: For X=1, Type I does not have PMI feedback
- Support for other values of X is not precluded
- Note the number of ports in CSI-RS resource configuration may not be the same with the number of ports in the PMI codebook

Objected by Huawei, ZTE
Huawei compromise: remove 20, 28
ZTE compromise: 24 should also be removed
Ericsson: do not agree to have such gap between between 16 and 32

Petitioners' Exhibit 1007, p. 1285
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

ZTE: let's have 24 FFS

Working assumptions:

- For Type I, CSI feedback using a PMI codebook for X CSI-RS ports is supported
- Supported values of X are at least 1,2,4,8,12,16,[24],32
  - Note: For X=1, Type I does not have PMI feedback
- Support for other values of X is not precluded
- Note the number of ports in CSI-RS resource configuration may not be the same with the number of ports in the PMI codebook

R1-1611414 **On number of CSI-RS ports for NR MIMO ZTE, ZTE Microelectronics**
R1-1613278 **On port combining codebooks in Type I CSI feedback Ericsson** (Revision of R1-1612350)

R1-1613175 **WF on CSI Framework for NR Samsung, AT&T, NTT DOCOMO**

Agreements:

- A UE can be configured for CSI acquisition with the following features:
  - N≥1 CSI reporting settings, M≥1 RS settings, J≥1 IM settings, and a CSI measurement setting which links the N CSI reporting settings with the M RS settings and J IM settings
  - A CSI reporting setting includes at least the following:
    - Time-domain behavior: aperiodic or periodic/semi-persistent
    - Frequency-granularity, at least for PMI and CQI
    - FFS: Which CSI parameters are reported
      - If PMI is reported, PMI Type (Type I or II) and codebook configuration
  - An RS setting includes at least the following:
    - Time-domain behavior: aperiodic or periodic/semi-persistent
    - RS type which encompasses at least CSI-RS
    - RS resource set(s) of K resources
  - An IM setting includes at least the following:
    - Time-domain behavior: aperiodic or periodic/semi-persistent
    - IM types which encompasses CSI-IM
    - FFS: RS setting and IM setting can be merged
  - A CSI measurement setting includes at least the following :
    - One CSI reporting setting
    - One RS setting
    - One IM setting
    - For CQI, reference transmission scheme setting
- Study the possibility of configuring a UE with multiple CSI measurement settings including dynamic indication to select a preferred CSI measurement setting
  - Including selection of resource(s) out of the K resources within an RS setting
- UE supports up to L CSI measurement
  - Value of L may depend on the UE capability

Wednesday session

R1-1613287 **WF on NR NW Initiated Beam Switching Intel, Ericsson**
Also supported by CATT
Agreements:

- NR to provide robustness against beam pair link blocking
  - Study mechanisms to achieve the above purpose
    - E.g., by enabling PDCCH/PDSCH monitoring with N beams
      - E.g., N=1, 2, …
      - E.g., TDM monitoring, simultaneous monitoring, etc.
    - E.g., by enabling composite beams via e.g., SFBC and/or multi-stage control channel
    - The examples are not intended to be exhaustive

R1-1613288 **WF on NR UE requested beam switching Intel Corporation, Samsung**

R1-1613177 **WF on interference measurementLG Electronics, Intel, Ericsson, Huawei**

Agreements:

Petitioners' Exhibit 1007, p. 1286
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- NR supports CSI calculation based on one-shot measurement of interference.
- For one-shot interference measurement, study at least one of the following alternatives:
  - Alt1. Dynamic indication of aperiodic IMR.
  - Alt2. Configuration of periodic/semi-persistent IMR with dynamic indication of interference measurement restriction.
  - Alt3. Configuration of periodic/semi-persistent IMR with semi-static configuration of interference measurement restriction.
  - Other alternatives are not precluded
  - Note that the definition of IMR (e.g., ZP CSI-RS, NZP CSI-RS, a hybrid of ZP/NZP CSI-RS, DM-RS, etc.) is a separate topic
  - Note that the connection of the above alternative(s) with measurement setting is a separate topic

R1-1613171 **WF on periodic and semi-persistent CSI reporting Samsung, NTT DOCOMO, Ericsson, LGE**

Agreements:

- For NR, support both periodic and semi-persistent CSI reporting:
  - For periodic: higher-layer configuration of reporting periodicity and timing offset
  - FFS for the case of semi-persistent CSI reporting w.r.t. reporting periodicity and timing offset
  - FFS on detailed signaling

R1-1613110 **WF on interference measurement for CSI in TDD Intel, LGE, NTT DOCOMO**

Agreement: NR to study interference measurement and reporting mechanism by capturing same-link and cross-link interference in TDD systems for both DL and UL transmissions

R1-1613542 WF on Beam Correspondence Samsung, NTT DOCOMO, InterDigital, MediaTek, Convida Wireless, Sharp

Possible agreements:

- Support indication of UE's capability on reciprocity calibration to TRP.
- Study whether or not procedure(s) for determining reciprocity calibration is needed
  - e.g. as shown in appendix
  - e.g. metrics to be considered SNR/Power (beam-quality), CSI, and others

R1-1613682 **WF on Beam Correspondence Samsung, NTT DOCOMO, InterDigital, MediaTek, Convida Wireless, Sharp**

Agreements:

- Companies are encouraged to refine the definition of beam correspondence, if necessary
  - Note: whether or not to introduce this definition in NR is a separate topic
- Under the refined definition of beam correspondence (if any), study whether or not mechanism(s) for determining UE's beam correspondence is needed.
  - the study may consider the following aspects -
    - e.g. metrics to be considered SNR/Power (beam-quality), CSI, and others
    - e.g. values of the metrics at which beam correspondence is declared
    - e.g., complexity/overhead
    - e.g., possibility of supporting reporting to the gNB about beam correspondence at the UE

R1-1613365 WF on beam management for control and data channel ZTE, ZTE Microelectronics, ASTRI, Intel

Also supported by Samsung

Possible agreements:

- For downlink control channel, NR supports beam management with and without beam-related indication
  - When beam-related indication is provided, information pertaining to UE-side beamforming/receiving procedure used for downlink control channel reception can be indicated through QCL to UE
    - FFS: Information other than QCL
- FFS: DL control and data channels share the same beam resource pool at least for beam-related indication
  - e.g. A beam resource pool is a pool of reference signal resources for beam group indication via QCL
- Study separate beam-related indication for DL control and data channels within the shared beam resource pool

R1-1613670 **WF on beam management for control and data channel ZTE, ZTE Microelectronics, ASTRI, Intel, Samsung, LGE**

Petitioners' Exhibit 1007, p. 1287
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreements:
- NR supports with and without a downlink indication to derive QCL assumption for assisting UE-side beamforming for downlink control channel reception
  - FFS: details
    - E.g., QCL assumption details
    - E.g., indication signaling (e.g. DCI, MAC CE, RRC, etc.)
    - E.g., beam-related indication for DL control and data channels

R1-1613740 WF on Group-based Beam Management ZTE, ZTE Microelectronics, ASTRI (Revision of R1-1613366)
R1-1613725 WF on event-driven UL transmission in NR LG LG Electronics, ZTE, ZTE Microelectronics, Intel, NTT DOCOMO, Samsung, Nokia, ASB
R1-1613774 WF on UE initiated UL transmission in NR LG Electronics, Ericsson, Huawei, HiSilicon
Also supported by MTK

Agreements:
- NR should study the necessity of event-driven UE initiated UL transmission, e.g., in the event of beam quality degradation
  - E.g. due to UE mobility/rotation, blockage, and/or link failure, etc.
  - FFS: details of event(s) of beam quality degradation

R1-1613425 WF on codebook design for multi-panel based MIMO Huawei, HiSilicon, Intel

Agreement:
- Consider the impact of the antenna panel array
  - Study the impact of antenna panel array in NR CSI feedback design.
- Note: Different antenna panel may or may not be from same TRP.

R1-1613582 WF on codebook structure for NR Intel (4)
R1-1613288 WF on NR UE requested beam switching Intel Corporation, Samsung
R1-1613157 WF on beam reporting LG (5)
R1-1613589 WF on beam indication and reporting Samsung (2)
Conclusion: Discuss further till next meeting to clarify P-1/P-2/P-3 in terms of being periodic, aperiodic, etc. – Alexei (Intel)

R1-1613727 WF on beam indication and reporting Samsung, Ericsson, NTT DOCOMO, Intel, LGE, Verizon, KT
R1-1613649 WF on UL Beam Management Huawei, HiSilicon, China Unicom, Softbank, Xinwei, MTK, NTT DOCOMO
R1-1613677 WF on Unified Codebook Structure for Type I and II CSI Samsung, Intel, CATT, AT&T
R1-1613441 WF on Type I and Type II CSI feedback Huawei, HiSilicon, China Unicom

R1-1613431 WF on CSI timing for NR LG Electronics, Samsung, Ericsson
R1-1613428 WF on beam management procedure Samsung

R1-1613504 WF on CSI-RS resource pooling Ericsson, LG Electronics, Huawei, HiSilicon, Samsung

Agreements:
- Support UE specific RRC configuration of one or more CSI-RS resource sets
  - As one operation example, CSI-RS resources within a set can be dynamically shared amongst users
- Support dynamic allocation of one or more CSI-RS resources from the one or more sets to one or more users
  - Allocation can be aperiodic (single-shot)
  - Allocation can be on a semi-persistent basis
    - Note: semi-persistent CSI-RS transmission is periodic while allocated
- Study the following aspects
  - Signaling mechanism for dynamic allocation/de-allocation
    - e.g. via MAC CE or L1 control signaling, via hierarchical control signaling with MAC-CE and DCI
    - De-allocation may or may not be dynamically signaled at a later point in time
  - Signaling mechanism for slot configuration (i.e., periodicity, subframe offset like in LTE)
  - Signaling format for dynamic indication of CSI-RS resource(s)
  - Signaling overhead reduction approaches

7.1.3.4 Other

Including MIMO calibration issues

R1-1613104 Summary of [86b-19] email discussion on Phase 2 MIMO calibration for NR ZTE, ZTE Microelectronics(Revision of R1-1611423)
Companies are encouraged to check the proposals in R1-1613104. Revisit later this week.
Thursday
R1-1613741 Way forward on Phase 1 and Phase 2 MIMO calibration for NR ZTE (Revision of R1-1613718)
Conclusion: All proposals in R1-1613741 are endorsed

R1-1613744 NR-MIMO Phase-1 Calibration Results ZTE, ZTE Microelectronics
Conclusion:
1. The spreadsheet in R1-1613744 containing the results is endorsed
2. Email (till next meeting) to collect additional phase 1 and phase 2 simulation results and clarify simulation assumptions, if any – Ruyue (ZTE)

R1-1611677 Further discussion of UL power control for NR Huawei, HiSilicon
R1-1612876 Power control for MIMO Nokia, Alcatel-Lucent Shanghai Bell

R1-1613724 WF on UL TPC NTT DOCOMO, CATT, Huawei, HiSilicon, Samsung

Agreements:
1. For NR-PUSCH at least targeting eMBB,
    1. Open-loop power control based on pathloss estimate is supported.
        1. Pathloss is estimated using DL RS for measurement
        2. Fractional power control is supported
        3. FFS: Which DL RS(s) for measurement is used (The RS may be beamformed).
    2. Closed-loop power control is supported, which is based on NW signaling.
        1. Dynamic UL-power adjustment is considered
2. Further study on:
    1. Numerology specific power control
        1. e.g. numerology specific power control parameters
    2. Beam specific power control parameters
    1. Power control for other RSs and physical channels
    2. Power control for grant free PUSCH if supported
    3. Power control per layer (group)

7.1.4 Scheduling/HARQ aspects

R1-1612710 Consideration on wider BW operation for NR NTT DOCOMO, INC.

- Proposal 1: Consider multiple PSS/SSS transmissions in an NR carrier with a wider NW channel bandwidth and strive to minimize the effort on initial access from UE perspective.
- Proposal 2: Consider also implementation-based approach to single PSS/SSS transmission in an NR carrier for the case when the UE channel BW is narrower than the NW channel BW
- Proposal 3: The following aspects for NR carrier aggregation/dual connectivity should be reused from the LTE.
  - Cross-carrier scheduling and joint UCI feedback for the single numerology scenario
  - TB mapping per NR carrier
  - UL TPC for the single numerology scenario
- Proposal 4: The following aspects should be considered for NR carrier aggregation/dual connectivity in Phase 1.
  - Intra-TRP and inter-TRP with ideal and non-ideal backhaul scenarios are targeted.
  - For non-stand-alone operation, the PBCH and system information don't need to be transmitted from all the NR carriers and other channels are configurable when needed.
- Proposal 5: The following aspects should be further studied for NR carrier aggregation/dual connectivity in Phase 1.
  - Number of carriers
  - TB mapping across NR carriers
  - Carrier on/off switching mechanism
  - Different numerologies between different/same carrier(s) for a given UE

Decision: The document is noted.

R1-1613218 WF on UE bandwidth adaptation in NR MediaTek, Acer, AT&T, CHTTL, Ericsson, III, InterDigital, ITRI, NTT Docomo, Qualcomm, Samsung, Verizon

- For single carrier operation, NR should allow UE-specific RF bandwidth adaptation for UE operations in DL (e.g. DL reception, measurements) and UL transmission
  - UE-specific RF bandwidth adaptation for UL is not necessarily coupled with that for DL
  - FFS detailed mechanism
- Send LS to RAN4 to study the feasibility of UE RF bandwidth adaptation for single carrier operation and its corresponding transition time
  - Consider the cases shown in the appendix

Discussion: Nokia commented that RAN4 should study first before agreeing such WF
Decision: The document is noted.

Agreements:

1. Send LS to RAN4 to study the following points for single/multi-carrier operation
   1. How fast is the UE RF bandwidth adaptation
   2. How much power saving is possible for UE RF bandwidth adaptation
   3. Other benefits
   4. Whether any of the above depends on the conditions, such as
      1. Whether or not first and second RF bandwidth are centered at the same frequency
      2. Whether or not first RF bandwidth are partially or fully contained in the second RF bandwidth
      3. The ratio of first and second RF bandwidth
      4. Whether or not first and second RF bandwidth are in the same band
      5. Dependency of modulation scheme
      6. Whether or not neighbor cell synchronization signals are within first RF bandwidth
      7. Whether or not first and/or second RF bandwidth are centered at the same frequency as neighbor cell synchronization signals

IPR2024-01121

8. Whether or not additional reference signals are needed, for example for AGC settling
9. Whether it depends on transmission direction

2. LS includes corresponding agreements/WA for DL control in past meetings
    1. Note: RAN1 is under discussion on RF bandwidth adaptation for DL data and UL control/data

Formatted: Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm, Tab stops: Not at 1.27 cm

Formatted: Bulleted + Level: 2 + Aligned at: 1.9 cm + Indent at: 2.54 cm, Tab stops: Not at 2.54 cm

R1-1613659 Draft LS on UE RF Bandwidth Adaptation in NR Mediatek
Agreed in R1-1613663

7.1.4.1 *Physical downlink control channel*

R1-1612908 Summary of E-mail discussions on downlink control signaling Ericsson
The document was presented by Stefan Parkvall from Ericsson.
Decision: The document is noted.

Agreements:
- The time/freq. resource containing at least one search space is obtained from MIB/system information/implicitly derived from initial access information
- Time/freq. resource containing additional search spaces, can be configured using dedicated RRC signaling
- Other solution is not precluded

Agreements:
- The reference signals in at least one search space do not depend on the RNTI or UE-identity
    - FFS: The reference signals in at least an additional search space do not depend on the RNTI or UE-identity
- FFS: For one UE, there is the case the channel estimate obtained for one RE is reusable across multiple blind decodings involving that RE
- In an additional search space, reference signals can be configured, FFS: explicitly or implicitly

Possible working assumption:
- At least for single-stage design, a DCI message is transmitted in one control subband in the frequency domain
    - Note: Consider means to ensure sufficient frequency diversity, e.g. sufficiently wide control subband, distributed RBs for one control channel candidate in the control subband, etc.
    - PRBs for control subband can be contiguous or non-contiguous in the frequency domain

Continue offline discussion until Tuesday – (Ericsson)

R1-1611656 Summary of email discussion [86b-23] on DL control channel design Huawei, HiSilicon
The document was presented by David Mazzarese from Huawei.
Decision: The document is noted. Continue offline discussion until Tuesday – (Huawei)

Tuesday session
R1-1613311 Summary of offline discussion on DL control channels Ericsson
The document was presented by Stefan Parkvall from Ericsson.
Decision: The document is noted, and the following is agreed:

Agreements:
- At least for single-stage DCI design:
    - A control resource set (formerly called control subband) is, in the frequency domain, a set of PRBs within which the UE attempts to blindly decode downlink control information
        - The PRBs may or may not be frequency contiguous
        - A UE may have one or more control resource sets
        - Working assumption: One DCI message is located within one control resource set
- In frequency-domain, a PRB is the resource unit size (may or may not including DM-RS) for control channel

Agreements:
- NR should support dynamic reuse of at least part of resources in the control resource sets for data for the same or a different UE, at least in the frequency domain
    - FFS if resource reuse can be done in time domain as well
    - FFS: DL data DM-RS location in time should not vary dynamically as a consequence of dynamic reuse of control resources for data
    - FFS: time/frequency granularity of the resource reuse
    - FFS: signaling needed, if any

Petitioners' Exhibit 1007, p. 1293
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1611211 **Discussion on search space design for DL control channels Huawei, HiSilicon**

- *Proposal 1: Both UE-specific search space and common search space are supported in NR.*
- *Proposal 2: UE-group-specific search space in NR can be further studied.*
- *Proposal 3: Common search space is defined within at least one predefined or semi-statically configured control subband in a carrier.*
- *Proposal 4: UE-specific search space is configured either dynamically or semi-statically.*

Decision: The document is noted.

R1-1613023 **On the transmission of DL control information and data using different numerologies Nokia, Alcatel-Lucent Shanghai Bell**

- *Observation #1: Dynamic scheduling of multiple numerologies increases PDCCH blind detection burden at UE*
- *Observation #2: With RF beamforming, multiple short PDCCH symbols increases the PDCCH capacity compared to the case with one longer PDCCH symbol.*
- *Observation #2: From performance point of view, it is feasible to have larger subcarrier spacing for control compared to that of data.*
- *Proposal #1: Consider different numerologies for control and data as an enabler for dynamic scheduling between multiple numerologies, and for improved PDCCH capacity in the case of RF beamforming.*

Decision: The document is noted.

R1-1613668 **WF on two stage DCI design Huawei, HiSilicon, Qualcomm, OPPO, Convida, ZTE, Fujitsu, Mediatek, InterDigital, Intel**

R1-1613091 **WF on CCE for NR DL Control ZTE, Qualcomm, Nokia, Alcatel-Lucent Shanghai Bell, Panasonic, Huawei,**

R1-1613720 **Summary of offline discussion on DL control channels Ericsson**

Agreements:

- ~~1.~~• when the control resource set spans multiple OFDM symbols, NR support a control channel candidate to be mapped to multiple OFDM symbols or to a single OFDM symbol
  - ~~1.~~0 The gNB can inform UE which control channel candidates are mapped to each subset of OFDM symbols in the control resource set. FFS: details of the signaling (implicit or explicit)

7.1.4.2 Physical uplink control channel

R1-1613162 Summary of e-mail discussions on uplink control signaling Ericsson (Revision of R1-1612916)
The document was presented by Stefan Parkvall from Ericsson.
Decision: The document is noted.

Agreements:

- Physical uplink control signaling should be able to carry at least hybrid-ARQ acknowledgements, CSI reports (possibly including beamforming information), and scheduling requests
- Support 'UCI on PUSCH', i.e. using some of the scheduled resources for UCI in case of simultaneous UCI and data
- Support 'simultaneous PUSCH and PUCCH at least for the long PUCCH format', i.e. transmit uplink control on PUCCH resources even in presence of data
- At least a low PAPR/CM design should be supported for the 'long PUCCH'
- A combination of semi-static configuration and (at least for some types of UCI information) dynamic signaling is used to determine the PUCCH resource both for the 'long and short PUCCH formats'
- It should be possible to dynamically indicate (at least in combination with RRC) the timing between data reception and hybrid-ARQ acknowledgement transmission as part of the DCI.

Agreements:

- Support FDM of 'short UCI' and data, both within a UE and between UEs at least for the case where the PRBs for short UCI and data are non-overlapping
- FFS: PUSCH in the short UL duration can be scheduled independently

---

Tuesday: Following lunch time offline

R1-1613349 Summary of offline discussion on UL control channels Ericsson

The document was presented by Stefan Parkvall from Ericsson.

Decision: The document is noted.

R1-1611843 Design of short duration UL control channel for NR LG Electronics

- Proposal 1: Following design alternatives are to be considered for multi-symbol UL control channel.
  - Alt. 1: Repetition of one-symbol UL control channel structure over multiple symbols
  - Alt. 2: TDM between RS and UCI
    - Alt. 2-1: RS is located in the first symbol.
    - Alt. 2-2: RS is located in the fixed symbol (e.g., second last symbol within a slot).
- Proposal 2: Consider short duration UL control channel around first transmitted UL symbols in a slot.
- Proposal 3: Consider multiplexing between UL control channels having different duration (with different number of symbols) within UL control region.

Decision: The document is noted.

R1-1611998 Scheduling request design for NR Intel Corporation

- Proposal 1
  - *For NR, SR can be transmitted using on/off signalling mechanism.*
  - *SR can be combined with other UCI feedback, where 1 bit information with positive or negative SR can be explicitly included in NR PUCCH.*
- Proposal 2: *SR resource allocation mechanism should be investigated with considerations of deployment scenarios and duplex modes for NR.*
- Proposal 3: *BSR transmission via NR PUCCH should be considered for low latency uplink transmission.*
- Proposal 4: *SR can be used to request resource for uplink data transmission using a numerology different from the pre-configured one.*
- Proposal 5: *For non-standalone deployment scenario, SR via LTE anchor cell can be used to request resource for uplink transmission in NR booster cell.*

Decision: The document is noted.

R1-1612533 Scaled Numerology for UL control channels Samsung

- Observation 1: BLER performance of Scheme A will be less than or equal to Scheme B in case that same DMRS overhead is assumed for both schemes when back-off gain of Scheme B is taken into account.
- Observation 2: BLER performance of Scheme A will be better than or equal to Scheme B in case that different DMRS overhead is assumed for each scheme when back-off gain of Scheme B is taken into account.
- Proposal: Investigate scaled numerology for NR UL control channel further with consideration of DMRS overhead.

Decision: The document is noted.

R1-1612073 UL channelization in short UL duration Qualcomm Incorporated

- Proposal 1: The short UL duration can consist of at least two half-symbols depending on numerology.
  - DMRS for PUCCH is transmitted in the first half-symbol, while UCI content is transmitted in the second half-symbol.
- Proposal 2: The waveform for PUCCH in short UL duration is DFT-S-OFDM.
- Proposal 3: For simultaneous PUCCH and PUSCH from the same UE, consider either piggyback PUCCH in PUSCH, or transmit PUCCH in adjacent RBs with PUSCH.

Petitioners' Exhibit 1007, p. 1296
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal 4: For a UE with simultaneous PUCCH and SRS, UE may drop/delay SRS.

Decision: The document is noted.

R1-1612920 On multiplexing of short UCI and data Ericsson

Ericsson→ no need to present this particular paper – covered during email discussion

Decision: The document is noted.

Thursday session

R1-1613349 Summary of offline discussion on UL Control Channels Ericsson

R1-1613636 WF on PUCCH channelization Huawei, HiSilicon, CATT, CMCC, ERICSSON, MediaTeK, Nokia, ASB, NTT DOCOMO, OPPO, Panasonic, Vivo, Xiaomi, Xinwei

- A UCI carried by long duration UL control channel can be transmitted in one slot or multiple slots
  - Transmission across multiple slots should allow at least a total duration of 1 ms
  - FFS the numbers of the slots

Decision: The document is noted, modified as follows:

Agreements:

1. A UCI carried by long duration UL control channel at least with low PAPR design can be transmitted in one slot or multiple slots
   1. Transmission across multiple slots should allow a total duration of [1] ms at least for some cases
      1. FFS: more than [1] ms at least for some cases
   2. FFS the numbers of the slots

R1-1613721 Summary of offline discussion on UL control channel s Ericsson

Agreements:

2. In order to support TDM of short PUCCH from different UEs in the same slot, a mechanism to tell the UE in which symbol(s) in a slot to transmit the short PUCCH on is supported at least above 6 GHz (exact mechanism FFS)

R1-1613411 WF on Long Duration PUCCH LG Electronics, Intel, Samsung, NTT DOCOMO

Agreements:

3. For UL control channel with long duration, TDM between RS and UCI is supported at least for DFT-S-OFDM
   1. FFS on location of RS symbol(s) (e.g., front-loaded RS, fixed-location RS)

R1-1613632 WF on position of UL control symbol ZTE, Intel, Samsung, InterDigital, Sony

The document was presented by … from …

Discussion:

Decision: The document is noted.

7.1.4.4 URLLC specific aspects

R1-1611221 Control channel design for URLLC Huawei, HiSilicon

- *Observation 1: The reliability requirement for the DL assignment should exceed 99.999% in order to support single shot transmission.*
- *Observation 2: The requirement of NACK to ACK error is dependent on data channel reliability.*
- *Proposal 1: Strive for a reliable and spectrum efficient DL control channel considering the following three options*
  - *Opt 1: Reduce the DCI payload size*
  - *Opt 2: Allocate more time-frequency resources*
  - *Opt 3: Exploit the multi-path diversity, e.g. spatial/frequency/carrier*
- *Proposal 2: A compact DCI format can be considered targeting URLLC where a set of condensed scheduling information is conveyed.*
- *Proposal 3: A split DCI format design can be considered for URLLC.*

Decision: The document is noted.

R1-1612003 Downlink URLLC transmission and multiplexing with eMBB Intel Corporation

- Proposal 1
  - *DL mini-slot with flexible duration is supported.*
  - *Scheduling granularity less than 7 symbols slot duration is supported for 60 kHz SCS.*
  - *Further study support of 1 symbol mini-slot duration for the case of 15 kHz SCS.*
- Proposal 2: *Strive for solutions that minimize eMBB UE complexity when eMBB is multiplexed with URLLC services.*
- Proposal 3: *Strive for common solutions to handle intra-cell preemption and inter-cell time-selective interference due to multiplexing of eMBB and URLLC.*

Decision: The document is noted.

R1-1612079 HARQ design for URLLC Qualcomm Incorporated

- *Observation 1: Adaptive HARQ provides significant gains over one-shot and non-adaptive HARQ schemes in terms of spectral efficiency.*
- *Observation 2: Adaptive HARQ naturally leads to asynchronous CQI in the form of extended/super ACK, where receiver informs transmitter of instantaneous channel conditions either explicitly (i.e., CQI report) or implicitly (i.e., required bandwidth, MCS, etc.)*
- *Observation 3: Adaptive HARQ's gain over non-adaptive HARQ increases under bursty interference.*
- *Observation 4: The channel coding scheme has to be sufficiently flexible to allow the rateless HARQ operation. Specifically, it should allow a fine granularity of channel coding rates to allow the user device to transmit continuously until the ACK is received.*
- *Proposal 1: NR should support adaptive HARQ with asynchronous CQI for URLLC.*
- *Proposal 2: NR should support rateless HARQ for URLLC.*

Decision: The document is noted.

Wednesday session

R1-1613517 WF on grant-free support for UL URLLCHuawei, HiSilicon, NTT Docomo, Vodafone, Ericsson, Nokia, CATR, CATT, Spreadtrum, Fujitsu, InterDigital, OPPO, Convida Wireless, ZTE

- An UL transmission scheme without scheduling request and grant is supported for URLLC
  - Resource can be shared among one or more users

Formatted: Indent: Left: 0.63 cm, Hanging: 0.63 cm, Bulleted + Level: 1 + Aligned at: 0.63 cm + Indent at: 1.27 cm

Petitioners' Exhibit 1007, p. 1299
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- FFS: resource configuration details
- FFS: which specific mechanisms to resolve resource collision
- FFS other details of design

Discussion: Also supported by Sharp
Decision: The document is noted, modified as follows:

Agreements:
- At least an UL transmission scheme without grant is supported for URLLC
  - Resource may or may not be shared among one or more users
    - FFS: resource configuration details
  - FFS other details of design

Thursday session

R1-1613596 WF on UL grant-free for URLLC ZTE, ZTE Microelectronics, Huawei, Hisilicon, CATR, Convida Wireless, III, InterDigital

- For UL URLLC
  - Contention-based transmission scheme without grant is supported
  - For physical resource configuration
    - Opt. 1: randomly selected by each UE from the pre-defined resource pool(s)
    - Opt. 2: pre-configured by base station
    - Other options are not precluded
    - Combination of different options is not precluded
  - Companies are encouraged to propose specific mechanism and evaluation to solve resource collision, e.g. Interference cancellation, HARQ

Decision: The document is noted.

R1-1613532 WF on HARQ support for UL URLLC Huawei, HiSilicon, NTT Docomo, Nokia, Oppo, InterDigital, Fujitsu, CATR, Spreadtrum, CATT, Intel, ZTE

- For an UL URLLC transmission scheme without grant, HARQ/retransmission is supported
  - FFS retransmissions are also without grant and/or triggered by grant
  - FFS if retransmissions are based on A/N feedback or not
  - FFS if adaptive HARQ/retransmission is needed and possible mechanisms

Decision: The document is noted. Also supported by Ericsson, ETRI

R1-1613578 WF on URLLC HARQ support in DL Intel, Huawei, HiSilicon

Agreement: Asynchronous and adaptive HARQ is supported for DL

R1-1613641 WF on URLLC UL transmission LG, Intel

Petitioners' Exhibit 1007, p. 1303
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Conclusion:

- One aspect that should be considered further for the NR-LDPC design is the lifting size definition:
  - E.g. the lifting size $z = c*2^d$, where c is chosen from a set C of positive integers and, for each value of c, d is taken from the set D = [0,1, 2, 3, 4, 5, 6, 7, 8]
    - FFS the set C

R1-1613093 WF on Basics of LDPC Design Ericsson, NTU, Qualcomm, Intel, Nokia, ASB, LG, Samsung

Agreements:

- Code extension of a parity-check matrix is used for IR HARQ/rate-matching support
  - Use lower-triangular extension, which includes diagonal-extension as a special case
- For the QC-LDPC design, the non-zero sub-blocks have circulant weight <=2
  - Circulant weight is the number of superimposed circularly shifted Z×Z identity matrices
- In parity check matrix design, the highest code rate ($R_{max,j}$) to design j-th H matrix for is
  - $R_{max,j}$ <=8/9
  - $R_{max,j}$ is the code rate of the j-th H matrix before code extension is applied ($0 \leq j < J$)
  - $R_{max,j}$ is the code rate after accounting for the built-in puncturing, if this is applied in H matrix design
  - Rate matching to support transmission code rate higher than $R_{max,j}$ is not precluded

For RAN1 Jan Adhoc, companies are encouraged to work on further key characteristics / principles of the protomatrix.
For comparisons between LDPC designs, continue to use the same simulation assumptions.
Companies are encouraged to use sum-product flooding decoding algorithm with 50 iterations as a reference; other variants may also be provided.

Bureau Veritas and CGC withdrew their support.
Proposal:
- Polar is supported as the channel coding scheme for DL and UL control channels for eMBB (except FFS for very small payloads)

R1-1613577 WF on coding technique for control channel for eMBB LG, AT&T, Ericsson, NEC, Qualcomm
Proposal:
- For DCI, tail-biting convolutional code (TBCC) is adopted as a channel coding technique for NR
- For UCI with encoder input size [16]<=K<=100 bits, TBCC is adopted as a channel coding technique for NR
- FFS: enhancements to LTE TBCC including generator polynomials with larger constraint length, lower native code rate

R1-1613249 WF on channel coding Etisalat, Telus, Bell Mobility, China Unicom
Proposal:
- LDPC is supported as the channel coding scheme for DL eMBB data with information block up to 1024 bits
- Polar is supported as the channel coding scheme for UL eMBB data with information block up to 1024 bits
- Polar is supported as the channel coding scheme for DL and UL control channel

R1-1613248 WF on NR channel coding Verizon Wireless, AT&T, CGC, ETRI, Fujitsu, HTC, KDDI, KT, Mitsubishi Electric, NextNav, Nokia, Alcatel-Lucent Shanghai Bell, NTT, NTT DOCOMO, Samsung, Sierra Wireless, T-Mobile USA
Proposal:
- Adopt LDPC as the single channel code for uplink and downlink eMBB data channels for all relevant info block sizes
- Adopt Polar as the channel code for the uplink control information
  - FFS for very small block lengths where repetition/block coding may be preferred
- Adopt TBCC as the channel code for the downlink control information

R1-1613250 WF on Channel Coding for NR Vodafone, CMCC, Ericsson, Deutsche Telekom, TELUS, Bell Mobility, China Unicom, China Telecom
Proposal:
- Flexible LDPC (f-LDPC) is supported as the channel coding for both DL and UL eMBB data channel for all relevant information block sizes
  - It is not precluded that other coding schemes can be added later in future release
- Polar Coding is supported as the channel coding for both Uplink and Downlink eMBB control channel (except FFS for very small payloads)

Agreement:

- UL eMBB data channels:
  - Working Assumption to adopt flexible LDPC as the single channel coding scheme for small block sizes (to be confirmed unless significant issues are identified by the RAN1 Jan adhoc in relation to performance, implementation complexity and flexibility)
  - (Note that it is already agreed to adopt LDPC for large block sizes)
- DL eMBB data channels:
  - Adopt flexible LDPC as the single channel coding scheme for all block sizes
- UL control information for eMBB
  - Adopt Polar Coding (except FFS for very small block lengths where repetition/block coding may be preferred)
- DL control information for eMBB
  - Working Assumption to adopt Polar Coding (except FFS for very small block lengths where repetition/block coding may be preferred)
    - To be confirmed unless significant issues are identified by the RAN1 Jan adhoc in relation to performance, latency, power consumption and implementation complexity

7.1.6 Duplex and interference management

R1-1613711 Chairman's notes of AI 7.1.6 on duplexing for NR Ad-Hoc chair (Qualcomm)
The document was presented by Wanshi Chen from Qualcomm.
Discussion:
Decision: The document is endorsed and content incorporated below.

R1-1611224 General discussion on flexible duplex Huawei, HiSilicon
R1-1611404 Clarification on flexible duplex CATT
R1-1612560 Views on NR Duplexing Samsung

R1-1613291 WF on Terminology for Flexible Duplex LG Electronics, Huawei, HiSilicon
R1-1613503 WF on Terminology and Categorization for Duplexing LG Electronics, ZTE, Huawei, HiSilicon
Agreements:

- Referring to TR 38.913, the terminology of "duplexing flexibility" in NR means at least one of the following mechanisms to manage resources flexibly for uplink and downlink for both paired and unpaired spectrum.
  - 1) UL and DL usage is flexibly changed in time domain in unpaired spectrum.
  - 2) UL and DL usage is flexibly changed in time domain in UL band in paired spectrum
  - 3) UL and DL usage is flexibly changed in time domain in DL band in paired spectrum
- Note: the definition of the above terminology is not intended to have impact on prioritizing discussion on any of the above mechanisms

R1-1613219 Way Forward on operation of flexible duplex Huawei, HiSilicon, LGE
R1-1613462 Operation on paired spectrum Huawei, HiSilicon

R1-1613139 WF on Dynamic TDD AT&T, Ericsson, Intel, Samsung
Agreements:

- NR should support dynamically assigned DL and UL transmission directions at least for data on a per-slot basis at least in a TDM manner
  - FFS control signaling details (e.g. UE or cell-specific, applicable for cross and/or same-slot scheduling, switching between dynamic and semi-static operation, etc.)
  - FFS adaptation at the level of a mini-slot
  - Other aspects, if any, are not excluded
- Note: the applicability of the above bullets in terms of spectra is a separate discussion

R1-1613515 WF on measurements for dynamic TDD Samsung
R1-1613319 WF on OTA signaling for dynamic TDD in NR Mediatek, CATT

Agreements:

- At least following schemes are identified to be further studied aiming to mitigate cross-link interference with and without the assumption on inter-cell coordination:
  - Advanced receiver for interference cancellation/suppression
  - RS design (e.g. symmetric RS) and timing alignment between DL and UL
  - Sensing/measurement scheme (e.g. LBT-like, OTA measurement if any, etc.)
  - Power control and coordinated schemes (e.g. coordinated beamforming/scheduling, OTA signalling if any, etc.)
  - Link adaptation
- Strive for common cross-link interference mitigation schemes for both paired and unpaired spectrum.
- For further study of measurements of cross link interference (CLI), aim for (if possible) reusing a physical reference signal used for other purposes
  - The need to enable CLI measurement should be taken into account when designing the RS which is also to be used for CLI measurement
  - Study metric(s) to be used for CLI measurement, e.g., RSRP
  - Physical reference signal used for CLI measurement aim for the same type for DL & UL (e.g. DM-RS type, CSI-RS type, etc.)
  - To support CLI measurement, RS of a UE or a TRP aim to be received by another UE or another TRP

R1-1612899 Channel model for evaluation of Rural scenario Ericsson
R1-1613312 Way Forward on channel model for rural scenario in NR Huawei, HiSilicon, CATT, CATR
R1-1613116 Channel model for evaluation of Rural scenarioEricsson, T-Mobile USA, Telstra, Samsung, AT&T, Sprint, Xilinx, Intel, NTT DOCOMO
Also supported by Verizon, Nokia, ASB

Working assumption:

Petitioners' Exhibit 1007, p. 1309
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Use 38.900 RMa as a starting point for NR evaluations in the rural deployment scenario for frequencies below 6 GHz, with the following modifications:
  - FFS on possible modifications to O2I and elevation parameters in 38.900 RMa
    - Based on new measurements of O2I and 3D parameters in rural scenario
    - Companies are encouraged to bring new measurement results, if any

R1-1612192 **Discussion on the azimuth direction of the main beam for high speed scenario evaluation CMCC**

Agreements:
- The optimized azimuth beam direction should be determined by observing both DL geometry and UL geometry.
- One option for antenna downtilt for high speed scenario is to reuse the downtilt for rural scenario, i.e., 6 degrees.
- One value for the optimized azimuth beam direction is 27 degrees to the railway track. This is obtained assuming that the half power beam points to the midpoint between the two adjacent sites along the railway.

R1-1612170 **Requirements on Future Railway Mobile Communication ZTE**

Coexistence

R1-1611681 **Coexistence between NR and LTE Huawei, HiSilicon**

Proposal 1: RAN1 to focus on coexistence in the same licensed frequency band:
- *Co-located LTE/NR with synchronization for unpaired or paired spectrum deployment*
- *Non-co-located LTE/NR, with or without synchronization for unpaired or paired spectrum deployment, with or without fast backhaul connections.*

Proposal 2: NR/LTE coexistence should consider TDM, FDM, and using a LTE carrier or a NR carrier as NR user's anchor carrier.

Proposal 3: Coexistence requirements for NR mainly include:
- *For co-located LTE/NR, resource sharing and indication via forward compatible designs*
- *For non-co-located LTE/NR, interference management at least by reusing LTE interference management schemes.*

Proposal 4: Coexistence requirements for LTE mainly include:
- *For co-located LTE/NR, introducing higher degree of adaptation/flexibility in time/frequency domains*
- *For non-co-located LTE/NR, considering further enhanced interference management schemes.*

Proposal 5: Coexistence should be supported by LTE/NR at subframe-level in time domain and at PRB-level in frequency domain if the same numerology and slot size is used.

Proposal 6: NR should provide sufficiently flexible design forward compatible with NR and LTE further evolution (e.g., new LTE features such as short TTI).

Decision: The document is noted.

R1-1612887 **Uplink operation for LTE+NR Dual Connectivity VODAFONE Group Plc**

The document highlights that there are some deployment complexities and drawbacks in requiring 2 uplink carriers to always be operated with LTE+NR aggregation (DC), and allowing a single uplink carrier to transport both LTE uplink and NR L1/2 control feedback would simplify operation when deploying NR in a new band, and make it no less complicated than deploying LTE radio in that band.
Asks RAN1 to study this further, as part of the LTE-NR coexistence work, and consider specifying this capability within Rel-15.
Discussion: Intel→ contribution seems more appropriate for discussion within RAN2 rather than in RAN1.
Decision: The document is noted.

R1-1613034 **LTE-NR Coexistence Samsung**

- *Proposal 1: Design TDD UL-DL configurations for NR such that at least a subset of the configurations are compatible with those of LTE.*
- *Proposal 2: Support indication of the starting symbol for NR transmission.*

Decision: The document is noted.

R1-1613263 **WF on LTE-NR Coexistence Huawei, HiSilicon, AT&T, Orange**

The document was presented by David Mazzarese from Huawei.
Discussion: Chair→ focus on proposal 1 first "NR mechanisms that enable coexistence with LTE"
Samsung→ are we going to agree all the proposed mechanisms? – too detailed at this stage, let's discuss principles first
Nokia: spectrum sharing needs to be addressed anyway
NTT DOCOMO→ shouldn't we define first the key features affecting coexixtence
Decision: The document is noted.

Agreements:

Petitioners' Exhibit 1007, p. 1310
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- For LTE and NR coexistence,
  - In NR design, consider support of flexible starting point and duration of scheduled resources as a tool to avoid for example the control region of MBSFN subframes and be able to use resources in the unused MBSFN subframes of an LTE carrier
    - Note: those mechanisms may be reused from forward compatibility mechanisms
    - FFS: use of mini-slot
    - FFS: Dynamically or semi-statically varying starting point and duration
  - NR design supports adapting the bandwidth occupied by NR carrier(s) at least as fast as LTE carrier aggregation schemes
    - FFS: Detailed design
  - FFS: Allowing NR transmissions while avoiding OFDM symbols carrying CRS on a DL LTE subframe
    - Further discussion needed on how to handle sTTI transmissions of LTE
    - Note: those mechanisms may be reused from forward compatibility mechanisms, or mechanisms for multiplexing eMBB and URLLC on the DL, or mini-slot
  - Allowing NR transmissions while avoiding OFDM symbols carrying SRS on an UL LTE subframe
    - Further discussion needed on how to handle sTTI transmissions of LTE
  - FFS: PRB-level resource allocation can be used as a tool to avoid for example PSS/SSS, PBCH, EPDCCH, PUCCH, PRACH, as well as PRB-level scheduled LTE PDSCH and LTE PUSCH, of an LTE carrier
  - FFS: Mapping NR signals and channels around the LTE CRS patterns
  - Note: those mechanisms may be reused from forward compatibility mechanisms

Possible agreements:

- NR should support a mechanism to avoid collision between DL and UL transmissions between NR and LTE
  - Design at least one semi-statically assigned DL/UL transmission direction for NR that avoids DL/UL interference with at least one LTE DL/UL subframe configuration

Wednesday session

Agreements:

- For adjacent channel/band operation of NR and LTE in the unpaired spectrum
  - Design at least one semi-statically assigned DL/UL transmission direction configuration for NR that avoids DL/UL interference with at least one LTE TDD DL/UL configuration and special subframe configuration
  - This does not preclude at most one semi-statically DL/UL transmission direction configuration in NR specification
  - Note: DL/UL interference also can be avoided by using dynamically assigned DL/UL transmission direction in some cases
  - FFS: Backhaul signaling between NR and LTE for interference coordination
  - FFS: Other mechanisms

- Note that the above agreements do not imply that UE has to support simultaneous connection of NR and LTE in the same or overlapping carrier
- Note: that above mechanisms may be reused from forward compatibility mechanisms, or mechanisms for multiplexing eMBB and URLLC on the DL, or mini-slot

R1-1612927 **On scrambling Ericsson**

- Scrambling of unicast data should not depend on the transmission time or the identity of a transmission point.

Decision: The document is noted.

R1-1611248 **Forward compatibility considerations on NR operations of the unlicensed band Huawei, HiSilicon**

Proposal 1: NR should study the operations on the unlicensed bands including sub-1GHz, 2.4GHz, 5GHz and 60GHz.
Proposal 2: At least the following requirements from regulation should be considered when studying forward compatibility for unlicensed band operations

- *Channel bandwidth and occupied channel bandwidth (OCB)*
- *maximum channel occupancy time (MCOT)*
- *Listen before talk (LBT)*

Proposal 3: Flexible channel bandwidth considering coexistence should be supported for different unlicensed bands.
Proposal 4: NR should strive to minimize reservation signal in unlicensed band transmission in the frame structure and reference signal design.
Proposal 5: NR should support flexible timing relationship to ensure the following transmission and reception finishing within same MCOT.

- *DL data reception and corresponding acknowledgement*
- *UL assignment and corresponding UL data transmission.*

Decision: The document is noted.

Decision: CR0054r1 to 38.900 (Rel-14, F) is agreed.

Section 7.1.3
R1-1613021 Draft CR for TR38.900 Section 7.1.3 ETRI
Decision: Agreed as CR0065 to 38.900 (Rel-14, F) in R1-1613244.

Section 7.3
R1-1613189 TR38.900_CR_Azimuthal_Angle_Notation Fraunhofer
Decision: CR0053r1 to 38.900 (Rel-14, F) is agreed.

Section 7.4.1
R1-1613074 TR38.900_CR_Correction_of_UMa_BP_definition Fraunhofer HHI (Revision of R1-1612962)
Decision: CR0061r1 to 38.900 (Rel-14, F) is agreed.

Section 7.5
R1-1613077 Ground Reflection Model Fraunhofer HHI
Proposes a new component to the model.
Late submission – check until RAN1#88

Section 7.6.3
R1-1612897 Correction for spatial consistency procedure Ericsson
Decision: CR0058 to 38.900 (Rel-14, F) is agreed.
R1-1613064 Correction for spatially-consistent UT mobility handling Ericsson (Revision of R1-1612896)
Further revised in R1-1613525
R1-1613525 Correction for spatially-consistent UT mobility modelling Ericsson, Fraunhofer HHI, Nokia, Alcatel-Lucent Shanghai Bell
Decision: CR0057r2 to 38.900 (Rel-14, F) is agreed.
Note – there may be some remaining issues with this CR – a revised version (revision 3) is submitted in R1-1613497, which companies are encouraged to check until RAN1#88. It is proposed to un-agree R1-1613525.
Friday: Confirmation that R1-1613525 is not agreed and the CR is postponed to next meeting.

R1-1612735 Detailed modeling methodology of spatial consistency NTT DOCOMO, INC.
Decision: Continue discussion at RAN1#88; possibly consider a CR to the calibration section of the TR.

Section 7.6.5
R1-1613063 Correction for correlation modeling for multi-frequency simulations Ericsson (Revision of R1-1612895)
Decision: Discuss offline until RAN1#88.

Section 7.7.1

Petitioners' Exhibit 1007, p. 1313
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1613353 **Correction for channel models for link-level evaluations** **Ericsson** (Revision of R1-1612894)
Decision: CR0055r1 to 38.900 (Rel-14, F) is agreed.

Section 7.7.2
R1-1613073 **TR38.900_CR_TDL_and_KF_scaling** **Fraunhofer HHI** (Revision of R1-1612953)
Decision: CR0060r1 to 38.900 (Rel-14, F) is agreed.

Section 7.7.5
R1-1613065 **Correction for scaling of angles for CDL models** **Ericsson** (Revision of R1-1612987)
Decision: CR0062r1 to 38.900 (Rel-14, F) is agreed.

Section 7.8.2
R1-1612898 **Correction for terminology of UE antenna model and scattering** **Ericsson**
Decision: CR0059 to 38.900 (Rel-14, F) is agreed.

R1-1613066 **Correction for scenario description** **Ericsson**
Late submission
Decision: Check until RAN1#88.

Not treated.
R1-1613637 Additional feature calibration results Xinwei
R1-1613638 Update of additional feature calibration results Xinwei

TR36.873
R1-1613315 **Draft CR for TR36.873 Section 5.1.3** **ETRI** (Revision of R1-1613022)
Decision: The CR is agreed as CR0011 to 36.873 (Rel-12, F) in R1-1613245.

R1-1612967 **TR36.873_CR_Section_7.1** **Fraunhofer HHI**
R1-1613195 **TR36.873_CR_Section_7.2** **Fraunhofer HHI**
R1-1612982 **TR36.873_CR_Section_7.3** **Fraunhofer HHI**
R1-1613192 **TR36.873_CR_LOS_Probability** **Fraunhofer HHI**
Nokia – not correct.
No consensus to agree the above 4 CRs.
If consensus emerges on some useful changes, this can be revisited in a future meeting.

R1-1613191 **TR36.873_CR_Section_7.3** **Fraunhofer HHI**
Decision: CR0006r1 to 36.873 (Rel-12, F) is agreed.

TR25.996
R1-1613076 **Correction of Circular Angle Spread** **Fraunhofer HHI**
Late submission
Decision: Check until RAN1#88.

TR36.814
R1-1613193 **TR36.814_CR_Section_B.1.2.2.1** **Fraunhofer HHI**
Decision: CR0002r1 to 36.814 (Rel-9, F) is agreed.
R1-1613194 **TR36.814_CR_LOS_Probability** **Fraunhofer HHI**
Decision: CR is not pursued.
Consider adding a note in 38.900 to state the equivalence of the formulae – revisit at RAN1#88.

8 Closing of the meeting

Mr Chair thanked all for the hard work during the week. Still two meetings to complete the SI on NR with the confirmation that January ad-hoc meeting will be hosted by NAF3 in Spokane, Washington.

Before closing the meeting, RAN1 chair raised the issue regarding the number of contributions in RAN1 following the comments made by several companies during this week.
Chair: should I limit the number of contributions per company?
Nokia (VC): risk with such a limitation is on contributions addressing too many topics in one unique Tdoc, and consequently a difficulty to address and treat them
Fujitsu: Having more informative titles may help to sort them out
Huawei: Companies should work together before the meeting and come with joint contributions
Samsung→ commented that they noticed nice combination of supporting companies in many way forward – not really fair!
Intel: Support the idea to limit the number of WF per company

Petitioners' Exhibit 1007, p. 1314
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

RAN1 chair: acknowledge that a number of WF are meaningless (applauses by RAN1) – noticed a sort of competition
- also noticed that WF as one specific company proposal is in fact a late contribution
Samsung: Increasing the granularity of sub-agenda may help
AT&T: better stop such online discussion as meeting closing time has ready passed – exchange ideas over email reflector could help to progress further
Qualcomm: doesn't believe that email discussion is a good idea
RAN1 chair: let's stop – will decide by himself and let RAN1 WG knows about it

Huawei (David Mazzarese) commented that NR TR was endorsed while he wasn't in the room due to too many offline discussions – some of the Huawei's comments on TR have been ignored
NTT DOCOMO (rapporteur) → Huawei delegates were present when TR has been endorsed
RAN1 chair: TR is for for information to plenary – still two meetings in front of RAN1 to complete the SI – there will be opportunity to capture/improve the content of the TR in the the future.

MCC: Purpose of the NR ad-hoc meeting hosted by NAF3 in January 2017 is clear.
RAN1 mandates this Ad hoc meeting with full decision power for NR. This Ad hoc meeting is for NR only.

Meeting was closed at 17:17.
See you all in Athens, and in Spokane for NR interested..

Annex C-1: List of Outgoing LSs from RAN1 #87

TDoc #	Title	Source	Release	Related WIs	Reply to	To	Cc	Original LS	Reply in
R1-1613208	LS to RAN2/3 on RAN1 progress on MC enhancements	RAN1, Huawei	Rel-14	UTRA_MCe-Core		RAN2, RAN3			
R1-1613330	LS on RRC parameters for PUSCH in UpPTS	RAN1, CMCC	Rel-14	LTE_UL_CAP_enh-Core		RAN2	RAN3, RAN4		
R1-1613331	LS on PUSCH in UpPTS	RAN1, CMCC	Rel-14	LTE_UL_CAP_enh-Core		RAN2, RAN3, RAN4			
R1-1613334	LS on possible RF impacts related to sPUSCH design	RAN1, Ericsson	Rel-15	LTE_sTTIandPT-Core		RAN4			
R1-1613348	Reply LS on RAN2 agreements for NR DL-based mobility and cell definition	RAN1, Samsung	Rel-14	FS_NR_newRAT	R2-167313	RAN2	RAN3, RAN4		
R1-1613468	LS on RSTD measurement for Rel-14 NB-IoT positioning	RAN1, Mediatek	Rel-14	NB_IOTenh-Core		RAN2, RAN4			
R1-1613481	LS for SRS Carrier-Based Switching Agreements	RAN1, Huawei	Rel-14	LTE_SRS_switch-Core		RAN2, RAN4			
R1-1613492	[DRAFT] Reply LS to RAN2 on capturing new numerology for TS.36.300	RAN1, Ericsson	Rel-14	MBMS_LTE_enh2-Core		RAN2			
R1-1613494	LS on MAC CE based activation/release mechanism for aperiodic and multi-shot CSI-RS	RAN1, Qualcomm	Rel-14	LTE_eFDMIMO-Core		RAN2			
R1-1613574	LS on long-term basis co-channel coexistence between DSRC/IEEE 802.11p and LTE PC5 for V2V operating over the same frequency channels	RAN1, Ericsson	Rel-14	LTE_V2X-Core		RAN			
R1-1613618	LS on MUST Higher Layer Signaling	RAN1, MediaTek	Rel-14	LTE_MUST-Core		RAN2			
R1-1613624	LS on Updated L1 parameters for SRS Carrier-Based Switching	RAN1, Huawei	Rel-14	LTE_SRS_switch-Core		RAN2	RAN4		
R1-1613629	LS on Text Proposal for TS 36.300 for SRS Carrier-Based Switching	RAN1, Huawei	Rel-14	LTE_SRS_switch-Core		RAN2			
R1-1613663	LS on UE RF Bandwidth Adaptation in NR	RAN1, MediaTek	Rel-14	FS_NR_newRAT		RAN4			
R1-1613692	LS on minimum system information	RAN1, LG Electronics	Rel-14	FS_NR_newRAT		RAN2			
R1-1613730	LS reply on coverage enhancement in SC-PTM for FeMTC and eNB-IoT	RAN1, Ericsson	Rel-14	LTE_feMTC-Core, NB_IOTenh-Core	R1-1611083	RAN2			
R1-1613731	LS reply on LS on NB-IoT Rel-14 RACH and Paging on non-anchor carrier	RAN1, Ericsson	Rel-14	NB_IOTenh-Core	R1-1611084	RAN2			

Petitioners' Exhibit 1007, p. 1321
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

TDoc #	Title	Source	Release	Related WIs	Reply to	To	Cc	Original LS	Reply in
R1-1613748	LS on sub-carrier spacing and carrier frequency	RAN1, Ericsson	Rel-14	FS_NR_newRAT		RAN4			
R1-1613755	LS on agreement on OTDOA enhancement in RAN1#87	RAN1, Intel	Rel-14	UTRA_LTE_iPos_enh2-Core		RAN2, RAN3			
R1-1613757	LS on EVM assumption in MUST Case1/2 performance evaluations	Nokia, Alcatel-Lucent Shanghai Bell	Rel-14	LTE_MUST-Core		RAN4			
R1-1613758	LS regarding RAN1 agreements on FeMBMS	RAN1, Intel	Rel-14	MBMS_LTE_enh2-Core		RAN2	RAN4		
R1-1613760	LS on Rel-14 FeMTC OTDOA enhancements	RAN1, Ericsson	Rel-14	LTE_feMTC-Core		RAN2, RAN3, RAN4			
R1-1613761	LS on OTDOA agreements for NB-IoT	RAN1, Qualcomm	Rel-14	NB_IOTenh-Core		RAN2, RAN3, RAN4			
R1-1613763	LS on TBS and DCI formats for NB-IoT multicast	RAN1, HiSilicon	Rel-14	NB_IOTenh-Core		RAN2			
R1-1613764	LS on power consumption and latency reduction in NB-IoT	RAN1, Huawei	Rel-14	NB_IOTenh-Core		RAN2			
R1-1613765	LS reply on PHR for two-stage scheduling	RAN1, Huawei	Rel-14	LTE_eLAA-Core		RAN2			
R1-1613770	Response LS to IEEE 802.11 regarding LAA	RAN1, Qualcomm Incorporated	Rel-13	LTE_LAA-Core	IEEE EC-16-0140-01-00EC (R1-167908)	IEEE 802 LAN/MAN Standards Committee	Wi-Fi Alliance, The City of New York Office of the Mayor, RAN, RAN2, RAN4		
R1-1613778	Response LS on resource reservation issues	RAN1, LG Electronics	Rel-14	LTE_SL_V2V-Core	R2-168932	RAN2			

Petitioners' Exhibit 1007, p. 1322
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Annex C-2: List of Incoming LSs from RAN1 #87

TDoc #	Title	Source	Release	Related WIs	Reply to	To	Cc	Original LS	Reply in
R1-1611082	Characteristics of terrestrial IMT systems for frequency sharing / interference analysis in the frequency range between 24.25 GHz and 86 GHz	ITU-R WP 5D	Rel-14	FS_NR_newRAT		RAN1		LS_EOs_5D_374Att4.13	
R1-1611083	LS on coverage enhancement in SC-PTM for FeMTC and eNB-IoT	RAN2, Ericsson	Rel-14	LTE_feMTC-Core, NB_IOTenh-Core		RAN1	RAN3	R2-167234	R1-1613730
R1-1611084	LS on NB-IoT Rel-14 RACH and Paging on non-anchor carrier	RAN2, Ericsson	Rel-14	NB_IOTenh-Core		RAN1		R2-167235	R1-1613731
R1-1611085	LS on supporting PHR for two-stage scheduling	RAN2, Huawei	Rel-14	LTE_eLAA-Core		RAN1		R2-167302	
R1-1611086	LS on capabilities for 2-step scheduling for eLAA	RAN2, Ericsson	Rel-14	LTE_eLAA-Core		RAN1		R2-167307	
R1-1611087	LS on RAN2 agreements for mobility enhancement	RAN2, Intel	Rel-14	LTE_eMob-Core		RAN3	RAN1, RAN4	R2-167312	
R1-1611088	LS on RAN2 agreements for NR DL-based mobility and Cell definition	RAN2, Ericsson	Rel-14	FS_NR_newRAT		RAN1	RAN3, RAN4	R2-167313	
R1-1611089	Response LS on Category M1 UE and VoLTE	RAN2, Ericsson	Rel-14	FS_LTE_eVoLTE	R5-167215	RAN5	RAN1, GSMA NG, GSMA RILTE	R2-167316	
R1-1611090	Response LS on Measurement gap enhancement	RAN2, Ericsson	Rel-14	LTE_meas_gap_enh-Core	R4-167024	RAN4	RAN1	R2-167317	
R1-1611091	Reply LS on blind detection evaluations	RAN4, MediaTek	Rel-14	LTE_MUST-Core		RAN1		R4-168660	
R1-1611092	LS on SRS switching time reporting	RAN4, Huawei	Rel-14	LTE_SRS_switch-Core		RAN2	RAN1	R4-168955	
R1-1611093	LS on SSTD report mapping	RAN4, CATT	Rel-13	LTE_dualC_enh-Core		RAN2	RAN1, RAN5	R4-168956	
R1-1611094	LS response on Network Assistance for Network Synchronization in LTE	RAN4, Huawei	Rel-14	FS_LTE_NW_SYNC		RAN, RAN3	RAN1	R4-168957	
R1-1611444	LS on Multi-carrier enhancements for UMTS	RAN2, Ericsson	Rel-14	UTRA_Mce-Core		RAN4	RAN1	R2-167169	
R1-1611445	LS on TTI switching for MC enhancements	RAN2, Huawei	Rel-14	UTRA_Mce-Core		RAN1, RAN3		R2-167171	
R1-1611446	LS to RAN1 on V2V agreements	RAN2, LGE	Rel-14	LTE_SL_V2V-Core		RAN1		R2-167188	
R1-1611447	LS Response on introducing a new special subframe configuration	RAN3, CATT	Rel-14	LTE_UL_CAP_enh-Core	R1-168559	RAN1, RAN2		R3-162612	

Petitioners' Exhibit 1007, p. 1323
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

TDoc #	Title	Source	Release	Related WIs	Reply to	To	Cc	Original LS	Reply in
R1-1611448	Response LS on the Make Before Break solution	RAN3, ZTE	Rel-14	LTE_eMob-Core	R2-165969	RAN2	RAN1, RAN4	R3-162646	
R1-1611449	LS on Category M1 UE and VoLTE	RAN5, Ericsson	Rel-14	FS_LTE_eVoLTE		RAN2	RAN1, GSMA NG, GSMA RILTE	R5-167215	
R1-1611450	LS on NextGen QoS interim agreements	SA2, Intel	Rel-14	FS_NextGen		RAN2, RAN3	RAN1	S2-166289	
R1-1611451	Requirements for mobile backhaul/fronthaul in a G.fast Deployment Environment	ITU-T Study Group 15	Rel-14	FS_NR_newRAT		RAN1, RAN4		COM 15 – LS 405 – E	
R1-1611452	Reply LS on QoS requirements for V2X	SA1, Qualcomm	Rel-14	V2XARC	S2-164927	SA2, RAN2, CT1	RAN1, RAN3	S1-163425	
R1-1613126	IEEE 802 LMSC response LS on energy detection threshold in future 802.11 technologies	IEEE 802 LMSC	Rel-13	LTE_LAA-Core		RAN1	RAN	IEEE EC-16-0203-00-00EC	
R1-1613316	Response LS on Use of Exceptional Pool	RAN2, LGE	Rel-14	LTE_SL_V2V-Core	R1-1610930	RAN1		R2-168931	
R1-1613317	LS to RAN1 on resource reservation issues	RAN2, LGE	Rel-14	LTE_SL_V2V-Core		RAN1		R2-168932	
R1-1613446	Reply LS for Voice and Video enhancement for LTE	RAN2, Huawei	Rel-14	LTE_VoLTE_ViLTE_enh-Core	R1-1611057	RAN1		R2-168949	
R1-1613592	LS on RAN2 agreements on FeMBMS	RAN2, Ericsson	Rel-14	MBMS_LTE_enh2-Core				R2-168951	

Petitioners' Exhibit 1007, p. 1324
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Annex D: List of Approved updated WIDs

None

Petitioners' Exhibit 1007, p. 1325
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

3GPP TSG RAN WG1 Meeting #88 **R1-17xxxxx**
Athens, Greece, 13th – 17th February 2017

Annex E: **List of draft TSs/TRs agreed at RAN1 #87**

Tdoc Number	Title	Source	Conclusion/Decision
R1-1613687	TR 38.802 v1.0.0 Study on New Radio (NR) Access Technology - Physical Layer Aspects	NTT DOCOMO, INC.	Endorsed

Petitioners' Exhibit 1007, p. 1326
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Annex F: List of actions

- **Outgoing LS.**

[87-01] Karri (Nokia)
R1-1613773 Reply LS on Requirements for mobile backhaul/fronthaul in a G.fast Deployment Environment Nokia
Email approval until 24th Nov.
Done: .

[87-14] Hanbyul (LGE)
LS of V2X (Agreement list)
Email approval until 8th Dec on the LS to RAN2/4 capturing all the agreements and working assumptions

[87-15] Hanbyul (LGE)
LS of V2X (RRC parameter list)
Email approval until 8th Dec on the LS to RAN2 including RRC parameters

- **CR approval**

[87-02] Srinivas (Qualcomm)
R1-1611580 Draft CR for maximum timing advance assumptions for LAA and relation to UL grants
Email approval until RAN1#88

[87-03] Editors
MUST CR
Editors will provide updated draft CRs for MUST including agreements and WA until Tues 22nd Nov, and email approval until Mon 28th Nov.
Rapporteur will provide agreement lists until Friday 18th Nov.

[87-04] Editors
SRS CR
Editors will provide updated draft CRs for SRS including agreements and WA until Tues 22nd Nov, and email approval until Mon 28th Nov.
Rapporteur will provide agreement lists until Friday 18th Nov.

[87-05] Editors
V2V CR
Editors will provide updated draft CRs for V2V including agreements and WA until Tues 22nd Nov, and email approval until Mon 28th Nov.
Rapporteur will provide agreement lists until Friday 18th Nov.

Petitioners' Exhibit 1007, p. 1327
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

[87-06] Editors
High Speed CR
Editors will provide updated draft CRs for High Speed including agreements and WA until Tues 22nd Nov, and email approval until Mon 28th Nov.
Rapporteur will provide agreement lists until Friday 18th Nov.

[87-07] Editors
UL cap. enh. CR
Editors will provide draft CRs for UL enhancements including agreements and WA until 9th Dec, and email approval until Thurs 15th Dec.
Rapporteur will provide agreement lists until Mon 21st Nov.

[87-08] Editors
eMBMS CR
Editors will provide draft CRs for eMBMS including agreements and WA until 9th Dec, and email approval until Thurs 15th Dec.
Rapporteur will provide agreement lists until Mon 21st Nov.

[87-09] Editors
V2X CR
Editors will provide draft CRs for V2X including agreements and WA until Fri Jan 27th.
Editors may update draft CRs for comments received until RAN1#88 Athens.
Rapporteur will provide agreement lists until Thurs 15th Dec.

[87-10] Editors
eFD-MIMO CR
Editors will provide draft CRs for eFD-MIMO including agreements and WA until Fri Jan 27th.
Editors may update draft CRs for comments received until RAN1#88 Athens.
Rapporteur will provide agreement lists until Thurs 15th Dec.

[87-11] Editors
FeMTC CR
Editors will provide draft CRs for FeMTC including agreements and WA until Fri Jan 27th.
Editors may update draft CRs for comments received until RAN1#88 Athens.
Rapporteur will provide agreement lists until Thurs 15th Dec.

[87-12] Editors
NB-IoT enh. CR
Editors will provide draft CRs for NB-IoT enh. including agreements and WA until Fri Jan 27th.
Editors may update draft CRs for comments received until RAN1#88 Athens.
Rapporteur will provide agreement lists until Thurs 15th Dec.

Petitioners' Exhibit 1007, p. 1328
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

[87-13] Editors
eVoLTE
Editors will provide draft CRs for eVoLTE including agreements and WA until Fri Jan 27th.
Editors may update draft CRs for comments received until RAN1#88 Athens.
Rapporteur will provide agreement lists until Thurs 15th Dec.

- **Text proposal for TS and TR**

None

- **Miscellaneous**

[87-16] Yi (Huawei)
Congention control for V2X (1)
Email approval until 1st Dec on the working assumption and [1000]ms

[87-17] Hanbyul (LGE)
Congention control for V2X (2)
Email discussion until RAN1#88 on the FFS points in the congestion control

[87-18] Yi (Huawei)
UE behaviour for V2X
Email approval until 1st Dec on the UE behaviour with the following starting points

[87-19] Seungmin (LGE)
V2V synchronization
Email approval until 1st Dec on this proposal

[87-20] Eko (Samsung)
RRC parameter list of eFD-MIMO
Email approval until 1st Dec, then send LS to RAN2 – Eko, Samsung

[87-21] Jonghyun (LGE)
QCL for eFD-MIMO
Email approval until Wed 23rd Nov.

[87-22] Mark (Ericsson)

Petitioners' Exhibit 1007, p. 1329
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-1613608 Way Forward on text proposal for gray mapping and power allocation Huawei, HiSilicon, SONY
To update the CR regarding spatial layer power allocation and/or Gray mapping for email approval till 11/22

[87-23] Johan (Ericsson)
RRC parameter list of FeMTC
Email approval of RRC parameter lists until 24th Nov.

[87-24] Matthew (Huawei)
RRC parameter list of NB-IoT enh.
Email approval for the higher layer parameters list and send to RAN2 until November 25

[87-25] Xia Yuan (Huawei)
sTTI scheduling
Email discussion until 18th Jan. of sTTI scheduling (e.g., R1-1613373 and R1-1613422) – Xia Yuan (Huawei)

[87-26] Yu Bo (Huawei)
RRC parameter list of eVoLTE
Email approval of RRC parameter lists until 1st Dec.

[87-27] Yeohun (Samsung)
Potential solution of eMBB and URLLC Multiplexing
Email discussion until 8th Dec. to list the potential solution – Yeohun (Samsung)

[87-28] Hyunsoo (LGE)
DMRS design for DL data channel for NR
To collect companies proposals on DMRS design for DL data channel for NR to facilitate evaluation for the next RAN1 meetings till 8th Dec.

[87-29] Hyunsoo (LGE)
Simulation assumption for NR DMRS
To discussion/agree on simulation assumptions till 15th Dec.

[87-30] Ruyue (ZTE)
NR MIMO Calibration
Email (till next meeting) to collect additional phase 1 and phase 2 simulation results and clarify simulation assumptions, if any

[87-31] Stefan (Ericsson)
DL L1/L2 control channel design for NR
Email discussion until 11th Jan.

Petitioners' Exhibit 1007, p. 1330
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

3GPP TSG RAN WG1 Meeting #88 **R1-17xxxxx**
Athens, Greece, 13th – 17th February 2017

[87-32] Fred (NTT DOCOMO)
UL L1/L2 control channel design for NR
Email discussion until 11th Jan.

Petitioners' Exhibit 1007, p. 1331
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

3GPP TSG RAN WG1 Meeting #88 **R1-17xxxxx**
Athens, Greece, 13th – 17th February 2017

Annex G: List of participants at RAN1 #87

Please see excel file attached to this report

Petitioners' Exhibit 1007, p. 1332
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

3GPP TSG RAN WG1 Meeting #88 **R1-17xxxxx**
Athens, Greece, 13th – 17th February 2017

Annex H: **TSG RAN WG1 meetings in 2017 – 2018**

Dear all,

Please find a preliminary version of last week report…
It is far from being the final version as still a lot from Friday's review need to be incorporated (some of my hand-written notes are not in).
Nevertheless all available Tdocs have been uploaded – and a first version of Tdoc_list is available in 3GU – I uploaded the list only today after having checked the almost 1800 documents submitted in RAN1#84bis … A number of discrepancies needed to be fixed before uploading it

Still I miss the following (these are listed in Chair's notes – likely from // sessions – but do not exist !!)

R1-163457	WF on CSI-RS RE density for non-precoded CSI-RS	Samsung, Nokia, Alcatel-Lucent Shanghai Bell, NEC, LGE, ZTE, ETRI, NTT DOCOMO, Huawei	7.3.3.1.1			reserved	2016-04-11 12:00:00			-								
R1-163465	PUSCH Performance with short TTIs	MediaTek	7.3.10.2			reserved	2016-04-11 12:00:00			-								
R1-163655	WF on Hybrid CSI Reporting	Samsung, Alcatel-Lucent Shanghai Bell, CATT, Nokia, Qualcomm, LG Electronics, Beijing Xinwei, Interdigital, AT&T, China Telecom, Huawei, HiSilicon, CMCC, CATR, Ericsson	7.3.3.2.2			reserved	2016-04-12 12:00:00			-								
R1-163674	CR for TS36.211 related to 2+4 PRB se	Panasonic	7.1.5			reserved	2016-04-12 12:00:00			**R1-163858**								
R1-163675	CR for TS36.213 related to 2+4 PRB se	Panasonic	7.1.5			reserved	2016-04-12 12:00:00			**R1-163859**								
R1-163762	WF on uplink power control in LAA	LGE	7.3.1.6			reserved	2016-04-13 12:00:00			-								
R1-163829	WF on further details of DCI contents for multi-TTI transmission	Qualcomm	7.3.1.1			reserved	2016-04-14 12:00:00			-

3GPP TSG RAN WG1 Meeting #85 **R1-16xxxx**
Nanjing, China, 23rd – 27th May 2016

Table of contents

1 Opening of the meeting 6
1.1 Call for IPR 6
1.2 Competition law statement 6
1.3 Network usage conditions 6
2 Approval of Agenda 6
3 Approval of Minutes from previous meetings 7
4 Highlights from RAN Plenary 7
5 Incoming Liaison Statements 7
6 UTRA 10
6.1 Maintenance of UTRA Releases 4 – 13 10
6.1.1 FDD 10
6.1.2 TDD 10
6.2 Multi-Carrier enhancements for UMTS - WID in RP-152290. 10
6.2.1 Performance evaluation 10
6.2.2 Impact on current mechanisms 11
6.2.3 Other 11
6.3 DTX/DRX enhancements in CELL_FACH - WID in RP-160601. 11
6.3.1 DRX improvements 11
6.3.2 DTX improvements 11
6.3.3 Other ..... **Error! Bookmark not defined.**
6.4 Other ..... **Error! Bookmark not defined.**
7 E-UTRA 11
7.1 Maintenance of E-UTRA Releases 8 – 13 11
7.1.1 Maintenance of E-UTRA Release 8 – 12 11
7.1.2 Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers 12
7.1.3 Maintenance of Release 13 licensed-assisted access to unlicensed spectrum 14
7.1.4 Maintenance of Release 13 elevation beamforming/full-dimension MIMO for LTE 17
7.1.5 Maintenance of Release 13 further LTE physical layer enhancements for MTC 20
7.1.6 Other 26
7.2 LTE Release 13 26
7.2.1 NB-IoT 26
7.2.1.1 Downlink physical channels and signals ..... **Error! Bookmark not defined.**
7.2.1.1.1 Remaining details of NB-PBCH and NB-MIB contents ..... **Error! Bookmark not defined.**
7.2.1.1.2 NB-PDCCH ..... **Error! Bookmark not defined.**
7.2.1.1.3 NB-PDSCH ..... **Error! Bookmark not defined.**
7.2.1.1.4 System information and paging transmission ..... **Error! Bookmark not defined.**
7.2.1.1.5 NB-PSS and NB-SSS ..... **Error! Bookmark not defined.**
7.2.1.1.6 Reference signals ..... **Error! Bookmark not defined.**
7.2.1.1.7 Physical layer measurements ..... **Error! Bookmark not defined.**
7.2.1.1.8 Other ..... **Error! Bookmark not defined.**
7.2.1.2 Uplink physical channels and signals ..... **Error! Bookmark not defined.**
7.2.1.2.1 NB-PUSCH ..... **Error! Bookmark not defined.**
7.2.1.2.2 Uplink narrowband DM-RS ..... **Error! Bookmark not defined.**
7.2.1.2.3 Uplink control information ..... **Error! Bookmark not defined.**
7.2.1.2.4 Random access ..... **Error! Bookmark not defined.**
7.2.1.2.5 Other ..... **Error! Bookmark not defined.**
7.2.1.3 Other ..... **Error! Bookmark not defined.**
7.3 LTE Release 14 26
7.3.1 Enhanced Licensed-Assisted Access to Unlicensed Spectrum 40
7.3.1.1 PUSCH design ..... **Error! Bookmark not defined.**
7.3.1.2 SRS design ..... **Error! Bookmark not defined.**
7.3.1.3 Uplink control information on an LAA SCell ..... **Error! Bookmark not defined.**
7.3.1.4 PRACH design ..... **Error! Bookmark not defined.**
7.3.1.5 Channel access framework ..... **Error! Bookmark not defined.**
7.3.1.6 Other ..... **Error! Bookmark not defined.**
7.3.2 Support for V2V services based on LTE sidelink 40
7.3.2.1 Enhancement to sidelink physical layer structure ..... **Error! Bookmark not defined.**
7.3.2.1.1 DM-RS for PSCCH and PSSCH ..... **Error! Bookmark not defined.**
7.3.2.1.2 DM-RS for PSBCH ..... **Error! Bookmark not defined.**
7.3.2.1.3 Other ..... **Error! Bookmark not defined.**
7.3.2.2 Enhancement to sidelink resource allocation ..... **Error! Bookmark not defined.**

3GPP TSG RAN WG1 Meeting #85 **R1-16xxxx**
Nanjing, China, 23rd – 27th May 2016

Main facts summary

3GPP TSG WG RAN1 #84 bis meeting, hosted by Samsung, was held in Haeundae Grand Hotel in Busan, Korea.
The meeting started at 9:05 on Monday 11th April and finished at 17:15 on Friday 15th April 2016.
The number of attending delegates, having signed the participants' paper list, was **387.**

The schedule of the week was as follows:

- Monday: Common session on Agenda items 1, 2, 3, 4, 5, 7.1.2 (Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers), 7.1.3 (Maintenance of Release 13 LAA) and 7.1.4 (Maintenance of Release 13 EB/FD-MIMO) followed by Study on Latency reduction techniques (AI 7.3.10.1 on Evaluation results, AI 7.3.10.2 on Channel design for shortened TTI)
- Monday afternoon (LTE)
  - Session on NB-IoT (AI 7.2.1) chaired by Matthew Baker.

- Tuesday (NR): chaired by Satoshi Nagata
- Tuesday (LTE session1): chaired by Matthew Baker
  - eMBMS enhancements for LTE (AI 7.3.5), SRS Carrier Based Switching for LTE (AI 7.3.6) and Enhancements on Full-Dimension (FD) MIMO for LTE (AI 7.3.3).
- Tuesday (LTE session2): chaired by Wanshi Chen
  - Rel-13 eMTC CRs (and possibly other CRs (e.g., LAA, MIMO, eCA), Further Indoor Positioning enhancements for UTRA and LTE (AI 7.3.7), Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1) and Support for V2V services based on LTE sidelink (AI 7.3.2).
- Tuesday (LTE session3):
  - Study on channel model for frequency spectrum above 6 GHz (AI 8.2) chaired by Tuomo Säynäjäkangas from Nokia followed by session on NB-IoT (AI 7.2.1) chaired by Brian Classon from Huawei.
- Tuesday (HSPA): Multi-Carrier enhancements for UMTS (AI 6.2) chaired by Carmela Cozzo from Huawei.

- Wednesday (LTE)
  - Rel-13 CRs (LAA, MIMO), Support for V2V services based on LTE sidelink (AI 7.3.2), Study on Latency reduction techniques (AI 7.3.4) and Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1) chaired by Satoshi Nagata on one hand.
  - Rel-13 eMTC CRs chaired by Wanchi Chen followed by a session on NB-IoT (AI 7.2.1) chaired by Matthew Baker on the other hand.
- Wednesday (HSPA): DTX/DRX enhancements in CELL_FACH (AI 6.3) chaired by Florent Munier from Ericsson followed by Maintenance and revisions chaired by Carmela Cozzo from Huawei.

- Thursday (LTE):
  - Study on LTE-based V2X Services (AI 7.3.3), Study on Latency reduction techniques (AI 7.3.4), Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1) and Support for V2V services based on LTE sidelink (AI 7.3.2) chaired by Satoshi Nagata on one hand.
  - Rel-13 eMTC CRs (and possibly other CRs (e.g., LAA, MIMO, eCA) chaired by Wanchi Chen followed by Study on channel model for frequency spectrum above 6 GHz (AI 7.3.5) chaired by Tuomo Säynäjäkangas from Nokia on the other hand.
- Thursday afternoon (LTE)
  - Session on NB-IoT (AI 7.2.1) chaired by Matthew Baker.

- Friday: Revisions. Again finalization of eMTC CRs and continued NB-IoT in the morning.

The list of action points that required RAN1 close follow-up is listed in Annex F (end of document).

The number of contribution documents for this meeting was xxx, and those documents were categorized as followed.

Agenda Item	Input Document	Discussed Document

Note: The amount of documents includes those discussed during the email discussion session post meeting.

3GPP TSG RAN WG1 Meeting #85 **R1-16xxxx**
Nanjing, China, 23rd – 27th May 2016

1 Opening of the meeting

Mr Satoshi Nagata (RAN1 Chairman) welcomed the participants of the RAN WG1 84 bis meeting and opened the meeting at 09:00.
Mr Younsun Kim welcomed the delegates on behalf of Samsung and detailed the domestic arrangements for the full week. The host kindly offered buffet lunch to all RAN1 delegates.

1.1 Call for IPR

The attention of the members of this Technical Specification Group was drawn to the fact ***that 3GPP Individual Members have the obligation*** *under the IPR Policies of their respective Organizational Partners to* ***inform their respective*** *Organizational Partners* ***of Essential IPRs they become aware of****.*
The members take note that they are hereby invited:

- *to investigate whether their organization or any other organization owns IPRs which were, or were likely to become Essential in respect of the work of 3GPP.*
- *to notify their respective Organizational Partners of all potential IPRs, e.g., for ETSI, by means of the IPR Information Statement and the Licensing declaration forms (e.g. see the ETSI IPR forms http://webapp.etsi.org/Ipr/).*

1.2 Competition law statement

The Chairman also drew Member's attention to the fact that 3GPP activities are subject to antitrust and competition laws and that compliance with said laws is therefore required of any participant of this WG meeting including the Chairman and Vice Chairmen.
In case of question, please contact your legal counsel.
The present meeting will be conducted with strict impartiality and in the interests of 3GPP.
Furthermore, the Chairman reminded Members that timely submission of work items/contributions in advance of WG meetings is important to allow for full and fair consideration of such matters.

1.3 Network usage conditions

The PCG has laid down the following network usage conditions:

Users shall not use the network to engage in illegal activities. This includes activities such as copyright violation, hacking, espionage or any other activity that may be prohibited by local laws.

Users shall not engage in non-work related activities that consume excessive bandwidth or cause significant degradation of the performance of the network.
Since the **network is a shared resource**, users should exercise some basic etiquette when using the 3GPP network at a meeting. It is understood that high bandwidth applications such as downloading large files or video streaming might be required for business purposes, but delegates should be strongly discouraged in performing these activities for personal use. Downloading a movie or doing something in an interactive environment for personal use essentially wastes bandwidth that others need to make the meeting effective. The meeting chairman should remind end users that the network is a shared resource; the more one user grabs, the less there is for another. Email and its attachments already take up significant bandwidth (certain email programs are not very bandwidth efficient). In case of need the chair can ask the delegates to restrict IT usage to things that are essential for the meeting itself.

1. DON'T place your WiFi device in ad-hoc mode
2. DON'T set up a personal hotspot in the meeting room
3. DO try 802.11a if your WiFi device supports it
4. DON'T manually allocate an IP address
5. DON'T be a bandwidth hog by streaming video, playing online games, or downloading huge files
6. DON'T use packet probing software which clogs the local network (e.g., packet sniffers or port scanners)

2 Approval of Agenda

R1-162141 Draft Agenda of RAN1#84bis meeting RAN1 Chair
Satoshi Nagata (Chairman) proposed the agenda for the meeting, as well the schedule of the week.
Discussion: Fujitsu → for NR and NB-IoT, more details of the topics for discussion might be helpful
Panasonic who will be chairing the different sessions? NB-IoT (Monday) chaired by Matthew Baker, NB-IoT (Tuesday, Wed) chaired by Brian Classon – all NR sessions will be chaired by RAN1 chair – all others topics be split betwwen both RAN1 Vice Chairmen.
Mr Chair highlighted the difficulty to satisfy every one wishes while preparing the schedule of the week

Petitioners' Exhibit 1007, p. 1398
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

ZTE sees an issue having certain topics discussed in // between channel model and NR sessions→ Chair: schecule can be revisited during the week based on the progress.
Decision: The agenda is approved.

3 Approval of Minutes from previous meetings

R1-163406 Final Report of 3GPP TSG RAN WG1 #84 v2.0.0 ETSI (R1-163378)
The document was presented by Patrick Mérias (ETSI Mobile Competence Center) and provides the outcomes of last meeting in Malta.
Discussion: MCC→ report is revised to correct a formating issue in the conclusion of the email thread [84-11].
MCC apologized for having forgotten two agreed CRs in the LTE_EBF_FDMIMO CR pack to RAN#71. Both CRs are resubmitted at this meeting (see below) and will go for approval by next plenarybefore inclusion into the specs.
Decision: The document is approved.
R1-162341 CR on CSI-RS transmission in DwPTS Samsung 36.211 CR0216r2
Decision: The document is agreed.
R1-162342 Correction to the UE's assumption on DMRS ports ZTE 36.213 CR0593r1
Decision: The document is agreed.

R1-163379 Final Report of 3GPP TSG RAN WG1 #2AH_NB-IoT v1.0.0 ETSI
The document was presented by Patrick Mérias (ETSI Mobile Competence Center) and provides the outcomes of last meeting in Anaheim.
Discussion: No comment.
Decision: The document is approved.

R1-162190 Draft Report of 3GPP TSG RAN WG1 #AH Channel Model Nokia
The document was presented by Tuomo Säynäjäkangas from Nokia and provides the outcomes of the ad-hoc meeting in Ljubljana.
Discussion: No comment.
Decision: The document is approved.

4 Highlights from RAN Plenary

R1-163377 Selected highlights from RAN#71 of relevance to RAN1 RAN1 Chair
The document was presented by RAN1 Chair and shows the main decisions from RAN#71 impacting RAN1 future work.
Decision: The document is noted.

5 Incoming Liaison Statements

Dual connectivity related
R1-163370 Response LS on maximum UL Transmission timing difference in dual connectivity RAN2, Huawei
The document was presented by RAN1 Chair on behalf of Huawei and suggests RAN4 to consider the following 2 scenarii simultaneously:

- *Scenario 1 (addressed in TS 36.331): the pTAG in SCG is impacted due to exceeding the maximum uplink transmission timing difference between MCG and SCG when powerControlMode is configured to 1;*
- *Scenario 2 (addressed in TS36.321): only the SCell of sTAG is impacted due to exceeding the maximum uplink transmission timing difference between MCG and SCG when powerControlMode is configured to 1;*

Discussion: No action to RAN1.
Decision: The document is noted.

R1-163372 Reply LS on Pcmax definition of asynchronous overlapping transmissions in DC RAN4, InterDigital
The document was presented by Paul Marinier from InterDigital and provides the following answers to R1-153460.

- The statement ”power control changes are not allowed for one channel on one carrier in the middle of subframe” is correct and this is the RAN4 understanding as well, as the legacy Pcmax,c per carrier/per CG is applicable in RAN4 DC related specification.
- The Pcmax of a non-reference subframe does not change at the border of 2 reference subframes.

Decision: The document is noted.

LAA related
R1-163375 Liaison Statement to 3GPP from IEEE 802 LMSC IEEE 802 LMSC
The document was presented by RAN1 Chair on behalf of IEEE 802 and is an LS containing comments related to the LAA specification prepared by the 802.19 Coexistence Working Group. The document contains comments by participants in IEEE 802,

Petitioners' Exhibit 1007, p. 1399
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

particularly focused on CR_R1_157922 [36.213] and CR_RP_152258 [36.211] in the interest of improving the performance of all systems, including LAA, in unlicensed spectrum.
IEEE 802 believes this process of collaboration will result in an LAA specification that better supports fair sharing of unlicensed spectrum by both 802.11 and LAA equipment. Further, it will also result in a better LAA specification that leverages the long experience of IEEE 802 in defining effective and fair sharing protocols in unlicensed spectrum.
Discussion: Qualcomm is preparing a draft reply in R1-163413 (not yet ready).
Decision: The document is noted. Continue offline and contact Qualcomm – revisit by Friday
Friday
R1-163413 **Draft response LS to 802dot11 regarding LAA** **Qualcomm Incorporated**
The document was presented by Peter Gaal from Qualcomm.
Discussion: .More offline comments provided by Huawei and Broadcom… Qualcomm: they have not been captured yet.
Just before closing the meeting, Broadcom raised the issue that some of the questions may be more appropriate to RAN4 and one particular to RAN2. Qualcomm does not agree and believe RAN1 can (should) cover all of them.
Decision: The document is noted. Reply LS will be discussed at the next meeting.

R1-163388 **Liaison Statement regarding LAA** **Wi-Fi Alliance Coexistence Task Group**
The document was presented by RAN1 Chair on behalf of WFA and provides some comments on the LAA specification aimed at ensuring good coexistence between LAA and Wi-Fi. In addition, Wi-Fi Alliance highlights and provides complementary analysis on some of the comments contained in [R1-163375], which it believes are important to help ensure fair sharing and efficient use of unlicensed spectrum by LAA and Wi-Fi devices.
Discussion: Similar to previous LS, Qualcomm is preparing a draft reply in R1-163414 (not yet available).
Decision: The document is noted. Continue offline and contact Qualcomm – revisit by Friday
Friday
R1-163414 **Draft response LS to Wi-Fi Alliance regarding LAA** **Qualcomm Incorporated**
The document was presented by Peter Gaal from Qualcomm.
Discussion: Qualcomm still need to consider some additional comments posted on the email refelctor.
Decision: The document is noted. Reply LS will be discussed at the next meeting.

eMTC related
R1-163369 **Response LS on Paging for MTC RAN2, Ericsson**
The document was presented by Johan Bergman from Ericsson and reports the RAN2 agreements to introduce

- new UE category M1 (corresponding to the Rel-13 low complexity MTC capability), and
- new UE capabilities for CE Mode A and CE Mode B (corresponding to the Enhanced Coverage capability) into existing Inter-node RRC message UERadioPagingInformation (TS36.331).
- a new Inter-node RRC message UEPagingCoverageInformation into TS36.331, for the purpose to upload enhanced coverage information from eNB to EPS (MME), and to be downloaded to eNB(s) at paging.

Discussion: No action to RAN1.
Decision: The document is noted.

V2X related
R1-163373 **LS on V2V Requirements** **RAN, Qualcomm, LG Electronics**
The document was presented by Hanbyul Seo from LGE and asks RAN1 to take the potential requirements in [ETSI EN 302 571, "Intelligent Transport Systems (ITS)"], in particular the PSD limitation (assuming approximately 23dBm maximum Tx power UE, but not precluding the addition of higher Tx power UE in future), into consideration.
Discussion: Intel → what "future" means here? LGE: 23dBm maximum Tx power UE is already captured in the WID
Decision: The document is noted.

R1-163374 **Reply LS on clarification of RSU types** **SA1, LG Electronics**
The document was presented by Hanbyul Seo from LGE and confirms that there are two types of Road Side Unit defined as follows in TS 22.185.

> **Road Side Unit**: A stationary infrastructure entity supporting V2X applications that can exchange messages with other entities supporting V2X applications.
> *Note: RSU is a term frequently used in existing ITS specifications, and the reason for introducing the term in the 3GPP specifications is to make the documents easier to read for the ITS industry. RSU is a logical entity that combines V2X application logic with the functionality of an eNB (referred to as eNB-type RSU) or UE (referred to as UE-type RSU)*

Decision: The document is noted.

PRACH enhancement in high speed scenario
R1-163371 **LS on A New PRACH Cyclic Shift Restriction Set** **RAN4, Nokia**
The document was presented by Jari Lindholm from Nokia and asks RAN1to investigate whether the new restricted set of cyclic shifts for extra high speed cells proposed at Section 6.5.3.1 in [TS 36.878] and the solution proposed in [R4-152604] are suitable for supporting uplink Doppler offset, at least, up to +/-2.5KHz, and if the proposed new restricted set of cyclic shifts for extra high speed cells is a suitable solution, RAN4 would ask RAN1 to consider introducing the new restricted set into TS 36.211 in Rel-14.

Petitioners' Exhibit 1007, p. 1400
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted.

R1-162619 PRACH enhancement in high speed scenario Huawei, HiSilicon

The document was presented by Guo Zhiheng from Huawei and is summarized as follows:

- Observation 1: Solution 1 (only use the root sequence without cyclic shifts) requires no UE enhancement and has no specification impact with the drawback that the number of available preamble sequence is very limited.
- Observation 2: *highSpeedFlag* should only be used for the unrestricted set or restricted set selection.
- Observation 3: Solution 2 (define new restricted set of cyclic shift) needs UE enhancement with the advantage that the root sequence with cyclic shift could be used as random access preamble.
- Observation 4: the valid random access sequence number of solutions 2 and 3 (improved new restricted set of cyclic shift) is larger than solution 1 and the number of available random access sequence of solution 3 is almost twice of solution 2.
- Observation 5: the number of available random access sequence of solution 2 is less than solution 1 while $N_{CS} \geq 55$.
- Proposal: adopting solution 3 (improved new restricted set of cyclic shift) as PRACH enhancement solution.

Discussion: RAN1 Chair: what does this proposal aim to? Huawei→ to open the technical discussion.
Decision: The document is noted.

R1-162766 Considerations for PRACH options related to LS R4-161254 Ericsson

The document was presented by Daniel Larsson from Ericsson and shows an analysis of the different options in the LS [R1-163371] by comparison with options available using current specification. It shows that we can reach similar maximum Doppler, 3250 Hz, which corresponds to 650 km/h assuming a carrier frequency of 2.7 GHz in two ways. The first option is to add two additional hypotheses to get three in total. This has the advantage of being backwards compatible. However the PRACH capacity will suffer due to the risk of the BS sending the wrong responses, even if this can be mitigated by grouping explained in [R4-158133].
Decision: The document is noted.

R1-163199 DRAFT Reply LS on A New PRACH Cyclic Shift Restriction Set Nokia

The document was presented by Jari Lindholm from Nokia and states that the current high speed mode of PRACH can be enhanced to support higher UE speeds with a new restricted set of cyclic shifts for extra high speed cells as described in TR 36.878.
Discussion: According to the RAN plenary decision the required RAN1 specification changes will be done during 2nd half of 2016.
Decision: The document is noted.

Rel-14 WI on eMBMS enhancements for LTE

R1-162623 [Draft] LS on RAN plenary eMBMS enhancements for LTE Huawei, HiSilicon

The document was presented by Weiming Xiao from Huawei and is a follow-up to RAN#71 approval of Rel-14 WI on eMBMS enhancements for LTE [RP-160675], in which the following objective was included:

Specify means of using subframes 0, 4, 5, 9 (FS1) and 0, 1, 5, 6 (FS2) for MBSFN. (RAN2, RAN1)
The non-MBSFN subframes for unicast can only be used as Scell

RAN1 asks RAN to clarify the meaning of the above description" The non-MBSFN subframes for unicast can only be used as Scell". RAN1 understands it may be used to address the concern of backward compatibility, but still does not understand how this sub-bullet resolves the backward compatibility issue.
Discussion: Ericsson (rapporteur) is fine to delete "The non-MBSFN subframes for unicast can only be used as Scell" but can be done directly in RAN – no need to send an LS
Qualcomm→ let discuss in RAN1 and agree what to do.
Decision: The document is noted. Will be treated in the eMBMB session.

NR related

R1-163390 Characteristics of terrestrial IMT systems for frequency sharing / interference analysis in the frequency range between 24.25 GHz and 86 GHz RAN, NTT DOCOMO

The document was presented by RAN1 Chair and is a request for technical support and information relevant to the frequency range (24.25-86 GHz) from ITU-R WP5D group:

- provide the information on IMT-2020 system characteristics between 24.25 GHz and 86 GHz to be used in sharing and compatibility studies.
- WP 5D constraints are for
  - Initial system characteristics by October 2016 meeting of WP 5D
  - Final system characteristics by February 2017 meeting of WP 5D

Discussion: Coordination with RAN4 is needed.
Decision: The document is noted. Rapporteur shall take care of it.

Petitioners' Exhibit 1007, p. 1401
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-163395 **LS on path loss accuracy and sensitivity in 5G channel modeling** **New York University Wireless**
The document was presented by RAN1 Chair on behalf of NYU WIRELESS - a multi-disciplinary academic research center at New York University in Brooklyn. Upon RAN chair's decision, the attached paper is made available in RAN1 and RAN as it is relevant for the RAN1 "Study on channel model for frequency spectrum above 6 GHz"
Discussion: Content shall be reviewed in channel model session.
Decision: The document is noted.

The following LS have been received during the course of the week:
R1-163685 **LS to RAN1 on RAN2 agreements related to V2V** **RAN2, Panasonic**
Decision: The document is treated under AI 7.3.2.
R1-163686 **LS on reviewing all LTE features up to Rel-13 for Category M1 UEs** **RAN2, NTT DOCOMO**
Decision: The document is treated under AI 7.1.5.
R1-163852 **LS on Power Headroom report** **RAN2, Huawei**
Decision: The document is treated under AI 7.2.1.

Postponed to next meeting.
R1-163896 LS on NB-IoT RRM requirements RAN2, Huawei

6 UTRA

R1-163610 **Chairpersons' summary of the UMTS sessions** **UMTS Session Chairpersons (Huawei, Ericsson)**
The document was presented by Carmela Cozzo from Huawei and Florent Munier from Ericsson.
Decision: The document is endorsed and content is incorporated as below.

6.1 Maintenance of UTRA Releases 4 – 13

6.1.1 FDD

R1-163197 **Clarification on measuring the transmitted code power for the downlink DPCH slot formats #17 and #18** **Ericsson**
Decision: The document is noted and CR0205 cat F to 25.215 (Rel-12) is agreed.
R1-163198 **Clarification on measuring the transmitted code power for the downlink DPCH slot formats #17 and #18** **Ericsson**
Decision: The document is noted and CR0206 cat A to 25.215 (Rel-13) is agreed.

6.1.2 TDD

None.

6.2 Multi-Carrier enhancements for UMTS - WID in RP-152290.

6.2.1 Performance evaluation

R1-162996 **Evaluation of 2+10 ms TTI configuration in DB-DC-HSUPA** **Huawei, HiSilicon**
Decision: The document is noted.
R1-162997 **Evaluation of 10+10 ms TTI configuration in DB-DC-HSUPA and DC-HSUPA** **Huawei, HiSilicon**
Decision: The document is noted.
R1-163192 **Evaluation of Multicarrier Enhancements for DC-HSUPA** **Ericsson**
Decision: The document is noted.
R1-163193 **Evaluation of Multicarrier Enhancements for DB-DC HSUPA** **Ericsson**
Decision: The document is noted.

Conclusions

- Continue evaluation using the link simulation setup used for the presented results
  - Expand the range of power values used in the two carriers:
    - Primary carrier: 0(no data) to 0.2W(no grant limit), with constant step size
  - Expand distance between UE and NodeB: 0 to 0.6Km (10m resolution)
  - Metrics:
    - DC
      - 10 vs. 2+2
      - 10+10 vs. 2+2
    - DB-DC (2+10 means 2ms in the lower band and 10ms in the higher band)
      - 2+10 vs. 2+2
      - 10+10 vs. 2+2
      - 10 vs. 2+2

Petitioners' Exhibit 1007, p. 1402
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Provide results showing with and without power limitation on the primary carrier
- Control channel overhead in DC and DB-DC cases is not considered.

6.2.2 Impact on current mechanisms

No contributions touching that topic.

6.2.3 Other

R1-162998 **TR 25.707 v0.1.1 on Multi-Carrier Enhancements for UMTS** **Huawei, HiSilicon**
Include text proposals agreed in RAN1#84
Decision: The document is endorsed as v0.2.0 in R1-163609 for future updates.
R1-163194 **Text proposal: Evaluation of Multicarrier Enhancements** **Ericsson**
Decision: The document is noted.

6.3 DTX/DRX enhancements in CELL_FACH - WID in RP-160601.

6.3.1 DRX improvements

R1-162239 **Further Discussions on HS-SCCH DRX lite proposal** **Qualcomm Europe Inc.(France)**
Decision: The document is noted.
R1-163195 **On the DRX enhancements in CELL_FACH** **Ericsson**
Decision: The document is noted.

Conclusion on DRX improvements
Qualcomm to double check:
- reduction in scheduling capability due to power sharing across HS-SCCH codes / scheduling instances
- redesign of the QC proposed solution in R1-162239 making sure both HS orders as well corresponding RX burst are within the same DRX cycle.
- Get back on re-using existing IEs for the purpose of 640ms proposal.

6.3.2 DTX improvements

R1-162240 **A dicussion note on EUL Inter-Arrival times in Cell Fach** **Qualcomm Europe Inc.(France)**
Decision: The document is noted.
R1-162999 **Evaluation of DTX in CELL_FACH** **Huawei, HiSilicon**
Decision: The document is noted.
R1-163000 **DTX design in CELL_FACH** **Huawei, HiSilicon**
Decision: The document is noted.
R1-163196 **On evaluating the implicit release of common E-DCH resources in CELL_FACH** **Ericsson**
Decision: The document is noted.

Conclusions on DTX improvements:
According to the CELL FACH traffic model studied during this work item, it was found that longer timers are impacting the cell capacity and the average blocking more significantly than shorter timers.

Evaluation will continue. Future simulations will include (but are not limited to) shorter timers (less than 80ms).
It is foreseen that DTX can provide gains in two scenarios:
- DTX during inactivity timer (i.e. prior to timer expiration)
- DTX during the time interval prior to retransmission

7 E-UTRA

7.1 Maintenance of E-UTRA Releases 8 – 13

R1-163837 **Chairman's Notes of Agenda Item 7.1 on Maintenance of E-UTRA Releases 8 - 13** **Session Chairman (Nokia)**
The document was presented by Matthew Baker from Nokia and .provides the outcomes of the remaining maintenance issues (except eMTC)
Decision: The document is endorsed and the content incorporated below.

7.1.1 Maintenance of E-UTRA Release 8 – 12

None.

Petitioners' Exhibit 1007, p. 1403
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

7.1.2 Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers

R1-163200 Coding of higher layer parameter codebooksizeDetermination-r13 Nokia, Alcatel-Lucent iShanghai Bell

- *codebooksizeDetermination-r13 = 0* is replaced with *codebooksizeDetermination-r13 = dai* and *codebooksizeDetermination-r13 = 1* is replaced with *codebooksizeDetermination-r13 = cc*.

Decision: The document is noted and CR0197 to 36.212 is agreed in R1-163421.

R1-163201 Coding of higher layer parameter codebooksizeDetermination-r13 Nokia, Alcatel-Lucent Shanghai Bell

Decision: The document is noted and CR0622 to 36.213 is agreed in R1-163422.

R1-162104 Discussion on HARQ-ACK ordering in case of semi-static codebook configuration for eCA Huawei, HiSilicon

The document was presented by Yongxia Lyu from Huawei.

- Observation 1: HARQ-ACK bit ordering with Alternative 2 follows the Rel-12 principle but a new bit ordering is used with Alternative 1.
- Observation 2: HARQ-ACK bit for DL SPS PDSCH without corresponding PDCCH/EPDCCH is captured with Alternative 2 but is omitted with Alternative 1.
- Observation 3: There is no substantial difference of HARQ-ACK feedback performance between Alternative 1 and Alternative 2.
- Proposal 1: For FDD, the description of semi-static HARQ-ACK codebook determination for PUCCH format 4/5 in TS 36.213 is removed and that in TS 36.212 is kept.
- Proposal 2: For TDD, the pseudo code for semi-static HARQ-ACK codebook determination in TS 36.213 is removed and the parameters $o_{c,l}^{ACK}$ and B_c^{DL} are defined for PUCCH format 4/5 in TS 36.213.

Discussion: CR is in R1-162142.
Decision: The document is noted.

R1-162142 Correction on HARQ-ACK ordering in case of semi-static codebook configuration of eCA in 36.213 Huawei, HiSilicon Rel-13 36.213 - CR0608 F

Decision: The document is noted. It is agreed in principle to use the pseudo code in 36.212 and remove the corresponding part in 36.213. Continue offline discussion – (Huawei)

Monday evening

R1-163514 Correction on HARQ-ACK ordering in case of semi-static codebook configuration of eCA Huawei, HiSilicon Rel-13 36.213 - CR0608r1 F

Decision: The document is agreed.

R1-162105 Discussion on SPS HARQ-ACK bit handling in case of dynamic codebook configuration for eCA Huawei, HiSilicon

The document was presented by Fredrik Berggren from Huawei.

Proposal. If the misalignment of HARQ-ACK codebook size between the eNodeB and the UE for the case the SPS PDSCH is not received should be avoided, consider to always append the SPS HARQ-ACK bit for all subframes that are activated for SPS transmission.

Discussion: CR is in R1-162143.
Decision: The document is noted.

R1-162143 Correction on SPS HARQ-ACK bit handling in case of dynamic codebook configuration of eCA in 36.213 Huawei, HiSilicon, Samsung, Lenovo Rel-13 36.213 - CR0575r1 F

Decision: The document is noted. Continue offline discussion – (Huawei)

R1-163416 Corrections on HARQ-ACK generation for eCA in 36.213 CATT (R1-162253)

The document was presented by Fang Chen Cheng from CATT.

Discussion: Huawei→ concern can be taken into account in a revision of R1-162143.
Decision: The document is noted.

Monday evening

R1-163500 Correction on SPS HARQ-ACK bit handling in case of dynamic codebook configuration of eCA in 36.213 Huawei, HiSilicon, Samsung, Nokia, Fujitsu, CATT Rel-13 36.213 - CR0575r2 F

Decision: The document is agreed.

R1-162751 Correction on reporting mode 1-0 and 1-1 for aperiodic CSI of eCA in 36.212 Huawei, HiSilicon

The document (CR0193 to 36.212) was presented by Yongxia Lyu from Huawei.

- Modify the description of "Channel quality information formats for wideband CQI reports" in section 5.2.2.6.1 to be aligned with the section 7.2.1 of 36.213.

Discussion: DraftCR is in R1-162106. Ericsson's alternative is in R1-163089.

Petitioners' Exhibit 1007, p. 1404
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted.
R1-162106 **Alternative correction on reporting mode 1-0 and 1-1 for aperiodic CSI of eCA in 36.212 Huawei, HiSilicon**
Decision: The document is noted.

R1-163089 **Correction on aperiodic CSI reporting mode 1-0 and 1-1 Ericsson Rel 13 36.212 - CR0194 F**
Discussion: Also supported by Intel, CATT, ZTE
Huawei won't object – is fine to follow the majority
Decision: The document is agreed.
R1-163090 **Correction on aperiodic CSI reporting mode 1-0 and 1-1 Ericsson Rel 13 36.213 - CR0615 F**
Decision: The document is agreed.

R1-162254 **Corrections on n_HARQ-ACK calculation for PUCCH format 4/5 in 36.213 CATT**
Decision: The document is noted. Continue offline discussion – (CATT)

R1-162256 **Corrections on Simultaneous HARQ-ACK and P-CSI in 36.213 CATT**
- Describe UE behavior for HARQ-ACK and P-CSI multiplexing when falls back to Rel-12 behavor.

Decision: The document is noted and CR0623 to 36.213 is agreed in R1-163433.
Further revised and agreed in R1-163526 (CR623 Rev. 1).

R1-162258 **Clarification on PUCCH format 4/5 resource derivation in 36.213 CATT**
Discussion: Huawei→ point on UE behaviour is not needed
Decision: The document is noted. Continue offline discussion – (CATT)

R1-162422 **Clarification on Simultaneous transmission of HARQ-ACK and SR in 36.213 CATT**
Discussion: LGE→ don't support the need for separate descriptions for PUCCH format 4/5 with dynamic HARQ-ACK codebook and fixed HARQ-ACK codebook
Decision: The document is noted. Continue offline discussion – (CATT)
R1-163507 **Clarification on Simultaneous transmission of HARQ-ACK and SR in 36.213 CATT, LGE**
Decision: The document is noted.
R1-163530 **Corrections on simultaneous transmission of HARQ-ACK and SR in 36.213 CATT, LGE, Nokia**
Decision: The document is noted and agreed as CR0632 to 36.213 in R1-163533.

R1-163334 **Discussion on the motivation to capture the timing for secondary cell activation / deactivation for eCA in 36.213 Huawei, HiSilicon**
The document was presented by Yongxia Lyu from Huawei.
- Proposal 1: It is necessary to specify UE CSI report action explicitly if PUCCH SCell is not active in subframe n+8
- Proposal 2: It is necessary to specify the CSI timing requirement of subframe n+8 shall only be applied on the CSI reporting on an activated serving cell.

Discussion: What the UE should do does already exist in the spec.
Decision: The document is noted.
R1-162727 **Correction on timing for secondary cell activation / deactivation for eCA in 36.213 Huawei, HiSilicon Rel-13 36.213 - CR0610 F**
- Add the related description to capture the timing agreements for PUCCH SCell activation/deactivation.

Decision: The document is noted. Continue offline discussion until Wednesday – (Huawei)
R1-163458 **Correction on timing for secondary cell activation / deactivation for eCA in 36.213 Huawei, HiSilicon Rel-13 36.213 CR0610r1 F**
Decision: The document is agreed.

R1-162645 **Remaining Issue on HARQ-ACK Codebook Determination Samsung**
The document was presented by Aris Papasakellariou from Samsung.
Proposal: For TDD, HARQ-ACK codebook size in the PUSCH is determined as for FDD.
Discussion: Remaining Issues on HARQ-ACK Codebook Determination are proposed in following 2 CRs.
Decision: The document is noted.
R1-162646 **Draft CR on Correction for DAI Presence for eCASamsung**
Decision: The document is noted. Continue offline discussion until Wednesday – (Samsung)
R1-163626 **Correction on DAI Presence in DCI formats for eCA Samsung, Nokia, Alcatel-Lucent Shanghai Bell, Panasonic Rel-13 36.212 CR201 F**
Decision: The document is agreed.

R1-162647 **Draft CR on Correction for HARQ-ACK Codebook Determination in eCA Samsung**

Petitioners' Exhibit 1007, p. 1405
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted. Continue offline discussion until Wednesday – (Samsung)
R1-163527 **CR on Correction for HARQ-ACK Codebook Determination in eCA** **Samsung** **Rel-13 36.213 CR0630 F**
Decision: The document is agreed.

7.1.3 Maintenance of Release 13 licensed-assisted access to unlicensed spectrum

Channel access
R1-162449 **Discussion on contention window adjustment procedure** **LG Electronics**
The document suggests a TP to apply to the contention window adjustment procedure
Decision: The document is noted.
R1-162450 Correction on contention window adjustment procedure LG Electronics
R1-163752 Draft CR on CWp adjustment Qualcomm Incorporated

R1-162847 **Draft CR for handling DTX,NACK/DTX,any state in HARQ feedback for LAA multi-carrier operation BROADCOM LIMITED**
Clarify how DTX, NACK/DTX, any states for TBs sent on the unlicensed channel are handled for the purpose of caluculating the percentage of ACK values in the reference subframe
Decision: The document is noted.

R1-162917 **Draft CR for the contention window adjustment procedure in LAA downlink channel access Nokia, Alcatel-Lucent Shanghai Bell**
For the definition of "reference subframe", the phrase "for which HARQ-ACK feedback is available" is changed to "for which at least some HARQ-ACK
Decision: The document is noted. Continue offline discussion until Wednesday – (Nokia)
Revised in R1-163462 **Draft CR for the contention window adjustment procedure in LAA downlink channel access Huawei, HiSilicon**
Decision: The document is noted.
Revised in R1-163756 **Draft CR for the contention window adjustment procedure in LAA downlink channel access Huawei, HiSilicon, LGE, WILUS, Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document is noted.
Revised in **R1-163681** **Draft CR for the contention window adjustment procedure in LAA downlink channel access Huawei, HiSilicon, LGE, WILUS, Nokia, Alcatel-Lucent Shanghai Bell, Broadcom**
Decision: The document is noted and agreed as CR0651 to 36.213 in R1-163831.

R1-162853 **Discussion on slot misalignment between LAA and Wi-Fi BROADCOM LIMITED**
Observation 1: Misalignment of slot boundaries across different technologies can cause significant impact to performance.
Observation 2: The impact of slot misalignment decreases as the CCA duration within a CCA slot is increased from 4us.
Observation 3: Change in T_{sl} and T_f from the specified values of 9us and 16us respectively will prevent any mechanism implemented in future to align slot boundaries across technologies.
Proposal 1: 3GPP shall consider enhancing LAA LBT in one of the following ways:
- *LAA requires a mechanism by which an LAA eNB accurately time aligns its channel access slots with those of coexisting IEEE 802.11 devices. One means to do so is to detect and transmit the 802.11 PHY preamble.*
- *Alternatively, in the case of LAA LBT that is capable only of energy detection, LAA LBT procedure reduces the transmission burst ending position detection error by requiring a larger CCA period Xμs (X > 4, e.g. X=7) in each CCA slot, and requires detection results to be reported every 1μs during each CCA period*

Proposal 2: LAA should conform to the CCA slot length of 9us exactly and it should exactly comply with the durations 9us and 16us for T_{sl} and T_f respectively.

Discussion: Broadcom has concern changing the durations, also expressed when informing RAN4 via LS from last meeting.
Ericsson→ LS was agreed by RAN1, not by a few companies.
No consensus on the proposed technical enhancements → Mr Chair suggested to continue offline.
Broadcomm would like the slot misalignment issue being evaluated and considered by other companies. Can RAN1 agree that there is an issue?
Mr Chair→ technical solutions need to be reconsidered.
Decision: The document is noted. No consensus, continue offline discussion until Wednesday – (Broadcom)
Wednesday: Still no consensus, continue discussion until the next meeting

R1-162855 **Further Discussion on LAA DL Multi-Channel Access Coexistence Issues BROADCOM LIMITED**
Observation 1: LAA lacks the similar channel frequency planning rules that are used by the 802.11ac devices for the channel bandwidth larger than 20 MHz in 5 GHz band. That means LAA eNB can use any multi-channel combination within 5 GHz band for the channel access, which is not necessarily aligned with 802.11ac multi-channel positions defined by IEEE.

Petitioners' Exhibit 1007, p. 1406
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Observation 2: In general, the Wi-Fi network performance is degraded when it coexists with the LAA network that uses the flexible channel grouping than when it coexists with the LAA network that uses the 802.11 channel grouping.
Observation 3: Using the self-deferral or not in the LAA multi-channel access can impact the Wi-Fi network coexistence performance.
Proposal 1: In the case of LAA operation using up to four 20 MHz channels in unlicensed band, those channels shall reside in a single specified 80 MHz channel group aligned with IEEE 802.11.
Discussion: Qualcomm→ all the points raised in this contribution have been already considered in recent past before agreeing coexistence decisions (RAN1#83). No need to reopen the discussion.
Ericsson→ better to wait for the outcomes of the current discussions in ETSI BRAN.
Mr Chair→ this was already discussed in previous RAN1 meetings, currently under discussion in ETSI BRAN – doesn't really see the need for 3GPP to continue the discussion.
Decision: The document is noted. No consensus.

R1-162856 Draft CR for pausing of random backoff counter for LAA multi-carrier operation BROADCOM LIMITED
Clarify that the random backoff counter is paused for all the channels which are not selected for transmission while the eNB is transmitting on a set of channels
Discussion: .
Decision: The document is noted. Continue offline discussion until Wednesday – (Broadcom)
Wednesday: Prepare a draft CR in R1-163459 – revisit on Thursday – (Broadcom).
Conclusion: Continue discussion until the next meeting

R1-162451 Correction to the usage of undefined terminology "channel" LG Electronics
Decision: The document is noted and agreed as CR0625 to 36.213 in R1-163435.

R1-163296 Clarification on channel access procedure after an additional defer duration for DL LBT WILUS Inc.
Discussion: .
Decision: The document is noted. TP is agreed in principle and CR shall be prepared accordingly in R1-163436 (CR0626 to 36.213). Later on Monday, R1-163436 is agreed.

R1-163386 CR on Freezing ECCA counter during LBT for DRS Qualcomm Inc.
Discussion: LGE→ current spec is ok.
Decision: The document is noted. Continue offline discussion – (Qualcomm)
Conclusion: Proposed CR is not pursued.

Partial subframe
R1-162133 Discussion on the support of DwPTS in partial ending subframes Huawei, HiSilicon, Samsung, CATT
The document was presented by Xia Yuan from Huawei.

- Proposal 1: Reuse the following existing FS2 DwPTS functionalities to the partial ending subframe on LAA Scell.
  - Duration of PDCCH up to 2 symbols in DwPTS
  - ECCE size determination in DwPTS
  - DMRS pattern in DwPTS
  - EPDCCH monitoring in DwPTS
  - TBS determination for PDSCH transmitted in DwPTS
- Proposal 2: there is no PSS in the third OFDM symbol for the partial ending subframe and the following data/control transmission can be supported by the central 6 PRBs.

Condition		Type of data transmission supported by the central 6 PRBs
The partial ending subframe is not subframe 0 or 5		CRS and DMRS Based PDSCH transmission; EPDCCH transmission
The partial ending subframe is subframe 0 or 5	The duration of the partial ending subframe is less than 12 OS	
	The duration of the partial ending subframe is 12 OS, (FS1 PSS/SSS is transmitted)	CRS based PDSCH transmission

- Proposal 3: PSS/SSS is transmitted in the partial ending subframe following frame structure type 1 when the subframe duration is 12 OFDM symbols.

Decision: The document is noted.

R1-162914 CR Discussion for Ending Partial Subframe in LAA Nokia, Alcatel-Lucent Shanghai Bell
Decision: The document is noted. Nokia is fine to follow R1-162133
R1-162915 Draft CR for 36.211 on the support of ending partial subframe in LAA Nokia, Alcatel-Lucent Shanghai Bell
R1-162916 Draft CR for 36.213 on TBS determination for ending partial subframe in LAA Nokia, Alcatel-Lucent Shanghai Bell

Petitioners' Exhibit 1007, p. 1407
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-163164 Clarification on subframe structure for ending partial subframe in 36.211 Samsung

R1-162638 Clarification on "special subframe" for frame structure type 3 in 36.213 Huawei, HiSilicon, Samsung, CATT
Decision: The document is noted.

R1-163525 Clarification on "special subframe" for frame structure type 3 in 36.213 Huawei, HiSilicon, Samsung, CATT, Nokia, Alcatel-Lucent Shanghai Bell, Ericsson, Qualcomm
Decision: The document is noted and agreed in R1-163531 as CR0631 to 36.213.
R1-163521 Draft CR for 36.211 on the support of ending partial subframe in LAA Nokia, Alcatel-Lucent Shanghai Bell, CATT, Ericsson, Samsung, Huawei, HiSilicon
Decision: The document is noted and agreed in R1-163528 as CR0235 to 36.211.

R1-163205 Modulation Order Determination for Downlink Partial Subframes Panasonic
The document was presented by Alex Golitschek from Panasonic.

- Observation 1: For a UE configured to use up to 64-QAM, when increasing the modulation level for MCS levels 7-9 & 13-16, 5 additional choices for MCS/TBS are available. For well-positioned UEs, the corresponding throughput gain for partial subframes has been observed in simulations to exceed 10%.
- Observation 2: For a UE configured to use up to 256-QAM, in a partial subframe 256-QAM cannot be currently assigned if the UE should attempt to decode the packet.
- Observation 3: For a UE configured to use up to 256-QAM, when increasing the modulation level, 256-QAM can be assigned and a peak throughput gain of 33.5% is observed.
- Proposal: Specify that for an initial partial subframe, the UE uses the proposed tables to determine the modulation order and the TBS (where existing tables are applied for I_{MCS})

Decision: The document is noted.
R1-163367 MCS Tables for Initial Partial TTI in LAA Ericsson
The document was presented by Havish Koorapaty from Ericsson.

- Proposal 1 If new MCS tables are to be introduced for DL initial partial TTIs, the designs should be carefully optimized for high link and system performance.
- Proposal 2 New MCS tables for DL initial partial TTI are proposed.

Discussion: Panasonic believes that Ericsson's proposal performs better while Panasonic's proposal is simpler to implement→ matter of preference which one to choose but both are OK.
Nokia supports Ericsson's MCS table.
Panasonic ok to follow the Ericsson proposal – would like to work out the CR wordings
Decision: The document is noted.

R1-163206 MCS/TBS Determination for initial partial DL subframes Panasonic
R1-163368 MCS Tables for Initial Partial TTI in LAA Ericsson
Decision: The document is noted. Further revised in:
R1-163508 MCS Table for Initial Partial TTI in LAA Ericsson, Panasonic
Decision: The document is agreed as CR0628 to 36.213.

RRM measurement
R1-162134 Discussion on the support of 2CRS ports in DRS for LAA Huawei, HiSilicon
Decision: The document is noted.
R1-162235 Discussion on the number of CRS ports in DRS Qualcomm Inc.
Decision: The document is noted.
R1-162637 Clarification on CRS antenna port number in DRS in 36.211 Huawei, HiSilicon
Continue offline discussion until Wednesday – (Huawei, Qualcomm)
Wednesday
R1-162236 Draft CR on UE assumptions of number of CRS ports in DRS Qualcomm Inc.
Decision: The document is noted. Continue offline discussion – (Qualcomm) – revisit after Thur am coffee break
Thursday
R1-163461 Clarification on UE assumptions on the number of CRS ports in the DRS Qualcomm Inc.
Decision: The document is noted. Agreed as CR0648 to 36.213 in R1-163680.
Send LS to RAN4 to inform them of the agreement of this CR, also indicating that RAN1 does not intend this to impact RAN4 requirements.
Friday
R1-163682 [DRAFT] LS on PUSCH transmission for eLAA Qualcomm
Decision: The document is noted and final LS is agreed in R1-163928.

Petitioners' Exhibit 1007, p. 1408
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Others

R1-163002 **Draft CR on clarification for LAA CSI processing Qualcomm Incorporated**

The document was presented by Srinivas Yerramalli from Qualcomm.

- Add a condition on the subframe configuration being set to a valid value for the subframe to be used for CSI measurements.

Decision: The document is noted. Agreed as CR0627 to 36.213 in R1-163501.

R1-162135 **Draft CR on search space definition for LAA DL partial subframes in 36.213** **Huawei, HiSilicon**

The document was presented by Xia Yuan from Huawei.

- Clarify that when the UE is not configured with 's07', the UE would not monitor the PDCCH common search space.

Decision: The document is noted. Continue offline discussion until Wednesday – (Huawei)

Wednesday: Consensus that CR is not needed.

R1-163384 **CR on applicability of DL procedures to LAA** **Qualcomm Inc.**

The document was presented by Srinivas Yerramalli from Qualcomm.

Decision: The document is noted. Agreed as CR0200 to 36.212 in R1-163532.

R1-163385 **CR on correction to EPDCCH procedures to FS3** **Qualcomm Inc.**

The document was presented by Srinivas Yerramalli from Qualcomm.

Decision: The document is noted. Agreed as CR0232 to 36.211 in R1-163502.

MCC post meeting: note that CR number in cover sheet should be read as CR0232 – not CR0200 – and correction will apply before submission to plenary.

R1-163420 **Draft CR for 36.213 on multi-channel access procedure in LAA** **Nokia, Alcatel-Lucent Shanghai Bell**

The document was presented by Sigen Ye from Nokia.

Decision: The document is noted. Continue offline discussion until Wednesday – (Nokia)

Wednesday: Change to 15.1.5.1.1 is agreed in principle – updated in R1-163684 – agreed as CR0645 to 36.213 in R1-163672

Continue offline discussion – revisit on Thursday – (Nokia) – recommendation of Session Chair to RAN1 Chairman will be to proceed with a Working Agreement if the situation is unchanged.

Conclusion: The existence of multiple groups of channels is already agreed.

Ericsson noted that Broadcom participated in RAN1#83 and did not object to the agreement that mentions "a group carriers", and participated in subsequent email discussion.

Broadcom states that they had a different interpretation of the agreement.

Broadcom stated that multiple groups without restrictions are not allowed.

Broadcom subsequently stated that their view is that multiple groups are not allowed.

Broadcom states that "*the* number of carriers" implies that there is only one group.

Broadcom is invited to submit a CR indicating their proposed restrictions for discussion - R1-163460.

Thursday

New (compromise) proposal in **R1-163671 Draft CR for 36.213 on multi-channel access procedure in LAA Nokia, Alcatel-Lucent Shanghai Bell**

Decision: The document is noted – companies are invited to check and discuss this offline until Friday – revisit on Friday.

Friday: Continue discussion until the next meeting

R1-163431 **Draft CR for 36.212 on subframe configuration for LAA** **Nokia, Alcatel-Lucent Shanghai Bell**

The document was presented by Sigen Ye from Nokia.

Decision: The document is noted. Agreed as CR0198 to 36.212 in R1-163503.

Friday

R1-163925 **Initial CCA Behaviour in the Channel Access Procedure** **Ericsson**

Decision: The document is noted and CR0649 to 36.213 is agreed.

R1-163927 **Draft CR on clarification for channel sensing** **Qualcomm**

Decision: The document is noted and CR0650 to 36.213 is agreed.

R1-163786 **[Draft] LS on DRS Duty Cycle** **Qualcomm**

Decision: The document is noted and final LS is agreed in R1-163931

7.1.4 Maintenance of Release 13 elevation beamforming/full-dimension MIMO for LTE

CSI-RS

R1-162435 **Clarification of CSI-RS on extended CP** **NEC**

- Changed UE behavior to restrict CSI-RS transmission in DwPTS for extended CP.

Petitioners' Exhibit 1007, p. 1409
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Changed the table 6.10.5.2-2 and the table title to support normal subframe only.

Decision: The document is noted, revised in **R1-163522** and agreed as CR0236 to 36.211 in:

R1-163534 **Clarification on CSI-RS for estended CP NEC, Samsung, CATT**

R1-162436 **Clarification on PDSCH mapping to resource elements NEC**

Decision: The document is noted. Agreed as CR0233 to 36.211 in R1-163504.

R1-162652 **Draft CR on CSI-RS description in TS 36.211 Samsung**

Decision: The document is noted. Agreed as CR0234 to 36.211 in R1-163505 assuming the following:

- ~~up to twenty four~~one or more configurations for CSI reporting for which the UE shall assume non-zero transmission power for the CSI-RS, and

SRS

R1-163075 **Correction on the description about UpPTS length for premable format 4 of PRACH ZTE**

- In section 5.7.1, the UpPTS length for preamble format 4 for PRACH is further cleared that the legacy UpPTS symbols still can be used for PRACH preamble format 4 as long as the length of legacy UpPTS is $4384 \cdot T_s$ and $5120 \cdot T_s$

Decision: The document is noted. Agreed as CR0237 to 36.211 in R1-163535.

DM-RS

R1-162447 **Correction on the description of DMRS table ZTE**

Decision: The document is noted. Agreed as CR0199 to 36.212 in R1-163506.

R1-163076 **Correction on the description about DMRS ZTE**

- Clarify the condition when port={11,13} is used for transmission
- Fix the description of using DMRS ports for PDSCH transmission and DMRS sequence generation.

Decision: The document is noted, revised in **R1-163819** and agreed in R1-163673 (CR0242 to 36.211) with original formula shown as strickthrough.

R1-163122 **Correction on UE assumption on DMRS ports ZTE**

- Clarify UE assumption in case of the new DMRS table in DCI formats 2C and 2D is configured for single-antenna port transmission scheme.

Decision: The document is noted. Revised in **R1-163688**.

R1-163082 **Clarification of OCC=2 and OCC=4 DMRS MU-MIMO Transmission Ericsson**

The document was presented by Mark Harrisson from Ericsson.

- A UE can use a simpler E-MMSE-IRC receiver while providing higher capacity via 3 MU-MIMO layers than if the UE only uses R-ML with two MU-MIMO layers.
  - Mixed OCC=2 and OCC=4 need not affect E-MMSE-IRC receivers when they use OCC=2 to estimate coscheduled interference.
  - The UE is free to use R-ML or E-MMSE-IRC according to channel conditions and implementation with mixed OCC=2 and OCC=4.
- The current specification does not identify UE behavior for 2 layer MU-MIMO transmission with OCC=2, and so requires correction.
- In order to not prevent eNB from multiplexing Rel-13 UEs with OCC=2 and OCC=4 as agreed, it is necessary to specify UE behaviour when port 7 is coscheduled with ports 8,13 and when port 8 is coscheduled with ports 7,11.

Discussion: CR is in R1-163085..

Decision: The document is noted.

R1-163085 **MU-MIMO with Mixed Orthogonal Cover Code Length Ericsson**

Decision: The document (CR0613 to 36.213) is noted. CR0613 is postponed according to the conclusion below:

Conclusion: Views from UE vendors are invited until RAN1#85 – revisit at RAN1#85.

Class A feedback (including codebook)

R1-162649 **Rationale for draft CR on FD-MIMO codebooks (36.213) Samsung**

Decision: The document is noted.

R1-162650 **Draft CR on FD-MIMO codebooks (36.213) Samsung**

Discussion: Supported by Samsung, Ericsson, CATT, NTT DOCOMO, AT&T, Deutsch Telecom, KDDI, China Telecom, Nokia Networks, NEC, KT Corporation, ETRI, Mitsubish Electric, National Instruments, Sprint

Objected by Huawei, HiSilicon

Decision: The document is noted. Continue offline.

Conlusion: There is no consensus in RAN1.

R1-162655 **Clarification on periodic CSI reporting for class A in TS 36.213 Samsung**

Petitioners' Exhibit 1007, p. 1410
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Observation: The parameter H' in PUCCH mode 1-1 cannot be configured since current specification does not support simultaneous configuration of 'widebandCQI' and 'subbandCQI'.
- Proposal: RAN1 should discuss and decide a way to configure H'.

Discussion: Samsung suggested the following 3 alternatives:
Alt 1: send LS to RAN2 to resolve the issue - supported by NEC
Alt 2: Fix H' to 2 - No support
Alt 3: Define the relationship between M_{RI} and H' (Samsung preferred solution)
Qualcomm would like to use RRC reconfiguation without having new RRC configuration(s) – Alt 4 – also supported by LGE
Decision: The document is noted. Prepare a draft LS (R1-163512) to RAN2 asking them to solve the issue - (Samsung)
R1-163512 [Draft] LS on signalling of periodic CSI reporting for class A Samsung
Decision: The document is noted and final LS is agreed in R1-163668.

R1-163091 Correction to S1 and S2 definition and i2 bit width Ericsson
Decision: The document is noted and CR0195 to 36.212 is agreed.

Class B feedback
R1-162651 Draft CR on missing CRI-only table (36.212) Samsung

- Add payload table for CRI-only reporting in section 5.2.2.6.1 and clarification in section 5.2.2.6.2

Discussion: .Huawei has detected a potential overlapping issue with already agreed CR from last meeting.
Decision: The document is noted. Continue offline.
Revised in **R1-163660** and agreed as CR0203 to 36.212 in R1-163796, removing changes on cover page, changes-on-changes, and adding CR number.

R1-162653 Clarification on non-PMI based CSI reporting in TS 36.213 Samsung
Proposal 1: The conditions for non-PMI reporting mode for 'CLASS B' eMIMO-Type in PUCCH reporting should be correctly captured in the current specification.
Observation: Two options for UE assumption on precoding matrix for PUSCH mode 3-0/PUCCH mode 2-0 are available.

- *Alternative 1: Remove all assumptions on precoding matrix in non-PMI based CSI reporting mode descriptions.*
- *Alternative 2: Release the assumption that 'a single precoding matrix is selected from the CBSR' and clarify that 'for each subband a preferred precoding matrix is selected from the codebook subset assuming transmission only in the subband' in non-PMI based CSI reporting mode descriptions.*

Proposal 2: Support both options in observation 2 and revise the corresponding descriptions in the current specification.
Decision: The document is noted.
R1-162654 Draft CR on non-PMI based CSI reporting in TS 36.213 Samsung
Decision: The document is noted. Continue discussion until RAN1#85.

R1-162453 Correction on the linkage between CSI-RS and CSI-IM for Class B LG Electronics

- Capture the agreed description on one to one linkage between the IDs in NZP-CSI-RS-ID-List and CSI-IM-List, and the other associated parameters on *p-C-AndCBSR-PerResourceConfigList* and *alternativeCodebookEnabledFor4TXProc*.

Decision: The document is noted. Agreed as CR0629 to 36.213 in R1-163513.

R1-162656 Clarification on CRI reporting Samsung
The document was presented by Youngwoo Kwak from Samsung.

- Proposal 1: Usage of CSI-RS ID for class B in TM9 should be clarified.
- Proposal 2: Clarify linkages Linkages between CSI-RS, CSI-IM, alternative 4Tx codebook, P_C and CBSR.

Decision: The document is noted. Proposal 1 agreed – prepare CR accordingly.
Wednesday
R1-163687 Draft CR on CSI-RS ID configuration for TM9 in 36.213 Samsung
Decision: The document is noted and agreed as CR0647 to 36.213 in R1-163670 with ME+RAN boxes checked on cover page.

Codebook (Rank 5 – 8)
R1-162343 Further evaluation on Rank 5-8 Codebook ZTE
Proposal 1: Adopt the proposed codebook which reuses legacy 8Tx codebook as Rel-13 rank 5-8 codebook.
Decision: The document is noted.
R1-162452 Discussions on rank 5-8 codebookLG Electronics
Proposal 1. Adopt rank 5-8 codebook in [R1-157461] (this option allows W_2 feedback for rank 5-8) for Rel-13 FD-MIMO.
Decision: The document is noted.
R1-162967 Evaluation of Rel. 13 rank 5-8 codebook NTT DOCOMO

Petitioners' Exhibit 1007, p. 1411
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Observation: Rank 5-8 codebooks in Scheme 1 and Scheme 2 have similar performance. Scheme 3 suffers from obvious performance degradation.
Proposal: Confirm the working assumption on rank 5~8 codebook.
Decision: The document is noted.

R1-163087 **Rank 5-8 Class A FD-MIMO Codebook Alternatives and Performance** **Ericsson**
Observations:
- *A 24% increase in transmissions involving ranks 5-8 is observed in 3D-UMi with the 16-port rank 5-8 codebooks when compared to the Rel-10 8-port rank 5-8 codebooks.*
- *A 32% increase in transmissions involving ranks 5-8 is observed in 3D-UMi with the 16-port rank 5-8 codebooks when compared to the Rel-10 8-port rank 5-8 codebooks.*
- *The 16-port ranks 5-8 codebooks yields 3.5% to 6.3% mean user throughput over the alternative 8-port ranks 5-8 codebooks.*

Proposal: The current Rel-13 codebooks for CLASS A rank 5 to 8 should be kept.
Decision: The document is noted.

R1-163136 **Simulation Results of RAN 5-8 Codebook Beijing Xinwei Telecom Techn.**
Observation 1: In the system level simulation, the percentage of UE with rank greater than or equal to 5 is less than 5%. Thus it is fairer to compare rank 5-8 codebook performance through link level simulation, in which rank 5-8 percentage would very high under high SNR.
Observation 2: Even for link level simulation where there are more UEs with rank greater than 5, R13 FD-MIMO codebook still has limited gains compared to R10 codebook.
Decision: The document is noted. Further revised in R1-163415.

Alt.1: rank 5-8 code book as captured in 157789 is supported (confirm the WA)
Alt 2: rank 5-8 code book as captured in 162343 is supported (ZTE)
Alt 3: rank 5-8 code book as captured 157461 is supported (LGE)

Possible conclusions
1: If RAN1 cannot reach a consensus until wed, then rank 5-8 class A codebooks are not supported in Rel-13
2: No new Rank 5-8 class A codebook (i.e above Alt 2 and 3) is introduced in Rel-13
3: RAN1 cannot find critical issues for existing WA about Rank 5-8 codebook
Still ZTE had concern about the above conclusion 3 – ZTE objected
Mr Chair, 3 companies having concern with conclusion 1, 2 companies having concern with conclusion 2 – let's agree on conclusion 3
For the sake of making progress, ZTE agreed to the conclusion 3 but asked to note that their concern is on additional complexity of the rank 5-8 codebook without providing any performance gains

Conclusion:
- RAN1 can not find critical issues for existing WA about rank 5 – 8 codebooks

R1-163088 Discussion on Correction to Rank 5-8 Operation in Class A Config 1 Ericsson
R1-163086 **Correction to rank 5-8 FD-MIMO CSI feedback** **Ericsson**
Decision: The document is noted and CR0614 to 36.213 is agreed.

Others
R1-162344 **Remaining issues on CSI processing relaxation** **ZTE**
Decision: The document is noted. Continue discussion until RAN1#85.

7.1.5 Maintenance of Release 13 further LTE physical layer enhancements for MTC

R1-163891 **Chairman's Notes of Agenda Item 7.1.5 on eMTC CRs** **Ad-hoc chair (Qualcomm)**
The document was presented by Wanshi Chen from Qualcomm and .provides the outcomes of the remaining maintenance issues related to eMTC.
Decision: The document is endorsed.

R1-163768 LS on PRACH preamble power for eMTC Ericsson
The LS is endorsed. The final LS is agreed in R1-163791

R1-163686 LS on reviewing all LTE features up to Rel-13 for Category M1 UEs RAN2
R1-163749 Reply LS on RAN2 review of all LTE features up to Rel-13 for Category M1 UEs Ericsson
R1-163913 [Draft] Reply LS on RAN2 review of all LTE features up to Rel-13 for Category M1 UEsEricsson

Petitioners' Exhibit 1007, p. 1412
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The draft reply LS is for email approval till 4/20/2016 – Johan (Ericsson)

The document was presented by … from … and .
Discussion: .
Decision: The document is noted.

Collision Handling
R1-162456 Correction on collision of dynamically scheduled data and semi-statically scheduled data for Rel-13 eMTC LG Electronics
Decision: The document is noted.
Conclusion: The CR in R1-162456 is agreed in principle by adding "Half-duplex". Also discuss further offline whether TA has impact on subframe definitions between DL and UL.
Prepare final CR, to be visited later this week.
R1-163783. The CR is agreed in R1-163787, with the following update: "overlaps partially or fully → collides partially or fully"

R1-163811 Collision between PUCCH format 2 and PDSCH with repetitions Qualcomm

R1-162659 Clarification on MPDCCH/PDSCH Collision with PSS/SSS/PBCH Samsung
Decision: The document is noted.
R1-163353 Collision between PSS/SSS and MPDCCH/PDSCH for MTC Ericsson
Decision: The document is noted.
R1-163352 Collision between PBCH and MPDCCH for MTC Ericsson
Decision: The document is noted.
Proposed Conclusion:
- For an M-PDCCH candidate, if colliding with PSS/SSS (even partially), it is dropped in the given subframe
- For a DM-RS based PDSCH transmission, for the REs colliding with PSS/SSS, the REs are punctured by PSS/SSS
- For CRS based PDSCH, if colliding with PSS/SSS, Alt 2 in R1-162659 is agreed
- Prepare a CR, to be visited later this week

Further discussion offline – Aris/Yufei (also include discussion on collision between M-PDCCH and PBCH)
The corresponding CR agreed in principle in **R1-163661.** Correct a typo in the doc and agreed in R1-163790
Email approval about R1-163817 until 21st April – Johan (Ericsson)

R1-162594 On the collision between eMTC SIB and MPDCCH/PDSCH in TS 36.213 Huawei, HiSilicon
Decision: The document is noted. Further discussion offline, revisited later this week
The CR in 162594 is endorsed. Prepare final CR, revisited later this week
R1-163794 On the collision between eMTC SIB and MPDCCH/PDSCH in TS 36.213 Huawei, HiSilicon

R1-163006 Remaining issues for eMTC Qualcomm Incorporated
Decision: The document is noted.
R1-163093 Clarification on MBSFN subframe handling for BL/CE UEs CATT
Decision: The document is noted.

Proposal:
- Clarify the behaviour of different unicast PDSCH TM with respect to valid MBSFN subframes as follows:
  - For TM1/2/6, the UE does not expect to receive PDSCH in the valid MBSFN subframes, and they are counted as a repetition.
  - For TM9, the UE receives PDSCH and is counted as a repetition.

Continue offline discussion – Hao (Qualcomm)

R1-163780 Clarification of TM1/2/6 on MBSFN subframes Qualcomm Inc

The CR in 163780 is endorsed. Prepare final CR, revisited later this week: R1-163812
R1-163812 Clarification of TM1/2/6 on MBSFN subframes Qualcomm

R1-163781 Correction of fallback behavior for TM9 Qualcomm Inc

The CR in 163781 is endorsed. Prepare final CR, revisited later this week: R1-163813
R1-163813 Correction of fallback behavior for TM9 Qualcomm Inc

Agreement:

Petitioners' Exhibit 1007, p. 1413
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- In case of collision between periodic CSI and PDSCH with repetitions, the periodic CSI is dropped for a half-duplex UE.
  - Note: may also be related to subframe definitions for DL/UL due to TA
- Prepare a CR, to be visited later this week – Hao (Qualcomm)
- Covered by R1-163811

R1-163773 Collision between PUCCH format 2 and PDSCH with repetitions Qualcomm Inc.

The CR in 163773 is endorsed.

Proposal:
- For BL/CE UEs in CEModeB configured in transmission mode 9, resource elements occupied by cell-specific reference signals shall be counted in the PDSCH mapping but/and
  - not used for transmission of the PDSCH in non-MBSFN subframes
  - used for transmission of the PDSCH in MBSFN subframes
- For BL/CE UEs in CEModeA configured in transmission mode 1, 2 or 6, the UEs shall postpone receiving the transmission in the MBSFN subframes included in the set of BL/CE DL subframes.
- For BL/CE UEs in CEModeB configured in transmission mode 1, 2 or 6, the UEs shall drop receiving the transmission in the MBSFN subframes included in the set of BL/CE DL subframes.

Continue offline discussion – Yanping (CATT). The corresponding CR agreed in principle in **R1-163705.** Refine wording and revisit later this week. – revisit on Friday - R1-163679

R1-163679 Correction on RE mapping in MBSFN subframe for BL/CE UEs in CEModeB CATT, Panasonic, Intel, Sony, Ericsson

R1-163351 **Collision between PBCH and PRS for MTC** **Ericsson**
Decision: The document is noted.
Conclusion:
- No standardized solution is necessary for handling colliding between PBCH and PRS

Re-tuning Handling
R1-162250 **eMTC corrections for 36.211 (Proposal 4) Sequans Communications**
Decision: The document is noted.
R1-162251 eMTC corrections for 36.212 Sequans Communications
R1-162445 **Issues with retuning for different UL transmissions in eMTC (TS 36.211)** **NEC**
Decision: The document is noted.
R1-163003 **Discussion of issues with rate matching for UL narrow band change** **Qualcomm Incorporated**
Decision: The document is noted.
R1-163004 **Draft CR on narrow band hopping** **Qualcomm Incorporated, Ericsson, Nokia, Alcatel-Lucent Shanghai Bell,** Intel
Decision: The document is noted.

Conclusion:
- The CR in R1-163004 is agreed in principle. Prepare final CR, to be visited later this week – Hao (Qualcomm) The corresponding CR in R1-163702 is agreed.
- Further discussion offline w.r.t. PUCCH to PUCCH retuning as identified in R1-162445 – Yassin (NEC)
  - **R1-163709** WF on PUCCH to PUCCH retuning NEC, Qualcomm, InterDigital, Sequans, Ericsson, LGE

Proposal:
- Revoke the following agreement:

RAN1#84 agreement:
- Shortening of PUCCH 1/1a/1b in the first slot of a subframe is realized by using in the first slot with PUCCH 1/1a/1b resource mapping from symbols 1 through 6 in the first slot while maintaining the existing PUCCH 1/1a/1b DM-RS locations.

- Agree the following proposal:
  - For PUCCH 1/1a/1b, UL retuning gaps are generated by puncturing of the affected SC-FDMA symbols: last symbol and first symbol of the prior and the latter subframe respectively
    - Except if SRS subframe, shortened format of legacy behaviour is applied, i.e., shortened format is applied in the first subframe, and first symbol of the second subframe is punctured.

Petitioners' Exhibit 1007, p. 1414
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Continue discussion till RAN1#85

MPDCCH Aggregation of up 2+4 PRBs

R1-162250 **eMTC corrections for 36.211 (Proposal 3) Sequans Communications**
Decision: The document is noted.
R1-162657 **Draft CR on 24 ECCE Aggregation Level for TS 36.211** **Samsung**
Decision: The document is noted.
R1-162658 **Draft CR on 24 ECCE Aggregation Level for TS 36.213** **Samsung**
Decision: The document is noted.
R1-163156 **draft CR for TS36.211 related to 2+4 PRB set** **Panasonic Corporation**
Decision: The document is noted.
R1-163159 **draft CR for TS36.213 related to 2+4 PRB set** **Panasonic Corporation**
Decision: The document is noted.
R1-163133 **MPDCCH remaining issues related to 2+4 PRB set** **Panasonic Corporation**
Decision: The document is noted.

Conclusion:
- The CRs in 2657, 2658, 3156, and 3159 are agreed in principle, except the following:
  - Text regarding "if the detected MPDCCH is located within 4 PRB set, $n_{\mathrm{PUCCH}}^{(1,p_0)}$ is the sum between $2N_{RB}^{ECCE,q}$ and the value obtained by above procedure." (Note: it occurs in multiple places)
    - This text is further discussion
- Suzuki to provide updated CRs (R1-163674 and R1-163675 for 211 and 213 respectively) including the above text – revisit on Friday.

R1-163858 CR for TS36.211 related to 2+4 PRB set Panasonic, Qualcomm, Samsung, Sequans, Sierra Wireless, Ericsson, Intel,

R1-163859 CR for TS36.213 related to 2+4 PRB set Panasonic, Qualcomm, Samsung, Sequans, Sierra Wireless, Ericsson, Intel,

R1-162252 **eMTC corrections for 36.213 (Proposal 1)** **Sequans Communications**
Decision: The document is noted.
Further discussion offline regarding proposal 1 in R1-162252

R1-162613 **Discussion on MPDCCH AL and search space for extended CP** **Huawei, HiSilicon**
Decision: The document is noted.
Proposal:
- For MPDCCH UE-specific search space configured with 2 or 4 PRB-pairs and mPDCCH-NumRepetition=1,
  - MPDCCH case A and B in Table 6.8B.1-2 of TS36.211 are defined similar as EPDCCH.
  - AL 1 should be included in Table 6.8B.1-2 of TS36.211 for MPDCCH format 0 in case B.
- For MPDCCH UE-specific search space configured with 2 + 4 PRB-pairs or mPDCCH-NumRepetition>1, and MPDCCH common search space,
  - MPDCCH case B in Table 6.8B.1-2 of TS36.211 applies for extended CP as well as special subframes with special subframe configuration 1,2,6,7,9 and normal CP, case A applies otherwise.
  - AL $\in \{1,2,4,8,12\}$ and the agreed number of monitored candidates are used for MPDCCH in case B.

Further discussion offline, revisit later this week

R1-162961 **Draft CR on MPDCCH format for Rmax=1 and 2/4 PRBs** **InterDigital Communications**
Decision: The document is noted.
Conclusion: The CR in R1-162961 is endorsed, prepare final CR, to be visited later this week
Non-repetition case:
R1-163704 – approved in R1-163676 (36211CR240) with ME+RAN boxes checked on cover sheet.
R1-163755 – approved in R1-~~163677-163844~~ (36213CR635) with red text changed to black.
Note that Format 6-2 does not need to be included.

R1-163008 **Miscellaneous corrections for eMTC (Proposals 4&5)** **Qualcomm Incorporated**
Decision: The document is noted. Covered in R1-163677.

Petitioners' Exhibit 1007, p. 1415
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreement:
- Clarify the MPDCCH case definition when using legacy EPDCCH candidate table.
- Use Case 1 for normal subframes and normal CP, and case 3 otherwise.

Prepare a CR, to be visited later this week.

36.211

R1-162250 eMTC corrections for 36.211 (except Proposal 3) Sequans Communications
Decision: The document is noted. Discuss further offline regarding proposal 2 in R1-162250.

R1-163561 Correction of cyclic hopping term for PUSCH DMRS (TS 36.211) NEC (R1-162444)
Decision: The document is noted. Discuss further offline regarding R1-163561.
Continue discussion until RAN1#85.

R1-162610 On the granularity for SIB1-BR frequency hopping in TS 36.211 Huawei, HiSilicon
Decision: The document is noted. Discuss further offline.
CR is not needed.

R1-162611 Corrections to TS 36.211 for eMTC Huawei, HiSilicon
Decision: The document is noted.
Conclusion: the CR in 2611 is endorsed, prepare final CR, to be visited later this week.
Agreed in **R1-163698 (36211CR238)**

R1-163354 DMRS initialization of CSS for MTC Ericsson
Decision: The document is noted.
R1-163355 Missing words in PRACH starting subframe paragraph for MTC Ericsson
Decision: The document is noted.

36.212

R1-162593 On MPDCCH order identification in CE Mode B Huawei, HiSilicon
Decision: The document is noted.
Agreement:
- When an M-PDCCH is used for M-PDCCH order, the two spare bits corresponding to the location of two MSB bits in the MCS field can be fixed to 11 (in addition to resource block assignment field set to all '1's) based on option 2a or option 2b**.**
  - Option 2b is adoped

R1-163542 Identify MPDCCH order in CE mode B in TS 36.212 Huawei, HiSilicon, CATT, MediaTek, Sierra Wireless
Decision: The document is noted. Further discussion offline on 3542, prepare final CR, to be visited later week
- Including the editorial changes in 2614

Agreed in **R1-163689 (36212CR202)**

R1-162592 Identify MPDCCH order in CE mode B in TS36.212 Huawei, HiSilicon
R1-163541 Identify MPDCCH order in CE mode B in TS 36.212 Huawei, HiSilicon, CATT, MediaTek,

R1-162614 Corrections to TS36.212 for eMTC Huawei
Decision: The document is noted.

R1-163567 MCS field in DCI format 6-2 for paging for MTC Ericsson
Revision of **R1-163357**
Decision: The document is noted.
R1-163568 MCS field in DCI format 6-2 for paging for MTC Ericsson
Revision of **R1-163362**
Decision: The document is noted.

R1-163349 Channel interleaver correction for eMTC Nokia, Alcatel-Lucent Shanghai Bell
Decision: The document is noted. Discuss further offline.
Revised in R1-163771
Continue discussions until the next meeting

36.213

Petitioners' Exhibit 1007, p. 1416
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-162252 **eMTC corrections for 36.213 (except Proposal 1) Sequans Communications**
Decision: The document is noted.
R1-163417 **Correction on Type1 and Type2 MPDCCH CSS transmission for Rel-13 eMTC LG Electronics**
Revision of R1-162457 (instead of 2455)
Decision: The document is noted. Discuss further offline, and prepare a final CR.
Agreed in R1-163782 **(36213CR636)**

R1-163350 **MDPCCH candidate overflow monitoring correction for eMTC Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document is noted. Discussion further offline, and prepare a final CR.
Revised in R1-163683 and again in **R1-163772**
Agreed in R1-163677 (36213CR633r2) with correction "any of its MPDCCH candidates"

R1-163361 **MPDCCH repetition for paging and random access for MTC Ericsson**
Decision: The document is noted.

R1-162454 **Correction on PDSCH transmission timing for Rel-13 eMTC LG Electronics**
Decision: The document is noted. The CR is endorsed, final CR to be visited later this week.
Revised in **R1-163784**.
Agreed in R1-163678 (36213CR368r1), with filename to be corrected with correct CR number, and check the RAN impact box on cover sheet.

R1-162612 **Corrections to TS 36.213 for eMTC Huawei, HiSilicon**
Decision: The document is noted. The CR is endorsed, final CR to be visited later this week.
Agreed in R1-163697 **(36213CR634)**

R1-162873 **Correction of paging PDSCH transmission for MTC UE Ericsson, Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document is noted.
R1-163007 **Clarifcation on CSI measurement with respect to R_CSI, max Qualcomm Incorporated**
Decision: The document is noted.
R1-163552 **WF on CSI measurement with respect to R_CSI, max Panasonic, Qualcomm**
Decision: The document is noted.

Proposal for the working assumption:
- For narrowband CSI
  - $R_{CSIMax} <= Y_{ch}$
    - the reference subframes are defined as the last subframes of the period of nCQI_ref for each hopping narrowband.
  - $R_{CSIMax} > Y_{ch}$
    - The time location of the reference subframes is not defined but UE should reflect the situation of the last subframes of Y_{ch} for each hopping narrowband.
    - The period of the reference subframes should take into account as the offset of CQI value i.e. if $R_{CSIMax} = 2$ ms, it means spectral efficiency is scaled by a factor of 2.
- For wideband CSI
  - $R_{CSIMax} < Y_{ch}$ x (number of hopping frequencies) and/or R_{CSIMax} mod (Y_{ch}) is not zero
    - The time location of the reference subframes is not defined but UE should reflect the situation of the last subframes of Y_{ch} x (number of hopping frequencies).
    - The period of the reference subframes should take into account as the offset of CQI value i.e. if $R_{CSIMax} = 2$ ms, it means spectral efficiency is scaled by a factor of 2.

Discuss further offline
R1-163008 Miscellaneous corrections for eMTC Qualcomm Incorporated
Conclusion:
- The first 2 proposals in R1-163008 are agreed. Prepare a CR, revisit later

R1-163814 Correction on RV and MPDCCH starting position Qualcomm
R1-163359 Update RRC parameter names for MTC Ericsson
R1-163360 PUCCH repetition for Msg4 for MTC Ericsson
R1-162455 Correction on Type1 and Type2 MPDCCH CSS transmission for Rel-13 eMTC LGE
Check offline whether 162455 is already included or not in other CRs

Others
R1-163005 Discussion on paging occasion overlap for eMTC Qualcomm Incorporated
Continue discussion till RAN1#85
R1-163161 RRC parameters discussion on per CE or per cell Panasonic Corporation
Conclusion:
- Regarding the potential mix CQI and ACK/NACK in the same PRB in eMTC

Petitioners' Exhibit 1007, p. 1417
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- This will not have no RRC impact.
- Discuss till next meeting whether or not there is specification impact

R1-163100 Remaining issue on M determination for aperiodic CSI for eMTC before RRC configuration LG Electronics

7.1.6 Other

R1-162768 Correction on RRC parameter for configuring new TBSs Ericsson
Change the RRC parameter from *tbsTableAlt* to *tbsIndexAlt* in TS 36.213 to be aligned with RAN2 spec based on LS R1-160240 from RAN2
Decision: The document is noted and CR0612 to 36.213 Rel-12 is agreed.
R1-162767 Correction on RRC parameter for configuring new TBSs Ericsson
Decision: The document is noted and shadow CR0611 to 36.213 Rel-13 is agreed.

R1-163001 On SRS dropping under different CPs or 6-symbol UpPTS in CA Qualcomm Incorporated
The document was presented by Wanchi Chen from Qualcomm and discusses how to address the issue regarding SRS dropping in CA particularly when two or UL CCs have different CPs or when the 6-symbol UpPTS is configured.

- Proposal 1: In Rel-13 and beyond, when the UE is configured with CA of different CPs under a single TAG configuration, consider adopting the same rule regarding SRS dropping as in the case when the UE is configured with multiple TAGs in CA
- Proposal 2: In Rel-13 and beyond, when the UE is configured with a 6-symbol UpPTS under a single TAG, consider adopting the same rule reading SRS dropping as in the case when the UE is configured with multiple TAGs in CA

Discussion: Fujitsu→ ok to have a CR but limited to Rel-13. Fine to Qualcomm (CR not yet available).
Decision: The document is noted. Both proposals are agreed in principle . Prepare CR for Rel-13 only until Wednesday – Qualcomm
Friday
R1-163434 Corrections SRS dropping in CA in 36.213 Qualcomm Inc. Rel-13 36.213 CR0624 F
Decision: The document is noted and CR0624 to 36.213 Rel-13 is agreed.

7.2 LTE Release 13

7.2.1 NB-IoT

WID in RP-152284.
The objective is to specify a radio access for cellular internet of things, based to a great extent on a non-backward-compatible variant of E-UTRA, that addresses improved indoor coverage, support for massive number of low throughput devices, low delay sensitivity, ultra low device cost, low device power consumption and (optimised) network architecture.

The document was presented by … from … and .
Discussion: .
Decision: The document is noted.

R1-162634 Summary of RAN2 open items with possible RAN1 dependence Huawei, HiSilicon
Agreement:

- The DL NB-IoT UE category has total number of soft channel bits = 2112 bits.

R1-162635 Draft 36.212 CR for NB-IoT Huawei
Decision: The document is noted and agreed in R1-163405 (CR0192 rev 1).

R1-163418 Introduction of NB-IoT (36.211 CR0224 rev 3) Ericsson
Decision: The document is noted. Editor (Asbjorn) to provide update with comments by Wed.
R1-163593 Introduction of NB-IoT (36.211 CR0224 rev 4) Ericsson
Decision: The document is noted and CR0224r4 to 36.211 is agreed as the basis for the next update.

R1-163409 Draft 36.213 for NB-IoT Motorola Mobility
Decision: The document is noted. Editor (Bob Love) to have an update by Friday.
Friday:
R1-163912 Draft 36.213 for NB-IoT Motorola Mobility
Decision: The document is noted and agreed as the basis for the next update.

R1-162636 Introduction of NB-IoT Huawei

Petitioners' Exhibit 1007, p. 1418
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document (Draft 36.300 section 5 CR for NB-IoT) is noted and agreed as the basis for the next update. Next update will be provided by Friday - (Huawei)

R1-163899 **Introduction of NB-IoT Huawei**
Decision: The document is noted.

R1-163918 **Introduction of NB-IoT Huawei**
Decision: The document is noted and CR is endorsed

R1-163900 **[DRAFT]Reply LS on updated TS 36.300 section 5 for NB-IoT Huawei**
Decision: The document is noted and final LS is agreed in R1-163932 by updating Tdoc number of attachment file.
MCC post meeting: It appears that the agreed LS to RAN2 should include R1-163918 as the attachment (latest endorsed draftCR), and not the previous version of the 36.300 draftCR (R1-163899). Final LS is agreed in R1-163937 by including the correct attachment file.

R1-163426 Text Proposal for TR 36.802 (NB-IoT; Technical Report for BS and UE radio transmission and reception) Huawei

R1-163446 LS to RAN4 on NB-IoT Huawei
Approved in R1-163449 with bold/underlined addition in normal font.

Updated LS to account for 12 UL-DMRS sequences for the 3 tone case.
R1-163870 Updated LS to RAN4 on NB-IoT Ericsson
Endorsed in R1-163871, with the inclusion of the equation above the table to avoid confusion between m in the last LS and u in this one.

R1-163592 LS on NB-IoT to RAN2 (Matthew- Huawei)
Endorsed in R1-163807, including the NB-PRACH subcarrier locations table and removing bold/underline.

R1-163578 Spreadsheet of RRC parameters Huawei

R1-163579 Draft LS to RAN2 on RRC parameters
Endorsed in R1-163809, removing the sentence "RAN1 will continue to inform RAN2 about further updates to the list."

R1-163738 Jumbo LS to RAN4 (Matthew – Huawei)
Agreed in R1-163739.

Incoming LS from RAN2
R1-163852 LS on Power Headroom report
So far RAN2 does not include PHR for other cases than MSG3 but RAN2 would like to understand whether there is any need to report PHR in other cases than in MSG3.

Conclusion on LS reply:
For the typical applications targeted by rel-13 NB-IoT there may not be much benefit. In the future, there may be some benefit for longer sessions. RAN1 sees no additional impact at the physical layer for additional PHR reporting.
Draft LS reply to RAN2 in R1-163808 including the above text – Yubo (Huawei)
Endorsed in R1-163869.

Editors (211,212,213) to provide updates including agreements and working assumptions from RAN1#84bis by April 29.
Email approval deadline is May 5.

7.2.1.1 Downlink physical channels and signals

R1-163439 WF on DL OFDM baseband signal generation Intel

Agreement:
- A common OFDM baseband signal generation for NB-IoT downlink for all operation modes is described with respect to the centre frequency of the NB-IoT carrier
  - Exact equation to be provided by the TS36.211 specification editor

7.2.1.1.1 NB-PDCCH

R1-162458 Remaining issues on NB-PDCCH LG Electronics

Petitioners' Exhibit 1007, p. 1419
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreement on starting subframes:
- The search space starting subframe reuses the principle of eMTC
  - The period reuse the principles from eMTC
    - T=R*G, G values to be determined
    - An additional offset on the value of T may be considered
- Postpone NPDCCH repetitions that overlap with transmission gap
- FFS whether to also allow an offset to the period (value FFS)
  - Additional offset = R*G1, G1=0,2,4,8

R1-163275 Remaining Details on DCI Contents Samsung

Agreement:
- In DCI format N1, ACK/NACK Resource Indication: 4 bits

R1-162773 NB-IoT - Remaining issues for NPDCCH Ericsson

Agreement:
- An NPDCCH block of subframes is scrambled in the same way as PDCCH and the scrambling is reset every 4th NPDCCH subframe.
-

R1-162757 Remaining issues on NB-PDCCH design for NB-IoT ZTE

Agreement:
- Always have 6 bits for subcarrier allocation in 36.212, 36.213 uses 5 of the 6 bits for the 15kHz case

R1-163587 WF on starting subframe Huawei
R1-163570 WF on starting subframe ZTE
R1-163260 Detail on scheduling delay for NPDSCH and NPUSCH MediaTek Inc.
Section 2
Agreements:
- $(10n_f + \lfloor n_s/2 \rfloor) \bmod T = 0$
- G={1.5, 2, 4, 8, 16, 32, 48, 64}
- eNB only configures values that result in T>=4
- T=Rmax*G

R1-163801 Remaining details of starting subframes Huawei, HiSilicon, Intel, Mediatek
Revised in R1-163804.

Agreement:
- For UE-SS, G is UE-specific
- For CSS for RAR/Msg3re-tx/Msg4, G is cell-specific and NPRACH resource-specific

R1-162625 Remaining details of NB-PDCCH Huawei, HiSilicon
R1-162626 DCI for NB-IoT Huawei, HiSilicon
R1-162772 NB-IoT - DCI content Ericsson
R1-162902 Remaining issues on NB-PDCCH Nokia, Alcatel-Lucent Shanghai Bell
R1-162972 DCI design for NB-IoT Intel Corporation
R1-162973 DL gaps and remaining details of timing relationships for NB-IoT Intel Corporation
R1-163010 NB-PDCCH Design Qualcomm Incorporated

R1-163271 NB-PDCCH Timing and Collision Sony

7.2.1.1.2 NB-PDSCH

Numbers of repetitions
R1-163168 Views on remaining issues of NB-PDSCH NTT DOCOMO, INC.

Petitioners' Exhibit 1007, p. 1420
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreement:
Repetitions can be applied to any supported MCS by NB-IoT

R1-162903 Remaining issues on NB-PDSCH Nokia, Alcatel-Lucent Shanghai Bell

Agreement:
- The predefined set of NB-PDSCH numbers of repetitions of the allocated subframes (i.e. N_{SF}) is {1, 2, 4, 8, 16, 32, 64, 128, 192, 256, 384, 512, 768, 1024, 1536, 2048}.
- 4 bits in DCI (for both normal and paging NB-PDSCH) indicate one value in the above set
  - Note that this shall not imply anything about how the number of PUSCH repetitions is indicated!

R1-162974 Remaining details of NB-PDSCH design Intel Corporation
Proposal 2: The maximum number of repetitions for the NB-PDSCH is 2048 and the range for NB-PDSCH repetitions can be {1, 2, 4, 8, 16, 32, 64, 128, 256, 512, 1024, 2048}. The DCI indicates one of 8 values that are configured via RRC.

R1-163802 WF on scrambling sequence initialization Huawei, HiSilicon, Nokia, Samsung, CATT, Ericsson, Sharp

Agreement:
- For NB-PUSCH the scrambling sequence is according to Section 7.2 of TS 36.211
- For NB-PDSCH and NB-PUSCH

$$c_{\text{init}} = n_{\text{RNTI}} \cdot 2^{14} + \text{mod}(n_f, 2) \cdot 2^{13} + \lfloor n_s/2 \rfloor \cdot 2^9 + N_{\text{ID}}^{\text{cell}}$$

Gap configuration
R1-162774 NB-IoT - Remaining issues for NPDSCH design Ericsson
R1-162459 Remaining issues on NB-PDSCH LG Electronics
Section 2
Agreement:
- Single gap configuration is defined for NB-IoT downlink transmission.
- There can be one gap configuration for the PRB with NBPSS/NBSSS/SIB1, and with multi-PRB one optional additional gap configuration for the other PRB(s). If not configured then the same gap is used.

R1-163447 WF on Application of DL Gap for NB-IoT Ericsson, ...

Agreement:
- For each configuration, the cycle starts with transmission period followed by the subframes for the gaps
- The gap configuration is optional; if not configured it means there is no gap
- DL transmission gap does not apply to SIB transmission.
- Gaps configuration is applied for both NPDCCH CSS for paging and NPDSCH carrying the paging message
  - The same configuration is used for paging NPDCCH and NPDSCH as that of other DL transmission
  - For paging, R_NPDCCH_max refers to Rmax of paging CSS configured by eNB

R1-163569 WF on DL Gap Configuration for NB-IoT ZTE...
Agreement:
- X1 can be configured by SIB.
- When NB-PDCCH/NB-PDSCH repetitions are overlapping with a DL gap, the NB-PDCCH/NB-PDSCH repetitions are postponed to the next valid DL subframe.

R1-163448 WF on Further Details of DL Gap Configuration for NB-IoT Ericsson, Intel

Agreement:
- Starting point of gap period (SFN=0, sf=0)
- {Gap starting point periodicity, Gap size} are
  - signaled separately
    - 2 bits each
- X_1 is 2 bits
  - {32, 64, 128, 256}
- Gap starting point periodicity and gap size are
  - On an absolute number of subframes

Petitioners' Exhibit 1007, p. 1421
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-163743 Ericsson

Agreement:
- When DL transmission gap is configured, each cycle starts with subframe (n_f, n_s) where T_g is the Gap starting point periodicity, and

$(10n_f + \lfloor n_s/2 \rfloor) \bmod T_g = 0$

  - 10240 is an integer multiple of T_g

R1-163742 WF on value set of *Gap starting point periodicity and Gap size* ZTE, Huaei, HiSi, Mediatek

Agreement:
- *Gap period :{*∈{64, 128, 256, 512}

Agreements:
- *Value set of Gap size is chosen from:*
  - *Gap size:* {1/8, 1/4, 3/8, 1/2} * Gap period

R1-163011 NB-PDSCH Design Qualcomm Incorporated

Other
R1-163260 Detail on scheduling delay for NPDSCH and NPUSCH MediaTek Inc.

R1-163441 WF on scheduling delay of NPDSCH and NPUSCH MediaTek, Panasonic, Huawei, Intel, ZTE, Nokia, Ericsson, Samsung

Agreement:
- Defined 4 fixed values as {8, 16, 32, 64}, the scheduling delay for NPUSCH is the value indicated by DCI

R1-163868 WF on scheduling delay of NPDSCH and NPUSCH Mediatek

Agreement:
- 3 bits indicate number of valid DL subframes. The gap between end of NPDCCH and the start of the associated NPDSCH equals k_{delay} valid DL subframes + 4ms
- Two fixed sets for different Rmax for the respective search space, above and below a threshold.
  - If Rmax <128
    - {0,4,8,12,16,32,64,128}
  - If Rmax>=128,
    - {0,16,32,64,128, 256,512,1024}

Agreement:
- The gap indicated by DCI used for NPUSCH scheduling delay indicates absolute number of subframes.

R1-162835 On non-anchor PRBs for NB-IoT multi-carrier operation Sharp

7.2.1.1.3 System information and paging transmission

Agreement:
- Confirm the working assumption that the NB-SIB1 modification period is 40.96sec
- Confirm the working assumption to use 2 bits in MIB to indicate the two LSB of hyper SFN

Section 3

R1-163492 WF on NB-SSS LG
R1-163495 WF on PCID indication Huawei

Agreements:
- NB-SSS periodicity is 20ms
- The following information is indicated by the NB-SSS:
  - One of 504 PCIDs
  - 80ms boundary (4 values)
- NB-SSS sequence is composed of a length-131 frequency-domain ZC sequence and a binary scrambling sequence
  - Root indices {3..128}
- PCID is indicated by combination of ZC root index and a binary scrambling sequence
- 80ms boundary is indicated by the one of 4 time-domain cyclic shifts, {0, 33, 66, 99}
- The binary scrambling sequence is a Hadamard sequence

R1-163596 NB-SSS Evaluations Huawei, HiSilicon
Revision of R1-163577

Agreement:

- *The mapping function from NB-IoT cell ID to the root index and the index of the scrambling sequence can follow the rules as:*

Petitioners' Exhibit 1007, p. 1423
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

$$u = mod(PCI, 126) + 3$$

$$q = \left\lfloor \frac{PCI}{126} \right\rfloor$$

- Cyclic shift C_i ($0 \le i \le 3$) is applied to the NB-SSS signal in the ($8*k + 2*i$)-th frame, where $0 \le k \le 127$.

R1-163728 WF on scrambling sequence for NB-SSS LGE

R1-163735 WF on scrambling sequence design for NB-SSS Huawei, HiSilicon, Intel

Agreement:

- NB-SSS sequence is generated according to R1-162976 with following correction:

$$SSS(n) = e^{-\frac{j\pi r_p(n')(n'+1)}{N_{ZC}}} c_{s_p}(n)\, e^{-\frac{j2\pi l_q n}{d_{max}}}, \quad where\ n' = n\ mod\ N_{ZC}, n = \{0,1,\dots,N_{ZC}\}$$

$$l_0 = 0, l_1 = 33, l_2 = 66, l_3 = 99$$

$$d_{max} = 132$$

- The binary scrambling sequence for NB-SSS is a Hadamard sequence generated as

$$\boldsymbol{b_q(n) = Hadamard_{s_q}^{128x128}(mod(n,128))}, \quad q = 0,1,2,3$$

$$s_0 = 0, s_1 = 31, s_2 = 63, s_3 = 127$$

NB-PSS

R1-162977 Baseband signal generation for NB-IoT downlink Intel Corporation
Section 2

Agreement:

- NB-PSS is mapped to sub-carriers #0-10 of the NB-IoT carrier.

Agreement:

- NB-PDSCH/PDCCH on a given NB-IoT carrier are not mapped to the subframes containing NB-PSS/NB-SSS/PBCH on that carrier
  - Any transmission in such a subframe is postponed

AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-163423 WF on narrowband DM-RS design for single tone transmission LG

Agreement for single-tone:

- Use element-wise product of length-16 Hadamard code and Gold-sequence.
- Use the LTE Gold-sequence in section 7.2 of TS 36.211
  - Initialization value of second m-sequence is 35

R1-163437 WF on DMRS multi-tone evaluation methods Ericsson, Nokia, Lenovo, LG, ZTE

Agreements for multi-tone:

- DMRS symbol locations for multitone are the same as for LTE
- For 3-tone case, 12 base sequences are provided (new sequences, not truncated versions of the 6-tone sequences)
- For 6-tone case, 14 base sequences are provided
- The available base sequence in a cell for each number of tones can be indicated by a SIB; otherwise, for 3-tone and 6-tone cases it is given by CellID mod 12 for 3 tone and mod 14 for 6 tone.
  - 12-tone case follows legacy behaviour for ascertaining the base sequence.
- Define 3 cyclic shifts for the 3-tone case and 4 for the 6-tone case
  - No CSs for 12-tone case
- Cyclic shifts are indicated by SIB and not indicated in DCI
- No OCC
- Sequences are QPSK in frequency domain

FFS:

- Exact sequences for 3-tones and 6-tones are FFS based on cross-correlation evaluations – revisit on Wed
  - Cross-correlation method to be used for comparison:
    - xcorr_coeffs = NFFT * IFFT(seq1 .* conj(seq2), NFFT) / length(seq1)
  - Starting point for comparison and selection is the sequences proposed in R1-162462, R1-162730, R1-162762, R1-162906, and R1-163016.

R1-163424 WF on narrowband DM-RS design for multi tone transmission LGE

R1-163591 WF on DMRS Ericsson

Agreements:

- For each of the 3-tone base DMRS sequence, three cyclic shifts are defined as $\bar{r}(n)=e^{j 2\pi/3 \alpha n} r(n)$ where $r(n)$ is a base sequence, $0 \le n < 3$ and α is the cyclic shift $0 \le \alpha < 3$.
- For each of the 6-tone base DMRS sequence, four cyclic shifts are defined as $\bar{r}(n)=e^{j 2\pi/6 \alpha n} r(n)$, where r(n) is a base sequence, $0 \le n < 5$ and α is the cyclic shift $\alpha = \{0, 1, 2, 4\}$

Agreement:

- Take 14 of the sequences in p6 of R1-163591, as below except 1,11

m	φ(0), φ(1), φ(2), φ(3), φ(4), φ(5),					
0	1	1	1	1	3	-3
~~1~~	~~1~~	~~1~~	~~-1~~	~~-3~~	~~-3~~	~~3~~
2	1	1	3	1	-3	3
3	1	-1	-1	-1	1	-3

10	3	-1	3	-3	-1	1
~~11~~	~~3~~	~~3~~	~~-3~~	~~-3~~	~~-3~~	~~-1~~
12	3	-3	3	-1	3	3
13	-3	1	3	1	-3	-1
14	-3	1	-3	3	-3	-1
15	-3	3	-3	1	1	-3

R1-163734 WF on 3 tone DMRS Qualcomm, Samsung, Ericsson, ZTE, Panasonic, Nokia, Sony, LG, Intel

Superseded Agreement:

Petitioners' Exhibit 1007, p. 1426
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- 14 base sequences for 3-tone case are defined as $r_u(n) = e^{j\varphi(n)\pi/4}, \quad 0 \le n \le 2$

m	φ(0),φ(1),φ(2)		
0	1	-3	-3
1	1	-3	-1
2	1	-3	1
3	1	-3	3
4	1	-1	-3
5	1	-1	-1
6	1	-1	3
7	1	1	-3
8	1	1	-1
9	1	1	3
10	1	3	-3
11	1	3	-1
12	1	3	1
13	1	3	3

R1-163806 WF on 3 tone DMRS Qualcomm
Makes a correction to the table.

Agreement:
- 12 base sequences for 3-tone case are defined as $r_u(n) = e^{j\varphi(n)\pi/4}, \quad 0 \le n \le 2$

u	φ(0),φ(1),φ(2)		
0	1	-3	-3
1	1	-3	-1
2	1	-3	3
3	1	-1	-1
4	1	-1	1
5	1	-1	3
6	1	1	-3
7	1	1	-1
8	1	1	3
9	1	3	-1
10	1	3	1
11	1	3	3

The following working assumption is confirmed.

- Working Assumption:
  - Support 3 DM-RS symbols per 7 symbol period
  - The DM-RS sequence is obtained as
    - Use single tone DM-RS PUSCH spread by length 3 OCC sequence defined for PUCCH
      - The OCC ID is pseudo-randomly selected (from existing OCCs) according to $n_{cs}^{cell}(n_s, l) \bmod 3$
  - Working Assumption can be changed to 1 DMRS symbol at RAN1#84bis if significant gain is not observed compared to 1 DMRS symbol.

Agreement:
- DM RS symbols for 3.75kHz ACK/NACK are contained in the first three NB-IoT symbols
- DM RS symbols for 15kHz ACK/NACK are contained in the NB-IoT symbols 2,3, and 4 (starting from symbol 0)

R1-163736 WF on resource allocation for A/N transmission Huawei
R1-163440 WF on UCI LGE

Agreement for UCI:
- Fixed baseline subcarrier, and
  - 3.75kHz: 3 bits for frequency allocation, 1 bit for time allocation
    - Starts from subcarrier 45, and offset grows negatively
      - Offset values are {0, -1, -2, -3, -4, -5, -6, -7}
    - Time offset is 0,1 x 8ms
  - 15kHz: 2 bits for frequency allocation, 2 bit for time allocation
    - Starts from subcarrier zero, and offset grows positively
      - Offset values are {0, 1, 2, 3}
    - Time offset is 0,1,2,3 x 2ms

Proposed Agreement for timing reference:
- Alt. 1: A/N transmission is relative to a configured time domain reference point (at least 12 ms later than the end of NPDSCH). The time domain reference point is configured by higher layer signalling.
- Alt. 2: A/N transmission delay is relative to the end of the corresponding NPDSCH transmission plus 12ms.

Discuss Thursday

R1-163803 WF on time domain resource allocation for ACK/NACK transmission Huawei, HiSilicon, Intel, Panasonic, Samsung, ZTE

Proposed Agreement:
- Alt 1: Baseline time point for time domain allocation:
  - A/N transmission is relative to the first time reference point which is at least 12 ms later than the end of NPDSCH
  - The period of the time reference point is fixed to [16]ms.
    - The start of the period is from (SFN#0, subframe#0).
- Alt. 2: A/N transmission delay is relative to the end of the corresponding NPDSCH transmission plus 12ms.

Email approval to decide between these two alternatives – Xiaolei (Huawei)

R1-163740 WF on numbers of repetitions for ACK/NACK Nokia, ASB

Agreement:
- The predefined set of numbers of repetition for ACK/NACK resource unit is {1, 2, 4, 8, 16, 32, 64, 128}

7.2.1.2.4 Random access

R1-162464 Remaining issues on RACH transmission for NB-IoT LG Electronics
R1-162630 Remaining NB-IoT random access physical layer aspects Huawei, HiSilicon

R1-163805 WF on remaining issues about NB-PRACH power settings ZTE, HW,Hisilicon

Agreement:
- For the values of *preambleInitialReceivedTargetPower,* reuse the legacy LTE value

R1-163597 WF on remaining details of NB-PRACH Huawei

Agreements:

Petitioners' Exhibit 1007, p. 1428
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- The adjustment of the uplink transmission timing is applied from the start of the first NPUSCH transmission which starts at least 12ms after the end of the corresponding timing advance command transmission.

Agreements:
- The NB-PRACH subcarrier locations are according to the following table

		"Frequency location in subcarrier offset"						
		0	12	24	36	2	18	34
"Number of subcarriers"	12	0 – 11	12 – 23	24 – 35	36 – 47	2 – 13	18 – 29	34 – 45
	24	0 – 23	12 – 35	24 – 47	Invalid	2 – 25	18 – 41	Invalid
	36	0 – 35	12 – 47	Invalid	Invalid	2 – 37	Invalid	Invalid
	48	0 – 47	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid

Agreements on NB-PDCCH order:
- NB-PDCCH order is carried in format N1
- 1 bit field indicates NB-PDCCH order
- The starting number of NPRACH repetitions is included (2 bits)
- The remaining bits in DCI format N1 are set to '1'.

Agreements:
- For a given NB-PRACH resource configuration, the NB-PRACH resource
  - starts at 0ms within each SFN periodicity, and the NB-PRACH opportunity occurs at "Starting time of period" within each NB-PRACH periodicity.

Agreements
- The symbol value for NB-PRACH is 1

R1-163588 WF on the UL grant in RAR Huawei

Agreement on the UL grant in RAR:
- UL subcarrier spacing: 3.75 kHz or 15 kHz (1 bit)
- Msg3 subcarrier allocation: Same as in UL grant on NB-PDCCH
- MCS/TBS: Use 3 states to indicate the 3 options for TBS = 88 bits from agreed NB-PUSCH MCS/TBS tables. Reserve the other states for future.
  - 000 is pi/2 BPSK for ST and QPSK for MT, N_RU=4
  - 001 is pi/4 QPSK for ST and QPSK for MT, N_RU=3
  - 010 is pi/4 QPSK for ST and QPSK for MT, N_RU=1
  - Others are reserved
- Scheduling delay: Same as NB-PUSCH
- Msg3 repetition number: Same as NB-PUSCH
- Padding bits are up to RAN2 when specifying RAR

R1-163598 WF on remaining details of NB-PRACH configuration Huawei

Agreement:
- Up to 3 NPRACH resource configurations can be configured in a cell
- The fraction of the total number of subcarriers that are reserved for single-tone transmission of MSG3 cannot be zero in at least one of the resources with the number of NB-PRACH repetitions other than (32, 64, and 128)
- If a UE selects the resource reserved for single tone MSG3, MSG3 is allocated with a single tone
- 2 bits indicate the starting subcarrier index of the range reserved for indication of UE support for multi-tone Msg3 transmission by {0, 1/3, 2/3, 1}xN_sc^NPRACH
- The other subcarriers in the NPRACH resource configuration are the range for single-tone transmission of MSG3
- UE select randomly from within its range of subcarriers
- This implies that if all PRACH resources have no range reserved for the indication of UE support for multi-tone MSG3, the UE must use the NPRACH resources reserved for single tone transmission of MSG3
- NOTE: This is not an indication of UE capability which is indicated in MSG3

Agreements:

- $M_{NPUSCH,c}(i)$: {1/4, 1, 3, 6,12} (reflecting UL transmission resource bandwidth normalized by 15 kHz)
  - No power adjustment parameter in DCI, i.e. $f_c(i)=0$
  - Power control for ACK/NACK: alpha = 1
  - If number of repetitions (including the initial transmission) of the allocated RUs > 2, then UE uses max power
- The set of values for power offset between NB-RS and LTE CRS is {-6, -4.77, -3, -1.77, 0, 1, 1.23, 2, 3, 4, 4.23, 5, 6, 7, 8, 9} dB.
- Value set of *powerRampingStep* is the same as LTE: {0, 2, 4, 6} dB

R1-163445 WF on NB-PRACH power rampingZTE, Ericsson
R1-163595 PRACH ramping ZTE, HW, Hisilicon, [Ericsson , Sierra wireless]…

Agreement:
- It is ran1 understanding that the following power ramping equation can be reused for NB-PRACH but one item ($-10*\log_{10}(numRepetitionPerPreambleAttempt)$ to adjust repetition's effect need to be added
  - Set PREAMBLE_RECEIVED_TARGET_POWER to *preambleInitialReceivedTargetPower* + DELTA_PREAMBLE + (PREAMBLE_TRANSMISSION_COUNTER – 1) * *powerRampingStep* – $10*\log_{10}(numRepetitionPerPreambleAttempt)$

DELTA_PREAMBLE is set to 0

R1-162904 UL power control for NB-IoT Nokia, Alcatel-Lucent Shanghai Bell
R1-162765 Remaining issues on UL power control for NB-IoT ZTE

Section 2.2

PHR:
Agreements:
- NB-PHR is computed based on a 15kHz single-tone transmit power for NB-PUSCH data transmission regardless of the actual subcarrier spacing:
  $PH(i) = P_{CMAX,c}(i)-\{P_{O\_NPUSCH,c}(1)+\alpha_c(1)\cdot PL_c\}$
- There will be 4 reportable values of PHR
  - Exact values to be determined by RAN4 and specified in 36.133.

Petitioners' Exhibit 1007, p. 1430

R1-162975 Remaining details of Paging for NB-IoT Intel Corporation
Section 2

R1-163590 WF on valid/invalid subframe configurations and MBSFN subframe configuration Panasonic, ZTE, Mediatek

Agreements:
- Valid subframe configuration
  - Valid subframe configuration are optionally bit-map configured over 10ms or 40ms for inband and 10ms for standalone/guardband by NB-SIB1.
    - NOTE: For standalone/guardband this optional signaling may be useful for future coexistence
  - In the subframes that contain PSS/SSS/PBCH/NB-SIB1 in the carrier that contain PSS/SSS/PBCH/NB-SIB1
    - these subframes are invalid subframes i.e. to postpone the transmission regardless of the signalling.
  - For the remaining subframes,
    - If no bit-map is provided, these subframes are valid subframes
    - Otherwise, to follow the signalling.
- For inband
  - NB-IoT UE do not know about MBSFN subframes; they are transparent to the NB-IoT UE.
  - The UE may assume the same assumptions on legacy CRS in all valid subframes for inband
  - It is up to the network to decide whether MBSFN subframes are configured as valid or invalid.

- For valid subframe configurations for multi-PRB
  - One bit-map for the PRB with NBPSS/NBSSS/SIB1 in SIB1
  - RAN2 can decide of one or both of:
    - An additional bit-map for other PRB may be provided with dedicated signaling
    - Additional bit-map(s) for other PRBs within SIB
      - Up to RAN2 if this is per operation mode or across operation modes

R1-163589 WF on Collision Handling for NB-IoT Ericsson
Discuss offline

Tx collisions

R1-162633 Procedures for colliding transmissions Huawei, HiSilicon

Agreements:
- For standalone and guard band operations, NB-IoT channels and signals, except NB-PBCH, occupy the REs corresponding to "LTE CRS" calculated according to physical Cell_ID.
- There is no NB-IoT signaling of LTE CSI-RS or PRS.
- NB-PDCCH and NB-PDSCH are rate matched around LTE CRS for in-band operation.

R1-163565 WF on PUSCH multi-subframe scheduling in LAA LG Electronics, Qualcomm, Sharp
Agreement:
- DCI format(s) to schedule PUSCH transmission in k<= N subframes with single TB per subframe or two TBs per subframe
  - Value(s) of N is FFS
  - Value N is either semi-statically configured or hard-coded, to be further decided
- DCI format(s) will have the following scheduling information types:
  - Type A: common to all the scheduled subframes (appearing only once in a DCI)
    - carrier indicator, resource assignment, Cyclic shift for DM RS and OCC index
  - Type B: subframe specific information (appearing N times for N subframes scheduling)
    - NDI
  - FFS MCS is type A or type B
  - FFS HARQ process number and redundancy version are type A or type B
  - FFS details of scheduling timing indication, and whether it's type A or type B

Petitioners' Exhibit 1007, p. 1432
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - FFS: Type C: applied only to one of the scheduled subframes (appearing only once in a DCI)
    - CSI request, SRS request, TPC
  - Note: there are maybe other information fields in DCI, to be decided later
- Note: the DCI formats here may not be a complete list, e.g., depending on discussion on resource allocation for PUSCH

Resource Allocation
R1-162355 On the Intermodulation Distortion Issue with Multi-cluster Transmission Intel Corporation
R1-163020 PUSCH resoure allocation granularity Qualcomm Incorporated
R1-162660 UL Waveforms for PUSCH Samsung

R1-163573 Way forward on the IMD issue with Multi-cluster Transmission (>2) Intel, Samsung, Broadcom
R1-163563 WF on PUSCH resource allocation LG Electronics, Samsung, ITL
Agreement:
- For eLAA PUSCH transmission, one interlace is the basic unit of resource allocation, which is composed of 10RBs for 20MHz
  - Working assumption: the 10RBs are spaced equally in frequency domain for 20MHz
    - Ex for 20MHz eLAA SCell: interlace 0 is composed of RBs 0,10,20,...,90
    - Send an LS to RAN4 asking whether or not RAN4 sees issues with the working assumption. RAN1 also discussed the possibility of having unequal spacing in frequency domain for the 10-RB interlace based resource allocation – Jeongho (Intel) - R1-163703 – approved in **R1-163683**
  - FFS the case of other system bandwidth(s)
- A UE can be assigned one or more interlaces
  - The total number of RBs used for transmission should be a multiple of 2,3 and 5
  - Decide one of the following alternatives:
    - Alt 1: UL resource allocation type 0 is used to allocate multiple interlaces to a UE
      - UL grant indicates start index and allocated number of interlaces with consecutive indices
    - Alt 2: bitmap based resource allocation
    - Alt 3: predefined resource allocation patterns
  - FFS: excluding some UL RBs from the resource allocation

R1-163584 WF on PUSCH transmissions in eLAA Huawei, HiSilicon
Agreement:
- Confirm the working assumption
  - The minimum latency is 4ms between the subframe carrying the UL grant and subframe(s) of the corresponding PUSCH(s)

Agreement:
- For the UL DMRS for eLAA,

- Reuse the legacy UL DMRS generation sequence
  - That is, the sequence is generated based on the transmitted bandwidth and mapped in a way similar to that of the legacy resource allocation type 1
- The symbol position of the UL DMRS of eLAA is the same as the UL DMRS position in LTE PUSCH subframe
- The frequency position of the UL DMRS is the same as the PUSCH REs

7.3.1.2 SRS design

R1-162729 Summary on [84-15] SRS without PUSCH in eLAA Huawei, HiSilicon
R1-163585 WF on SRS without PUSCH in eLAA Huawei, HiSilicon, Qualcomm

Agreement:
- Working assumption: Periodic SRS without PUSCH is NOT supported in Rel-14 eLAA WI
- A-periodic SRS without PUSCH is supported at least in DL ending partial subframes in Rel-14 eLAA WI
  - FFS the case of UL subframes
- LBT for aperiodic SRS without PUSCH
  - 25us one-shot LBT within eNB MCOT;
  - Cat 4 LBT outside of eNB MCOT
    - FFS contention window size parameters, including possibility of non-adapting contention window size
  - FFS no LBT if SRS is transmitted within 16us of the DL transmission within eNB MCOT
  - FFS whether or not the eNB can indicate a LBT type

Agreement:
- Aperiodic SRS without PUSCH can be triggered by dynamic signaling at least via DL grants
  - UE is configured by RRC one or more sets of SRS parameters
    - The configuration details are FFS
  - FFS other possible triggering mechanisms, e.g.:

Petitioners' Exhibit 1007, p. 1434
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Group DCI
- UE-specific DCI
- One or several of the above options may apply

R1-163586 WF on general SRS aspects in eLAA Huawei, HiSilicon, CATT

Agreement:

- Only wideband SRS transmission in supported in eLAA
  - Existing max # SRS RBs for a given system bandwidth is the baseline
    - FFS whether or not to extend/shift to # of RBs > max # RBs in the legacy case
- Working assumption: SRS is based on legacy comb structure
  - As a baseline, comb = 2 and 4
  - FFS whether or not support different comb value(s)

Proposal – Continue discussion till RAN1#85

- Alt 1: A-periodic SRS without PUSCH is supported also in regular UL subframes, where the SRS is located in the 2nd symbol of the subframe
  - Supported by: Nokia, ASB, QC, LG (2nd choice), HW, HiSi, DCM, Kyocera, Intel, WILUS, ITRI, ZTE, E/// (2nd choice)
  - Objected by: SS, Panasonic, MTK, Broadcom
- Alt 2: A-periodic SRS without PUSCH is supported also in regular UL subframes, not to be multiplexed with other UEs' PUSCH transmission in the same subframe and the SRS is located in the last symbol of the subframe
  - Supported by: E///, CATT, LG, MTK (2nd choice)
  - Objected by: Pana, Broadcom
- Alt 3: A-periodic SRS without PUSCH is NOT supported also in regular UL subframes
  - Supported by: SS, MTK, Pana, Sharp, Broadcom, Lenovo
  - Objected by: HW, HiSi, DCM, QC, Nokia, ASB, CATT

7.3.1.3 Uplink control information on an LAA SCell

R1-162262 UCI transmission for Rel-14 eLAA CATT
R1-162939 PUCCH design in eLAA Mediatek
R1-163145 Transmission of uplink control information on an LAA SCell in DL partial subframes Ericsson

Agreement:

- PUCCH on LAA SCell is not introduced in eLAA within the current scope of the work item
  - The introduction of PUCCH at a later stage in Rel-14 is not precluded

Agreement:

- Simultaneous L-cell PUCCH and LAA SCell PUSCH transmission is supported by the UE
  - Note: Not configuring this would impact PUSCH transmission opportunities on the LAA SCell
  - Note: whether this feature is optional or mandatory is a separate discussion
  - Note: this does not necessarily imply that a UE needs support simultaneous PUCCH and PUSCH within one band or adjacent bands

Petitioners' Exhibit 1007, p. 1435
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Working assumption:

- eLAA supports transmission of UCI including at least HARQ-ACK on PUSCH within a "cell group" consisting of only LAA SCells at least for self-scheduling
  - No PUCCH on any SCell in the CG
  - This cell group is not referring to a PUCCH cell group
  - FFS: Timing relationship between DL transmissions and HARQ-ACK

Agreement:

- Transmission of aperiodic CSI on an LAA SCell is supported at least for aperiodic CSI for an unlicensed carrier
  - Both aperiodic CSI only (without UL-SCH) and aperiodic CSI with UL-SCH are supported
    - FFS the conditions for aperiodic CSI only on an LAA SCell
- Transmission of periodic CSI on an LAA SCell is not supported within the current scope of the eLAA work item
  - The introduction of periodic CSI on an LAA Scell at a later stage in Rel-14 is not precluded

7.3.1.4 PRACH design

R1-162471 Random access procedure in LAA LG Electronics

R1-163785 WF on PRACH procedure in LAA LG Electronics, Intel, Samsung

Working Assumption:

- PRACH resource configuration in time and frequency in LAA SCell:
  - RRC configuration of frequency resource(s), sequence set, and time domain resources
    - Omitting time domain resources from the RRC configuration can be studied, considering e.g. interactions with LBT.
  - FFS whether any of the following can be dynamically adapted by PDCCH, or deterministically derived by the UE:
    - time domain resources
    - frequency resources for actual transmission
    - sequences for actual transmission
    - If using PDCCH, FFS whether common or UE-specific

R1-163818 WF on PRACH waveform Nokia, Alcatel-Lucent Shanghai Bell, CATT, Panasonic, Samsung

Proposals:

- LAA-PRACH is based on LTE PRACH format 0 and/or format 4 repeated *N* times in frequency
  - The value of *N* is configurable and ≥ ~~2~~includes at least {1, 2, ...}
  - The placement of the PRACH clusters in frequency shall be able to fulfil the ETSI regulation on occupied channel bandwidth
    - PRBs for LAA-PRACH for each value of *N* are defined in the specification, exact positions are FFS
  - FFS: CP of the PRACH format 0 is shortened by [1 symbol] to provide room for LBT

Petitioners' Exhibit 1007, p. 1436
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

– FFS: The value of Timing Advance for LAA-PRACH transmission is configurable

R1-163853 WF on PRACH waveform Ericsson
Proposal:
- Preamble durations of up to 1 ms are supported in eLAA.
- PRACH is transmitted in one or more of RB interlaces
  – The interlaces to use is configured by RRC
- PRACH preamble is based upon repetition of one DFTS-OFDM symbol of the same length as a PUSCH DFTS-OFDM symbol.
- A region for LBT is provided by not transmitting one or more OFDM symbols

Continue evaluation both options as listed below till RAN1#85

7.3.1.5 Channel access framework

Extending the agreement reached during the Rel-13 WI on LAA and for corresponding agreed channels and signals

Agreement:
- If the sum total duration of DL and UL transmissions [and UL LBT] is less than the obtained channel occupancy duration, it is sufficient for the UE(s) to perform a single 25us LBT to access the channel and perform UL transmission
  - FFS the conditions, if any, on the usage of 25us LBT especially w.r.t. traffic class
  - FFS the […] part

R1-163148 On Performance of UL Channel Access Procedures for PUSCH with Self-Carrier Scheduling Ericsson

R1-163707 Way forward on UL LBT Intel, Samsung
Proposal:
- The scheduled UL subframe is not within an obtained channel occupancy duration, Cat-4 LBT is used for UL LBT.
  - FFS: Whether the UL maximum contention window size can be smaller than that for DL category 4 LBT
- Energy detection threshold used for UL LBT for both self-carrier and cross-carrier scheduling is based on the energy detection threshold rule for DL LBT.
- LBT for UL grant only transmission by eNB follows Cat-4 LBT with high priority.

Petitioners' Exhibit 1007, p. 1437
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- FFS: the priority class to be used for UL grant only transmission.

R1-153611	WF on supporting 500km/h relative speed case	LG Electronics, Huawei, HiSilicon, Samsung, CATT
R1-163524	WF on DMRS Mapping for PC5 based V2X	Ericsson, Qualcomm, Vodafone
R1-163624	WF on support of the increased subcarrier spacing for V2V communication	Intel, ITRI

Conclusion:

- Send an LS to RAN4 asking for urgent feedback especially regarding feasibility, RAN4 specification impact, and implementation impact of the following 4 design alternatives, and kindly request a response as soon as possible. Note that RAN1 is intended to conclude this topic during this week - Stefano (Ericsson)
  - The company names will NOT be included in the LS
  - Add as the background that RAN#71 agreed:
    - *The outcome of this work item should be able to support a relative speed of up to 500 km/h with enhancements/changes (if necessary) to the physical layer structure designed for the relative speed up to 280 km/h.*

The four alternatives:

- Alt 1:
  - "4V structure" for PSSCH/PSCCH is kept (which is already an agreement in RAN1)
  - In order to support 500 km/h relative speed case, lowering the coding rate can be used
    - FFS how to adapt MCS, RB size, and/or number of transmission subframes depending on the situation
      - This may or may not have any specification impact
  - Confirm the working assumption:
    - 15 kHz subcarrier spacing with 1 msec TTI length
  - Supported by:
    - LG Electronics, Huawei, HiSilicon, Samsung, CATT, ZTE, Nokia, ASB, OPPO (9)
  - Objected by:
    - E///, QC
- Alt2
  - For PC5-based V2V:
    - A DMRS RE is transmitted every 6th subcarrier in all symbols of the scheduled transmission
      - DFT precoding is NOT applied to data REs
      - Offset of the DMRS RE within a RB is FFS
      - FFS between rate matching and puncturing
      - FFS details of the DMRS sequence
  - Confirm the working assumption:
    - 15 kHz subcarrier spacing with 1 msec TTI length
  - Supported by: Ericsson, Qualcomm, Vodafone (3)
  - Objected by: SS, HW, HiSi, CATT, Nokia, ASB
- Alt 3:

Petitioners' Exhibit 1007, p. 1439
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - Increased subcarrier spacing from 15kHz to 60kHz is supported for LTE PC5 V2V communication
  - Supported by: Intel, ITRI (2)
- Alt 4: Alt 2 + Alt 3 (with 30kzh tone spacing)
  - Supported by: Intel (1)

Friday
Alt.5: Alt.1 + adapt MCS, the number of RBs, and the number of transmission subframes depending on the UE absolute speed and UE synchronization source (e.g. GNSS or eNB
FFS one or more PSCCH format(s) need to be supported
Supported by Ericsson, Huawei, HiSilicon, LGE, ZTE, CATT, Nokia, Vodafone, CATR, Samsung, Sharp, Sony, ASB, Lenovo, OPPO, Xinwei

RAN1 Chair→ can alt.5 be agreed
Objection from Qualcomm – see control channel issue and would like to get RAN4 feedback – ok to take it as working assumption
CATT→ afraid that situation will be identical at next meeting
T-Mobile→ 16 companies supporting, one against – why not to declare a working agreement and move one
Intel→ prefer to keep the WA approach
Nokia

R1-163692 LS on PC5 DMRS and L1 format for V2V Ericsson
The LS is approved in R1-163693, by removing "demodulation" from "demodulation feasibility".

Petitioners' Exhibit 1007, p. 1440
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-163612 WF on resource sensing LG Electronics, Huawei, HiSilicon, CATT, Nokia, OPPO, Samsung, Sony, ITL, Beijing Xinwei, Sequans, Ericsson, DOCOMO, Panasonic, Potevio, ITRI, Sharp, NEC, ZTE, Fujitsu

Agreement:

- Both SA decoding and energy measurement are supported for sensing in UE autonomous resource selection.
  - FFS how each of SA decoding and energy measurement is used.
  - Note: strive for a design with managable complexity especially in terms of SA blind decodes, UE buffer, etc.

Agreement:

- If at TTI n resource selection/reselection is triggered in UE autonomous resource selection mode,
  - The UE at least senses between TTI n-a and TTI n-b (FFS a and b with a>b>0), where a and b are integers
    - Working assumption: The values a and b are common for V2V UEs.
  - UE selects time-frequency resource(s) for PSSCH
  - UE transmits SA in TTI n+c where c is an integer
    - FFS whether c is a fixed value (>= 0) or variable.

Agreement:

- In UE autonomous resource selection mode, SA can be transmitted for every TB.
  - FFS whether to support transmitting and/or receiving TB without SA
  - FFS whether every data (re)transmission for the same TB has the associated SA transmission.

Agreement:

- In UE autonomous resource selection mode,
  - UE transmits SA at TTI n+c indicating the associated data which is transmitted at TTI n+d (FFS d with d>=c), where c and d are integers
  - UE indicates whether it intends to reuse the frequency resource signaled for transmission at TTI n+d for potential transmission at TTI n+e for another TB (FFS e with d<e), where e is an integer
    - FFS whether this indication is implicit or explicit.
    - FFS if and how to signal the value for e
    - FFS how the UE determines the value for e
    - FFS whether e is a single value or can be multiple values
    - FFS whether, and if so how, a UE can notify later that it no longer intends to use the resource at TTI n+e.
    - FFS how the UE decides to indicate this
    - Other details FFS

R1-163623 WF on Priority Support for V2V Communication Intel, Ericsson, III
R1-163879 Harmonized WF on Priority Support for V2V Communication Intel, Ericsson, III, Huawei, HiSilicon, Nokia, Alcatel-Lucent Shanghai Bell, CATT, ITRI, LGE, Samsung

Agreement:

- Proposal 1:
  - Priority handling is supported over PC5 for eNB-scheduled and UE- autonomous V2V communication
- Proposal 2:
  - The priority information is taken into account in the resource (re)selection for UE-autonomous mode
    - Further details are FFS
- Proposal 3:
  - Down-select between two alternatives at RAN1#85 meeting
    - Alt.1 Priority information is signaled in SCI
    - Alt.2 Priority information is not signaled in SCI

Conclusion for Energy measurement for sensing:

- Continue discussion until next meeting for the following options for the purpose of resource selection for PSSCH
  - Measurement of reception power of the decoded SA
  - Measurement of energy in SA resource
  - Measurement of energy in data resource

Agreement:

- Reselection is triggered if
  - A counter meets an expiration condition, or
  - The counter is reset to a value when reselection is triggered.

Petitioners' Exhibit 1007, p. 1441
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- FFS whether this value is random, fixed, and/or the same across UEs
- UE identifies that the current resource allocation cannot fulfil the requirement, e.g., latency, reliability, priority, fairness, or QoS requirement (details FFS), or
- FFS how to impose limitation in the resource size selected by a UE
- Working assumption: UE detects resource allocation (including the indication of the intention of reusing the frequency resource as per the existing agreement) of another UE which potentially overlaps with its current resource allocation (including the indication of the intention of reusing the frequency resource as per the existing agreement) and the detected situation meets a condition, or
- The condition is FFS, not precluding applying different conditions for different priorities (if any relevant case happens in priority handling from RAN1 point of view).
- eNB triggers reselection, or
- FFS whether some information needs to reported from UE to eNB
- FFS additional condition(s), e.g.,
- If it is supported that a UE can notify later that it no longer intends to use the resource at a future TTI, reselection triggering condition related to this notification.
- Reselection triggered by notification on resource collision from another UE
- Reselection triggered by sensing of resources utilization above a threshold
- Reselection triggered by higher layer
- Other conditions are not precluded

Send an LS to RAN2 to capture the agreements on resource allocation – Hanbyul (LGE)

R1-162677 Semi-persistent transmission support for SL Samsung

R1-163537 WF on SPS for V2V mode 1 Panasonic, Huawei, HiSilicon, OPPO, LG Electronics

Agreement:

- For SPS of V2V traffic for mode-1 SPS on PC5:
  - The eNB may configure multiple SPS configurations for a given UE
    - At least SPS-configuration-specific MCS (if MCS is part of the SPS-configuration) and SPS-configuration-specific periodicity can be configured
      - FFS if/which other SPS parameters can differ across the SPS-configurations
    - The eNB can dynamically trigger/release the different SPS-configurations by use of (E)PDCCH
      - Details of the trigger/release are FFS
  - Working assumption: The UE can indicate to the eNB that it does not intend to transmit data before a transmission associated to an SPS configuration
    - FFS any details of the signaling protocol
    - FFS whether eNB acknowledgment of the UE indication is needed

R1-163613 WF on multiplexing SA and data LG Electronics, Nokia
R1-163627 WF on TDM of SA and data Samsung, Intel, Sequans
R1-163625 WF on MPR for transmission of PSCCH and PSSCH in the same subframe Intel

Agreement:

- When SA and the associated data are transmitted in the same TTI, they can be transmitted in non-adjacent RBs.

Working assumption:

- In V2V, SA resource and data resource are always FDMed from system perspective
  - If significant issues are found, can consider further supporting TDM

Agreement:

- A data pool is always associated with an SA pool.
- An RB of an SA pool in a TTI cannot be included in the associated data pool.
- An RB of an SA pool in a TTI cannot be included in another SA pool (if exists).
- Working assumption: At least an RB of a data pool in a TTI can be included in another data pool (if exists).
- An RB of an SA pool in a TTI cannot be included an un-associated data pool (if exists)

Agreement:

- The following two cases are supported:
  - SA and the associated data are transmitted in the same TTI,
  - SA and the associated data are transmitted in different TTIs
    - The scheduling timing between SA and associated data is variable
      - In UE-autonomous resource selection mode, the timing is chosen by the transmitting UE from a configurable range
      - In eNB-scheduling mode, the timing is determined by eNB
      - SA includes information about the scheduling timing

Petitioners' Exhibit 1007, p. 1443

R1-162393 Prioritization-based resource allocation for sidelink-based V2V communication Fujitsu

7.3.2.3 Coexistence of PC5-based V2V operation and legacy Uu operation

Including inter-UE coexistence in the same carrier frequency, intra-UE coexistence in the same carrier frequency, and intra-UE coexistence in different carrier frequency

R1-163036 Coexistence of PC5-based V2V operation and legacy Uu operation Qualcomm Incorporated
R1-163180 Discussion on co-existence between PC5-based V2V and legacy Uu NTT DOCOMO, INC.
R1-162824 [DRAFT] LS on V2X multicarrier configuration Ericsson LM
Conclusion:

- The draft LS in R1-162824 is endorsed in principle. Further discussion offline to refine the wording. Revisit later this week – Stefano (Ericsson)

R1-163745 LS on V2X multicarrier configuration Ericsson

The LS is agreed in R1-163746, by the following updates:

- Accepting the changes in change marks
- multichannel operation for PC5 V2V
- Change reference [2] to TS 102 687

R1-163633 WF on coexistence of PC5-based V2V and WAN LG Electronics, NTT DOCOMO, ZTE
Agreement:

- The followings are supported for the purpose of coexistence between PC5-based V2V and WAN:
  - Sidelink open loop power control is re-used for SL TX for V2V
    - FFS RSRP based resource selection

- SL TX for V2V can be prioritized over WAN TX
  - FFS the details (e.g., applicability to Mode 1 and/or Mode 2, etc), especially whether existing D2D mechanism can be reused,
  - The prioritization is managable by eNB. Details FFS.
- The same receiver capability of D2D communication UEs is assumed for V2V UEs. That is, a Rx chain is available at all time to receive V2V signals without affecting WAN reception (from RAN1 perspective) when the UE is configured to receive V2V.

R1-162415	Coexistence of PC5-based V2V operation and legacy Uu operation	ZTE
R1-162485	Discussion on coexistence of PC5 based V2V operation and legacy Uu operation	LG Electronics
R1-162681	Discussions on coexistence of PC5-based V2V and legacy Uu	Samsung
R1-163338	Coexistence of PC5 V2V operation and legacy Uu	Huawei, HiSilicon

7.3.2.4 Enhancement to sidelink synchronization procedure

Low priority is given to enhancements to Rel-12/13 SLSS-based synchronization.

R1-162337	Discussion on the synchronization source priority	Guangdong OPPO Mobile Telecom.
R1-162416	Enhancement to sidelink synchronization	ZTE
R1-162682	Synchronization for PC5 based V2V	Samsung
R1-163037	Synchronization Procedure for V2V	Qualcomm Incorporated
R1-163203	Sidelink synchronization procedure supporting V2V	Nokia, Alcatel-Lucent Shanghai Bell

R1-163725 WF on SLSS ID for enabling LTE-based ITS coexistence Ericsson

Proposal:

- SL SS transmitted by a UE participating in ITS safety services in a given carrier is distinguishable from SL SS transmitted by a UE participating ITS non-safety services in the same carrier.
  - If a UE participates in both ITS safety and ITS non-safety services in a given carrier, then it transmits only SL SS associated with ITS safety
  - Other details FFS
  - Note: this is not intended to impact the working assumption on the sequence design of SL SS and the agreement on the location of SL SS
  - Note: how to capture it in the specification is up to RAN2
  - Send an LS to RAN2 – Ricardo (Ericsson)

Continue discussion till RAN1#85

R1-163628 Way Forward on SLSS for V2V PC5 Huawei, HiSilicon, Samsung, Sharp, ITRI, CATR, LG Electronics, NTT DOCOMO, Potevio

Proposal:

- For the V2V PC5 SLSS:
  - SLSS ID from GNSS timing can be defined by some reserved value(s) of the SLSS IDs:
    - FFS: the detailed reserved value(s) of the SLSS IDs
    - Notes: the reserved value(s) of the SLSS IDs can be (pre-)configured or pre-defined

Continue discussion till RAN1#85

R1-163654 WF on V2V and D2D co-existence Samsung, Huawei, HiSilicon, Sharp, ITRI

Proposal:

- SLSS should be differentiated between Rel-14 V2V and Rel-13 D2D
  - Details FFS

Continue discussion till RAN1#85

R1-163710 Way Forward on V2V PC5 timing Huawei, HiSilicon, ITRI, OPPO, CATR, Potevio, NEC, Nokia, ASB, Samsung

Proposal:

- PC5 TTI index/subframe number and frame number are derived from the UTC timing at least when GNSS is the direct synchronization reference for PC5 based V2V transmission
  - FFS: how to derive the TTI index/subframe number and frame number

Continue discussion till RAN1#85

R1-163882 Way forward on synchronization source priority NTT DOCOMO, Oppo, LGE

Agreement:

Petitioners' Exhibit 1007, p. 1445
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Whether eNB timing or GNSS timing is prioritized can be per carrier cell-specifically configured by the cell on which an UE camps
  - The carrier that UE camps on can be different carrier other than the carrier that the priority is configured
  - If the UE does not receive such a configuration, UE selects synchronization source with the same priority order as out of coverage case
    - FFS: The priority order for out of coverage case
  - Send an LS to RAN2 and RAN4 – Shinpei (DCM)

R1-163580 WF on enhancements for non-precoded CSI-RS LG Electronics, Ericsson, ETRI, NEC, Samsung
Agreements:

- For {20, 24, 28, 32} ports, a CSI-RS resource for class A CSI reporting is composed as an aggregation of *K* CSI-RS configurations [i.e. RE patterns].
  - The number of REs in the kth configuration $N_k \in \{4, 8\}$
    - The same $N_k = N$ can be used for all k
      - FFS whether the same $N_k = N$ for all k is the only permitted configuration
      - FFS whether the set of values of N_k might be further restricted for some numbers of CSI-RS ports
    - FFS whether a different set of N_k might apply in case of CDM4
    - FFS on including N_k=2.
  - Aim to enable the support of CSI-RS port sharing with Rel-13 and Rel-12 UEs
  - The per-port CSI-RS density is FFS based on one or more of the following alternatives:
    - FDM
    - TDM
    - Partial port
    - Partial overlapping, e.g. for 32 ports, ports 15-38 in PRB#1, ports 23-46 in PRB#2
    - Aperiodic CSI-RS with partial bandwidth
    - Measurement restriction in frequency domain
    - CDM, e.g. 2 x N_k ports transmitted in a single N_k resource
    - Other schemes
    - Note that the following are not precluded:
      - per-port CSI-RS density per PRB = 1
      - different per-port CSI-RS densities for different CSI-RS ports is not precluded

R1-163617 WF on Design Principles for {20, 24, 28, 32} ports NZP CSI-RS resource in Rel-14 Qualcomm, Intel, Xinwei, ZTE
Proposal:

- The aggregation of CSI-RS resource configuration is used to support {20, 24, 28, 32} NZP CSI-RS ports
- Backward compatibility with Rel-13 and Rel-12 UEs for CSI-RS port sharing shall be supported
- The use of CDM-length 2 and 4 is maintained for {20, 24, 28, 32} CSI-RS ports
  - The CDM-length 8 is not precluded. Details FFS.
- FFS on lower density and overhead reduction techniques

R1-163457 WF on CSI-RS RE density for non-precoded CSI-RS Samsung, Nokia, Alcatel-Lucent Shanghai Bell, NEC, LGE, ZTE, ETRI, NTT DOCOMO, Huawei
Revision of R1-163616
R1-163549 WF on additional REs for Class A NZP CSI-RS resource Intel

7.3.3.1.2 Beamformed CSI-RS

More efficient resource utilization for UE-specific BF CSI-RS, including aperiodic CSI-RS

R1-162686 Specification impact of aperiodic CSI-RS Samsung
R1-162599 Efficient utilization of BF CSI-RS Huawei, HiSilicon
R1-163039 Enhancements on Beamformed CSI-RS for eFD-MIMO Qualcomm Incorporated
R1-162368 On possible approaches to CSI-RS overhead reduction for Class B FD-MIMO Intel Corporation

Petitioners' Exhibit 1007, p. 1447
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-162281 On aperiodic CSI-RS transmission CATT
R1-162807 Proposals for Improving RS Utilization for beamformed CSI-RS Transmission Schemes Nokia, Alcatel-Lucent Shanghai Bell

R1-162346 Enhancements on Beamformed CSI-RS ZTE
R1-162488 Enhancements on beamformed CSI-RS including aperiodic CSI-RS LG Electronics
R1-162969 Discussion on Aperiodic CSI-RS NTT DOCOMO
R1-162987 Discussion on resource utilization for UE-specific BF CSI-RS ITRI
R1-163134 Considerations on Aperiodic CSI-RS Beijing Xinwei Telecom Techn.

R1-163582 WF on enhancements for aperiodic CSI-RS LG Electronics, NTT DOCOMO, Samsung, ZTE
Proposal:

- Aperiodic NZP CSI-RS resource is supported in Rel-14, where
  - It can only be configured for PUSCH based A-CSI reporting.
  - Two types of CSI-RS resource configurations are supported:
    - Type 1: Reuse of legacy (semi-static) CSI-RS resource allocation/configuration
    - Type 2: A new aperiodic CSI-RS resource allocation/configuration
      - Without *Subframe_config*
      - Whether aperiodic CSI-RS resource allocation/configuration (e.g. # of ports, CSI-RS pattern, port subset) is semi-static or dynamic or a combination between semi-static and dynamic is FFS
      - Note: If resource allocation/configuration is fully semi-static, no extra bit in the UL-related DCI is needed to support aperiodic CSI-RS
  - Aperiodic CSI-RS transmission instance is indicated by UL-related DCI:
    - For Type 2, aperiodic CSI-RS transmission is in the same DL subframe as the associated UL-related DCI
    - For Type 2, aperiodic CSI-RS can be transmitted in any DL subframe that the UL-related DCI can be present.
  - Other alternatives, e.g., indicated by DL-related DCI, are FFS.
- Details on rate matching needed due to aperiodic NZP/ZP CSI-RS transmission(s) are FFS.
- FFS: Aperiodic CSI-IM resource is supported in Rel-14.

R1-163618 Way Forward on overhead reduction for Class B Beamformed CSI-RS Qualcomm, Intel, Ericsson, Xinwei
Agreements:

- Until RAN1#85, down-selection/merge the following alternatives for reducing the overhead for beamformed CSI-RS, considering overhead reduction, performance, backward compatibility, UE implementation complexity:
  - Alt.1: Aperiodic CSI-RS
    - E.g., One-shot CSI-RS transmission with transmission on the same subframe as triggering subframe
  - Alt.2: Dynamic CSI-RS activation and/or deactivation
    - E.g., One-shot or multi-shot CSI-RS transmission after the triggering subframe
  - Alt.3: Reduced frequency density via decimation over part or all of the bandwidth
  - Alt.4: MR with dynamic sharing of the beams on CSI-RS resources among the UEs
  - Alt.5: Triggered measurement of one of multiple CSI-RS configurations
  - Alt.6: Spatially multiplexed beamformed CSI-RS
  - Other approaches are not precluded

R1-163546 WF on overhead reduction for Class B FD-MIMO with K = 1 Intel, Nokia, ASB

7.3.3.1.3 Uplink DM-RS

Evaluate and, if needed, specify more orthogonal ports with partially overlapping BW allocations
R1-162282 Discussion on UL DMRS enhancement CATT
R1-162347 Discussion on UL DMRS enhancement for eFD-MIMO ZTE
R1-162369 Uplink DM-RS enhancements for FD-MIMO Intel Corporation

R1-163040 Improving Uplink DM-RS Orthogonality for MU-MIMO Qualcomm Incorporated

Petitioners' Exhibit 1007, p. 1448
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-163135 Discussion on uplink DM-RS enhancement Beijing Xinwei Telecom Techn.

R1-163602 WF on UL DMRS Intel Corporation, Nokia, Alcatel-Shanghai Bell, Samsung, CATT
Also supported by NEC
R1-163834 WF on Uplink DMRS Intel, Samsung
Also supported by Nokia & ASB

Agreements:
- Evaluation assumptions on Slides 2 and 3.

Conclusions:
- Consider the following possible DMRS enhancements in the evaluation:
  - IFDMA DMRS with a comb number of 2 and/or 4
  - More DMRS symbols (with or without larger OCC), e.g.:
    - IFDMA DMRS subcarriers with PUSCH REs, or
    - across 2-subframe pairing
  - Enhancement of DMRS sequence generation, including DMRS transmitted in a wider BW than the associated PUSCH
  - Frequency domain OCC
- Other solutions are not precluded
- Companies are to state their Rel-13 baseline scheme.

7.3.3.2 CSI Reporting

R1-162688 Discussions on periodic CSI reporting for class A in eFD-MIMO Samsung

7.3.3.2.1 Non-precoded CSI-RS codebooks

For newly defined number of ports for NP CSI-RS for a subset of possible port layouts,both 1D and 2D

R1-162283 Antenna port layouts for Rel-14 FD-MIMO CATT

Petitioners' Exhibit 1007, p. 1449
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-163581 WF on Hybrid CSI Reporting Samsung, Alcatel-Lucent Shanghai Bell, CATT, Nokia, Qualcomm, LG Electronics, Beijing Xinwei, Interdigital, AT&T, China Telecom, Huawei, HiSilicon, CMCC, CATR
Revised in R1-163665 Samsung, Alcatel-Lucent Shanghai Bell, CATT, Nokia, Qualcomm, LG Electronics, Beijing Xinwei, Interdigital, AT&T, China Telecom, Huawei, HiSilicon, CMCC, CATR, Ericsson
(Note that slide 3 is illustrative only)

Agreements:

- Specify at least one of the following enhancements on Rel.14 CSI reporting:
  - One CSI process configured with 2 independent eMIMO-Types associated with different sets of parameters
    - Each eMIMO-Type is associated with a set of K≥1 NZP CSI-RS resources
    - Note that the 2 independent eMIMO-Types may be of the same Class
    - Note that if it decided that the two independent eMIMO-Types are always of the same class, then only 1 eMIMO-Type with 2 different sets of parameters would be sufficient.
  - An additional mechanism for CSI calculation applied to a configuration with a pair of CSI processes each of which is configured with 1 eMIMO-Type
- Notes:
  - This does not preclude the possibility of specifying a new eMIMO type in Rel-14 and the use of this new type for Hybrid CSI reporting
  - Down-selection (if any) between the two enhancements will be decided in RAN1#85

R1-163548 WF on hybrid Class A and Class B operation Intel
Revised in R1-163763 WF on hybrid Class A and Class B operation Intel, Samsung, LG

Observations:
The following alternatives have been discussed and may be studied:

- Study the following alternatives for the CSI reporting for hybrid Class A and Class B K=1 FD-MIMO and compare with the baseline of Alt 1 including i2 and CQI
  - Alt 1: Class A CSI with single i1 + RI
  - Alt 2: Class A CSI with multiple i1 + RI
  - Alt 3: Class A CSI with single i1
  - Alt 4: Class A CSI with multiple i1
  - Note for the Alt 3-4 RI can be restricted to 1
  - Note that any of the above alternatives may be reported with or without CQI and/or i2
  - Note that the CSI measurement may be based on partial or whole set of CSI-RS ports
  - Other alternatives and merging of alternatives are not precluded
- Study the following alternatives for the CSI reporting for hybrid Class B and Class B FD-MIMO and compare with the baseline of both Class Bs with full CSI
  - Alt 1: The first Class B has K>1 with CRI, and optionally i1, second Class B has K =1
  - Alt 2: The first Class B has K>1 with K independent CSI reports, second Class B has K =1
  - Alt 3: The first Class B has K=1 with PMI, second Class B has K =1
  - Alt 4: The first Class B has K>1 with CRI, and optionally i1, second Class B has K >1
  - Alt 5: The first Class B has K>1 with K independent CSI reports, second Class B has K >1
  - Alt 6: The first Class B has K=1 with PMI, second Class B has K >1
  - Other alternatives and merging of alternatives are not precluded

7.3.3.2.3 Advanced CSI reporting and interference measurement

(Second priority) Evaluate and, if needed, specify enhancements on CSI reporting to improve eNB precoding and interference measurement for MU transmissions

R1-162595 Discussion on analog CSI feedback Huawei, HiSilicon
R1-162693 Linear combination codebook and CSI reporting Samsung
R1-162812 Initial Evaluation Results with Advanced CSI Reporting Nokia, Alcatel-Lucent Shanghai Bell

R1-163454 WF on Rel.14 Advanced CSI Nokia, Alcatel-Lucent Shanghai Bell, Samsung, CATT, Huawei, HiSilicon, Qualcomm

Conclusions:

- Evaluate proposed advanced CSI schemes
- Baseline for comparison:
  - Implicit CSI feedback based on Rel.13 codebook (as well as its extension to >16 ports) or other legacy codebooks if applicable

Petitioners' Exhibit 1007, p. 1450
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Performance and feedback overhead should be provided
- Simulation scenarios:
  - FTP model 1 with 70% and 50% traffic loading
  - Evaluations should include dynamic switching between MU- and SU-MIMO
  - Other simulation details can refer to 36.897 EB/FD MIMO SI

Candidates for PMI Enhancement:

- Codebook based (implicit feedback)
  - Linear combination codebook (enhanced W2) for Non-precoded CSI-RS and beamformed CSI-RS
  - MU CSI (e.g., additional i_1, $i_{1,1}$, or $i_{1,2}$)
  - Other new or modified codebooks
- Explicit feedback
  - Channel quantization
  - Eigenvector quantization
  - Covariance matrix quantization
- Analog feedback
- Note: other schemes are not precluded

Candidates for CQI Enhancement:

- CQI Derivation
  - Interference estimation based on NZP CSI-RS
  - MU-CQI conditioned on MU hypotheses and CSI-IM
- Reduced CQI feedback delay
- Note: other schemes are not precluded

R1-163127	Consideration on DM RS based open loop transmission	CATR
R1-163212	Need for discussions on DMRS based Open/Semi-open loop MIMO schemes for eFD-MIMO	CEWiT

R1-163455 WF on DMRS-based Open-Loop and Semi-Open-Loop MIMO CATT, Alcatel-Lucent Shanghai Bell, CATR,Intel, Huawei, HiSilicon, Nokia, Samsung

Agreement:

- Evaluate open-loop and semi-open-loop MIMO schemes until RAN1#85
  - Example schemes proposed in RAN1#84bis are provided below
  - NOTE: other schemes are not precluded
- Companies are encouraged to provide performance, CSI feedback and transmission details

Example: a CSI-process with K = 1 CSI-RS

- Alt-1a: Transparent DMRS (i.e. DMRS and PDSCH precoded identically)
  - PMI feedback points to one of N precoding hypotheses, where each precoding hypothesis corresponds to a set of M>1 precoding matrices on a subband
    - PMI overhead $\log_2(N)$ bits, where N can be 1
  - Example:
    - PRB-level or subcarrier(s)-level cycling of M precoders
    - Cycling for a subset of codebook by Codebook-subset-restriction
    - Cycling for i2, not for i1 (W1 reporting only for dual-stage codebook, e.g. Rel.10 8Tx, Rel.12 4Tx, Rel.13 Class A and its possible Rel.14 enhancements)
- Alt-1b: Non-transparent DMRS (i.e. DMRS and PDSCH precoded differently)
  - Received PDSCH signal as y = HW1W2s + n, where, S is unprecoded PDSCH, W2 refers to OL-precoding from L layer PDSCH to D DMRS ports, W1 refers to CL-precoding from DMRS/PDSCH to CSI-RS ports (or non-precoded channel)
  - RI/PMI feedback: quantization of W1, based on H and knowledge of W2
  - CQI feedback: quantization of HW1W2
  - Example of W2 precoding (open-loop)
    - Rank-1: SFBC (RE-level)
    - Rank-2: LD-CDD or layer permutation

Example: a Class B CSI-process with K>1 CSI-RS

- Alt-2a:
  - A single wideband CRI report and/or long-term PMI
  - Open-loop/semi-open-loop with K=1 is performed in the CSI-RS resource indicated by CRI
- Alt-2b:
  - CRI cycling, no CRI report
  - open-loop/semi-open-loop with K=1 is performed in the corresponding CSI-RS resource indicated by CRI

7.3.4 Downlink Multiuser Superposition Transmission for LTE - *WID in RP-160680*

R1-163169 Discussion on candidate multiuser superposition transmission scheme NTT DOCOMO, INC.
R1-163299 On the operation and network assistance for MUST Case 1 and 2 Nokia, Alcatel-Lucent Shanghai Bell
R1-163340 Consideration on power allocations for MUST Huawei, HiSilicon

R1-163788 WF on modulation order and spec enhancement LG Electronics, Intel, MediaTek

Note:
- MUST-Near/MUST-Far UEs will be used in the relevant discussions.

Agreement:
- For Case 1 and 2 described in MUST WID,
  - MUST-Far UE's modulation order is limited at least to QPSK when it is co-scheduled with MUST-Near UE in a given subframe
    - FFS whether or not to support 16QAM for MUST-Far UEs
      - More study is necessary

R1-163776 Way forward on superposition transmission for MUST MediaTek, Huawei, HiSilicon
Agreement:
- For Case 1 & 2, up to two co-scheduled UEs per spatial layer are supported
- For Case 1 & 2, MUST category 2 with one or more transmission power ratios for co-scheduled MUST UEs in each constellation combination is supported
  - One or more transmission power ratios for each constellation combination are supported
    - FFS: The number of multiple power ratios is down-selected from 1 to 8
  - The superposed constellation corresponding to one of transmission power ratios in each constellation combination is a legacy constellation
    - For (MOD_N, MOD_F) = (QPSK, QPSK), 16QAM legacy constellation
    - For (MOD_N, MOD_F) = (16QAM, QPSK), 64QAM legacy constellation
    - For (MOD_N, MOD_F) = (64QAM, QPSK), 256QAM legacy constellation
  - If 2 or more power ratios are supported, the other multiple transmission power ratios for a MUST-far UE in each constellation combination can be selected from the following value ranges:
    - For (MOD_N, MOD_F) = (QPSK, QPSK), the power ratio range as a starting point is [0.6, 0.95]
    - For (MOD_N, MOD_F) = (16QAM, QPSK), the power ratio range as a starting point is [0.6, 0.95]
    - For (MOD_N, MOD_F) = (64QAM, QPSK), the power ratio range as a starting point is [0.6, 0.95]
  - FFS the impact if 16QAM for MUST-Far UE is supported
  - For further down-selection on the set of transmission power ratios, companies are encouraged to provide the scheduling PDF of power ratios and the corresponding performance for different sets of power ratios

Agreements:
For all MUST evaluations (cases 1, 2 & 3):
•For 2Tx & Case 1 and 2, up to two co-scheduled UEs per spatial layer are considered
•For 2Tx & Case 3, up to two co-scheduled UEs within a cell are considered
•For 4/8Tx & Case 3, up to four co-scheduled UEs within a cell are considered
Note that the above scheduling options may be considered per PRB, per group of PRBs, or per scheduled UE's bandwidth

R1-163824 Way forward on control signaling for MUST ZTE, LG Electronics
LGE withdrew the co-sourcing
Continue discussion offline
R1-163774 Way forward on MUST mechanisms for efficient operation NTT DOCOMO, INC., MediaTek
Agreement:

- For MUST case 1 and case 2, the candidate assistance information for signalling or blind detection by the MUST-near UE include:
  - Existence of MUST interference per spatial layer
  - Transmission power allocation per spatial layer of its PDSCH and of the MUST-far UE's PDSCH
  - Modulation order of each codeword of MUST paired UE's PDSCH
    - This information is only needed if modulation order of MUST-far UEs is not limited to QPSK
- For MUST case 3, in addition to the above:
  - PMI or DMRS port/sequence of the MUST-paired UE
- Each of the above may be either:
  - per PRB, or
  - per group of PRBs, or
  - single value across the UE's scheduled bandwidth

R1-163775 Draft LS to RAN4 Mediatek
Revised and agreed in R1-163836.

7.3.5 eMBMS enhancements for LTE - WID in RP-160675

R1-163840 Chairman's Notes of Agenda Item 7.3.5 on eMBMS enhancements for LTE Session Chairman (Nokia)
The document was presented by Matthew Baker from Nokia and .provides the outcomes of the eMBMS session.
Discussion: .
Decision: The document is endorsed.

To revisit on Friday:
R1-163452: Scenarios and simulation assumptions for longer CP (David Bhatoolaul, Nokia):
Try to agree it quickly; if it needs more time, email approval until Friday 22nd April.

R1-163285 Work plan for eMBMS enhancements in LTE Ericsson
Decision: The document is noted.

Clarifications regarding the WID:

- Objective a may be supported on carrier on which legacy UEs can be scheduled
  - It is assumed that subframes contain a new numerology are signalled as MBSFN subframes
  - Signalling of services to legacy and new UEs is handled by higher layers, so RAN1 assumes that legacy UEs would not be configured to receive MBMS services in an MBSFN subframe that had a new numerology
  - If legacy UEs are to be supported on the carrier, the legacy control region shall not be impacted by the new numerology in a subframe
  - FFS whether MBMS MDT measurements would be impacted by any new numerology
- Objectives b and c mean that legacy UEs cannot be scheduled on the carrier
- Carriers supporting objective b may also support unicast traffic for Rel-14 UEs
- FFS what SI has to be supported on a carrier supporting objective b
- FFS whether carriers supporting objective c may also support unicast traffic for Rel-14 UEs
- FFS whether the reduced density of CRS with objectives b and c impacts time/frequency tracking, and if so, how this is handled
- Note that if there is additional RAN1 impact from objective d, it is in the area of how to support the self-contained SI as mentioned in WID

R1-163286 Skeleton TR for eMBMS enhancements for LTE Ericsson
Decision: The document is noted.
Correct the typos in TR and include the conclusion regarding objective f - R1-163451 – approved as v0.1.0 – TR number to be allocated by MCC.
Send endorsed skeleton TR to RAN2 in an LS and delegate responsibility for populating the TR to RAN2 - R1-163470 – approved in R1-163450 with the following change: "With the above conclusion, ~~there is no additional work in~~ RAN1 expects that most of the work in the objectives that are related to the study part of the work item is in the remit of RAN2."

Not treated.
R1-162736 General discussion on eMBMS enhancements Lenovo (Beijing) Ltd

7.3.5.1 Longer cyclic prefix for MBSFN subframe

Priority at RAN1#84bis is to define the required simulation assumptions.

Simulation assumptions
R1-163363 Longer cyclic prefix evaluation considerations Nokia, Alcatel-Lucent Shanghai Bell
Decision: The document is noted.

Note typo in table 3: 20-tap Rayleigh fading channel, plus caption relates to Scenario 2.
FFS what UE speeds need to be / can be supported.
Intel – should consider a high mobility scenario

R1-163288 Simulation assumptions for evaluation of longer CP for MBSFN subframes Ericsson
Decision: The document is noted.
R1-163163 Discussion on longer CP for MBSFN subframe Intel Corporation
Decision: The document is noted.
R1-162138 Simulation assumption and evaluation method for longer cyclic prefix Huawei, HiSilicon
Decision: The document is noted.
R1-163047 Evaluation assumptions for longer cyclic prefix Qualcomm Incorporated
Decision: The document is noted.
Offline discussion during this week to summarise the scenarios and simulation assumptions on which consensus can be reached – David Bhatoolaul (Nokia) - R1-163452 (Fri, or email approval)

Initial simulation results
R1-162137 Consideration on longer cyclic prefix Huawei, HiSilicon
Decision: The document is noted.
R1-163048 Evaluation results for longer cyclic prefix Qualcomm Incorporated
Decision: The document is noted.

Discussion
R1-163049 Design options for longer cyclic prefix for MBSFN subframes Qualcomm Incorporated
Decision: The document is noted.

7.3.5.4 Study TV transport service of UEs not being authenticated

Study whether there is any impact to the RAN1 specification by UEs receiving a TV transport service in a cell without being authenticated

R1-162621 Consideration on TV reception without authentication Huawei, HiSilicon
R1-163052 Specification impact of anonymous TV service Qualcomm Incorporated
R1-163291 RAN1 impact of supporting TV services reception for unauthenticated UEs Ericsson
Conclusion: There is no RAN1 impact from objective f
Capture this in the update of the TR

7.3.5.5 Other

7.3.6 SRS switching between LTE component carriers - *WID in RP-160676*

R1-163841 Chairman's Notes of Agenda Item 7.3.6 on SRS Carrier Based Switching for LTE Session Chairman (Nokia)
The document was presented by Matthew Baker from Nokia and .provides the outcomes of the SRS session.
Discussion: .
Decision: The document is endorsed.

Petitioners' Exhibit 1007, p. 1456
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

No issues to revisit on Friday

R1-162587 **Work plan for SRS switching WI Huawei, HiSilicon**
Decision: The document is noted.

7.3.6.1 General Operation of SRS Carrier Based Switching

Develop general mechanism.

R1-163211 **Scenarios and requirements on SRS switching** **SoftBank Corp.**
Decision: The document is noted.
R1-163166 **Discussion on SRS carrier based switching** **Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document is noted.
R1-162585 **General Operation of SRS Carrier Based Switching** **Huawei, HiSilicon**
Decision: The document is noted.
R1-162737 Discussion on SRS carrier switching Lenovo (Beijing) Ltd
R1-162769 **On General Operation of SRS Carrier Based Switching** **Ericsson**
Decision: The document is noted.
R1-162770 **[DRAFT] LS on SRS carrier switching interruption time** **Ericsson**
Decision: The document is noted. Approved in R1-163453 with the following changes:
RAN1 expects that there will be changes to the interruption time requirements due to the introduction of SRS carrier based switching and would like RAN4 to:

- ~~Provide the applicable~~ RF retuning time and interruption time (in terms of µs rather than subframes) due to SRS carrier based switching considering ~~at least the following~~
  - Inter-band CA, Intra-band CA and combination of intra- and inter-band CA
  - ~~Frame structure type 2 and frame structure type 3~~
  - ~~Different or same TAG~~
  - ~~Antenna switching~~
  - ~~Number of supported carriers at the UE~~
- Inform RAN1 whether~~Is~~ it is possible to apply SRS based carrier based switching between any carriers
- ~~Study~~ Inform RAN1 ~~if~~ whether there is any impact to DL reception in the UE due to the application of SRS carrier based switching

Note that since the feature is intended to support reciprocity based channel estimation, the antenna or antennas used for SRS switching should be the same as used for DL reception on the given CC.

R1-162292 Discussion on carrier based SRS switching CATT
R1-163053 General operation of SRS switching Qualcomm Incorporated
R1-163054 Draft LS on switching time for SRSQualcomm Incorporated
R1-163614 Way Forward on SRS carrier based switching Huawei, HiSilicon, Qualcomm, Softbank
Decision: The document is noted.

Agreement:
Design Principles for SRS carrier based switching:

- SRS carrier based switching support should follow these general guidelines:
  - Applicable for deployment scenarios that have a TDD CC without the capability to have the corresponding UL CC configured
    - FFS: For eIMTA
  - Strive to reduce negative impacts on other transmissions and reception, especially UCI
  - Take into consideration switching times

Agreements:

- SRS switching solution(s) should be applicable to any TDD UL-DL configurations and special subframe configurations.
- SRS switching solution(s) should be applicable to any combination of UL-DL and special subframe configurations among CCs that are not prevented for other reasons
- The solution should not require to introduce any new TDD UL-DL configuration or special subframe configuration

7.3.6.2 Specification Impacts to Support SRS Carrier based Switching

Focus is on identifying more detailed specification changes / enhancements in order to support SRS carrier based switching
R1-163055 Specification impact of supporting SRS switching Qualcomm Incorporated
Decision: The document is noted.
R1-162586 Specification Impacts to Support SRS Carrier based Switching Huawei, HiSilicon

Petitioners' Exhibit 1007, p. 1457
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted.
R1-162698 SRS Carrier Switching Aspects Samsung
R1-162771 Specification Impacts to Support SRS Carrier based Switching Ericsson
Decision: The document is noted.

Conclusions:
Potential standards impacts to consider include:
- Configurations for SRS on TDD CCs without PUSCH
- SRS switching indication signaling
  - FFS: RRC or L1 or both
- Collision handling
- FFS: Possible new symbol positions for SRS
- Power control for SRS on TDD CCs without PUSCH
- Timing advance for SRS on TDD CCs without PUSCH
- FFS: Which of periodic and/or aperiodic SRS is supported, and corresponding details/enhancements

7.3.6.3 Other

7.3.7 Further Indoor Positioning enhancements for UTRA and LTE - *WID in RP-160538*

R1-163894 Chairman's Notes of Agenda Item 7.3.7 on IndPos_enh Ad-hoc chair (Qualcomm)
The document was presented by Wanshi Chen from Qualcomm and .provides the outcomes of the IndPos_enh session.
Discussion: .
Decision: The document is endorsed.

R1-163283 Considerations on Distributed Antenna System (DAS) Scenario for Indoor Positioning China Unicom
Decision: The document is noted.

7.3.7.1 OTDOA Enhancements

R1-162606 Discussion on the same PCI case for OTDOA enhancements Huawei, HiSilicon
Decision: The document is noted.
R1-162935 On OTDOA enhancements Intel Corporation
R1-163056 Introduction of OTDOA enhancements for the shared Cell-ID scenario Qualcomm Incorporated
R1-163057 Draft CR Introduction of OTDOA enhancements for the shared Cell-ID scenario Qualcomm Incorporated
R1-163551 WF on sorting out the options for OTDOA enhancements Huawei, HiSilicon
Decision: The document is noted.

Agreement:
- As a starting point for Rel-14 WI, RAN1 decides to prioritize the following:
  - OTDOA enhancements for the same PCI:
    - Support positioning related reporting by a UE corresponding to the respective PRS muting pattern per TP
    - Support virtual cell ID per TP
      - FFS: How to generate PRS sequence /v_shift with the virtual cell ID per TP until RAN1#85

R1-162874 Further details on PRS pattern enhancement Ericsson
Decision: The document is noted.
Discuss further till next meeting
R1-162875 Richer RSTD reporting for OTDOA enhancements Ericsson
Decision: The document is noted.
R1-162876 Adaptive RSTD measurement reporting for OTDOA enhancements Ericsson
Decision: The document is noted.
R1-163058 Introduction of UE inter-frequency RSTD calibration accuracy reporting Qualcomm Incorporated
Decision: The document is noted.
Further discussion offline

7.3.7.2 PRS-based Beacons

R1-163059 Introduction of PRS based Terrestrial Beacon Systems Qualcomm Incorporated
Decision: The document is noted.

Decision: The document is noted.
Further discussion offline

7.3.7.4 Other

R1-162878 Indoor/Outdoor Classification for Indoor Positioning Enhancement Ericsson

7.3.8 Uplink Capacity Enhancements for LTE - *WID in RP-160664*

Specification of 256QAM in uplink transmission, with focus on the design of MCS table, 256QAM related signalling, and UE category. In addition, specify support of UL PUSCH in special subframe (the work starts from Q3 2016).

R1-163842 **Chairman's Notes of Agenda Item 7.3.8 on Uplink Capacity Enhancements for LTE Session Chairman (Nokia)**
The document was presented by Matthew Baker from Nokia and .provides the outcomes of the UpCap session.
Discussion: .
Decision: The document is endorsed.

To revisit on Friday:
R1-163463 LS to RAN4 on 256QAM support per band & band combination - (Klaus, Nokia)
- should be quick to approve.

R1-163344 Work Plan for the UL Capacity Enhancement for LTE WI Ericsson, CMCC
Note – according to the WID agreed by RAN plenary, work on PUSCH in UpPTS will not start until Q3 – hence companies are welcome to submit contributions earlier but there will not be an agenda item or online discussion before Q3.

Constellation
R1-163269 Non-uniform 256QAM for UL Capacity Enhancement Sony

R1-163650 WF on UL 256QAM modulation mapping Huawei, HiSilicon, CATR, Nokia, Alcatel-Lucent Shanghai Bell, Ericsson
Agreement:
Re-use the modulation mapping in section 7.1.5 of 36.211 for UL 256QAM

MCS & TBS tables
R1-163347 Physical Layer Design Aspects of UL 256QAM Ericsson
Agreements:
- Assume the same number of bits for the MCS field in the DCI message to support UL 256QAM as it is currently, i.e. 5 bits
- MCS table supporting UL 256QAM can only be used in the UE specific search space for DCI format 0 and DCI format 4, and any new UL DCI format introduced for LAA, when the CRC is scrambled with C-RNTI
  - FFS whether the configuration of the UL 256QAM MCS table can be done separately for DCI formats 0 and 4
  - Configure the use of the MCS table for UL 256QAM separately per uplink power control subframe set
- Introduce Qm corresponding to 256QAM for UL at applicable places in the specification
- UL 256QAM and DL 256QAM are configured independently.

R1-163060 Discussion of UL 256QAM Qualcomm Incorporated

R1-162865 Discussion on UL 256QAM design CMCC
R1-162624 TBS table design for UL 256QAM Huawei, HiSilicon

R1-163346 On the Performance of UL 256QAM Ericsson
R1-163345 MCS Table Design for UL 256QAM Ericsson
R1-162140 MCS table for UL 256QAM Huawei, HiSilicon
R1-163696 Discussion on standardization impacts of UL 256QAM Intel Corporation

Sections 2.1
Revision of R1-162372
R1-162787 On 256QAM UL MCS Table design Nokia, Alcatel-Lucent Shanghai Bell

R1-163690 WF on UL 256QAM Ericsson, Nokia, Alcatel-Lucent Shanghai Bell
R1-163652 WF on UL 256QAM MCS table Huawei, HiSilicon, CATR, ZTE

Agreements:
- The minimum TBS index for 16QAM is 11
- The minimum TBS index for 64QAM is 20
- The minimum TBS index for 256QAM is 30
- 3 entries are reserved for retransmissions
- The number of PUSCH MCS entries to support 256QAM is down-selected between
  - Alt 1: 6
  - Alt 2: 5
  - Alt 3: 4

R1-163651 WF on UL 256QAM TBS table Huawei, HiSilicon, CATR, CMCC, China Unicom, China Telecom, ZTE, Deutsche Telekom, Sprint
Also supported by AT&T.

Agreements:
- Reference number of REs available in PUSCH for UL 256QAM TBS design is 144 REs/PRB
- The maximum coding rate for PUSCH with 256QAM should not exceed 0.931
- FFS whether or not to introduce new TBS index(es) for PUSCH with 256QAM
  - Companies are encouraged to submit evaluations to RAN1#85

EVM
R1-163061 Initial link level evaluation results for UL 256QAM Qualcomm Incorporated
RAN4 is assumed to be already doing this work.

UE categories
R1-162622 Discussion on UE categories with introduction of UL 256QAM Huawei, HiSilicon
R1-162786 On 256QAM UL UE categories and UE capability signalling Nokia, Alcatel-Lucent Shanghai Bell
R1-163348 UE Category and UE Capability Support for UL 256QAM Ericsson
R1-163696 Discussion on standardization impacts of UL 256QAM Intel Corporation
Section 2.3
Revision of R1-162372

R1-163708 WF on UL 256QAM UE capabilities Nokia, Alcatel-Lucent Shanghai Bell, Ericsson
Agreements:
- Introduce at least 3 new UL UE categories achieving peak data rate for 256QAM PUSCH
  - Based on UL UE category 5
  - Based on UL UE category 13
  - Based on UL UE category 14
  - FFS: Based on UL UE category 8

Note: the 256QAM UL peak data rate is around 30-40% higher than the base categories listed above.
- Extend the UL/DL UE category combinations in TS 36.306 to include for each current DL UE category paired with a 64QAM UL UE category a new combination with the respective enhanced 256QAM UL UE category
  - A UE signalling a 256QAM category shall also signal its base category
- UE 256QAM UL support/capability can only be indicated by a UE belonging to the new UL UE Categories achieving 256QAM UL peak data rate (i.e. ue-CategoryUL >14).
- Send an LS to RAN4 to ask for their input on whether the 256QAM support should be per UE or per band & band combination - R1-163463 (Klaus, Nokia)

Note that RAN1 assumes that UE capability signalling details are up to RAN2.

7.3.9 Study on LTE-based V2X Services - *SID in RP-160657*

R1-163895 **Chairman's Notes of Agenda Item 7.3.9 on V2X Ad-hoc chair (Qualcomm)**
The document was presented by Wanshi Chen from Qualcomm and .provides the outcomes of the V2X session.
Discussion: .
Decision: The document is endorsed.

Email approval for a TP (to be prepared by Hanbyul, LGE) capturing the agreements/conclusions below until 4/22/2016.

7.3.9.1 Evaluation results

To collect the evaluation results to be included in TR36.885

7.3.9.1.1 Uu transport for V2V, V2P, and V2I/N

Including evaluation of the feasibility in terms of meeting latency requirements, network coordination required, resource efficiency, and energy efficiency of UE

R1-162373 Performance analysis of Uu transport for V2V communication Intel Corporation
R1-162496 Evaluation results on the enhancement of Uu transport for V2V LG Electronics
R1-162497 Evaluation results on the feasibility of Uu transport for V2P and V2I/N LG Electronics
R1-162834 Simulation Results for Uu-Based V2V Ericsson LM

7.3.9.1.2 PC5 transport for V2P and V2I/N

Including potential V2V performance degradation

R1-162293 Evaluation results on PC5-based V2I CATT
R1-162294 Evaluation results on PC5-based V2P CATT
R1-162417 Evaluation results for LTE-based V2X ZTE
R1-162498 Evaluation results on PC5 transport for V2P and V2I/N LG Electronics
R1-162699 Evaluation results for PC5 based V2P and V2I/N Samsung
R1-163062 PC5 for V2V and V2P Qualcomm Incorporated
R1-163183 Evaluation of PC5 transport for V2P/V2I/I2V communications NTT DOCOMO, INC.

7.3.9.1.3 Other

7.3.9.2 Support of Uu transport for V2V, and PC5/Uu transport for V2I/N and V2P

7.3.9.2.1 Enhancement to multi-cell multicast/broadcast

Including optimization on set of cells performing the same multicast/broadcast and multicast/broadcast transmission based on PDSCH/PMCH

R1-163182 Evaluation of Uu transport for V2x communications NTT DOCOMO, INC.
R1-162374 Discussion on multi-cell multicast/broadcast enhancements for V2V communication Intel Corporation
R1-162499 Discussion on potential enhancements for multi-cell multicast/broadcast LG Electronics
R1-162124 Uu DL enhancements for V2X Huawei, HiSilicon
R1-163063 System level performance using SC-PTM and eMBMS Qualcomm Incorporated

R1-163604 WF on enhancements for multi-cell multicast/broadcast LG Electronics, CATR, CMCC, Deutsche Telekom, General Motors, ETRI, Fujitsu, Huawei, HiSilicon, III, ITL, KRRI, KT Corporation, LG Uplus, OPPO, Samsung, SK Telecom, Xinwei, ZTE

Conclusion:

- RAN1 has observed performance benefit with the following enhancements to DL multicast/broadcast :
  - Dynamic scheduling for multicast/broadcast transmissions
    - I.e., PDCCH-based scheduling of TBs associated to a TMGI
  - Semi-static scheduling for multicast/broadcast transmissions
  - Use of DM-RS based transmission scheme from multiple TPs including reception for idle UEs
    - This does not imply introduction of any new TM
  - DMRS-based single-cell multicast
  - PDSCH transmitted from multiple TPs
  - CRS based PDSCH/PDCCH transmitted from TP(s) that differ from the TP(s) transmitting the system information
  - DMRS based PDSCH/EPDCCH transmitted from different TP(s)
  - Use of normal CP
  - HARQ feedback
  - CSI feedback
  - Note 1: Gain, complexity, and specification impact of each enhancement are expected to be different.
  - Note 2: some enhancements may be possible without spec impact.
  - Note 3: Network/UE complexity has not been studied in RAN1.
  - Note 4: some enhancement(s) listed above may assume some level of inter-TP coordination, which does not necessarily result in spec changes

Petitioners' Exhibit 1007, p. 1461
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - Note 5: some enhancement(s) listed above may be based on contribution(s) from a limited number of company or companies
- RAN1 is still continuing study at least some of the above enhancements
- The above is to be captured in the TR
- Send LS to RAN2 to inform the following feature is beneficial from RAN1 viewpoint:
  - UE identifies which broadcast transmissions (e.g., TMGI) are relevant to it, e.g., depending on the position of the UE.

R1-163860 LS on DL broadcast/multicast for V2X LGE

The LS is endorsed, and agreed in R1-163862.

R1-163701 Way Forward on DL enhancement for Uu-based V2X Huawei, HiSilicon, Ericsson

R1-162418 Multi-cell multicast/broadcast for V2V ZTE
R1-162700 PDSCH-based enhancements for V2X multicasting Samsung
R1-163339 Uu DL enhancements for V2X Huawei, HiSilicon

7.3.9.2.2 Enhancements to unicast

Including UL enhancement (e.g., SPS enhancement, SR enhancement)

R1-162419 Uu transport enhancement for V2X ZTE
R1-162500 Discussions on UL enhancements for V2X LG Electronics
R1-162563 SR enhancements on uplink unicast for V2X services Sony

R1-163603 WF on UL SPS for Uu Ericsson, Huawei
R1-163827 Harmonized WF on UL SPS for Uu and PC5 Ericsson, Huawei, LGE, Panasonic

7.3.9.2.3 Enhancements to sidelink

Including identification of the case requiring further enhancements over PC5-based V2V and complexity of supporting transmission of pedestrian UEs

R1-162831 Uu Enhancements for V2X Ericsson LM

R1-163634 WF on PC5-based V2P/P2V LG Electronics, NTT DOCOMO, Ericsson

Conclusion:

- The following observations are made in PC5-based V2P/P2V.
  - The scenario of P-UE TX to V-UE RX is more battery efficient than the scenario of V-UE TX to P-UE RX
    - Note: this observation is made based on evaluations from a limited number of companies
    - Analysis result of P-UE power consumption based on figure 1 in R1-163062 (details to be discussed during TP preparation) is captured in TR 36.885.
  - For the purpose of for P-UE TX to reduce the power consumption and UE complexity, at least the followings are beneficial:
    - Random resource selection.
    - FFS Sensing operation during a limited time

R1-163854 WF on DSRC/LTE-based ITS Coexistence Ericsson

Conclusion:

- The LS reply from RAN1 to RAN for LTE/DSRC coexistence includes in principle the points:
  - RAN1 has discussed co-existence between DSRC and LTE-based ITS (sidelink) for safety ITS. RAN1 believes that ITS systems are important and should protect each other and in particular safety ITS.
  - Technology neutrality is essential in order to enable choice of most suitable radio technology for each ITS service as well as to enable a technology phasing in the future (e.g., towards 5G)
  - RAN1 believes that technology neutrality is enabled by describing common coexistence rules that are followed by all potential ITS technologies. Such rules may be specific for a certain region. RAN1 believes that the details of the common coexistence rules are out of RAN1 scope and should be discussed in relevant SDOs in each region.
  - For deployment of PC5-based LTE-V2V and 802.11p in the same geographical area, the ideal option is when they use different frequency channels. Note that co-deployment of both technologies is not likely to happen in all regions.
    - FFS in terms of providing example(s)
  - FFS other aspects

7.3.10 Study on Latency reduction techniques - *SID in RP-150465*

Focus on this SI in 2Q 2016 will follow approved WF (RP-160650)

R1-162116 Discussion on enhanced frame structure for latency reduction in TDD Huawei, HiSilicon

R1-163523 Way Forward on enhanced frame structure type 2 for latency reduction Huawei, HiSilicon
The document was presented by Yongxia Lyu from Huawei.

- Enhanced frame structure type 2 is recommended to be supported for latency reduction
  - Additional subframe type(s) with symbol(s) for downlink transmission, GP and symbol(s) for uplink transmission should be supported
    - Downlink transmission includes DL control and DL data
    - Uplink transmission includes UL control and UL data
      - FFS SRS
    - FFS GP position and GP duration
  - More than 2 Downlink-to-Uplink Switch-points in a radio frame should be supported
    - FFS the number of the new Downlink-to-Uplink Switch-points in a radio frame
    - FFS the position(s) of the new Downlink-to-Uplink Switch-points in a radio frame
  - Backward compatibility should be preserved
    - Additional subframe type(s) can be used to replace a subset of the following subframe(s)
      - Alt. 1: MBSFN subframe(s) and UL subframe(s) configured to legacy UEs
      - Alt. 2: UL subframe(s) according to the UL/DL configuration indicated by SIB1
      - Alt. 3: MBSFN subframe(s) configured to legacy UEs
      - Alt. 4: DL subframes and UL subframe(s) according to the UL/DL configuration indicated by SIB1
      - FFS which alternative to be selected.
    - Special subframe(s) according to the UL/DL configuration indicated by SIB1 can be used as additional subframe type(s) for new UEs

Discussion: Also supported by Panasonic.
Decision: The document is noted. Continue offline discussions until Wednesday – (Huawei)

R1-163843 Chairman's Notes of Agenda Item 7.3.10 on Study on Latency Reduction Techniques Session Chairman (Nokia)
The document was presented by Matthew Baker from Nokia and .provides the outcomes of the Latency session.
Discussion: .
Decision: The document is endorsed.

To revisit on Friday:

1. R1-163466: Link level evaluation results (Daniel, Ericsson) – should be quick to approve.
2. R1-163664: Findings from link level evaluation results (Daniel, Ericsson) – should be quick to approve.
3. R1-163464: Link level evaluation results (Laetitia, Ericsson) – should be quick to approve.
4. R1-163718: Findings from link level evaluation results (Laetitia, Ericsson) – should be quick to approve.

System level evaluations

R1-162107 Performance evaluation on TTI shortening Huawei, HiSilicon
The document was presented by Yongxia Lyu from Huawei.

- Observation 1: UPT performance of 1ms TTI decreases a lot once FTP file size becomes larger than SSThresh, when TCP connection is kept for a long time.
- Observation 2: From 0ms to 10ms CN delay, the UPT gain decreases in 20MHz system.
- Observation 3: RU does not significantly affect the UPT for 500KB and 100KB, but for 12.5KB high RU brings much more UPT gain than lower RU.
- Observation 4: 2 symbols and 4 or 3 symbols TTI have significant mean UPT gain in both 10MHz and 20MHz system. 1 symbol TTI has marginal mean UPT gain for 500KB FTP file in 10MHz system. 7 symbols TTI has smaller mean UPT gain than other TTI lengths in both 10MHz and 20MHz system.
- Observation 5: Short TTI has more mean UPT gain in 120km/h than 3km/h.
  - The mean UPT gain of 2 symbols TTI in case of 3km/h and 120km/h is similar to 4 or 3 symbols TTI in 10MHz and 20MHz, but larger than other TTI length cases.
- Proposal 1: 2 symbols and 4 or 3 symbols TTI length could be further considered.

Decision: The document is noted.

R1-162536 Evaluation results on shortened TTI with dynamic overhead of control channel Panasonic
The document was presented by … from Panasonic.
Observations

Petitioners' Exhibit 1007, p. 1464
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Improvement of user throughput and reduction of packet delay by using shortened TTI. It is mainly because of short TCP ACK delay.
- The gain of File size = 100kbits is larger than it of 500kbyte
- The gain of cell 95% UPT UE and 50% UPT UE is larger than it of cell 5% UPT UE
- For very shortened TTI, overhead of RS/PDCCH would impact throughput and latency. Especially for 1-symbol TTI, the performance of UPT and latency would be quite challenging for cell-edge UEs.
- The gain of low load is larger than it of high load

Proposal 1: Different UEs may use different TTI length and it could be configured by eNB.
Proposal 2: RAN1 should discuss how to optimize overhead of RS and DCI for shortened TTI. In order to reduce overhead, shared RS among sTTIs and compact DCI could be considered.
Decision: The document is noted.

R1-162943 System-level performance evaluation for TCP throughput enhancement with dynamic TTI tuning Mediatek
The document was presented by Weidong Yang from MediaTek.

- Proposal 1: RAN 1 decides sPDCCH design, and evaluates reasonable L1/L2 control overhead, so that latency reduction gain of shortened TTI for different scenarios can be correctly evaluated.
- Observation 2: Whether dynamic TTI scheme provides significant latency reduction gain over shortened TTI scheme depends heavily on the design of shortened TTI. If shortened TTI is not so efficient, e.g., involved with a larger proportion of control overhead compared to legacy TTI, dynamic TTI schemes have a larger room to enhance latency performance.
- Observation 3: Given a scenario of longer file transmission time, e.g., low Uu throughput scenario or a larger file size, dynamic TTI schemes provide more throughput gain over shortened TTI scheme, but less throughput gain over legacy TTI scheme.
- Observation 4: With file size is small, dynamic TTI scheme has the same delay gain as that of shortened TTI scheme.
- Observation 5: As file size increases, delay gain of shortened TTI scheme and dynamic TTI scheme are reduced.
- Observation 6: The delay gain of dynamic TTI over either shortened TTI or legacy TTI is non-negative for different file size.
- Observation 7: As file size increases, dynamic TTI scheme has better delay performance than either the legacy TTI scheme or the shortened TTI scheme.
- Proposal 2: RAN 1 evaluates the feasibility of dynamic TTI schemes so as to guarantee positive latency reduction gain for shortened-TTI enabled UE.
- Proposal 3. RAN 1 includes the evaluation of dynamic TTI to the technical report of RAN 1 LATED, i.e. TR 36.881.

Decision: The document is noted.

R1-163518 Text proposal on system level results for latency reduction Ericsson
The document was presented by Laetitia Falconetti from Ericsson and suggests capturing in Annex B of the TR the system evaluation results of sTTI.
Discussion: Ericsson→ does not include all availble results to this meeting (for formatting reason).
Decision: The document is noted. Continue offline until Wednesday (Ericsson)
Wednesday
Revised in R1-163717
In case of fixed control overhead, add the following information in the note field (companies to provide this info to Laetitia):

- "Total control overhead per subframe compared to all available REs in the sTTIs [%]:"
- "Maximum number of UEs that can be scheduled per sTTI:"

Companies are asked to check 3717 and provide any comments (on RAN1 reflector and to Laetitia (Ericsson)) by 8:30am Thur.
Updated version to be agreed on Friday - R1-163464.

R1-163519 Text proposal on findings from the system level evaluation of latency reduction Ericsson
The document was presented by Laetitia Falconetti from Ericsson and .
Discussion: Ericsson→ does not include all availble results to this meeting (for formatting reason).
Decision: The document is noted. Continue offline until Wednesday (Ericsson)
Wednesday
Revised in R1-163718 - be updated including any comments from companies (on RAN1 reflector and to Laetitia) revisit on Fri.

7.3.10.2 Channel design for shortened TTI

Provide channel design including reference signals for s(E)PDCCH, sPDSCH, sPUSCH, sPUCCH, and details on multiplexing between existing non-sTTI and sTTI UEs.

R1-163515 Way forward on sPDCCH Huawei, HiSilicon, Ericsson

The document was presented by Yongxia Lyu from Huawei.

- sPDCCH (PDCCH for short TTI) needs to be introduced for short TTI.
  - Each short TTI on DL contains an sPDCCH region
    - An sPDCCH assigns a sPDSCH allocated within the same short TTI
      - The number of possible sPDSCH within an short TTI is for further study
    - An sPDCCH grants a sPUSCH
      - The number of possible sPUSCH to grant from an sPDCCH(s) within an sTTI is for further study
- Both CRS-based sPDCCH and DMRS-based sPDCCH are recommended to be supported
  - In the first sTTI of a subframe, legacy PDCCH region can be shared by CRS-based sPDCCH and legacy PDCCH;
  - In time domain, sPDCCH should be placed
    - For CRS-based sPDCCH, in first one or two symbols within a sTTI;
    - For DMRS-based sPDCCH,
      - Alt.1: in first one symbol or two symbols within a sTTI;
      - Alt.2: in all symbols within a sTTI.
  - In frequency domain, sPDCCH can be placed
    - Alt.1: in a distributed manner;
    - Alt.2: in a localized manner.
  - sPDSCH assigned by a sPDCCH can be allocated to unused REs within the sPDCCH region if sPDCCH region is not shared with PDCCH region
    - Details are for further study
  - sPDCCH is aggregated by a certain number of CCEs, where each CCE consists of 36 REs

  - For DMRS-based sPDCCH, FFS on whether sharing the same DMRS for sPDCCH and its scheduled sPDSCH or not.
- On sPDCCH monitoring region,
  - Frequency resource for sPDCCH monitoring region can be informed by eNB;
    - FFS: semi-static vs dynamic, cell-specific vs UE-specific, explicit vs implicit
- The number of maximum PDCCH BDs for UE SSs within a subframe is no more than
  - 32 for UEs not supporting UL transmission mode 2;
  - 48 for UEs supporting UL transmission mode 2.
- Two-level DCI can be considered for sTTI scheduling
  - Slow DCI is carried in legacy PDCCH region and transmitted at most once per subframe
  - Fast DCI is carried by sPDCCH and transmitted within a sTTI.

Decision: The document is noted.

Agreement:
- sPDCCH (PDCCH for short TTI) needs to be introduced for short TTI.
  - Each short TTI on DL may contain sPDCCH decoding candidates

The remaining parts of R1-163515 are for offline discussion until Wednesday – (Huawei, Ericsson)

R1-163516 Way forward on TMs for sTTI Huawei, HiSilicon, Ericsson, Mitsubishi Electric

The document was presented by Yongxia Lyu from Huawei.
- Both CRS based TMs and DMRS based TMs are recommended to be supported for sTTI transmission.
  - CRS can be used without modification to demodulate sPDSCH.
    - FFS: 4-layer MIMO using 4 CRS antenna ports.
  - It would be necessary to introduce new DMRS design(s) for sPDSCH demodulation
    - For a certain TTI length, PRB bundling may be necessary to achieve sufficient channel estimation accuracy.
    - FFS: the number of DMRS antenna ports that can be supported for a given short-TTI length.
    - The following DMRS patterns are further studied
      - CDM in time domain to design the DMRS pattern for sTTI
      - CDM in frequency domain to design the DMRS pattern for sTTI

Decision: The document is noted, modified as follows:

Agreements
- Both CRS based TMs and DMRS based TMs are recommended to be supported for DL sTTI transmission
  - No change for CRS definition
    - FFS: Supporting more than 2 layers for sPDSCHs
  - Further study is needed about DMRS design(s) for sPDSCH demodulation
    - For a certain TTI length, increased PRB bundling sizes may be necessary to achieve sufficient channel estimation accuracy.
    - FFS: the number of DMRS antenna ports that can be supported for a given short-TTI length.
    - For a certain TTI length, new DMRS design(s) may be needed

R1-163539 WF on sPDSCH LGE

The document was presented by Yunjung Yi from LGE.
- A UE is not expected to receive legacy TTI unicast PDSCH and short TTI unicast PDSCH simultaneously on one carrier
- The configured short TTI length can be different per UE
- TTI length of PDSCH can be dynamically changed

Decision: The document is noted.

Possible agreements:
- A UE is not expected to receive legacy TTI unicast PDSCH and short TTI unicast PDSCH simultaneously on one carrier
- Single short-TTI length can be configured for a UE
- The configured short TTI length can be different per UE
- TTI length of PDSCH can be dynamically changed

Continue offline discussion until Wednesday – Yunjung (LGE)

R1-163538 WF on sPUCCH design LG Electronics, Ericsson

The document was presented by Yunjung Yi from LGE.
- At least two sPUCCH formats are recommended to be supported

- One sPUCCH format for HARQ-ACK and/or SR feedback for a serving cell
  - The maximum supportable payload: Two HARQ-ACK bits + One SR
  - Intra-TTI frequency hopping is recommended to be supported
- One sPUCCH format for CSI feedback and/or multiple HARQ-ACK bits, e.g. as in CA and frame structure type 2
  - FFS: Supported payload size
  - FFS: Intra-TTI frequency hopping

Discussion: .
Decision: The document is noted. Continue offline discussion until Wednesday – Yunjung (LGE)

R1-163545 **Way Forward on sPDCCH** **ZTE, Mediatek**
The document was presented by Zhisong Zuo from ZTE.

- SPDCCH should be introduced in sTTI
  - SPDCCH is located in the first or first few OFDM symbol(s) of a sTTI
  - Frequency resource for SPDCCH should be configurable
  - Demodulation based on CRS
- Legacy PDCCH or SPDCCH can be used to schedule sPDSCH in one sTTI
- Number of blind decodes for one UE in a sTTI should be limited
- Efficient multiplexing of Data and Control, e.g. REs on the first few symbols not used for control can be used for Data

Discussion: .
Decision: The document is noted. Continue offline discussion until Wednesday – Zhisong (ZTE)

The document was presented by … from … and .
Discussion: .
Decision: The document is noted.

R1-163523 Way Forward on enhanced frame structure type 2 for latency reduction Huawei, HiSilicon
Also supported by Panasonic

Possible agreements:

- Enhanced frame structure type 2 is recommended to be supported for latency reduction

- Additional subframe type(s) with symbol(s) for downlink transmission, GP and symbol(s) for uplink transmission should be supported
  - Downlink transmission includes DL control and DL data
  - Uplink transmission includes UL control and UL data
    - FFS SRS
  - FFS GP position and GP duration
- More than 2 Downlink-to-Uplink Switch-points in a radio frame should be supported
  - FFS the number of the new Downlink-to-Uplink Switch-points in a radio frame
  - FFS the position(s) of the new Downlink-to-Uplink Switch-points in a radio frame
- Backward compatibility should be preserved
  - Additional subframe type(s) can be used to replace a subset of the following subframe(s)
    - Alt. 1: MBSFN subframe(s) and UL subframe(s) configured to legacy UEs
    - Alt. 2: UL subframe(s) according to the UL/DL configuration indicated by SIB1
    - Alt. 3: MBSFN subframe(s) configured to legacy UEs
    - Alt. 4: DL subframes and UL subframe(s) according to the UL/DL configuration indicated by SIB1
    - FFS which alternative to be selected.
  - Special subframe(s) according to the UL/DL configuration indicated by SIB1 can be used as additional subframe type(s) for new UEs

R1-163851 TDD evaluation assumptions LG

The document was presented by Yunjung Yi from LGE.

- For SLS/analysis of latency reduction for TDD
  - Legacy TDD DL/UL configuration #0,#1, and #2 can be evaluated.
  - The sets of "fixed" DL and UL subframes are assumed
    - Subframe #0 and #5 are assumed as normal fixed downlink subframe
    - Subframe #2 are assumed as uplink subframe
  - Evaluation sets include at least the followings
    - Reference set: Legacy TDD DL/UL configuration with legacy TTI
    - Set 1: full flexibility on other subframes
      - All downlink subframes are MBSFN subframes and can be replaced with additional subframe type
      - All uplink subframes can be replaced with additional subframe type
      - Special subframe can be replaced with additional subframe type
    - Set 2: full flexibility only on UL subframes
      - All downlink subframes are fixed as downlink subframes
      - Special subframes are fixed as special subframes
      - All uplink subframes can be replaced with additional subframe types
    - Set 3: keep legacy TDD DL/UL configuration
      - All downlink subframes are fixed as downlink subframes
      - All uplink subframes are fixed as uplink subframes
      - Special subframes are fixed as special subframes
  - Simulation results is recommended to include at least
    - Performance comparison of Set 3 compared to reference set
    - Performance comparison of other sets compared to Set 3
    - Comparison among different TTI lengths within the same set to evaluate the gain from TTI shortening.
  - Coexistence issue needs to be address in set 1 and set 2

Discussion: Ericsson→ not clear how the coexistence issue will be evaluated.

8.1 Study on New Radio Access Technology

SID in RP-160671

R1-163103 Workplan for Study on Study on New Radio (NR) Access Technology NTT DOCOMO, INC.
The document was presented by Kazuaki Takeda from NTT dOCOMO. For information and provides initial RAN1 work plan for the NR study. Work plan shall be further updated according to the progress of the study.
Decision: The document is noted for information.
Thursday: Rapporteur will submit an updated work plan involving all WGs in the next meeting.

R1-163104 3GPP & ITU-R WP 5D Coordination on "5G" NTT DOCOMO, INC.
The document was presented by … from … and summarizes items related to 3GPP & ITU-R Working Party 5D (WP 5D) coordination on "5G". There are two on-going activities in WP 5D which would need coordination with 3GPP:

- IMT-2020 candidate technology submission.
- IMT-2020 parameters required for sharing studies in preparation for WRC-19 agenda item 1.13.

Discussion: Mr Chair→ need for a close coordination with RAN4 to reply to ITU-R. Refer to RP-160598.
Decision: The document is noted.

R1-163376 Draft TR 38.802 Study on New Radio (NR) Access Technology - Physical Layer Aspects NTT DOCOMO, INC.
The document was presented by … from … and .
Discussion: .
Decision: The document is noted.

8.1.1 Overview of new radio interface

High level design proposals addressing all usage scenarios, requirements and deployment scenarios, e.g., eMBB, MTC and URLLC. Companies are encouraged to limit the number of papers to two per company and to three pages per contribution.

R1-162144 Flexible air interface for 5G Huawei, HiSilicon
The document was presented by David Mazzarese from Huawei.

- Proposal 1: To ensure forward compatibility for the new radio, physical layer functionalities (such as signals, channels and signaling mechanisms) specific to a service/usage scenario should be confined within its flexibly-configured time/frequency partition. Sharing of some common physical layer functionalities among some services should be supported. UEs should be able to operate properly once a new service is added and occupies subcarriers (e.g. PRBs) within the UE's system bandwidth. Therefore the new radio should not require the transmission of wideband signals and channels.
- Proposal 2: The new radio interface should be designed to support being configurable to meet the diverse requirements. This includes flexibility to configure waveforms and multiple access schemes, OFDM numerologies and frame structure, transmission protocols and channel coding/modulation schemes.

Petitioners' Exhibit 1007, p. 1471
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal 3: The new radio interface should be designed to support the coexistence of different numerologies on a single continuous block of spectrum (with minimized or no guard band). Frequency localized OFDM-based waveform is one candidate technique to be studied.

Decision: The document is noted.

R1-162145 Overview of radio access mechanism for 5G Huawei, HiSilicon

- Proposal 1: In order to provide a boundary-less radio access with UE cell-centre-like experience for the new radio, RAN1 should study the following in a dense urban deployment scenario:
  - Radio access design without rigid association with a physical cell. Physical layer design that is based, as much as possible, on an identifier that can identify a UE across coverage of a logical access entity.
  - Network-oriented measurement and discovery with uplink signals to assist in UE-TRP association. Tracking mechanisms based on uplink transmissions that can minimize mobility interruption.
- Proposal 2: In order to provide low latency low overhead radio access, RAN1 should study the design of physical channels, reference signals and sequences that enable:
  - A lighter or no random access procedure for UE fast re-entry to the system
  - Uplink transmission mechanisms without dynamic request and grant.

Decision: The document is noted.

R1-162171 General design principles for 5G new radio interface: System operations Samsung

The document was presented by Younsun Kim from Samsung.

- Design principle 1: Provide specification support for both sub-6GHz and over-6GHz spectrum in 5G phase 1.
- Design principle 2: Support system bandwidth larger than 20MHz for both sub-6GHz and over-6GHz spectrums.
- Design principle 3: Support both FDD and TDD modes of operation.
- Design principle 4: Design 5G so that it can coexist with LTE when deployed on LTE spectrum.
- Design principle 5: Support forward compatibility resources on time and frequency domain resources which are not used for essential system operations.
- Design principle 6: Strive for a common structure for both sub-6GHz and over-6GHz considering different channel characteristics and target verticals.
- Design principle 7: Minimize transmissions which must occupy entire system bandwidth or always turned ON.
- Design principle 8: Strive for a common specification design to support similar set of features.

Discussion: LGE asked clarifying the figure on spectrum allocation – especially TDD allocation.
Not a Samsung's proposal – reflects current understanding, shared with RAN4

Decision: The document is noted.

R1-162172 General design principles for 5G new radio interface: Key functionalities Samsung

- Proposal 1: OFDMA is the baseline for 5G new radio DL/UL with additional consideration of SC-FDMA for UL.
- Proposal 2: Strive for minimal number of numerology sets while taking into account the different requirements on wide range of frequency spectrum, various use case, and complexities.
- Proposal 3: Consider adoption of a new channel coding scheme for 5G new radio and support LDPC as a candidate
- Proposal 4: FD-MIMO and its enhancements is the baseline for 5G new radio MIMO
- Proposal 5: Adopt joint time-varying analog and digitial beamforming (hybrid beamforming) for over-6GHz band system design.
- Proposal 6: Support reduced latency for TDD mode of operation of 5G new radio by reducing the DL-UL periodicity or by introducing dynamic TDD.
- Proposal 7: 5G new radio should support both standalone operation and non-standalone operation.

Decision: The document is noted.

R1-162192 Frequency scalable NR design from < 1GHz to mmW Qualcomm Inc.

The document was presented by Tingfang Ji from Qualcomm.

- Proposal 1: NR should be optimized for licensed/shared/unlicensed spectrum access, e.g., self-contained waveform/transactions.
- Proposal 2: NR should support different carrier frequency and/or deployment scenarios with scalable numerologies, e.g., following 2^N scaling.
- Proposal 3: mmW-specific design should be introduced to the air interface in addition to designs optimized for sub6 GHz access, e.g., support of both RF beamformed and non-beamformed broadcast/control channels.
- Proposal 4: Sub6 GHz and mmW specification should share common features that define the radio hardware envelope, e.g., channel coding, receiver MIMO processing, HARQ timeline, etc.

Discussion: Linear scaling was debated.

Decision: The document is noted.

R1-162222 Design principles of NR in RAN1 ZTE

The document was presented by Yifei Yuan from ZTE.

Petitioners' Exhibit 1007, p. 1472
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal 1: Abstract (separate) some common parts from Layer1to form L0 to support all kinds of different scenarios
- Proposal 2: List some important issues that may affect compatibility especially forward compatibility
- Proposal 3: Non-orthogonality access e.g. MUSA (multi users shared access).should be considered in NR especially for mMTC/IoT

Decision: The document is noted.

R1-162238 A Dynamic TDD Radio Interface National Instruments Corp.

The document was presented by Nikhil Kundargi from National Instruments and introduces guidelines for designing a new frame structure suitable for Massive MIMO. This frame structure has been prototyped in multiple real world test beds to validate its practicability in ITU 2020 deployment scenarios. We also presented a flexible dynamic RAT to accommodate extensions of the numerology to 100 MHz channels based on this frame structure.

Discussion: on the concept of long CP (overhead issue)
Introduction of variable CP for flexibility – complexity issue to be considered

Decision: The document is noted.

R1-162301 5G New Radio Interface Design CATT

The document was presented by Fang Chen Cheng from CATT and lists the following proposals as the potential guideline of 5G interface design

- Wide range of system bandwidth
- Further enhancement of link adaptation
- Dynamic multi-antenna technologies
- Efficient support of large packets and small packets with extended coverage and power saving
- Minimized RS overhead
- Opportunistic radio access
- Variable length of TTI with self content control information
- Support central and distributed network control
- Universal frame structure for downlink, uplink and sidelink air interface design
- New waveform for asynchronous multi-subcarrier reception
- Efficient Broadcast and multicast
- Non-NR carrier embedded in the 5G carrier

Decision: The document is noted.

R1-162332 Overview of New Radio Interface Fujitsu

The document was presented by Tim Moulsley from Fujitsu.

- Proposal 1: Identify features expected to be supported in Phase 1 and Phase 2 and study designs for Phase 1 that can be forward compatible with Phase 2 (and beyond).
- Proposal 2: Investigate efficient TDD frame structure options which can achieve efficient utilization of radio resources and low latency.
- Proposal 3: Supporting enhanced inter-cell operation control for UDN should be studied (including interference control and joint transmission).
- Proposal 4: The multiple connectivity can be studied in both inter-frequency and intra-frequency cases.
- Proposal 5: Dynamic TDD can be studied for the NR.
- Proposal 6: The combination of multiple connectivity (for FDD and TDD) and dynamic TDD can be studied in NR.
- Proposal 7: Aim for a unified uplink transmission framework which is beneficial for both mMTC and URLLC scenarios.

Decision: The document is noted.

R1-162379 Overview of new radio access technology requirements and designs Intel Corporation

The document was presented by Ralf Bendlin from Intel and shows high level views on some of the important design aspects for a next generation new radio access technology including non-orthogonal multiple access, frame structure, waveform, low overhead system information acquisition, coexistence of different numerologies and services as well as channel coding.

Decision: The document is noted.

R1-162426 Consideration on the design of NR NEC Corporation

The document was presented by … from NEC.

- Proposal 1: New RAT should be highly flexible and scalable to meet diverse requirements for three usage scenarios.
- Proposal 2: New RAT should support tight interworking; DC/CA can be performed among 5G new RATs, and DC can be performed between 5G new RAT and LTE.
- Proposal 3: FDD and TDD should be considered for the carrier frequency below 6GHz, and TDD can be considered for carrier frequency above 6GHz.

Decision: The document is noted.

R1-162512 Overview of new radio interface design LG Electronics

The document was presented by … from LGE.

- Frequency-band specific design should be considered
  - Multiple set of numerologies to cover very wide range of frequencies should be supported
  - Band-specific transmission scheme should be considered.
- The new RAT system should be very flexible and dynamic
  - Always-on or periodic signaling/channel should be minimized
  - Flexible HARQ timing should be supported
  - Flexible duplex should be enabled

Decision: The document is noted.

R1-162513 Discussion on new radio design and requirements in consideration of various use cases LGE

Decision: The document is noted.

R1-162547 Some Considerations on Enabling Radio Technologies for 5G NR Spreadtrum Communications, CATR

The document was presented by Jinhui Chen from Spreadtrum.

Decision: The document is noted.

R1-162564 Consideration on multiple access for new usage scenarios Sony

The document was presented by … from Sony.

- Observation 1: There may be shortages in the resources to transmit in new usage scenarios because these scenarios are characterized by a simultaneously massive number of device connections, low latency, and high reliability capabilities.
- Proposal 1: Non-Orthogonal Multiple Access (NOMA) technology should be considered to improve the spectral efficiency for New RAT.
- Proposal 2: Not only downlink NOMA but also Uplink NOMA should be a target candidate technology.
- Proposal 3: RAN1 should consider reducing the use of user specific information in each transmit functional block to be able to easily apply NOMA technologies.

Decision: The document is noted.

R1-162567 Considerations for eMBB in the new RATETRI

The document was presented by … from ETRI.

- Tight interworking between the macro cell and the small cell should be considered.
- Mobility-related structures and functions should be considered in a high speed deployment scenario.
- The unified design of the new RAT frame structure should take both below and above 6GHz frequency bands into account.

Decision: The document is noted.

R1-162577 Flexible framework for New Radio INTERDIGITAL COMMUNICATIONS

The document was presented by Paul Marinier from InterDigital.

- Framing and numerology
  - Support for multiple TTI's and symbol durations
  - Low latency decoding
  - Low HARQ-ACK transmission delay
  - Control signaling split
- Multiplexing and scheduling
  - Orthogonal multi-carrier baseline
  - Advanced UE transmission waveform
  - Physical layer processing robust to short bursts of interference
  - UE-based scheduling within allocated pool of resources
- Deployment
  - Minimization of always-on signals
  - Blank resources
  - Flexible provision of reference signals and resources
  - Use of LTE signals in tightly integrated LTE-NR scenarios

Decision: The document is noted.

R1-162580 Overview of NR techniques Mitsubishi Electric Co.

The document was presented by … from Mitsubishi.

- Proposals related to Massive MIMO
  - User interference cancellation at transmitter: precoding/postcoding design
  - CSI reporting with higher resolution
  - Investigation on impact of realistic assumptions on channel reciprocity (i.e., mismatches
  - in RF circuit characteristics between TX and RX)
  - RS design, including SRS, to reduce pilot contamination

Petitioners' Exhibit 1007, p. 1474
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted.

R1-162741 Discussion on new radio interface Lenovo (Beijing) Ltd
The document was presented by Xinghua Song from Lenovo.
- Proposal 1: Consider common/symmetric DL/UL waveform design at least for above 6GHz.
- Proposal 2: Support multiple/scalable numerologies in NR to support frequency bands up to 100GHz.
- Proposal 3: Frame structure should flexibly support eMBB/mMTC/URLLC in the carrier.
- Proposal 4: NR should keep the always-on signals as minimum as possible to achieve higher efficiency and better forward compatibility.
- Proposal 5: Ultra-dense deployments should be emphasized in the NR design and TRP coordination should be studied including inter-TRP interference management, resource coordination, joint scheduling, mobility management, etc.
- Proposal 6: Study RAN functional split and interface in different deployments and carrier frequencies considering RAN virtualization and its impact on PHY.
- Proposal 7: Provide RAN1 feedback on the RAN functional split to RAN2/3.

Discussion: RAN1 chair→ is proposal 6 also be proposed to RAN2/3? Same approach
Decision: The document is noted.

R1-162791 Overview of next generation new radio access technology MediaTek Inc.
The document was presented by … from MediaTek.
- Proposal 1: For eMBB including medium and high end MTC service, urban macro and dense urban scenarios with below ~40GHz spectrum and the wide system bandwidth are focused for optimal design.
- Proposal 2: For URLLC, small cell layer in dense urban scenario or indoor scenario with below ~40GHz spectrum is focused for optimal design.
- Proposal 3: For mMTC targeting the low end MTC service, rural scenario with below 1GHz spectrum (e.g., 700Mhz) is focused for optimal design.
- Proposal 4: Multiplexing of the different usage scenarios should be transparent for a device in system design.
- Proposal 5: The set of waveform numerologies should be restricted with the justified scenarios to reduce the UE implementation complexity.
- Proposal 6: The mechanism to support the flexible narrow band and wide band operation should be studied for UE energy efficiency.
- Proposal 7: The more advanced receiver should be considered to improve the spectrum efficiency and data throughput.
- Proposal 8: Reduction on PHY control and pilots can be considered to achieve the high performance.
- Proposal 9: A codec, achieving the high throughput with low power consumption, should be studied to meet 5G requirements with feasible implementation.
- Proposal 10: Support of flexible frame structure should be considered in the system design.

Decision: The document is noted.

R1-162867 Design principles for new radio CMCC
The document was presented by Tong Hui from CMCC.
- Proposal 1: The deployment scenarios and requirements in RAN SI "Scenarios and Requirements for Next Generation Access Technologies" should be the basic principle for new radio interface design.
- Proposal 2: Forward compatibility should be supported for Phase 1 (R15) design of new radio.
- Proposal 3: A software defined air interface including multiple air interface profiles is required to meet diverse requirements of all three usage scenarios. The AI profile should be tailored for specific service requirements and network/UE capabilities.

Decision: The document is noted.

R1-162882 Requirements for the 5G New Radio physical layer Nokia, Alcatel-Lucent Shanghai Bell
The document was presented by Karri Ranta-aho from Nokia.
- Both FDD and TDD should be supported.
- Multiple different OFDM numerologies should be supported for different deployment environments and frequency bands.
- Multiple different TTI lengths or should be supported for different latency and cell range targets.
- Support for flexible/dynamic TDD should be considered for configurations optimized for bands above 3 GHz.
- mMTC point of optimization should be around or below 1 GHz.
- Single carrier waveforms should be considered for configurations optimized for very high bands, e.g. > 40 GHz, as well as for mMTC.
- LBT mechanism should be supported for Licenced-Assisted Access.

Decision: The document is noted.

R1-162929 Overview of OTFS Waveform for Next Generation RAT Cohere Technologies, AT&T, CMCC, Deutsche Telekom, Telefonica, Telstra

Petitioners' Exhibit 1007, p. 1475
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The document was presented by … from Cohere and requests that the Orthogonal Time Frequency & Space (OTFS) modulation and reference signal multiplexing scheme is thoroughly evaluated on its merits for the air interface of 5G systems and included in the Technical Report TR38.802 "TR for Study on New Radio Access Technology Physical Layer Aspects".
Decision: The document is noted.

R1-163105 Overview of eMBB opration for NR access techonology NTT DOCOMO, INC.
The document was presented by Fred Takeda from NTT DOCOMO.

- Proposal 1: Study numerology parameters for OFDM-based waveform for NR.
  - Scalable numerology parameters can be a starting point.
  - Feasibility and benefit of modified OFDM-based waveforms can also be studied.
- Proposal 2: Consider lean radio-frame with flexible dynamic TDD as a candidate radio frame design for NR.
  - Study design/procedure of dynamic subframe such that highly flexible TDD operation is enabled.
  - Study design/procedure of fixed DL subframe such that various scenarios can efficiently be supported.
- Proposal 3: Study native support for massive MIMO and/or virtual cell operations for NR.
  - Various massive MIMO operations/configurations should be investigated.

Decision: The document is noted.

R1-163129 Overviewon new air interface CATR
The document was presented by … from CATR.

- Proposal 1: eMBB, mMTC and URLLC should have the same priority to be study and specified. Fundamental physical layer signal structure design should take all three usage scenario into account
- Proposal 2: 5G NR framework should be capable to provide diverse usages in one carrier without guard band.
- Proposal 3: NR supports set of numerologies to meet all deployment scenarios.
- Observation 1: The main expected spectrum for NR will be TDD and dynamic TDD design should be supported at the very beginning.

Decision: The document is noted.

R1-163157 Requirements for New Radio Interface IITH
The document was presented by Kiran Kuchi from IITH.
Decision: The document is noted.

R1-163190 New RAT Using imparity CCFD for mMTC III
The document was presented by … from III and proposes the CCFD architecture in new RAT.

- Using the imparity CCFD with TDD, allows UL and DL be allocated in the same time and in the same bandwidth. Moreover, decide resource schedule according with the position or direction of UE can reduce the interference between UE and UE to achieve the same service coverage as non-CCFD TDD, so that we can get better performance.

Decision: The document is noted.

R1-163215 Overview of NR Ericsson
The document was presented by Stefan Parkvall from Ericsson.
Decision: The document is noted.

R1-163280 On new radio interface design targets and principles China Unicom
The document was presented by … from China Unicom and .

- Proposal 1: for design the unified air interface, reducing CAPEX and OPEX should be considered; the enabled technologies should be identified for different usage scenarios and coexistence and coordination between these technologies should be further studied.
- Proposal 2: For E2E network slicing, the key issues should be considered including how to mapping the core network slicing to radio interface slicing and how to calculate the actual bearing physical resources.

Decision: The document is noted.

R1-163292 Overviews of physical layer signal structure for New RAT Sharp
The document was presented by … from Sharp.
Observation 1:

- For downlink, OFDM-based waveform is the baseline for NR.
  - Suitable for flexible UE multiplexing in spatial and/or power domains, such as MU-MIMO and MUST.
- For uplink, both single carrier signal and OFDM-based waveform can be considered for flexible UE multiplexing.

Observation 2: Full flexible UL/DL subframe allocation is one of the key requirements for NR to support.

- The ratio of UL/DL traffic becomes more flexible based on:
  - Location, time, etc

Observation 3: UE complexity for supporting multiple 3GPP-RATs should be taken into account when coding scheme is studied

- mMTC and/or URLLC specific terminal may support only NR. In this case, mMTC and/or URLLC UE may not need to support turbo decoder.

Petitioners' Exhibit 1007, p. 1476
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted.

R1-163293 Unlicensed bands support in New RAT Sharp

Observation 1: The increasing number of supported band is serious issue in terms of NR global terminal since frequency range will be dramatically increased in NR.

Observation 2:

- Unlicensed spectrum becomes more important and can be used as an "international band"
- Native support of unlicensed spectrum is one of the key requirements for NR.
  - FFS: standalone on unlicensed spectrum

Decision: The document is noted.

R1-163615 Way Forward on Ovverview of NR NTT DOCOMO, Alcatel-Lucent Shanghai Bell, Huawei, HiSilicon, Nokia, Samsung

The document was presented by Kazuaki Takeda from NTT DOCOMO.

- Largest component carrier bandwidth not smaller than 80 MHz
- Waveform is based on OFDM
  - Multiple numerologies are considered
  - A form of DFT-S-OFDM and/or OFDM with filtering/windowing is further considered
  - FFS for case where PA efficiency is an issue
- Frame structure(s) supporting
  - FDD and TDD duplex arrangement
  - Downlink, uplink, and sidelink transmission
  - Access and backhaul
  - Operation in licensed and at least licensed-assisted operation in unlicensed band
- Study flexible/dynamic TDD, including both downlink and uplink transmissions in the same subframe interval
- Study enhanced massive MIMO analog/digital/hybrid beam-forming
- Study multiple access mechanisms including UL-grant less transmission, contention-based transmission, non-orthogonal multiple access

Decision: The document is noted, modified as follows:

Agreements

- Largest component carrier bandwidth not smaller than 80 MHz for at least one numerology is supported
- Waveform is based on OFDM
  - Multiple numerologies are supported
  - Additional functionality on top of OFDM such as DFT-S-OFDM, and/or variants of DFT-S-OFDM, and/or filtering/windowing, and/or OTFS is further considered
    - Complementary non-OFDM based waveform is not precluded for some specific usecases (e.g., mMTC use case)
- Study frame structure(s) supporting at least
  - FDD duplex arrangement
  - TDD duplex arrangement
  - Downlink transmission
  - Uplink transmission
  - Sidelink transmission
  - Access link
  - Backhaul/relay link
  - Stand alone operation in licensed band
  - Non stand alone operation in licensed band
  - Licensed-assisted operation in unlicensed band
- Study flexible/dynamic TDD, including both downlink and uplink transmissions in the same subframe interval
- Study enhanced massive MIMO analog/digital/hybrid beam-forming
- Study multiple access mechanisms including UL-grant less transmission, contention-based transmission, non-orthogonal multiple access
- Study flexible duplex

Not treated.

R1-163216 Some design principles for NR Ericsson

8.1.2 Forward compatibility for new radio interface

Solutions how to achieve forward compatibility with Phase II specification and beyond.

R1-162193 Forward compatible NR design Qualcomm Inc.

The document was presented by Tingfang Ji from Qualcomm.

- Proposal 1: Waveforms for initial access and paging should have limited time/frequency footprint.
- Proposal 2: Self-contained data and mobility transactions are highly desirable, such that UE activity during a transaction is limited to confined time/frequency footprint.
- Proposal 3: Persistent signals such as CRS should be configurable based on different use cases.
- Proposal 4: Identify the characteristics for each feature/services for forward compatibility analysis
- Proposal 5: Forward compatibility signalling of blank time/frequency resources should be defined for the introduction of unknown features

Decision: The document is noted.

R1-163392 Consideration on forward compatibility for new radio interface ZTE (R1-162223)

The document was presented by Yifei Yuan from ZTE.

- Regarding frame structure, self contained frame structure, flexible data subframes and flexible numerology should be considered.
- Regarding user centric design, the design principle should be to minimize mandatory signals in the network for lower interference and better network efficiency. Reference signals should be designed in on-demand and UE specific manner. Broadcast channel for system information should include only the common and essential system information.
- Regarding MIMO framework, CSI and transmission scheme should be decoupled. We should strive for universal MIMO framework for different scenarios and use cases. Multi-level CSI feedback is considered to flexibly adapt to different CSI requirements. In additional to data channel, design of MIMO framework should also consider support of beam based control channel, broadcast channel and synchronization signal.

Decision: The document is noted.

R1-162514 Consideration on forward compatible new radio interface design LG Electronics

The document was presented by Eunsun Kim from LGE.

- Always-on or periodic signalling/channel should be minimized
- Flexible and dynamic DL/UL configuration should be supported
- Flexible HARQ timing should be supported
- New waveform of NR should provide multiplexing of different numerologies/usecases

Decision: The document is noted.

R1-162553 Forward compatibility aspect of NR Panasonic Corporation

The document was presented by Hidetoshi Suzuki from Panasonic.

- Proposal 1: Different usage scenarios are realized by sub-RATs, where certain amount of independency is achieved among sub-RATs.
- Proposal 2: The system is designed as to allow different sub-RATs to use different time/frequency resource. Overlapping among sub-RATs is subject to case-by-case discussion.
- Proposal 3: The system is designed to allow the introduction of new waveform in different time/frequency resource usage.
- Proposal 4: The system is designed to reduce the inter-sub-RAT interference (emission).
- Proposal 5: The need of sub-RAT specific synchronization signals are subject to case-by-case discussion.
- Proposal 6: The use of CRS or DMRS depends on use cases and could be different among sub-RATs.
- Proposal 7: PBCH/MIB like very initial common channels should be minimized but cell detection latency should also be taken into account.
- Proposal 8: The need of sub-RAT specific PBCH/MIB like very initial common channels is subject to case- by-case discussion.
- Proposal 9: On demand SIBs transmission or constant periodic SIBs transmission depends on the frequency of incoming UEs. Depending on the use cases, both may be required and it is sub-RAT specific.
- Proposal 10: Cell common L1 control signalling needs careful design for forward compatibility.
- Proposal 11: Signal dynamic range should be taken into account for the possibility of future compatibility among multiple sub-RATs.
- Proposal 12: Signal dynamic range should be taken into account for the flexibility on DL, UL and sidelink duplex.
- Proposal 13: Signal dynamic range should be taken into account for sharing frequencies among operators.

Petitioners' Exhibit 1007, p. 1478
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted.

R1-163294 Forward compatibility for New RAT Sharp

The document was presented by John Kowalski from Sharp.

- Observation from Co-cell/site/carrier operation perspective:
  - Phase II NR should co-exist with Phase I NR on the same carrier component.
    - FFS: FDM, TDM or any other multiplexing scheme within a carrier component
    - FFS: how dynamically reallocate Phase I NR resources and Phase II NR resources
- Observation from eNB perspective:
  - Phase II NR eNB should support the connectivity to Phase I NR UE.
    - FFS: Phase II eNB support Phase I UE and Phase II UE at the same time and frequency
  - Phase I eNB should support the connectivity to Phase II UE.
    - FFS between following two alternatives
      - Alt.1: Phase II UE is mandated Phase I functionality.
      - Alt.2: Phase II NR has the backward compatibility with Phase I NR.
        - E.g. common signaling and/or air-interface
- Observation from UE perspective:
  - At least Phase I NR UE should be allowed to connect to Phase II NR eNB.
  - Phase II NR UE does not need to support all Phase I functions.
    - FFS:how to divide the feature sets for forward compatibility.
- Observation from Specification perspective:
  - From the specification perspective, UE specific physical layer parameters may provide flexible extensions of physical layer structures in Phase II even for cell specific use cases.

Decision: The document is noted.

R1-163555 WF on Forward Compatibility Huawei, HiSilicon

The document was presented by David Mazzarese from Huawei.

Observations for forward compatibility and for compatibility of different features within each release:

- Support of Coexistence over a single continuous block of spectrum
  - NR and other 3GPP RAT (e.g. LTE, NB-IoT)
  - different NR numerologies
  - different services
- Support of multiple services (in any phase/release)
  - services using future designs (e.g. waveform, frame structure, multiple access, etc)
  - services using the same OFDM-based waveform with different numerology
- Support of accommodating new technical features
  - seamlessly integrate new device categories
  - enable UEs that do not support the full system BW (e.g. low-cost MTC)

Proposal: Phase 1 and later phases of NR should be designed with the following principles to ensure forward compatibility and compatibility of different features:

- Support of blank resources in time/frequency
- waveform with lower emissions outside the useful subbands compared to CP-OFDM without windowing and filtering
- Strive for
  - Minimizing the amount of signals/resources that needs to be transmitted irrespective of incoming traffic
  - Maximizing the amount of resources that can be flexibly utilized without causing backward compatibility issues in the future
  - Minimizing transmission of (always-on) wideband signals and channels
- Flexible configuration of signals, channels and resources
  - Strive to avoid short periodicity of always-on periodic signals and channels
  - Rely more on dynamically configured quantities
- Physical layer functionalities (signals, channels, signaling) should be confined within its flexibly-configured time/frequency resource (for control, data, reference signals)
- Rely more on UE-specific quantities

Decision: The document is noted.

Agreements:

- Phase 1 and later phases of NR should be designed with the following principles to ensure forward compatibility and compatibility of different features:
  - Strive for
    - Maximizing the amount of time and freq. resources that can be flexibly utilized or that can be left blanked without causing backward compatibility issues in the future
      - Blank resources can be used for future use
    - Minimizing transmission of always-on signals

Petitioners' Exhibit 1007, p. 1479
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Confining signals and channels for physical layer functionalities (signals, channels, signaling) within a configurable/allocable time/freq. resource

Possible observations
- For forward compatibility and for compatibility of different features within each release, the following observations are made:
  - Support of Coexistence over a single continuous block of spectrum
    - NR and other 3GPP RAT (e.g. LTE, NB-IoT)
    - different NR numerologies
    - different services using the same OFDM-based waveform with different numerology
  - Support of multiple services (in any phase/release)
    - services using future designs (e.g. waveform, frame structure, multiple access, etc)
  - Support of accommodating new technical features
    - seamlessly integrate new device categories
    - enable UEs that do not support the full system BW (e.g. low-cost MTC)

Not treated.

Decision: The document is noted.

8.1.3 Evaluation assumptions for new radio interface

Discussions on models, scenarios, parameters, and methodology that can be used for evaluating technology proposals.

R1-163659 Evaluations assumptions for NR NTT DOCOMO
The document was presented by Takeda Kazuaki from NTT DOCOMO.
Discussion: Very first attempt (drawn by Tuesday's session) – aiming for review and try to agree some assumptions within the next couple of days (common consensus needed).
Chair: any companies can propose their views to the rapporteur.
Companies wondered whether the content can be very useful (if all can suggest whatever they like and nobody is forced performing evaluations and providing feedback)
Concern with the complexity of evalutions that assumptions may triggered
Decision: The document is noted. Continue offline discussion until Thursday – (NTT DOCOMO)

Tuesday conclusion:
Continue offline discussion about waveform and multiple access assumptions – Wuyong (Huawei), (also LGE, Qualcomm, ZTE, DOCOMO (KPI, metrics))
Continue offline discussion about channel coding and modulation related assumptions – Keeth (Nokia) (also LGE)
Continue offline discussion about antenna modeling assumptions (R1-163547) until Wednesday- (Intel)

Wednesday
R1-163557 Way forward on assumptions for multiple access evaluation Huawei, HiSilicon
Decision: The document is noted.
R1-163556 Way forward on assumptions for waveform evaluation Huawei, HiSilicon
Decision: The document is noted.

Possible agreements:

Petitioners' Exhibit 1007, p. 1480
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Link level simulation is used for waveform evaluation.
  - Whether and how to do system level simulation for waveform is FFS.
- Four evaluation cases should be used in link level simulation, which are
  - Case 1: DL single numerology case
  - Case 2: DL mixed numerology case
  - Case 3: UL single numerology case (asynchronous transmission)
  - Case 4: UL mixed numerology case (synchronous transmission)

R1-163713 Way Forward on requirements for the evaluation of channel coding scheme LG Electronics, Ericsson, CATT, AT&T, Fujitsu
Decision: The document is noted.

R1-163700 WF on Channel coding for 5G NR Nokia, Alcatel-Lucent Shanghai Bell
The document was presented by Keeth Jayasinghe from Nokia.
Decision: The document is noted. Further revised in **R1-163757**.
R1-163757 WF on Channel Coding Evaluation for 5G New Radio Nokia, Alcatel-Lucent Shanghai Bell, Samsung, Huawei, Sony, ZTE, Intel, Qualcomm, InterDigital, NTT DOCOMO
Discussion: Ericsson → preference to consider 256QAM modulation.
Decision: The document is noted, modified and agreed as follows:

Agreements: Coding Candidates
- Identified channel coding schemes for each usage scenario

eMBB	mMTC	URLLC
	Convolutional codes	Convolutional codes
LDPC	LDPC	LDPC
Polar	Polar	Polar
Turbo	Turbo	Turbo

- Common simulation assumptions are required to evaluate theoretical performance of proposed coding schemes
- Selection of the coding scheme should also consider various other aspects

Initial Simulation Assumptions
- Focus mainly on the BLER performance of candidate coding schemes.
- Evaluate performance of coding schemes with similar code rates and block sizes.
- Exact code constructions should be provided.
  - Example: Parity check matrices, polar code construction, ..
- Encoding/decoding complexity of the adopted algorithms should be described.

Agreements: Simulation assumptions : eMBB
- Evaluate the block error rate (BLER) performance versus SNR

Channel*	AWGN		
Modulation	QPSK, 64 QAM		
Coding Scheme	Turbo	LDPC	Polar
Code rate	1/5, 1/3, 2/5, 1/2, 2/3, 3/4, 5/6, 8/9		
Decoding algorithm**	Max-log-MAP	min-sum	List-X
Info. block length*** (bits w/o CRC)	100, 400, 1000, 2000, 4000, 6000, 8000 Optional(12K, 16K, 32K, 64K)		

* Fading channels will be simulated in the next stage
** These algorithms are starting points for further study. Other variants of agreed algorithms can be used for encoding and decoding (Complexity details should be illustrated)
*** At least these info. block length and code rate shall be evaluated. Other info. block lengths and code rates are not precluded. Similar info. and encoded block lengths should be used for the evaluation. Total coded bits = info. Block length/code rate. Note: these info. block length and code rate are only for initial performance evaluations. They are not interpreted as design targets or assumptions for complexity analysis.

- General guidelines
  - Existing code constructions can be used for evaluation

Petitioners' Exhibit 1007, p. 1481
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Whenever feasible, performance comparison should adopt coding constructions with matching computational complexities

Simulation assumptions : URLLC and mMTC

- Evaluate BLER performance versus SNR

Channel*	AWGN			
Modulation	QPSK, 16 QAM			
Coding Scheme	Convolutional codes	LDPC	Polar	Turbo
Code rate	1/12, 1/6, 1/3			
Decoding algorithm**	List-X Viterbi	min-sum	List-Y	Max-log-MAP
Info. block length*** (bits w/o CRC)	20, 40, 200, 600, 1000			
* Fading channels will be simulated in the next stage ** These algorithms are starting points for further study. Other variants of agreed algorithms can be used for encoding and decoding (Complexity details should be illustrated) *** At least these info. block length and code rate shall be evaluated. Other info. block lengths and code rates are not precluded. Similar info and encoded block lengths should be used for the evaluation. Total coded bits = info. Block length/code rate. Note: these info. block length and code rate are only for initial performance evaluations. They are not interpreted as design targets or assumptions for complexity analysis.				

- General guidelines
  - Existing code constructions can be used for evaluation
  - Whenever feasible, performance comparison should adopt coding constructions with matching computational complexities
  - BLER simulations down to 10^{-4} is recommended (to observe the error floor) for URLLC

R1-163547 **WF on antenna modelling and related parameters for NR evaluations** **Intel, Samsung**
Decision: The document is noted. Continue offline discussion about antenna modeling assumptions (revision in R1-163706) until Thursday- (Intel)

Thursday
R1-163706 **WF on antenna modelling for NR evaluations** **Intel, Samsung**
Discussion: Telecom Italia→ Concern that realistic antennas configurations be assumed for low bands (700 MHZ, 4GHZ) – repeated comment already formulated during the last plenary
Decision: The document is noted. Continue offline discussion about antenna modeling assumptions (revision in R1-163863) until Thursday- Alexei (Intel)

R1-163861 **Summary of evaluation assumptions for NR** **NTT DOCOMO**
The document was presented by Kazuaki Takeda from NTT DOCOMO.
Discussion: Telecom Italia→ same comment "realistic antennas configurations be assumed for 700 MHZ, 4GHZ" applies.
Fujitsu: various companies interested in evaluating the case of a carrier frequency around 4GHz for the micro layer in the dense urban scenario - should be captured.
Decision: The document is noted.

Agreements:
RAN1 agrees all proposals of R1-163861 including the following changes for carrier frequency for dense urban
Proposal: Macro layer: Around 4 GHz
Proposal: Micro layer: Around 30GHz, 4 GHz
Note that RAN1 will continue simulation assumptions
Note that antenna modeling and parameters will be updated

R1-163560 Way forward on assumptions for multiple access evaluation Huawei, HiSilicon
Decision: The document is noted.

Agreements:

Petitioners' Exhibit 1007, p. 1482
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Link-level simulation (LLS) and system-level simulation (SLS) are used for multiple access evaluation.
  - LLS* is used for feasibility investigation of new MA proposals, comparison of different proposals in typical scenarios
  - SLS is used for comparison of proposals, and verification with traffic/scheduling/multi-cell interference dynamics

* LLS includes LLS with optional analytical model.

Agreement: Slides 4, 5, 6, 7 in R1-163560 are agreed.

Conclusion:
- Preliminary LLS evaluation results are encouraged to be provided for RAN1#85

Petitioners' Exhibit 1007, p. 1483
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The document was presented by Ramon Khalona from INL and .

- Observation: To overcome all of the above inefficiencies of OFDM and to meet the new requirements a new waveform should be considered.
- Observation: FBMC systems provide much better spectral shaping and relaxed output filter requirements than OFDM.
- Proposal: Filtered OFDM/UFMC should be considered as one of the waveform candidates; however, a proper analysis must be performed to understand the trade-offs against the conventional OFDM.
- Proposal: FBMC should be considered as one of the waveform candidates, including a detailed analysis of its benefits vs. complexity trade-offs.

Decision: The document is noted.

R1-163311 Discussion on new waveforms CEWiT

The document was presented by … from CEWiT and proposes to consider and study both OFDM and non-OFDM based waveforms as candidate waveforms for the NR systems.

Decision: The document is noted.

R1-162152 OFDM based flexible waveform for 5G Huawei, HiSilicon

The document was presented by … from Huawei and .

Observation: OFDM-based orthogonal waveforms have the following advantages:

- Supporting a flexible and forward compatible air interface;
- Enhanced spectrum localization performance;
- Reuse of legacy OFDM-based transmission thanks to the complex-domain orthogonality retained within sub-bands;
- Amicable to MIMO technologies;
- Simpler insertion of reference signals.

Proposal: OFDM based orthogonal waveforms including filtered-OFDM, windowing-OFDM, UF-OFDM should be considered for further evaluation.

Decision: The document is noted.

R1-163110 Initial link level evaluation of waveforms NTT DOCOMO, INC.

The document was presented by Petra Weitkemper from NTT DOCOMO.

- Observation 1: W-OFDM, F-OFDM and FBMC/OQAM could much improve the OOB emission compared to traditional CP-OFDM.
- Observation 2: F-OFDM could reach overall better OOB performances compared to W-OFDM.
- Observation 3: W-OFDM and F-OFDM are more suited for short burst transmission compared to FBMC/OQAM.
- Observation 4: Without DFT spread, all the waveforms have similar PAPR performance.
- Observation 5: Introducing DFT spread to F-OFDM and W-OFDM has similar PAPR impact compared to CP-OFDM.
- Observation 6: Introducing DFT spread to FBMC/OQAM lead to much lower PAPR reduction compared to the other waveforms.
- Observation 7: The BLER performances of W-OFDM, UF-OFDM and FBMC/OQAM is close to traditional CP-OFDM, while f-OFDM suffers loss for high coding rates.
- Observation 8: Introducing tone offset subcarriers improves the f-OFDM BLER performance with high coding rates. The loss compared to other waveforms becomes minor.
- Observation 9: Under extreme high mobility, FBMC/OQAM outperforms other waveforms.
- Observation 10: All considered waveforms perform similar with 2x2 MIMO spatial multiplexing and linear receivers. Observations 7, 8 and 9 are also valid here.
- Observation 11: Non-linear MIMO schemes like Alamouti or sphere detection cannot be easily combined with OQAM modulation. This is drawback for FBMC/OQAM.
- Observation 12: W-OFDM, UF-OFDM, f-OFDM and FBMC/OQAM outperform CP-OFDM under asynchronous access transmission due to their reduced OOB emissions.
- Observation 13: FBMC/OQAM and f-OFDM needs much smaller of guard subcarriers to achieve the same performance as the synchronous CP-OFDM compared UF-OFDM and W-OFDM.
- Observation 14: Introducing tone offset subcarriers degrades the f-OFDM BLER performance under asynchronous access transmission. The wider filter bandwidth increases the interference to the neighboring users.
- Proposal 1: CP-OFDM should be considered as the baseline waveform.
- Proposal 2: W-OFDM and F-OFDM should be further considered as new waveform candidates.

Decision: The document is noted.

R1-162750 Link-level performance evaluation on waveforms for new RAT Spreadtrum Communications

The document was presented by Jinhui Chen from Spreadtrum.

- Observation 1: When uplink transmission are synchronized in time but not in frequency, F-OFDM achieves small gain over OFDM against CFO, while FBMC achieves significant gain over OFDM against CFO except for the closest subcarrier that suffers from loss of real-orthogonality.

Petitioners' Exhibit 1007, p. 1484
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Observation 2: When uplink transmission are synchronized in frequency but not in time, F-OFDM achieves moderate gain over OFDM against time offset while FBMC achieves significant gain over OFDM except for the closest subcarrier that suffers from loss of real-orthogonality.
- Observation 3: For OFDM, interference from the numerology with large subcarrier spacing to that with small subcarrier spacing is higher than the other way around.
- Observation 4: When numerologies with different subcarrier spacing coexist, F-OFDM achieves marginal gain over OFDM, while FBMC achieves significant gain at a cost of one subcarrier as the guard band.

Decision: The document is noted.

R1-162925 Design considerations on Waveform in UL for New Radio systems INTERDIGITAL COMMUNICATIONS

The document was presented by … from InterDigital.

- Proposal: Waveforms which use DFT-S-OFDM as a basis should be studied for the UL of the new radio.

8.1.4.2 Multiple access scheme

R1-163160 Generalized Precoded OFDMA (GPO) IITH

The document was presented by Kiran Kuchi from IITH.
Decision: The document is noted.

R1-162153 Overview of non-orthogonal mutliple access for 5G Huawei, HiSilicon

The document was presented by … from Huawei.

- Observation 1: The expected functionalities for 5G MA are different in each usage scenario and are summarized (see Table 1).
- Observation 2: Non-orthogonal MA can have advantage over OMA in many aspects (see Table 2), which deserves careful investigation in 5G NR.
- Proposal 1: Code domain non-orthogonal design is needed in addition to the power domain superposition to deal with channel and interference uncertainties.
- Proposal 2: Sparse spreading is an important feature in the code domain design to enable high level of overloading with close to ML detection performance and reasonable detection complexity.

Decision: The document is noted.

R1-162155 Sparse Code Multiple Access (SCMA) for 5G Radio Transmission Huawei, HiSilicon

- Multi-dimensional modulation and sparse spreading should be further studied as a candidate scheme for non-orthogonal multiple access for 5G new radio.

Decision: The document is noted.

R1-162870 On Unified Framework for Multi-Access Schemes CMCC

The document was presented by Nan Hu from CMCC.

- Proposal 1: Considering diversified 5G scenarios and enhanced performance requirements, new multiple access schemes should be studied.
- Proposal 2: It is preferred to compare the structure of various non-orthogonal multiple access schemes for a better understanding of their mechanisms which may facilitate future down selection and harmonization in RAN1. A unified framework of multiple access techniques is proposed for such comparison.
- Proposal 3: Current proposed non-orthogonal multiple-access schemes may be merged to a single non-orthogonal multiple-access scheme based on the unified framework, while the orthogonal multiple-access scheme should be a special of the merged non-orthogonal multiple-access scheme.

Decision: The document is noted.

R1-162203 NR multiple access evaluation proposals Qualcomm Inc.

The document was presented by … from Qualcomm.

- Proposal 1: different multi-access candidates can be evaluated/optimized for different use cases, such as eMBB, eMTC and uRLLC. However, it is recommended to start with analytic comparisons before directly going to full blown system level simulations. This can include, but not limited to:
  - Capacity analysis for NOMA vs OMA for eMBB
  - Link budget vs capacity trade-off for mMTC
  - Signaling overhead for NOMA vs OMA for mMTC
- Proposal 2: If there is a clear need to do system level simulations for evaluation/decision, agreement has to be made regarding the evaluation assumptions, then different scheme can be compared focusing on the key performance matric list (see section 3).

Decision: The document is noted.

R1-163383 Candidate Solution for New Multiple Access CATT (R1-162306)

The document was presented by … from CATR and deals with a code based NOMA scheme with following characters to alleviate error propagation problem of SIC:

- It takes joint optimization of transmitter and receiver, with unequal transmission diversity order but identical diversity order after detection.
- It uses sparse coding to map user data onto sharing resources.

System level evaluation results show that the proposed NOMA scheme is beneficial in both spectrum efficiency and connection density.

Decision: The document is noted.

R1-162517 Considerations on DL/UL multiple access for NR LG Electronics

The document was presented by … from LGE.

- Suggestion 1: OMA (e.g. OFDMA for DL, SC-OFDMA for UL) should be considered as a baseline MA scheme for NR study.
- Suggestion 2: OFDMA can also be considered as MA scheme for UL in NR if PAPR of the UE operating in NR system is not important issue.
- Suggestion 3: To consider NoMA schemes as a candidate of the MA schemes in NR, it is required to justify the advantages and/or to complement the defects.
- Suggestion 4: It can be considered to use NoMA scheme such as NCMA in order for supporting massive connectivity or contention based MA in special scenarios.
- Suggestion 5: Combination of multiple MA schemes, including OMA and NoMA schemes can be considered for NR design in special scenarios.

Decision: The document is noted.

R1-163695 WF on multiple access for NR ZTE, Qualcomm Incorporated

- Non-orthogonal multiple access should be evaluated for all three scenarios: mMTC, eMBB, ULLRC.
- For uplink transmission for mMTC,
  - Non-orthogonal transmission is grant-free based
  - The candidate non-orthogonal schemes include (but not limited to):
    - Multi-user shared access (MUSA)
    - Resource spread multiple access (RSMA)
    - Sparse code multiple access (SCMA)
    - Pattern defined multiple access (PDMA)
    - Non-orthogonal coded multiple access (NCMA)
    - Frequency domain spreading

Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1486
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Observations:
- Examples non-orthogonal schemes include (but not limited to):
  - For UL, Multi-user shared access (MUSA) (e.g., R1-162226)
  - Resource spread multiple access (RSMA) (e.g., R1-163510)
  - Sparse code multiple access (SCMA) (e.g., R1-162153)
  - Pattern defined multiple access (PDMA) (e.g., R1-163383)
  - Non-orthogonal coded multiple access (NCMA) (e.g., R1-162517)
  - Low code rate spreading (e.g., R1-162385)
  - Frequency domain spreading (e.g., R1-162385)
  - Non-orthogonal multiple access (NOMA) (e.g., R1-163111)

R1-163656 WF on multiple access for NR CMCC, Huawei, HiSilicon, Fujitsu, CATT, China Telecom

Observation: Non-orthogonal multiple access methods proposed for the ~~5G~~ NR within this meeting show potentials to have benefits over orthogonal MA for eMBB, mMTC and URLLC respectively
- Non-orthogonal MA (No-MA) should be investigated for diversified ~~5G~~ NR usage scenarios and use cases, including at least eMBB (UL and DL), mMTC (UL), and URLLC (UL)
- Code and/or power domain No-MA schemes should be studied
- At least for UL mMTC, autonomous/grant-free/contention based No-MA should be studied
- Flexible MA framework should be studied which can select and/or adjust between OMA and No-MA

Discussion: Better not use 5G in 3GPP.
Decision: The document is noted.

Agreements:
- Non-orthogonal multiple access should be investigated for diversified NR usage scenarios and use cases
- At least for UL mMTC, autonomous/grant-free/contention based non-orthogonal multiple access should be studied

The document was presented by … from … and .
Discussion: .
Decision: The document is noted.

8.1.5 Numerology and frame structure for new radio interface

R1-163536 Numerology and frame structure for 5G new radio interface: over-6GHz Samsung (R1-162180)

The document was presented by … from Samsung.
- Proposal 1: The numerology design of over-6 GHz (e.g., around 30 GHz and 70 GHz) and sub-6 GHz (e.g., around 4 GHz) needs to be separately optimized.
- Proposal 2: For the numerology design over 6 GHz, study of bands below 40 GHz is prioritized over that of bands above 40 GHz.
- Proposal 3: The numerology above 6 GHz should be designed to support at least the coverage of ISD = 200m.
- Proposal 4: CP length should be long enough to compensate the channel delays and other effects while keeping a reasonable CP overhead ratio (e.g., longer than 300 – 400 ns).
- Proposal 5: Based on observations 8, 11 and 12, it is preferred to use 75 kHz as subcarrier spacing for 5G new radio interface over 6 GHz, especially for the carrier frequency range between 28 GHz and 40 GHz.
- Proposal 6: It is preferred to use 150 kHz as subcarrier spacing for 5G new radio interface over 40 GHz if subcarrier spacing larger than 75 kHz is needed.

Petitioners' Exhibit 1007, p. 1487
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal 7: Taking into account implementation complexity, maximum FFT size should be limited and we prefer to use 2048 FFT size and 100 MHz bandwidth per CC for 75 kHz subcarrier spacing as a baseline.
- Proposal 8: For 5G new air interface over 6 GHz, TDD is preferred rather than FDD and Self-contained frame structure is supported for forward compatibility.

Decision: The document is noted.

R1-162206 Frame structure requirements Qualcomm Inc.

The document was presented by … from Qualcomm.

- Proposal 1: Frame structure should be composed of two fundamental units, i.e., TTIs and SFs. A *Transmission Time Interval (TTI)* is the smallest time unit over which transmission can occur, in multiples of symbols. A *Subframe (SF)* is the smallest unit consisting of one or multiple TTIs, such that both a transaction from the source to destination and a transaction from the destination to the source are completed. There may be one or multiple TTIs per SF.
- Proposal 2: Frame structure should allow for scalability to address different services. This should include supporting of services with a target HARQ-RTT latency of 1ms, or services with an end-to-end application layer latency of 1ms.
- Proposal 3: Frame structure should allow for multiplexing of different services, such as EMBB and URLLC.
- Proposal 4: Frame structure should accommodate user multiplexing according to the topologies of basestation-to-UE uplink and downlink, and UE-to-UE sidelink.
- Proposal 5: Frame structure should support very wideband as well as narrowband deployment scenarios, including TDD and FDD allocations, and address both sub-6GHz and mmW spectrum.
- Proposal 6: Frame structure should be able to exploit channel reciprocity efficiently in TDD through availability of frequent sounding opportunities.
- Proposal 7: Frame structure should enable dynamic TDD assignment with support for managing interference between source and destination pairs (e.g., among uplink, downlink, or sidelink).
- Proposal 8: Frame structure should enable *self-contained subframes*, whereby the source-to-destination transmission as well as the response to that transmission, going from the destination-to-source, are both contained in the same subframe.
- Proposal 9: Frame structure should enable self-contained subframes with a single interlace structure.
- Proposal 10: Frame structure may include multiple interlaces subject to forward compatibility constraints.
- Proposal 11: Frame structure may include multiple interlaces subject to overhead constraints for given target latency.
- Proposal 12: Frame structure should allow for modes where a short intermediate round of communication between the source and destination can occur within a subframe.
- Proposal 13: Frame structure should allow for tight coupling across aggregated carriers.

Decision: The document is noted.

R1-163397 Numerology requirements Qualcomm Inc. (R1-162204)

The document was presented by Tingfang Ji from Qualcomm.

- Proposal 1: Numerology design should be determined based on the general requirements in Section 2 for the specific deployment scenario.
- Proposal 2: It is proposed to have scaled subcarrier spacing = $\Delta f_0 * 2^k$ in order to achieve high multiplexing efficiency between different numerologies.
- Proposal 3: It is proposed to have 2^M symbols per TTI to ensure flexible TTI downscaling for URLLC from 2^M symbols to 1.
- Proposal 4: It is proposed to have 2^M symbols per TTI and scaled subcarrier scaling = $\Delta f_0 * 2^k$ at the same time to ensure flexible numerology scaling up and down in the same TTI. Scalable short symbols are to support low latency and scalable long symbols are to ensure robustness in MBSFN/COMP type of features.
- Proposal 5: it is proposed to have NR numerology family as:
  - subcarrier spacing $\Delta f_k = \Delta f_0 * 2^k$,
  - $CP_k = CP_0/2^k$,
  - $16*2^k$ symbols per ms,

  where one example is: Δf_0 = 17.5 kHz, CP_0 = 5.36us, 16 symbols per ms and k is an integer.

Decision: The document is noted.

R1-162386 Numerology for new radio interface Intel Corporation

The document was presented by Joonyoung Cho from Intel.

- Proposal 1: For operating frequencies in low-to-mid frequency bands (for e.g., > 6 GHz and < 40 GHz), 75 kHz subcarrier spacing is preferred because of frequency drift and phase noise considerations.
- Proposal 2: For high frequency bands (e.g., >=40 GHz), a much higher subcarrier spacing (e.g., 375 kHz) can be considered.
- Proposal 3: The radio frame length is recommended to be kept as 10 ms, regardless of subcarrier spacing for efficient inter operations between LTE and NR-Phase 1 and NR-Phase 2.
- Proposal 4: For high frequency bands (e.g., >=40 GHz), designing a system targeting delay spread of omnidirectional channel can result in high overheads, thus re-configurable CP lengths can be considered as an option to reduce overheads and improve spectral efficiency.

Petitioners' Exhibit 1007, p. 1488
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal 5: A TTI of 0.2 ms consisting of 14 symbols when 75 kHz subcarrier spacing is used should be considered for NR for low-to-mid frequency bands (for e.g., > 6 GHz and < 40 GHz).

Decision: The document is noted.

R1-162742 **Frame structure design for next radio interface** **Lenovo (Beijing) Ltd**

The document was presented by Xinghua Song from Lenovo.

- Proposal 1: Multiple TTI lengths with scalability should be supported in NR.
- Proposal 2: For NR, the following subframe types are supported
  - Special subframe containing DL(data and/or control), GP, and UL (data and/or control)
  - DL only subframe
  - UL only subframe
- Proposal 3: Dynamic TDD should be supported and how to signal the flexible TDD frame structure should be studied.

Discussion: Fujitsu→ what subframe duration being considered. Lenovo→ may depend on the scenarios to be supported

Decision: The document is noted.

R1-162795 **Numerology Considerations for Next Generation New Radio Access** **MediaTek Inc.**

The document was presented by Pekai Liao from MediaTek.

- Proposal 1: A set of OFDM-based numerologies supporting all the deployment scenarios should be studied, including one that is backward compatible with LTE and one tailored to dense urban with sub-carrier spacing of 60 or 75 kHz.
- Proposal 2: The design should consider the system aspects such as cyclic-prefix overhead, resource block granularity as well as the device implementation aspects such as FFT size, clock rate, etc.

Decision: The document is noted.

R1-163112 **Initial views on frame structure for NR access technology** **NTT DOCOMO, INC.**

The document was presented by Fred Takeda from NTT DOCOMO.

- Observation 1: Lean radio-frame with flexible dynamic TDD would be a good candidate radio frame design for the new RAT.
- Observation 2:
  - Fixed DL subframe is transmitted by TP periodically to deliver necessary channels/signals/RSs.
    - Necessary functions and their periodicities could be different depending on use-case and scenario.
  - Further investigation is necessary on how to design the fixed DL subframe.
    - Forward compatibility should be taken into account.
- Observation 3: Further study is necessary on how to design dynamic subframe.
  - It is highly important to ensure high flexibility in dynamic subframe operations.
    - It is desirable to indicate the usage of each subframe by the DL control signalling in the subframe.
    - It is desirable to support flexible (explicit) operations of HARQ and CSI feedback.
  - Self-contained operation would bring different benefits and can also be another solution.
    - Very quick HARQ-ACK feedback can realize extra low latency operation.
    - Overhead saving by linking time/frequency resource information between the channels/signals.

Decision: The document is noted.

R1-163227 **Numerology for NR** **Ericsson**

The document was presented by Erik Dahlman from Ericsson and proposes to adopt 3 different OFDM numerologies for 5G new RAT; 15, 30, and 60 kHz. All numerologies are derived from the baseline 15 kHz numerology via scaling. The 15 kHz numerology is identical to LTE.

- Proposal 1: 5G new RAT will define a set of OFDM numerologies
- Proposal 2: Other OFDM numerologies of the set are derived from the baseline OFDM numerology of the set via scaling
- Proposal 3: A subcarrier spacing is integer dividable by all smaller subcarrier spacings of the set
- Proposal 4: The baseline OFDM numerology for 5G new RAT is the LTE numerology including both normal and extended cyclic prefix ($\Delta f_1, T_{ofdm,1}, T_{cp,1}, T_{cp,1}{}'$)
- Proposal 5: For 5G new RAT Phase I, in addition to the baseline OFDM numerology the following OFDM numerologies are defined: ($\Delta f_2 = 2 \cdot 15$ kHz $= 30$ kHz, $T_{ofdm,2} = 66.67/2$ µs $= 33.33$ µs, $T_{cp,2} = 4.69/2$ µs $= 2.35$ µs, $T_{cp,2}{}' = 16.67/2$ µs $= 8.33$ µs) and ($\Delta f_3 = 4 \cdot 15$ kHz $= 60$ kHz, $T_{ofdm,3} = 66.67/4$ µs $= 16.67$ µs, $T_{cp,3} = 4.69/4$ µs $= 1.17$ µs, $T_{cp,3}{}' = 16.67/4$ µs $= 4.17$ µs).

Discussion: Compatibility with IoT is key aspect when refarming LTE to 5G new RAT.

Decision: The document is noted.

R1-163605 **WF on NR Numerology** **NTT DOCOMO, INC.**

The document was presented by Fred Takeda from NTT DOCOMO.

- For NR, it is necessary to support more than one values of subcarrier-spacing
  - A value of subcarrier-spacing is derived from a particular value of subcarrier-spacing multiplied by N where N is an integer

Petitioners' Exhibit 1007, p. 1489
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Alt.1: At least one of LTE subcarrier-spacing (15 kHz) is one of the supported values
  - FFS: Whether other LTE subcarrier-spacing are also the supported values
- Alt.2: Any LTE subcarrier-spacing is not one of the supported values
- FFS: exact value of the particular value and possible values of N

– The values of possible subcarrier-spacing will be further narrowed-down in RAN1#85

Decision: The document is noted.

Possible agreements
For NR, it is necessary to support more than one values of subcarrier-spacing

- Values of subcarrier-spacing are derived from a particular value of subcarrier-spacing multiplied by N where N is an integer
  - Alt.1: Subcarrier-spacing values include 15 kHz subcarrier spacing (i.e LTE based numeroly)
  - Alt.2: Subcarrier-spacing values are based on multiple or division of 15 kHz subcarrier spacing without 15 kHz subcarrier spacing (LGE's proposal)
  - Alt.3: Subcarrier-spacing values include 17,5 kHz subcarrier spacing with uniform symbol duration including CP length
    - Note: other values are not precluded
  - FFS: exact value of the particular value and possible values of N
- The values of possible subcarrier-spacing will be further narrowed-down in RAN1#85

Agreements

- For NR, it is necessary to support more than one values of subcarrier-spacing
  - Values of subcarrier-spacing are derived from a particular value of subcarrier-spacing multiplied by N where N is an integer
    - Alt.1: Subcarrier-spacing values include 15 kHz subcarrier-spacing (i.e., LTE based numerology)
    - Alt.2 Subcarrier-spacing values include 17.5 kHz subcarrier-spacing with uniform symbol duration including CP length
      - Note: Other values are not excluded
    - Note: other alternatives are not precluded
    - FFS: exact value of a particular value and possible values of N
  - The values of possible subcarrier-spacing will be further narrowed-down in RAN1#85
- Companies are encouraged to provide detailed analysis and input the views in the following table

	Proponent name			
	Set 1	Set 2	Set 3	…Set X
Subcarrier-spacing (kHz)				
Component carrier bandwidth (MHz)				
OFDM symbol length (μs)				
CP length (μs)				
Nb of symbols / subframe				
Subframe length (ms)				
Frame length (ms)				
Note				

R1-162931 **Frame Structure and Numerology for New RAT Cohere Technologies**

- Proposal: Consider a configurable frame and numerology to address the diverse next generation deployment scenarios
  - In particular, consider a configurable TTI length to meet the performance targets for all use cases

Decision: The document is noted.

R1-162227 **Numerology design of new RAT ZTE**
Decision: The document is noted.

Wednesday
R1-163620 **15 KHz and 17.5 KHz based numerology comparison** **Qualcomm Incorporated**
The document was presented by Tingfang Ji from Qualcomm.
Decision: The document is noted.

R1-163715 **WF on Numerology Comparison Qualcomm Incorporated, ZTE**
The document was presented by Jing Jiang from Qualcomm.
Scalable numerology: 15kHz vs. 2^N family comparison

- Link-level numerology comparison (simulation)
  - Typical 3GPP channel models: scaled EPA/EVA/ETU depending on deployment scenarios
  - Numerology evaluation over mmWave band
- TTI scaling down (analysis)

- Comparison between 15kHz (non-integer symbol) vs. 17.5kHz (scalable number of symbols)
- Link-level evaluation of long CP (simulation)
  - Long DS channel model performance evaluation at the link-level
  - 15kHz family based on LTE ECP vs. 17.5kHz scaled SCS (8.75kHz or 4.375kHz)
- NB-IOT coexistence evaluation (simulation/analysis)
  - Guardband overhead comparison
- LTE TDD Coexistence (analysis):
  - Additional GP overhead quantification
- Sampling Rate Complexity (analysis)

Decision: The document is noted. Continue offline.

R1-163559 **WF on Band Agnostic Numerology Specification Huawei, HiSilicon, Ericsson**

The document was presented by David Mazzarese from Huawei.

- RAN1 specifications and PHY features of the New Radio should continue to be specified in a band-agnostic manner
  - OFDM numerologies supported by NR will not be limited to any specific band or frequency range in RAN1 specifications
  - In particular, the higher-order numerologies should not only be limited to higher frequencies
  - strive for a common structure regardless of frequency-band of operation considering different channel characteristics and target verticals

Discussion: Huawei suggested having at least that the band agnostic aspect be a common understanding.
Samsung too early to agree such statement → want to let RAN4 decide
Decision: The document is noted.

Thursday

R1-163770 **WF on Scaling of subcarrier spacing Ericsson, Qualcomm, Nokia, Alcatel Lucent Shanghai Bell, NTT DOCOMO**

The document was presented by Stefan Parkvall from Ericsson.

- The subcarrier spacing for the NR scalable numerology should scale as
  - $f_{sc} = f_0 * 2^m$ where
    - f_0 is FFS
    - m is an integer chosen from a set of possible values

Decision: The document is noted.

Possible agreement

- The subcarrier spacing for the NR scalable numerology should scale as
  - $f_{sc} = f_0 * m$ where
    - f_0 is FFS
    - m is an integer chosen from a set of possible positive values

Possible agreement

- The subcarrier spacing for the NR scalable numerology should scale as
  - $f_{sc} = f_0 * m^n$ where
    - f_0 is FFS
    - m is one value and is an integer chosen from a set of possible positive values
    - n is an integer chosen from a set of possible values

Possible agreements:

- For future evaluations, RAN1 assumes
  - The subcarrier spacing for the NR scalable numerology should scale as
  - $f_{sc} = f_0 * 2^m$ where
    - f_0 is FFS
    - m is an integer chosen from a set of possible values
- Other values are not precluded
  - Possible other values include followings
    - The subcarrier spacing for the NR scalable numerology should scale as
    - fsc = f0 * m where
      - f0 is FFS
      - m is an integer chosen from a set of possible positive values
- RAN1 continues further study until #85 meeting

Agreements:

- RAN1 will continue further study and conclude between following alternatives in the next meeting
  - Alt. 1:

        - The subcarrier spacing for the NR scalable numerology should scale as
        - $f_{sc} = f_0 * 2^m$ where
            - f_0 is FFS
            - m is an integer chosen from a set of possible values
    - Alt. 2:
        - The subcarrier spacing for the NR scalable numerology should scale as
        - $f_{sc} = f_0 * M$ where
            - f_0 is FFS
            - M is an integer chosen from a set of possible positive values
- All companies are requested to analyze/evaluate following aspects
    - Realistic phase noise
    - How each alternative allows mixing different numerologies
- All companies are requested to propose exact values of
    - f_0, m, and M

R1-163554 **WF on Band Agnostic Numerology Specification Huawei, HiSilicon**
The document was presented by David Mazzarese from Huawei.
- For the study of NR, RAN1 assumes that OFDM numerologies with different subcarrier spacings are allowed to be used in the same band and frequency range
    - For example 15 kHz subcarrier spacing and 60 kHz subcarrier spacing could both be used below 6 GHz

Decision: The document is noted and is modified as follows:

Agreements:
- For the study of NR, RAN1 assumes that multiple (but not necessarily all) OFDM numerologies can apply to the same frequency range
    - Note: RAN1 does not assume to apply very low value of subcarrier spacing to very high carrier frequency

Not treated.

Decision: The document is noted.

Friday
R1-163903 Way Forward on Frame Structure for NR Qualcomm Incorporated, NTT DOCOMO, Panasonic
- At least the following should be considered in the NR frame structure study:
  - A time interval with demodulation RS, the assignment, the acknowledgement, and data
  - The RS used for the demodulation of the data is only within this time interval
  - The design should not preclude the possibility for the following
    - The assignment for the data in this time interval and corresponding RS used for the demodulation are only within this time interval.
    - The acknowledgment for the data in this time interval and corresponding RS used for the demodulation are only within this time interval.

Discussion: LG→ different proposal in R1-163886
Huawei→ Time interval characteristics far to be clear- too early to agree.
Ericsson→ good starting point
Decision: The document is noted.
R1-163886 WF on frame structure for NR LG Electronics, Qualcomm Incorporated, Lenovo
- At least followings are considered in design of frame structure for NR
  - Three types of schedulable time unit can be defined, each consisting of:
    - 1) DL transmission only, 2) UL transmission only, 3) both DL and UL transmissions
    - DL transmission can include DL control and/or DL data
    - UL transmission can include UL control and/or UL data
    - Further study is necessary on:
      - Combination of control/data part within each type of time unit
      - Location of control/data resource within each type of time unit

Decision: The document is noted. No consensus for neither of the proposals.
Ericsson → would be worth trying to list a number of topics to look at (considered as key aspects for further progress)
RAN1 chair: can set up an email discussion to address the frame structure proposals
Samsung → do not understand why the proposals should be discussed
NTT DOCOMO: email discussion may help to capitalize on the offline discussions made during the week and further get rid of the confusions
Focus could be on understanding time interval regarding demodulation RS, assignment, acknowledgement and data.
Conclusion:
Email discussion

8.1.6 Channel coding and modulation for new radio interface

8.1.6.1 Channel coding

R1-162181 Channel coding for 5G new radio interface Samsung
The document was presented by … from Samsung.
- Proposal 1: Companies are encouraged to provide qualitative and/or quantitative info on hardware complexity in order to support 20Gbps decoding throughput (for both new channel coding scheme and LTE turbo code)
- Proposal 2: HW complexity should be one of the key criterions for down selection of new channel coding schemes in RAN1. Details on how to do down selection should be discussed.
- Proposal 3: In addition to HW complexity, other factors such as encoding/decoding latency and performance at extremely low error rate that relate to 5G KPIs should be considered.
- Proposal 4: Flexibility related to code block size and code rate are important aspects to be considered when determining the channel coding scheme for 5G new air interface. RAN1 should discuss how to capture this aspect in the study item phase.
- Proposal 5: Determine parameters for evaluation of new channel coding schemes for 5G new interface considering different requirements for eMBB, URLLC, and mMTC. Initial evaluations can be done using QPSK modulation in AWGN channel considering
- Proposal 6: Approve the set of parameters for evaluation in Table 2 as a starting point
- Proposal 7: Approve the evaluation and selection procedures:
  - Evaluate the feasibility of implementation and down-select first
  - Decide clear definitions for flexibility and evaluation parameters

Petitioners' Exhibit 1007, p. 1493
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Evaluate the coding performance for down-selected proposals and select the most adequate

Decision: The document is noted.

R1-162896 Channel coding requirements for 5G New Radio Nokia, Alcatel-Lucent Shanghai Bell

The document was presented by Keeth Jayasinghe from Nokia.

Proposal 1: Different requirement shall be considered to select the channel coding scheme or schemes for next generation radio technologies. Key requirements of each usage scenario of next radio access can be identified as in the following table:

eMBB	mMTC	URLLC
Good error performance with high throughput	Good error performance with low throughput	Very good error performance with low/medium throughput
High energy efficiency	Simple implementation	Low latency encoding/decoding
High chip area efficiency	High energy efficiency	Very low error floor
Low latency encoding/decoding		

Proposal 2: Single channel coding scheme from Turbo, LDPC, and Polar shall be selected for eMBB.

Proposal 3: mMTC and URLLC usage scenarios should consider the channel coding scheme to be adopted for eMBB as the baseline, and adopting a different channel coding scheme than for eMBB should only be introduced if compelling benefits are identified.

Proposal 4: mMTC and URLLC usage scenarios shall adopt simple channel coding scheme if it is different from the eMBB channel coding scheme.

Decision: The document is noted.

R1-163274 Evaluation methodology for 5G New Radio channel coding Nokia, Alcatel-Lucent Shanghai Bell

Decision: The document is noted.

R1-162162 High level comparison of candidate FEC schemes for 5G Huawei, HiSilicon

The document was presented by Carmela Cozzo from Huawei and shows a preliminary comparison of some FEC candidates for the new radio, specifically on Polar Code compared to the LTE Turbo Code and Tail-biting Convolutional Code (TBCC).

Decision: The document is noted.

R1-162230 Discussion on channel coding for new radio interface ZTE

The document was presented by Huaming Wu from ZTE.

- Proposal 1: TBCC and its performance improvement should be considered for short packet transmission.
- Proposal 2: Binary and Non-binary LDPC codes should be considered for eMBB in the new RAT.
- Proposal 3: Polar code and its application in the new RAT is FFS.
- Proposal 4: Packet coding should be considered for the new RAT to improve error correction and HARQ performance while reducing decoding complexity and latency.
- Observation 1: Turbo code may not be suitable for the case of large bandwidth, high reliability and short packet transmission.
- Observation 2: Packet coding has better performance and steeper slope performance curve. It is very suitable for high throughput scenarios with high reliability.
- Observation 3: Packet coding can reduce the complexity and latency of encoders & decoders, while keeps the same performance of transmission packet as a long codeword. The packet coding can be used in low complexity and low latency Scenarios.

Decision: The document is noted.

R1-162397 Outer erasure code Qualcomm Incorporated

The document was presented by Tingfang Ji from Qualcomm.

- Proposal 1: Outer erasure codes should be considered as part of 5G SI
- Proposal 2: To use outer erasure code to combat bursty puncturing/interference to achieve high efficiency, reliability with low latency and low uplink feedback and downlink signaling overhead
- Proposal 3: To use outer erasure code to reduced latency and buffering requirements
- Proposal 4: To use outer erasure code over broadcast channel to combat bursty interference, time selective fading and shadowing
- Proposal 5: Outer erasure codes should be designed with rate compatibility, support outer HARQ on top of PHY inner HARQ. Erasure coding and the corresponding outer HARQ process can be enabled/disabled efficiently with low signaling overhead
- Proposal 6: Outer erasure code performance should be evaluated based on key metrics such as spectrum efficiency, reliability, latency, overhead and encoding/decoding complexity

Decision: The document is noted.

R1-162797 HARQ enhancement for improved data channel efficiency MediaTek Inc.

The document was presented by … from MediaTek.

- Observation 1: Single HARQ partition per TB in LTE will suffer large retransmission penalty for future large TB sizes.

Petitioners' Exhibit 1007, p. 1494
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal 1: Finer ACK/NACK partition in a TB for the chance of eliminating retransmissions of correct data in a TB.
- Proposal 2: Allow retransmission data of a HARQ process to be multiplexed with new data of another HARQ process in the same transmission.
- Proposal 3: Impose proper correlation between the encoder outputs of retransmission data and new transmission data multiplexed in the same transmission so that new transmission data volume can be increased by partly leveraging retransmission combing gain.

Decision: The document is noted.

R1-163232 Performance study of existing turbo codes and LDPC codes Ericsson

The document was presented by Yufei Blankenship from Ericsson.

- Finer granularity in LTE turbo code rate provides system-wide performance advantage, especially for the low code rate regime.
- Incremental-redundancy based HARQ available to LTE turbo codes has great performance advantage, compared to 802.11n LDPC codes with Chae combining only.
- With the same set of (code rate, info block length), 3GPP LTE turbo code and 802.11ad LDPC codes achieve comparable performance.
- With the same set of (code rate, info block length), 3GPP LTE turbo code requires much fewer iterations compared to the LDPC code defined for IEEE 802.11ad.

Decision: The document is noted.

R1-163130 Considerations on channel coding for NR CATR

The document was presented by … from CATR.

- Observation 1: Coding schemes for NR should support variety TBS, flexible coding rates selection, low decoding error rate and fast decode.
- Proposal 1: Coding schemes for control channel, broadcast channel and data channel should be designed independently.
- Proposal 2: In NR, error floor should be avoided for high reliability transmission.
- Proposal 3: Decoding latency, data storage and power consumption should be carefully evaluated to make coding schemes selection.
- Proposal 4: RM, TBCC, Polar code could be considered for broadcast and control channel.
- Proposal 5: Turbo, LDPC and Polar code could be considered for data channel.

Decision: The document is noted.

R1-163662 Way Forward on Channel Coding Scheme for 5G New Radio Samsung, Nokia, Qualcomm, ZTE, Intel, Huawei

- Candidates for 5G new RAT data transmission are identified as the following
  - LDPC code
  - Polar code
  - Convolutional code
- Selection of 5G new RAT channel coding scheme(s) will consider,
  - Performance
  - Implementation complexity
  - Latency (Decoding/Encoding)
  - Flexibility

Decision: The document is noted and modified as follows:

Agreements:

- Candidates for 5G new RAT data transmission are identified as the following
  - LDPC code
  - Polar code
  - Convolutional code (LTE and/or enhanced convolutional coding)
  - Turbo code (LTE and/or enhanced turbo coding)
  - Note: It is RAN1 common understanding that combination of above codes is not precluded
  - Note: Outer erasure code is not precluded
- Selection of 5G new RAT channel coding scheme(s) will consider,
  - Performance
  - Implementation complexity
  - Latency (Decoding/Encoding)
  - Flexibility (e.g., variable code length, code rate, HARQ (as applicable for particular scenario(s)))

8.1.6.2 Modulation

R1-162163 Applying Multi-Dimensional Modulation to Non-Orthogonal Multiple Access Huawei, HiSilicon
The document was presented by Wang YI from Huawei.

- Observation 1: Multi-dimensional modulation provides significant spectral efficiency improvement compared to linear spreading, especially when higher-order modulation is used.
- Observation 2: Multi-dimensional modulation provides lower detection complexity by allowing lower number of projection points compared to linear spreading.
- Proposal: Further consider multi-dimensional modulation for non-orthogonal multiple access scenarios in 5G.

Decision: The document is noted.

TR update

R1-162710 TP for TR38.900 Section 7.1 - coordinate systems Samsung, Nokia

Petitioners' Exhibit 1007, p. 1496
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion:
Decision: The document is agreed

R1-162711 **TP for TR38.900 Section 7.2 and 7.3 - scenarios and antenna modeling** **Samsung, Nokia**

Discussion:

ZTE: For indoor office and shopping mall, do you assume multi floor case?
Samsung: No
ZTE: We need many floors for the calibration. Are we going to increase the number of floors in the future?
Samsung: It can be discussed in the future. This TP is for scenarios and antenna modelling.

Decision: The document is agreed

R1-162712 **TP for TR38.900 Section 7.4 - pathloss, LOS, O-I modeling** **Samsung, Nokia**

Discussion:

Ericsson: One issue on LOS PL discontinuities need to be captured.
Samsung: This is based on working assumption from last meeting. Further changes can be made during this meeting if needed.
ZTE: 7.4.1.1 note says the central frequency. PL f is not going to be fc if BW is large.
Samsung: That is a typo.

Decision: The document is revised in 3468

R1-163468 **TP for TR38.900 Section 7.4 - pathloss, LOS, O-I modeling** **Samsung, Nokia**

Discussion:

Decision: The document is agreed

R1-162713 **TP for TR38.900 Section 7.5 - fast fading** **Samsung, Nokia**

Discussion:

Ericsson: LSP has strong frequency dependencies. We are not comfortable with that.
Samsung: This is based on working assumption from last meeting. Changes can be reflected in the next version.
Ericsson: We prefer brackets instead.
Nokia: We agree with Samsung. This is based on working assumption. Of course that need to be confirmed.

Decision: The document is agreed

R1-162714 **TP for TR38.900 Section 7.6 - additional modeling components** **Samsung, Nokia**

Discussion:

ZTE: Oxygen loss offset need to be clarified. Is it LOS distance? Is it deterministic or random?
Samsung: TP is based on agreements from last meeting.
Nokia: Calculation in Keysight document is not entirely correct.
CATT: Examples are not clear.
Huawei: We also found some errors in Keysight calculations. We could take this offline to find the correct equation.
Nokia: We should agree this now capturing agreements from last meeting.
Samsung: We could fix the oxygen error

Decision: The document is revised in 3469

Petitioners' Exhibit 1007, p. 1497
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-163469 **TP for TR38.900 Section 7.6 - additional modeling components** **Samsung, Nokia**

Discussion:
Decision: The document is agreed

R1-162715 **TP for TR38.900 Section 7.7 and 7.8 - Link-level channel model and calibration** **Samsung, Nokia**

Discussion:
Decision: The document is revised in 3470

R1-163470 **TP for TR38.900 Section 7.7 and 7.8 - Link-level channel model and calibration** **Samsung, Nokia**

Discussion:
Decision: The document is agreed

R1-163396 **Correction in "Large Bandwidth and Large Antenna Array" section of R1-162714** **Keysight**

Mathematical error was found in the new equation to cope "Large Bandwidth and Large Antenna Array" in ***Error! Reference source not found.****. The correction to the problem is proposed in section* ***Error! Reference source not found.****.*

Please, note that the "additional model component" for large bandwidth and large antenna arrays defined in ***Error! Reference source not found.*** *does not solve issues for spherical wave modelling and non–WSS propagation across antenna elements.*

Chair: Tdoc was requested late

Discussion:
Decision: The document is noted

R1-163488 **TP for TR38.900** **Samsung, Nokia**

Discussion:

Huawei: We are OK but comment on fast fading model where distance is km. We could unify the units.
Samsung: WE can correct for the next version

Decision: The document is agreed

8.2.1 Remaining details on large scale modelling for >6GHz

Remaining details on LOS probability, pathloss (including penetration loss) and shadow fading

LOS probability

R1-162522 **Remaining details on LOS probability in indoor open office scenario** **LG Electronics**

Proposal 1: For indoor open office scenario, adopt table 3 for parameterizations.

Discussion:
Decision: The document is not treated

Petitioners' Exhibit 1007, p. 1498
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-162716 **LoS probability model for indoor open-office scenario** **Samsung**

Proposal 1: Adopt the proposed LoS probability model for indoor open-office scenario:

$$P_{LoS} = \begin{cases} 1, & d \le 3 \\ \left(e^{-\frac{d-3}{14.6}}\right), & 3 < d \le 21 \\ \left(e^{-\frac{d-21}{69.2}}\right) * 0.15, & d > 21 \end{cases}$$

Discussion:
Decision: The document is not treated

R1-162241 **LOS probability for indoor open office** **Huawei, HiSilicon, AT&T, CMCC, Ericsson, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung**

Observation 1: considering the continuity of the model, the LOS probability model for open office agreed in R1-161727 is of the same form as the LOS probability for mixed office agreed in R1-161640.

Proposal 1: the LOS probability model for indoor open office should be:

$$P_{LOS}^{Open\_office} = \begin{cases} 1, & d \le 5 \\ \exp(-(d-5)/70.8), & 5 < d \le 49 \\ \exp(-(d-49)/211.7) \cdot 0.54, & d > 49 \end{cases}$$

Discussion:
Decision: The document is agreed

Penetration loss

R1-163097 **Additional Considerations on Building Penetration Loss Modeling for 5G System Performance Evaluation** **Straight Path Communications**

Proposal: For building penetration loss modelling, the low-loss model shall be used with 80% probability, the high-loss model shall be used with 10% probability, and a medial loss model (the average of the high-loss and the low-loss model) shall be used for 10% of the probability, with the low-loss model and the high-loss model as defined in R1-161687.

Discussion:
Decision: The document is revised in 3408

R1-163408 **Additional Considerations on Building Penetration Loss Modeling for 5G System Performance Evaluation** **Straight Path Communications**

Proposal 1: The low loss model should be used with 80% probability, the high loss model should be used with 10% probability, and a medial loss model (the average of the high-loss and the low-loss model) should be used for 10% of the probability.

Proposal 2: The low loss model should be used with 80% probability and the high loss model should be used with 20% probability for Urban Micro; the low loss model should be used with 90% probability and the high loss model should be used with 10% probability for Urban Macro.

We request RAN1 to select one of these two proposals for New Radio (NR) system performance evaluation purposes.

Decision: The document is not treated

R1-163255 **Removing square brackets in the O2I penetration loss modeling** **Ericsson, Nokia, NTT DOCOMO, Samsung**

Proposal 1: Use a value of 5 dB for compensating the path loss through the external wall for non-perpendicular incidence angles

Discussion:
Decision: The document is agreed

R1-163256 **Removing square brackets in the O2I penetration loss modeling, part 2** **Ericsson, NTT DOCOMO, Samsung**

Proposal: Use a standard deviation of 7 dB to represent the variation of the building penetration loss

Discussion:

Decision: The document is agreed

R1-163485 **WF on O2I LSPs** **Ericsson, Huawei, HiSilicon**

Discussion:

Decision: The document is agreed

Path loss modeling

Chair: See also late LS from NYU Wireless in R1-163395 with following findings:

Results show the CI model with a 1-m reference distance is suitable for outdoor environments, while the CIF model is more appropriate for indoor channel modeling. The CI and CIF models are easily implemented in existing 3GPP models by making a very subtle modification—by replacing a floating non-physically based constant with a frequency-dependent constant that represents free-space path loss in the first meter of propagation. This paper shows this subtle change offers better model parameter stability, better accuracy in sensitivity tests over a vast range of microwave and mmWave frequencies, scenarios, and distances, is easier to use in analysis, and has intuitive appeal while using a simpler model with fewer parameters.

R1-163258 **Shortcomings of the proposed LOS path loss models** **Ericsson**

Observation 1: The new LOS path loss models suffer from strong discontinuities at the break point.

Observation 2: The 3D SCM LOS path loss models can represent also the new measurements well due to the similarity of the parameters

Proposal: Adopt the 3D SCM 36.873 LOS path loss models for use in the UMa and UMi scenarios.

Petitioners' Exhibit 1007, p. 1500
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion:

NTT: Does this propose using 3D CM for 6-100 GHz?
Ericsson: Yes.
NTT: We agree with discontinuity problem but higher bands shall be verified also.
Ericsson: Both models have the same frequency dependence.
NTT DOCOMO: We should indicate actual estimation accuracy.
ZTE: If we change the PL model how about SF then?
Ericsson: We have inconsistency also with SF.
Huawei: We have a late contribution on how to solve this.

Decision: The document is noted

R1-162231 Comparison of CIF vs. ABG model for pathloss modeling Qualcomm Inc.

Proposal: While the CIF and ABG models lead to comparable fits in modeling the path loss, the ABG model is poorer than the CIF model on two counts: i) more parameters are used in the ABG model than the CIF model, ii) the ABG model is more unstable than the CIF model in predictive power. Thus, the CIF model should be used for capturing path loss in >6 GHz channel modeling.

Discussion:
Decision: The document is not treated

R1-162310 Discussion on NLOS path loss modeling CATT

Proposal: For NLOS path loss channel modelling, the close-in model may be preferable for its physics basis.

Discussion:
Decision: The document is not treated

R1-162570 Comparing ABG and CI pathloss model Nokia, Qualcomm, Alcatel-Lucent Shanghai Bell

Observation-1: The close-in (CI) reference distance path loss model does a significantly better job at predicting path loss performance in frequency, distance, and across environments.

Observation-2: The CI path loss model has a much more stable parameterization than the alpha-beta-gamma (ABG) path loss model when determining the parameters on different sets of distances, frequencies, and environments.

Observation-3: A linear modeling of the increase or decrease with the log of frequency does not accurately model real world conditions.

Proposal: Adopt the CI path loss model for both LOS and NLOS conditions for at least the outdoor channels.

Discussion:

AT&T: Conclusion says outdoor only?
Nokia: We mean at least for outdoor. It should be sufficient also for indoor.
NTT DOCOMO: We should use ABG model.
Qualcomm: We have analysed also indoor case in our document.
Ericsson: You say linear modeling is invalid but also CI model in linear. It is actually worse than ABG model. It does not model the reality accurately.
Nokia: Our observation is based on the measurement data. Prediction capability is important aspect.
AT&T: We could go with CI for LOS and ABG for NLOS cases.
Nokia: That is a good point. Both models have their merits. We need to make progress in this meeting.

Petitioners' Exhibit 1007, p. 1501
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Huawei: We also have similar thinking on usage cases.
ZTE: For LOS either one is fine but for NLOS case the ABG is better.
Nokia: We support CI as we don't have enough measurement data. Gamma value is not stable.

Decision: The document is noted

R1-162571 System level simulation using ABG and CI modelling Nokia, Alcatel-Lucent Shanghai Bell

Discussion:
Decision: The document is withdrawn

R1-162425 Path loss model for indoor environment NTT DOCOMO, NTT

Proposal: If ABG model is used for indoor NLOS case, single slope model is used.

Discussion:
Decision: The document is not treated

R1-162717 Discussion on pathloss modeling for UMi NLoS environment Samsung

Proposal: Keep the ABG formula used in ITU and 3GPP pathloss model for the consistent modeling, and there is no significant reason to change the formula from ABG model to CI model

Discussion:
Decision: The document is not treated

R1-162989 38GHz Pathloss Model for UMi Scenario Street Canyon Scenario ITRI, MediaTek Inc.

Proposal 1: For LOS case, the working assumption model [1] is quite close to our 38GHz data fitted model.

Proposal 2: For NLOS case, the ABG model can provide better modeling accuracy than CI model.

Proposal 3: The measurement results and fitted parameters can be captured in the TR.

Discussion:
Decision: The document is not treated

R1-162247 Path loss modeling for NLOS propagation Huawei, HiSilicon, Ericsson, NTT DOCOMO, Samsung

Proposal 1: for NLOS propagation case, the pathloss model in ***Error! Reference source not found.*** *should be adopted as working assumption.*

Proposal 2: The inclusion of path loss dependency on the UE and eNB height similar to that in the 3D SCM model should be further considered

Proposal 3: The consistency with the 3D SCM model for below 6 GHz should be further considered

Discussion:

Nokia: We found ABG model with small distance better than free space PL. What is the explanation on that?
Ericsson: Behaviour is the same also for CI model.
Huawei: We propose the dual slope for indoor.
NTT DOCOMO: Does table 6 propose a frequency and distance range? Do you capture the range in a TR?
Huawei: These are based on measurements. We plan to capture in a TR.

Petitioners' Exhibit 1007, p. 1502
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Ericsson: Proposal 1 may be controversial. Can we agree on proposals 2 and 3?
Nokia: Consistency is important but could be studied in future work items.

Decision: The document is noted

R1-163428 Amendment for LOS pathloss working assumption Huawei, HiSilicon

Chair: Late contribution

Proposal: the LOS pathloss in table can be agreed.

Discussion:

Ericsson: Original 3D model distance dependency is consistent with physics. This is not a physical behaviour.

Decision: The document is noted

R1-163471 WF on pathloss modeling Nokia

Discussion:

Chair: In offline discussion the status was as follows
Alt.1 is objected by Huawei
Alt.2 is objected by Ericsson, Qualcomm
Alt.3 is objected by Nokia, Qualcomm

Huawei: We also prepared a WF. We could ask supporting companies.
Nokia: We need to find a compromise solution so we prefer to ask objecting companies.
Huawei: We agree we need to find a compromise. That's why we proposed another way.
NTT DOCOMO: We may be able to agree step by step with different scenarios.
Qualcomm: We are OK to work with alternative 2 as well.
Ericsson: Alt 2 UMa model is CI. This is incomplete proposal regarding UE height. We are happier with Alt 1.
Nokia: ABG model do not have UE height dependency either. We could make Alt 2 as working assumption. We could confirm that on May meeting.
Ericsson was not OK at this point of time.
Samsung: We need to start the calibration in this meeting. PL issues shall be agreed in this meeting. We encourage companies to compromise.
Nokia: Alt 2 as working assumption. UE height to be clarified in the next meeting.
Ericsson: We could say the same also for Alt 1.
Nokia can live also with Alt 1.
Qualcomm: We should down select and make the progress.
Huawei: We have 9 supporting companies for Alt 3. That is majority view from our point.
Nokia: Huawei's WF is already captured but this is consensus based group.
Huawei: We should check the least restrictive alternative.
Ericsson: We could start with alternative with majority support which is Alt 3.
Nokia: That is not a compromise.
CATT: We could take 873 3D CM approach as a working assumption.
Nokia: How should we do work based on that?
Ericsson: FFS would be adapting parameters with new measurements.
Nokia: We can further compromise. Alt 1 with indoor scenario with both ABG and CI models.
Huawei: That is confusing. We should treat all scenarios in a similar way together.
Samsung: We are not treating scenarios in a different way.

Decision: The document is revised in 3486

R1-163486 WF on pathloss modeling Nokia

Petitioners' Exhibit 1007, p. 1503
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion:

Decision: The document is revised in 3637

R1-163637 WF on NLOS pathloss for UMa, Umi-Street Canyon and Indoor-office Nokia, Samsung, CATT, Ericsson, NTT Docomo, Intel, Qualcomm, ZTE

Discussion:

ZTE: 1st bullet has FFS. Models in 2nd bullet can be changed.
Nokia: Yes

Decision: The document is agreed

R1-163483 WF on LOS pathloss model Huawei, HiSilicon

Discussion:

Nokia: You propose 3D UMa for LOS. What is your consideration on >6GHz
Huawei: We believe the information based on measurements is useful
Nokia: Can we agree this together with our WF?
Huawei: This tries to solve the working assumption. These are separate issues.
Ericsson: We propose to re-use 3D CM for Uma and UMi LOS. This is different approach.
Huawei: We have introduce lot of new measurements >6GHz.
Nokia: We did not compare the LOS case for 3D CM applicability for >6GHz.
Ericsson: We did compare the LOS case with 3D CM with CI model with new measurements and the match is pretty good.

Decision: The document is noted

R1-163484 WF on NLOS pathloss model Huawei, HiSilicon, Ericsson, ETRI, Fraunhofer HHI, Keysight, LGE, Samsung, Spirent

For NLOS pathloss
- *For UMi-Street Canyon, adopt ABG model*
- *For Indoor-office, adopt ABG single slope model*
- *For UMa, adopt ABG model*

Discussion:

Nokia: We cannot accept this which is actually alt 3 in our WF.
Huawei: It is and preferred way for sourcing companies.
NTT DOCOMO: WE can support this WF.

Decision: The document is noted

Rural Macro model

R1-163640 WF on RMa model Ericsson

Adopt the ITU-R M.2135 Rural Macro model for rural macrocell simulations
Enhance the RMa model to 3D using elevation parameters taken from the 5G UMa model
Tuning of the elevation parameters is FFS
For example, the elevation angle spread is expected to be lower in rural scenarios
Capture the model in the TR by reference to M.2135 + a table with the additional parameters
Put square brackets around the "UMa" parameters pending further tuning

Petitioners' Exhibit 1007, p. 1504
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion:

Samsung: This is good starting point. This seems to be out of scope as CM SI scope is for >6GHz.
Nokia: Do we really have to extend it to 3D? If not we could use ITU CM.
Samsung: ZoD distribution is going to be challenging but there are some merits on this. We can utilize elevation beamforming. It would be good to assume 3D CM for RMa.
Nokia: Antenna heights are higher for rural deployment. We cannot simply re-use 3D CM parameters for RMa.
Ericsson: WE agree. We need to tune them. Antenna height is 35 m. It is small effort compared to UMa 25 m.
Samsung: We can discuss this in the main NR session as this is out of the scope of CM SI.
Ericsson: 5G evaluation need CM also for RMa. Who does CM for <6GHz if we don't?
Nokia: We are neutral. It would be good to include but we have already agreed 5 scenario for the SI.
Sharp: We agree with Nokia but also sympathize the Ericsson proposal. CM is needed ASAP.
Ericsson: Doing this in NR session instead then we do we document this?
Huawei: Would it be possible to postpone to decision for the next meeting. We need to understand operatos positions better.
Nokia: If we need to extend the scope that need to be decided in plenary.
Samsung: SI is for >6GHz. Rural is for <6GHz.

Decision: The document is noted

8.2.2 Remaining details on fast fading modelling for >6 GHz

Remaining details on large scale, small scale parameters, channel generation steps, etc.

Measurements

R1-163252 **New InH measurements of the frequency dependence of delay spread** **Ericsson, Telstra**

Proposal: Delay spread modeling in the InH scenario should be frequency independent

Discussion:
Decision: The document is not treated

R1-163257 **Requirements for Comparability of Radio Channel Measurements** **Ericsson**

Proposal: When comparing different measurement data at different frequencies and/or from different campaigns the following requirements should be fulfilled:

1. *The same measurement bandwidth should be used*
2. *Equal antenna pattern should be used (may also be synthesized)*
3. *Equal dynamic range should be used, both in delay and angle domains*
4. *When the channel is sampled in space the same volume in terms of number of wavelengths should be used*
5. *The environment should be equal i.e. same location and same variability in terms of moving people and vehicles etc.*
6. *Locations of antennas should be the same*
7. *The oxygen absorption at 60 GHz should be compensated for using propagation path lengths as agreed in* ***Error! Reference source not found.****. This is important for securing smooth frequency properties when extrapolating/interpolation using 60 GHz.*

Discussion:
Decision: The document is not treated

Channel generation

Petitioners' Exhibit 1007, p. 1505
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-162576 Joint proposal on fast fading channel generations Samsung, AT&T, CMCC, ETRI, Huawei, HiSilicon, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm

Proposal 1: Adopt the full detailed method of channel generation steps in Section 7.3 of TR36.873 at least in the following cases:

- *Case 1: For low complexity evaluations*
- *Case 2: To compare with earlier simulation results,*
- *Case 3: When none of the additional modeling components are turned on.*
- *Other cases are not precluded*

Proposal 2: Modification of the steps in the other cases can be further studied.

Discussion:
Decision: The document is agreed

R1-162954 Text proposal to TR 38.900 to add channel coefficient generation procedures Huawei, HiSilicon

This contribution proposes some content to the 12 steps in section-2 in TR36.873.

Discussion:

CATT: Changing BS and UE to TX and RX that will impact on many other places as well. Maybe better to leave as is.
Intel agree with CATT.
ZTE: We support this change. CATT comment is editorial issue which can be considered later if needed.
Ericsson: Intention is good but there is a problem. BS could be TX and RX. We have different parameters in BS and UE side.
Huawei: We can clarify if requirement is for UL or DL but we need to consider also UE to UE aspects.
Nokia: In general we support the change but we also agree with Ericsson. We can agree this in later phase.

Decision: The document is noted

R1-162957 Text proposal to TR 38.900 to add dual mobility Doppler Huawei, HiSilicon

This contribution proposes some content to the 12 steps in section-2 in TR36.873.

Discussion:

Samsung: It is not clear when should we apply this. More considerations are needed. We can clarify this later.

Decision: The document is noted

Large scale parameters

R1-162311 Analysis on measurement data and proposed modeling CATT

Proposal 1: The azimuth and zenith angular spread of arrival may have the same tendency corresponding to increasing frequency.

Proposal 2: More data should be used to get the proper values of α *and* β *for the fitting equation* $\alpha 10(1+f)+\beta$.

Proposal 3: Since 30GHz and 70GHz could be target frequency for system simulation, at least the parameters for these two frequencies should match the measured data.

Discussion:
Decision: The document is not treated

Petitioners' Exhibit 1007, p. 1506
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-162572 Refinement on UMa LSP Nokia, Samsung, AT&T, CMCC, Ericsson, Huawei, HiSilicon, Intel, KT Corporation, NTT DOCOMO, Qualcomm

Proposal: For UMa, adopt the large-scale parameters from [2] with Tables 5 and 12 replaced with the ones from this contribution.

Discussion:
Decision: The document is agreed

R1-162719 Discussion on large-scale parameters in indoor office environment Samsung

Proposal: For indoor office scenario,

- *Adopt the LS parameters in Table 2.*
- *Adopt the LS cross-correlation parameters from IMT-Advanced channel model in ITU-R M.2135.*

Discussion:

Ericsson: Table 2 summary summaries only some frequency bands. We have considered constant values in other scenarios. Have you compensated oxygen loss in 60 GHz?
Samsung: This table is for information. We are not considering frequency dependency. No compensation for oxygen loss.
Huawei: We could capture this data in the future.

Decision: The document is noted

R1-162956 Discussion on the sum-of-sinusoids based LSPs Huawei, HiSilicon

Observation: Sum-of-sinusoid method provides spatially consistent LSPs such as shadowing with reasonable complexity.

Discussion:
Decision: The document is not treated

R1-162232 Indoor and outdoor measurements on frequency-dependent delay spreads Qualcomm Inc.

Proposal: Frequency dependent models for large scale parameter(s) appear to be intuitive and measurement results support this intuition. In particular, frequency dependent delay spread models should be considered for >6 GHz channel modeling.

Discussion:
Decision: The document is not treated

R1-163253 On the frequency dependence of LSPs in reported UMi and InH measurements Ericsson

Proposal: Use a functional form for frequency dependence of LSPs and SSPs containing a constant term and a frequency-dependent term of the following form: $\boldsymbol{LSP = a + [b] \cdot function(f)}$*, where the strength of the frequency-dependent term is FFS*

Discussion:
Decision: The document is not treated

Petitioners' Exhibit 1007, p. 1507
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-163254 On the frequency dependence of LSPs Ericsson

Proposal: Use a functional form for frequency dependence of LSPs and SSPs containing a constant term and a frequency-dependent term of the following form: $\boldsymbol{LSP = a + [b] \cdot function(f)}$*, where the strength of the frequency-dependent term is FFS*

Discussion:

Qualcomm: We have done measurement and we have seen frequency dependency. More analysis is still needed.
ZTE: Do LSP refer to one parameter or two parameters?
Ericsson: We should be careful while specifying frequency dependency. We have separate contribution on measurements in R1-163257.
CATT: Our measurement campaign in indoor scenarios observe frequency dependency

Decision: The document is noted

Small scale parameters

R1-162243 Discussion on frequency dependent SSP Huawei, HiSilicon

Proposal 1: for indoor office, frequency dependent cluster ASA and cluster ZAS should be modelled.

Discussion:

Ericsson: We cannot find the info on used antenna.
Huawei: Wide beam for RX and rotation 10 degree horn antenna for TX.

Decision: The document is noted

Large and small scale parameters

R1-162242 Large-scale and small-scale channel modeling for outdoor to indoor scenario Huawei, HiSilicon

Proposal1: the O-to-I large-scale and small-scale parameters should be modified due to new measurement above 6GHz.

Proposal2: the O-to-I model parameters could be adopted as defined from ***Error! Reference source not found.*** *to* ***Error! Reference source not found.*** *for UMi and UMa scenarios.*

Discussion:
Decision: The document is not treated

R1-162246 Large-scale and small-scale channel modeling for indoor hotspot Huawei, HiSilicon, AT&T, CMCC, Ericsson, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung, ETRI

Proposal 1:.for indoor office, the recommended LSP from Table 1 to Table 4 should be adopted for large-scale channel modeling of this SI.

Proposal 2:.for indoor office, the recommended SSP in Table 5 and Table 6 should be adopted for cluster-level small–scale channel modeling of this SI.

Discussion:
Decision: The document is revised in 3427

Petitioners' Exhibit 1007, p. 1508
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-163427 Large-scale and small-scale channel modeling for indoor hotspot Huawei, HiSilicon, AT&T, CMCC, Ericsson, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung, ETRI

Proposal 1:.for indoor office, the correlation distance and cross correlation of LSP in IMT-A can be reused for azimuth domain channel characteristics. The recommended LSP from Table 1 to Table 4 should be adopted for large-scale channel modeling of this SI.
Proposal 2:.for indoor office, the number of rays per cluster and per cluster shadowing in IMT-A can be reused. The recommended SSP in Table 5 and Table 6 should be adopted for cluster-level small–scale channel modeling of this SI.

Discussion:

ZTE: Table 5 and 6 mention number of clusters. We think 4 is small number. Table 3 => 3rd number from the bottom gives a negative value.
CATT: Number of clusters are small. Listed results are not complete. Table 1 frequency dependency requires further studies.
Huawei: We can update frequency dependency in the future. Values as in brackets.
Ericsson: Number of clusters could also be in brackets.

Decision: The document is revised in 3472

R1-163472 Large-scale and small-scale channel modeling for indoor hotspot Huawei, HiSilicon, AT&T, CMCC, Ericsson, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung, ETRI, CATT

Proposal 1:.for indoor office, the correlation distance and cross correlation of LSP in IMT-A can be reused for azimuth domain channel characteristics. The recommended LSP from Table 1 to Table 4 should be adopted for large-scale channel modeling of this SI.
Proposal 2:.for indoor office, the number of rays per cluster and per cluster shadowing in IMT-A can be reused. The recommended SSP in Table 5 and Table 6 should be adopted for cluster-level small–scale channel modeling of this SI.

Discussion:

ZTE: You changed to fixed number which is not frequency dependent at all.

Decision: The document is agreed

R1-162718 Updated joint proposal on large-scale and small-scale parameters for UMi scenario Samsung, AT&T, CMCC, Ericsson, Huawei, HiSilicon, Intel, KT Corporation, Nokia Networks, NTT DOCOMO, Qualcomm, ETRI

Proposal 1: For UMi Street canyon, adopt the updated delay spread model in Table 1 and the updated ZoD model in Table 2 to replace the proposal in [1]

Proposal 2: The current K-factor parameters in 3D-SCM UMi can be reused for UMi Street canyon scenario.

Proposal 3: For UMi Street canyon, adopt the correlation distance parameters in Table 3

Proposal 4: For UMi Street canyon, adopt the cross-correlation parameters in Table 4, which parameters are taken from 3GPP 3D-SCM UMi scenario

Discussion:

ZTE: Cross correlation table, is it assumption or observation?
Samsung: Correlations are analysed in Annex. There is no strong frequency dependency.

Decision: The document is agreed

R1-163251 Modelling of LSPs and SSPs for the outdoor to indoor propagation Ericsson, Nokia Networks, AT&T, CMCC, ETRI, Huawei, HiSilicon, Intel, KT Corporation, NTT DOCOMO, Qualcomm, Samsung

Petitioners' Exhibit 1007, p. 1509
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Proposal 1: Adopt the first or the second approach for the LSP and SSP parameters for the outdoor to indoor links in the UMa and UMi scenarios

Proposal 2: Consider further modifications of the LSPs if additional O2I measurement data is made available

Discussion:
Decision: The document is agreed

Clustering

R1-162233 Clustering methodology and results for indoor and outdoor scenarios Qualcomm Inc.

Proposal 1: The design of good beamforming protocols differ significantly depending on whether a small/large number of clusters capture the multi-antenna channel. Reusing 36.873 parameters for number of clusters should be done with precaution.

Proposal 2: Mixing ray tracing data with measurements in determining cluster statistics is not a good idea.

Proposal 3: Given the extensive measurements on azimuthal and spherical scans performed at Qualcomm at millimeter wave frequencies, Qualcomm's data on indoor office and shopping mall should be included in further studies that lead to development of cluster statistics for > 6 GHz channels.

Discussion:
Decision: The document is not treated

R1-162994 Implementation of cluster delay spread NTT DOCOMO, NTT

Proposals 1: The Alternative 1 and 2 can be used for the case of channel bandwidth is narrow with low complexity of implementation

Proposals 2: The Alternative 3 can be beneficial for various channel bandwidths with low complexity of implementation.

Proposals 3: The Alternative 4 should be used for the case of requirement for high accuracy of channel with various bandwidths.

Discussion:
Decision: The document is not treated

R1-163115 A hierarchical agglomerative clustering algorithm for channel modelling Intel Corporation, Ericsson, Nokia Networks, AT&T, CMCC, ETRI, Huawei, HiSilicon, KT Corporation, NTT DOCOMO, Qualcomm, Samsung, University of Southern California

This contribution illustrates the merits of the HAC algorithm:

- *It jointly processes delay, angle and space information for clustering MPCs.*
- *It is able to find compact, yet not necessarily convex, clusters in delay-angular domain and it does so without excluding the presence of outliers.*
- *Low sensitivity with respect to the resolution of the input data, thus ensuring consistent results across measurements taken in the same environment but with different resolutions.*
- *It produces spatially consistent clusters.*
- *It allows to cluster MPCs disregarding on whether these are fully specified both in angle and delay domain.*

Discussion:

Petitioners' Exhibit 1007, p. 1510
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is agreed

Time variation

R1-163246 Channel modeling with time-varying delays and angles Ericsson

Proposal: Modify the equivalent of equation (7.21) in ***Error! Reference source not found.*** *in the new model according to the suggestion in section* ***Error! Reference source not found.****.*

Discussion:
Decision: The document is not treated

R1-163636 WF on modeling of time-varying angles Ericsson

Proposal 1: Replace the factor in the channel coefficient equation

Field Code Changed

Proposal 2: Proposal 1 needs only to be considered in case the Doppler frequencies are time-varying. This could be due to:

Non-linear UE movement

Time-varying angles of arrival due to spatial consistency modeling

Discussion:

Sharp: Does this work for wideband scenarios?
Ericsson: We are not sure actually. Doppler could change over the BW.
Intel: What mobility model is used? Anchor point could be related to phase discontinuity.
Ericsson: Simulations were done with 873 implementation. We should not get phase discontinuity.
Samsung: Which part in the current TR you want to change?
Ericsson: That is up to rapporteur.
Intel: UE moving around the circle the values change.
Nokia: Updating anchor point for non-linear movement. How often to update anchor point?
Ericsson: There is a criteria for that.
ZTE: When to use this?
Ericsson: Whenever the Doppler frequencies are not constant.
Huawei: Title should be time varying Doppler. Which frequency was assumed? We have concerns on non-linear movement.
Ericsson: Title can be changed. Non-linear movement is only one example.
LGE: Are you suggesting this to drop based model?
Huawei: More time is needed to check results.

Decision: The document is noted

8.2.3 Remaining details on modelling of additional features for >6GHz channel model

8.2.3.1 Remaining details on blockage modelling

R1-162234 TP on Dynamic Blockage Modeling Qualcomm Inc.

Propose (TP) the parameters for modeling dynamic blockage according to a stochastic model.

Discussion:

Intel: Basically this is similar view than ours except some parts.
CATT: LOS and NLOS states to be considered. Blocking should not be lower than NLOS.

Petitioners' Exhibit 1007, p. 1511
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Interdigital. We agree with this except some parameters.
Samsung: We need further discussion in this area.

Decision: The document is noted

R1-162312 **Clarification on blocking model CATT**

Discussion:
Decision: The document is withdrawn

R1-162573 **Remaining details on blockage modelling Nokia, Alcatel-Lucent Shanghai Bell**

Discussion:
Decision: The document is revised in 3381

R1-163381 **Remaining details on blockage modelling Nokia, Alcatel-Lucent Shanghai Bell**

Proposal-1: Consider K+1 blockers for each user where K blockers to mimic the blockage effect due to moving objectives around the UE and one blocker to mimic the blockage effect due to very close range of obstacles to the UE (self-blockage)
Proposal-2: The one blocker for self-blockage doesn't need to be consistent in spatial domain. The K blockers for surrounding objectives should be spatially consistent. The centers of K blockers are generated by correlation grids with corresponding blockage correlation distance and interpolation.
Propsoal-3: A single blocking radius (fixed or statistical) is applied per cluster.
Proposal-4: The centers of blockage shall be temporally consistent by using a 3D (spatial/temporal) correlation grid.
Proposal-5: Enabling blockage modeling shall not dramatically change large scale parameters specified for each scenario.
Proposal-6: Focusing on remaining modeling parameters listed in open issues

Discussion:
Decision: The document is not treated

R1-163078 **Power Attenuation in Dynamic Blockage INTERDIGITAL COMMUNICATIONS**

Proposal 1: Consider the second approach in Proposal A5 in ***Error! Reference source not found.*** *and use the log-normal distribution for shadowing loss.*

Discussion:
Decision: The document is not treated

R1-162523 **Remaining details on blockage modeling for channel modeling >6GHz LG Electronics**

Proposal 1: The temporal consistency should be modeled for blockage modeling only in case of assuming severe transition of test environment such as radio link failure test. Other condition is not precluded and further study might be needed.
Proposal 2: Considering implementation complexity, it is preferable to adopt simple interpolation-based approach in option 2.
Proposal 3: The decorrelation time for center of blocking region would be different between far-field and near-field blockage.

Discussion:
Decision: The document is not treated

Petitioners' Exhibit 1007, p. 1512
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-162388 **Remaining details on blockage modelling Intel Corporation**

Proposal 1: The additional shadowing of one blocker should consider the link between the transmitter and the blocker for indoor scenario as in equation (2-1).
Proposal 2: When calculating the additional shadowing on the LoS channel cluster, the blocker model including center and span, can still be built in the receiver's polar coordinate system. Then the blocker model in the transmitter's coordinate system can be derived by center ($\boldsymbol{\varphi_{Rx} - \pi, \pi - \theta_{Rx}, r_{Tx}}$), azimuth angular span $\boldsymbol{A_{Rx} r_{Tx}/r_{Rx}}$, zenith angular span $\boldsymbol{Z_{Rx} r_{Tx}/r_{Rx}}$.
Proposal 3: For NLoS channel cluster, a virtual transmitter can be assumed at the extension line of AoA/ZoA.
Proposal 4: The additional shadowing on the NLoS channel cluster can be calculated based on the link between virtual transmitter and receiver in the same way as LoS channel cluster.
Proposal 5: The distance between the virtual transmitter and the blocker can be randomly generated in the range of [r_{Rx} $d_{Tx\to Rx} - r_{Rx}$].
Proposal 6: The definition of LoS/Shadow region can be clarified, e.g. using figure 3, for knife edge model.
Proposal 7: The candidate of number of angularly blocked regions can be {1, 2, 3, 4}.
Proposal 8: The additional shadowing of hand-held blockage can be modelled as a fixed attenuation and frequency dependency can be considered.
Proposal 9: The existence/absence of hand-held blockage can be modelled as a discrete event.

Discussion:
Decision: The document is not treated

R1-162720 **Discussion on blockage modeling for above 6GHz channel model Samsung**

Proposal 1: The framework proposed in A8 should be used in the blockage modeling for above 6 GHz channels.
Proposal 2: The distance between the receiver and the blocking screen should be randomly generated.
Proposal 3: The average blocking period should be used in the simulation. The average blocking period is determined by Eq. (4).
Proposal 4: The blockage attenuation is constant during the blockage period. Linear transition periods of 0.01s are introduced at both sides of the blockage period.
Proposal 5: The number of blockage regions is modeled by a Poisson distributed random variable as Eq. (5).
Proposal 6: Scenario-dependent parameters listed in Table 2 need to be determined via measurements.
Proposal 7: The channel generation procedure with blockage should apply the flowchart in Figure 4.

Discussion:
Decision: The document is revised in 3393

R1-163393 **Discussion on blockage modeling for above 6GHz channel model Samsung**

Proposal 1: The framework proposed in A8 should be used in the blockage modeling for above 6 GHz channels.
Proposal 2: The distance between the receiver and the blocking screen should be randomly generated.
Proposal 3: The average blocking period should be used in the simulation. The average blocking period is determined by Eq. (4).
Proposal 4: The blockage attenuation is constant during the blockage period. Linear transition periods of 0.01s are introduced at both sides of the blockage period.
Proposal 5: The number of blockage regions is modeled by a Poisson distributed random variable as Eq. (5).
Proposal 6: Parameters of the angular blocking region in (6) can be presented by (7) and (11).
Proposal 7: Scenario-dependent parameters listed in Table 2 need to be determined via measurements.
Proposal 8: The channel generation procedure with blockage should apply the flowchart in Figure 5.

Petitioners' Exhibit 1007, p. 1513
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is not treated

R1-163247 Further considerations on blockage modeling Ericsson

The following additions to the agreed WF on blocking are proposed:
Proposal A3-1: The blocking objects are modeled as screens of a fixed size randomly placed in physical locations
Proposal A4-1: Each UE should only consider the nearest K blockers (excluding self-blocking)
Proposal A5-1: The attenuation of each ray or cluster due to a certain blocker is calculated using the formula given in R1-161696
Proposal A6-1: UEs may share blockers if these are simultaneously among the K closest of both UEs
Proposal A7-1: The blocking objects may be moving
Proposal A3/7-2: Typical blocker sizes and speeds are FFS. The values given in Table 1 of R1-161623 can be considered as starting points for further discussion

Discussion:
Decision: The document is not treated

R1-163473 WF on blockage modelling Qualcomm Inc., Intel, Samsung, Nokia, Shanghai Bell, Ericsson, Interdigital

Down-select between either A or B options for proposal 3,5,6 and 7.

Discussion:

Intel: With B6 we need to consider also blocking between UEs. More considerations are needed with B6.
Ericsson: It is possible we do not disregard that with this model.
CATT: Figure below proposal 7 is not clear. Distance is related also with size of the blocker.
Ericsson: There is a difference between A and B options regarding blocking and the size of the object.

Decision: The document is agreed

8.2.3.2 Remaining details on spatial consistency modelling

Time evolution

R1-162949 Discussion on time evolution of angles Huawei, HiSilicon

Proposal 1: Adopt the model of time-variant angles given by equations (1)~(3) under the framework of spatial consistency model in [2].

Discussion:
Decision: The document is not treated

Angular consistency

R1-162244 Discussion on angular consistency model Huawei, HiSilicon

Proposal 1: The composite PASs in azimuth and zenith dimension of all clusters are generated by

Petitioners' Exhibit 1007, p. 1514
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

$$\phi_{n,AOA}' = \frac{2(\sigma_{ASA}/1.4)\sqrt{-\ln(P_n/\max(P_n))}}{k_c C}, \quad \theta_{n,ZOA}' = -\frac{\sigma_{ZSA}\ln(P_n/\max(P_n))}{k_c C},$$

where kc is the calibration coefficient to slow down the varying rate of angles in position.
Proposal 2: kc = 16 is a suitable value for the new model in UMi scenario.

Discussion:
Decision: The document is not treated

Spatial consistency

R1-162313 **Clarification on spatial consistency and blockage model** **CATT**

Proposal 1: The propagations should be LOS or NLOS only within a grid, and the correlation distance could have relation with ASA and AOA.
Proposal 2: The probability, position, and size of the blockers should be defined clearly.
Proposal 3: The additional shadowing of the user in LOS condition should be compared with the path loss difference between LOS and NLOS to decide the appropriate state of the user.

Discussion:
Decision: The document is not treated

R1-162389 **Remaining details on spatial consistency modelling** **Intel Corporation, InterDigital**

Proposal 1: For drop based MU-MIMO simulation, use baseline model for spatial consistency.
Proposal 2: For mobility based simulation such as beam tracking, use baseline model for initial UE dropping, followed by updating cluster delay using equation (4-1) and updating cluster angles with the limit of equation (4-2).
Proposal 3: If moving between different channel states is modelled, define soft LOS/NLOS and indoor/outdoor states and the path loss and fast fading channel are defined as a function of soft LOS/NLOS and indoor/outdoor states as in equation (5-1) and (5-2).
Proposal 4: Spatial consistency can also be calibrated as:

- *Drop UE pairs with fixed distance between the two UEs of one pair, e.g. 3 meters.*
- *Define system wide statistics between the links of two UEs to the same TRP, e.g. the serving TRP of the first dropped user in each pair.*
- *For phase-1 calibration, the difference of the LOS/NLOS state and indoor/outdoor state of each UE pair can be used as system wide statistics metrics.*
- *For phase-2 calibration, the Eigen value/or Eigen value ratio of the channel cross covariance matrix of each UE pair can be used as system wide statistics metrics.*

Discussion:

Huawei: What is the baseline model for Proposal 1? Do you assume shared clusters among users?
Intel: Working assumption and shared clusters are assumed. We have not done MU-MIMO simulations.
Huawei: That is important before agreeing proposal 1. Figure 2 leads to negative delays.
Intel: We have rounded to the minimum delay.
Huawei: What is the max moving distance? How the covariance matrix is defined?
Intel: 500 m. Matrix can be defined similarly as before, between the UEs.
ZTE: Equation 4-2. How to implement the limitation on change of angle? It is not necessary that all clusters are continuous.
Intel: Change is defined in equation. Existing stochastic model do not model this.
Ericsson: Proposal 1 assume baseline model but proposal 2 is not in line with that. It is difficult to say now how the model will be used in the future.
LGE: How can you simulate indoor / outdoor cases?
Intel: We force UE to be always outdoor.

Decision: The document is noted

Petitioners' Exhibit 1007, p. 1515
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-162524 **Remaining details on spatial consistency modeling for channel modeling >6GHz** **LG Electronics**

Proposal 1: The working assumption should be confirmed and further discussion might be needed on how to support mobility or large array.
Proposal 2: It would be more preferable to fix the grid size to one value for large/small scale parameters and the value can be potentially the maximum correlation distance among parameters.

Discussion:
Decision: The document is not treated

R1-162721 **Discussion on spatial consistency for above 6GHz channel model** **Samsung**

Proposal 1: Alternative 1 with the proposed Step 1 to Step 5 is used in spatial consistency modeling for above 6GHz channels. Delays/AoAs/shadow fading of users in the same group are initialized according to Eq. (2) to Eq. (8).
Proposal 2: If UEs are moving in straght lines in the simulation, exponential function should be used as the filter function to generated spatially consistent random variables.

Discussion:
Decision: The document is not treated

R1-162743 **Discussion of spatial consistency modeling** **Lenovo (Beijing) Ltd**

Proposal: Generate spatially correlated random variables with the 2D filtering method.

Discussion:
Decision: The document is not treated

R1-162880 **Discussion on spatial consistency for above 6GHz** **CMCC**

Proposal: Scatters' position could be assumed based on information of the cluster power, delay and angles. The assumption of scatterers' position could faciliate the modeling of spatial consistency, for example, for UEs at difference locations (or when UE moves), the scatterer position can be used to modify angles of scatterers for different UEs (or for one UE at different positions).

Discussion:
Decision: The document is not treated

R1-162950 **Text proposal to TR 38.900 to add spatial consistency model** **Huawei, HiSilicon**

This contribution proposes some content to the 12 steps in section-2 in TR36.873.

Discussion:

Ericsson: This goes beyond of agreements so far.
Huawei: We intend to progress with common parts.
Ericsson: We prefer proposal instead of TP.
CATT: Do we need to consider handover in simulating multiple cells?
Huawei: That is not excluded.

Decision: The document is noted

Petitioners' Exhibit 1007, p. 1516
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-162958 **Text proposal to TR 38.900 to add spatially consistent drops** **Huawei, HiSilicon**

This contribution proposes some content to the section 7 of TR38.900.

Discussion:

Ericsson: This do not necessary simplify. Better to consider consistency for all the users.
CATT: Is this in line with agreement from last meeting?
Nokia: It would be better to have spatial consistency always.
Qualcomm: We should consider also complexity.
Samsung: We need to study details further as shown in our contribution.
Sharp: How do you determine the correlation distance?

Decision: The document is noted

R1-163077 **An Alternative Interpolation Formula for Spatial Consistency** **INTERDIGITAL COMMUNICATIONS, Intel Corporation**

Proposal 1: If the interpolation of i.i.d. random variables is to be used for spatial consistency, then consider the interpolation formula in (3).

Discussion:
Decision: The document is not treated

R1-163248 **Further considerations on spatial consistency** **Ericsson**

Proposal: The revised steps 5-7 proposed in section 3 should be adopted for channel generation

Discussion:

Intel: Mathematically this looks nice but the change is significant. Few people in this session participated in the work with original steps. It is better not to change the steps. Are there measurements supporting this? Also correlation distance is impacted.
ZTE: Our view is in the middle. This provides good solution but we are confused by using uniform delay.
Ericsson: There is no measurement support but the current model has artificial behaviour. Larger the delay more paths you see.
Intel: Nobody is sure whether this is convenient approach.
Huawei: It is difficult to say the relation of angle and delay from UE side. If there is no reason to keep the order then we could also change it. We should analyse further with measurement results.
Ericsson: Other models have this kind of behaviour.

Decision: The document is noted

R1-163250 **Further details on LOS and indoor state spatial consistency modelling** **Ericsson**

Proposal 1: Introduce soft LOS states in the spatial consistency modeling
Proposal 2: Do not introduce soft indoor/outdoor states. FFS how user mobility dropping in simulations should avoid users transiting between the states
*Proposal 3: Use the knife edge-based method described in section **Error! Reference source not found.** for modeling the soft LOS states*

Discussion:
Decision: The document is not treated

R1-163467 **WF on spatial consistency** **Intel Corporation, InterDigital, Huawei, HiSilicon**

Petitioners' Exhibit 1007, p. 1517
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion:
Decision: The document is revised in 3475

R1-163475 WF on spatial consistency Intel Corporation, InterDigital, Huawei, HiSilicon, Qualcomm, Ericsson, LGE, Nokia, Alcatel Shanghai Bell, NTT DoCoMo, Samsung, CATT, ETRI, Lenovo, Motorola Mobility, NTT, ZTE, AT&T

Discussion:
Decision: The document is agreed

R1-163480 WF on channel temporal evolution Intel Corporation, InterDigital, Huawei, HiSilicon, Qualcomm

Discussion:

Ericsson: We support proposal for soft LOS on indoor states but we have concerns on temporal channel evolution in R1-163248.
Chair: Discuss both options further for the next meeting.

Decision: The document is noted

R1-163481 WF on generating spatial consistent random variables Lenovo, Motorola Mobility, InterDigital, Ericsson, CATT, Fujitsu

Proposal 1: Adopt the 2D filtering method to generate spatial consistent random variables.
Proposal 2: To obtain random variables within a grid area, FFS between interpolating using the generated random variables at the corners of the square grid or approximating with the random variable at the closest grid point.

Discussion:

Intel: We agree with the observation but the implementation was not captured in a TR. It was left for implementation.
Lenovo: Companies may then make errors impacting the calibration.
Huawei: This is important topic but we have also contribution R1-162956 on this. Did you consider the complexity? What is the max size of the map?
Lenovo: You can generate the area around the UE.
Intel: We could put a note in autocorrelation section referring to this.
Ericsson: TR could have informative section or annex. It would be good to have metrics for the calibration campaign.
OK for Lenovo.
Nokia: This is more like an implementation details. We don't need to define every single details.
Huawei: This is not only implementation issue. We need 2D or even higher D spatial consistent paramaters.

Decision: The document is noted

8.2.3.3 Remaining details on large antenna array modelling

R1-162314 Further discussion on large antenna array CATT

Proposal 1: The Large BW and large antenna modeling applies only when either of the following conditions holds:

(1) Antenna aperture is greater than $\frac{C}{n \cdot \Delta f_{sc} \cdot N_{FFT}}$ *meter in either azimuth or elevation.*

Petitioners' Exhibit 1007, p. 1518
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

(2) BW is greater than $\frac{N_{RB}N_{sc}^{RB}}{n \cdot N_{FFT}} \cdot \frac{C}{D}$ *Hz.*

Discussion:
Decision: The document is not treated

R1-162722 Discussion on large antenna modeling Samsung

Proposal 1: For >6GHz, X = 16 and for <6GHz, X = 8.
Proposal 2: Large bandwidth support applies when the bandwidth is larger than 0.1 GHz.
Proposal 3: TOAs are modeled for the strongest 3 clusters.
Proposal 4: Intra-cluster are only considered in the first 3 strongest clusters

Discussion:

Huawei: How to test phase change? What is too much? Do you assume different requirements for different frequencies?
Samsung: Few degree seems to be good criteria.
NTT DOCOMO: Larger BW will have more clusters.
Ericsson: Table 1 phase errors to be considered. Large arrays will be more common in BS side.
Qualcomm: Phase error depends on implementation.
Huawei: We should not mix antenna to the channel which is changing all the time.
LGE: Wed are preparing WF

Decision: The document is noted

R1-163245 Channel modeling considerations for supporting large antenna arrays Ericsson

Proposal 1: The amplitude distribution within a cluster is modeled with a linear decay in dB units from the cluster center in azimuth and elevation.
Proposal 2: The distribution of sub-paths is uniform in azimuth and elevation.

Discussion:
Decision: The document is not treated

R1-163474 WF on large antenna modeling LG Electronics, ETRI, InterDigital, Keysight, Samsung

Proposal 1: One of the following alternatives is agreed as condition to apply large BW and large antenna array modeling: Alt1, Alt 2, Alt 3
Proposal 2: The channel response of section 7.6.2 in R1-162714 needs to be updated as follows

Discussion:

Samsung: Alternatives 2 and 3 are not following the agreements from previous meeting. We support Alt 1.
Ericsson: We see some issues with previous agreements. Other alternatives correct those.
Nokia: Alt 1 value Y could be related to carrier frequency.
Ericsson: No. It is a relation with BW and array size. Confusion with connection between proposals 1 and 2.
CATT: Alt 2 and 3 are basically the same. Alt 1 is more comprehensive.
Huawei: There are 3 different aspects. Proposal 2 solves the one of them. We support Alt 2 to solve one problem.
Nokia: Alternatives 2 and 3 are against agreements from last meeting.
Samsung: We support Alt 1 and proposal 2.
Ericsson: We need to analyse further. We could discuss further over email.

Decision: The document is revised in 3487

Petitioners' Exhibit 1007, p. 1519
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-163487 **WF on propagation delay modeling over large antenna array** **LG Electronics, ETRI, InterDigital, Keysight, Samsung, Ericsson, Huawei**

Discussion:

Decision: The document is agreed

8.2.3.4 Remaining details on modelling of other additional features

R1-162315 **Further discussion on atmospheric attenuation** **CATT**

Proposal 1: Subtract the impact of oxygen absorption from the measurement data before parameterizing the model
Proposal 2: Apply the frequency-dependent oxygen loss in frequency-domain channel response for the large channel bandwidth. Possible simplification can be considered to reduce the channel modeling complexity.
Proposal 3: Apply a single oxygen loss to the channel impulse response of a cluster for narrow bandwidth, e.g., <1GHz, which is a special case of Proposal 2

Discussion:

Decision: The document is agreed

R1-162955 **Discussion on stochastic reflection modeling** **Huawei, HiSilicon**

Proposal: Specular reflection term is taken into account in the channel model as an optional term.

Discussion:

Ericsson: If you add into LOS what would be the K-factor? Do we need to split the K-factor?
Huawei: Yes
Ericsson: That would be very complicated. We propose to apply only to NLOS.
Huawei: We could keep LOS as FFS.
CATT: Why the reflection is the 2nd part? Any impacts on other parameters like blocking?
LGE: Why do you use this optional term?
Huawei: It depends on the case.

Decision: The document is noted

R1-163479 **WF on UE rotational motion** **INTERDIGITAL COMMUNICATIONS, Qualcomm, Ericsson, Intel, Lenovo**

Discussion:

Fraunhofer: Antenna pattern should include time dependent angles. Then you need to change both pattern and angles. We have concerns with changing pattern.
InterDigital: Pattern itself is not changing.
ZTE: Is this always on?
InterDigital: Can be turned off.
LGE: What is the criteria to turn off?
InterDigital: Not decide yet.
Nokia: This says it is for mobility. You should consider movement together with rotation.
Qualcomm: We need to consider mobility at the same time

Petitioners' Exhibit 1007, p. 1520
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Samsung: Current model is for global coordinate system. We don't need to revise the equation. We don't need to discuss when to turn on/off.
Intel: Rotation can be turned on individually without the mobility.
InterDigital: We agree can be turned on individually.

Decision: The document is noted

8.2.4 Remaining details on link-level channel models

Remaining details on beamforming modelling, scaling, etc.

Summary of email discussion

R1-162960 Summary of email discussion on link level channel model Huawei, HiSilicon

Proposal 1: The summary of email discussion described in section "2. Summary of email discussion" above is agreed as way forward.

Discussion:

Ericsson: Is this intended as WF for this meeting?
Huawei: Yes

Decision: The document is agreed

Linke level modeling

R1-162723 Discussion on LLS channel modeling Samsung

Proposal: For simplified LLS channel modelling, the normalized CDL model can be converted to TDL channel coefficient by applying Eq. (1) with brick-wall spatial filter defined by Eq. (2).

Discussion:
Decision: The document is not treated

R1-162951 Discussion on channel model for link level simulation Huawei, HiSilicon, Spirent, Keysight

Proposal: The link level channel models described in this document should be included in the channel model TR.

Discussion:
Decision: The document is not treated

R1-162959 Discussion on channel model for link level simulation in LoS scenario Huawei, HiSilicon, Spirent, Keysight, NTT DOCOMO

Proposal: The LOS link level channel models described in this document should be included in the channel model TR.

Discussion:
Decision: The document is not treated

R1-163249 Further details on link level channel models Ericsson

Proposal 1: Use angular scaling of CDLs such that a range of angular spreads can be represented by a single CDL

Petitioners' Exhibit 1007, p. 1521
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Proposal 2: Use angular translation of CDLs such that a range of mean angles can be represented by a single CDL
Proposal 3: If LOS link level models are introduced, these should include scalable K-factors.

Discussion:
Decision: The document is not treated

R1-163429 Text proposal for TR 38.900 to add link level channel models including LOS Huawei, HiSilicon, CATT

Chair: Late contribution

Discussion:

Ericsson: This includes some parts of the email discussion but LOS case is not discussed and agreed.
Samsung: We have concerns on LOS table.
ZTE: Number of clusters was not agreed either for system level model. We should avoid the inconsistency between link and system level models.

Decision: The document is revised in 3476

R1-163476 Text proposal for TR 38.900 to add link level channel models Huawei, HiSilicon, CATT

Discussion:

Samsung: How to capture editorial errors in TR is up to rapporteur.
NTT DOCOMO: Comment on delay.

Decision: The document is agreed

R1-163489 WF on link level channel models for LOS Huawei, HiSilicon, Spirent, NTT DOCOMO, Vodafone

Proposal 1: Link level channel models for the LOS case are included in the TR.
Proposal 2: The LOS channel models are generated by the same method as the NLOS channel models were already generated.
Proposal 3: The LOS channel model tables in following pages are adopted as way forward.

Discussion:

Ericsson: What is the gain between LOS and NLOS cases? Our document discuss LOS channels. We have concern adding detailed model. K-factor scaling should be included.
Huawei: It is a K-factor. We try to minimize the number of variables. Existing models are based on NLOS.
Samsung: Ericsson proposal sounds good but we support this WF.
Ericsson: We can support if we include K-factor scaling.
Nokia: How to capture that in the model? We can also support if solve also K-factor issue.

Decision: The document is revised in 3491

R1-163491 WF on link level channel models for LOS Huawei, HiSilicon, Spirent, NTT DOCOMO, Vodafone, CMCC. CATT, CATR, AT&T, Ericsson

Proposal 1: Link level channel models for the LOS case are included in the TR.
Proposal 2: The LOS channel models are generated by the same method as the NLOS channel models were already generated.
Proposal 3: The LOS channel model tables in following pages are adopted as way forward.
Proposal 4: The K factor will be scalable. Example values of K factor and guidelines on how to scale the K factor will be added to the TR.

Petitioners' Exhibit 1007, p. 1522
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion:

Decision: The document is agreed

R1-163490 WF on spatial filtering for TDL channel models Huawei, HiSilicon, Qualcomm

Discussion:

Ericsson: There are 2 different alternatives in step. We propose to approve the 2nd one. With that we can co-source. We need to know what alpha is. What should we write to the TR.
LGE: Would it be possible to use either options or do we need to down select?
Huawei: We can have both in TR or we can also decide here.
Qualcomm: WE can leave the detail later.
Samsung: We support Ericsson suggestion step 4 scaling parameter is introduced.

Decision: The document is revised in 3643

R1-163643 WF on spatial filtering for TDL channel models Huawei, HiSilicon, Qualcomm, Samsung, Ericsson

Discussion:

Decision: The document is agreed

8.2.5 Channel modelling calibrations

8.2.5.1 Calibration scenarios and assumptions

Including UE antenna modelling

UE antenna modelling

R1-162237 UE antenna modeling for link level calibration purposes Qualcomm Inc.

Proposal 1: It is important to have a model that captures the basic aspects of subarrays and directional coverage while keeping the modeling complexity low.
Proposal 2: The antenna gain and array size should match expectations in a typical device.

Discussion:
Decision: The document is not treated

R1-162744 Discussion of antenna assumption for channel model calibration Lenovo (Beijing) Ltd, Motorola Mobility

Proposal 1: Define different antenna configurations for different frequency range.
Proposal 2: Consider defining multiple antenna configurations corresponding to different types of MS.
Proposal 3: Frequency dependent antenna radiation pattern is FFS.
Proposal 4: The full connectivity model is the baseline. Hybrid beamforming is FFS.

Discussion:

Petitioners' Exhibit 1007, p. 1523
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Qualcomm: Why do we need to talk about the connectivity model?
Lenovo: How antenna elements are connected will have an impact on performance.
Huawei: We don't need to model many models. It is better to assume typical case for calibration purposes.
Nokia: We don't see a need to have multiple models.
Ericsson: Scope of this SI is channel model. Calibration will validate that implemented 12 steps are comparable. We can assume very generic antenna model.
Lenovo: We agree no detailed model is needed for the CM.

Decision: The document is noted

Scenarios

R1-162316 Further discussion on calibration scenarios CATT

Proposal 1: The 3-sector deployment can be used for indoor-office calibration scenario.
Proposal 2: the antenna pattern defined in table 7.1-1[5] and antenna modeling [4] is also applicable for indoor-office.
Proposal 3: Equation 4 can be used for calculating downtilt angle for indoor office.

Discussion:
Decision: The document is not treated

R1-162952 Discussion on channel modeling calibration scenarios Huawei, HiSilicon

Proposal 1: layouts of indoor hotspot, urban micro and urban macro scenario mentioned above should be adopted in calibration of channel model.
Proposal 2: parameters in table 1 should be adopted in calibration of channel model.

Discussion:
Decision: The document is not treated

Scenarios and assumptions

R1-162423 Further details on calibration scenarios and assumptions NTT DOCOMO, NTT

Proposal 1: Multiple carrier frequency bands can be considered for each scenario, e.g., indoor-office, UMi and UMa.
Proposal 2: Multiple eNB antenna configurations can be considered, depending on the calibration requirement. The necessity of considering multiple UE antenna configurations is FFS.
Proposal 3: If 3-sector antenna array model is used for the indoor scenario for calibration purpose, consider the antenna array placement model in Figure 1.
Proposal 4: Consider the placement of the antenna panel on the roof with the bore-sight facing the ground, and consider omni-directional antenna pattern in the azimuth and directive antenna pattern in the elevation in this case.
Proposal 5: RAN-1 shall study the beamwidth and tilting angle for the indoor antenna array placement.
Proposal 6: If random eNB antenna dropping shall be modeled, consider to reuse the model described in Section A.2 of TR 36.897.
Proposal 7: Take the simulation assumptions in Table 1 and Table 2 for channel model calibration.

Discussion:
Decision: The document is not treated

R1-162525 Discussion on calibration scenarios and assumptions LG Electronics

Proposal 1: For calibration purpose, we think that BS antenna structure with a single panel is sufficient, i.e. MgNg = 1, and adopt Table 1 for BS antenna configurations.
Proposal 2: Adopt Table 2 for UE antenna modeling.

Petitioners' Exhibit 1007, p. 1524
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion:
Decision: The document is not treated

R1-162724 Calibration scenarios and assumptions Samsung

Proposal 1: In phase 1, calibrate above 6GHz channel model according to Table 1
Proposal 2: In phase 2, calibrate above 6GHz channel model according to Table 2, and if needed, account for feedback from phase 1 calibration.
Proposal 3: Phase 3 calibration is FSS.

Discussion:
Decision: The document is not treated

R1-162574 Scenarios and simulation assumption for calibration Nokia, Ericsson, AT&T, CMCC, ETRI, Huawei, HiSilicon, Intel, KT Corporation, NTT DOCOMO, Qualcomm, Samsung

Proposal 1: Use the scenarios, assumption and metrics from phase-1 and phase-2 calibrations in TR36.873 as starting point.
Proposal 2: Include 3D-UMa, 3D-UMi-Street Canyon, Indoor-office as the calibration scenarios
Proposal 3: Calibration assumption should consider multiple carrier frequencies, e.g. 6, 30, 70 Ghz. (further down-selection is possible)
Proposal 4: Adopt the detail calibration assumption in Section 3.
Proposal 5: Target to include the additional features in the general test metrics as much as possible.

Discussion:

Samsung: This is good starting point but we realized now that 1 and 2 GHz BWs may not need to be calibrated. We could consider 100 MHz and 200 MHz.
CATT: Is the intention to omit phase 3?
Nokia: We did not touch that. We don't need to have baseline calibration for this SI.
ZTE: If we simulate only lower BWs do you then assume only frequencies <6GHz?
Samsung: No
LGE: Do we really need to connect system BW with carrier frequency?
Nokia: Reason is to reduce the calibration cases. We can put system BWs in brackets.
Interdigital: Do you assume wrap around also in the office?
Nokia: Only for Uma and UMi.

Decision: The document is revised in 3477

R1-163477 Scenarios and simulation assumption for calibration Nokia, Ericsson, AT&T, CMCC, ETRI, Huawei, HiSilicon, Intel, KT Corporation, NTT DOCOMO, Qualcomm, Samsung

Discussion:

Decision: The document is agreed

R1-163635 WF on simulation assumption for large-scale calibration Nokia, Samsung

Discussion:

Ericsson: For O2I it would make sense to have 50/50 for calibration purposes.
Samsung: We are not sure that's better.
Huawei: We agree with Ericsson. We have 2 different penetration losses. 50/50 is more reasonable.

Petitioners' Exhibit 1007, p. 1525
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Nokia: How do we resolve the amount of indoor users? When we drop the users we don't need to worry about O2I.
Huawei: Penetration loss is not dependent on distribution.
NTT DOCOMO: 80% indoors was agreed last time.
Huawei: We should assume 50% high loss and 50% low loss.
ZTE: Why do we discuss this now? We could take just whatever number.
Nokia: We have also other non-realistic assumptions.
Ericson: This is one of the important issue. We should be changed to 50/50.
Samsung: We should consider the numbers again in the next meeting.
Fraunhofer: MS ant configuration says only 1 element polarized 90 degrees. What does it means.
Samsung: Ant pattern is omnidirectional.
NTT DOCOMO: We need to define the orientation of antenna panel.

Decision: The document is revised in 3641

R1-163641 WF on simulation assumption for large-scale calibration Nokia, Samsung

Discussion:

Huawei: With minimum distance of 1 m would be safer.

Agreed with clarification: minimum distance is only in 2D.

Decision: The document is agreed

R1-163638 WF on simulation assumption for full calibration Nokia, Samsung

Discussion:

Ericsson: We should add 60GHz. Which angle spreads these are?
Samsung: DoA.
LGE: UE array orientation parameters. Why don't we use the same than for 3D CM?
Samsung: WE didn't check 3D CM but OK with that.
Fraunhofer: CDF definition in 3D CM is based on eigen value of covariance matrix. Could we change it to average value instead?
Samsung: We had similar discussion in 873.
Intel: 2 angles having 60 degree difference? We could consider 0 and 0.
Samsung: No strong view on that.
Ericsson: 1st and 2nd could be better than largest and smallest.
NTT DOCOMO: 2 different ant antenna ray configurations and CSI port mapping. Does it mean 4 different configurations?
Samsung: We can do editing.
ZTE: We could ask companies to prove table. Is this full calibration for the next phase?
Samsung: This is for calibrating the channel model. We can check in the next meeting.
Nokia: Ant configuration 1 is good enough for most of the calibrations except eigen value. Is configuration 2 only for eigen value.

Decision: The document is revised in 3642

R1-163642 WF on simulation assumption for full calibration Nokia, Samsung

Discussion:

Samsung: WE propose the email discussion for the calibration campaign:
- 1 week for LS fading
- By next meeting for the full calibration

Ericsson: How do we proceed with FFS for PL model?
NTT DOCOMO: We are not sure if this kind of strict deadline for email discussion is necessary.
Samsung: Motivation is the target for finalizing things step by step.
NTT DOCOMO: Are there change to have 1st calibration round until June plenary?
Samsung: It may be possible until August.

Petitioners' Exhibit 1007, p. 1526
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Huawei: Deadline should be explicit.
Samsung: 25 Apr is the deadline.
Qualcomm: What exactly are we agreeing now?
Samsung: LS fading we use the values in brackets.

Finalize details by email discussions for the next meeting. Samsung will lead the email discussion.

Decision: The document is working assumption

R1-163639 **WF on calibration of additional features** **Huawei, HiSilicon**

At least the following additional features should be included into the calibration procedure of this SI.
Spatial consistency.
Blockage

Discussion:

Samsung: Previous 2 WFs can be used also for additional features.
Ericsson: We should re-use the same table and add mobility of the users.
Huawei: There should be some new metrics to be used.
Nokia: How do we generate the change of angles? We have to model UE position changing.
Huawei: We have different approaches. Not to assume mobility or to assume mobility.
Nokia: Angle of cluster will be changing for moving user.
Huawei: Same user dropping approach can be used.
Qualcomm: It is good idea to consider few other metrics. These metrics are not clear at this point.
Intel: We agree with Qualcomm. We could have very simple extension to current approach.
Nokia: Channel autocorrelation based on user distance would be good parameter.
Ericsson: We haven't finalized these metrics yet. We could discuss over the email, for the next meeting.
Huawei: 1st bullet may be easy to agree in high level. Exact metrics depends on the final solutions.
Nokia: Do we assume angle between users or within one user?
Huawei: We can discuss details over the mail.

The 1st bullet is agreed

Decision: The document is noted

8.2.5.2 Metrics for channel model calibrations

R1-162245 **Initial results of calibration phase 1** **Huawei, HiSilicon**

Initial calibration results of phase1 for indoor hotspot, urban micro and urban macro scenarios
Proposal: take the coupling loss and geometry results into account in phase 1 of channel modelling calibration for multiple company comparison.

Discussion:
Decision: The document is not treated

R1-162317 **Discussion on calibration phases and metrics** **CATT**

Proposal 1: The channel calibration simulation for above 6GHz can be divided into three phases similar to the simulation phases in TR 36.873.
Proposal 2: The metrics in each phase in TR 36.873 can be chosen as the baseline metrics in corresponding phases in simulation for above 6GHz, the corresponding additional metric/s may be defined and added to respective phases with implementation of additional features in channel coefficient generation procedure.
Proposal 3: Simulation assumptions shown in table 1 can be used for phase 1 calibration for above 6GHz channel modeling.

Petitioners' Exhibit 1007, p. 1527
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion:
Decision: The document is not treated

R1-162424 Metrics on channel model calibrations NTT DOCOMO, NTT

Proposal 1: Phase-1 calibration of >6GHz channel model is based on the phase-1 calibration of the 3D channel model. Coupling loss and geometry are used for phase-1 calibration.
Proposal 2: Phase-2 calibration of >6GHz channel model is based on the phase-2 calibration of the 3D channel model. Wideband SINR and singular values are used for phase-2 calibration.
Proposal 3: Capture the metrics defined in Table 1 and Table 2 in TR for phase-1 and phase-2 calibration respectively.
Observation: Some of the additional features developed for >6GHz channel model are required by specific 5G technologies and can be calibrated during the technology study item.
Proposal 4: RAN 1 shall decide for each additional feature, whether include that feature in phase-1 and phase-2 calibration or establish a separate calibration for it.

Discussion:

Huawei: On proposal 4, it would be good to complete the calibration on all additional features.
NTT DOCOMO: Can we complete all additional features for the next meeting? What is phase 3?
Huawei: It depends on the progress. Phase 3 means additional features.

Decision: The document is noted

R1-162526 Discussion on metrics for channel modeling calibration LG Electronics

Proposal 1: The metrics in 3D channel model calibration can be reused for the calibration of the above 6GHz channel modeling.
Proposal 2: To align with a practical system, one antenna element is assumed for the coupling loss and geometry in the calibration. Also, to compare with the previous channel modeling, vertically fixed beam with N=1 can be assumed for the coupling loss and geometry in the calibration.

Discussion:
Decision: The document is not treated

R1-162725 Metrics for channel model calibrations Samsung

Discussion:
Decision: The document is withdrawn

R1-162953 Discussion on channel modeling calibration procedures Huawei, HiSilicon

Proposal 1: channel modeling calibration should verify the support for channel model requirements.
Proposal 2: channel modeling calibration should align the implementation of channel model among companies.
Proposal 3: the 4-step procedures should be considered in channel modeling calibration.
Proposal 4: the parameters and metrics in table1-4 should be considered in channel modeling calibration.

Discussion:
Decision: The document is not treated

R1-163430 WF on channel model calibration procedures Huawei, HiSilicon

Chair: Late contribution

Discussion:

Petitioners' Exhibit 1007, p. 1528
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

CATT: We support this WF.
Nokia: Step 4 is unnecessary. Step 3 is not needed necessary for each feature.
Samsung: Nokia proposal already propose full details.
Lenovo: Steps 4 is unnecessary at this point.

Decision: The document is noted

8.2.6 Consistent extension of the additional features to < 6GHz

No contributions

8.2.7 Map-based methodology

Summary of email discussion

R1-163117 **Email discussion on map-based hybrid model** **Keysight**

This contribution was able to report the email discussion as such without any edition work because of the relatively small number of messages sent.

Discussion:
Decision: The document is noted

Mab-based hybrid model

R1-163095 **Simulations of map-based hybrid channel model** **ZTE**

Observation 1: The proposed map-based hybrid model provides at least the following in terms of spatial consistency:

- *The realistic transition between LoS condition and NLoS condition.*
- *The smooth and close-to-real evolutions of power-delay profile, power-azimuth profile and power-zenith profile over UE's moving trajectory for the significant clusters or rays.*
- *The realistic birth-death processes for significant clusters or rays.*

Observation 2: The time consumption of the proposed map-based hybrid model is more than acceptable for the system-level simulations.

Discussion:
Decision: The document is not treated

R1-163096 **Map-based hybrid model to meet modeling requirements** **ZTE**

Observation: The map-based hybrid model fully meets all agreed modelling requirements.

Discussion:
Decision: The document is not treated

R1-163116 **Generality of map-based hybrid model** **Keysight**

This contribution has presented few simulation results to demonstrate versatility of output parameters of deterministic channel models. The simulation results show substantial statistical variation of parameters. We conclude that with a sufficient size and realistic, i.e. not too homogenous, map and a rich deployment a satisfactory generality can be reached.

Petitioners' Exhibit 1007, p. 1529
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

When adding more stochastic components, as is the case with the map–based hybrid model, even more diverse radio channels can be generated.

Discussion:
Decision: The document is not treated

R1-163119 Distance Dependent Cluster–Wise Angular Spread Keysight

This contribution has presented a distance dependent cluster–wise rms angular spread for the map–based hybrid model. The proposal utilizes the information of both the interaction type and the distance to/from first/last interaction points that are inherently available for deterministic clusters of the map-based hybrid model. The proposed enhancement increases the model accuracy and realism with a minimal increase of computational complexity.

Discussion:
Decision: The document is not treated

Text Proposals

R1-163094 Detailed implementation and text proposal for map-based hybrid model ZTE

Proposal: RAN1 agrees the text proposal in appendix, as an alternative methodology for high-frequency channel modeling.

Discussion:
Decision: The document is revised in 3404

R1-163102 TP for map-based hybrid model Keysight

The attached TP is to provide an update to TR 38.900. It adds the section 8 to the TR.

Discussion:
Decision: The document is not treated

R1-163404 Joint text proposal for map-based hybrid channel model ZTE, Keysight

Proposal: RAN1 agrees, in principle, the text proposal in appendix, as an alternative methodology for high-frequency channel modeling. How to finalize the sharing of certain modeling details with stochastic-only channel model is FFS.

Discussion:

Sharp: We are confused on which clusters to be removed. Are you minimizing the information loss?
ZTE: For removal of random clusters, we believe info from digital map is enough.
Ericsson: Important part is in the beginning on when to use the hybrid model. We need better guidance on which model to use and when. Consistency between results is important.
ZTE: We can revise the wording but the intention is that hybrid model is good compliment for stochastic model. If people are interested they can then use the model. E.g. agreed UMa model is based on both methods. Stochastic model is based on measurements and ray tracing.
Sharp: If results are different then how to draw the conclusion?
ZTE: That applies also to stochastic only model.
Samsung: People not participated channel model work may not know which model to use in future evaluations. We could say that bybrid model is not calibrated. It would be OK to have text as informative. This is based on inputs from 2 companies only.

Decision: The document is revised in 3478

Petitioners' Exhibit 1007, p. 1530
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-163478 **Joint text proposal for map-based hybrid channel model ZTE, Keysight, CATR**

Discussion:

Nokia: We are fine in principle but hoe to capture should be left for rapporteur.
Ericsson: Concern having map based model. If it is validated with measurements then we are fine.
ZTE: WE have discussed this over email after AH. What parameters you like to see?
Ericsson: It says now the map based model is not calibrated. We don't know if it match with reality.
ZTE: Deterministic will be closer to realistic than stochastic model. Now we combine these models.
Ericsson: Deterministic typically worse regarding PL than stochastic.
ZTE: We gave lot of details in Malta meeting already. What else do you want to see?
Ericsson: Typical metrics for calibration.
ZTE: We can agree this as working assumption and provide results for the next meeting.
Ericsson fine but we may need to revise this based on results.

Decision: The document is working assumption

8.2.8 Other

mmMAGIC results

R1-162872 **Initial 60 GHz channel sounding results from the mmMAGIC project for corner diffraction and surface scattering Keysight**

This paper has presented results from an isolated corner diffraction measurement and surface scattering in indoor and outdoor environments of a modern building. A wideband (2 GHz) channel sounder was used at a carrier frequency of 60 GHz.
An "add-on module" needs to be developed to extend the current stochastic channel models to support spatial consistency in expected use cases. This will allow the model to accuracy represent received signal strength and multi-path variations along a route of consecutive points. The model should address the transition from LoS to NLoS (i.e. the role of corner diffraction) as well as the effects of diffuse scattering from rough and smooth building and terrain surfaces.
More measurement data is required to determine the isolated diffuse scatter process for a single interaction at mmWave frequencies, and then to determine the model for the process.

Discussion:
Decision: The document is not treated

Dear all,

RAN1#86 Tdoc_list has finally been successfully uploaded to 3GU last night – you may, if needed, download it from the portal…
I've not checked all AIs yet. So all statuses are not properly reflected but I will work on that ☺
All maintenance CRs should be ok – as I'm also preparing RAN1 inputs to next plenary, full list of the agreed CRs should soon be available but I'm currently checking CRs to 38.900 (AI 8.2) – I'll distribute it to the reflector when ready
Very first draft of the minutes is attached

Table of contents

1 Opening of the meeting 7
1.1 Call for IPR 7
1.2 Competition law statement 7
1.3 Network usage conditions 7
2 Approval of Agenda 7
3 Approval of Minutes from previous meeting 8
4 Highlights from RAN Plenary 8
5 Incoming Liaison Statements 8
6 UTRA 14
6.1 Maintenance of UTRA Releases 4 – 13 14
6.1.1 FDD 14
6.1.2 TDD 15
6.2 DTX/DRX enhancements in CELL_FACH - WID in RP-160185 15
6.2.1 DRX improvements 15
6.2.2 DTX improvements 15
6.3 Multi-Carrier enhancements for UMTS - WID in RP-161259. 16
6.3.1 2ms+10ms and 10ms+10ms configurations for (DB)-DC-HSUPA 16
6.4 Others 16
7 E-UTRA 16
7.1 Maintenance of E-UTRA Releases 8 – 13 16
7.1.1 Maintenance of E-UTRA Release 8 – 12 17
7.1.2 Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers 18
7.1.3 Maintenance of Release 13 licensed-assisted access to unlicensed spectrum 18
7.1.4 Maintenance of Release 13 elevation beamforming/full-dimension MIMO for LTE 18
7.1.5 Maintenance of Release 13 further LTE physical layer enhancements for MTC 19
7.1.6 Maintenance of Release 13 NB-IoT 22
7.2 LTE Release 14 25
7.2.1 Enhanced Licensed-Assisted Access to Unlicensed Spectrum *WID in RP-160881.* 25
7.2.1.1 PUSCH design ..... **Error! Bookmark not defined.**
7.2.1.2 SRS design ..... **Error! Bookmark not defined.**
7.2.1.3 Channel access framework ..... **Error! Bookmark not defined.**
7.2.1.4 Others ..... **Error! Bookmark not defined.**
7.2.2 Support for V2V services based on LTE sidelink - *WID in RP-161272* ..... **Error! Bookmark not defined.**
7.2.2.1 Remaining details of physical layer structure ..... **Error! Bookmark not defined.**
7.2.2.2 Remaining details of UE autonomous resource selection mode ..... **Error! Bookmark not defined.**
7.2.2.2.1 Details of transmission resource (re)selection based on SA decoding and power/energy measurement ..... **Error! Bookmark not defined.**
7.2.2.2.2 Details of timing of PSCCH/PSSCH transmission and the indication of the intention to reuse the frequency resource for another TB ..... **Error! Bookmark not defined.**
7.2.2.2.3 Details of the measurement metric to reflect the congestion level ..... **Error! Bookmark not defined.**
7.2.2.2.4 Others ..... **Error! Bookmark not defined.**
7.2.2.3 Remaining details of resource pool design ..... **Error! Bookmark not defined.**
7.2.2.4 Remaining details of scheduling for sidelink resource in eNB scheduling mode . **Error! Bookmark not defined.**
7.2.2.4.1 Details of DCI format for SPS and dynamic scheduling ..... **Error! Bookmark not defined.**
7.2.2.4.2 Others ..... **Error! Bookmark not defined.**
7.2.2.5 Remaining details of SCI contents ..... **Error! Bookmark not defined.**
7.2.2.6 Remaining details of coexistence of PC5-based V2V operation and legacy Uu operation . **Error! Bookmark not defined.**
7.2.2.7 Remaining details of sidelink synchronization procedure ..... **Error! Bookmark not defined.**
7.2.2.8 Others ..... **Error! Bookmark not defined.**
7.2.3 LTE-based V2X Services - *WID in RP-161298* ..... **Error! Bookmark not defined.**
7.2.3.1 Enhancement to UL SPS ..... **Error! Bookmark not defined.**
7.2.3.2 Resource selection for pedestrian UEs ..... **Error! Bookmark not defined.**
7.2.3.3 Others ..... **Error! Bookmark not defined.**
7.2.4 Enhancements on Full-Dimension (FD) MIMO for LTE - *WID in RP-160623* ..... **Error! Bookmark not defined.**
7.2.4.1 Reference signals ..... **Error! Bookmark not defined.**
7.2.4.1.1 Non-precoded CSI-RS ..... **Error! Bookmark not defined.**
7.2.4.1.2 Beamformed CSI-RS ..... **Error! Bookmark not defined.**
7.2.4.1.3 Uplink DM-RS ..... **Error! Bookmark not defined.**
7.2.4.2 CSI reporting ..... **Error! Bookmark not defined.**

Main facts summary

3GPP TSG WG RAN1 #86 meeting, hosted by the European Friends of 3GPP, was held at the Gothia Towers Hotel, Gothenburg, Sweden.
The meeting started at 9:00 on Monday 22nd August and finished at 17:00 on Friday 26th August 2016.
The number of attending delegates, having confirmed their participation through the electronic check-in application, was **422.**
Note that the number of registered was a kind of record and reached 599.

The schedule of the week was as follows:

- Monday: Common session on Agenda items 1, 2, 3, 4, 5, 7.1.2 (Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers), 7.1.3 (Maintenance of Release 13 LAA) and 7.1.4 (Maintenance of Release 13 EB/FD-MIMO) followed by Study on Latency reduction techniques (AI 7.3.10.1 on Evaluation results, AI 7.3.10.2 on Channel design for shortened TTI)
- Monday afternoon (LTE)
  - Session on NB-IoT (AI 7.2.1) chaired by Matthew Baker.

- Tuesday (NR): chaired by Satoshi Nagata
- Tuesday (LTE session1): chaired by Matthew Baker
  - eMBMS enhancements for LTE (AI 7.3.5), SRS Carrier Based Switching for LTE (AI 7.3.6) and Enhancements on Full-Dimension (FD) MIMO for LTE (AI 7.3.3).
- Tuesday (LTE session2): chaired by Wanshi Chen
  - Rel-13 eMTC CRs (and possibly other CRs (e.g., LAA, MIMO, eCA), Further Indoor Positioning enhancements for UTRA and LTE (AI 7.3.7), Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1) and Support for V2V services based on LTE sidelink (AI 7.3.2).
- Tuesday (LTE session3):
  - Study on channel model for frequency spectrum above 6 GHz (AI 8.2) chaired by Tuomo Säynäjäkangas from Nokia followed by session on NB-IoT (AI 7.2.1) chaired by Brian Classon from Huawei.
- Tuesday (HSPA): Multi-Carrier enhancements for UMTS (AI 6.2) chaired by Carmela Cozzo from Huawei.

- Wednesday (NR): chaired by Satoshi Nagata
- Wednesday (LTE session1): chaired by Matthew Baker
  - Rel-13 CRs Maintenance (AI 7.1), Uplink Capacity Enhancements for LTE (AI 7.3.8), Study on Latency reduction techniques (AI 7.3.10) and Enhancements on Full-Dimension (FD) MIMO for LTE (AI 7.3.3).
- Wednesday (LTE session2): chaired by Wanshi Chen
  - Support for V2V services based on LTE sidelink (AI 7.3.2), Study on LTE-based V2X Services (AI 7.3.9) and Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1).
- Wednesday (LTE session3):
  - Study on channel model for frequency spectrum above 6 GHz (AI 8.2) chaired by Tuomo Säynäjäkangas from Nokia followed by session on NB-IoT (AI 7.2.1) chaired by Brian Classon from Huawei.
- Wednesday (HSPA): DTX/DRX enhancements in CELL_FACH (AI 6.3) chaired by Florent Munier from Ericsson followed by Maintenance.

- Thursday (NR): chaired by Satoshi Nagata
- Thursday (LTE session1): chaired by Matthew Baker
  - Rel-13 CRs Maintenance (AI 7.1), Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1), Study on Latency reduction techniques (AI 7.3.10), Enhancements on Full-Dimension (FD) MIMO for LTE (AI 7.3.3) and Downlink Multiuser Superposition Transmission for LTE (AI 7.3.4).
- Thursday (LTE session2): chaired by Wanshi Chen
  - Rel-13 eMTC CRs (AI 7.1.5), Downlink Multiuser Superposition Transmission for LTE (AI 7.3.4), Study on LTE-based V2X Services (AI 7.3.9), Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1) and Support for V2V services based on LTE sidelink (AI 7.3.2).
- Thursday (LTE session3):
  - Study on channel model for frequency spectrum above 6 GHz (AI 8.2) chaired by Tuomo Säynäjäkangas from Nokia and session on NB-IoT (AI 7.2.1) chaired by Brian Classon from Huawei.

- Friday: Revisions. Continued offline in the morning (eLAA,…).

The list of action points that required RAN1 close follow-up is listed in Annex F (end of document).

The number of contribution documents for this meeting was xxxx, and those documents were categorized as followed.

1 Opening of the meeting

Mr Satoshi Nagata (RAN1 Chairman) welcomed the participants of the RAN WG1 86 meeting and opened the meeting at 09:00. Mr Johan Bergman from Ericsson welcomed the delegates on behalf of the European Friends of 3GPP, Alcatel-Lucent, Apple, BlackBerry, Deutsche Telekom, Ericsson, Huawei, Intel, KPN, Motorola, Nokia, Orange, Qualcomm, SIMAlliance, Sony, TeliaSonera, Telefonica, TIM, Telenor, Vodafone and detailed the domestic arrangements for the full week.

1.1 Call for IPR

The attention of the members of this Technical Specification Group was drawn to the fact ***that 3GPP Individual Members have the obligation*** *under the IPR Policies of their respective Organizational Partners to* ***inform their respective*** *Organizational Partners* ***of Essential IPRs they become aware of****.*
The members take note that they are hereby invited:

- *to investigate whether their organization or any other organization owns IPRs which were, or were likely to become Essential in respect of the work of 3GPP.*
- *to notify their respective Organizational Partners of all potential IPRs, e.g., for ETSI, by means of the IPR Information Statement and the Licensing declaration forms (e.g. see the ETSI IPR forms http://webapp.etsi.org/Ipr/).*

1.2 Competition law statement

The Chairman also drew Member's attention to the fact that 3GPP activities are subject to antitrust and competition laws and that compliance with said laws is therefore required of any participant of this WG meeting including the Chairman and Vice Chairmen. In case of question, please contact your legal counsel.
The present meeting will be conducted with strict impartiality and in the interests of 3GPP.
Furthermore, the Chairman reminded Members that timely submission of work items/contributions in advance of WG meetings is important to allow for full and fair consideration of such matters.

1.3 Network usage conditions

The PCG has laid down the following network usage conditions:

Users shall not use the network to engage in illegal activities. This includes activities such as copyright violation, hacking, espionage or any other activity that may be prohibited by local laws.

Users shall not engage in non-work related activities that consume excessive bandwidth or cause significant degradation of the performance of the network.
Since the **network is a shared resource**, users should exercise some basic etiquette when using the 3GPP network at a meeting. It is understood that high bandwidth applications such as downloading large files or video streaming might be required for business purposes, but delegates should be strongly discouraged in performing these activities for personal use. Downloading a movie or doing something in an interactive environment for personal use essentially wastes bandwidth that others need to make the meeting effective. The meeting chairman should remind end users that the network is a shared resource; the more one user grabs, the less there is for another. Email and its attachments already take up significant bandwidth (certain email programs are not very bandwidth efficient). In case of need the chair can ask the delegates to restrict IT usage to things that are essential for the meeting itself.

1. DON'T place your WiFi device in ad-hoc mode
2. DON'T set up a personal hotspot in the meeting room
3. DO try 802.11a if your WiFi device supports it
4. DON'T manually allocate an IP address
5. DON'T be a bandwidth hog by streaming video, playing online games, or downloading huge files
6. DON'T use packet probing software which clogs the local network (e.g., packet sniffers or port scanners)

2 Approval of Agenda

R1-166055 **Draft Agenda of RAN1#86 meeting** **RAN1 Chair**
Satoshi Nagata (Chairman) proposed the agenda for the meeting, as well the schedule of the week.
Discussion: No comment.
Decision: The agenda is approved.

Petitioners' Exhibit 1007, p. 1628
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

3 Approval of Minutes from previous meeting

R1-166056 Final Report of 3GPP TSG RAN1 #85 v1.0.0 ETSI

The document was presented by Patrick Mérias (ETSI Mobile Competence Center) and provides the outcomes of last meeting in China.

Discussion: MCC→ due to the inflation of contributions (>1800 at meeting start), RAN1 will shortly burst the 9999 tdocs per year barrier (4 digits upper limit) – RAN1 was warned that 5 digits numbering might be introduced at the next meeting.
MCC→ rapporteurs of WI/SI chairing sessions during the week are requested to highlight and use the bold type to clearly show the treated contributions in their notes and help MCC recording correct statuses in 3GU.

Decision: The document is approved.

4 Highlights from RAN Plenary

R1-166057 Selected highlights from RAN#72 of relevance to RAN1 RAN1 Chair

The document was presented by RAN1 Chair and feedbacks the decisions made by RAN#72, relevant to RAN1.

Discussion: Chair → regarding the additional ad-hoc meetings for NR, current view is as follows:

- January 2017 – 5days meeting – likely in the US (exact location still to be defined)
- June 2017 – 4days meeting – likely in Asia (Japan, India)

Decision: The document is noted.

5 Incoming Liaison Statements

R1-166073 LS to RAN1 on clarification on MIMO capability RAN2, Huawei

The document was presented by Xia Yuan from Huawei and raises an IOT issue if UE and network have different understanding in the case where, for instance the UE supports following two combinations simultaneously:

Combination 1: Band A 4*4 layers; Band B 2*2 layers
Combination 2: Band A 2*2 layers; Band B 4*4 layers;

How can the UE to determine the maximum number of layers for RI bit and Kc? 4*4 layers for band A or 2*2 layers for band A?

Decision: The document is noted.

R1-167906 Reply LS for clarification on MIMO capability Huawei

Discussion: .Qualcomm confirmed solution 2 is the preferred one. Potential UE capability discussion may be needed in RAN2.

Decision: The document is noted and final LS is agreed in R1-167914.

R1-166086 LS on 256QAM support for UE Category 9/10 from Rel-12 RAN, Intel

The document was presented by Seunghee Lee from Intel and asks to create the CRs reflecting that:

- For a Rel-12 UE supporting all UE radio access capability parameters for both Cat.9/10 and Cat.13,
  - The UE can report both Cat.9/10 and Cat.13
    - The eNB may understand that the UE supports all UE radio access capability parameters of both Cat.9/10 and Cat.13
      - Therefore either category can be applied individually (but not a combination of parameters of different categories)

Decision: The document is noted.

R1-166192 Discussion on UE reporting both category 9/10 and 13 Huawei, HiSilicon

The document was presented by Xia Yuan from Huawei.

- Proposal: DL UE category 13 could indicate category 9 or 10 if supported

Decision: The document is noted.

R1-166500 Discussion on simultaneous signaling of categories 9/10 and 13 Intel Corporation

The document was presented by Alexei from Davydov and proposes the following principles for deriving rate matching parameters and storing the received soft channel bits for such UEs are as follows:

- No specification change is required for the rate matching procedure in TS 36.212 to support UE simultaneously indicating support of category 9/10 and 13
- To support UE simultaneously indicating support of category 9/10 and 13 the Nsoft for sorting the received soft channel bits in TS 36.213 should be based on UE category 9/10 rather than DL category 13.

Discussion: Qualcomm → not aligned with RAN's agreement

Decision: The document is noted.

R1-167191 Introduction of simultaneous signalling of categories 9/10 and 13 Intel Corporation
R1-167192 Introduction of simultaneous signalling of categories 9/10 and 13 Intel Corporation

Agreements:

Petitioners' Exhibit 1007, p. 1629
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- No specification change is required for the rate matching procedure in TS 36.212 to support UE simultaneously indicating support of category 9/10 and 13
- For TS 36.213, N'_{soft} is the maximum "Total number of soft channel bits" [12] among all the indicated UE categories [11] of this UE.

R1-167398 Correction on storing soft channel bits for different UE categories Huawei, HiSilicon, NTT DOCOMO, SoftBank

- Change the soft channel bits assumption to be suitable for all the UE categories in TS36.213 so that the total number of soft channel bits is based on the maximum "Total number of soft channel bits" of all the UE categories supported by this UE.

Decision: The document is noted and CR0704 to 36.213 is not pursued.

Following LS was received during RAN1#86:

R1-168520 LS on Support of CAT 9/10 and CAT 13 RAN2

RAN2 agrees to use existing IEs i.e the UE indicates both ue-Category-v1170 (= Category 9/10) and ue-CategoryDL-r12 (= Category 13) when it supports both Category 9/10 and Category 13. RAN2 confirms that there is no backward compatibility issue when the UE sends both UE category IEs. Furthermore, the corresponding Rel-12/13 CRs for TS36.306 have been agreed in R2-165855 and R2-165856.

Decision: The document is noted.

LAA

R1-166066 Long Term Evolution in Operation in Unlicensed Spectrum Must Not Interfere with Wi-Fi City of Madison (Office of the Mayor of)

The document was presented by RAN1 Chair.

Decision: The document is noted.

R1-166083 Response to Wi-Fi Alliance comments on "Way forward on coexistence tests for LAA" RAN4, Qualcomm, Ericsson

The document was presented by RAN1 Chair.

Decision: The document is noted.

R1-167928 LS on CSI measurement ambiguity in LAA RAN4, LGE

The document (Incoming LS received in RAN1#86) was presented by Joon Kui Ahn from LGE and asked RAN1 to clarify whether following sentence could be applied in LAA CSI reporting case or not.

"*For a non-BL/CE UE, if there is no valid downlink or no valid special subframe for the CSI reference resource in a serving cell, CSI reporting is omitted for the serving cell in uplink subframe n.*" (in RAN1 specification TS 36.213 for CSI reporting)

Decision: The document is noted.

R1-166812 Discussion on RAN4 LS on CSI measurement ambiguity in LAA LG Electronics

Decision: The document is noted. Continue offline discussion until Friday – (LGE)

Friday: No progress – continue discussion until the next meeting.

R1-167880 Reply LS on Rel-13 LAA specifications RAN, Qualcomm, NTT DOCOMO

The document was presented by Srinivas Yerramalli from Qualcomm

Decision: The document is noted.

R1-167881 "Response to Liaison Statement on coexistence simulation results for DL only LAA" Wi-Fi Alliance

The document is a response to the liaison statement questions asked in R1-161396, summarizes changes made to the ns-3 simulator, and how such changes affect the results presented in R1-156621.

Decision: The document is noted. Continue offline discussion until Friday, if needed –(Qualcomm)

R1-167118 Draft response LS to WFA regarding LAA Qualcomm Incorporated

Friday Decision: Qualcomm withdrew R1-167118 as there did not seem to be a need identified (in this meeting at least) to respond to the LS.

R1-167908 Review of 3GPP LAA Specification Rel. 13 IEEE 802 LMSC

The document states that some of the comments in IEEE 802's Liaison Statement to 3GPP RAN1 dated 18 March 2016 (802.19-16-0037-09) have been resolved satisfactorily and represents a great success for the consensus process that started with the 3GPP LAA Workshop back in August 2015. However, there are a number of important outstanding issues, for which IEEE requests RAN1 to continue to look for satisfactory compromises with IEEE 802 and other interested stakeholders..

Decision: The document is noted. Continue offline discussion until Friday – (Qualcomm)

Friday Decision:

R1-166666 Draft response LS to 802dot11 regarding LAA Qualcomm Incorporated

Petitioners' Exhibit 1007, p. 1630
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The document is noted.

eMTC

R1-166069 LS on HARQ process selection for UL asynchronous HARQ RAN2, Huawei

The document was presented by Matthew Webb from Huawei.

- In asynchronous HARQ operation, HARQ process is associated with TTI based on the received UL grant except for UL grant in RAR. Each asynchronous HARQ process is associated with a HARQ process identifier. For UL transmission with UL grant in RAR, HARQ process identifier "0" is used.

Discussion: No action to RAN1 – no impact to spec
Decision: The document is noted.

R1-166081 LS on continuous uplink transmission in eMTC RAN4, Intel

The document was presented by Debdeep Chatterjee from Intel and asks RAN1 to specify UL compensation gaps, including related UE behaviour.
Discussion: No action to RAN1.
Decision: The document is noted.

NB-IoT

R1-166061 Reply LS on questions on NB-IOT CT1, Nokia

The document was presented by Rapeepat Ratasuk from Nokia.
Discussion: No action to RAN1.
Decision: The document is noted.

R1-166070 LS to RAN1 on WLAN RSSI RAN2, Nokia

The document was presented by Klaus Hugl from Nokia and asks RAN1 to correct the definition of WLAN RSSI.
Decision: The document is noted.

R1-167547 Correction to the Beacon RSSI definition Nokia, Intel, Alcatel-Lucent Shanghai Bell, Qualcomm Incorporated, Ericsson

Decision: The document is noted and CR0034 to 36.214 (Rel-12) is agreed.

R1-167549 Correction to the WLAN RSSI definition Nokia, Intel, Alcatel-Lucent Shanghai Bell, Qualcomm Incorporated, Ericsson

Decision: The document is noted and CR0035 to 36.214 (Rel-13) is agreed.

Latency reduction

R1-166071 LS to RAN1 on RAN2 agreements on skipping Uplink transmission RAN2, Nokia

The document was presented byTimo Lunttila from Nokia and asks RAN1

- to confirm the RAN2 assumption that non-adaptive retransmissions on SPS resource are done based on RV 0 and to provide feedback if any concern,
- to align RAN1 specifications if needed regarding the assumption that the UCI should be sent on PUCCH even if there is a valid PUSCH allocation on that subframe

Decision: The document is noted.

R1-167507 Addition of LTE_LATRED_L2-Core Ericsson LM

Add that PUSCH is not transmitted if not high layers generates a MAC entity for the corresponding HARQ process
Decision: The document is noted and CR0709 of 36.213 is for email approval until Sept 12th (Spec editor – Motorola Mobility)

R1-167023 On skipping uplink transmission Nokia, Alcatel-Lucent Shanghai Bell

The document was presented byTimo Lunttila from Nokia.

- Proposal #1: The RAN2 working assumption on using RV0 with non-adaptive retransmissions on SPS resources can be confirmed.
- Proposal #2: In the case of UL skipping, UCI consisting of HARQ-ACK, periodic CSI and/or scheduling request indicator is transmitted on PUCCH following the legacy rules for the case when there is no PUSCH transmission.
- Proposal #3: An UL grant triggering Aperiodic CSI transmission is considered as a regular dynamic UL grant. UL skipping does not apply in this case.

Decision: The document is noted.

R1-167506 Discussion on skipping Uplink transmission Ericsson

The document was presented by Daniel Larsson from Ericsson and proposes to:

- Agree to the LS to RAN2 in R1-167505
- Agree to the CR in R1-167507

Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1631
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-167505 [DRAFT] LS on RAN2 agreements on skipping Uplink transmission Ericsson

R1-166665 Discussion of LS from RAN2 on skipping uplink transmission Qualcomm Incorporated
Decision: The document is noted.

Agreements:
- In the case of UL skipping, UCI consisting of HARQ-ACK, periodic CSI and/or scheduling request indicator is transmitted on PUCCH following the legacy rules for the case when there is no PUSCH transmission.
- An UL grant triggering Aperiodic CSI transmission is considered as a regular dynamic UL grant. UL skipping does not apply in this case

Continue discussion until Friday – (Nokia)
Friday:
R1-168527 [DRAFT] Reply LS on RAN2 Agreements on Skipping Uplink Transmission Nokia
Decision: The document is noted and final LS is agreed in R1-168528.

R1-166084 Reply LS on SRS carrier switching interruption time RAN4, Huawei
The document was presented by Weimin Xiao from Huawei.
Decision: The document is noted and acknowledged by RAN1.

V2X
R1-166060 LS to RAN1 on RAN2 agreements related to V2X RAN2, LGE
The document was presented by Hanbyul Seo from LGE and provides RAN2 TP (R2-163650) capturing agreements of RAN2#93bis – already included in the TR 36.885.
Decision: The document is noted.

R1-166062 LS to RAN1 on SPS RAN2, LGE
The document was presented by Hanbyul Seo from LGE and informs RAN1 that for UL SPS, the majority of companies agree that from a RAN2 point of view, it is not necessary to send an indication to the eNB that an SPS grant will not be used. Therefore, the working assumption on "the UE can indicate to the eNB that it does not intend to transmit data before a transmission associated to an SPS configuration" is not needed.
Decision: The document is noted.

R1-166068 Reply LS on EPC procedures for providing eNB with V2X authorization information RAN2, LGE
The document was presented by Hanbyul Seo from LGE and provides answers to SA2.
Discussion: No action to RAN1.
Decision: The document is noted.

R1-166072 LS to RAN1 on agreed TPs RAN2, LGE
The document was presented by Hanbyul Seo from LGE and provides RAN2 TPs (R2-164495, R2-164497, R2-164553) capturing agreements of RAN2#94 – already included in the TR 36.885.
Decision: The document is noted.

V2V
R1-166063 LS on V2V transmission path selection RAN2, Huawei
The document was presented by Philippe Sartori from Huawei and provides the follwing RAN2's agrrements:
- The following configurations are allowed by eNB for transmission of V2V: 1) Uu only, 2) PC5 only and 3) both Uu and PC5 for V2V transmissions in different carriers.
- If both Uu and PC5 are configured for V2V transmissions, it is left up to UE upper layers which path is selected. FFS whether any additional AS information is provide to upper layers.
- The eNB can configure the V2V transmission configuration in SIB and/or dedicated signalling.

Decision: The document is noted.

R1-166082 Reply LS on V2V multicarrier configuration RAN4, LGE, Ericsson
The document was presented by Stefano Sorrentino from Ericsson and shows RAN4 conclusion to scenarios supporting multiple component carrier (MCC) operation for V2V services based on LTE sidelink functionality:
- Analysis and specification of transmission and reception requirements for single component carrier (CC) operation will be completed as a first priority (e.g. for both licensed LTE bands and ITS spectrum at 5.9GHz).
    - The analysis and specification of transmission and reception requirements for MCC V2V operation will be completed in RAN4 as second priority as part of the V2V WI.

Petitioners' Exhibit 1007, p. 1632
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - If the MCC operation for V2V service can't be completed within V2V WI time line, RAN4 suggests to further study in Rel-14 pending agreement in the RAN plenary. Therefore MCC operation for V2V operation will be supported in Rel-14.
- Note that MCC V2V operation will depend on the V2V UE RF architecture and RAN4 needs further time to study support of MCC V2V operation and LTE operation with intra UE capabilities.

Decision: The document is noted.

R1-167878 LS on V2V Authorization RAN3, Huawei

RAN3 believes that the V2V authorization information needs to be provided to the eNB from a trusted node (i.e. the MME or another eNB), and to be extensible in the future (i.e. further considering the possible outcome of the RAN V2X SI). RAN3 has technically endorsed the attached CRs which introduce a *Vehicular Services Authorized* IE.

Discussion: No action to RAN1.
Decision: The document is noted.

Network Assistance for Network Synchronization in LTE

R1-166085 LS on Network Assistance for Network Synchronization in LTE RAN, Huawei

The document was presented by Elean Fan from Huawei and asks RAN1 clarifying the feasibility on standardization of the time-stamps T1 and T2 for received RACH preamble in case of Solution 1 (network based solution reusing the existing signaling during handover).
Decision: The document is noted.

R1-167177 Feasibility on standardization of the time-stamps for received RACH preamble Huawei

- UE transmitting RACH upon handover is an existing procedure in LTE
- To get the time stamps T1 and T2 upon receiving the RACH preamble, no UE changes are required
- To get the time stamps T1 and T2 upon receiving the RACH preamble, no additional physical layer signalling is required

Decision: The document is noted.
R1-166198 Reply LS on Network Assistance for Network Synchronization in LTE Huawei

Agreements:

- UE transmitting RACH upon handover is an existing procedure in LTE
- RAN1 does not need to specify eNB measurements to support this feature (if specified)

R1-167916 Reply LS on Network Assistance for Network Synchronization in LTE RAN1
Decision: The document is agreed.

Mobility enhancements

R1-166074 LS on the evaluation of simultaneous transmission and reception RAN2, ZTE
Decision: The document is noted.

R1-166078 Response LS on the feasibility of mobility enhancement solutions RAN3, ZTE

There is no information exchanged, today, related to timing offset, between source and target eNBs in asynchronous case over any RAN3 interfaces.

Decision: The document is noted.

R1-166080 Reply LS on the feasibility of mobility enhancement solutions RAN4, ZTE
Decision: The document is noted.

R1-167810 Summary of email discussion on replying LS for mobility enhancement solutions ZTE Corporation
Decision: The document is noted.

VoLTE

R1-166075 LS on VoLTE and video quality related enhancements RAN2, Ericsson

The document was presented by Johan Bergman from Ericsson and asks RAN1 to investigate the trade-off between packet delay budget and achievable coverage to assess the benefits of VoLTE/video quality related enhancements, and provide feedback.
Decision: The document is noted.

HSPA (see AI6.3)

R1-166067 LS on RAN2 aspects on MC enhancements RAN2, Huawei
R1-166076 LS on Multi-carrier enhancements RAN3, Huawei

NR

R1-166058 Updated characteristics of terrestrial IMT systems for frequency sharing / interference analysis in the frequency range between 24.25 GHz and 86 GHz ITU-R WP5D

The document was presented by RAN1 Chair en behalf of ITU-R and the following updates from the previous version:

1. Three parameters (access technique, modulation parameters and channel spacing) were removed.

Petitioners' Exhibit 1007, p. 1633
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

2. Two new parameters (Duplex Method and SINR operating range) were added. However, the relevance of Duplex Method parameter for sharing studies is still being considered.

Decision: The document is noted.

R1-167375 [Draft] LS on Parameters for WP5D sharing and compatibility studies NTT DOCOMO, INC.

The document was presented by Kazuaki Takeda from NTT DOCOMO.

Discussion: Qualcomm → 1024QAM should be mentioned – to be considered at the same level as the others
Samsung → concern of introducing 1024QAM (no proposal yet available)

Decision: The document is noted and agreed with updated Note 2 in R1-167917 as follows:

Note 2: There is no agreement in RAN1, but the use of QPSK, 16QAM, 64QAM, 256QAM, and possibly 1024QAM constellations are at least considered, while details, e.g., mapping of bits to constellation points, are under study. Accordingly, SINR operating range includes at least the SINR values for which QPSK, 16QAM, 64QAM, 256QAM, and possibly 1024QAM can be used.

R1-166059 MODELLING AND SIMULATION OF IMT NETWORKS FOR USE IN SHARING AND COMPATIBILITY STUDIES ITU-R WP5D

The document was presented by RAN1 Chair en behalf of ITU-R and describes detailed IMT system parameters needed for modelling, their implementation in the simulations, and the methodology to calculate the aggregate effect of potential interference generated by an IMT system.

Decision: The document is noted.

R1-167882 Proposal for Improved RMa model and upgraded open source channel simulator NYU Wireless

The document shares the results of recent modelling and measurements that will correct errors in the existing 3GPP RMa model as it appears in TR 38.900, and offers recently published results that may help in system and link-level simulations, as well as highlighting the use of these results in an improved version of an open source simulator discussed in a July 2016 IEEE T-MTT paper and in the upcoming October 2016 "All Things Cellular" paper.

Decision: The document is noted.

R1-166064 INCREASING LEVELS OF RF NOISE IN THE ENVIRONMENT AND CONSEQUENT INTERFERENCE TO RADIOCOMMUNICATION SERVICES ITU-R WP 1A

The document was presented by RAN1 Chair en behalf of ITU-R and deals with increasing levels of RF noise radiated or superimposed along the electrical mains supply and the consequent increase in instances of EMI.

Decision: The document is noted.

R1-166077 Reply LS on Formation of IEEE 1914 Next Generation Fronthaul Interface Working Group RAN3, Intel

The document was presented by … from Intel and informs IEEE 1914 that in the context of the NR SI, RAN architecture and functional splits are being studied by RAN3.

Discussion: No action to RAN1.

Decision: The document is noted.

R1-166079 LS on Characteristics of terrestrial IMT systems for frequency sharing/interference analysis in the frequency range between 24.25 GHz and 86 GHz RAN4, Nokia

The document was presented by Tuomo Säynäjäkangas from Nokia.

Discussion: No action to RAN1.

Decision: The document is noted.

R1-167879 Reply LS to ITU-R WP5D/TEMP/39(Rev.2) = RP-160508 on Characteristics of terrestrial IMT systems for frequency sharing/interference analysis in the frequency range between 24.25 GHz and 86 GHz RAN, Nokia

The document was presented by Tuomo Säynäjäkangas from Nokia and confirms the following schedule agreed RAN:

RAN#72 (June 2016): RAN send LS to ITU-R WP5D including time plan and expected future LSs from 3GPP to WP5D
RAN#73 (Sep 2016): RAN send LS to ITU-R WP5D on initial system characteristics based on RAN1&RAN4 input
RAN#74 (Dec 2016): RAN send LS to ITU-R WP5D on final system characteristics based on RAN1&RAN4 input
Note: Dependent on the ITU-R WP5D deadline (which is not yet published in RP-160508), RAN may approve the output by correspondence after the Dec. 2016 meeting.

Decision: The document is noted.

R1-166087 LS on 5G NR study – mMTC use case RAN, MediaTek

The document was presented by … from MediaTek and informs RAN1 that within the scope of the NR Study, NB-IoT and eMTC should be used as the reference benchmark for assessing the performance of new proposals according to mMTC use case.

Decision: The document is noted.

R1-167534 Discussion on benchmark mMTC with NB-IoT/eMTC MediaTek Inc.

- Proposal #1: The new techniques for mMTC should provide significant gain compared with NB-IoT/eMTC.

Petitioners' Exhibit 1007, p. 1634
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal #2: Building penetration loss is added in channel model in system level evaluation for mMTC.
- Proposal #3: Performance in coverage extension (i.e., 154dB, 164dB) should be evaluated and benchmarked with NB-IoT/eMTC. Data rate v.s. MCL curve can be used as a metric.
- Proposal #4: Spectral efficiency in both normal coverage and extended coverage level should both be evaluated and benchmarked with NB-IoT/eMTC. Sum throughput v.s. MCL can be used as a metric.
- Proposal # 5: PAPR and CM of NR for mMTC should not be higher than NB-IoT, especially in extended coverage.
- Proposal #6: The BOM cost of low-end mMTC device in NR needs to be benchmarked with NB-IoT/eMTC.
- Proposal #7: Single solution is strived for all the scenarios (e.g., normal coverage and extended coverage) and operation modes (e.g., standalone and inband deployed with eMBB/ URLLC).

Decision: The document is noted.

R1-166065 **LS on 5G millimeter wave channel simulator** **NYU WIRELESS**
The document was presented by RAN1 Chair en behalf of NYW and shares the results of the recent July 2016 IEEE T-MTT paper, and provides information about a new public resources useful for 5G air interface and system design work.
Decision: The document is noted.

R1-168136 [DRAFT] Reply LS on VoLTE and video quality related enhancements CMCC
Agreed in R1-168256

R1-168295 Draft LS regarding agreements for FeMTC
Agreed in R1-168300

The document was presented by … from … and
Discussion: .
Decision: The document is noted.

6 UTRA

R1-168038 **Chairpersons' summary of the UMTS sessions** **UMTS Session Chairpersons (Huawei, Ericsson)**
The document was presented by Carmela Cozzo from Huawei and Gerardo Medina.
Decision: The document is endorsed and incorporated as follows.

Incoming Liaison Statements related to AI 6.3.
R1-166067 **LS on RAN2 aspects on MC enhancements** **RAN2, Huawei**
Decision: The document (RAN2 agreed TP) is noted.
R1-166076 **LS on Multi-carrier enhancements** **RAN3, Huawei**
Decision: The document (RAN3 agreed TP) is noted.
Both TPs have already been included in TR25.707.

6.1 Maintenance of UTRA Releases 4 – 13

6.1.1 FDD

R1-166495 **Clarifications on UL Discontinuous Transmission with DCH enhancements** **Qualcomm Europe Inc.(France)**
Decision: CR0749 to 25.214 (Rel-12, F) is agreed.
R1-166496 **Clarifications on UL Discontinuous Transmission with DCH enhancements (Rel. 13)** **Qualcomm Europe Inc.(France)**
Decision: CR0750 to 25.214 (Rel-12, A) is agreed.

R1-167681 **Discussion on power scaling for R13 DC HSUPA with CS** **Huawei, HiSilicon**
R1-167711 **25.214 CR (Rel-13, F) Correction of Dual Carrier HSUPA enhancements for UTRAN CS** **Huawei, HiSilicon**
Decision: The document is revised and CR0753r1 to 25.214 (Rel-13, F) is agreed in R1-168031

R1-167709 **25.214 CR (Rel-13, F) Correction of DCH enhancements** **Huawei, HiSilicon**
Discussion: CR category should be A
Decision: The document is noted, revised and CR0751r1 to 25.214 (Rel-13, A) is agreed in R1-168032
R1-167710 **25.214 CR (Rel-12, A) Correction of DCH enhancements** **Huawei, HiSilicon**
Discussion: CR category should be F
Decision: The document is noted, revised and CR0752r1 to 25.214 (Rel-12, F) is agreed in R1-168033

Petitioners' Exhibit 1007, p. 1635
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-167758 **On incorporating the definition of "UL DPCH 20ms Mode" in TS 25.212 Ericsson**
Decision: The documment is noted and CR is not pursued.
R1-167759 **On incorporating the definition of "UL DPCH 20ms Mode" in TS 25.212 Ericsson**
Decision: The documment is noted and CR is not pursued.
R1-167760 **Editorial clarification on the definitions of "UL DPCH 10ms Mode" and "UL DPCH 20ms Mode" of DCH enhancements for UMTS Ericsson**
Decision: CR0754 to 25.214 (Rel-12, D) is agreed.
R1-167761 **Editorial clarification on the definitions of "UL DPCH 10ms Mode" and "UL DPCH 20ms Mode" of DCH enhancements for UMTS Ericsson**
Decision: CR0755 to 25.214 (Rel-13, A) is agreed.

R1-167762 **On incorporating the definition of "UL DPCH 20ms Mode" and adding the TS 25.321 in the list of references of TS 25.211 Ericsson**
Decision: The document is noted, revised and CR0323r1 to 25.211 (Rel-12, D) is agreed in R1-168035 (without the change: addition of the definition)

R1-167763 **On incorporating the definition of "UL DPCH 20ms Mode" and adding the TS 25.321 in the list of references of TS 25.211 Ericsson**
Decision: The document is noted, revised and CR0324r1 to 25.211 (Rel-13, F) is agreed in R1-168036 (without the change: addition of the definition)

6.1.2 TDD

None.

6.2 DTX/DRX enhancements in CELL_FACH - WID in RP-160185

6.2.1 DRX improvements

R1-167682 **Considerations on DRX in CELL_FACH Huawei, HiSilicon**

R1-167764 **On incorporating the DL scheduling notification based on regular HS-SCCH control information to the new power saving mechanism in CELL_FACH Ericsson**

R1-167765 **DL scheduling notification based on regular HS-SCCH control information as part of the new power saving mechanism in CELL_FACH Ericsson**

R1-167813 **Discussions on HS-SCCH DRX in CELL_FACH design Qualcomm Europe Inc.(France)**
R1-167814 **Introduction of HS-SCCH Order for HS-SCCH DRx feature in enhanced Cell Fach Qualcomm Europe Inc.(France)**
R1-167815 **UE Procedures for HS-SCCH DRx feature in enhanced Cell Fach Qualcomm Europe Inc.(France)**

Conclusions for 6.2.1:
RAN1 recommends a Rx Burst duration of 1 subframe or 2 subframes in the HS-DSCH receiving formula specified in TS 25.331 (LS to be sent to RAN2)
R1-168030 **LS on Updates on HS-SCCH DRx Feature in Cell Fach RAN1, Qualcomm**
Decision: The document is noted and LS is agreed.

HS-SCCH order is to be used to signal a UE wake-up trigger.
Email discussion until next plenary submission deadline (Sept 9th on Qualcomm CRs.

6.2.2 DTX improvements

R1-167683 **Considerations and evaluation of DTX in CELL_FACH Huawei, HiSilicon**
R1-167684 **DTX solution in CELL_FACH Huawei, HiSilicon**
R1-167766 **A complementary assessment on the potential gains associated to the introduction of DTX in CELL_FACH Ericsson**
R1-167767 **Technical findings on introducing DTX in CELL_FACH Ericsson**

Conclusions:
Based on R1-167766 findings, the average gains from DTX in cell FACH range from 0.02 to 0.10 (10 resources) and from 0.07 to 0.34dB for the case of 25 common E-DCH resources configured in the cell. The following table summarizes the gains from DTX in CELL_FACH

Petitioners' Exhibit 1007, p. 1636
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Summary of the potential gains that can be obtained by fully applying DTX on the stand alone UL DPCCH in CELL_FACH without severely impacting the cell's capacity

Average Blocking Target 5%	Back-off timer configurations	10 Common E-DCH resources configured in the Cell		25 Common E-DCH resources configured in the Cell	
		Range of the Percentile Gain (90-99% Percentile)	Range of the Average Gain	Range of the Percentile Gain (90-99% Percentile)	Range of the Average Gain
	4TTIs – 24TTIs (8ms-48ms)	0.11508dB – 0.2333 dB	0.0206dB – 0.1028 dB	0.2333dB – 0.6085 dB	0.0745dB – 0.3419dB

6.3 Multi-Carrier enhancements for UMTS - WID in RP-161259.

R1-168089 **LS on Multi-Carrier enhancements**
W.r.t configuring Multi-Carrier enhancements in combination with legacy features, RAN2 would like to understand, in case that primary and secondary uplink frequency is configured with different TTIs, whether it is feasible to configure uplink DTX on either primary frequency or secondary frequency or both.
Decision: The document is noted.

6.3.1 2ms+10ms and 10ms+10ms configurations for (DB)-DC-HSUPA

R1-167685 **Overview of multicarrier enhancements Huawei, HiSilicon**
R1-167686 **Initial considerations on power scaling Huawei, HiSilicon**

Agreement: The legacy power scaling can be reused for DB-DC/DC 10ms+10ms TTI configurations.

R1-167687 **Initial considerations on TTI switching Huawei, HiSilicon**
R1-167768 **TTI Switching for Multicarrier Enhancements in UMTS Ericsson**

Agreement: It is RAN1 opinion that the TTI switching mechanism should be introduced in Multicarrier Enhancements for HSUPA.

R1-168037 **Ls to RAN2/3 on RAN1 progress on MC Enhancements, Huawei**
Decision: The document is noted and the LS is agreed.

6.4 Others

R1-167755 **PRACH optimization for latency reduction during uplink signalling traffic Nokia, Alcatel-Lucent Shanghai Bell**

7 E-UTRA

7.1 Maintenance of E-UTRA Releases 8 – 13

Only essential corrections.
Note that individual companies can submit draft CRs to this agenda item for Rel-13 items.

R1-166190 **Introduction of 1.2Gbps and 1.6Gbps UE categories in Rel-13 Huawei, HiSilicon, SoftBank**
Proposal 1: Introduce DL UE categories 18 and 19 to support DL peak data rate of 1.2Gbps and 1.6Gbps respectively
Proposal 2: Reuse UL cat 3, 5, 7 and 13 for DL cat 18 and 19 as corresponding UL categories
The specification impacts on TS36.212 can be found in a companion contribution [R1-167401].
Decision: The document is noted.
R1-167401 **Introduction of 1.2Gbps and 1.6Gbps UE categories in Rel-13 Huawei, HiSilicon, NTT DOCOMO, SoftBank**
The document was presented by Xia Yuan from Huawei.
Assuming 1.2Gbps and 1.6Gbps UE categories in Rel-13 also support 8*8 MIMO deployment, the CR defines the soft buffer assumption for 8-layer encoding for 1.2Gbps and 1.6Gbps UE categories in Rel-13.
Discussion: . CR not needed if 8*8 MIMO is not supported in the two new UE categories.
If 8*8 MIMO is supported, CR is needed and RAN1 should let RAN knows about it

Petitioners' Exhibit 1007, p. 1637
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted and revised as a draft CR in

R1-168311 Introduction of 1.2Gbps and 1.6Gbps UE categories in Rel-13 Huawei, HiSilicon, NTT DOCOMO, SoftBank

Decision: The document is noted and the draft CR is technically endorsed by RAN1.

R1-168312 [Draft] LS on introducing 1.2Gbps and 1.6Gbps UE categories in Rel-13 Huawei

Decision: The document is noted and final LS is agreed in R1-168377

R1-167398 Correction on storing soft channel bits for different UE categories in Rel-11 Huawei, HiSilicon, NTT DOCOMO, SoftBank

Decision: The document is noted, revised and CR0704r1 (Rel-11, F) is agreed in R1-168313. Also supported by Intel.

R1-167399 Correction on storing soft channel bits for different UE categories in Rel-12 Huawei, HiSilicon, NTT DOCOMO, SoftBank

Decision: The document is revised and CR0705r1 (Rel-12, A) is agreed in R1-168314. Also supported by Intel.

R1-167400 Correction on storing soft channel bits for different UE categories in Rel-13 Huawei, HiSilicon, NTT DOCOMO, SoftBank

Decision: The document is revised and CR0706r1 (Rel-13, A) is agreed in R1-168315. Also supported by Intel.

R1-167902 Introductions of new UE categories Qualcomm Incorporated

R1-168356 Way Forward on introduction of new UL categories Qualcomm

- Choose Alternative 2
  - Send an LS to RAN2 recommending developing the necessary CRs and sending them to RAN #73
- Note: This doesn't mean approving any of these categories – that would be decided at the Plenary

Decision: The document is noted.

R1-168357 [Draft] LS on introduction of new UL categories Qualcomm

R1-168431 Way Forward on introduction of new UL categories Qualcomm

- Choose Alternative 1
- Send two separate LSs to RAN2 recommending developing the necessary CRs and sending them to RAN#73
  - Introducing UL Category 19-20 with *TEI13*

UE UL Category	Maximum number of UL-SCH transport block bits transmitted within a TTI	Maximum number of bits of an UL-SCH transport block transmitted within a TTI	Support for 64QAM in UL	Support for 256QAM in UL
UL Category 19 – Rel-13	226128	75376	Yes	No
UL Category 20 – Rel-13	301504	75376	Yes	No

  - Introducing UL Category 21-22 with *LTE_UL_CAP_enh-Core*

UE UL Category	Maximum number of UL-SCH transport block bits transmitted within a TTI	Maximum number of bits of an UL-SCH transport block transmitted within a TTI	Support for 64QAM in UL	Support for 256QAM in UL
UL Category 21 – Rel-14	316584	105528	Yes	Yes
UL Category 22 – Rel-14	422112	105528	Yes	Yes

- Note: This doesn't mean approving any of these categories – that would be decided at the Plenary

Decision: The document is noted and the WF is agreed. Qualcomm requested to take a note that their preference remains Alt. 2.

R1-168432 [Draft] LS on introduction of new UL categories in Rel-13 Qualcomm

Decision: The document is noted and final LS is agreed in R1-168459.

R1-168433 [Draft] LS on introduction of new UL categories in Rel-14 Qualcomm

Decision: The document is noted and final LS is agreed in R1-168460.

7.1.1 Maintenance of E-UTRA Release 8 – 12

R1-166194 Discussion on the understanding of maximum code rate Huawei, HiSilicon

The document was presented by Xia Yuan from Huawei.

For Rel-12 DL UE categories and onwards, they shall NOT skip decoding a transport block in an initial transmission if the effective channel code rate is lower than or equal to 0.931, no matter whether they have 256QAM capability or not.

Decision: The document is noted.

R1-166229 Clarification on HARQ feedback under TDD-FDD CA in Rel-12 Qualcomm Incorporated

The document was presented by Wanshi Chen from Qualcomm and deals with one particular issue in TDD/FDD CA, where an FDD CC is configured as Pcell and with one of the DL MIMO transmission modes, while one or two TDD CCs are configured as Scell. In a subframe when a Pcell PUCCH or a PUSCH is transmitted and when the corresponding subframe in the TDD Scell(s) is an UL subframe, the following intended behavior is recommended to be confirmed by RAN1:

- If only one single codeword is detected on the FDD Pcell,
  - If PUCCH is transmitted, PUCCH format 1a is used;
  - If PUSCH is transmitted, 2-bit HARQ is assumed.

Petitioners' Exhibit 1007, p. 1638
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion: Intel→ format 1b should be feedback
Decision: The document is noted. Continue offline discussion until Friday (Qualcomm)
Friday
R1-168501 Offline summary on Clarification on HARQ feedback under TDD-FDD CA in Rel-12 (R1-166229) Qualcomm

- The conclusion for the issue discussed in R1-166229 is aligned with RAN1 understanding, with the clarification that "PUCCH format 1a is *effectively* used" for the case of PUCCH format 1b with channel selection, due to the codepoints (ACK, ACK) or (NAK, NAK) for PUCCH format 1b when only one TB is detected for the MIMO Pcell
- No CR is necessary

R1-167432 draft CR on the correction from SC-FDFMA to SC-FDMAPanasonic Corporation
The document was presented by Alex Golitschek from Panasonic.
Decision: The document is noted and agreed as CR0279 to 36.211 in R1-167933.

7.1.2 Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers

R1-166600 Draft 36.213 CR Clarification on HARQ-ACK transmission CATT
The document was presented by Fang Chen Cheng from CATT.
Decision: The document is noted and agreed as CR0719 to 36.213 in R1-167936.

7.1.3 Maintenance of Release 13 licensed-assisted access to unlicensed spectrum

R1-166138 Correction on "special subframe" for frame structure type 3 in 36.213 for Rel-13 LAA Huawei, HiSilicon
The document was presented by Xia Yuan from Huawei.
Decision: The document is noted and agreed as CR0718 to 36.213 in R1-167934.

R1-166813 Correction on CSI reference resource definition in LAA LG Electronics
The document was presented by Joon Kui Ahn from LGE.
Decision: The document is noted. Continue offline discussion until Friday.
Friday: Not pursued.

R1-167180 Correction for energy detection threshold for multi-carrier LBT operation in 36.213 for Rel-13 LAA Huawei, HiSilicon
Decision: The document is not pursued.

R1-167181 Correction for PHICH resource reservation on the LAA cell in 36.211 for Rel-13 LAA Huawei, HiSilicon
The document was presented by Xia Yuan from Huawei.
Decision: The document is noted and agreed as CR0280 to 36.211 in R1-167935.

R1-167402 Correction on the determination of EPDCCH starting position ITRI
The document was presented by Chien-min Lee from ITRI.
Decision: The document is noted. Continue offline discussion until Friday.
Friday: CR0264 to 36.211 is agreed.

R1-167785 Draft CR on LAA post transmission backoff BROADCOM LIMITED
The document was presented by Sindhu Verma from Broadcom.
Decision: The document is noted. Continue offline discussion until Friday.
Friday:
R1-168546 CR on LAA post transmission backoff BROADCOM LIMITED
Decision: The document is noted. Typo in CR number. CR is revised and agreed as CR0741r1 in R1-168555.

7.1.4 Maintenance of Release 13 elevation beamforming/full-dimension MIMO for LTE

R1-166230 Draft CR on FD-MIMO codebooks Qualcomm Incorporated
Decision: The document is noted. Continue offline discussion until Friday – Chao (Qualcomm)
Friday: revised in **R1-167937** and agreed as CR0740 to 36.213 in R1-168544.

R1-166337 Correction on FD-MIMO Codebooks in 36.213 Nokia, Alcatel-Lucent Shanghai Bell, Samsung
The document was presented by Min Zhang from Nokia.
Decision: The document is noted and CR0693 to 36.213 is agreed.
R1-166502 Correction on class B codebook Intel Corporation
Decision: The document is not pursued.

Petitioners' Exhibit 1007, p. 1639
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-166338 Correction on RRC Parameters for SRS Enhancement in 36.213 Nokia, Alcatel-Lucent Shanghai Bell
The document was presented by Min Zhang from Nokia.
Decision: The document is noted and CR0694 to 36.213 is agreed.

R1-166501 Quasi co-location assumptions for DM-RS antenna ports in MU-MIMO Intel Corporation
The document was presented by Alexei Davidov from Intel.
Discussion: .
Decision: The document is noted. Continue offline discussion until Friday.
Friday
R1-168365 Quasi co-location assumptions for DM-RS antenna ports in MU-MIMOIntel Corporation
Decision: The document is not pursued.

R1-166503 Correction on bitwidth of class A codebook Intel Corporation
Decision: The document is noted and CR0213 to 36.212 is agreed in R1-167938.

R1-167168 Corrections on CRI bit width in 36.212 Huawei, HiSilicon
Decision: The document is noted and CR0214 to 36.212 is agreed in R1-167939.

R1-167678 Corrections on Codebooks in 36.213 Huawei, HiSilicon
Decision: The document is noted and CR0710 to 36.213 is agreed.

R1-167404 Correction on the citation of table indexs for mapping of ICRI to MCRIITRI
Decision: The document is noted and CR0708 to 36.213 is agreed.

7.1.5 Maintenance of Release 13 further LTE physical layer enhancements for MTC

R1-168400 Chairman's notes of AI 7.1.5 on Maintenance of Release 13 further LTE physical layer enhancements for MTC Ad-Hoc chair (Qualcomm)
The document was presented by Wanshi Chen from Qualcomm.
Decision: The document is endorsed and content is incorporated as follows.

UL compensation gaps
R1-166655 Considerations on UL compensation gaps Sony

Valid subframes
R1-166237 On valid MBSFN subframes and SIB2 decoding for eMTC Qualcomm Incorporated
R1-166238 Draft LS for valid MBSFN subframes for eMTC Qualcomm Incorporated
Conclusion: Continue offline discussion coming up a suggested text for changing 36.331 (Qualcomm), as part of the LS.
Friday:
R1-167959 Draft LS to RAN2 regarding valid MBSFN subframes for eMTC Qualcomm
Decision: The document is noted. The LS in R1-167959 is endorsed with "MBSFN subframes are given by (2)" changed to "MBSFN subframes are given by (1)". LS is revised and final version is agreed in R1-168425.

R1-167945 Draft CR for MBSFN subframes and SIB2 decoding Qualcomm Incorporated
Decision: The document is noted. The CR is R1-167945 is endorsed, and final CR is agreed as CR0721r2 to 36.213 (Rel-13, F) in R1-168437.

R1-167433 Clarification of valid subframe in eMTC Panasonic Corporation
Decision: The document is noted. The CR in R1-167433 is endorsed with the update non-BL/CE, and final CR is agreed as CR0283 to 36.211 (Rel-13, F) in R1-168234.

R1-167434 Clarification of valid subframe in eMTC Panasonic Corporation
Decision: The document is noted. The CR in R1-167434 is endorsed with potential parameter name update (for offline discussion), and final CR to be prepared in R1-168235
Note: this CR is also to be included part of the offline discussion for the LS to RAN2 to be drafted by Alberto (Qualcomm)
Friday:
R1-168235 Clarification of valid subframe in eMTC Panasonic Corporation
Decision: The document is not presented (different content). Email discussion/approval based on R1-167434 until Sept 1st (Panasonic)

R1-167854 MBSFN subframes are invalid DL BL/CE subframes for BL/CE UE Ericsson
Not pursued.

Petitioners' Exhibit 1007, p. 1640
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

DCI
R1-166236 CR for SRS bit in DCI Qualcomm Incorporated
R1-166622 Presence of SRS bit in DCI 6-0A and 6-1A Sequans Communications
R1-166624 eMTC corrections for RAN1 specifications Sequans Communications (Section 6)
Decision: The CR in R1-166236 is endorsed, and agreed as CR0738 to 36.213 (Rel-13, F) in R1-168535.

R1-167155 On the mapping of TPC command field to power correction values in TS 36.213 Huawei, HiSilicon
Decision: The CR in R1-167155 is endorsed with the following update "0/3/4/6-0A", and agreed as CR0723 to 36.213 (Rel-13, F) in R1-168156.

R1-167737 Draft CR for clarification of DCI sizes for format 6-1A (TM6 and TM9) in TS 36.212 Virtuosys Limited
Decision: Discuss further offline
Friday:
R1-168161 Draft CR for clarification of DCI sizes for format 6-1A (TM6 and TM9) in TS 36.212 Virtuosys Limited
Decision: The CR in R1-168161 is agreed in principle, and final CR is agreed in R1-168452.
Post meeting: MCC noticed that wrong CR number was provided and revised R1-168452 in R1-168212 (CR0216r1 to 36.212)

MPDCCH
R1-167941 Draft CR for clarification on MPDCCH monitoring on SFN rollover and search space overlap Qualcomm Incorporated
Decision: Continue offline discussion, including R1-167862
R1-167862 Overlapping MPDCCH search spaces for BL/CE UE Ericsson
Friday:
R1-168509 Clarification on MPDCCH monitoring on SFN rollover and search space overlap Qualcomm Incorporated
Decision: CR0736 to 36.213 (Rel-13, F) is agreed.

R1-166621 MPDCCH search-space with Temporary C-RNTI Sequans Communications
Decision: CR0259 to 36.211 (Rel-13, F) is agreed.
R1-166624 eMTC corrections for RAN1 specifications Sequans Communications (Section 3)

R1-167154 Correction on MPDCCH in the special subframe for CEModeB in TS 36.211 Huawei, HiSilicon
Decision: The CR in R1-167154 is endorsed in principle (further check offline about 36.213 text). Final CR is agreed as CR0281 to 36.211 in R1-168155.

R1-167184 Correction on the reference of narrowband definition in TS 36.213 Huawei, HiSilicon
Decision: CR0698 to 36.213 (Rel-13, F) is agreed.

R1-167187 Correction on the MPDCCH scheduling Paging in special subframe in TS 36.213 Huawei, HiSilicon
Decision: The CR in R1-167187 is endorsed with the following update (final CR to be prepared in R1-168158)
- For TDD, in special subframes, ~~and~~for MPDCCH in Type-1 ~~-~~common search space

R1-167403 Correction on the determination of DL narrowbands for MPDCCH candidates ITRI
R1-167679 Correction on Type0-common search space monitoring in TS 36.213 Huawei, HiSilicon
R1-167680 Correction on indentation in TS 36.211 Huawei, HiSilicon
Continue discussion offline.
Friday
R1-168158 Correction on the MPDCCH scheduling Paging in special subframe in TS 36.213 Huawei, HiSilicon
Decision: CR0724 to 36.213 (Rel-13, F) is agreed.

PDSCH
R1-166234 CR for PDSCH scrambling for SIQualcomm Incorporated
R1-167186 Correction on the scrambling initialization for SIB1-BR/SI for eMTC in TS 36.213 Huawei, HiSilicon
Decision: The CR in R1-167186 is endorsed in principle (further discuss offline about the wording), and final CR is agreed as CR0700 to 36.213 (Rel-13, F) in R1-168157.

R1-166235 Draft CR for P-RNTI PDSCH hopping Qualcomm Incorporated
R1-167849 Frequency hopping for PDSCH for SI and paging messages for BL/CE UE Ericsson
Decision: The CR in R1-167849 is agreed, along with the CR in R1-166235. Revised CR (using R1-167849) to be revisited in R1-167953
Decision: CR0272 to 36.211 (Rel-13, F) is agreed in R1-167953.

R1-167185 Correction on the relationship between IMCS and ITBS for DCI format 6-1A in TS 36.213 Huawei, HiSilicon
Decision: CR0699 to 36.213 (Rel-13, F) is agreed.

R1-167714 RV version for PDSCH carrying paging Nokia, Alcatel-Lucent Shanghai Bell
Decision: Continue offline discussion
Friday:
R1-168359 RV version for PDSCH carrying paging Nokia, Alcatel-Lucent Shanghai Bell
Decision: The CR in R1-168359 is endorsed. Provide a revision with the change tracking on the cover sheet removed in **R1-168399** agreed as CR0729r1 to 36.213 (Rel-13, F).

R1-167856 PDSCH start subframe in TDD for BL/CE UE Ericsson
Decision: The CR in R1-167856 is endorsed by adding a space in between "DL" and "subframe". Final CR is agreed as CR0714r1 to 36.213 (Rel-13, F) in R1-168462.

DL reference signals
R1-167153 Correction on scrambling sequence initialization for reference signals associated with PDSCH and MPDCCH in TS 36.211 Huawei, HiSilicon
R1-167852 Scrambling of DL DMRS for BL/CE UE Ericsson
Decision: CR0275 to 36.211 (Rel-13, F) is agreed.
R1-167861 Enable cross-subframe channel estimation for BL/CE UE Ericsson
Decision: CR0276 to 36.211 (Rel-13, F) is agreed.

CSI
R1-166240 Draft CR for subband CQI report without hopping Qualcomm Incorporated
Decision: Continue offline discussion
Friday: No progress – continue discussion at next meeting.

R1-166241 Draft CR for subband CQI report and TM6 Qualcomm Incorporated
Decision: The CR in R1-166241 is endorsed, and final CR is agreed as CR0215 to 36.212 (Rel-13, F) in 1-168287.
R1-167857 Repetition with aperiodic CSI for BL/CE UE Ericsson
Decision: Continue offline discussion especially regarding whether or not UCI is transmitted in the same set of subframes for PUSCH transmission. Finally CR0715 to 36.213 (Rel-13, F) is agreed.

PUSCH
R1-166683 Draft CR on RV Cycling for PUSCH Samsung
Decision: Further discussion offline, including PDSCH aspects
The CR in R1-168161 is endorsed with the superscript PUSCH corrected to PDSCH, and final CR is agreed as CR0732 to 36.213 (Rel-13, F) in R1-168450 (NOTE: MCC will take care of removing "DRAFT" on the cover page)

R1-167311 Draft CR for PUSCH rate matching and SRS dropping Qualcomm Incorporated
Decision: Further discussion offline
Conclusion:
- The principle in R1-167311 is aligned with RAN1 understanding. No CR is necessary.

PUCCH
R1-166242 Draft CR for PUCCH transmission and invalid subframes Qualcomm Incorporated
Decision: Further discussion offline. Finally CR is agreed as CR0737 to 36.213 (Rel-13, F) in R1-168521.
R1-166243 Draft CR for aperiodic CSI with repetitions Qualcomm Incorporated
R1-166244 Draft CR for PUCCH resource allocation Qualcomm Incorporated
Decision: The CR in R1-166244 is endorsed, and final CR is agreed as CR0728 to 36.213 (Rel-13, F) in R1-168519.
R1-167858 PUCCH resource start offset in RRC_CONNECTED for BL/CE UE Ericsson
R1-166428 Remaining issues on eMTC CATT (Proposal 2)

IPR2024-01121

Further discussion offline

Further in the week:
R1-168461 WF on PUCCH retuning for BL/CE UE Ericsson
R1-168465 Operation Alternatives for PUCCH Retuning Samsung
R1-168514 WF on PUCCH retuning for BL/CE UE Ericsson, Samsung, NEC, Qualcomm, Virtuosys, Sony, Sierra Wireless, NTT DoCoMo, AT&T, Intel
Also supported by Verizon

Agreements:
- PUCCH retuning gap for BL/CE UEs is created through puncturing
- RAN1 would discuss the possibility to have 1-bit signalling for PUCCH puncturing vs. PUCCH rate matching for PUCCH retuning in Rel-14

The corresponding CR to be drafted for email approval until 9/2 – (Ericsson)

Random access
R1-166232 Draft CR for clarification on PRACH system frame number Qualcomm Incorporated
Decision: Further discussion offline. Finally CR is agreed as CR0285 to 36.211 (Rel-13, F) in R1-168508.
R1-166233 Draft CR for overriding of valid-invalid mask for msg3 Qualcomm Incorporated
R1-166623 Transport block size determination for Msg2 Sequans Communications
Decision: CR0695 to 36.213 (Rel-13, F) is agreed.
R1-167855 Msg2 TBS determination for BL/CE UE Ericsson
R1-166624 eMTC corrections for RAN1 specifications Sequans Communications (Sections 5 and 7)
R1-167157 Correction on the determining PRACH starting subframe in TS 36.211 Huawei, HiSilicon
Decision: Further discussion offline
R1-167718 Overriding of invalid subframe for msg3 PUSCH when R=1 Nokia, Alcatel-Lucent Shanghai Bell
Decision: CR in R1-167718 is endorsed with the following update (final CR to be prepared in R1-168424).
- When ~~value of is~~ the number of Msg3 PUSCH repetitions

Decision: CR0722r1 to 36.213 (Rel-13, F) is agreed in R1-168424.

R1-167853 Default max number of PUSCH repetitions for Msg3 for BL/CE UE Ericsson
Decision: Further discussion offline. Finally CR0711 to 36.213 (Rel-13, F) is agreed.

R1-167940 Correction for UL grant size in RAR Sequans Communications
Late submission
Decision: Further discussion offline.
The CR in R1-167940 is agreed in principle but should be based on 36.213 V13.2.0. Revised and agreed **R1-168513** (CR0720r1 to 36.213).

R1-167909 Frequency hopping interval for MPDCCH during random access for BL/CE UE Ericsson
Late submission
Decision: Further discussion offline. Finally CR0278 to 36.211 (Rel-13, F) is agreed.

Collisions
R1-166619 MPDCCH collision with PSS/SSS Sequans Communications
Conclusion:
- The principle in R1-166619 is aligned with RAN1 understanding. No CR is necessary

R1-166620 MPDCCH mapping over reserved CRS tones in PBCH subframes Sequans Communications
Decision: Further discussion offline.
Conclusion:
- The principle in R1-166620 is aligned with RAN1 understanding. No CR is necessary.

R1-166624 eMTC corrections for RAN1 specifications Sequans Communications (Sections 2 and 4)
R1-166659 Simultaneous transmission & reception in HD-FDD Sony
Conclusion:
- Proposal 1 in R1-166659 is aligned with RAN1 understanding. No CR is necessary.

R1-167156 Clarification on collision between SR and PDSCH with repetitions in TS 36.213 Huawei, HiSilicon
Decision: Further discussion offline.

7.1.6 Maintenance of Release 13 NB-IoT
R1-168401 Chairman's notes of AI 7.1.6 on Maintenance of Release 13 NB-IoT Ad-Hoc chair (Qualcomm)

Petitioners' Exhibit 1007, p. 1643
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The document was presented by Wanshi Chen from Qualcomm.
Decision: The document is endorsed and content is incorporated as follows.

DL Common Channels
R1-166247 Draft CR for N_SF value for SI Qualcomm Incorporated
R1-166197 Corrections on NPDSCH related procedure in TS 36.213 Huawei, HiSilicon
Decision: The CR in R1-166197 is endorsed in principle. Refined text for the last change. Revised and agreed as CR0692r1 to 36.213 (Rel-13, F) in R1-167990.
R1-166642 Missing definition of higher layer parameter eutra-CRS-SequenceInfo NEC
R1-167783 Corrections on Narrowband reference signal (NRS) in TS 36.211 Ericsson
Decision: Agree in principle to capture eutra-CRS-SequenceInfo related information in 36.213. Further discussion offline on the details. To be revisited in final CR in R1-168319 (NEC)
Friday:
R1-168319 Missing definition of higher layer parameter eutra-CRS-SequenceInfo NEC
Decision: Final CR is agreed as CR0730 to 36.213 (Rel-13, F) in R1-168374.

R1-167178 Corrections on the presence of NRS for standalone and guard band operation mode in TS 36.211 Huawei, HiSilicon
Also supported by Qualcomm, Intel
R1-167437 Clarification of NRS assumption Panasonic Corporation
Also supported by ZTE, Ericsson, DCM, Nokia, ASB, Samsung, LGE
Decision: Continue discussion offline
R1-168444 Corrections on the presence of NRS for standalone and guard band operation mode in TS 36.211 Huawei, HiSilicon
Decision: CR0263 to 36.211 (Rel-13, F) is agreed.
R1-168238 Clarification of valid NB-IoT DL subframe configuration Samsung , Panasonic
R1-168516 Clarification of NB-IoT DL subframe configuration Huawei, HiSilicon
Decision: The CR in R1-168516 is endorsed, revised in:
R1-168539 Clarification of NB-IoT DL subframe configuration Huawei, HiSilicon
Decision: CR0739 to 36.213 (Rel-13, F) is agreed.

R1-167166 Correction on NPBCH in TS 36.211 Huawei, HiSilicon
Decision: CR0260 to 36.211 (Rel-13, F) is agreed.
R1-167183 Correction on BCH rate matching in TS 36.212 Huawei, HiSilicon
Decision: CR0211 to 36.212 (Rel-13, F) is agreed.
R1-167174 Correction on NPSS mapping in TS 36.211 Huawei, HiSilicon, Rohde & Schwarz
Decision: Continue discussion offline
Friday:
R1-168293 Correction on NPSS mapping in TS 36.211 Huawei, HiSilicon, Rohde & Schwarz
Decision: CR0262r1 to 36.211 (Rel-13, F) is agreed.

LS received during RAN1#86
R1-168340 LS on applicability of NRSRQ measurement RAN4, Huawei
R1-168296 Correction on NRSRQ applicability Huawei, HiSilicon
Decision: CR0037 to 36.214 (Rel-13, F) is agreed.

Antenna Ports
R1-167435 Correction of NB-IoT antenna port mapping Panasonic, Huawei, HiSilicon, NEC, MediaTek
Decision: The CR in R1-167435 is endorsed in principle. Further re-wording offline. Final CR is agreed as CR0284 to 36.211 (Rel-13, F) in **R1-168236**.
R1-167436 Quasi-colocation of NB-IoT antenna portsPanasonic, Huawei, HiSilicon
Decision: The CR in R1-167436 is endorsed with change from section 16.6 to 16.7. Further re-wording offline. Final CR is agreed as CR0726 to 36.213 (Rel-13, F) in **R1-168237**

Further discussion offline whether antenna port in 36.214 needs to be clarified or not (Panasonic)
Friday:
R1-168199 Correction on NRS port number mappingHuawei, HiSilicon, Panasonic, Samsung
Decision: CR0036 to 36.214 (Rel-13, F) is agreed.

NPDCCH
R1-166184 Correction on NPDCCH related procedure on TS 36.213 Huawei, HiSilicon
Decision: CR0690 to 36.213 (Rel-13, F) is agreed.

Petitioners' Exhibit 1007, p. 1644
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Note: the gap includes the one under the sentence "If NPUSCH UL Gap is inserted at the end of NPUSCH transmission"

R1-166499 **Draft CR on parameters for NPDCCH order** **Qualcomm Incorporated**
Decision: Further discussion offline, including the change from N0 to N1, whether or not N-PDCCH order is used or not, whether or not a mapping table is used, and "repetition level" to "repetition #", whether or not the necessity of last sentence
Decision: No CR is necessary.

R1-167312 Draft CR about Correction on PDCCH order related description ZTE
R1-167176 **On NPDCCH scrambling** **Huawei, HiSilicon**
R1-167179 Corrections on NPDCCH scrambling in TS 36.211 Huawei, HiSilicon
Withdrawn

R1-167419 **Corrections on NPDCCH scrambling in TS 36.211 Huawei, HiSilicon, Intel, Neul, Qualcomm**
Also supported by MTK
Decision: CR0265 to 36.211 (Rel-13, F) is agreed.
R1-167188 **Corrections on NPDCCH search space for random access in connected mode in TS 36.213 Huawei, HiSilicon**
Decision: CR0701 to 36.213 (Rel-13, F) is agreed.

NPDSCH
R1-167313 Draft CR on clarification of scheduling delay ZTE
Decision: The CR of the first change of 16.3.3 in R1-167313 is endorsed. Final CR is agreed as CR0734 to 36.213 (Rel-13, F) in R1-168496.
R1-167782 Corrections on DL Gap on NPDSCH TS 36.211 Ericsson
Decision: Further discussion offline
R1-167438 Clarification of valid NB-IoT DL subframe configuration Panasonic Corporation
Decision: Further discussion offline

PUSCH
R1-166180 **Correction on DMRS for NB-IoT in TS 36.211** **Huawei, HiSilicon**
R1-167314 **Draft CR on clarification of DM RS** **ZTE**
Decision: Further discussion offline on R1-166180 and R1-167314.
CR0253 to 36.211 (Rel-13, F) is agreed in R1-166180.

R1-166182 **Correction on SC-FDMA signal generation for NB-IoT in TS 36.211** **Huawei, HiSilicon**
Decision: CR0255 to 36.211 (Rel-13, F) is agreed.
R1-166641 Correction to SC-FDMA baseband signal generation for NB-IoT NEC
R1-166245 **Draft CR for PUSCH timing delay for NB-IoT** **Qualcomm Incorporated**
Decision: Further discussion offline.
The CR in R1-166245 is endorsed. Final CR is agreed as CR0731 to 36.213 (Rel-13, F) in R1-168375.

R1-167172 **Correction on NPUSCH related procedure on TS 36.213** **Huawei, HiSilicon**
Decision: CR0696 to 36.213 (Rel-13, F) is agreed.
R1-167316 **Remaining issue on collision of NPUSCH and NPRACH** **ZTE**
R1-167173 **Correction on UL collisions in TS 36.211** **Huawei, HiSilicon**
Decision: The CR in R1-167173 is endorsed in principle. Offline discussion on refined wording (including whether possible LS to RAN2 and RAN4). Revised and agreed as CR0261r1 to 36.211 (Rel-13, F) in **R1-167991**.

NPRACH
R1-166181 **Correction on NPRACH in TS 36.211** **Huawei, HiSilicon**
Decision: Revised and agreed as CR0254r1 to 36.211 (Rel-13, F) in R1-168364.
R1-166248 **Draft CR for NPRACH generation** **Qualcomm Incorporated**
R1-167315 **Draft CR on clarification of random access signal generation** **ZTE**
R1-167838 **Corrections on NPRACH generation TS 36.211** **Ericsson**
Decision: Offline discussion for the above 4 CRs. To have a single final CR to be revisited in R1-168364.

R1-166183 **Correction on random access procedure for NB-IoT on TS 36.213** **Huawei, HiSilicon**
Decision: The CR in R1-166183 regarding section 16.3.2 is endorsed. Final CR is agreed as CR0689r1 to 36.213 (Rel-13, F) in R1-167989.

R1-168172 **Introduction of a reserved range of NPRACH sub-carriers for contention based access, Ericsson, ZTE, Qualcomm**

Petitioners' Exhibit 1007, p. 1645
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The CR in R1-168172 is endorsed in principle, conditional on RAN2 approval of 36331CR2334. Remove the comment, and showing change tracking for deletion and insertion of equation. Final CR is agreed as CR0282r1 to 36.211 (Rel-13, F) in R1-168495.

Other UL

R1-166246 Capability for NB-IoT uplink gaps Qualcomm Incorporated
Decision: Further discussion offline

R1-167317 Remaining power control issue on multiple NB-IoT carriers operation ZTE
Decision: Further discussion offline

R1-168284 WF on signaling of nrs-Power of non-anchor carrier ZTE, Qualcomm,Panasonic
Agreement:

- nrs-Power offset of non-anchor PRB relative to nrs-Power of anchor PRB should be included in RRC signaling.
- Send LS to RAN2 – R1-168474
  - {-12, -10, -8, -6, -4,-2, ~~-1~~, 0, 3}

R1-168474 LS on nrs-Power signaling for NB-IoT non-anchor carrier ZTE
Decision: The document is noted and final LS is agreed in R1-168497 including the above update.

RRC Parameters

R1-166195 Corrections to RRC parameter names for NB-IoT in TS 36.211 Huawei, HiSilicon
Decision: CR0256 to 36.211 (Rel-13, F) is agreed.

R1-166196 Corrections to RRC parameter names for NB-IoT in TS 36.213 Huawei, HiSilicon
Decision: CR0691 to 36.213 (Rel-13, F) is agreed.

R1-167911 Phase difference between NRS and CRS Qualcomm Incorporated
Late submission
Decision: Further discussion offline

R1-168358 Phase difference between NRS and CRS Qualcomm Incorporated
Decision: The draft CR in R1-168358 is endorsed in principle, adding a note about overlap with LTE baseband signal generation sections. Final CR is agreed as CR0735 to 36.213 (Rel-13, F) in R1-168507.
Note: this CR is not intended to change legacy LTE signal generation.

7.2 LTE Release 14

7.2.1 Enhanced Licensed-Assisted Access to Unlicensed Spectrum WID in RP-160881.

R1-168402 Chairman's notes of AI 7.2.1 on Enhanced Licensed-Assisted Access to Unlicensed Spectrum Ad-Hoc chair (Nokia, Ericsson)

Contents incorporated below

Editors will provide updated draft CRs including the agreements and WA until 6th Sep., and email approval until 12th Sep.
Rapporteur will provide agreement lists until 29th August.

R1-166224 Introduction of eLAA into 36.212 HuaWei Technologies Co., Ltd
R1-167551 Introduction of eLAA Ericsson

7.2.1.1 PUSCH design

Remaining details including PUSCH structure, resource allocation and scheduling aspects

R1-166123 PUSCH resource allocation Huawei, HiSilicon
R1-167776 Resource Allocation with Minimal Predefined Patterns for eLAA PUSCH KT Corp.
R1-166249 Remaining details of PUSCH waveform Qualcomm Incorporated

R1-167133 Special handling of MCS/TBS for normal PUSCH and the PUSCH containing UCI/SRS/blanking symbol(s) Huawei, HiSilicon
R1-167182 Remaining issues on scheduling design for eLAA Huawei, HiSilicon
R1-167190 Discussion on synchronous and asynchronous HARQ method for eLAA Huawei, HiSilicon
R1-167343 Remaining details on PUSCH resource allocation and scheduling design for eLAA NTT DOCOMO, INC.
R1-167420 MCS, TBS and TPMI Determination in Single and Multi-Subframe Grants Panasonic
R1-167421 Codeword Disabling for eLAA Uplink MIMO Panasonic
R1-167605 Remaining details on DCI design for multiple-subframe scheduling for LAA UL SHARP Corporation, MTI
R1-167606 Remaining details on PUSCH structure for LAA UL SHARP Corporation
R1-167719 On PUSCH Structure for Transmission within First DFTS-OFDM Symbol Ericsson
R1-167720 On Resource Allocation Aspects for eLAA Ericsson
R1-167721 On Remaining details of Scheduling Aspects for eLAA Ericsson
R1-167734 Indication of starting symbol for multi-subframe scheduling ETRI
R1-167776 Resource Allocation with Minimal Predefined Patterns for eLAA PUSCH KT Corp.

Agreement:
For enabling the start times within the first DFTS-OFDM symbol, a longer cyclic prefix for the next DFTS-OFDM symbol to occupy part of the first DFTS-OFDM symbol is used

Agreement:
- RA field in DCI 0A/4A/0B/4B is 6 bits
- The 64 code points indicated by the 6 bits include the legacy RIV for contiguous interlace allocation except the code points for the allocation of 7 contiguous interlaces (70 PRBs)
  - This set of code points has 51 values
- Additional code points are defined for allocation of interlaces as follows:
  - 0,1,5,6
  - 2,3,4,7,8,9
  - 0, 5
  - 1, 6
  - 2, 7
  - 3, 8
  - 4, 9
  - 1, 2, 3, 4, 6, 7, 8, 9
  - Remaining code points are reserved

Agreement:
One of four starting symbol positions can be signaled for the first subframe in DCI formats 0A/4A/0B/4B

Agreement:
LBT type is not explicitly signaled to the UE for SRS without PUSCH.

Agreement:
- MCS 0-28 indicated to the UE in DCI formats 0A/4A/0B/4B are interpreted according to the uplink MCS table for modulation and TBS
- RV is explicitly signaled for all MCSs.

Petitioners' Exhibit 1007, p. 1647
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreement:
- TB disabling is indicated if MCS 29 is indicated for the corresponding TB in DCI formats 4A/4B.
  - The disabling applies for all scheduled subframes for DCI format 4B

Agreement:
- An aperiodic CSI report without UL-SCH is triggered when the UE receives DCI formats 0A/0B with MCS 29 and an aperiodic CSI trigger
- An aperiodic CSI report without UL-SCH is triggered when the UE receives DCI formats 4A/4B with MCS 29 for both TBs and an aperiodic CSI trigger
- UE is not expected to receive an aperiodic CSI only request if more than one subframe is scheduled with DCI formats 0B/4B

Agreement:
- 4 bits for timing offset are included in DCI format 0A/4A
  - Note: This is already agreed for DCI format 0B/4B
- DCI format 0A/4A includes 4 bits indicating HARQ process ID
  - Note: This is already agreed for DCI format 0B/4B
- DCI format 0A includes 2 bits RV indicating RV=0, 1, 2, or 3
- DCI format 4A includes 2 bits RV indicating RV=0, 1, 2 or 3 which is common to both TBs

Agreement:
- For each DCI format 0B, 4A and 4B the following BD adjustment is applied
  - (0, 33, 66, 100)% for 1st and 2nd AL and (0, 50, 100, 150)% for 3rd to 5th AL

Agreement:
If not otherwise indicated by the RRC parameter supportedBlindDecoding-r13, the eNB can assume the total number of supported blind decodes to be #CCs_supported*32+#CCs_UL_TM2_supported*16 USS BDs

- SRS triggering offset in format 0B/4B (Klaus)

R1-168028 WF on SRS triggering with DCI Format 4B Nokia, ASB

Agreement:
- For SRS triggered with DCI format 4B, the SRS subframe location is determined relative/as an offset n to the first subframe of the multi-subframe scheduling burst according to

  $n = mod(x, N)$

  where x is the value of the SRS subframe indication in the SRS parameter set configuration ($x \in \{0,1,2,3\}$) and N is the number of scheduled UL subframes.

Agreement:
Precoder indicator field in DCI format 4B applies to all the subframes in the DCI
  - Mapping to number of layers and TPMI is the same as DCI format 4

A single DMRS and OCC field is signaled for all subframes indicated in DCI formats 0B/4B
- The parameter n^(2)_DMRS,Lambda applies to all indicated subframes

Agreement:
The UE is not expected to start a new transmission subject to LBT earlier than 1 DFTS-OFDM symbol after the end of the previous transmission by the UE

Agreements:
- C-PDCCH indicates a pair of values (UL burst duration, offset)
  - UL burst duration is the number of consecutive UL subframes belonging to the same channel occupancy, with the DL subframes in the same channel occupancy signaling the UL burst duration.
  - Offset is the number of subframes to the start of indicated UL burst from the start of the subframe carrying the C-PDCCH.
  - The LBT procedure for any UL subframe from the subframe in which C-PDCCH was received upto and including all subframes until the end of the signaled UL burst duration, for which the eNB had already indicated to perform Category 4 LBT, can be switched to an LBT based on 25 us CCA.
    - The UE shall not switch to 25 us CCA if only part of a set of contiguously scheduled subframes without gap appears in the UL burst indication
  - The UE is not required to receive any DL signals/channels in a subframe indicated to be a UL subframe on the carrier

Petitioners' Exhibit 1007, p. 1648
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- 5 bits to indicate combinations of offset and burst duration.
  - The code points include {offset, duration} combinations as follows
    - All combinations of {{1, 2, 3, 4, 6}, {1, 2, 3, 4, 5, 6}}
    - Reserved
    - No signaling of burst and offset

Agreements:

- DCI 0A/4A/0B/4B includes a single bit to indicate whether the UL grant is a triggered grant or not.
- If it is a triggered grant, the UE may transmit after receiving a 1 bit trigger in the PDCCH DCI scrambled with CC-RNTI in a subframe received after the subframe carrying the UL grant
- The timing between the 2nd trigger transmitted in subframe N and the earliest UL transmission is a UE capability, if the earliest UL transmission is before subframe N+4 (UE capability signaling between transmission in subframe N+1 and N+2 and N+3)
- The 4 bit field 'SF timing' in DCI format 0A/4A/0B/4B for the triggered grant is reused as follows:
  - When the UE may transmit after reception of the trigger is signaled to the UE 2 bits are reused to indicate X:
    - Having received a trigger in subframe N, the UE is allowed to start transmission in subframe N+X+Y
      - X={0,1,2,3} indicated reusing two bits in the DCI
      - Y is given by the UL burst offset in the C-PDCCH DCI scrambled by CC-RNTI in the same subframe where the trigger is transmitted
  - The UE receives signaling in the first DCI 0A/4A/0B/4B grant indicating the number of subframes after which the grant becomes invalid reusing 2bits. The initial grant becomes invalid if M ms after the initial grant, no valid trigger has been received.
    - 2 bit: M={8,12,16,20}
- UE follows the LBT type indicated by the UL grant

Agreements:

- When CSI report is triggered using DCI 0A/4A/0B/4B, the reference subframe is the last valid subframe with reference to the subframe in which the CSI report is transmitted
- Note: This may not need any specification change

Agreements:

- DCI formats 0A and 1A which are transmitted in the same serving cell and that schedule the same serving cell shall have the same sizes. Bit padding is used to achieve this.

7.2.1.2 SRS design

Remaining details including whether SRS is transmitted for small gaps between SRS and following PUSCH

R1-166136	Remaining issues on LBT for SRS for eLAA	Huawei, HiSilicon
R1-166254	SRS procedures for eLAA	Qualcomm Incorporated
R1-166663	LBT parameters for SRS in eLAA	Sony
R1-166687	Remaining issues of SRS transmission followed by PUSCH	Samsung
R1-166816	Consideration on SRS and following PUSCH	LG Electronics
R1-166988	Remaining details of SRS design for eLAA	ZTE
R1-167625	On the Subframe Indication in SRS Triggering in eLAA	Nokia, Alcatel-Lucent Shanghai Bell
R1-167722	On the Minimum Gap between SRS and PUSCH Transmissions	Ericsson

Agreement (Update of previous agreements: (RAN1#85 Email discussion [85-05-04]))

- If the triggering for SRS without PUSCH is received in a DL assignment in subframe n, the UE should send SRS without PUSCH in subframe n+k (not considering the LBT failure).
  - The SRS transmission is not limited to DL ending partial subframe
- k is indicated by 3 bits in DL grant. "000" represents no triggering for SRS without PUSCH; "001"~"111" represents SRS without PUSCH is transmitted in subframe n+4~n+10 respectively.

7.2.1.3 Channel access framework

Remaining details including LBT options for SRS not immediately followed by PUSCH, contention window size adjustment for UL Category 4 LBT, continuing transmission of continuously scheduled subframes, energy detection threshold, LBT related signaling aspects and revised and 2-stage grants.

R1-168078 WF on multi-carrier UL LBT operation Huawei, HiSilicon

Agreement:

- A UE that has received UL grants on a set of carriers scheduled with Cat. 4 LBT with the same starting point in the subframe on all carriers can switch to a 25 us LBT immediately before transmission on a carrier in the set if Cat. 4 LBT has successfully completed on a designated carrier in the set.
  - The UE must select one carrier uniformly randomly among the carriers which were scheduled with Cat. 4 LBT as the designated carrier prior to starting the Cat. 4 LBT procedure on any of the carriers in the set.
- Note: if operating in the 5GHz band, refer to the ETSI regulations w.r.t. choosing the set of carriers.

Agreements:

- When the UE is scheduled two sets of UL subframes with Cat. 4 LBT, with two different UL grants and the Cat. 4 LBT does not complete for transmission of any of the subframes in the first set of UL subframes, then the Category 4 LBT for the second set of UL subframes is performed as follows
  - If the LBT priority class of the second set of UL subframes is the same as the first set of UL subframes, the UE may continue the Cat. 4 LBT for the first set of subframes for transmission of the second set of UL subframes
  - If the LBT priority class of the second set of UL subframes is different from the first set of UL subframes
    - If the LBT priority class of the second set of UL subframes(e.g. Class 1) is higher than the priority class of the first set of UL subframes (e.g., Class 3), the UE may terminate the previous Cat. 4 LBT and start a new Cat. 4 LBT
    - If the LBT priority class of the second set of UL subframes (e.g., Class 3) is lower than the priority class of the first set of UL subframes (e.g., Class 1), the UE shall terminate the previous Cat. 4 LBT and start a new Cat. 4 LBT

Petitioners' Exhibit 1007, p. 1650
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Note: If the UE continues Cat. 4 LBT, it shall use all the Cat. 4 LBT parameters that were used for the first set of subframes

R1-168165 WF on UE PSD restriction in eLAA

R1-168181

Agreement:
- For LBT for SRS not transmitted contiguously with PUSCH, a Cat. 4 LBT with priority class 1 is used.
- SRS transmissions do not contribute to the contention window update.

Agreement (Update of previous agreement)
- ~~FFS:~~ For a set of consecutive scheduled subframes without any gaps that are subject to LBT, after the first successful LBT in that set, the UE continues transmission for all the remaining subframes in the set.
  - FFS: Early termination of the channel occupancy

Agreement:
For category 4 LBT for PUSCH transmission on LAA SCell, the CWS is adjusted per UE and at UE based on the following procedures at UE and eNB:
- If the UE fails to transmit all of the scheduled contiguous subframes with a category 4 LBT, UE may keep the contention window size unchanged for all the LBT priority classes.
- The first subframe with UL-SCH that was transmitted at least 4 ms prior to the UL grant reception in the most recent transmitted burst of contiguous subframes that is transmitted after performing a category 4 LBT procedure is defined as the reference subframe. The HARQ ID of the reference subframe is HARQ_ID_ref.
- Based on the UL grant content
  - if the NDI bit for at least one of the active HARQ processes (i.e. TB not disabled) of HARQ_ID_ref in the reference subframe is toggled, the contention window size at the UE is reset for all the priority classes.
  - Otherwise (i.e. HARQ_ID_ref not scheduled or NDI of the active HARQ process(es) of HARQ_ID_ref not toggled) the contention window size of all priority classes at the UE is increased to the next higher value.
- The CWS is reset to the minimum value if the maximum CWS is used for K consecutive LBT attempts for transmission only for the priority class for which maximum CWS is used for K consecutive LBT attempts.
  - K is selected by UE implementation from the set of values from (1, …,8).

Agreement:
- The maximum energy detection threshold requirement for a UE is aligned with the requirement for an eNB as specified in Rel-13
- The eNB can signal a RRC parameter to the UE so that the UE can derive a maximum energy detection threshold value.
  - If no RRC signalling is received, the UE uses a default maximum energy detection threshold value, X_Thresh_Max, as defined in Rel-13, using Pc_max_H,c for P_TX in the calculation of X_Thresh_Max

Agreement:
- RRC signaling has the ability to indicate to a UE either an absolute maximum energy detection threshold value or an offset to the default maximum energy detection threshold value
- Absolute maximum energy detection threshold values are indicated in the range of -85 dBm to -52 dBm in steps of 1 dB.
- Offset to the default maximum energy detection threshold value are indicated in the range of -13 dB to +20 dB in steps of 1 dB.
- Note: Ability to signal a certain maximum energy detection threshold does not indicate feasibility of operating at that threshold value.

R1-168345 [Draft]LS on further RRC Parameters for Enhanced LAA for LTE,
Agreed in R1-168346

Agreement:
The UE is not required to consider LBT success or failure on the set of carriers on which transmission is attempted in order to apply power scaling rules for that set of carriers

Petitioners' Exhibit 1007, p. 1651
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreement:
If the UE starts a contiguous transmission spanning a set of subframes on an LAA SCell, and the UE suspends transmission prior to the last scheduled subframe in the transmission, then the UE may resume transmission on the remaining subframes in the transmission immediately after performing an LBT of duration 25 microseconds if the channel was observed to be continuously idle since the transmission was suspended. If the channel was not observed to be continuously idle, then the UE may resume transmission after performing a successful Cat. 4 LBT with LBT parameters according to the indicated LBT priority class in the UL grant that scheduled the subframe in the transmission.

Agreement:
The UE may expect an LBT priority class field in a UL grant regardless of the LBT type indicated to the UE in the UL grant. If 25 us LBT is indicated as the LBT type, then the LBT priority class is the one used by the eNB to obtain access to the channel. If Cat. 4 LBT is indicated as the LBT type, then the LBT priority is the one that is to be used by the UE to perform its Cat. 4 LBT.

Agreement:
If the eNB schedules UL transport blocks with 25 us LBT in a shared channel occupancy without scheduling any DL transport blocks and if less than 10% of the scheduled UL transport blocks have been received successfully, the eNB increases its contention window size, otherwise the eNB resets its contention window.

Agreement:
- An eNB starting the DL transmission based on Type B multi-carrier LBT acquiring a given MCOT, can share its channel occupancy with its UEs on each of the carriers completing 25us LBT in the DL, if the UL transmission follows the previous subframes (DL transmission or UL transmission from other UEs on the same carrier) with a gap of not more than 25us and a successful 25us UL LBT is performed by the UE within the gap

R1-167552 Introduction of V2V support Ericsson

R1-168458 36.201CR0016 Introduction of V2V into 36.201 Nokia
Modify section 4.2.1 as follows:
Sidelink transmissions are defined for ProSe Direct Discovery and ProSe Direct Communication between UEs. The sidelink transmissions use the same frame structure as uplink and downlink when the UEs are in network coverage; however, the sidelink transmissions are restricted to a sub-set of the uplink resources. V2X communication between UEs is supported via sidelink transmissions or via the eNB.
Revision in R1-168201.

R1-168100 Summary of Monday V2V offline discussions LG Electronics

R1-168126 Response LS to Priority for V2V RAN WG2

R1-168245 Draft LS on RAN1 agreements in sidelink-based V2V LG Electronics [RAN WG1]

Petitioners' Exhibit 1007, p. 1652
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Updated in R1-168249. **Approved in R1-168251** with the following change:

- At least when SA and data are transmitted in the same subframe, SA resource should be reselected only when the associated data resource is reselected

R1-168246 Draft LS on L1 parameters for sidelink-based V2V LG Electronics, [RAN WG1]
Approved in R1-168252 with the following change:

- Add the probability p used in Step 3 with the value range [0, 0.2, 0.4, 0.6, 0.8].
- Capture the following in the comments of "Minimum of PSSCH MCS" and "Maximum of PSSCH MCS":
  - Note that the current RAN1 specification does not support 64 QAM in sidelink.
- **Overall Description:**

RAN1 agreed on L1 parameters for LTE_SL_V2V-Core. RAN1 would like to inform RAN2 that the list of agreed L1 parameters is in the attached spreadsheet. Changes to the content of R1-165968 are marked in yellow. RAN1 would like to observe that congestion control and synchronization will be discussed and the outcome may have RRC impact.

Agreement:

Petitioners' Exhibit 1007, p. 1654
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Step 2: UE excludes resources at least based on SA decoding and additional conditions.
  - When SA and its associated data are transmitted in same subframe, option 2-1 (measure on DMRS of PSSCH) is supported
    - Option 2-1: A resource is excluded if it is indicated or reserved by a decoded SA and PSSCH RSRP in the associated data resource is above a threshold.
      - PSSCH Reference Signal Received Power (PSSCH-RSRP) is defined as the linear average over the power contributions (in [W]) of the resource elements that carry demodulation reference signals associated with PSSCH, within PRBs indicated by the associated PSCCH.
      - The reference point for the PSSCH-RSRP shall be the antenna connector of the UE.
      - If receiver diversity is in use by the UE, the reported value shall not be lower than the corresponding PSSCH-RSRP of any of the individual diversity branches.
  - The threshold is a (pre)configurable function of the priority information.
    - SA contains the 3-bit PPPP field.
    - The threshold is in a range between [-128 dBm] and [0 dBm] with the granularity of [2] dB including minus infinity and plus infinity.
      - Email discussion until 2nd Sept. on the numbers in the brackets – Philippe (Huawei)
    - The threshold is dependent of both the priority information of the TB to be transmitted and the priority information of the decoded SA.
      - 64 thresholds are (pre)configured in total.
  - In Step 2, a UE that decodes an SA in TTI m + c within the sensing period assumes that the same frequency resource is reserved by the SA transmitter UE at TTI m + d +P*i.
    - P is a parameter fixed to 100 in Rel-14. Possible configurability of this parameter in future releases should be considered in the CR.
    - i is selected in the range [0, 1, …, 10] which will be restricted by carrier-specific network configuration or preconfiguration. i=0 means "no intention to reserve the frequency resource."
      - RAN1 assumes the full flexibility in signaling this restriction, e.g., 10-bit bitmap is signaled in this (pre)configuration to indicate each of [1, …, 10] is allowed or not.
      - Selection of i is up to UE implementation. RAN1 assumes that UE performs no transmission or no resource reservation if it has no data. FFS in RAN2 how to ensure this RAN1 assumption.
    - i is signalled in the SA using a 4-bit field.
  - In Step 2, if an instance of a candidate semi-persistent resource X with the period of P*I collides with a next instance of the resource Y, which is reserved by another UE's SA and meets the condition of exclusion in the agreed threshold-test, then the UE shall exclude resource X.
    - I is the value to be signaled for i in its SA.
  - If the number of remaining resource after Step 2 is smaller than [20]% of the total resources within the selection window, the UE repeats Step 2 using all the thresholds increased by [3] dB until the number of remaining resource after Step 2 is larger than [20]% of the total resources.
    - Each resource in this counting corresponds to the desired resource allocation.
    - Other mechanisms related to the congestion control will be discussed in the V2X WI if time is not allowed in the V2V WI.
    - Companies are encouraged to check what the proper number above is. The number can be revisited during the CR phase.
- In Step 3,
  - The measurement periodicity of PSSCH resource is P in this step.
    - The measurement is restricted to the resources remaining after Step 2.

Consideration of the following are moved to the V2X work item:

- Case of SA and its associated data being transmitted in different subframes

Agreement:

- "The total resources within the selection window" above means the total resources in the interval determined in Step 1 to identify the resources the UE must take into account as possible candidates resources.

Agreement:

- In Step 3,
  - Step 3-0: When the counter reaches zero,
    - With probability p, the UE keeps the current resource and the counter is reset.
    - With probability 1-p, resource is reselected by Step 3-1 and 3-2.
    - Carrier-specific parameter p is (pre)configured in the range [0, 0.2, 0.4, 0.6, 0.8].
  - Step 3-1: UE measures and ranks the remaining PSSCH resources based on total received energy and selects a subset
    - The subset is the set of candidate resources with the lowest total received energy. The size of the subset is [20]% of the total resources within the selection window.
      - Note that the size of this subset is equal to the minimum possible size of the outcome of Step 2.

Petitioners' Exhibit 1007, p. 1655
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Step 3-2: UE randomly selects one resource from the subset
- When a TB is transmitted in one subframe, when a UE tries to select M sub-channels in one subframe in Step 3, a resource can be any M contiguous sub-channels not excluded in Step 2.
- Energy measurement of each resource is the average of the energy measured in each constituent sub-channel.

Email discussion until 2nd September on the definition of the energy measurement in each sub-channel - Hanbyul (LGE).

[20%] value to be checked until RAN1#86bis.

Agreement:
- When a TB is transmitted in two subframes, at least the following resource selection is supported:
  - One resource is selected using the mechanism defined for the case where a TB is transmitted in one subframe.
  - Selection of another resource is random under the condition that
    - The selected resource shall be in the remaining subset of the outcome of step 3, and
    - The selected resource shall not be in the same subframe as the first resource, and
    - The SCI shall be able to indicate the time gap between the two selected resources.
  - If no resource can meet the condition for the second resource selection, a TB is transmitted only using the first resource.

Any other resource selection methods can be considered in the V2X work item, taking into account progress in ETSI, e.g. the following:
-The resource allocation follows the resource allocation when a TB is transmitted in a single subframe, but the resource is defined as a set of subchannels in two consecutive subframes.

SA resource selection

R1-166826 Resource selection details for UE autonomous resource selection mode in PC5-based V2V LG Electronics
Section 2.2

R1-167834 V2V SA Resource selection PANASONIC R&D Center Germany

R1-167923 WF on SA and data association Huawei, HiSilicon, LGE, Ericsson, Qualcomm
Also supported by Panasonic

Agreement:
- A UE cannot transmit TB without SA, i.e., SA is transmitted with each (re)transmission of a TB.

Agreement:
- At least when a pool is (pre)configured such that a UE always transmits SA and data in the same subframe, UE is not expected to combine PSCCH transmitted in different subframes.

Agreement:
- When a pool is (pre)configured such that a UE always transmits SA and data in adjacent RBs in the same subframe,
  - The sub-channel with the lowest index among those selected for data transmission is used for SA transmission.
- When a pool is (pre)configured such that a UE can transmit SA and data in non-adjacent RBs in the same subframe,
  - The number of SA candidate resources in a SA pool is the same as the number of sub-channels in the associated data pool.
    - Sequential one-to-one association is made between an SA candidate resource and a sub-channel in the associated data pool.
  - The SA resource associated with the lowest index among those selected for data transmission is used for SA transmission.
- PSCCH DM RS CS is blindly detected.
  - Transmitter UE randomly selects one CS out of 4 candidates (details FFS) for every PSCCH transmission.
  - At each SA resource candidate, a UE is not required to decode more than one PSCCH.
    - It is RAN1 understanding that a UE will select the CS with the highest reception power. The related UE requirement is up to RAN4 decision.
- At least when SA and data are transmitted in the same subframe, SA resource should be reselected only when the associated data resource is reselected.

Agreement:

- UE makes resource selection/reselection decision at TTI m (>=n).
  - TTI m when the UE makes resource selection/reselection decision is the arrival time of the corresponding TB.
- For resource reselection, the UE must take into account as possible candidates resources in the interval [m+T1,m+T2] in Step 1.
  - T1 <= [4] where T1 is up to UE implementation.
  - 20 <= T2 <=100 where T2 is up to UE implementation.
    - Selection of T2 shall fulfill the latency requirement.
- Sensing window is changed to [m-a, m-b), where a=b+1000 and b=1.
- Note: If there is any inconsistency between the above proposal and the existing agreement, the above proposal overrides.
- If a problem is found, e.g., in designing the time resource indication in SCI, this agreement may be revisited.

R1-167695 On PSCCH and PSSCH retransmission and combining options Intel Corporation

R1-168101 WF on resource pool configuration LG Electronics

Agreement:

- Case 1: When a pool is (pre)configured such that a UE always transmits SA and data in adjacent RBs in the same subframe,
  - The resource pool consists of one or multiple sub-channels in frequency domain.
    - A sub-channel consists of a group of contiguous RBs in a same subframe.
    - The sub-channel size in a resource pool can be configured by eNB or preconfigured.
      - Candidate size of a sub-channel is {5, 6, 10, 15, 20, 25, 50, 75, 100}
    - Each sub-channel includes one SA resource candidate at the low end of the sub-channel from system perspective.
      - The SA resource candidate can be used for data transmissions.
    - Resource pool configuration includes the number of sub-channels in the pool.
    - Different sub-channels have disjoint group of adjacent RBs.
- Case 2: When a pool is (pre)configured such that a UE transmits SA and data potentially in non-adjacent RBs in the same subframe,
  - The PSSCH resource pool consists of one or multiple sub-channels in frequency domain.
    - A sub-channel consists of a group of contiguous RBs in a same subframe.
    - The sub-channel size in a resource pool can be configured by eNB or preconfigured.
      - Candidate size is for email discussion until 2nd September (Hanbyul, LGE).
        - Note that only the RB sizes supported for UE transmission in Rel-13 will be supported in Rel-14 V2V.
        - The maximum number of sub-channels possible in a subframe is 20.
        - The minimum candidate size is not less than 4.
    - PSSCH resource pool configuration includes the number of sub-channels in the pool.
    - Different sub-channels have disjoint group of adjacent RBs.
    - A resource pool consists of N contiguous PRBs in frequency domain.
      - N = The sub-channel size * the number of sub-channels.

Petitioners' Exhibit 1007, p. 1658
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- The PSCCH resource pool consists of a set of contiguous PRBs.
  - The size of a PSCCH resource pool is configurable.
  - Candidates of PSCCH resource are disjoint.
- Energy sensing granularity of PSSCH in Step 3 is the size of sub-channel.
- The UE always (re)selects an integer number of adjacent subchannels for transmission.
- A UE is not expected to try to decode more than [100] RBs in a subframe.
- A UE is not expected to try to decode more than [10] PSCCHs in a subframe.
- SA pool and the associated data pool can overlap. An SA pool and a non- associated data pool can overlap.
  - This overrides the existing agreement including "An RB of an SA pool in a TTI cannot be included an un-associated data pool (if exists)" made in RAN1#84bis.

Agreement:
- When a pool is (pre)configured such that a UE always transmits SA and data in adjacent RBs in the same subframe,
  - A resource pool consists of N contiguous PRBs in frequency domain.
    - N = The sub-channel size * the number of sub-channels.
    - A UE transmits PSSCH on the largest subset of PRBs in the selected sub-channel(s) subject to the DFT size restriction and the adjacency to the associated SA resource.
- When a pool is (pre)configured such that a UE can transmit SA and data in non-adjacent RBs in the same subframe,
  - The UE always transmits on an integer number of adjacent subchannels.

R1-168082 WF on pools for V2X Ericsson

Agreement:
- V2V pool is defined by a repeating bitmap mapped to all subframes except for at least SLSS subframes which are skipped
  - The bitmap length is 16, 20, or 100.
  - FFS if/how to handle the case where the bitmap does not repeat an integer number of times within the DFN period
- The bitmap defines which subframes are allowed for V2V SA/data transmission and/or reception for a pool.

Association of SA and data

R1-166162 Multiplexing of SA and its associated data Huawei, HiSilicon

R1-167925 WF on time resources indication Huawei, HiSilicon, LGE, Ericsson

Agreement:
- Once resource reselection is triggered, UE reselects resources for all the transmissions corresponding to a TB.
- SA only schedules transmission(s) corresponding to one TB.
- UE is not required to perform PSSCH-RSRP measurement in a TTI that occurs before the reception of a successfully decoded associated SA.
  - UE applies the PSSCH-RSRP measured in a TTI that occurs at or after the reception of a successfully decoded associated SA to a TTI that is indicated by the SA but occurs before the reception of the SA.
- Number of transmissions of a TB is 1 or 2.
- Each SA indicates the time/frequency resources of all the data transmissions corresponding to the same TB.

7.2.2.4 Remaining details of scheduling for sidelink resource in eNB scheduling mode

R1-166956 Cross carrier and multi-operator scheduling for V2V over PC5 Ericsson

7.2.2.4.1 Details of DCI format for SPS and dynamic scheduling

Including how to trigger/release different SPS configurations

R1-166981 Scheduling of V2V SPS resources ZTE
R1-167589 DCI contents for SPS and resource allocation in Mode 1 INTERDIGITAL COMMUNICATIONS

WF on multiple SPS configuration Huawei
WF on eNB scheduling DOCOMO

Agreement:

- DCI for dynamic scheduling:
- At least the following fields are included in the DCI
  - CIF (3 bits)
    - Interpretation of CIF is (pre)configured. This (pre)configuration can be different from CIF for UL/DL.
  - Lowest index of the sub-channel allocated to the initial transmission
  - SA content
    - Time gap between initial transmission and retransmission: [4] bits
    - Frequency resource location of the initial transmission and retransmission: 8 bits
  - FFS
    - TPC
- The DCI length is the same as DCI format 0 configured for UL of the UE.
  - An RNTI different from C-RNTI/SPS-RNTI is used.
- Time location of the initial transmission is the first subframe included in the resource pool on the V2V carrier that occurs after 4 ms from the DCI transmission subframe.
- Email discussion until 2nd September to finalise the above square-bracketed figure and FFS (Shailesh, Qualcomm)

SPS scheduling is postponed to V2X work item, e.g.:

- For SPS, the following are included in the DCI in addition to the content of the DCI for dynamic scheduling:
  - SPS configuration indicator
    - FFS whether this can indicate more than 1 SPS configuration
  - SPS activation / release indicator

7.2.2.4.2 Others

7.2.2.5 Remaining details of SCI contents

R1-166202 Scheduling assignment design for V2V Huawei, HiSilicon
R1-166262 Details of SCI Qualcomm Incorporated
R1-166434 Discussion on contents of scheduling assignment CATT

R1-167510 SA contents for V2V Lenovo (Beijing) Ltd
R1-167590 SCI contents for R14 V2V INTERDIGITAL COMMUNICATIONS

Agreement:

- SCI contents (48 bits in total):
  - Priority: 3 bits
  - Resource reservation: 4 bits
  - MCS: 5 bits
  - CRC: 16 bits
- Retransmission index: 1 bit
- Time gap between initial transmission and retransmission: [4] bits
  - This fields indicates a value in [0, [15]]. Value 0 means no retransmission of the associated TB.
  - Frequency resource location of the initial transmission and retransmission: Working assumption: 8 bits
  - Frequency location of the other transmission and the number subchannels are jointly encoded.
  - Reserved bits: [7] bits

Petitioners' Exhibit 1007, p. 1660
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- A UE transmitting SCI defined in Rel-14 V2V WI shall set all these bits to 0.
- A UE shall not use this field as virtual CRC.
- RV 0 and 2 are used for the initial transmission and retransmissions, respectively.

Email discussion until 2nd September to confirm the above working assumption and square-bracketed figures, and the details of joint encoding of frequency location of the other transmission and number of subchannels (Philippe, Huawei)

7.2.2.6 Remaining details of coexistence of PC5-based V2V operation and legacy Uu operation

Including prioritizing sidelink transmissions over UL transmissions

R1-166125 Coexistence of cellular and V2V services on the same carrier Huawei, HiSilicon
R1-166206 Power control for SA and data Huawei, HiSilicon

Power control
R1-166206 Power control for SA and data Huawei, HiSilicon

R1-168146 WF on power control LG Electronics, Huawei, HiSilicon, Qualcomm

Agreement:

- When PSCCH and the associated PSSCH are transmitted in the same subframe,
  - Power control parameters are (pre)configured only for PSSCH.
  - PSD offset to that of PSSCH is used to determine the transmission power of PSCCH.
    - The PSD offset is fixed to X(FFS in [0, 3]) dB in specifications.
    - Email approval until 1st September – Hanbyul (LGE)
  - For all cases, the PSD difference between PSCCH and PSSCH shall be the same as the PSD offset value.

7.2.2.7 Remaining details of sidelink synchronization procedure

Including priority order of synchronization sources for remaining cases. Low priority is given to enhancements to Rel-12/13 SLSS-based synchronization.

R1-166168 Timing alignment of different synchronization sources for V2V Huawei, HiSilicon

R1-167804 Final details of V2V synchronization procedure Nokia, Alcatel-Lucent Shanghai Bell
R1-167837 V2V synchronization remaining issues PANASONIC R&D Center Germany

R1-168283 WF on GNSS Priority for Synchronization Huawei, HiSilicon

Agreement:

- GNSS is at the highest priority of synchronization source for time and frequency when the following conditions are met:
  - The UE is out of coverage on the V2X carrier (as defined by RAN2)
  - The UE does not receive any eNB synchronization configuration
  - The UE directly receives GNSS with sufficient reliability (as defined by RAN4)
  - The UE does not receive any SLSS_net signal with in-coverage indicator 1
- The existing agreements apply when at least one of the above conditions is not met.
  - FFS UE behaviour when the UE is out-of-coverage and receives SLSS_net.
- RAN1 observed the potential benefit of (pre)configuring an offset to shift the DFN #0 w.r.t the reference timing derived from GNSS. RAN1 assumes that RAN2 will decide whether this feature will be included in the outcome of V2V WI.
  - The offset is in range [0, 1 ms] with the granularity of 1 us.
- LS to RAN2 to inform this (Stefano – Ericsson) in R1-168244. Approved in R1-168250 with adding RAN4 to CC.

Agreement:

- SLSS period is 160 ms. Note that this changes the existing working assumption.

7.2.2.8 Others

R1-166834 Open issues for V2V work item completion LG Electronics
R1-166835 on supporting 64 QAM for PC5-based V2V LG Electronics
R1-167152 Discussion on inband emission suppression for V2V communications Huawei, HiSilicon

Rapporteur will capture in the status report all remaining essential issues of V2V that are to be transferred to the V2X WI.

LS to RAN2:
R1-168202

7.2.3 LTE-based V2X Services

WID in RP-161298

R1-168404 Chairman's Notes of Agenda Item 7.2.3 on LTE-based V2X Services Session Chairman (Nokia)
Contents incorporated below
Endorsed

R1-166836 Work plan for LTE-based V2X Services LG Electronics

7.2.3.1 Enhancement to UL SPS

Including support for multiple SPS configurations

R1-166170 SPS enhancement on Uu for V2X Huawei, HiSilicon
R1-166265 Uplink SPS enhancements for V2X Qualcomm Incorporated
R1-166437 Discussion on enhancement of UL SPS in V2X CATT
R1-167015 UL-SPS for LTE-based V2X services Ericsson

Agreements:

- A SPS RNTI for V2X over Uu is necessary.
  - FFS whether this SPS RNTI is specific to V2X or can be the same as the legacy SPS C-RNTI
- A DCI format 0 for V2X scrambled by the SPS RNTI for V2X is used to activate or update the SPS.
- Both explicit release and an implicit release mechanism for SPS over Uu are supported (details FFS).
- Explicit signaling from the UE to the eNB (ask RAN2 if they can design the appropriate signalling, e.g. using a MAC CE) can be used to indicate to the eNB when activation/update/release is desired.
  - For activation, a "desirable time offset" (e.g. relative to SFN0) is included
- When the period is to be changed, the UE notifies the eNB with the new period
- Multiple SPS configurations can be active at the same time.

Petitioners' Exhibit 1007, p. 1662
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- An indicator(s) in DCI format 0 (e.g. SPS index or an indicator mapped to SPS index) is used to differentiate SPS configurations.
  - FFS whether existing field(s) (e.g. TPC for PUSCH) is reused or a new field is added
- FFS whether each SPS configuration is always activated/released by a separate DCI or whether multiple SPS configurations can be activated or released by a single DCI.

- In the event of a resource conflict between SPS configurations, only one transmission can occur
  - RAN1 leaves it up to RAN2 to determine any possible mechanism for resolving resource conflicts between SPS configurations

R1-166837	Discussion on details of (E)PDCCH design for uplink SPS	LG Electronics

7.2.3.2 Resource selection for pedestrian UEs

Including random resource selection for P-UEs potentially on the PC5 resource pool shared with V-UE transmissions, with additional study on sensing operation during a limited time for P-UEs

R1-166838	Discussion on P-UE sidelink transmissions	LG Electronics
R1-166266	PC5 for V2P	Qualcomm Incorporated
R1-167805	On resource selection for V2P communication	Nokia, Alcatel-Lucent Shanghai Bell
R1-166723	Resource selection for pedestrian UE	Samsung
R1-166205	Discussion on the P-UE resource selection	Huawei, HiSilicon
R1-166986	Considerations for resource selection for P-UEs	ZTE
R1-166965	Discussion on P2x	Ericsson
R1-167362	Evaluation and discussion on resource selection for pedestrian UEs	NTT DOCOMO, Inc.
R1-167869	Discussion on sensing operation for P-UE	Sequans Communications
R1-166438	Discussion on resource selection for P-UE	CATT
R1-166993	Discussion on resource sensing and selection for pedestrian UEs	Spreadtrum Communications
R1-167512	Discussion on resource selection for pedestrian UEs	Lenovo (Beijing) Ltd
R1-167609	Power Efficient Sensing for V2X Pedestrian UEs	SHARP Corporation
R1-168385	WF on pedestrian UE resource selection	NTT Docomo, Huawei, HiSilicon

Proposal:

- If shared Tx resource pool is used by pedestrian UEs and vehicle UEs
  - Pedestrian UE can sense in a subset of subframes and skip sensing in other subframes for energy saving
    - FFS details on how/when UE skip sensing
    - Vehicle UE resource selection is reused as the baseline for pedestrian UE resource selection
      - FFS details
  - FFS whether pedestrian UE can skip sensing in all the subframes and use random resource selection

Agreement:

- The specification supports the possibility for a P-UE to use random selection, including at least all P-UEs which do not have sidelink Rx capability
  - If a P-UE uses random selection, it shall only pools in which random selection by P-UEs is permitted
  - It is up to network configuration whether a pool in which random selection by P-UEs is permitted overlaps with other pools
  - The specification supports the possibility to configure pools in which random selection by P-UEs is not permitted
- The specification supports the possibility for a P-UE to use partial sensing in a subset of subframes
  - Details of P-UE partial sensing are FFS
    - V2V sensing-based resource selection is the baseline; strive to define P-UE partial sensing-based resource selection to be as similar as possible to V2V sensing-based resource selection
  - FFS whether support of partial sensing is mandatory for P-UEs with sidelink Rx capability
  - FFS under what conditions a P-UE that supports partial sensing uses partial sensing
  - If a P-UE uses partial sensing,
    - details of resource pool FFS

R1-167981 WF on overhead reduction for Class A NZP CSI-RS ZTE Corporation, ZTE Microelectronics, Ericsson, Samsung, NTT DOCOMO

Agreement:

At least for Class A NZP CSI-RS with more than 16 CSI-RS ports:

- All ports in a CSI-RS resource are transmitted within the same subframe
  - i.e. CSI-RS overhead reduction is done in the frequency domain
- CSI-RS density d ∈ {1,1/2, and at least one other value <= 1/3} RE/RB/port
  - Other values of d are not precluded (e.g. $^2/_3$, ¾)
  - FFS whether different ports in a CSI-RS resource may have different densities
- FFS PDSCH rate matching in the REs in PRBs with no CSI-RS ports within a group
  - Opt-1: comb like transmission
  - Opt-2: frequency domain measurement restriction
- FFS the detailed signalling design

R1-166727 Discussions on CDM-8 for NP CSI-RS Samsung

7.2.4.1.2 Beamformed CSI-RS

At least decide on:

- *Scheme 1 and/or 2 – if down selection is needed*
- *Additional FFS details on scheme 1 and/or 2*

R1-166442 Support for aperiodic CSI-RS CATT
R1-166520 Evaluation of CSI-RS overhead reduction for Class B using frequency decimation Intel Corporation
R1-166728 Additional details on aperiodic CSI-RS Samsung

R1-167653 On Rate-matching of A-CSI-RS InterDigital Communications
R1-167675 Aperiodic CSI-RS transmission for beamformed CSI-RS Huawei, HiSilicon

R1-168046 WF on Aperiodic CSI-RS for Rel.14 Samsung, Nokia, Alcatel-Lucent Shanghai Bell, KT Corporation, Ericsson, LG Electronics, Interdigital, Qualcomm, AT&T, CHTTL, Xinwei, Straightpath, ITL

Agreement:
Aperiodic CSI-RS

- Two-step NZP CSI-RS resource configuration:
  - Step 1. RRC configuration with a newly defined Aperiodic CSI-RS-Resource-Config IE
    - Without Subframe_config
    - Configure a UE with ***K*** = {1, 2, .., 8} CSI-RS resources
  - Step 2. Activation/release mechanism
    - Activate ***N*** out of ***K*** CSI-RS resources per CSI process
      - Note: Activation refers to down selection of N out of K CSI-RS resources
      - Once activated, a CSI resource remains activated until released
      - FFS: Whether N is always equal to K or the case where K=N is not precluded
        - » If N is always equal to K, step 2 is bypassed
    - Choose at least one of the following alternatives for activation/release mechanism (TBD in RAN1#86bis)
      - Alt1. Using UL grant(s)
        - » FFS: Support for cross-carrier activation/release
      - Alt2. Using MAC CE
      - Other alternatives are not precluded
      - FFS the values of X and Y, max value of ***N*** (or the value of *N*), how to signal *N*
- One out of ***N*** CSI-RS resources is selected via the UL-related DCI
  - A UL grant carries a CSI request and indicates transmission of one CSI-RS resource if ***N***>1 aperiodic CSI-RS resources are activated for a CSI process for which the CSI is requested
    - A CSI request is for one CSI-RS resource per CSI process
    - Choose one out of the following alternatives for indicating transmission of **1** out ***N*** CSI-RS resources (TBD in RAN1#86bis)
      - Alt1. use code points from an existing DCI field to select **1** out ***N*** CSI-RS resources
      - Alt2. Introduce additional bit(s) in DCI
      - Note: The number DCI fields and number of code points for the combinations of CSI process, CC, and CSI-RS resource indication are FFS
- Only PUSCH based A-CSI reporting is supported
- Aperiodic CSI-RS transmission is in the same DL subframe as the associated UL-related DCI
  - FFS: Whether to CSI reference resource definition needs to change when aperiodic CSI-RS is used or not
- Whether and, if needed, how to support CSI processing relaxation for aperiodic CSI-RS are TBD
- FFS: Possibility to support aperiodic CSI-RS with *K*=1 and trigger (using UL-related DCI carrying A-CSI request) a subset of antenna ports.

"Multi-shot" CSI-RS

- Two-step NZP CSI-RS resource configuration:
  - Step 1. RRC configuration with a *Rel-13 periodic* CSI-RS-Resource-Config IE
    - Configure a UE with ***K*** = {1, 2, .., 8} CSI-RS resources
  - Step 2. Activation/release mechanism
    - Activate ***N*** out of ***K*** CSI-RS resources per CSI process

Petitioners' Exhibit 1007, p. 1666
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

        - Note: Activation refers to transmission of N CSI-RS resources
        - Once activated, a CSI resource remains activated until released
    - Choose at least one of the following alternatives for activation/release mechanism (TBD in RAN1#86bis)
        - Alt1. Using UL grant(s)
            - » FFS: Support for cross-carrier activation/release
        - Alt2. Using MAC CE
        - Other alternatives are not precluded
        - FFS the values of X and Y, max value of ***N*** (or the value of N), how to signal *N*
- CSI reporting
    - *N*=1: CQI/PMI/RI is reported
    - *N*>1: CRI (=0,1, …, *N* – 1) is reported along with CQI/PMI/RI associated with the reported CRI value

Overhead reduction for Class B – both for periodic and aperiodic CSI-RS
- Support CSI-RS frequency-domain density reduction for Class B
    - All antenna ports of a single CSI-RS resource configuration can be transmitted every N PRBs
        - *N* = 1 (existing CSI-RS design), 2, and >2
        - FFS: Exact mechanism

R1-168147 WF on Rate Matching Issue for Beamformed CSIRS LG Electronics, InterDigital, Samsung, Huawei, HiSilcon, Qualcomm, CATT

Agreement:
- A solution is to be selected from the following three alternatives for aperiodic ZP CSIRS resource indication (TBD RAN1#86bis)
    - Alternative-1: Aperiodic ZP CSIRS, dynamically indicated by a new common DCI.
        - The common DCI is monitored in common search space.
    - Alternative-2: Aperiodic ZP CSIRS, aperiodic ZP CSI-RS resource signaling field is introduced in DL DCIs for all TMs.
    - Alternative-3: Use the existing PQI states or increase the number of PQI states for TM10; no PDSCH RM solution for other TMs
        - In this case, aperiodic ZP CSIRS resource is not defined
- Definition of Aperiodic ZP CSIRS:
    - For PDSCH rate matching on BF CSIRS due to aperiodic CSI-RS and/or multi-shot CSI-RS, an aperiodic ZP CSIRS resource is indicated.
        - Aperiodic ZP CSIRS resource configuration is defined without Subframe_config
        - UE conducts PDSCH rate matching on aperiodic ZP CSIRS at the subframe when the DCI is signaled.
- Study the impact of collision between EPDCCH RE and aperiodic CSI-RS

R1-168148 WF on QCL issue for Beamformed CSIRS LG Electronics, Samsung, Intel

Agreement:
- Decide the need for QCL indication on DMRS to aperiodic and/or multi-shot CSI-RS NZP CSIRS (TBD RAN1#86bis)
- If needed, at least one solution is to be selected from the following alternatives (TBD RAN1#86bis)
    - Alt 1: UE is not expected that aperiodic and/or multi-shot NZP CSIRS is indicated in PQI for QCL purpose with DMRS.
    - Alt 2: aperiodic and/or multi-shot NZP CSIRS can be indicated in PQI for QCL purpose, and follow legacy QCL assumption
        - Periodic NZP CSI-RS can also be indicated for QCL purpose

R1-168050 WF on UL DMRS enhancement Intel

R1-167972 WF on UL DMRS Nokia, Alcatel-Lucent Shanghai Bell, Huawei, HiSilicon

Agreement:

- Support orthogonal DMRS (more than 2) for MU-MIMO with partial overlapping BW allocation by
  - IFDMA with at least RPF 2
    - FFS: RPF 4
- FFS during this week which new IFDMA sequence lengths (if any) shall be supported and designed
  - If any new lengths larger than 36 are supported, the corresponding DMRS sequences are generated by the legacy mechanism by extension of a Zadoff-Chu sequence
- FFS: whether and how CS of DMRS generation shall be modified to improve backward compatibility for the pairing with legacy UE.
- Additional power boosting shall be supported and applied to IFDMA DMRS depending on the value of RPF
  - FFS: x dB for RPF 2 and y dB for RPF 4

R1-168368 WF on UL DMRS Lengths Nokia, Alcatel-Lucent Shanghai Bell, Huawei, HiSilicon, Qualcomm, CATT, Samsung

Agreement:

- IFDMA Sequence Design for RFP=2,
  - New lengths larger than 36 are supported. The corresponding DMRS sequences are generated by the legacy mechanism by extension of a Zadoff-Chu sequence.
  - FFS: whether new lengths of 6, 18, 30 are supported

7.2.4.2 CSI reporting

7.2.4.2.1 Non-precoded CSI-RS codebooks

At least decide on:

- *Down selection of (N1, N2) and/or (O1, O2) configurations*

R1-166445 Codebook design for {20,24,28,32} ports CATT
R1-166523 Discussion on Class A codebook extension Intel Corporation

Petitioners' Exhibit 1007, p. 1668
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-166729	View on class A codebook extension	Samsung
R1-167639	On 1D antenna port layouts in Rel-14	Ericsson
R1-167140	Codebook for up to 32 ports CSI-RS	Huawei, HiSilicon

R1-168065 Way Forward on 1D Antenna Port Layouts Ericsson, Verizon, Kathrein-Werke, Deutsche Telekom, AT&T

Proposal:

- The following 1D antenna layouts are supported:
  - (N1,N2) = (16,1), (14,1) , (12,1), (10,1)

R1-166522	Performance evaluation of Class A codebooks with 32 ports	Intel Corporation
R1-166843	Discussions on non-precoded CSI-RS codebook design for eFD-MIMO	LG Electronics
R1-167348	Codebook Enhancement for eFD-MIMO	NTT DOCOMO, INC.
R1-166579	Discussion on codebook design to support up to 32 ports CSI-RS	Beijing Xinwei Telecom Techn.
R1-167638	Antenna port layout support for up to 32 Ports in Rel-14	Ericsson

R1-168353	Way Forward on Antenna Port Layouts	Ericsson, Qualcomm, Intel, CATT, AT&T, NTT DOCOMO
R1-168511	Way Forward on Antenna Port Layouts	Ericsson, QUALCOMM, Intel, CATT, ATT, DOCOMO, Verizon

- Simplify 1D configuration
  - Drop the (1,N2) rows (with red text)
    - Single design can be used for (N1,1) and (1,N2).
- Reduce UE computational complexity
  - Remove (8,8) combinations for 20, 24, 28, 32 ports (with green text)
    - Reduces number of beams by 2
    - Limited performance gain from (8,8) vs. (8,4)

Number of CSI-RS antenna ports, P	(N1,N2)	(O1, O2)
20 ports	(2,5)	(8,4), (8,8)
	(5,2)	(8,4), (4,4)
	(10,1)	(4,-),(8,-)
	(1,10)	(-,4),(-,8)
24 ports	(3,4)	(8,4), (8,8)
	(4,3)	(8,4), (4,4)
	(2,6)	(8,4), (8,8)
	(6,2)	(8,4), (4,4)
	(12,1)	(4,-),(8,-)
	(1,12)	(-,4),(-,8)
28 ports	(2,7)	(8,4), (8,8)
	(7,2)	(8,4), (4,4)
	(14,1)	(4,-),(8,-)
	(1,14)	(-,4),(-,8)
32 ports	(8,2)	(8,4), (8,8)
	(2,8)	(8,4), (4,4)
	(4,4)	(8,4),(4,4)
	(16,1)	(4,-),(8,-)
	(1,16)	(-,4),(-,8)

- The main concern of some companies is that the necessity or the complexity of all or a large group of codebook combinations is not justified by evaluation yet. Rel 13 does not support all possible layouts.
- However some UE vendors state that the complexity of codebook combination at the UE side is not a major issue. It is still an open question which codebook combination(s) are concerns.
- It is encouraged to indentify the problem or concern or redundancy for specific codebook combination(s).

Email discussion until the next meeting – Mark (Ericsson)

7.2.4.2.2 CSI reporting for hybrid CSI-RS

At least decide on:

- *Confirm working assumption of mechanism 1*
- *Additional mechanisms, if needed*
- *Reported CSI parameters, e.g. RI in the first and/or second report*

Petitioners' Exhibit 1007, p. 1669
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-168282 WF on hybrid CSI reporting LG Electronics, Samsung, LG Uplus, KT Corporation, ITRI, NTT Docomo, ITL, Ericsson, Xinwei, NEC, InterDigital

Agreement

- Confirm the working assumption of hybrid CSI
- Further details on Mechanism 1
  - Reporting content
    - For the 1st eMIMO-Type (CLASS A), $i1^{(1)}$ and x-bit $RI^{(1)}$ are reported, while $CQI^{(1)}$ and $i2^{(1)}$ are not reported
      - If UE supports up to 2 layers, x=0
      - If UE supports up to 8 layer, x=1 where $RI^{(1)}=\{1, 3\}$
    - For the 2nd eMIMO-Type (CLASS B K=1), $CQI^{(2)}$, $PMI^{(2)}$, $RI^{(2)}$ are reported
    - Note: Superscript (y) represents the y-th eMIMO-Type, where y=1,2.
    - FFS: Option for one eMIMO-Type to inherit RI reporting from another eMIMO-Type
  - **Working assumption**: No inter-dependence between CSI calculations across two eMIMO-Types
  - Reuse legacy CSI reporting mechanisms with the following refinement
  - For PUCCH-based P-CSI
    - Report $i1^{(1)}$ and $RI^{(1)}$ in one subframe
      - FFS: Using either PUCCH format 2 or 3
    - Periodicity of the CSI of 1st eMIMO-Type is an integer multiple of $RI^{(2)}$ periodicity of the 2nd eMIMO-Type.
    - Subframe offset of the 1st eMIMO-Type is defined relative to $RI^{(2)}$ subframe offset of the 2nd eMIMO-Type.
      - FFS: Whether subframe offset of the 1st eMIMO-Type can be fixed to 0
    - Priority rule for collision handling is FFS.
  - For PUSCH-based A-CSI
    - FFS: what CSI(s) will be reported from UE when aperiodic CSI reporting is triggered
      - Option 1: UE reports both CSI of 1st eMIMO-type and CSI of 2nd eMIMO-type.
      - Option 2: UE reports either one of the 2 eMIMO-types.
    - CSI encoding/mapping mechanisms is FFS.

Support of at least one more mechanism

R1-168286 WF on Hybrid CSI Reporting NTT DOCOMO, KT corporation, ITL, KDDI, LG Electronics, Mitsubishi Electric, NEC, Samsung, Sharp, Softbank, Sony, Straightpath

R1-168339 Way Forward on Inclusive Hybrid CSI-RS Framework Ericsson, ZTE Corporation, ZTE Microelectronics, Nubia, Xinwei, ITRI, ASTRI

Conclusion:

- **Proposal I:** For hybrid CSI with one CSI process, support CLASS B with K>1 CSI-RS resources for the 1st eMIMO-Type and CLASS B with K=1 CSI-RS resource for the 2nd eMIMO-Type
  - For the 1st eMIMO-Type, two options
    - Option 1: CRI (without CQI/PMI/RI) is reported
    - Option 2 (only support K=2): PMI assuming RI=1 for each of the two CSI-RS resources are reported
  - For the 2nd eMIMO-Type
    - CQI/PMI/RI are reported
  - Working assumption: No interdependence in CQI calculation between 1st and 2nd eMIMO-Types
    - FFS: for option 1, dynamic CSI-RS resource configuration for the 2nd eMIMO-Type based on CRI reporting 1st eMIMO-Type.
- **Proposal II:**
  - Hybrid CSI reporting with eMIMO-Type pairs is supported
    - No restriction on the configuration for 1st and 2nd eMIMO-Types
    - UE supports eMIMO-Type pairs
    - For TM9, different CSI-RS resources and/or CSI reporting configurations can be used for PUCCH and PUSCH
    - UE calculates one CSI report for only one eMIMO-Type of a pair at a time and one eMIMO-Type at a time
      - FFS: Define the period of CSI-RS associated with the 1st eMIMO-Type as N times of the period of CSI-RS associated with the 2nd eMIMO-Type, where N>1
        - Configurable or fixed value of N needs to be specified

Petitioners' Exhibit 1007, p. 1670
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Whether new dropping rules need to be specified
- Rel-13 CSI process configurations are supported
- A report for either eMIMO-type contains all Rel-13 CSI parameters (CQI/PMI/RI/CRI)

– Study whether it is possible to simplify a combination, or to down select, between/within proposals I and II

7.2.4.2.3 Advanced CSI reporting and interference measurement

At least decide on:

- *Select one advanced CSI scheme (combination-based codebook enhancement vs. channel quantization)*
- *The need for interference measurement enhancement*

Framework

R1-167971 WF on Advanced CSI feedback framework in Rel-14 Huawei, HiSilicon, Ericsson, Nokia, Alcatel-Lucent Shanghai Bell, Samsung, CATT, ZTE, NTT DOCOMO, Qualcomm, Intel, InterDigital, ITRI

Agreement:

- Specify CSI feedback enhancement with the following advanced CSI feedback framework:
  - Reduced space (eigenvectors)/W1 is constructed based on one of the following alternatives (TBD RAN1#86bis):
    - Alt1. Orthogonal basis (e.g. orthogonal DFT matrix)
    - Alt2. Non-orthogonal basis (e.g. Rel.13 Class A W1 for rank-1 and/or 2)
  - Reduced space representation/W2 is to further combine selected beams
  - Granularity of weighting(phase and/or amplitude) can be either wideband only or wideband/subband, and is constructed based on one of the following alternatives (TBD RAN1#86bis):
    - Alt1. Phase and amplitude
    - Alt2. Phase-only weighting
  - How the enhanced framework can be applicable for Class A and/or Class B eMIMO-Types is FFS
  - FFS: How to handle the relationship between advanced CSI feedback and legacy CSI feedback framework
- Companies are encouraged to provide results comparing the above alternatives, considering a mix of smaller and larger numbers of ports within the following antenna port configurations
  - {4,8,12,16,20,24,28,32} ports
  - Focus on rank<=2 scenario MU-MIMO for evaluation
  - Feedback overhead needs to be taken into account
  - For {4,8,12,16, 20,24,28,32}-port scenario, companies are encouraged to compare their proposals to dual-stage codebook enhancement with increased number of beams in W1

R1-167642 Discussion on Interference Measurement Enhancements Ericsson
R1-167644 On the need for W1 enhancements for advanced CSI Ericsson
R1-167674 Enhanced interference measurement Huawei, HiSilicon

R1-168504 WF on interference measurement in Rel-14, Huawei, HiSilicon, CATT, Samsung, Xinwei
- Specify interference measurement enhancements in Rel-14.

Conclusions:
- Whether the need of interference measurement enhancement in Rel-14 shall be decided in next meeting.
- If needed, one or more schemes shall be supported in Rel 14. Possible schemes are:
  - Definition and configuration of a new type interference measurement
    - Interference measurement is based on cancellation of intended signals
    - Both inter-cell and intra-cell interference should be captured
    - FFS NZP CSI-RS or DMRS as CSI-IM or PDSCH
  - Definition and configuration of a new type interference measurement
    - Only intra-cell interference to be measured using NZP
  - Aperiodic CSI-IM, based on
    - The existing CSI-IM
    - The new CSI-IM type (see above, if specified).
  - New UE measurement behavior for CQI reporting based on DMRS ports when corresponding PDSCH is transmitting.
  - If needed, L1/RRC signaling to assist UE interference measurement
  - Other schemes are not excluded.

Conclusions:
- Companies are encouraged to investigate the usage of new or existing PUCCH format for the purpose of analog feedback to carry advanced CSI.

7.2.4.3 DMRS-based open-loop and semi-open-loop transmission

At least decide on:
- *CSI parameters to be reported*
- *Down selection of Tx enhancement scheme, if needed*

Petitioners' Exhibit 1007, p. 1672
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-168446 WF on semi-open-loop transmission Samsung, Nokia, ASB, ZTE, ZTE Microelectronics, CATT, KT Corporation

Agreement:
- Support both CLASS A and CLASS B with K≥1 CSI-RS resources for the eMIMO-Type of semi-open-loop
  - For dual-stage codebook,
    - RI, i_1 and CQI reporting is supported for {CLASS A} and {CLASS B with K=1 and 8Tx/alternate 4Tx codebooks}
      - FFS: reporting i11 and/or i12 for Class A codebooks
    - CRI, RI, i_1 and CQI reporting is supported for CLASS B with K>1
    - FFS: reporting i1 and subsampled i2
    - FFS: Hybrid CSI with semi-open-loop
    - FFS: Reporting multiple CRIs for CLASS B K>1
  - For single-stage codebook with 2 and 4 ports (CLASS B with K>1), CRI, RI and CQI are reported
  - For single-stage codebook with 2 and 4 ports (CLASS B with K=1), RI and CQI are reported
- Support RE level transmitter operation on PDSCH for both CSI reporting and PDSCH transmission
  - Down selection from the following transmission schemes in RAN1#86bis, including possible combination
    - Precoder cycling
    - Tx diversity
    - LD-CDD
    - Layer Permutation

R1-168048 WF on DMRS-Based Open-Loop/Semi-Open-Loop CATT, Nokia, Alcatel-Lucent Shanghai Bell, CATR, Huawei, HiSilicon, InterDigital, Intel, Qualcomm

Conclusion:
- RAN1#86bis: companies need to justify the need for introducing new DMRS pattern(s) to support open-loop/semi-open-loop transmission scheme. Otherwise the proposal in R1-168048 is agreed.

R1-166275 Discussion on DMRS based OL and Semi-OL Transmission Qualcomm Incorporated

7.2.5 Downlink Multiuser Superposition Transmission for LTE

WID in RP-161019

R1-168406 Chairman's Notes of Agenda Item 7.2.5 on Downlink Multiuser Superposition Transmission for LTE Session Chairman (Qualcomm Inc.)
Contents incorporated below
Endorsed

7.2.5.1 Superposition transmissions

Power ratios, modulation, etc

Power ratio
R1-166185 Further discussion on power ratios for MUST Huawei, HiSilicon
R1-166277 Power ratio set considerations for MUST Qualcomm Incorporated
R1-166847 Discussion on power ratio and modulation order LG Electronics
R1-167508 Selection of power ratios for MUST Case1 & 2 MediaTek Inc.

Petitioners' Exhibit 1007, p. 1673
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-167689 MUST Case 1 and 2 transmission schemes Nokia, Alcatel-Lucent Shanghai Bell

R1-168141 Way forward on Power Ratios ZTE, ZTE Microelectronics, MediaTek, ITRI
R1-168152 WF on power ratios for MUST Case 1/2 Nokia, ASB, Qualcomm
R1-168316 Way Forward MUST power ratios Huawei, HiSilicon, MediaTek

Agreement:
- For Case 1/2, numbers of power ratios should be decided based on system level simulation and analysis:
  - For QPSK + QPSK, number of power ratios is to be selected from 2/3/4
  - For QPSK + 16 QAM, number of power ratios is to be selected from 2/3/4
  - For QPSK + 64 QAM, number of power ratios is to be selected from 1/2/3/4

Conclusion:
Companies are encouraged to provide principle of generating power ratio, examples are:
- Super-constellation/grid coordinates
  - Supported: Huawei, HiSilicon, Qualcomm, MediaTek, Nokia, ASB, KT
- Evenly spaced
  - Supported: ZTE, Mediatek, LG

Note that final selection of power ratios can be a combination of the above examples.

R1-168280 Way Forward on the Gray conversion LG Electronics, ZTE, ZTE Microelectronics, Huawei, HiSilicon
Agreements:
- For Gray-mapped composite constellation:
  - Alt 1: Bit-level Gray conversion is specified
  - Alt 2: Symbol-level Gray conversion is specified
  - Alt 3: up to implementation (where the bits are mapped to the composite-constellation)
- Down-select one alternative till next meeting

R1-168142 Way forward on MUST Transmission ZTE, ZTE Microelectronics, MediaTek, Sharp
Continue discussion next meeting

R1-168279 Way Forward on MUST UE multiplexing Huawei, HiSilicon
Proposals:
- In all PDSCH REs, the composite constellation symbols transmitted in a given sub-frame and a given spatial layer to a same MUST-near UE carry the same number of MUST-near UE codeword bits

Continue discussion next meeting

Petitioners' Exhibit 1007, p. 1674
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-167094 On signaling design for MUST case 3 CMCC
R1-167122 On downlink control signalling for MUST Intel Corporation
R1-167167 Demodulation performance for MUST far UE Huawei, HiSilicon
R1-167364 Discussion on remaining issues and signaling design for DL MUST NTT DOCOMO, INC.
R1-167443 Power ratio and assistance information for MUST case 1 and case 2 China Telecommunications
R1-167513 On scheduling constraints for MUST operation MediaTek Inc.
R1-167514 Supported TMs for MUST MediaTek Inc.
R1-167610 Signaling for MUST SHARP Corporation, MTI
R1-167688 On network assistance and operation of MUST Nokia, Alcatel-Lucent Shanghai Bell

R1-168328 Way Forward on MUST DCI Design for Case 1&2 Qualcomm, Nokia, ABS, NEC
Agreement:
- Consider the following options for providing MUST-near UE co-schedule information
  - Alt 1. Single DCI by adding bits in the self DCI
    - FFS details (particularly regarding RA alignment)
  - Alt 2. Use common companion DCI to carry all MUST-far UE information
    - FFS details (particularly regarding RA alignment)
  - Alt3. Use user-specific companion DCI to carry all MUST-far UE information within near-UE allocation
    - FFS details (particularly regarding RA alignment)
  - Other alternatives are not precluded
  - FFS the number of blind decodes
- Down-select one option until next meeting

R1-168241 Way Forward on MUST Assistance Information in Cases 1 and 2 MediaTek, Huawei, HiSilicon, NTT DOCOMO, CMCC
Agreements:
- The following assistance information is provided to MUST-near UE
  - For CRS based transmission schemes in MUST Case 1, the information of "existence of MUST interference" and "power ratio" is provided for each spatial layer
  - For MUST Case 2, "existence of MUST interference" and "power ratio" are signaled
  - FFS: how to signal "existence of MUST interference" (particularly the granularity) and "power ratio"

R1-168317 Way Forward on signaling design for MUST new DCI Huawei, HiSilicon, Media Tek, China Telecom, NTT DOCOMO, LG Electronics
R1-168149 WF on the Design Principle for a new DCI LG Electronics, MediaTek, Huawei, HiSilicon
Agreements:
- A new DCI should follow the design principles
  - In addition to assistance information, all legacy DCI contents should be able to be signaled to MUST UE.

R1-168376 WF on the number of MUST layers for Case 3 LG Electronics, MediaTek
Continue discussion next meeting

R1-168336 Way forward on for Case 3 ZTE, ZTE Microelectronics, Qualcomm, Sharp
Agreements:
- For DMRS based Case 3, support multiuser superposition transmission with orthogonal ports
  - FFS non-orthogonal ports

R1-168150 WF on PDSCH starting symbol LG Electronics, MediaTek
Agreements:
- The starting symbol of interfering PDSCH to be canceled or suppressed should be provided to MUST UE by one of the following the two options:
  - Option 1: it should be blindly detected or signaled (assuming potentially different starting symbols)
  - Option 2: MUST UE assumes the same starting symbol of interfering PDSCH as its own PDSCH
- Down-selection till next meeting

7.2.5.3 Evaluation for MUST using up to 8Tx

Conclude evaluation etc.

Evaluations
R1-166427 Discussion and evaluation for MUST Case 3 ZTE
R1-167095 Non-full buffer Evaluation for MUST case 3 DMRS-based TM CMCC
R1-167690 System-level Evaluation of Case 3 MUST Nokia, Alcatel-Lucent Shanghai Bell
R1-167515 System-level evaluation for MUST Case 3 MediaTek Inc.

Petitioners' Exhibit 1007, p. 1675
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-168291 WF on MUST supported TMs CMCC, Nokia, ASB, MTK, ZTE
Agreements:
- DMRS-based Case 3 is supported in
  - TM 8/9/10

Conclusion:
- Case 1&2 using up to 4Tx is not supported in DMRS-based TM

Possible working assumption:
- CRS-based Case 3 using 2Tx and 4Tx is supported in TM 4
  - Supported by: Nokia, ASB, ZTE, MTK, CMCC
  - Objected by: Huawei, HiSilicon, LG
  - Companies are encouraged to bring more results to confirm/abandon the WA.

Continue discussion next meeting

R1-168144 Way forward on Mechanism for Case 3 ZTE, ZTE Microelectronics, Qualcomm, Sharp

R1-167365 Evaluation for CRS-based MUST with 4 Tx antennas NTT DOCOMO, INC.

R1-166187 Implementation for MUST transmitter Huawei, HiSilicon

7.2.6 eMBMS enhancements for LTE

WID in RP-161297
R1-168407 Chairman's Notes of Agenda Item 7.2.6 on eMBMS enhancements for LTE Session Chairman (Nokia)
Contents incorporated below
Endorsed

7.2.6.1 Longer cyclic prefix for MBSFN subframe

R1-167090 Background Information on Inter-site Distances BBC

R1-167749 Link level simulation assumptions Huawei, HiSilicon
Note that delays in Table 1 should be a factor of 10 larger.

R1-168070 Summary of email discussion Ericsson

R1-166177 Evaluations of longer CP for eMBMS Huawei, HiSilicon
R1-166280 System level Evaluation results for longer cyclic prefix Qualcomm Incorporated
R1-167841 System simulation results for longer CP in MBSFN subframes Ericsson
R1-166281 Design options for longer cyclic prefix and link level simulation results Qualcomm Incorporated

R1-166528 Considerations on longer cyclic prefix for MBSFN subframes Intel Corporation

R1-167842 MBSFN reference signal design Ericsson

R1-168366 WF on eMBMS Enhancements Qualcomm, Ericsson, BBC, EBU, Nokia, ASB, Dish, AT&T, Telstra, Fraunhofer IIS, Verizon, Telefónica, Intel
Also supported by Nomor
Agreement:
- A single new numerology with a CP of at least 100us and core symbol duration of at least 400us is introduced for PMCH
  - Working assumption that the CP length is 200us and core symbol duration of 800us.
  - Link level results may be provided at RAN1#86bis.
  - Working assumption then to be confirmed at RAN1#86bis.

Agreements in respect of at least objectives a, b and c:
- If a carrier is operated with 100% MBSFN subframe allocation, the new CP length and legacy extended CP for 15kHz subcarrier spacing are supported

Petitioners' Exhibit 1007, p. 1676
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- It is understood that 100% MBSFN subframe allocation does not preclude some resources being set aside for e.g. cell search
  - FFS: Any SI that may be needed on this carrier will also be broadcasted in these subframes
  - In these subframes, FDM between PMCH and other channels (potentially with a different numerology) is not precluded.
- With the 100% MBSFN subframe confuguration, this carrier does not support unicast transmissions in the downlink
- This carrier can be configured without a unicast control region in a subset of the MBSFN subframes (including all of them)
  - The UE is not expected to receive PMCH with legacy extended CP for 15kHz subcarrier spacing in the MBSFN subframes without unicast control region
  - The UE is not expected to receive PMCH with the new CP in MBSFN subframes with unicast control region

- If a carrier is operated with less than 100% MBSFN subframe allocation, the new CP length and legacy extended CP for 15kHz subcarrier spacing are supported
  - This carrier has at least subframes 0 and 5 of each radio frame as non-MBSFN subframes
    - FFS: Further CRS reductions
  - This carrier can be configured without unicast control region in a subset of the MBSFN subframes (including all of them)
    - The UE is not expected to receive PDSCH/(E)PDCCH in the MBSFN subframes without unicast control region
    - The UE is not expected to receive PMCH with numerologies other than the new CP length in the MBSFN subframes without unicast control region
    - The UE is not expected to receive PMCH with the new CP length in MBSFN subframes with unicast control region
- eMBMS enhancements do not require changes to any channels and signals needed for MBMS operation except PMCH and MBSFN-RS
  - FFS whether use of more REs, TTI extension and/or change in payload are needed for PBCH coverage enhancements.

R1-168449 WF on the support of longer CP in MBSFN subframes Huawei, HiSilicon, Orange, ZTE
Proposal:
- Whether to introduce a new CP beyond the existing LTE CPs for eMBMS transmissions in Rel-14 should be concluded after the mapping of the SINR achievable with a 95% coverage probability to the corresponding MCS is agreed.

R1-168029 Draft LS regarding agreements for FeMBMS Qualcomm
Approved in R1-168200.

R1-166286 SRS Transmission on TDD CCs without PUSCH Qualcomm Incorporated
R1-166452 Further considerations on SRS carrier based switching CATT
R1-166531 On SRS transmission without PUSCH Intel Corporation

Agreements:

- No consensus to support in Rel-14 new SRS symbol position in addition to already agreed ones.

R1-167715 Power control for SRS switching Nokia, Alcatel-Lucent Shanghai Bell
R1-167485 Support of power control mechanism for SRS transmission in cells without configured PUSCH transmission Ericsson Inc.
R1-166128 Details on power control for SRS on TDD CCs without PUSCH Huawei, HiSilicon
R1-166739 SRS Transmission Aspects for Carrier Switching Samsung

Agreements:

- PC parameters
  - Configure open loop parameters Po and alpha for SRS-only CC
  - No need to have P_SRS_offset

- Down selection from TPC command options:
  - Option 1: by UL grant DCI 0/4 (with cross-carrier indication)
  - Option 2: by DL DCI (with cross-carrier indication)
  - Option 3: by group DCI

  - Adopt Option 3 and only apply to SRS-only CC without PUSCH
    - Joint group DCI for triggering and TPC
    - FFS: Number of bits for each UE and the meaning for the states of the field
    - Introduce RNTI for the group

- Support 2 types of PHR as in Rel-13
  - Details FFS
- Dropping/power scaling rules as in Rel-13

R1-167484 Support of non-contention based PRACH transmission Ericsson Inc.
R1-166129 Details on timing advance for SRS on TDD CCs without PUSCH Huawei, HiSilicon

Agreements:

- SRS-only CC without PUSCH needs to be configured in a TAG
- PRACH
  - PRACH trigger and SRS trigger for a SRS-only carrier are independent
  - Support all PRACH preamble formats

7.2.7.2 Details of periodic and/or aperiodic SRS

Petitioners' Exhibit 1007, p. 1678

R1-166145 Signaling for PUSCH on UpPTS Huawei, HiSilicon
R1-166146 Transmission of PUSCH on UpPTS Huawei, HiSilicon
R1-166295 Control for PUSCH in UpPTS Qualcomm Incorporated
R1-167097 Timing for newly added PUSCH in UpPTS CMCC
R1-167098 Discussion on the TBS scaling design CMCC
R1-167099 Discussion on TTI bundling design for PUSCH in UpPTS CMCC
R1-167141 UCI in PUSCH on UpPTS Huawei, HiSilicon

R1-168096 WF on new special subframe configuration CMCC, ZTE, CATT
R1-168097 WF on timing design for PUSCH in UpPTS CMCC
R1-168098 WF on TTI bundling for PUSCH in UpPTS CMCC, NEC
R1-168099 WF on TBS scaling design for PUSCH in UpPTS CMCC

Agreement:

- Support a new special subframe configuration 10 as in the following table, with 6 DL symbols of NCP in DwPTS, together with 6 symbols of NCP in UpPTS or with 5 symbols of ECP in UpPTS

Special subframe configuration	Normal cyclic prefix in downlink			Extended cyclic prefix in downlink		
	DwPTS	UpPTS		DwPTS	UpPTS	
		Normal cyclic prefix in uplink	Extended cyclic prefix in uplink		Normal cyclic prefix in uplink	Extended cyclic prefix in uplink
10	$13168 \cdot T_s$	$13152T_s$	$12800T_s$	-	-	-

- Send LS to RAN2 about the supported new special subframe configuration

Agreement:

- In UpPTS, independent transport block(s) is transmitted as a separate transmission resource

Agreement:

- Support synchronized HARQ timing
- For TDD UL/DL configuration 1~5, specify the timing from UL grant to PUSCH according to the following table, when supporting PUSCH transmission in UpPTS, i.e.,
  - *The UE shall upon detection of a PDCCH with DCI format 0/4 in subframe n intended for the UE, adjust the corresponding PUSCH transmission in subframe n+k, where the k is in the following table*

Petitioners' Exhibit 1007, p. 1681
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

TDD UL/DL Configuration	DL subframe index *n*									
	0	1	2	3	4	5	6	7	8	9
1	6	6			4	6	6			4
2		5		4			5		4	
3	4							4	4	4
4								4	4	4
5								4	4	

Agreement:
- For TDD UL/DL configuration 0, reuse the UL index field in UL grant to schedule PUSCH in UpPTS.

Agreement:
- For TDD UL/DL configuration 1~5, down-select between the following options for HARQ transmission:
  - Option1: Only support adaptive HARQ transmission, i.e., the retransmission of a PUSCH in UpPTS is scheduled by a UL grant with NDI not toggled
  - Option2: Support both adaptive and non-adaptive HARQ transmission. For non-adaptive HARQ transmission, the PHICH is used, and the PHICH timing is designed based on the following principle:
    - Principle: To keep the backward compatibility, the PHICH corresponding to PUSCH in UpPTS can only be added in DL subframes including legacy PHICH region
- FFS if non-adaptive HARQ transmission is supported for TDD UL/DL configurations 0 and 6

Agreement:
- Support TTI bundling for TDD configuration 2 and 3 when supporting of PUSCH in UpPTS
- Specify the scheduling and HARQ timing for TTI bundling as follows
  - The UE shall upon detection of a PDCCH with DCI format 0 in subframe n intended for the UE, adjust the corresponding PUSCH transmission in subframe n+k, with k in the following table

TDD UL/DL Configuration	DL subframe number *n*									
	0	1	2	3	4	5	6	7	8	9
2		5		4			5		4	
3	4							4	4	4

7.2.10 Further Enhanced MTC for LTE

SID in RP-161321

R1-168411 Chairman's notes of AI 7.2.10 on Further Enhanced MTC for LTE Ad-Hoc chair (Ericsson)
Contents incorporated below
Endorsed

R1-167667 WI work plan for Further Enhanced MTC for LTE Ericsson

7.2.10.1 Higher data rates

R1-166297 Support of larger data channel bandwidth Qualcomm Incorporated
R1-167892 Initial analysis on bandwidth and TBS increase for FeMTC Intel Corporation
Revision of R1-166536

Agreement:
- The wider bandwidth operation is enabled by eNB.
- Wider bandwidth PDSCH/PUSCH is cross subframe scheduled by MPDCCH.
- MPDCCH follows Rel-13 design, which implies that it can be decoded by a UE operating in narrowband operation (6RB).
- If a new grant is introduced for wideband PDSCH/PUSCH, the number of blind decodings of MPDCCH does not increase with respect to Rel-13 eMTC.

R1-166535 Views on support of higher data rates for FeMTC Intel Corporation
R1-167158 On supporting larger maximum TBS Huawei, HiSilicon
R1-168057 WF on support of larger maximum TBS and channel bandwidth for FeMTC Intel, Spreadtrum, Huawei, HiSilicon, Ericsson

Petitioners' Exhibit 1007, p. 1682
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreement:
- For Rel-14 FeMTC UEs, the maximum UL TBS for CEMode A UEs with maximum 1.4 MHz bandwidth in TDD/HD-FDD is increased to 2984 bits.
  - Idle mode operations reuse the Rel-13 eMTC design.
- Study till next meeting whether there are any issues with a maximum useable PDSCH/PUSCH channel bandwidth which is a multiple of 6 PRBs.
- For Rel-14 FeMTC UEs supporting larger UE channel BW for PDSCH and PUSCH:
  - The larger max. DL TBS is at least 2984 bits.
  - The larger max. UL TBS is at least 2984 bits.
- For Rel-14 FeMTC UEs with larger TBS and channel BW:
  - Idle mode operations reuse the Rel-13 eMTC design.

Agreement:
- For Rel-14 BL UEs in CE mode A (FFS for CE mode B), the single larger maximum UE channel BW for PDSCH and PUSCH in RRC connected mode is 5 MHz.
- For Rel-14 non-BL UEs in CE mode A (FFS for CE mode B), the single larger maximum UE channel BW for PDSCH and PUSCH in RRC connected mode is (FFS: 5 or 20) MHz.

7.2.10.2 Multicast

R1-168166 WF on Multicast for FeMTC Nokia, Alcatel-Lucent Shanghai-Bell, Ericsson, Qualcomm

Proposal:
- All BL/CE UEs supporting SC-PTM, are able to decode the SC-MCCH even if it is configured for worst case CE Mode B operation and the UE is only a CE Mode A capable UE
- A cell supporting FeMTC SC-PTM, has the option to configure multiple parallel SC-MTCH services.
- FFS: A BL/UE UE can receive SC-PTM services in:
  - Idle mode only
  - Connected mode only
  - Either Idle or connected modes
- A MPDCCH search space is used to schedule the SC-MCCH.
  - Both dynamic and SPS-like scheduling are supported
  - FFS: If the SS reuses existing definition or is a new SS.
- A MPDCCH search space is used to schedule the SC-MTCH.
  - Both dynamic and SPS-like scheduling are supported
  - FFS: If the SS reuses existing definition or is a new SS.

7.2.11 Enhancements of NB-IoT

WID in RP-161324.
The objectives apply to the in-band, guard-band, and standalone operation modes and the same coverage enhancement targets as defined in the Rel-13 NB-IoT work item.
R1-168412 Chairman's Notes of Agenda Item 7.2.11 on Enhancements of NB-IoT Session Chairman (Qualcomm Inc.)
Contents incorporated below
Endorsed with following updates

R1-166189 NB-IoT Release 14 enhancements work plan Huawei, HiSilicon
Noted

7.2.11.1 Positioning

R1-168114 WF on observations on NB-IoT positioning performance Ericsson, ZTE
R1-168310 WF on simulation assumption for NB-IoT positioning ZTE, Ericsson, Nokia, Alcatel-Lucent Shanghai Bell
Agreement:

- R1-168310 is agreed with the following updates:
  - Slide 3, add UL transmission timing error modelling according to RAN4 requirements

The above agreement is captured in R1-168363.

7.2.11.1.1 Requirements

R1-167743 Requirements for NB IoT Positioning Enhancements Evaluations VODAFONE Group Plc
R1-167101 Discussion on positioning requirements for enhanced NB-IoT CMCC
R1-167790 Requirements for NB-IoT/eMTC positioning Deutsche Telekom AG

R1-167983 WF on requirements for NB-IoT positioning Huawei, HiSilicon

Agreed way forward for reporting to RAN#73

- Report the horizontal accuracy and TOA estimation accuracy at 67%.
- Report the operator requirement to strive towards horizontal accuracy of 50 m for 67% of NB-IoT UEs
- Report observations on positioning accuracy for stationary (i.e., 0 km/h) and pedestrian (i.e., 3 km/h) and 30km/h UEs. 120km/h may be evaluated during the design.
- Report observations for outdoor channel models, and outdoor-indoor channel models where they are available.
- Report observations on time to determine position according to MCL
  - This is the time from trigger for positioning to availability of a positioning estimate
- Report observations on impact of having a lower power class UE
- Report observations on network complexity/cost, for example including LMUs (as described in 36.111)
- Other requirements as for Rel-13 NB-IoT, including
  - Report changes UE complexity compared to Rel-13 NB-IoT
  - Report total impact to UE battery life
  - Report scalability to support massive numbers of UEs per cell
- Report dependency of accuracy performance on synchronous (E-SMLC is assumed to know the absolute timing of each involved eNB) or asynchronous networks

Petitioners' Exhibit 1007, p. 1684
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Requirements are the same for all three operation modes (i.e. stand-alone/in-band/guard band) per the WID
- Companies can provide other inputs to RAN#73 on aspects outside the scope of RAN1 such as security, RAN sharing, etc.

R1-168192 WF on support of reduced processing time for 1ms TTI Intel, Ericsson, Huawei, HiSilicon, LG Electronics, Panasonic, Samsung, Nokia, Alcatel-Lucent Shanghai Bell, Sharp, NTT DOCOMO

Agreement:
- For FS1,2&3, a minimum timing n+3 is supported for UL grant to UL data and for DL data to DL HARQ for UEs capable of operating with reduced processing time with only the following conditions:
  - A maximum TA is reduced to x ms, where x <= 0.33ms (exact value FFS);
  - At least when scheduled by PDCCH
- For FS2, new DL HARQ and UL scheduling timing relations will be defined
  - Details FFS
- FFS:
  - Possible minimum timing of n+2 TTI
    - FFS max TA in this case
    - FFS what other restrictions (if any) on when reduced processing times of n+2 could be applied
  - Possibility of scheduling by EPDCCH.

R1-168243 WF on n+2 transmission timing for 1ms TTI Nokia, ASB

R1-168231 WF on fallback transmission for shortened processing time in 1ms TTI LG Electronics, Sharp, Huawei, HiSilicon, Qualcomm, Ericsson, Intel, NTT DOCOMO
Also supported by Nokia
Proposal:
- For UE capable of shortened processing time for 1ms TTI, the following fallback operations should be supported:
  - If PDCCH for DL assignment is transmitted in the common search space, use legacy processing timing with a minimum timing of 4ms for DL data to DL HARQ feedback

Petitioners' Exhibit 1007, p. 1688
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- If PDCCH for UL grant is transmitted in the common search space, use legacy processing timing with a minimum timing of 4ms for UL grant to UL data
- The above fallback operations are applied to both FS1 and FS2

Agreement:
- Reduced processing time(s) are RRC configured for the UE
- Working assumption: A mechanism for dynamic fallback to legacy processing timings (n+4) is supported
  - Details FFS
  - Working assumption can be revisited if it is not found to be feasible

R1-168187 WF on asynchronous UL HARQ Ericsson, Nokia, ASB

Agreement:
- PHICH-less asynchronous HARQ for UL is used for 1 ms TTI with shortened processing time
  - For FS1 and FS2, bit fields are defined in the applicable DCI messages to indicate HARQ processes ID and RV
  - No change in FS3 asynchronous UL HARQ operation

Asynchronous HARQ: QC, HW, HiSi, Ericsson, LGE, ZTE, Docomo, Nokia, ASB, Spreadtrum, Sharp
Synchronous HARQ: Samsung, CATT, ITRI,
Configurable by the network: Samsung, CATT, ITRI

R1-168261 WF on support of Synchronous UL HARQ Samsung
Proposal:
- PHICH-based synchronous HARQ for UL is supported for 1 ms TTI with shortened processing time for FS1 and FS2.
- For FS3, asynchronous UL HARQ is supported for 1 ms TTI with shortened processing time.

R1-168232 WF on PUCCH resource allocation for shortened processing time in 1ms TTI LGE

R1-168253 WF on further details of simulation assumptions for FeCoMP, ZTE Corporation, ZTE Microelectronics, Intel, ASTRI, Qualcomm, Ericsson, Nokia, Alcatel-Lucent Shanghai Bell, Samsung

Agreement:
- Add the following details into the simulation assumptions:
  - Performance Metric / Parameter
    - Mean, 5%, 50%, 95% user throughput
    - Served cell throughput
    - Resource utilization (RU)
    - Packet arrival rate λ
  - Overhead
    - 3 symbols for DL CCHs, 2 CRS ports and DM-RS overhead according to number of scheduled layers
  - Antenna Polarization Model
    - Model -2 from 36.873
  - Feedback
    - PUSCH 3-2 for non-reciprocity operation (PUSCH 3-0 for reciprocity based operation)
    - CQI, PMI and RI reporting triggered per 5ms
    - Feedback delay is 5 ms
    - Other parameters can be also used
- Baseline schemes are at least below:
  - Rel-13 FD-MIMO without coordination for CS/CB
  - DPS/DPB for NCJT
  - Other option can be also used
- Support M=1 in antenna configuration only for small cell layer in evaluation of Scenario D
- Fix the reference errors proposed in R1-167647

7.2.14.2 Potential enhancements for non-coherent joint transmission

R1-166711 Preliminary evaluation results for non-coherent JT for FeCoMP Samsung
R1-167143 Potential enhancements for non-coherent JT Huawei, HiSilicon
R1-167144 Initial simulation results of non-coherent JT Huawei, HiSilicon

R1-168267 WF on non-coherent JT schemes for FeCoMP, Huawei, HiSilicon, Intel, SoftBank Corp, ZTE, CATT, Qualcomm

Agreement:
- Capture the following non-coherent JT definition and classification in the TR
  - Definition: Non-coherent JT scheme corresponds to the transmission scheme where transmission of the MIMO layer(s) is performed from two or more transmission points (TPs) without adaptive precoding across the TPs.
  - Non coherent JT schemes can be classified based on the CWs transmitted from TPs:
    - **Case 1:** Different CWs are transmitted from different TPs. Each TP perform adaptive precoding independently
    - **Case 2a:** The same CW is transmitted from different TPs with spatial diversity (e.g. SFBC) coding/ spatial multiplexing.
    - **Case 2b:** The same CW is transmitted from different TPs with SFN.
  - Non coherent JT schemes can be classified based on overlapping of resource allocations from different TPs:
    - **Scheme1:** Fully overlapping scheme
      - In this scheme the resource allocations from different TPs for a UE are fully overlapped
    - **Scheme 2:** Partly overlapping scheme
      - In this scheme the resource allocations from different TPs for a UE are partly overlapped
    - **Scheme 3:** Non overlapping scheme,
      - In this scheme the resource allocations from different TPs for a UE are not overlapped

7.2.14.3 Potential enhancements for coordinated scheduling/beamforming with FD-MIMO

Include initial evaluation results

Contents incorporated below
Endorsed

7.2.15.1 VoLTE/video quality improvements

R1-167442 Performance evaluation of coverage enhancements for VoLTE/video quality China Telecommunications

Agreement:
Capture the following text in the reply LS to RAN2:

Petitioners' Exhibit 1007, p. 1693
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

1. VoLTE coverage can be effectively enhanced by relaxing the air interface delay budget. As an example, if the delay budget is extended to 100ms, about 1~3dB coverage gain can be achieved compared with 50ms delay budget for full duplex UEs. Extending maximum packet transmission time beyond 100ms can further improve the coverage. Techniques that can be used to extend the coverage if the air interface delay budget is relaxed are asynchronous UL HARQ transmission and different repetition levels in combination with RTP packet bundling.
   a) Note that the performance can be significantly impacted by the assumption of header compression.
2. The multi-subframe frequency hopping technique that was specified in CE mode A, which enables cross-subframe channel estimation, can be used to enhance the VoLTE coverage effectively.
3. The coverage for half-duplex FDD UEs is less than the coverage for full-duplex UEs. In order to maximize the VoLTE coverage that can be achieved in half-duplex FDD, opportunities to optimize the UL/DL resource utilization have been identified e.g. through techniques to reduce DL repetitions, new repetition factors, and adjusted scheduling delay.

ACTION: RAN1 respectfully asks RAN2 to take the above into account.

8.1 Study on New Radio Access Technology

SID in RP-161214

R1-167373 Workplan for Study on NR Access Technology NTT DOCOMO, INC.
Decision: The document is noted.
R1-167374 Draft TR 38.802 Study on New Radio (NR) Access Technology - Physical Layer Aspects NTT DOCOMO, INC.
The document (draft v0.0.4) was presented by Kazuaki Takeda from NTT DOCOMO.
Decision: The document is noted. Companies are encouraged to contact rapporteur until Wednesday.
Friday: Draft TR is revised in:
R1-168523 Draft TR 38.802 Study on New Radio (NR) Access Technology - Physical Layer Aspects NTT DOCOMO, INC.
Decision: The document is endorsed as v.0.1.0 in R1-168526.

8.1.1 Forward compatibility for new radio interface

General principles to achieve forward compatibility with Phase II specification and beyond

R1-166345 NR service multiplexing requirements Qualcomm Incorporated
The document was presented by Tingfang Ji from Qualcomm and provides Qualcomm's view on forward compatibility requirements, design and timeline for difference service multiplexing scenarios:

- eMBB networks + future URLLC services
- eMBB network + future mMTC services
- WAN network + future side link services
- eMBB non-standalone (NSA) + standalone (SA)
- eMBB licensed + unlicensed
- eMBB + positioning
- Other scenarios

Discussion: Chair suggested companies using the tables as shown in this contribution and get their feedback on the different scenarios.

Petitioners' Exhibit 1007, p. 1694
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Samsung → objection on NSA and SA
Decision: The document is noted. Revised in R1-168088.

R1-166868 NR operation in unlicensed spectrum LG Electronics
The document was presented by … from LGE.
- Proposal 1: With on-going work on LTE LAA for 5 GHz frequency, NR study can first focus on 60 GHz for unlicensed spectrum. For 5 GHz, it seems desirable to consider tight interworking between NR and LAA.
- Proposal 2: 120 kHz (FFS: 240 kHz) sub-carrier spacing can be considered for candidate numerologies for 60 GHz, the same as for 70 GHz.
- Proposal 3: The frame structure containing UL channel/signal in unlicensed spectrum should be designed considering channel access procedure.
- Proposal 4: For UL control design in unlicensed spectrum, consider regional regulation such as PSD, symbol duration, and multiplexing with UL sounding signal.
- Proposal 5: Consider how to transmit cell/beam identification related signals based on channel access procedure.

Decision: The document is noted.

R1-166682 Forward Compatibility of Broadcasted Signals and Channels for mMTC Sierra Wireless, S.A.
The document was presented by Serkan Dost from Sierra Wireless.
- Observation: In LTE, adding support for narrowband UEs required the duplication of many broadcasted signals/channels/info, resulting in >45% broadcasted resource usage in some cases.
- Conclusion: In LTE, it would have been advantageous if the legacy broadcasted signals/channels/info could have been decodable by narrowband UEs.
- Proposal: To avoid duplication, the NR broadcasted signals/channels/info should be decodable by both wideband and narrowband UEs
- Proposal: To optimize wideband UE performance, it shall be possible for NR broadcasted signals/channels/info to use wideband resources not decodable by narrowband UEs.

Decision: The document is noted.

R1-167119 Forward compatibility considerations on NR Integrated Access and Backhaul Qualcomm Incorporated
- Proposal 1: NR design should allow for multiple-hop self-backhauling without dictating hard limits on the hop count.
- Proposal 2: NR design should allow for topological redundant self-backhauling without confining the degree of inter-node connectivity.
- Proposal 3: NR design should allow for dynamic load balancing between backhaul links as well as between backhaul- and access links.
- Proposal 4: NR design should allow for accommodation of local changes in network topology while the remaining self-backhaul network carries traffic.

Decision: The document is noted.

R1-167235 Forward compatibility on duplexing Huawei, HiSilicon
The document was presented by Zukang Shen from Huawei.
- Proposal 1: NR should support unified duplex, fulfilling the following design targets:
  - It should allow traditional FDD operation on a paired spectrum
  - It should allow both DL and UL in either part of a paired spectrum
  - It should allow TDD operation on an unpaired spectrum where the DL/UL configuration is not dynamically changing;
  - It should allow TDD operation on an unpaired spectrum where the transmission direction of most subframes can be dynamically changing;
  - It should allow support of full duplex in the future in a forward compatible way
- Proposal 2: NR should support band-agnostic and duplex-agnostic frame structure.

Decision: The document is noted.

R1-166745 Dynamic Bandwidth Considerations for NR Samsung
The document was presented by … from Samsung.
- Observation 1: Provision of a low complexity and low cost system is necessary in order to overcome the limitations on the NR deployment that may be imposed by the requirement of a large number of RF chains to support very wide bandwidths.
- Observation 2: CA and CB can be considered to achieve freedom of spectrum usage by supporting dynamic BW configuration with CA/CB.
- Proposal: RAN1 should study a potential benefit of channel bonding scheme for unlicensed and shared spectrum in NR deployments.

Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1695
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-168059 **WF on unified duplex** **Huawei, HiSilicon, CMCC, NTT DOCOMO, CATR, Deutsche Telekom, Softbank**

The document was presented by Zukang Shen from Huawei.

- NR should support unified duplex, fulfilling the following design targets:
  - It should allow traditional FDD operation on a paired spectrum
  - It should allow different transmission directions in either part of a paired spectrum
  - It should allow TDD operation on an unpaired spectrum where the transmission direction of time resources is not dynamically changing;
  - It should allow TDD operation on an unpaired spectrum where the transmission direction of most time resources can be dynamically changing;
  - It should allow support of full duplex in a forward compatible way
  - Note: transmission directions include all of downlink, uplink, sidelink, and backhaul link

Discussion: Samsung concern with second sub-bullet and the timing for that one → make clear that it relates to forward compatibility target and not a design target without additional feasibility study (suggested LS asking RAN4 about it)
Decision: The document is noted, modified as follows:

Agreements:

- NR should support at least following design targets:
  - It should allow FDD operation on a paired spectrum
  - It should allow different transmission directions in either part of a paired spectrum
  - It should allow TDD operation on an unpaired spectrum where the transmission direction of time resources is not dynamically changing
  - It should allow TDD operation on an unpaired spectrum where the transmission direction of most time resources can be dynamically changing
  - FFS: It should allow support of full duplex in a forward compatible way
  - Note: transmission directions include all of downlink, uplink, sidelink, and backhaul link
  - Note that additional discussion is needed about the timing to support above targets, particulally the second sub-bullet
  - Note that some design targets may or may not be transparent to UE

Wednesday

R1-168106 **WF on Forward Compatibility for Broadcast Signals/Channels** **Sierra Wireless, Sony, Ericsson, Mediatek**

The document was presented by GustavVos from Sierra Wireless.

- Whether wideband and narrowband UEs can decode the same NR broadcasted signals and channels, should be considered.
  - This doesn't mean the broadcasted signals/channels need to be narrowband

Discussion: Also supported by Panasonic.
Decision: The document is noted and agreed as follows:

Agreements:

- Whether wideband and narrowband UEs can decode either all or partially the same NR broadcasted signals and channels, should be considered
  - This doesn't mean the broadcasted signals/channels need to be narrowband

Friday

R1-168132 **Way forward on the forward compatibility for NR unlicensed** **Intel, Interdigital, Ericsson, Nokia, ASB, Qualcomm, Huawei, HiSilicon, ZTE**

- At least 5 GHz and 60 GHz unlicensed bands are considered for NR unlicensed operation.
- RAN1 to start studying regulatory aspects of potential unlicensed spectrum from forward compatibility perspective.
- Note: Other unlicensed bands are not precluded for NR unlicensed operation.

Decision: The document is noted.

Not treated.

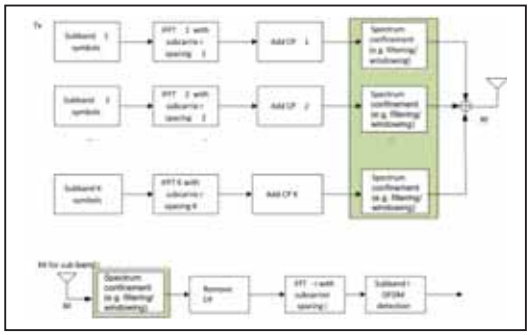
R1-167376 Comparison of candidate waveforms NTT DOCOMO, INC.
R1-167529 An RX based interference mitigation method for waveform with multiple numerologies MediaTek Inc.
R1-167550 Filter delay impact of filtered OFDM on fast feedback Ericsson
R1-167595 OTFS Performance Evaluation for High Speed Use Case Cohere Technologies
R1-167794 Waveform proposal for carrier frequencies beyond 40 GHz Nokia, Alcatel-Lucent Shanghai Bell
R1-167963 Way forward on waveform Huawei, HiSilicon, NTT DOCOMO, Nokia, ASB, Ericsson, Qualcomm, China Unicom, CATT, Samsung, CATR, Vodafone, InterDigital, LG Electronics, Softbank, Deutsche Telekom
Also supported by CT, Verizon
Agreement:

- At least up to 40 GHz for eMBB and URLLC services, NR supports CP-OFDM based waveform with Y greater than that of LTE (assuming Y=90% for LTE) for DL and UL, possibly with additional low PAPR/CM technique(s) (e.g., DFT-S-OFDM, etc.)
  - Y (%) = transmission bandwidth configuration / channel bandwidth * 100%
  - RAN1 specification will support transmission bandwidth configuration corresponding to Y up to approximately100%
  - Some evaluations in RAN1 show that Y for a NR carrier can be up to 98% of the evaluated channel bandwidths for both DL and UL without complexity and latency constraints [R1-166093]
  - Note: additional pre-processing techniques on top of CP-OFDM are not precluded, e.g., OTFS
- Additional waveforms may be supported by NR for e.g. other services (e.g. mMTC)
- It is recommended that RAN4 should target to support eNB/UE with Y significantly higher than 90% when defining the RAN4 requirements where the specification of Y should consider complexity and latency constraints
- In-band frequency multiplexing of different numerologies is supported in NR for both DL and UL, at least from the network perspective
  - It is expected that spectrum confinement on sub-band basis is specified as requirements on
    - Transmitter side in-band emission and EVM requirements
    - Reception performance in presence of other-subband interferer
    - The definition of sub-band is FFS
- From RAN1 perspective, spectral confinement technique(s) (e.g. filtering, windowing, etc.) for a waveform at the transmitter is transparent to the receiver
- Inform RAN4 the above agreements
  - RAN1 plans to perform more evaluations on waveform and will inform RAN4 with future updates, if any

R1-168422 WF on low-PAPR/CM technique Ericsson, Huawei, Panasonic, Vodafone, Qualcomm, ZTE, ZTE Microelectronics

Petitioners' Exhibit 1007, p. 1697
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121



Agreements:

- At least up to 40 GHz for eMBB and URLLC services,
  - CP-OFDM without specified low-PAPR/CM technique(s) is recommended to be supported for uplink
  - For data transmission, additional low-PAPR/CM technique(s) is only considered for uplink from RAN1 specification perspective
    - Additional low-PAPR/CM technique(s) for special downlink signals such as sync signals is FFS
    - Additional low-PAPR/CM technique(s) for other uplink signals/channels is FFS
  - Additional low PAPR/CM technique(s), if specified, and CP-OFDM without specified low-PAPR/CM technique(s) for uplink are considered *as complementary to each other*

R1-168240 LS on NR waveform Huawei

Conclusion:

- The LS is agreed in R1-168258, with the following update:
- ~~For clarification, Figure 1 gives an exemplary illustration of spectrum confinement on a sub-band basis.~~

- ~~Figure 1 Illustration of spectrum confinement on a sub-band basis for downlink~~

R1-168051 WF on Low PAPR Techniques for NR Uplink Qualcomm Inc., Samsung, MediaTek, Interdigital, Idaho National Lab, IITH, CEWiT, Reliance-jio, Tejas Networks, Oppo, Vodafone, Straightpath, LG Electronics, National Taiwan University, [AT&T], Verizon Wireless, National Instrument, Spreadtrum
Also supported by ZTE, ZTE Microelectronics

Agreement:

- NR uplink should target at least the same link budget (i.e. MCL) as LTE uplink, under the same usage scenarios and similar deployment configurations (e.g., same carrier frequency)
  - Details FFS
  - Techniques can be evaluated for the uplink scenarios
    - E.g., low PAPR/CM techniques (including DFT-s-OFDM)

R1-168392 WF on Guard-Band in NR Samsung, CEWiT, IITH, Tejas Networks, Reliance-jio, MediaTek, Ericsson, Nokia, ASB, CMCC, KDDI

Agreement:

- RAN1 should continue study whether/how to support guard-band for inter-subband interfering scenarios (e.g., cases 2/3/4) with considerations of the specification/performance impact

R1-168525 Way forward on the waveform for above 40GHz Nokia, ASB, Intel, InterDigital, Mitsubishi Electric, Qualcomm, MediaTeK, Ericsson, NTU, National Instruments

Agreements:

- When considering DL and UL waveforms for spectrum band above 40GHz, RAN1 should at least consider the impact of
  - Low PA efficiency
  - Phase Noise and Doppler impairments

8.1.2.2 Multiple access scheme

Including remaining evaluation assumptions for multiple access scheme evaluation

R1-166094 LLS Results for UL MA schemes Huawei, HiSilicon
R1-166405 Discussion on grant free concept for UL mMTC ZTE
R1-166493 Low Latency Scheduling-based UL Access Idaho National Laboratory
R1-166551 Views on UL multiple access for NR Intel Corporation
R1-167253 On system level evaluation of multiple access schemes for mMTC and eMBB use cases Nokia, Alcatel-Lucent Shanghai Bell
R1-167554 General framework for efficient access in NR Ericsson
R1-168073 WF on UL LLS for MA Huawei, HiSilicon, CATR, CATT, Fujitsu, Spreadtrum, China Telecom, InterDigital
R1-168427 WF on UL LLS for MA Huawei, HiSilicon, CATR, CATT, Spreadtrum, Fujitsu, CMCC, InterDigital, China Telecom

Observations:

- The following non-orthogonal multiple access schemes have been reported up to RAN1#86 for at least UL NR MA (listed in the order of proposed time, i.e., increasing tdoc number)
  - Sparse code multiple access (SCMA) (e.g., R1-162153)
  - Multi-user shared access (MUSA) (e.g., R1-162226)
  - Low code rate spreading (e.g., R1-162385)
  - Frequency domain spreading (e.g., R1-162385)
  - Non-orthogonal coded multiple access (NCMA) (e.g., R1-162517)
  - Non-orthogonal multiple access (NOMA) (e.g., R1-163111)
  - Pattern division multiple access (PDMA) (e.g., R1-163383)
  - Resource spread multiple access (RSMA) (e.g., R1-163510)
  - Interleave-Grid Multiple Access (IGMA), (e.g., R1-163992)
  - Low density spreading with signature vector extension (LDS-SVE) (e.g., R1-164329)
  - Low code rate and signature based shared access (LSSA), (e.g., R1-164869)
  - Non-orthogonal coded access (NOCA), (e.g., R1-165019)
  - Interleave Division Multiple Access (IDMA), (e.g., R1-165021)
  - Repetition division multiple access (RDMA), (e.g., R1-167535)
  - Group Orthogonal Coded Access (GOCA), (e.g., R1-167535)
- Based on the contributions and the assumptions listed in Tables 1/2/3 in R1-168427, it is observed that non-orthogonal MA outperforms OFDMA in terms of UL link-level sum throughput (R1-163560) and overloading capability in the evaluated scenarios

Agreements:

- NR should target to support UL non-orthogonal multiple access, in addition to the orthogonal approach, targeting at least for mMTC

Proposal:

- In the UL LLS evaluation of non-orthogonal multiple access for mMTC, it is recommended to consider at least the following
  - MA signature (e.g., code, codebook, sequence, interleaver, etc) collision
- FFS Channel correlation between UEs
  - FFS detailed channel correlation model

Continue offline discussion

R1-168074 WF on support of UL grant-free for N Huawei, HiSilicon, China Telecom, Fujitsu, InterDigital
R1-168067 WF on Clarification of Grant-free Transmission for mMTC ZTE, ZTE Microelectronics, Qualcomm, LGE

Agreement:

- NR should target to support UL "autonomous/grant-free/contention based" at least for mMTC

Conclusion:

- In RAN1 discussion for MA, grant-free is used to represent "autonomous/grant-free/contention based"

R1-168257 WF on Clarification of Grant-free Transmission for mMTC ZTE, ZTE Microelectronics, Qualcomm, LGE, Convida, InterDigital

Agreement:

- At least the following options for "autonomous/grant-free/contention based" UL transmission should be studied
  - Opt. 1: a UE performs random resource selection
    - Details FFS
  - Opt. 2: a UE's resource is pre-configured by eNB or pre-determined
    - Details FFS
  - Other options are not precluded

R1-168075 WF on further considerations of UL grant-free for mMTC Huawei, HiSilicon, CMCC, Fujitsu

Petitioners' Exhibit 1007, p. 1700
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-168428 WF on study of UL grant-free Huawei, HiSilicon, CATR, CATT, China Telecom, CMCC, Convida Wireless, Fujitsu, Intel, Spreadtrum, InterDigital, Oppo, Orange, ZTE, Also supported by Nokia, NTT DoCoMo

Agreements:

- Continue study at least the following:
  - Handling of potential collisions of MA signatures
  - Retransmission/repetition and potential combining, e.g. HARQ
  - Potential link adaptation, e.g. MCS/signature re-assigning
  - Relationship between grant-free and grant-based transmissions and associated UE behavior
  - Advanced receiver capabilities including complexity analysis

R1-168426 WF on definition of UL grant-free resource Huawei, HiSilicon, CATR, CATT, China Telecom, CMCC, Convida Wireless, Fujitsu, Intel, Spreadtrum, InterDigital, Oppo, Orange

R1-168423 WF on some definition of terminologies for "autonomous/grant-free/contention-based" MA LG Electronics, ETRI

R1-168325 WF on MA resource clarification ZTE, ZTE Microelectronics, Qualcomm

Agreements:

- A MA physical resource for "grant-free" UL transmission is comprised of a time-frequency block
  - Note: spatial dimension is not considered as a physical resource in this context
- A MA resource is comprised of a MA physical resource and a MA signature, where a MA signature includes at least one of the following:
  - Codebook/Codeword
  - Sequence
  - Interleaver and/or mapping pattern
  - Demodulation reference signal
  - Preamble
  - Spatial-dimension
  - Power-dimension
  - Others are not precluded
- Details on MA physical resource and MA signature resource FFS

R1-168538 WF on further clarification on grant-free transmission for mMTC LG Electronics, Huawei, HiSilicon, ETRI

Continue discussion next meeting

R1-168076 Way forward on physical layer abstraction for UL non-linear receiver Huawei, HiSilicon, CMCC, Samsung, CATT

Agreement:

- For calibration purpose ONLY:
  - For ML-type receiver, the PHY abstraction method discussed R1-168076 can be used at least for some MA schemes
    - If a different PHY abstraction method is used by a company, it has to be stated clearly and individually verified
  - Otherwise, the PHY abstraction method is up to each company
    - The PHY abstraction method is to be stated and individually verified by each company
- For evaluation purpose, PHY abstraction method is up to each company
  - A same method is used for calibration and evaluation by a given company, unless a single method can be agreed in RAN1 during evaluation phase

R1-168068 WF on UL Multiple Access Scheme Categorization for mMTC ZTE, ZTE Microelectronics, Qualcomm

R1-168069 WF on System Level Simulation Parameters for mMTC ZTE, ZTE Microelectronics, Qualcomm

R1-168326 WF on System Level Simulation Parameters for grant-free MA ZTE, ZTE Microelectronics, Qualcomm

Continue discussion next meeting especially regarding the motivation for overhead modeling and how to model the overhead

R1-168123 Way forward on non-orthogonal multiple access evaluation Samsung, Qualcomm, LGE

Revision of R1-168116

Agreement:

- For NR non-orthogonal multiple access evaluation, realistic channel estimation is prioritized and the following aspects are considered
  - The proposed DMRS pattern(s), if any, for channel estimation
    - FFS: DMRS overhead. E.g., LTE UL DMRS overhead can be used as a reference.
    - FFS: DMRS contamination due to inter-cell interference
    - FFS: Impact of DMRS collision in case of "autonomous/grant-free/contention based" multiple access
- Note: companies report the DMRS settings used for the LLS/SLS evaluation.

R1-168115 Way Forward on SLS assumptions for autonomous/grant-free/contention-based MA LG Electronics, ZTE, ZTE Microelectronics

R1-168540 WF on SLS baseline for NR MA Huawei, HiSilicon

Agreements:

- For providing absolute system level evaluation results for UL mMTC, for calibration purpose only

Petitioners' Exhibit 1007, p. 1701
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- CP-OFDM as the UL waveform
  - UL DMRS overhead, 1 OFDM symbol out of 7 OFDM symbols
- A UE selects a MA physical resource randomly from a pool of orthogonal MA physical resources
  - There is no partial overlapping between the MA physical resources selected by more than one UE
  - All orthogonal MA physical resources are of same size
- Rx MMSE receiver, assuming realistic channel estimation
  - No blind decoding assumed
- Same MCS for all UEs,
  - MCS is reported by each company
- Open loop power control
  - Alpha=1, P0= -90 dBm
- Packet size is fixed by 20 bytes
- FFS other parameters, if any
  - Email discussion on any other potential parameters until 9/2 – Yi Wang (Huawei)

- Note: The above assumptions only apply to the calibration purpose, i.e. other assumptions can be used for evaluation of proposed non-orthogonal multiple access scheme(s)

R1-168541 WF on work plan for NR MA Huawei, HiSilicon

Conclusion:

- Target the following in RAN1#86bis:
  - Summary of preliminary LLS comparisons
  - Summary of preliminary SLS comparisons

R1-168551 Email discussions on NR MA Huawei, HiSilicon

- Huawei will provide the initial version of template for preliminary simulation results summary by 9th Sept, and email discussion about this template by 16th Sep (Yi, Huawei)
  - Note that SLS and LLS will have different templates
- Email discussion on SLS calibration (Yi *Huawei*) until 16th Sep.
- Email discussion on potential categorization of NR MA schemes (Yifei *ZTE*) Until RAN1 #86bis

8.1.3 Numerology and frame structure for new radio interface

8.1.3.1 Numerology

*Focus on the set of scale factors n in fc=15*2^n that will be supported in Phase I, whether we have symbol alignment across the scalings or not*

Tuesday

R1-168090 WF on alignment among different numerologies LG Electronics, Qualcomm

The document was presented by Yunjung Yi from LGE.

- For different numerology alignment, define the following two cases
  - Inband case: different numerologies are multiplexed in the same NR carrier
  - Outband case: different numerologies are not multiplexed in the same NR carrier
- Symbol level alignment is assumed in the following cases
  - Different subcarrier spacings with the same CP overhead in inband case
- In other cases, symbol level alignment is not assumed.
  - FFS: Slot/subframe level alignment for outband case
- For normal CP family, choose one option from the followings for symbol-level alignment
  - For $F_s = F_0 * 2^n$ (n is a positive integer, $F_0 = 15$ kHz),
    - Each symbol length (including CP) of F_0 equals the sum of the corresponding 2^n symbols of F_s
    - Option 1: The first 2^n symbols of F_s have equal symbol length
    - Option 2: Except for the first symbol of F_s, all symbols of F_s have equal symbol length. The length of first symbol of F_s is sum of length of the second symbol and 0.51 us
      - Option 2-1. 0.51us can be reserved, and all symbols have the equal length

Discussion: Intel requested looking at 6553.

Petitioners' Exhibit 1007, p. 1703
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted.

R1-166553 Time interval alignment between different numerologies Intel Corporation

The document was presented by Joonyoung Cho from Intel.

- Proposal 1 (even split of 1 ms duration)
  - Duration of a time interval X for a given subcarrier spacing for cases of 15 kHz or larger is identical throughout the 1ms duration.
- Proposal 2 (single numerology for each subcarrier spacing and CP type)
  - Time interval X for a given subcarrier spacing and CP type has a single and identical numerology in all instances of the time interval X within the 1ms duration.
- Proposal 3 (1 ms boundary alignment for <15 kHz subcarrier spacing cases)
  - The start and end of a time interval X for a subcarrier spacing smaller than 15 kHz are aligned with 1 ms boundaries of 15 kHz subcarrier spacing subframes.

Decision: The document is noted.

Possible agreements:

- Symbol level alignment across the different subcarrier spacing is assumed in the case of the same CP overhead in the same subframe duration on the same NR carrier
- Extended CP is supported in NR

Continue offline discussion until Wednesday – (Qualcomm, Huawei)

Wednesday

R1-168321 Way forward on Cyclic Prefix Huawei, HiSilicon, LGE, Sony, Vodafone, Intel, CATR, CMCC Ericsson, Orange, Mediatek, Verizon, InterDigital, OPPO, CATT, China Telecom, AT&T

The document was presented by Zhenfei Tang from Huawei.

- More than one CP length should be supported for a given sub-carrier spacing
  - The different CP lengths for a given sub-carrier spacing should be of substantially different lengths.
  - For 60 kHz subcarrier spacing, at least one CP length is similar to the normal CP length of 15 kHz corresponding to LTE numerology
- Note: FFS whether all of sub-carrier spacings support more than one CP length or not
- Note: FFS whether supporting more than one CP length for a given sub-carrier spacing is mandatory or optional for a given UE

Decision: The document is noted.

R1-168338 WF on CP overhead ZTE, ZTE Microelectronics, Qualcomm

The document was presented by Thorsten Schier from ZTE.

- CP overhead should be studied, especially for the case of 60 kHz subcarrier spacing.
- NR should support solutions with the same or better performance than LTE in all channel conditions

Decision: The document is noted.

Agreements:

- NR design should allow potentially defining multiple CP lengths for a given subcarrier spacing in Phase I or later
  - Multiple CP lengths do not mean the normal CP have 2 different CP lengths in the LTE
- It should be possible to deploy NR with 60 kHz subcarrier spacing in the channel that have the same delay spread that LTE can handle with the normal CP length as one use case
  - Other subcarrier spacing solution can be considered with an equal priority in the further study
- More than one CP length should be studied for a given subcarrier spacing
  - The different CP lengths for a given subcarrier spacing can be of substantially different lengths
  - For 60 kHz subcarrier spacing, at least one CP length can be similar to the normal CP length of 15 kHz corresponding to LTE numerology
  - Other proposals are not precluded
- Note: FFS whether all of subcarrier spacings support more than one CP length or not
- Note: FFS whether supporting more than one CP length for a given subcarrier spacing is mandatory or optional for a given UE

R1-168305 WF on alignment among different numerologies LG Electronics, Intel, Ericsson, Qualcomm, Samsung, Verizon

Agreements:

- Subframe duration in ms for a reference numerology with subcarrier spacing (2^m*15)kHz is exactly $1/2^m$ ms

Working assumption:

- Alignment within a subframe

Petitioners' Exhibit 1007, p. 1704
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Symbol level alignment across different subcarrier spacings with the same CP overhead is assumed within a subframe duration in a NR carrier
- FFS: Unlicensed spectrum case

R1-168503 Way forward on slot alignment Huawei, HiSilicon, MediaTek
R1-168524 Way forward on slot alignment Huawei, HiSilicon, MediaTek

8.1.3.2 Frame structure

R1-166364 NR numerology scaling and alignment Qualcomm Incorporated

The document (Sections 3 and 4 only) was presented by Qualcomm.

- Proposal 2: tones of scaled numerology have center of subcarrier aligned on the grid of base numerology with wider SCS being a subset of narrower SCS in a nested manner
- Proposal 3: fixed number of tones per RB regardless of numerology
- Proposal 4: RB partition is fixed for each numerology, and schedule allocates RB based on user-specific numerology in the unit of integer number of RBs for that numerology

Decision: The document is noted.

R1-166765 Discussion on resource block size in NR Samsung

The document was presented by Young Han Nam from Samsung.

- Observations
  - NR should support much wider range of transmission bandwidth than LTE
  - Minimum payload size gives an impact on determining the PRB size and the minimum size of payload could be different depending on the potential applications and use cases to be identified.
  - Fixed time and frequency granularity approach would provide limited scalability and flexibility.
  - Scalable time and frequency granularity would sufficiently provide scalability and flexibility.
- Proposal: PRB size to be specified in NR should support scalable time/frequency granularity.

Decision: The document is noted.

R1-167338 Discussion on physical resource block for NR numerologies Panasonic Corporation

The document was presented by … from Panasonic.

- Proposal 1: The number of REs in a PRB is roughly same as LTE regardless of subcarrier spacing for eMBB and mMTC.
- Proposal 2: The number *M* of subcarriers in a PRB is same regardless of subcarrier spacing for eMBB and mMTC.
- Proposal 3: PRB boundary is aligned among numerologies. Possible guard is realized by rate matching and/or puncturing..
- Proposal 4: Centre DC subcarrier handling is same among downlink, uplink and sidelink.
- Proposal 5: PRB boundary position should not be influenced by DC subcarrier insertion. If one carrier needs to be nulled, it is realized by rate matching and/or puncturing.
- Proposal 6: Common PRB boundary position should be used regardless of the system bandwidth is odd number of PRBs or even number of PRBs.
- Proposal 7: PRB size well aligned with channel raster could be consider to simplify the RF component of UE.

Decision: The document is noted.

R1-167261 On resource block grouping and multicell coordination aspects for mixed numerology support Nokia, Alcatel-Lucent Shanghai Bell

The document was presented by Karri Ranta-aho from Nokia.

- Observation 1: Previous results indicate performance benefits when using UE/service-specific numerology, e.g. for mixing use cases with different velocities or latency requirements.
- Proposal 1: Grouping of resources into resource block groups (RBG) with same numerology should be considered as a solution for enabling mixed numerology and a configurable air interface.
- Proposal 2: The RBG has a common absolute size in both time and frequency and it defines the minimum granularity for variable numerology within a same NR carrier bandwidth.
- Proposal 3: The size of one physical resource block (PRB) in terms of number of resource elements is common for all numerologies.
- Observation 2: Different levels of coordination of numerology among cells are possible. The need for coordination depends on the processing technique.
- Proposal 4: New Radio should provide possibilities of at least partial numerology coordination via the inter-base-station interface (the NR variant of the X2 interface).

Petitioners' Exhibit 1007, p. 1706
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal 5: New Radio should provide possibilities of reference- and sounding symbol numerology alignment across multiple cells. For those reference and sounding symbols time-multiplexing with the option of full numerology alignment across different cells should be considered.

Decision: The document is noted.

R1-166941 On design of mixed numerology in a NR carrier ETRI

The document was presented by … from ETRI and investigates several issues in the NR carrier design under the mixed numerology framework.

Decision: The document is noted.

R1-166104 Discussion on time domain structures Huawei, HiSilicon

The document was presented by David Mazzarese from Huawei.

Proposal 1: Three time domain structures should be supported for the new radio.

- DL-only time domain structure composed of a DL transmission part
- UL-only time domain structure composed of an UL transmission part
- Mixed DL and UL time domain structure composed of a DL transmission part (located at the beginning), a guard and an UL transmission part (located at the end)
  - DL-dominant: a DL transmission part (mainly for data assignments and data), a guard, a configurable short UL transmission part (mainly for UCI and SRS).
  - UL-dominant: a configurable short DL transmission part (mainly for data assignments), a guard, a UL transmission part (mainly for data, UCI and SRS)

Proposal 2: NR should support both dynamic TDD operation and semi-static TDD operation.

- Candidate TDD UL/DL configurations could be defined in NR for semi-static TDD operation. FFS the detailed candidate TDD UL/DL configurations.
- The "direction" (uplink or downlink) of a subframe can change on subframe basis for dynamic TDD operation. FFS the indication of the "direction" of a subframe.

Proposal 3: The basic length of a time domain structure is equal to the subframe durartion, which is defined from a basic time unit of 1 ms corresponding to a basic subcarrier spacing f_0 with a given number of OFDM symbols for a given CP length, and the subframe duration scales with subcarrier spacing.

- Shorter subframe durations with 0.5ms, 0.25ms and 0.125ms are supported with the subcarrier spacing increasing.
- Longer subframe duration with the subcarrier spacing decreasing is FFS.

Proposal 4: A first DL control channel located at the front of each time interval of a basic length (i.e. subframe) of a time domain structure should be supported in NR. A second DL control channel embedded in the data region in DL subframe or DL-dominant structure can also be considered for NR.

Proposal 5: The reference signals used for demodulating a control channel or a data channel are contained only within the same time/frequency resource for that channel, and are transmitted only when that channel is present.

Decision: The document is noted.

R1-166365 Advanced frame structure Qualcomm Incorporated

The document was presented by … from Qualcomm.

- Observation 1. Advanced frame structures should allow for low priority links to yield to higher priority links to enable dynamic and decentralized UL-DL switching.
- Observation 2. Advanced frame structures should allow some gaps for sensing to enable control interval transmission on unlicensed spectrum.
- Observation 3. Advanced frame structures should allow for UE's to establish sidelink and exchange traffic while managing interference. This may apply to both broadcast and unicast sidelink transmissions.

Decision: The document is noted.

R1-166664 Frame Structure Design for NR Sony

The document was presented by Martin Beale from Sony.

- Proposal 1: RAN1 agree on (1) basic atomic building blocks of NR and (2) the time to process the building blocks.
- Proposal 2: During the NR study phase, RAN1 create some reference physical structures that are used for the purposes of evaluation.
- Proposal 3: Combinations of building blocks that span an Interval-X should be signaled semi-statically.
- Proposal 4: The DL transmission part, guard and UL transmission part can exist in any order within an Interval-X.
- Proposal 5: Within an Interval-X, there can be a guard region after the uplink transmission region.
- Proposal 6: RAN1 evaluates UE timing constraints before defining bidirectional self-contained TDD physical structures (Interval-X).
- Proposal 7: The basic physical structure of NR should allow the creation of NR subframes of a length that is either an integer multiple of the LTE subframe length or a common divisor of the LTE subframe length.

Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1707
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-167946 Outcome of off line discussion NTT DOCOMO, Inc.

The document was presented by Fred Takeda from NTT DOCOMO.

- A subframe duration is defined by *x* OFDM symbols for a given CP overhead.
  - *x* is the same for all subcarrier spacing values.
  - This does not preclude multiple scheduling occasions within a subframe duration.
  - This does not preclude that one scheduling occurs over multiple subframe durations.
- A UE assumes at least one reference numerology in a given NR carrier which defines subframe duration.
- Specification supports multiplexing numerologies in TDM and/or FDM within/across (a) subframe duration(s).

Decision: The document is noted, modified as follows:

Agreements:

- A subframe duration is defined by the duration of *x* OFDM symbols given a reference numerology
  - With the same CP overhead, a single value of *x* is specified irrespective of the subcarrier spacing value chosen for the reference numerology
  - This does not preclude multiple data transmission opportunities in time within a subframe duration
  - This does not preclude multiple control transmission opportunities in time for both DL and UL within the subframe duration
  - This does not preclude one data transmission to span over multiple subframe durations
- A UE has one reference numerology in a given NR carrier which defines subframe duration for the given NR carrier
  - FFS: In a given NR carrier, whether different UEs may have different reference numerologies or may not
- Specification supports multiplexing numerologies in TDM and/or FDM within/across (a) subframe duration(s) from a UE perspective

Agreement:

- PRB definition where the number of subcarriers per PRB is the same for all numerologies is supported
  - Examples of the number of subcarriers per PRB for NR study are 12, ~~10~~, 16
  - Additional PRB definition with the different number of subcarriers is not precluded

Agreement:

- For subcarrier spacing of 2^n * 15kHz, subcarriers are mapped on the subset/superset of those for subcarrier spacing of 15kHz in a nested manner in the frequency domain

Agreement: The number of subcarriers per PRB for NR study are 12, 16

Conclusion: RAN1 will down select the number of subcarriers per PRB in the next meeting

R1-167956 Way Forward on RB allocation for mixed numerologies ZTE, ZTE Microelectronics, Ericsson, Qualcomm

The document was presented by Patrick Svedman from ZTE.

- Subcarriers from scaled numerologies are aligned such that their center frequencies coincide
- RBs for different numerologies have a fixed grid
- Resources are allocated in integer numbers of resource blocks (RBs)
- For numerologies that are derived by sub-carrier spacing scaling from the same basic numerology, their RB grids are allocated according to the enclosed figure

Decision: The document is noted. Continue offline discussion until Tuesday

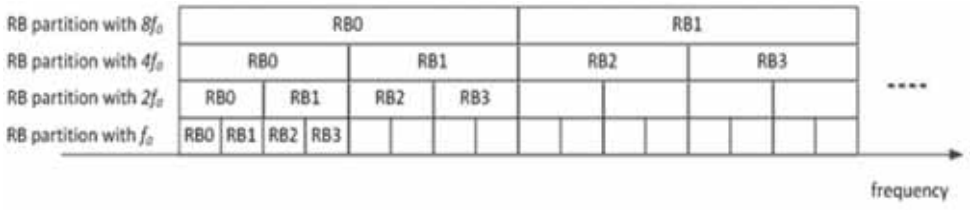
Tuesday: Revised in

R1-167978 Way Forward on RB allocation for mixed numerologies ZTE, ZTE Microelectronics, Ericsson, Qualcomm, Nokia, Alcatel-Lucent Shanghai Bell

- For one NR carrier
  - Each numerology has a fixed RB grid
  - Resources are allocated in integer numbers of resource blocks (RBs).
  - For subcarrier spacing of 2^n * 15kHz, RBs are mapped on the subset/superset of RBs for subcarrier spacing of 15kHz in a nested manner in the frequency domain

Decision: The document is noted. Further revised in:

R1-168140 Way Forward on RB allocation for mixed numerologies ZTE, ZTE Microelectronics, Ericsson, Qualcomm, Nokia, Alcatel-Lucent Shanghai Bell, Panasonic



Decision: The document is noted

Agreements:

- In one carrier when multiple numerologies are time domain multiplexed,
  - RBs for different numerologies are located on a fixed grid relative to each other
  - For subcarrier spacing of 2^n * 15kHz, the RB grids are defined as the subset/superset of the RB grid for subcarrier spacing of 15kHz in a nested manner in the frequency domain

Petitioners' Exhibit 1007, p. 1708
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Note that following numbering in the figure is just an example
- FFS: frequency domain multiplexing case

Continue offline discussion until Wednesday – Thorsten (ZTE)

R1-168309 Way Forward on RB grid definition for mixed numerologies ZTE, ZTE Microelectronics, Ericsson, Qualcomm, Nokia, Alcatel-Lucent Shanghai Bell, Panasonic, Convida Wireless

Conclusions: Proponents are encouraged to study followings

- Alt. 1: Adopt RB grid for FDM as it is agreed in TDM
- Alt. 2: Use RB grid corresponding to the reference numerology for FDM, applied the same grid to TDM, and revisit above agreements for TDM

Possible agreements:

- No explicit DC subcarrier reserved
- DL and UL have the same DC subcarrier handling

Continue offline discussion until Tuesday

Tuesday Agreement: No explicit DC subcarrier is reserved both for DL and UL

R1-166362 **Self-contained subframe timeline analysis Qualcomm Incorporated**

The document was presented by Jing Jiang from Qualcomm.

- Observation 1: A fundamental sustainability threshold for UE modem processing throughput on the downlink is one symbol processed per symbol time.
- Observation 2: In a self-contained DL subframe, the amount of gap between the end of the data channel to the beginning of ACK/NACK heavily impacts modem processing pipeline architecture and the hardware capability requirement.
- Observation 3: Even with symbol-by-symbol processing, the pipeline depth may span more than one symbol time. This in turn imposes a requirement for the amount of gap. Reducing the payload towards the end of the data channel is an effective way to decouple pipeline design and the amount of gap required.
- Proposal 1: UE capability framework should be designed to be flexible to facilitate hardware-efficient support for self-contained subframe.
- Observation 4: Scaled numerology facilitates better pipelined processing and offers significant timeline advantage, which is especially crucial for self-contained UL centric subframe.
- Proposal 2: Scaled numerology for the downlink control channel should be studied with applicability for uplink-centric and downlink centric self-contained subframe types.
- Observation 5: Symbol-by-symbol construction and transmission of uplink data is crucial for reducing the latency in UE responses.
- Proposal 3: Uplink reference signal and data channel should be designed to facilitate symbol-by-symbol processing on the UE. This study should extend up the protocol stack to ensure there is no roadblock and to identify potential cross-layer optimizations.
- Proposal 4: UL burst channel structure should be designed with considerations for processing timeline to feedback ACK/NACK.
- Observation 6: Self-contained subframe operation may be feasible with gaps on the order of ~1 OFDM symbol, and equivalently with X and Y on the order of 10s of us.
- Proposal 5: Downlink control and data channels should be designed with flexibility to support single-interlace transmission to allow time-critical processing on the eNB side for immediate ACK processing and potential retransmission.

Decision: The document is noted.

R1-167523 **Timing Relationship for NR Frame Structure MediaTek Inc.**

The document was presented by Peikai Liao from MediaTek.

- Proposal 1: For eMBB, the time separation, X, between the end of the DL data transmission and the beginning of corresponding acknowledgement reporting should be ≥ 160μs.
- Proposal 2: For eMBB, the time separation, Y, between the end of UL grant transmission and the beginning of the corresponding uplink data transmission should be ≥ 160μs.
- Proposal 3: For eMBB, the following timing relationship should be the baseline.

Petitioners' Exhibit 1007, p. 1709
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - Timing relationship between DL data reception and its corresponding acknowledgement in UL: Subframe N→N+2+K or N+4+K, where K is signalled to a UE dynamically and/or semi-statically; FFS K values
  - Timing relationship between UL assignment and its corresponding UL data transmission: Subframe N→N+2+K or N+4+K, where K is signalled in DCI; FFS K values
  - Timing relationship between DL scheduler and its corresponding DL data: Subframe N→N
- Proposal 4: For URLLC, further evaluate whether self-contained operation is necessary.
- Proposal 5: For self-contained operation, DL physical data channel structure should enable on-the-fly decoding with the following design considerations.
  - Demodulation pilots for the physical DL control channel should be located at the beginning of the physical DL control channel.
  - Decoding complexity of physical DL control channel should be reduced with high reliability, compared to LTE.
  - Demodulation pilots for the physical DL data channel should be located at the beginning of the physical DL data channel but other additional demodulation pilots at later location are not precluded.
  - Demodulation pilots for the physical UL data channel should be located at the beginning of the physical UL data channel but other additional demodulation pilots at later location are not precluded.
  - Coded bit to RE mapping should be frequency first and then time in DL data channel.
  - Code block size for DL data should be equal to or less than 3000 bits.
- Proposal 6: For self-contained operation, UL physical data channel structure should enable on-the-fly encoding with the following additional design considerations.
  - Demodulation pilots for the physical UL data channel should be located at the beginning of the physical UL data channel but other additional demodulation pilots at later location are not precluded.
  - Coded bit to RE mapping should be frequency first and then time in UL data channel.
  - Code block size for UL data should be equal to or less than 3000 bits.

Decision: The document is noted.

R1-167299 Timing requirements and scenarios for 5G NR Hybrid ARQ Nokia, Alcatel-Lucent Shanghai Bell

The document was presented by Karri Ranta-aho from Nokia.

- Observation 1: The timing of ACK/NACK's and the number of SAW channels shall be configurable to efficiently support for different network implementations (e.g. to account for L1-L2 latencies for C-RAN implementations). The range of timing values from uplink data transmission until reception of the corresponding ACK/NACK by the UE should be configurable to equal values of sub-ms up to values of ~6 ms.
- Observation 2: The HARQ scheme shall support asymmetric link operation, where the transmission time interval (TTI) and/or time of ACK/NACK transmissions can be configured differently for the uplink and downlink per UE.
- Observation 3: For URLLC, various HARQ enhancements such options for early ACK/NACK feedback, automatic retransmissions until reception of ACK, and potential joint UL/DL HARQ design shall be supported.
- Observation 4: For mMTC use cases, options for simplified HARQ operation are desirable, including support for low cost mMTC devices with half-duplex capabilities and relaxed timing requirements.
- Observation 5: The minimum supported timing relationship between DL data reception and the corresponding UL ACK/NACK transmission, as well as the minimum ttiming relationship between the UE receiving an UL scheduling assignment and corresponding UL data transmission, could be UE category dependent.
- Proposal 1: The following timing relationships shall be flexibly configurable per UE; (i) timing relationship between DL data reception and corresponding ACK/NACK, (ii) time-duration of the ACK/NACK transmission, and (iii) timing relationship between the UL assignment and corresponding UL data transmission. Configured per UE, using either dedicated RRC-, MAC-, or PHY-level control signalling,
- Proposal 2: It shall be studied if there are attractive complexity and cost tradeoffs from having UE categories with different minimum timing relationships for DL data reception and the corresponding UL ACK/NACK transmission, and between the UE receiving an UL scheduling assignment and corresponding UL data transmission.

Decision: The document is noted.

Observations:

- At least followings are potentially identified as mean to realize the short processing delay and RAN1 will continue to study it
  - Frequency-first and time-second mapping
  - Code block segmentation that facilitates symbol-by-symbol processing
  - Reduce symbol durations
  - DL assignment and UL grant before and/or at the beginning of its scheduled data duration
  - TBS restriction
  - Timing advanced restriction
  - Channel coding
  - Front loaded RS mapping for control channel
  - Grant free transmission

Petitioners' Exhibit 1007, p. 1710
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreements:

- Unless otherwise specified or indicated to the UE, the UE shall make no assumption on whether to transmit or to receive at least within the data region(s) in a given time interval X
  - Indication to the UE may include
    - Dynamic L1 signaling
    - RRC configuration
    - Broadcast signaling
    - …

Agreements:

- The following is supported for NR
  - From UE perspective, HARQ ACK/NACK feedback for multiple DL transmissions in time can be transmitted in one UL data/control region is supported
  - Some or all of the following timing relationships can be indicated to a UE dynamically by the L1 DL signaling (FFS: explicit or implicit)
    - Timing relationship between DL data reception and corresponding acknowledgement
    - Timing relationship between UL assignment and corresponding UL data transmission
    - Note: Default value, if any, for each timing relationship is FFS (agreement from RAN1 #85)
    - Note: Potential values for each timing relationship has to be studied further considering e.g., UE processing capability, gap overhead, UL coverage, and etc. (agreement from RAN1 #85)
    - Note: Other means of indicating the timing relationship are not precluded
  - Some or all of the following timing relationships can be indicated to a UE semi-statically (FFS: explicit or implicit)
    - Timing relationship between DL data reception and corresponding acknowledgement
    - Timing relationship between UL assignment and corresponding UL data transmission
    - Note: Default value, if any, for each timing relationship is FFS (agreement from RAN1 #85)
    - Note: Potential values for each timing relationship has to be studied further considering e.g., UE processing capability, gap overhead, UL coverage, and etc. (agreement from RAN1 #85)
    - Note: Other means of indicating the timing relationship are not precluded

Possible agreements:

- NR design at least supports the following
  - Fixed default timing relationship between DL assignment and corresponding DL data transmission
  - FFS: Additionally, a UE is indicated dynamically and/or semi-statically on timing relationship between DL assignment and corresponding DL data reception
    - Note: This additional signalling can overrides the fixed default timing
  - FFS: A UE is indicated dynamically and/or semi-statically on the duration for DL data reception and UL data transmission

Continue offline discussion within Wednesday – (LGE)

Wednesday

R1-168304 WF on Data Scheduling LG Electronics, Qualcomm

The document was presented by Yunjung Yi from LGE.

- NR design supports the following
  - A UE is indicated dynamically and/or semi-statically on timing relationship between DL assignment and corresponding DL data reception
  - FFS whether there is a fixed timing relationship between DL assignment and corresponding DL data transmission
  - A UE is indicated dynamically and/or semi-statically on the duration for DL data reception and UL data transmission

Decision: The document is noted.

R1-168290 WF on Legacy UEs Blank Resource Indication Qualcomm Incorporated, Samsung, Ericsson

The document was presented by Tingfang Ji from Qualcomm.

- Proposal 1: Study signalling describing blank resources in time- and/or frequency-domains in each "slot".
- Proposal 2: Consider broadcast and unicast signalling options
  - Unicast signalling could be in the DCI for scheduled legacy UEs to implicitly describe blank resources
  - Broadcast signalling could be used for scheduled and non-scheduled UEs

Decision: The document is noted.

Continue offline discussion until Thursday – Yunjung (LGE), Tingfang (Qualcomm)

R1-168434 WF on Resources for data scheduling LG Electronics, Qualcomm
R1-168502 WF on Resources for data scheduling LG Electronics, Qualcomm

Conclusions: Further study

- how to multiplex mini slot and slot

Petitioners' Exhibit 1007, p. 1711
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- the benefit and mechanism of indicating blank resources at least for forward compatibility perspective

R1-168058 Way Forward on Slot Types Huawei, HiSilicon, Docomo, Nokia, Alcatel-Lucent Shanghai Bell

The document was presented by David Mazzarese from Huawei.

- Basic slot types are shown in enclosed figure (seen from the network)
  - Basic slot type is defined by the number of (*N*) OFDM symbols using the same numerology
    - *N*=7 for normal CP, *N*=6 for extended CP
    - This means there can be 0, 1 or 2 DL/UL switching points within 1 ms at 15 kHz subcarrier spacing, depending on network choice
  - Shorter slots are obtained with larger subcarrier spacing
- Additional slot types are not precluded

Decision: The document is noted.

R1-167441 Comparison of time domain frame structure Panasonic Corporation

The document was presented by Hidetoshi Suzuki from Panasonic.

- Proposal: For 15 kHz subcarrier spacing of self-contained allocation with sufficient DL or UL data length cases, 2 HARQ process within 1ms and 1 DL to UL switching point should be used. In the other cases, 1 HARQ process within 1ms and 0 or 1 DL to UL switching period should be used.

Decision: The document is noted.

R1-168108 WF on time-domain structure in NR LGE, Panasonic

The document was presented by Yunjung Yi from LGE.

- Within a subframe of x OFDM symbols, at least the following are supported
  - DL portion
    - DL portion size can be from 0 to 14 symbols from the start of the subframe
  - UL portion
    - UL portion size can be from 0 to 14 symbols
    - The time-location of UL portion within a subframe can be flexible
- x = 14 with 15 kHz normal CP

Decision: The document is noted.

Possible agreements:

- Within a time transmission duration of y OFDM symbols, at least the following are supported
  - DL portion
    - DL portion size can be from 0 to y time transmission duration from the start of the time transmission duration
    - At least 0 and y are supported
  - UL portion
    - UL portion size can be from 0 to y time transmission durations
    - At least 0 and y are supported
    - The time-location of UL portion within a time transmission duration can be flexible
  - DL/UL portion is contiguous

Possible agreement:

- x = 14 with 15 kHz normal CP

Continue offline discussion within Tuesday – (Panasonic)

R1-168154 WF on time-domain structure in NR Panasonic

The document was presented by Hidetoshi Suzuki from Panasonic.

Decision: The document is noted and:

Possible agreements:

- In case of the same numerology between DL and UL, within a time duration of y OFDM symbols, the following are supported
  - DL portion
    - DL portion size can be from 0 to y symbol time duration from the start of the time duration
    - At least 0 and y are supported
  - UL portion
    - UL portion size can be from 0 to y symbol time duration
    - At least 0 and y are supported
    - The time-location of UL portion within a time transmission duration can be flexible
  - y symbols are contiguous
- FFS: Start from UL portion case
- At least following is supported.

Petitioners' Exhibit 1007, p. 1712
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - y = 14 in 15 kHz subcarrier spacing in normal CP
  - FFS: y= 7 with 15 kHz subcarrier spacing in normal CP
- FFS: a time duration y is same as a subframe duration or multiple time duration present in a subframe duration.
- FFS: different numerology between DL and UL

Continue offline discussion within Tuesday – (Panasonic)

Wednesday

R1-168167 WF on time-domain structure in NR Panasonic, LGE

Decision: The document (update of R1-168154) is noted. Further revised in:

R1-168341 WF on time-domain structure in NR Panasonic

Decision: The document is noted.

Possible agreements:

- In case of the same numerology between DL and UL, within a time duration of y OFDM symbols, the following are supported
  - DL portion
    - DL portion size can be from 0 to y symbol time duration from the start of the time duration
    - At least 0, y, one value within the range (0,y) are supported
    - Within a DL portion, one or multiple mini slots can be available.
  - UL portion
    - UL portion size can be from 0 to y symbol time duration
    - At least 0, y, one value within the range (0,y) are supported
    - The time-location of UL portion within a time transmission duration can be flexible
    - Within a UL portion, one or multiple mini slots can be available.
  - Each of DL portion and UL portion is contiguous.
  - The spec should allow DL portion and UL portion is TDMed with a gap (in case of non-full duplex)
- At least following is supported.
  - y = 14 in 15 kHz subcarrier spacing in normal CP
  - FFS: y= 7 with 15 kHz subcarrier spacing in normal CP
- FFS: The time duration y is the same as the subframe duration and/or a multiple of the time durations present in the subframe duration.
- FFS: different numerology between DL and UL
- FFS: time duration of y starts from UL
- FFS: whether and how to extend the discussion on DL portion/UL portion length required for the coexistence with LTE TDD

Continue offline discussion until Thursday – Suzuki (Panasonic)

R1-168368 WF on time-domain structure in NR Panasonic

Agreements:

- A slot can contain all downlink, all uplink, or {at least one downlink part and at least one uplink part}
  - FFS regarding the number of switching points, multiplexing of different use cases (e.g., multiplexing eMBB and URLLC use cases) and/or numerologies in the time domain

R1-168469 WF on slot and time interval X Huawei, HiSilicon, Sharp, Panasonic

R1-168294 WF on Frame Structure Ericsson, Huawei, Qualcomm, Nokia, Sony, DoCoMo, MediaTek, Fujitsu, CATT, Intel, ZTE, InterDigital

The document was presented by Stefan Parkvall from Ericsson.

- Subframe
  - Already agreed upon
  - Assume x=14 in the reference numerology for subframe definition (for normal CP)
  - FFS: y=x and/or y=x/2
- Slot
  - Slot of duration y OFDM symbols in the numerology used for transmission
  - An integer number of slots fit within one subframe duration (at least for transmission numerologies shorter than or equal the reference numerology)
  - The structure allows for ctrl at the beginning
  - The structure allows for ctrl at the end
  - The structure allows for ctrl at the end and at the beginning
  - One possible scheduling unit
- Mini-slot
  - Should at least support transmission shorter than y OFDM symbols in the numerology used for transmission
  - May contain ctrl at the beginning and/or ctrl at the end
  - The smallest mini-slot is the smallest possible scheduling unit (FFS: smallest number of symbols)

Petitioners' Exhibit 1007, p. 1713
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

› Note: the names are for the purpose of discussion. Whether some terms can be merged or not is FFS

Decision: The document is noted and modified as follows:

Agreements:

- Followings are considered as starting points of NR frame structure at least within the CP overhead
  - Subframe
    - Already agreed upon
    - Assume x=14 in the reference numerology for subframe definition (for normal CP)
    - FFS: y=x and/or y=x/2 and/or y is signalled
  - Slot
    - Slot of duration y OFDM symbols in the numerology used for transmission
    - An integer number of slots fit within one subframe duration (at least for subcarrier spacing is larger than or equal the reference numerology)
    - The structure allows for ctrl at the beginning only
    - The structure allows for ctrl at the end only
    - The structure allows for ctrl at the end and at the beginning
    - Other structure is not precluded
    - One possible scheduling unit
  - Mini-slot
    - Should at least support transmission shorter than y OFDM symbols in the numerology used for transmission
    - May contain ctrl at the beginning and/or ctrl at the end
    - The smallest mini-slot is the smallest possible scheduling unit (FFS: smallest number of symbols)
  - Note: the names are for the purpose of discussion. Whether some terms can be merged or not is FFS
  - FFS whether NR frame structure needs to support both slot and mini-slot or these can be merged

R1-168191 WF on different time intervals for NR frame structure ZTE, ZTE Microelectronics, Qualcomm

- For a reference numerology, multiple durations are defined in number OFDM symbols for time interval
  - A minimum duration is defined in x1 OFDM symbols
- At least from network perspectives, different durations of time intervals can be multiplexed in TDM and/or FDM
  - FFS: Whether or not NR support nested time interval structure for different duration.
  - Resources already allocated for a longer time interval may also be used for a shorter time interval
    - E.g. for URLLC operation

Decision: The document is noted. Further revised in:

R1-168331 WF on different time intervals for NR frame structure ZTE, ZTE Microelectronics, Qualcomm, Sharp, InterDigital

Discussion: .Also supported by MTI

Decision: The document is noted.

Possible agreements:

- At least for DL, it should be possible to override the ongoing transmission with a short transmission at least from NW perspective

Possible agreements:

- For a reference numerology, multiple durations are defined in number OFDM symbols for time interval
  - A minimum duration is defined in x_1 OFDM symbols

Possible agreements:

- At least from network perspectives, different durations of time interval can be multiplexed in TDM and/or FDM
  - FFS: Whether or not NR supports nested time interval structure for different duration
- Resources already scheduled for a longer time interval may be rescheduled for a shorter time interval , e.g. for URLLC operation
  - Option1: Ongoing transmission for longer interval is punctured
  - Option2: Ongoing transmission for longer interval is dropped
  - Other solutions are not precluded

Continue offline discussion until Thursday – Zhisong (ZTE)

R1-168438 WF on Supporting URLLC in NR LG Electronics, ZTE

R1-168499 WF on different time intervals for NR frame structure ZTE, ZTE Microelectronics, Qualcomm, LGE Sharp, MTI, InterDigital, CATT

R1-168545 WF on Supporting URLLC in NR LG Electronics, ZTE, Sharp, MTI,

R1-168550 WF on Supporting URLLC in NR LG Electronics, ZTE, Sharp, MTI,

Agreements:

Petitioners' Exhibit 1007, p. 1714
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- At least the following potential options should be considered
  - At least for shorter transmission UL, semi-static resource sharing between URLLC and eMBB
    - FDM and/or TDM manner
      - UL grant-free transmission for URLLC
      - Other schemes are not precluded
  - Dynamic resource sharing between URLLC and eMBB
    - For DL, mechanisms to schedule a transmission where the resources of it can overlap with resources of ongoing/scheduled longer transmission at least from network perspective
      - FFS: A similar or same mechanism applicability to UL
      - Preemption or superposition
      - Other schemes are not precluded
    - Scheduling based approaches (e.g., by adapting transmission duration or by using different subbands) to allow multiplexing of different durations of transmission
    - UL grant-free transmission for URLLC
    - Other schemes are not precluded
  - Other mechanisms are not precluded

R1-166488 Wireless backhaul/relay for NR AT&T GNS Belgium SPRL
Decision: The document is noted.
R1-166368 UE Power Consideration based on Days-of-Use Qualcomm Incorporated
Decision: The document is noted.
R1-168352 WF on NR UE Power Consumption Reduction Qualcomm
Agreements:

- Impact of UE DL reception energy consumption should be studied also considering the total power consumption mainly focusing on DoU
  - e.g., UE decoding power consumption in the physical layer DL control blind decoding in lack of grant
  - e.g., UE decoding power consumption in the slot with the data
  - e.g., UE decoding power consumption in the data reception process
  - e.g., UE decoding power consumption in the measurement
  - e.g., UE decoding power consumption in the SS
- UE power reduction techniques also should be studied

R1-168430 WF on number of HARQ processes for NR Qualcomm, DCM, ZTE~~, Verizon~~
R1-168342 Way Forward on HARQ Process for NR MediaTek, Intel, Samsung, Nokia, ASB

R1-168532 Way Forward on HARQ Process for NR Mediatek

R1-168395 WF on DL and UL transmission for NR CMCC, China Telecom, China Unicom, Softbank, CATT, Huawei, HiSilicon, OPPO, Nokia, Alcatel-Lucent Shanghai Bell, MediaTek, Qualcomm, Samsung, ZTE, ZTE Microelectronics, LG Electronics, CATR
Also supported by Ericsson, Convida, Xiaomi
Agreements:

- NR supports at least semi-statically assigned DL/UL transmission direction as gNB operation
  - The assigned DL/UL transmission direction can be signalled to UE by higher layer signalling

R1-168347 WF on additional RS for NR LG Electronics, Samsung, NTT DOCOMO
Agreements:

- In addition to the front-loaded RS agreed to study in RAN1#85, same or extended/additional RS is studied in NR of at least the following:
  - Estimate/compensate Doppler parameters
  - Compensate phase rotation and frequency offset
  - Note that RS may or may not be UE-specific

R1-168489 Use Cases/Scenarios for Slot Structure Discussion Qualcomm

R1-168531 WF on Use Case Discussion for Time Domain Structure Use Cases Qualcomm

Petitioners' Exhibit 1007, p. 1715
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Email discussion where proponents provide further input on use cases with completion by Sep 15th – Joseph (Qualcomm); e.g.,
  - What specific cases to support the particular numerologies such as 15 kHz subcarrier spacing
  - How often can DL control appear? UL control?
    - How is this associated with the transmission duration mentioned in R1-168489?
  - How often can user be scheduled?
    - What is smallest possible scheduled duration?
  - How often may gaps appear w/in transmission duration? How much overhead?
  - Note: please provide all lengths in terms of symbols for each intended SCS.
    - SCS as provided (or updated from) R1-168489 "Use Cases/Scenarios for Slot Structure Discussion"
    - Absolute times (e.g, ms or us) should also be supplied for clarification
    - Any other questions may be added

R1-168534 Way forward on time-domain structure NTT DOCOMO

R1-168491 Way forward on control channel for NR LG Electronics, Samsung, Panasonic
R1-168429 WF on Integrated Backhaul and Access Huawei, HiSilicon, AT&T, Samsung, Qualcomm, Ericsson, ASTRI

Conclusions:

- Mechanisms for joint operation of backhaul link and access link should be studied by NR, including
  - Study dynamic resource allocation among backhaul and access links, including TDM and FDM and SDM approaches under half-duplex constraint
  - Study multi-hop backhauling and multi-site connectivity in backhauling
  - Mechanism for integration of new TRPs/RNs carrying integrated backhaul and access functionalities
  - Mechanisms for discovery and management of backhaul links for the connected TRP/relay nodes (if supported) with integrated backhaul and access links
  - Other aspects/functionalities such as forward compatibility to study full duplex operation on backhaul and/or access links are FFS
- RAN1 should strive for a common mobility handling and beam management framework for mobile TRP/relay nodes (if supported) carrying joint operation of backhaul and access functionalities and the usual UEs
- Note: No assumption on particular RAN architecture

R1-167624 Channel Coding for NR NTT DOCOMO, INC.

R1-166775 Discussion on throughput and latency of NR candidate FECs Samsung
R1-166892 Comparison of throughput and complexity for Turbo and LDPC codes LG Electronics
R1-167214 Channel coding schemes for URLLC scenario Huawei, HiSilicon
R1-167215 Channel coding schemes for mMTC scenario Huawei, HiSilicon
R1-167271 Performance of mMTC and URLLC channel coding candidates Nokia, Alcatel-Lucent Shanghai Bell
R1-167565 Performance evaluation of channel coding for URLLC and mMTC InterDigital Communications
R1-167568 Channel coding simulation data sharing InterDigital Communications

R1-168163 WF on further channel coding simulation data sharing InterDigital, Qualcomm, Huawei, Ericsson, Samsung, MediaTek, LG, Nokia, ASB, ZTE, Intel, Sharp

Conclusion:

- Combined channel coding simulation data sharing is needed by filling in the base excel spreadsheets from participating companies
  - Example base excel spreadsheets are attached
  - Participating companies may add their data upon the combined excel spreadsheet and update the file version

Petitioners' Exhibit 1007, p. 1718
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

        - Offline emails can be used to track the updates: Moderator: Chunxuan Ye, Interdigital
    - Simulation curves may not be aligned given the same configuration, probably due to different codes or decoding algorithms
        - May need to specify further details of different channel codes
- Companies encouraged to further contribute, update and align their simulation results for RAN1 #86bis

R1-168285 WF on channel code evaluation for URLLC Qualcomm

Other comparisons

R1-166933	Latency Consideration of Channel Coding Candidates	Ericsson
R1-166934	Flexibility Consideration of Channel Coding Candidates	Ericsson
R1-167276	Evaluation criteria for URLLC and mMTC coding schemes	Nokia, Alcatel-Lucent Shanghai Bell

R1-168169 WF on Flexibility of Channel Coding Techniques Ericsson, Nokia, ASB, LG, Orange, IMT
Also supported by NEC.

Agreement:
- Channel coding techniques for NR, should support the following:
    - Info block size K flexibility:
        - Granularity at lower end of range of K = [D1] bits
            - D1 may be different for control and data channels
            - FFS whether D1 may be different for different code rates
        - FFS whether the granularity is coarser at higher values of K
        - Shortening (i.e. assigning info bits to known values, e.g. 0) may be used to provide info block size flexibility
    - Codeword size flexibility:
        - Basic code design with rate matching (i.e., puncturing and/or repetition) supports 1-bit granularity in codeword size

R1-167999 WF on Channel Coding Selection Qualcomm Incorporated, Samsung, Nokia, ASB, ZTE, MediaTek, Intel, Sharp, MTI, Interdigital, Verizon Wireless, KT Corporation, KDDI, IITH, CEWiT, Reliance-jio, Tejas Networks, Beijing Xinwei Telecom Technology, Vivo, Potevio, WILUS, Sony, Xiaomi
Also supported by Oppo.
Revision of R1-166376
Proposal:
- LDPC should be selected for eMBB data channel to provide performance and implementation advantages at high rate and large blocklength

R1-168040 WF on channel coding selection Huawei, HiSilicon, CMCC, CUCC, Deutsche Telekom, Orange, Telecom Italia, Vodafone, China Unicom, Spreadtrum
Not supported by Orange.
Proposal:
- Polar code is a candidate channel coding technique for NR for eMBB, URLLC, mMTC

R1-168164 WF on turbo code selection LG Electronics, Ericsson, CATT, NEC, Orange, IMT
Proposal:
- LTE turbo code should be supported for NR for at least low throughput including eMBB, mMTC, and URLLC
    - It can support flexibilities of information block sizes and code rates
    - Turbo code enhancement can be considered
- FFS: high throughput

Conclusion:
- The eMBB data channel coding scheme will be chosen at RAN1#86bis
    - including agreeing on the observations that led to the decision.
- Companies are encouraged to:
    - continue analysis and comparison in order to inform the final decision at RAN1#86bis
    - provide any remaining details, especially focusing on LDPC (in view of the situation in this meeting)
    - provide any remaining details of the flexibility requirements and how they can be satisfied, and corresponding implementation complexity and any impact on performance
- Note that consideration of combinations of coding schemes is not precluded.

Petitioners' Exhibit 1007, p. 1719
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- In case of changes to proposals already available, companies are encouraged to provide them at least 1 week before the normal submission deadline for RAN1#86bis.

R1-168171 WF on HARQ for NR Ericsson, Nokia, ASB, LG, CATT, ZTE, Qualcomm, MediaTek, InterDigital, Intel, Orange, IMT

Agreement:

- Channel coding technique(s) designed for data channels of NR support both Incremental Redundancy (IR) (or similar) and Chase Combining (CC) HARQ

R1-168170 WF on coding technique for control channel of eMBB Ericsson, Nokia, ASB, LG, NEC, Orange, IMT
Proposal:
- At least for control channel of eMBB UL and DL, tail-biting convolutional code (TBCC) is adopted as channel coding technique for NR
  - FFS: enhancements to LTE TBCC
  - FFS: if other coding techniques should also be included for control channel with info block size outside of 10-100 bits

R1-168024 WF on code selection for control channel Huawei, HiSilicon, CMCC, CUCC, Deutsche Telekom, Vodafone, MTK, Interdigital, Spreadtrum
Revision of R1-168042
Proposal:
- Polar code is considered as channel coding technique for NR for control channel UL and DL
  - Even a low complexity small list size polar decoder is shown to have a performance advantage over TBCC
- Further comparison of Polar and TBCC is encouraged

R1-168298 WF on control channel coding Nokia, ASB, LG, CATT, MediaTek
Revision of R1-168102
Agreement:
- Simulation Assumptions for eMBB control channel coding
  - Evaluate the block error rate (BLER) performance versus SNR
  - Evaluate the false alarm rate versus SNR

Channel	AWGN						
Modulation	QPSK						
Coding Scheme	Repetition	Simplex	TBCC	Turbo	LDPC	Reed-Muller	Polar
Code rate (for evaluation purposes)	1/24*, 1/12, 1/6, 1/3, 1/2, 2/3						
Decoding algorithm**	ML	ML	List-Viterbi	Scaled max log MAP	Adjusted min-sum	FHT	SC list
Info. block length (bits w/o CRC) (for evaluation purposes) ***	1, 2, 4, 8, 16, 32, 48, 64, 80, 120, 200						

* Code rate 1/24 is valid for info block length of 1-2 bits
** Other variants of agreed algorithms can be used for encoding and decoding (Complexity details should be illustrated)
*** Each of these info. block lengths shall be evaluated at at least one of the code rates. Other info. block lengths and code rates are not precluded. Similar info. and encoded block lengths should be used for the evaluation. Total coded bits = info. Block length/code rate. Note: these info. block length and code rate are only for initial performance evaluations. They are not interpreted as design targets or assumptions for complexity analysis.
- Companies are encouraged to provide information on complexity of their decoders, and on decoding latency.

Discuss initial views on multi-antenna scheme including analog/digital/hybrid beam-forming

R1-167291 Digital subsystem with hybrid beamforming Nokia, Alcatel-Lucent Shanghai Bell, Verizon Wireless
The document was presented by Mihai Enescu from Nokia.

- Observation 1: Operating using hybrid transceiver architecture suffers from increased scheduling latency and system overhead compared to digital architectures. Especially UL control signaling is expensive with hybrid architecture.
- Observation 2: Widening the RX beams for UL control may be used in some situations but would be far from optimal solution.
- Observation 3: Full digital subsystem could be implemented in cost efficient manner along with hybrid architecture.
- Observation 4: Full digital subsystem has high potential to improve hybrid architecture operation significantly.
- Proposal 1: Define UL control signal and channel and RS structures in a way to allow optimizing BS hybrid implementation with full digital RX subsystem:
  - narrowband resource allocation structures with flexible allocation and scheduling possibility
  - signal design to enable high multiplexing capability for the control signals like scheduling request

Decision: The document is noted.

R1-166089 Beam Management Procedure for NR MIMO Huawei, HiSilicon
The document was presented by Leiming Zhang from Huawei.

- Proposal 1: The following beam refinement procedures should be studied in NR, including reliability performance, overhead and so on.
  - DL or UL based joint TRP and UE beam refinement
  - DL or UL based UE beam refinement only
  - DL or UL based TRP beam refinement only
- Proposal 2: Beam probing for best beam(s) and angle estimation should be considered in NR.
- Proposal 3: A mechanism and signaling for fast link recovery among TRPs should be supported in NR.
- Proposal 4: Control beam(s) derived from the data beam(s) and using the refinement beams for control signal transmission should be considered in NR
- Proposal 5: Beam management procedures taking LF assisted control signalling transmission for HF should be taken into considerations in the overall beam management.

Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1722
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-167466 Key principles for beam management Ericsson

The document was presented by Mattias Frenne from Ericsson.

- Beam management is handled by L1/L2 procedures
- Strive to handle beam management within the CSI framework in NR (i.e. the framework used for link adaptation of data transmission).
- In the beam management procedures, one or multiple beam pair links (BPLs) are monitored by the network using uplink measurements by the TRPs and/or downlink measurements from the UE
- Support a sweep of BMRS in different TRP beams to allow for a measurement per TRP beam in the UE.
- Consider supporting a repetition of BMRS in the same TRP beam to allow for measurement of the TRP beam in different UE receive beams.

Decision: The document is noted.

R1-166379 Downlink MIMO transmission schemes Qualcomm Incorporated

The document was presented by … from Qualcomm.

- Proposal 1: The NR DL MIMO shall support CLSM using antenna ports with UE RSs.
- Proposal 2: For CLSM, the precoding granularity can be a single RE.
- Proposal 3: The NR MIMO shall support open-loop spatial multiplexing using antenna ports with UE RSs.
- Proposal 4: Study performance benefit of UE RS based open-loop spatial multiplexing with precoder cycling and small cyclic delay diversity.
- Proposal 5: Study performance benefit of UE RS based open-loop spatial multiplexing with implicit and explicit precoding.
- Proposal 6: The NR MIMO shall support transmit diversity using antenna ports with UE RSs.
- Proposal 7: Study performance benefit of UE RS based SFBC with transparent FSTD and non-transparent FSTD.
- Proposal 8: The NR MIMO shall support reciprocity based spatial multiplexing using antenna ports with UE RS.
- Proposal 9: For reciprocity based spatial multiplexing, the precoding granularity can be a single RE.
- Proposal 10: The NR MIMO may consider dynamic switching between close-loop and open-loop operations in addition to dynamic switching between spatial multiplexing and transmit diversity.

Decision: The document is noted.

WFs on Beam Management

R1-167951 WF on digital sub-system with hybrid beamforming Nokia, ASB

The document was presented by Mihai Enescu from Nokia.

- Support enhancing hybrid architecture operation using digital RX subsystem consisting of the same (or similar) amount of RxRUs as the number of antenna elements.
- UL Signal design and UL control channel design needs to follow the following principles:
  - Transmission bandwidth of the UL control signal and associated demodulation UL RS is significantly smaller than the system bandwidth, e.g. 10/20 MHz bandwidth.
  - UL Signal design to enable high multiplexing capability for the UL control signals like scheduling request.
  - Efficient joint operation of hybrid RX and digital RX, e.g. efficient utilization of UL data and UL control channels.

Discussion: Interference between narrowband and wideband should also be listed
Decision: The document is noted. Continue offline discussion until Tuesday – (Nokia)

R1-167962 WF on NR MIMO calibration ZTE Corporation, ZTE Microelectronics, Intel Corporation, Samsung

The document was presented by Ruyue Li from ZTE.

- RAN1 starts NR MIMO calibration to reach common ground for MIMO related evaluation:
- Link-level calibration
  - Support the subsequent link-level evaluation for candidate designs/approaches, e.g., reference signals;
  - Calibration assumptions and metrics are FFS;
- System-level calibration
  - Support the subsequent system-level evaluation for candidate designs/approaches, e.g., multi-beam sweeping/ selection/reporting;
  - Calibration assumptions and metrics are FFS;
- Approve the following scenario/channel model for link and system levels calibration:
- Link-level: CDL model with random angular offset, e.g.,
  - 3GPP TR38.900 CDL-A model (Delay spread = 10 ns)
  - 3GPP TR38.900 CDL-D model (Delay spread = 10 ns)
  - Mobility: 3km/h
  - Other details FFS

Petitioners' Exhibit 1007, p. 1723
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Notes: The angles should be wrapped around to be uniformly within 0-360 degrees in azimuth and clipped within 0-180 degrees in zenith angle via applying uniform-distribution translation angle in Section 7.7.5.1 in TR 38.900 accordingly.
- System-level: Indoor hotspot, urban macro, dense urban
  - Other details FFS

Discussion: Also supported by ASTRI, Xinwei, Mediatek
Decision: The document is noted. Continue offline discussion until Tuesday – (ZTE: R1-168273)

R1-168273 WF on NR MIMO calibration ZTE Corporation, ZTE Microelectronics, Intel Corporation, Samsung, ASTRI, Xinwei, MediaTek, Nokia, ASB, Ericsson, NTT DOCOMO, Qualcomm

R1-168487 WF on NR MIMO calibration ZTE Corporation, ZTE Microelectronics, Intel Corporation, Samsung, ASTRI, Xinwei, MediaTek, Nokia, ASB, Ericsson, NTT DOCOMO, Qualcomm, CATT
Agreements:

- For the purpose of calibration, companies are encouraged to provide baseline results for NR MIMO in the following meetings, including link-level and system level simulations
  - Discuss further on baseline simulation assumptions and metrics for calibration in email discussion after RAN1#86
  - Thereafter, email reflector is used to collect results (no online time for calibration discussions, similar to channel model calibration)
- Email discussion till 8th September ~~next meeting~~ to initiate by Ruyue (ZTE)
  - Including detailed simulation parameters for UE movement, rotation and/or channel/beam blockage is FFS – (to be included in Ruyue's email discussion)

R1-167950 WF on beam management Intel Corporation, Ericsson
The document was presented by Yuan Zhu from Intel.

- Distinguish two beam related procedures:
  - **Procedure A** is used to support beam based mobility
    - Main purpose is to discover TRP TX beams and perform mobility related measurements
    - UE RX beam training support may also be considered
    - Searching and discovering TRP TX beams from neighbor TRPs which are non-synchronized is supported
      - Note: TRPs may still be synchronized but the UE shall not make such assumption
    - L3 reporting
  - **Procedure B** is used to support beam management
    - Purpose is to track TRP TX beams and support UE to select UE RX beams
    - RS (beams) to measure on are explicitly configured to the UE
      - Note: No search/discovery procedure is involved
    - L1/L2 reporting

Discussion: Samsung asked for more time, not a simple change.
Decision: The document is noted.

R1-167961 WF on aperiodic beam sweeping and CSI reporting ZTE
The document was presented by Ruyue Li from ZTE.

- Study the following aspects of aperiodic beam sweeping:
  - Three types of beam sweeping for both UL and DL:
    - TRP beam sweeping only, keeping a fixed UE beam
      - supporting measuring multiple TRP beams by the same UE beam
    - UE beam sweeping only, keeping a fixed TRP beam
      - supporting measuring the same TRP beam with multiple UE beams
        - E.g. by time domain replica waveform. TRP Tx using the same TRP beam and UE receives using one UE beam per replica
        - E.g. by multiple wider sub-carrier spacing based OFDM symbols. TRP Tx using the same TRP beam and UE receives each symbol with different UE beam
    - Joint TRP and UE beam sweeping
  - Indication of TX and/or RX beam on control/feedback signaling:
    - Indication is per beam or per beam group
  - Content of aperiodic CSI report e.g. RSRP, RI/PMI/CQI, beam ID
  - NOTE: support various mobility scenarios
  - Others are not precluded
- Study aperiodic CSI in conjunction with aperiodic RS transmission:
  - Dynamic indication of aperiodic reference signal and interference measurement resource including

Petitioners' Exhibit 1007, p. 1724
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Aperiodic reference signal for channel measurement for CSI feedback and beam selection/training
- Aperiodic interference measurement resource for interference measurement, including using non-zero power reference signal
- Resource pool sharing for aperiodic channel and interference measurement resources
- DMRS based CSI feedback including CQI adjustment and beam refinement
  - Study the timing requirement among aperiodic CSI triggering, aperiodic RS transmission and CSI feedback.
    - Timing between CSI triggering and aperiodic RS transmission X
    - Timing between aperiodic RS transmission and CSI/beam feedback Y
- Others are not precluded

Decision: The document is noted.

R1-167947 WF on Beam Management Huawei, HiSilicon, Potevio

The document was presented by Leimin Zhang from Huawei.

- Study on the following aspects for beam management
  - TRP(s) used to transmit beam management RS is transparent to UE
  - Beam management procedure based on L1 and L2 procedure
  - Beam management procedure based on LF assisted HF
  - Beam management includes the following two stages:
    - Coarse beam alignment, i.e., periodic beam sweeping without prior acquired beam(s) information
    - Fine beam alignment, i.e., periodic/aperiodic beam sweeping with prior acquired beam(s) information
      - Strive to handle this procedure within a unified CSI framework in NR
      - Fast link recovery procedure due to UE movement/rotation/blockage
        - » E.g., Monitoring multiple beam pairs for link recovery
      - Beam probing based beam refinement/tracking
        - » E.g., beam selection, or angle estimation
- RS design principle of Beam Management
  - DL beam management can be based on DL DMRS in addition to DL RS dedicated to CSI acquisition and beam management
  - UL beam management can be based on SRS, UL DMRS and energy-efficient UE-specific tracking signals

Decision: The document is noted.

R1-167966 WF on Beam Management CATT, Samsung

The document was presented by Rakesh Tamrakar from CATT.

- RAN1 should study beam management procedures under different channel reciprocity assumptions
  - At a TRP or UE, with TX and RX channel reciprocity (e.g., beam reciprocity), TX beam (or RX beam) can be obtained from RX beam (or TX beam) to reduce overhead and latency
  - Without TX and RX channel reciprocity, beam management procedure may require TX and RX beam sweeping in both DL and UL links
- RAN1 should study different methods of determining a beam pair for communication, e.g.,
  - Joint determination: Tx beam and Rx beam of the beam pair are determined jointly
  - Separate determination: Tx beam or Rx beam of the beam pair are determined sequentially
- Study beam management procedure with and without explicit indication of beam(s) used for data/control channel or reference signal transmission

Decision: The document is noted.

Continue offline discussion until Tuesday – (Intel, ZTE, CATT, Huawei)

R1-168119 WF on beam management Intel Corporation, Nokia, Alcatel-Lucent Shanghai Bell, Verizon

- The following two DL beam management procedures are supported:
  - Procedure A for beam selection without prior acquired beam(s) information (can be called as beam acquisition)
    - For initial beam acquisition and maintenance
    - UE RX beam training is also supported
    - [for TRPs not necessarily having common baseband/sync or having non-ideal backhaul.
    - option 1: Measurement reports on L3; option 2: Measurement reports can be L2/L1 and/or L3]
  - Procedure B for beam selection with prior acquired beam(s) information (can be called beam adjustment)
    - B-1: to support inter/intra-TRP Tx beam change within an NR cell for the same UE Rx beam
    - B-2: to support UE Rx beam change for the same TRP Tx beam
    - Intra-TRP and inter-TRP beam management follow the same procedure
      - Note: UE may or may not need to know the TRP has changed for inter-TRP Tx beam change
    - [option 1: L1/L2 procedure; option 2: L3 is involved as well]
    - Note: Procedures B-1&B-2 can be performed jointly
    - Note: Procedures B-1&B-2 can be performed multiple times to achieve e.g. TRP Tx/UE Rx beam change simultaneously

Petitioners' Exhibit 1007, p. 1725
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Support managing multiple Tx/Rx beam pairs for a UE for fast link recovery
- Assistant information from another carrier (e.g., LF carrier) can be utilized in procedures A&B
  - E.g.. LF carrier is used to feedback the measurement for HF

Decision: The document is noted.

Possible agreements:

- The following two DL beam management procedures are supported:
  - Procedure A for initial beam acquisition without prior acquired beam(s) information (can be called as beam acquisition)
    - TRP TX beam and UE RX beam sweeping are supported
    - [Procedure A can be considered for mobility]
  - Procedure B for beam change with prior acquired beam(s) information (can be called beam adjustment)
    - B-1: to support inter/intra-TRP Tx beam change [within multiple TRPs] for the same UE Rx beam
    - B-2: to support UE Rx beam change for the same TRP Tx beam
    - Strive for the same procedure design for intra-TRP and inter-TRP beam management
      - Note: UE may not know the TRP has changed for inter-TRP Tx beam change
    - Note: Procedures B-1&B-2 can be performed jointly
    - Note: Procedures B-1&B-2 can be performed multiple times to achieve e.g. TRP Tx/UE Rx beam change simultaneously
    - [Procedure B can be considered for mobility]
  - Support managing multiple Tx/Rx beam pairs for a UE for fast link recovery
  - Assistant information from another carrier (e.g., LF carrier) can be utilized in procedures A&B
    - E.g., low frequency carrier is used to feedback the measurement for high frequency
  - [Procedure A can be used for beam maintenance]

Continue offline discussion until Wednesday – Yuan (Intel)

R1-168278 WF on DL beam management Intel Corporation, Huawei, HiSilicon, Ericsson, Nokia, Alcatel-Lucent Shanghai Bell, Verizon, MTK, LGE, NTT DoCoMo, Xinwei

Agreements: The following DL L1/L2 beam management procedures are supported within one or multiple TRPs:

- P-1: is used to enable UE measurement on different TRP Tx beams to support selection of TRP Tx beams/UE Rx beam(s)
  - For beamforming at TRP, it typically includes a intra/inter-TRP Tx beam sweep from a set of different beams
  - For beamforming at UE, it typically includes a UE Rx beam sweep from a set of different beams
  - FFS: TRP Tx beam and UE Rx beam can be determined jointly or sequentially
- P-2: is used to enable UE measurement on different TRP Tx beams to possibly change inter/intra-TRP Tx beam(s)
  - From a possibly smaller set of beams for beam refinement than in P-1
  - Note: P-2 can be a special case of P-1
- P-3: is used to enable UE measurement on the same TRP Tx beam to change UE Rx beam in the case UE uses beamforming
- Strive for the same procedure design for Intra-TRP and inter-TRP beam management
  - Note: UE may not know whether it is intra-TRP or inter TRP beam
- Note: Procedures P-2&P-3 can be performed jointly and/or multiple times to achieve e.g. TRP Tx/UE Rx beam change simultaneously
- Note: Procedures P-3 may or may not have physical layer procedure spec. impact
- Support managing multiple Tx/Rx beam pairs for a UE
- Note: Assistance information from another carrier can be studied in beam management procedures
- Note that above procedure can be applied to any frequency band
- Note that above procedure can be used in single/multiple beam(s) per TRP
- Note: multi/single beam based initial access and mobility treated within a separate RAN1 agenda item

R1-168322 Definitions supporting beam related procedures Nokia, Qualcomm, CATT, Intel, NTT DoCoMo, Mediatek, Ericsson, ASB, Samsung, LG

The document was presented by Mihai Enescu from Nokia.

- **Beam management** = a set of procedures to acquire and maintain a set of TRP(s) and/or UE beams that can be used for DL and UL transmission/reception, which include at least following aspects:
  - **Beam selection**= for TRP(s) or UE to select of its own beam(s).
  - **Beam measurement** = for TRP(s) or UE to measure characteristics of received beamformed signals
  - **Beam reporting** = for UE to report a property/quality of beamformed signal(s) based on beam measurement
  - **Beam sweeping** = operation of covering a spatial area, with beams transmitted and/or received during a time interval in a predetermined way.

Discussion: Ericsson → can a note be added that these are not related to mobility?

Petitioners' Exhibit 1007, p. 1726
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted.

R1-168468 Definitions supporting beam related procedures Nokia, Qualcomm, CATT, Intel, NTT DoCoMo, Mediatek, Ericsson, ASB, Samsung, LG

R1-167965 WF on CSI measurement and reporting in NR Huawei, HiSilicon

The document was presented by Ming Lei from Huawei.

- A unified CSI acquisition framework should be studied in NR, which shall support
  - CSI measurement based on CSI-RS
  - Beam measurement based on RS for beam management
  - Implicit and explicit CSI feedback
  - Reciprocity based CSI acquisition
- The implicit CSI feedback methods should be studied in NR
  - Codebook design
  - Interference measurement results obtained from
    - ZP CSI-RS
    - NZP CSI-RS
    - DMRS
  - Beam measurement results
- The explicit CSI feedback_methods should be studied in NR
  - Feedback of channel covariance matrix
    - E.g. based on Kronecker-product
  - Feedback of channel matrix or channel eigenvector
    - E.g. based on multi-beam combination
  - Both quantized and unquantized/analog feedback
- Multi-level CSI measurement and reporting with the following features should be supported in NR
  - Joint feedback of wideband/long-term and subband/short-term CSI
  - Based on hybrid non-precoded and beamformed CSI-RS
  - Joint feedback of explicit CSI and implicit CSI
- At least the following CSI measurement and reporting mechanisms should be studied by NR
  - Aperiodic CSI measurement and reporting
  - Semi-persistent CSI measurement and reporting
- Self-contained CSI triggering, measurement and reporting in a 'time interval X' should be studied in NR
  - Note: here the definition of 'time interval X' follows the agreements in RAN1#85 meeting

Decision: The document is noted. Continue offline discussion until Tuesday – (Huawei)

R1-168179 WF on CSI measurement and reporting in NR Huawei, HiSilicon, Ericsson, China Telecom

Decision: The document is noted and modified as follows:

Agreements:

- A simplified CSI acquisition framework should be studied in NR, which could support
  - CSI measurement based on CSI-RS (if supported)
  - Implicit and explicit CSI feedback
  - CSI acquisition based on different degree of reciprocity
  - Other features to be supported
- The implicit CSI feedback methods should be studied in NR
  - Codebook design
  - Interference measurement based on interference measurement resource which could be one or more of the following options
    - ZP CSI-RS (if supported)
    - NZP CSI-RS (if supported)
    - DMRS (if supported)
    - Other resources are not precluded
  - CSI feedback based on DMRS (if supported)
- The explicit CSI feedback_methods should be studied in NR
  - Feedback of channel covariance matrix
  - Feedback of channel matrix
  - Feedback of channel eigenvector
  - Both quantized and unquantized/analog feedback
  - Other methods are not precluded
- CSI measurement and reporting with the following components should be studied in NR
  - Wideband/long-term CSI
  - Subband/short-term CSI

Petitioners' Exhibit 1007, p. 1727
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Explicit CSI
- Implicit CSI
- Configuration of the above components individually or jointly is FFS

R1-167964 WF on DL Transmission Scheme Huawei, HiSilicon, NEC

- NR should support the multiplexing of different transmission schemes to different UEs at the same time-frequency resource (an example is shown by Figure 1)
- NR should support beam based transmit diversity
  - Beam based transmit diversity based on single-TRP transmission should be supported in NR
  - Beam based transmit diversity based on multi-TRP transmission should be supported in NR (an example is shown by Figure 2)
  - Beam based transmit diversity is based on DM-RS for demodulation
  - Beam based transmit diversity should be the fallback scheme of the multi-antenna based transmission mode
- The dynamic switching between different transmission schemes should be supported in a transmission mode

Decision: The document is noted.

R1-166788 Discussion on DL MIMO transmission schemes and modes in NR Samsung

- Study a unified MIMO transmission chain framework to support various transmission techniques (including DMRS based SM, TxD and RE-level precoder cycling), considering the following aspects:
  - Number of CWs
  - Whether to reuse CW-to-layer mapping and precoding framework or to design a new framework
  - DCI design alternatives – modular vs format-based

Decision: The document is noted.

Possible agreements:

- NR should support the multiplexing of different transmission schemes to different UEs at the same time-frequency resource (an example is shown by Figure 1)
- NR should support beam based transmit diversity
  - Beam based transmit diversity based on single-TRP transmission should be supported in NR
  - Beam based transmit diversity based on multi-TRP transmission should be supported in NR (an example is shown by Figure 2)
  - Beam based transmit diversity is based on DM-RS for demodulation
  - Beam based transmit diversity should be the fallback scheme of the multi-antenna based transmission mode
- The dynamic switching between different transmission schemes should be supported in a transmission mode

Continue offline discussion until Wednesday – (Huawei, Samsung)

Wednesday

R1-168271 WF on DL Transmission Scheme Huawei, HiSilicon, NEC, Intel

- RAN1 to study multiplexing of different transmission methods to different UEs at the same time-frequency resource
- RAN1 to study transmit diversity
  - SFBC
  - SFBC-FSTD
  - Other schemes are not precluded
  - Demodulation reference for transmit diversity is DM-RS
    - QCL with other types of RS should be studied
- Support dynamic switching between different transmission methods
  - One of the transmission methods shall be transmit diversity
- Note: the multiple antenna ports used for transmit diversity can be on different beams and/or on different TRPs and/or different polarizations

Decision: The document is noted.

R1-168394 WF on DL Transmission Scheme Huawei, HiSilicon, NEC , Intel, Samsung
R1-168476 WF on DL Transmission Scheme Huawei, HiSilicon, NEC , Intel, Samsung

Agreements:

- RAN1 to study transmit diversity for both data and control channels
  - Aspects to related to QCL (if any), # of ports, polarizations, etc.
- Demodulation reference signal for transmit diversity, if supported, could be
  - UE-specific RS (if supported by NR)
  - Shared (by two or more UEs)-RS (if supported by NR)
  - Other types of RS are not precluded

R1-168105 WF on Framework for NR MIMO Samsung, Ericsson

Petitioners' Exhibit 1007, p. 1728
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Strive to design a unified CSI framework, avoiding introducing multiple classes/subclasses and unnecessary (equally performing) configurations, while still covering a wide variety of use cases
- Strive to remove tight coupling (e.g. fixed timing relationships, joint configuration) between the following modular functions
  - CSI-RS transmission
  - CSI measurement
  - CSI reporting
  - Multi-antenna transmission method
  - Downlink control signaling
- Consider supporting independent scheduling/configuration of CSI-RS, CSI report and data transmission
- At least for DL and except for non-spatial transmit diversity, per layer DMRS is supported
  - Note: the precoding is assumed to be the same for the layer and the associated DMRS
- At least 8 orthogonal DMRS ports is supported for SU-MIMO scheduling
  - Consider further the need for more than 8 orthogonal DMRS ports for MU-MIMO scheduling
- Support dynamic switching between transmission methods, e.g. between
  - Spatial transmit diversity (e.g. for control channels)
  - Spatial multiplexing

Decision: The document is noted.

Agreements:

- Strive to design a unified CSI framework, avoiding introducing multiple classes/subclasses and redundant (equally performing) configurations, while still covering a wide variety of use cases and frequency bands
- Coupling/Decoupling (e.g. fixed timing relationships, joint configuration) between the following functions should be studied
  - RS transmission used for CSI acquisition (CSI-RS transmitted in DL and SRS transmitted in UL)
    - Use of other RS(s) is not precluded (e.g., DMRS)
    - Note that CSI-RS and SRS may or may not have the same physical signal design
    - Note that the reference signal naming can be revisited later
  - CSI measurement/reporting
  - Multi-antenna transmission method/scheme
  - Downlink control signaling
- Study flexible scheduling/configuration of CSI-RS, CSI report and transmission method/scheme for data and control
- DL DMRS and UL DMRS based spatial multiplexing (SU-MIMO/MU-MIMO) is supported
  - FFS: Necessity of sidelink spatial multiplexing
- At least 8 orthogonal DL DMRS ports is supported for SU-MIMO scheduling
- At least 8 orthogonal DL DMRS ports is supported for MU-MIMO scheduling
- Support dynamic switching between transmission methods/schemes, e.g. between
  - Transmit diversity
  - Spatial multiplexing

R1-168254 WF on UL MIMO transmission Huawei, HiSilicon, China Unicom, Samsung, NTT DOCOMO

The following aspects for UL MIMO transmission should be supported:

- Transmission schemes for both reciprocity calibrated UEs, reciprocity non-calibrated UEs, and non-reciprocity case
  - UE capability which indicates calibration accuracy for UL reciprocity based operation should be introduced
- Codebook based transmission
  - Frequency selective precoding should be considered for large system bandwidth
  - E.g., UE–aided and eNB-centric
- Non-codebook based transmission
  - E.g., reciprocity based (based on DL RS) transmission only for calibrated UEs
  - E.g., UE–aided and eNB-centric: UE recommends candidate UL precoders to eNB based on DL RS measurement , and BS determines the final precoder.

Decision: The document is noted.

Agreements:

The following aspects for UL MIMO transmission should be supported:

- Transmission schemes/methods for reciprocity calibrated UEs, reciprocity non-calibrated UEs, and non-reciprocity/partial reciprocity cases

Petitioners' Exhibit 1007, p. 1729
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- If needed, signalling associated with UL reciprocity based operation is introduced, e.g. UE capability which indicates calibration accuracy
- Whether to differentiate reciprocity non-calibrated UEs from non-reciprocity or not is to be studied
- Note: the number of transmission schemes/methods can be further discussed

- At least one of the following candidate schemes/methods is to be supported
  - Candidate 1: Codebook based transmission
    - Frequency selective and frequency non-selective precoding in digital domain can be considered for large system bandwidth
      - The support for frequency selective precoding is conditioned on decision on NR waveform(s)
      - FFS: The values of the large system bandwidth
    - E.g., BS-centric mechanism analogous to LTE
    - E.g., UE–aided and BS-centric mechanism: UE recommends candidate UL precoders from a predefined codebook to BS based on DL RS measurement, and BS determines the final precoder taken from the codebook.
    - E.g., UE–centric and BS-aided mechanism: BS provides CSI (e.g. channel response, interference-related information) to the UE, and the UE determines the final precoder based on the information from the BS
  - Candidate 2: Non-codebook based transmission
    - Frequency selective and frequency non-selective precoding in digital domain can be considered for large system bandwidth
      - The support for frequency selective precoding is conditioned on decision on NR waveform(s)
      - FFS: The values of the large system bandwidth
    - E.g., reciprocity based (based on DL RS) transmission only for calibrated UEs
    - E.g., UE–aided and BS-centric mechanism: UE recommends candidate UL precoders to BS based on DL RS measurement, and BS determines the final precoder.
    - E.g., UE–centric and BS-aided mechanism: BS provides CSI (e.g. channel response, interference-related information) to the UE, and the UE determines the final precoder based on the information from the BS
  - Note: Other transmission schemes/methods are not precluded.

R1-168173 WF on Frequency Selective Precoding for NR UL MIMO Samsung, Intel, NTT DOCOMO, Huawei

- Frequency selective UL precoding (at least for digital beamforming) should be studied in NR
  - Study UL precoder signaling
    - Example 1: Signaling of multiple PMIs (subband) via single or two-level DCIs
    - Example 2: Signaling of multiple PMIs via Data channel
    - Example 3: For TDD, precoder calculation at the UE based on DL RS
      - For TDD and reciprocity calibrated UE, UE recommends candidates UL precoders to BS based on the DL RS measurement, BS determines the final precoder
  - Study the use of UL frequency selective precoding for both dynamic beamforming and semi-dynamic beamforming
  - Study UL subband size (i.e. UL precoding granularity) considering following aspects
    - Implicit (defined by spec.) or explicit (by eNB/UE decision) signaling support
    - Whether to Align with DL or not

Decision: The document is noted and modified as follows:

Agreements:

- Study UL precoder signaling for frequency selective/non-selective precoding
  - Example 1: Signaling of single or multiple PMIs via DL control and/or data channels
    - Multiple PMIs can be signaled via a single DCI or multi-level DCI (1st level DCI contains a location indication to the 2nd level DCI)
  - Example 2: For TDD, precoder calculation at the UE based on DL RS
  - Notes:
    - The feasibility of frequency selective precoding is conditioned RAN1 decision on, e.g. NR frame structure, waveform(s)
    - Impact on other system design aspects (e.g. DL control channel decoding performance/complexity) should be considered.
- Study the use of UL frequency selective precoding for precoded transmission including precoder cycling
- For frequency selective precoding, study UL precoding granularity (i.e. UL subband size) considering following aspects
  - Implicit (defined by spec.) or explicit (by eNB/UE decision) signaling support
  - Whether to align with DL or not
- Evaluation should include UL specific aspects such as CM analysis according to UL waveform, etc.
- Study of frequency non-selective precoding is of higher-priority

Petitioners' Exhibit 1007, p. 1730
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

QCL

R1-167970 WF on the antenna ports QCL in NR Intel, LGE, Ericsson, Samsung, InterDigital, Huawei/HiSilicon

Decision: The document is noted.

Agreements:

- All physical channels and reference signals in NR are transmitted using antenna ports
- Agree as working assumption the following antenna port definition for NR (same as in LTE)
  - An antenna port is defined such that the channel over which a symbol on the antenna port is conveyed can be inferred from the channel over which another symbol on the same antenna port is conveyed.
- Working assumption: Parameters for antenna port QCL in NR includes at least (if QCL is supported)
  - Average gain, average delay, delay spread, Doppler shift and Doppler spread (same as in LTE)
  - Additional parameters are FFS
- FFS whether the QCL or other means can be used for UE beamforming management
- The following QCL assumptions for DM-RS antenna ports in NR are for further study
  - QCL across DM-RS antenna ports
    - All the DMRS antenna ports are QCL-ed with each other
    - Not all the DMRS antenna ports are QCL-ed with each other
  - QCL across scheduled PRBs for DM-RS antenna port
  - QCL among DM-RS antenna port groups
  - QCL of DM-RS antenna ports with antenna ports of other reference signals (RS to be defined in NR)
  - Other assumptions are not precluded
- Note: The antenna ports of demodulation reference signal (DM-RS) in NR are used to transmit at least physical data and, possibly, control channels and used at the UE for demodulation.

R1-168272 WF on QCL assumptions in NR Huawei, HiSilicon, China Telecom, DoCoMo, CATR, Intel

Decision: The document is noted.

Possible agreements:

- No QCL by default in NR unless otherwise specified

Possible agreements:

- For the QCL assumptions and configurations, the following should be supported:
  - By default, no QCL assumptions in NR for the following cases unless otherwise indicated
    - FFS: between synchronization signals and CSI-RS (if supported)
    - between synchronization signals and DMRS (if supported)
  - By default, no QCL assumptions for antenna ports transmitted in different time occasions (e.g. different subframes or TTIs) in NR unless otherwise indicated
  - With explicit or implicit indications, NR should
    - support multiple QCL configurations
    - support flexible QCL configurations at least for the following cases:
      - FFS: Among CSI-RS ports (if supported)
      - Between different types of antenna ports
      - FFS: among other types of RS ports in addition to CSI-RS and DMRS (if supported)
    - Note: The definition of explicit indication is NR BS notifies the UE by the signaling about QCL configuration
  - Note: QCL configuration is defined as the different sets of large-scale channel properties and, in case of explicit signaling, the supporting signaling mechanism to notify the UE

Continue offline discussion until Thursday – Ming (Huawei)

R1-168360 WF on QCL assumptions & configurations in NR Huawei, HiSilicon, China Telecom, DoCoMo, CATR, Intel

R1-168436 WF on QCL assumptions & configurations in NR Huawei, HiSilicon, China Telecom, DoCoMo, CATR, Intel

Agreements:

- All QCL assumptions that a UE is allowed to make among antenna ports should be identified and explicitly specified
- QCL is defined as follows:
  - Two antenna ports are said to be quasi co-located if properties of the channel over which a symbol on one antenna port is conveyed can be inferred from the channel over which a symbol on the other antenna port is conveyed.
  - Future refinement on QCL definition is not precluded

R1-168388 WF on beam management CATT, Samsung, National Instruments, ZTE

Agreements:

- Consider different channel reciprocity assumptions in beam management procedures

Petitioners' Exhibit 1007, p. 1731
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - At a TRP or UE, with TX and RX channel reciprocity (full or partial) (e.g., beam reciprocity), TX beam (or RX beam) can be obtained from RX beam (or TX beam) to reduce overhead and latency
  - Without TX and RX channel reciprocity, beam management procedure may require TX and RX beam sweeping in both DL and UL links
- RAN1 study different methods of determining Tx and Rx beam(s) for communication on one link direction (uplink or downlink), e.g.,
  - Joint determination: Tx beam and Rx beam are determined jointly
  - Separate determination: Tx beam or Rx beam are determined sequentially.
  - Multi-stage determination: for instance, coarse Tx-Rx beam determination followed by fine Tx-Rx beam determination
- Study beam management procedure with and without explicit signaling of beam(s) or beam group(s) used for transmission

R1-168386 WF on aperiodic CSI reporting ZTE Corporation, ZTE Microelectronics, ASTRI, Intel Corporation, Samsung, CATT

Agreements:

Study aperiodic CSI reporting in conjunction with aperiodic RS transmission:

- Dynamic indication of aperiodic RS and interference measurement resource including
  - Aperiodic RS for channel measurement for CSI reporting
  - Aperiodic interference measurement resource for interference measurement, including using non-zero/zero power RS, demodulation RS;
  - Resource pool sharing for aperiodic channel and interference measurement resources
- Study the timing requirement among aperiodic RS triggering, CSI reporting triggering, aperiodic RS transmission, and CSI reporting.
  - Timing between CSI triggering and aperiodic RS transmission X
  - Timing between aperiodic RS transmission and CSI reporting Y
  - Notes: Consider the single triggering for RS transmission and CSI reporting;
- Others are not precluded
- Note: aperiodic triggering doesn't preclude on-demand (using activate/release mechanism) triggering

R1-168186 WF on periodic and semi-persistent CSI for NR Samsung, Ericsson, Qualcomm

Agreements:

- Support at least one of the following schemes for CSI reporting:
  - Scheme 1: periodic CSI reporting analogous to LTE
  - Scheme 2: semi-persistent CSI reporting (e.g. activate/release mechanism analogous to LTE SPS)
  - Scheme 3: aperiodic CSI reporting
  - FFS: Possible signaling support
- Strive to design NR periodic, semi-persistent, and/or aperiodic CSI reporting, considering at least following aspects
  - UL coverage
  - Required RS
  - Reporting information type
  - Forward compatibility
  - Energy efficiency
  - RS and CSI reporting overhead
- Study whether to avoid specifying dependency between CSI reports in different reporting instances
  - Such dependencies, if any, can be different for periodic, semi-persistent, and/or aperiodic CSI reporting

CSI timing

R1-168135 WF on CSI timing relationship LG, InterDigital, Intel, Huawei

Agreements:

- Study flexible timings of RS indication/transmission for CSI measurement, CSI feedback triggering/reporting. Following aspects should be considered at least for periodic CSI (where appropriate)/aperiodic/semi-persistent CSI reporting
  - Linkage between each timing
    - Details FFS. Some non-exhaustive exemplary timing relationships include:
      - Ex1) RS indication and CSI feedback triggering
      - Ex2) RS indication and RS transmission
      - Ex3) RS indication, RS transmission, CSI feedback triggering and CSI reporting in the same [SF]
  - Signaling method for timing, if needed (if so, details)
  - Feasible time gap between RS transmission and CSI reporting taking CSI computation delay/complexity, propagation delay, channel coherence time, and UL timing advance into account
  - Signaling overhead needs to be taken into account
  - Note: the timing above refers to layer 1 control signaling, higher-layer signaling or a combination thereof
    - Note: RS indication can be RS triggering or RS activation/deactivation, and can include RS resource configuration.

Petitioners' Exhibit 1007, p. 1732
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

– Note: This doesn't preclude a fixed timing based RS transmission for CSI measurement, CSI feedback reporting.

R1-168176 WF on RS for CSI Acquisition and Demodulation in NR Huawei, HiSilicon

R1-168498 WF on RS for CSI Acquisition and Demodulation in NR Huawei, HiSilicon

Agreements:

- At least one of following RS configurations for CSI measurement are supported in NR
  - Aperiodic RS
  - Semi-persistent RS
  - Periodic RS
- Study RS pattern for CSI measurement in NR both for DL and UL
  - Study the density of RS
  - Study the position of RS in the [subframe]
  - Study the mapping of RS in one or several symbols

R1-168308 WF on support of rotatable UE with beamforming in NR LG, Intel, KT, MediaTek, InterDigital, Samsung

Agreements:

- Study impacts of UE movement, rotation and/or channel/beam blockage w.r.t. following aspects
  - UE/TRP beam change
  - CSI mismatch from CSI reporting instance to data transmission instance
- Study at least the following techniques under the consideration of UE movement, rotation and/or channel/beam blockage including
  - Beam management of UE/TRP Tx/Rx beams
  - Transmission/reception techniques to provide more robustness (e.g. semi-OL MIMO transmission, beam cycling, beam broadening)

R1-168389 WF on the design of downlink control channel ZTE Corporation, ZTE Microelectronics, Qualcomm, ASTRI, Intel Corporation

Revision of R1-168274

Agreements:

- Study the relationship of beam(s) used for L1 control channel and beam(s) used for data channel
  - E.g. Using different beamwidth for data and control
  - E.g. Using different beam directions for data and control
  - E.g. At least one beam is shared by data and control
  - E.g., same beam for data and control

R1-168486 WF on number of antenna ports for CSI-RS Ericsson, Samsung, Verizon, Sprint, Deutsche Telekom

Agreements:

- For NR, support DL CSI measurement with X antenna ports
  - Study the values of X = 1,2,4,8,12,16,20,24,28,32
  - Study whether additional values of X are needed, including X > 32 (e.g., 64)
  - Other values of X are not precluded

R1-168318 **Summary of Wednesday Offline Session on NR MIMO** **Samsung**

Decision: The document is noted.

R1-168448 Summary of Thursday Offline Session on NR MIMO Samsung

R1-168530 WF on network coordination aspects Nokia, Samsung, Mediatek, Intel, ASB

Agreements:

- Study to support various interference management schemes:
  - Interference management over different time scales:
    - Semi-static/preconfigured interference management
    - Dynamic interference management
  - Interference management where signals/channels from/to UE(s) is
    - Transmitted from/to multiple TRPs
    - Transmitted from/to single TRP
- The above study should consider:
  - Forward compatibility, e.g., for future introduction of additional interference management schemes (if any)
  - Low and high NR frequencies
  - Take into account backhaul/fronthaul latency constraints
  - Both TDD and FDD
  - Both data and control channels
  - Interference measurement/reporting
  - Taking into account interference management for advanced receivers
  - Taking into account various scenarios
  - Taking into account beam management, different antenna structures, etc.

Petitioners' Exhibit 1007, p. 1733
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-168536 WF on RS design principle in NR Huawei, HiSilicon

Agreements:

- NR support NR RS configured on a per UE basis
- FFS whether or not to support always-on non-UE-specific RS in NR
  - Including the details of always-on and non-UE-specific, if supported

R1-168529 WF on scenario and channel model for NR MIMO link and system level calibration ZTE Corporation, ZTE Microelectronics

8.1.6 Aspects related to initial access and mobility

Discuss PHY layer aspects related to initial access and mobility, considering beamforming aspects, for standalone and non-standalone operation

R1-167055 Overview on initial access and mobility Ericsson

The document was presented by Asbjorn Grovlen from Ericsson.

- Proposal 1: The initial time synchronization is provided by the Synchronization Signal(synchronization signal) where identical synchronization signal can be transmitted by multiple transmission points.
- Proposal 2: Target 100 ms periodicity for the synchronization signal and system information to limit the always-on signals for forward compatibility and lower energy consumption.
- Proposal 3: Idle-mode mobility measurements are based on the synchronization signals used for initial access.
- Proposal 4: Connected mode mobility measurements are based on specific reference signal unrelated to the synchronization signals used for initial access and idle mode mobility.
- Proposal 5: The reference signals for connected mode mobility can be configured that can be configured on a per-need basis

Decision: The document is noted.

R1-167294 Basic Principles for Initial Access and Mobility Nokia, Alcatel-Lucent Shanghai Bell, Verizon Wireless

The document was presented by Mihai Enescu from Nokia.

- Proposal 1: Periodic synchronization signal(s) are needed for initial search and synchronization.
- Proposal 2: Signal structure used for initial search signal should be common both in single-beam and multi-beam operation.
- Proposal 3: Default numerology is used for synchronization signals (per frequency band).
- Observation 1: Tens to hundreds of beams per cell which needs to be uniquely identifiable by the UEs.
- Observation 2: Hierarchical beam identification structure is needed.
- Observation 3: Synchronization signal needed for beam synchronization.
- Observation 4: Synchronization signal can convey ID that is used as basis to derive beam reference signal for the cell.
- Proposal 4: Physical broadcast channel needs to be defined to deliver essential system information.
- Proposal 5: PBCH should support both single-beam and multi-beam operation.
- Proposal 6: Random access procedure should support both single-beam and multi-beam operation.
- Proposal 7: Default numerology applied for the signals and channels in random access procedure.
- Proposal 8: Periodical downlink beam reference signals are basis for downlink based mobility.
- Proposal 9: Define a periodical discovery signal comprising synchronization signal(s), beam reference signals and physical broadcast channel transmitted by a cell.
- Observation 6: UL signal for UL based mobility may be used triggering downlink mobility measurements.
- Observation 7: UL based mobility likely more feasible at lower carrier frequencies than higher carrier frequencies where UE uses directional transmissions instead of omni-directional.

Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1736
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-167912 Discussion on initial access and mobility for NR NTT DOCOMO, INC.

The document was presented by Hiroki Harada from NTT DOCOMO.

- Proposal 1: RAN1 should study synchronization signal (SS) design for eMBB/URLLC.
  - Different design of SS for mMTC can be considered and introduced (if necessary) later.
- Proposal 2: NR should support multiple SS numerologies for different frequency bands and different synchronization accuracy requirements.
- Proposal 3: NR should support both single-beam based and multi-beam based approaches for SS transmission.
  - Target number of beams for SS transmission and corresponding resource mapping design should be studied.
- Observation 1: SS transmission periodicity for standalone NR carrier should be short (e.g., 5 or 10 ms) while SS transmission periodicity for non-standalone NR carrier can be longer (including possibility of no transmission) by using assistance from other NR or LTE carrier.
- Proposal 4: Only essential system information required for standalone initial access is transmitted in MIB (and SIB) as always-on signal and other system information can be provided on-demand after random access.
- Proposal 5: Design of identity parameter used for SS generation and MIB decoding should not limit NR deployment flexibility.
- Proposal 6: DL-based measurement should be assumed as baseline for UE controlled mobility.

Decision: The document is noted.

R1-167944 WF on NR initial access NTT DOCOMO, Nokia, ASB, Ericsson

The document was presented by Hiroki Harada from NTT DOCOMO.

- RAN1 should strive for a common framework, including for example structure of synchronization signals, for initial access
- More specifically, especially within a given frequency range, RAN1 should strive for a common framework covering
  - Single beam based and multi-beam based deployments
  - TDD and FDD operations
  - Different/mixed numerologies
  - Standalone and non-standalone operations
  - Licensed band and unlicensed band operations
- RAN1 should take following requirements into account to design synchronization signal(s) and essential system information for initial access
  - Providing at least following functionalities
    - Detection of NR cell and its ID
    - Initial time/frequency synchronization to the cell
    - Providing necessary information for random access
  - Providing sufficient number of identity parameters to allow deployment flexibility

Decision: The document is noted and modified as follows:

Agreements:

- RAN1 should strive for a common framework, including for example structure of synchronization signals, for initial access
- More specifically, especially within a group of frequency bands in the frequency range, RAN1 should strive for an unified framework covering
  - Single beam based and multi-beam based deployments
  - TDD and FDD operations
  - Different/mixed numerologies
  - Standalone and non-standalone operations
  - Licensed band and unlicensed band operations
  - FFS: mMTC use case
- RAN1 should take at least following requirements into account to design initial access
  - Providing at least following functionalities
    - Detection of NR cell and its ID
      - Note: In this context, NR cell corresponds one or multiple TRP(s)
    - Initial time/frequency synchronization to the cell
    - Providing necessary information for random access
  - Providing sufficient number of the identity values to allow deployment flexibility
  - FFS: supporting efficient mobility
  - FFS: supporting efficient inter-RAT measurement
  - Reducing the frequency hypothesis UE needs to search for compared to LTE
  - FFS: detecting beam ID(s)

R1-167957 WF on evaluation assumptions for initial access in NR Intel Corporation

Petitioners' Exhibit 1007, p. 1737
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The document was presented by Gregory Morozov from Intel.
Discussion: Huawei requested more time for detailed review.
Decision: The document is noted. Continue offline discussion until Tuesday – (Intel)
Tuesday: Evaluation assumptions have been revised in R1-168107 and agreed in R1-168162.
Continue offline discussion until Wednesday – (Intel)
Wednesday: Evaluation assumptions have been revised in R1-168239 , all brackets removed and agreed in R1-168255 by adding the following note in PHY abstraction: "Proponents are allowed to provide PHY abstraction details if used"
Note that R1-168255 superseeds the previously agreed R1-168162.

R1-168481 WF on evaluation assumptions for initial access in NR Intel
Agreed in R1-168493 with following updates in channel model
· CDL-C for 4 and 30GHz, CDL-D for 70 GHz (other CDL models are not precluded),

RACH procedure
R1-168124 **WF on RACH procedure for NR NTT DOCOMO, Ericsson, Nokia, Alcatel-Lucent Shanghai Bell**
The document was presented by Kazuaki Takeda from NTT DOCOMO.
- RACH procedure including RACH preamble (Msg. 1), random access response (Msg. 2), message 3, and message 4 is at least assumed for NR from RAN1 perspective
- Simplified RACH procedure, e.g., Msg. 1 (UL) and Msg. 2 (DL), should be further studied
  - Details on Msg. 1 and Msg. 2 are FFS
- The design of the random access procedure should take into account the possible use of multi-beam DL and multi-beam UL as well as multi-beam DL and single-beam UL
- In case that beam-forming is applied to DL broadcast channels/signals for initial access, association between DL broadcast channels/signals detected by UE for initial access and RACH resource is considered.
  - FFS: Details on association in the context of multi-beam DL - multi-beam UL and multi-beam DL - single-beam UL
- Multiple occasions for RACH preamble transmission in a given time interval is supported
  - FFS: Details on time interval
- Allow for RACH reception/RAR transmission in TRPs other than the one transmitting synchronization signals

Decision: The document is noted. Continue offline discussion until Wednesday – (NTT DOCOMO)

R1-168104 **WF on NR multi beam initial access ZTE**
The document was presented by Patrick Svedman from ZTE.
- RAN1 should study multi-beam based approaches to enable beamforming gain in each initial access step, considering:
  - Non Rx/Tx reciprocity at BS or UE
  - Full or partial Rx/Tx reciprocity at BS or UE
- RAN1 should strive for a unified initial access framework for different reciprocity cases.

Discussion: Also supported by InterDigital.
Decision: The document is noted. Continue offline discussion until Wednesday – (ZTE)

R1-168260 **WF on RACH procedure for NR NTT DOCOMO, ZTE, CATT, Samsung**
Decision: The document is noted.

Agreements:
- RACH procedure including RACH preamble (Msg. 1), random access response (Msg. 2), message 3, and message 4 is at least assumed for NR from RAN1 perspective
- Simplified RACH procedure, e.g., Msg. 1 (UL) and Msg. 2 (DL), should be further studied
  - Details on Msg. 1 and Msg. 2 are FFS
  - Study should include comparison with the above procedure (first bullet)
- The design of the random access procedure should take into account the possible use of single-beam and multiple beam operations, including
  - Non Rx/Tx reciprocity at BS or UE
  - Full or partial Rx/Tx reciprocity at BS or UE
- In case that multiple beam-forming is applied to DL broadcast channels/signals for initial access,
  - RACH resource is obtained by UE from detected DL broadcast channels/signals
    - FFS: Details on association
  - Other mechanism w/o association is also considered
- Multiple occasions for RACH preamble transmission in a given time interval are considered
  - Details are FFS
  - Other mechanism is not precluded
- Study further RACH reception/RAR transmission in TRPs/beams other than the one transmitting synchronization signals

Petitioners' Exhibit 1007, p. 1738
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

About RACH, continue offline discussion until Thursday focusing on evaluation assumptions and signal design – Patrick (ZTE), Kazuaki, (DOCOMO), Seunghee (Intel), Hyunseok (Samsung)

R1-168390 WF on Link Level Evaluation Assumptions for RACH Preamble NTT DOCOMO
Agreed in R1-168492 with following updates in channel model
· CDL-C for 4 and 30GHz, CDL-D for 70 GHz (other CDL models are not precluded),

R1-168127 **WF on RRM measurement in NR LG Electronics, NTT DoCoMo**
- For RRM measurement in NR, DL measurement is supported at least for idle mode UE with the consideration on
  - Both single-beam based operation and multi-beam operation
- FFS: Definition of RRM measurement for multi-beam based operation
- FFS: DL signal for RRM measurement in idle mode

Decision: The document is noted.

R1-166393 High speed mobility performance evaluations Qualcomm Incorporated
- Observation 1: For RRC inactive state, in mobility challenging scenario, DL based mobility can have high paging miss probability
- Observation 2: For RRC inactive state, in mobility challenging scenario, paging missing probability for DL based mobility can be improved at the expense of UE power consumption increase, e.g. more frequent and longer cell-search
- Observation 3: For RRC inactive state, in mobility challenging scenario, UL based mobility can still provide reliable paging because of fast closed-loop L1 handshake at each DRX wakeup (i.e., UE transmitting a reference signal and Network sending back a response signal)
- Observation 4: For RRC inactive state, in mobility challenging scenario, UL based mobility can provide better paging reliability and UE power consumption tradeoff, compared to DL based mobility
- Our proposals are as follows
- Proposal 1: NR shall support UL-based mobility in which UE transmits reference signals and RAN determines a mobility event based on measurements of reference signals of UE's.
- Proposal 2: NR shall consider supporting hybrid/dynamic DL-based and UL-based mobility
- Proposal 3: Evaluate mobility performance. Following are the proposed KPIs.
  - RRC inactive state (similar to LTE_IDLE)
    - Paging-miss rate
    - Call-setup delay (i.e., number of consecutive Network paging miss before UE establishes a connection)
    - Network paging resource utilization (e.g., number of TRPs involved in paging a UE)
    - UE (intra-frequency) cell-search rate (relates to UE power consumption.)
    - Comparative UE power consumption analysis
  - RRC connected state (similar to LTE RRC_CONNECTED)
    - Handover-failure rate
    - Mobility interruption time
    - User experience during the HO

Decision: The document is noted.

Agreements (made on Wednesday further to offline discussions refining R1-168127):
- For RRM measurement in NR, at least DL measurement is supported with the consideration on
  - Both single-beam based operation and multi-beam based operation
- FFS: Definition of RRM measurement for multi-beam based operation
- FFS: DL signal for RRM measurement
- FFS: When DL measurement is applied
- Note that there is no conclusion that DL measurement is a complete solution for RRM measurement in NR for now

R1-168137 **WF on RRM Measurement and Mobility Huawei, HiSilicon, Qualcomm**
- For RRM measurement and mobility in NR, the following should be supported:
  - UL measurement can be used for:
    - L1/L2 based intra NR cell TRP mobility
    - L3 based inter NR cell mobility
  - UL signals used for UL measurement includes:
    - At least an energy-efficient UE-specific UL tracking signals
  - DL measurement can be used for
    - intra NR cell TRP mobility and DL beam management
    - NR cell reselection

  Note: In this context, NR cell corresponds to one or multiple TRP(s)

Petitioners' Exhibit 1007, p. 1739
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted.

Conclusions:

- For RRM measurement and mobility in NR, RAN1 needs to study DL and UL based measurements considering following RAN2 study
  - RRC driven at 'cell' level
  - Zero/Minimum RRC involvement (e.g. at MAC /PHY)
  - FFS what is the definition of a cell

Continue offline discussion about the detailed evaluation assumptions until Wednesday – David (Huawei), Tingfang (Qualcomm)

R1-168464 Evaluation Scenarios and Assumptions for DL and UL Mobility Qualcomm, Huawei
R1-168488 Evaluation Scenarios and Assumptions for DL and UL Mobility Qualcomm Incorporated, Huawei, Intel

R1-166387 **Uplink based mobility physical channels Qualcomm Incorporated**
Decision: The document is noted.

R1-167059 **On the random access procedure Ericsson**
The document was presented by Asbjorn Grovlen from Ericsson.

- Proposal 1: NR should support a four message random access procedure in order to support larger distances between UE and TRP
- Proposal 2: Study additional two step random access procedure to reduce the delay of accessing the network
- Proposal 3: If synchronization signals are beamformed, an association between SS and PRACH preambles should be supported.

Decision: The document is noted.

R1-167378 **RACH procedures for NR NTT DOCOMO, INC.**
The document was presented by Hiroki Harada from NTT DOCOMO.

- Proposal 1: The RACH procedure involving a transmission/reception of RACH preamble, RAR, message 3 and message 4 is at least supported for NR.
- Proposal 2: The simplified RACH procedure including only RACH preamble (and UL control channel/data) and RAR should be further considered.
- Proposal 3: Association between RACH resource and beam index should be considered to support efficient multi-beam operation for RACH procedure.

Decision: The document is noted.

R1-166799 **Random access in NR considering flexible UE channel bandwidth Samsung**
The document was presented by … from Samsung.

- Requirements to support different UE bandwidths on the same NR carrier
  - In order to support UEs with different bandwidth capabilities on the same NR carrier, PRACH bandwidth should be larger than or equal to minimum supported UE bandwidth.
  - The NR-PDCCH for RAR and RAR should be transmitted by NR-BS over bandwidth less than or equal to channel bandwidth of UE.
  - The NR-PDCCH for MSG3 retransmission should be transmitted by NR-BS over bandwidth less than or equal to channel bandwidth of UE. Resources for MSG3 transmission should be allocated to UE over bandwidth less than or equal to channel bandwidth of UE.
  - The NR-PDCCH for MSG4 (re)transmissions should be transmitted by NR-BS over bandwidth less than or equal to channel bandwidth of UE. Resources for MSG4 transmission should be allocated to UE over bandwidth less than or equal to channel bandwidth of UE.
- Proposal: The RACH-related signals and channels should be designed to take a benefit from various bandwidth values that NR UEs may support.

Decision: The document is noted.

Wednesday

R1-166795 **Discussion on numerology aspects of NR synchronization signal Samsung**
Decision: The document is noted. Continue offline discussion about SS numerology – Samsung
R1-168277 WF on numerology for synchronization signals in NR Samsung, ETRI, CATT, NTT DOCOMO, Ericsson
Agreements:

Petitioners' Exhibit 1007, p. 1740
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- For subcarrier spacing of each synchronization signal (e.g. NR PSS,SSS) in a NR carrier, the following alternatives should be studied
  - Alt 1: Subcarrier spacing is predefined in the specification for a given frequency range
    - Ex: 15kHz for sub-6GHz, 60kHz for over-6GHz
    - Note that there are more than one frequency ranges
  - Alt 2: Subcarrier spacing is selected by NR BS
    - FFS: Details on the set of possible numerologies
    - Note: Blind detection of multiple numerologies can be considered
  - Alt 3: Single subcarrier spacing is predefined in the specification for all frequency ranges
  - Other alternatives are not precluded
- NR synchronization signal is based on CP-OFDM
  - Note that DFT-spread-OFDM based design is not precluded

R1-168091 WF on carrier bandwidth for initial access in NR Mediatek

- The synchronization channel and at least some essential system information are restricted within a certain specified bandwidth.
  - The specified bandwidth may depend on the range of the frequency bands.
  - The specified bandwidth is not larger than the minimum system bandwidth to be supported in the corresponding frequency bands
  - e.g., the specified bandwidth can be 5MHz, 20Mhz, 80Mhz depending on the range of frequency bands.
- FFS: mMTC case
- FFS: uplink bandwidth for RACH.

Decision: The document is noted. Continue offline discussion within Wednesday

Wednesday

R1-168299 WF on carrier bandwidth for initial access in NR MediaTek, SierraWirless

- The synchronization channel and at least some essential system information are restricted within a set of specified frequency resources.
- A set of specified frequency resources may depend on the range of the frequency bands and the numerology.
  - FFS: a set of frequency resources
- FFS: whether the used frequency resource is blindly detected by UE from a set of specified frequency resources or set by default according to the frequency bands.

Discussion: FFS: uplink bandwidth for RACH.

Decision: The document is noted. Continue offline discussion until Thursday

R1-168397 WF on carrier bandwidth for initial access in NR MediaTek,
R1-168483 WF on carrier bandwidth for initial access in NR MediaTek, Intel

Agreements:

- At least one transmission bandwidth within a carrier bandwidth can be specified for transmission of each synchronization signal and at least some essential system information.
  - The transmission bandwidth may be specified either differently according to the frequency range or the same across the frequency ranges
  - FFS: transmission bandwidths for each synchronization signal and at least some system information are same or not
  - FFS: the transmission bandwidth and the corresponding numerology
  - FFS: whether the used transmission bandwidth is blindly detected by UE from specified bandwidths according to the frequency bands

R1-168463 Way forward on initial access for NR LG Electronics, NTT DOCOMO
Also supported by Mitsubishi, ZTE
R1-168512 Way forward on initial access for NR LG Electronics, NTT DOCOMO, Panasonic, ETRI

Agreements:

- In order for the transmission of the information required for the initial access (e.g. configuration of random access resource), at least following options are to be studied:
  - Note: the above information can consist of multiple parts, and different option below can be applied for the transmission of each part
  - Opt 1: the transmission is scheduled by dynamic signaling (e.g. control channel)
  - Opt 2: the transmission is scheduled by semi-static signaling (e.g. via the previous part)
  - Opt 3: the transmission is done alone without associated signaling (e.g. predefined in spec)
- In the above study, at least following aspects should be considered:
  - Resource flexibility (e.g. in terms of ensuring forward compatibility, dynamic TDD operation)
  - Resource overhead

Petitioners' Exhibit 1007, p. 1741
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

– UE complexity (e.g. involved with decoding of the information)

R1-168494 WF on sync and carrier rasters Huawei, HiSilicon, Qualcomm, Nokia, Alcatel-Lucent Shanghai Bell, NTT Docomo, Ericsson, ETRI, InterDigital

Email approval until 1st September to tell the current RAN1 agreements and WA to RAN2

R1-166915 High level view on the study for eV2X LG Electronics
R1-166916 Remaining issues on the evaluation assumptions for eV2X LG Electronics
R1-167942 WF on coexistence between NR sidelink and LTE sidelink LG Electronics, Huawei, HiSilicon, Deutsche Telekom
Conclusion:
- This topic as in R1-167942 is to be revisited next meeting (after V2V WI, expected to be finished this meeting)

R1-167943 WF on remaining evaluation assumptions for eV2X LG Electronics, Deutsche Telekom, Huawei, HiSilicon
Proposal:
- The performance metric agreed in the email discussion [85-15] is captured in TR38.802
- The specific numbers of traffic model, inter-RSU distance, and UE distribution are by the agreed values in the TR 38.913. These values can be further updated modified, after SA1 input.
- Following the agreement in the SLS evaluation assumptions of rural and urban macro, [TBD for TDD] is removed in BS Tx power part for SLS evaluation assumptions of eV2X
- For the in-band emission modeling, RAN1 needs to study the impact of in-band emission and proper modeling for it for NR sidelink operations.
- For the LLS evaluation assumptions for eV2X, those in LTE V2X described in TR38.885 could be reused as start point, and updated if NR study has new proposals

Petitioners' Exhibit 1007, p. 1743
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Target frequency can be revisited

Further discussion offline

R1-167931 WF on performance metric for V2X NR Ericsson, LGE

Agreement:

- For the two alternatives as part of the RAN1#85 email discussion [85-15], the following is agreed:
  - Alt. 2: (1-Y) is the packet reception ratio calculated on a subset of UEs:
    - For one Tx packet, 1-Y is calculated by S/Z, where Z is the number of UEs in the intended set of receivers, and S is the number of UE with successful reception among Z.
      - Unicast is the special case where Z includes a single UE, where the PRR is average of packets of the unicast link

R1-167932 WF on system level simulations for V2X NR Ericsson

Proposal:

- Add 63GHz carrier frequency with 1GHz bandwidth (63-64GHz) for UE-UE and for UE-RSU [1]
- FFS UE-UE and UE-RSU channel models at 63GHz
- 40dBm e.i.r.p. Tx power limitation at 63GHz
- Revise the assumptions on RSU antenna pattern.
  - 4 antenna arrays with 2 elements each
  - The arrays point to the 4 streets in the intersection
  - Each antenna element irradiates with halfspherical uniform distribution over a 90deg azimuth angle
  - Antenna gain = 9dBi
- Slide 5 of R1-167932

Discuss further offline

R1-166110 On building material distribution modeling and indoor user ratio modeling Huawei, HiSilicon
R1-167387 Remaining details of the dense urban scenario NTT DOCOMO, INC.

Proposal: Regarding TRP dropping:

- Option 1 in Table II of R1-167387 is used for 4GHz case.
- Option 3 in Table II of R1-167387 is used for 30GHz case.
- Modelling of coverage enhancement schemes, e.g., using the multi-beam based transmission shall be considered, at least for 30 GHz case, in order to perform the macro-layer/micro-layer cell association.

Further discussion offline

R1-167553 On max EIRP values Ericsson

Agreement:

- Remove the brackets for urban macro scenario to set the EIRP limit to 78 dBm
- In dense urban scenario, set the EIRP limit to 73 dBm and 68 dBm for the macro and micro layers respectively
- In indoor open office scenarios, set the EIRP limit to 58 dBm

R1-167576 UE Transceiver Architecture and Noise Figure Assumptions for NR with Frequencies Above 6 GHz Straight Path Communications, Qorvo

R1-167876 High speed train scenario for RRH and relay at 30GHz: scenario and CDL-D descriptions Mitsubishi Electric

Revision of R1-166937

R1-167792 Battery Assumptions for NR u-blox AG, Sony
R1-166885 Evaluation assumptions for flexible duplex operation LG Electronics

R1-168125 Offline discussion summary NTT DoCoMo

Conclusion:

- The green parts in R1-168125 are endorsed
- Table A.2.1-1, 2, 3, cell E11, is endorsed with the following updates:
  - NOTE1: See Appendix for the derivation of maximum allowed EIRP (R1-164383, R1-167553).

R1-168121 Way Forward on O2I Penetration Loss Model Mix for NR Evaluation Straight Path, Ericsson, Samsung, Nokia, ASB, LGE, Huawei

Agreements:

- The following mix of O2I penetration loss models should be evaluated for high frequency for NR:
  - For Urban Micro and Urban Macro
    - Option1
      - Low loss model – 80%
      - High-loss model – 20%

Petitioners' Exhibit 1007, p. 1744
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Option2
  - Low loss model – 50%
  - High-loss model – 50%
- Other mix ratio(s) is not precluded.

R1-168053 WF on scenarios and evaluation assumptions for flexible duplex LG Electronics, Huawei, HiSilicon

Agreement:

- The WF in R1-168053 is agreed, with the following updates:
  - Channel model:
    - Current entries are used as a starting point
    - Can further discussion whether or not to update the channel model
  - Traffic model
    - Add optional DL/UL ratio of 1:1
    - Add one more packet size of 2Mbtyes
    - Add "other FTP model is not precluded"
  - UE receive noise figure:
    - Update according to last meeting's agreements on the noise figures (i.e., 10dB vs. 13dB)
  - Layout
    - Add: FFS other cluster dropping models for dense Urban

R1-168391 Offline dicussion updated sumary of evaluation assumptions for NR NTT DOCOMO, INC.

Agreements:

- The green entries in the attached spreadsheet in R1-168391 are agreed

R1-168371 WF on URLLC evaluation parameter and LLS method Huawei

Agreements:

- Slide 3 and slide 4 in R1-168371 are agreed
- Slide 5 in R1-168371 is agreed, with the following updates:
  - From "Companies report delay assumption, e.g., processing delay, transmission delay, re-transmission delay."
  - To "Companies report delay assumptions according to Table 1 in R1-166485". For calibration purpose only, the entries 1.1 and 1.4 of the Table 1 are assumed to be zero. In addition, each company reports the max number of HARQ re-transmissions.

R1-168441 WF on URLLC Evaluation Scenarios Intel, Ericsson, Qualcomm Inc.

Agreements:

- From RAN1 perspective, the following scenarios are used as a starting point for initial URLLC evaluations
  - Indoor Hotspot scenario
  - Urban Macro scenario

R1-168343 Extreme Long Range KPI Evaluation Qualcomm Incorporated, Ericsson, Huawei

R1-168174 WF on CDL-D model for high speed train scenario at 30GHz for RRH and relay Mitsubishi Electric, ETRI, Ericsson

Agreements:

- Slide 3 in R1-168174 is agreed

R1-168398 WF on URLLC System Capacity Definition Clarification Intel, Qualcomm Inc.

Agreements:

- System level evaluation method is used for URLLC system capacity study to analyze impact from inter-cell interference, queueing and scheduling latency, multiplexing with other services
- URLLC system capacity is calculated as follows:
  - C(L, R) is the maximum offered cell load under which Y% of UEs in a cell operate with target link reliability *R* under *L* latency bound
  - X = (100 – Y) % is the percentage of UEs in outage
  - A UE in outage is defined as the UE can not meet latency L and link reliability R bound
  - Companies report their assumption on X
- Note: definition of latency L and target link reliability *R* is provided in R1-168371

R1-168372 WF on channel model issues for flexible duplex evaluation Huawei, HiSilicon, Intel

Agreements:

- Slide 2 in R1-168372 is agreed with the following update:
  The following assumption is used as starting point for flexible duplex evaluation, and further update might be made ~~after more measurements are available~~.

Petitioners' Exhibit 1007, p. 1745
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-168373 WF on penetration issues for flexible duplex evaluation Huawei, HiSilicon, LG Electronics
Agreements:
- R1-168373 is agreed with the following update:
  The following assumption is used as starting point for flexible duplex evaluation, and further update might be made ~~after more measurements are available~~.

R1-168370 WF on Modeling Line-of-Sight Blockage for V2V Huawei, HiSilicon, Volkswagen, Ericsson, General Motors, Vodafone
Continue discussion next meeting

R1-168547 Offline dicussion further updated sumary of evaluation assumptions for NR NTT DOCOMO
Agreements:
- The green entries and F14 in the spreadsheet attached in R1-168547 are agreed.

R1-168510 WF on SLS evaluation methodologies for MA LG Electronics, ZTE, ZTE Microelectronics
Agreements:
- Slide 4 and slide 5 are agreed except the cell "packet size" and "Target packet drop rate"

Email discussion on the two options of the packet size and clarification on Target packet drop rate
as listed in R1-168510 until 9/1 – Kazuaki (DOCOMO)
R1-168485 Battery Lifetime Model for NR Sony, u-blox, Sierra Wireless
Email discussion on battery lifetime model in R1-168485 until next meeting – Martin (SONY)
Traffic model for urban coverage for massive connection (UL) (column I and row 21 in the excel sheet) was also discussed based on the draft papers. However, no consensus has been reached on.
Email discussion on traffic model for urban coverage for massive connection (UL) (until 9/15) – Wuyong (Huawei)

R1-168517 WF on Battery Life Evaluation Methodology for mMTC Qualcomm Inc.
Discuss discussion next meeting

R1-168543 Pathloss calibration between companies Qualcomm Inc.
Email discussion for path loss calibration for 3D UMa at carrier frequency of 700 MHz until 9/9 – Haitong (Qualcomm)

Agreed in R1-168009 CRxxxx, with addition of apostrophe in “clusters” below table 7.6.1-1.

Section 7.6.2.1
R1-167824 TR38.900_CR_Section_7.6.2.1 Fraunhofer HHI, Huawei, HiSilicon
R1-166809 Correction on large antenna array support in TR38.900 Samsung
Discuss offline how to merge R1-167824 and R1-166809. Prepare revision in R1-168010.

Section 7.6.2.2
R1-167920 TR38.900_CR_Section_7.6.2.2 Fraunhofer HHI, Huawei, HiSilicon
Revision of R1-167825
R1-166640 Draft CR on reference table to correlation distance for large bandwidth/antenna array NEC
Covered by R1-167920.

Section 7.6.3
R1-168110 TR38.900_CR_Section_7.6.3 Fraunhofer HHI
Agreed in principle, but to be revisited after merging any other changes from revision of R1-167236 -> R1-168012.
Revision of R1-167826

Petitioners' Exhibit 1007, p. 1749
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Section 7.6.3.1
R1-166808 Draft CR on spatially consistent random variable clarification in TR38.900 Samsung
Move to an earlier section of the TR - prepare a revision offline - R1-168011.
Agreed in R1-168478.

R1-167236 Correction to the spatial consistency Section 7.6.3 of TR38.900 Huawei, HiSilicon
Discuss offline with Samsung which changes are agreeable.
Note typos in "maybe 2D processes with Uniformely distributed (delays and angles) or Normaly"
Put references in correct section.
Merge any agreeable changes into R1-168012.

Section 7.6.3.3
R1-167472 Clarification and correction of the soft LOS state model in TR 38.900 Ericsson
R1-167479 Correction to soft LOS state Ericsson, Intel
Already included in R1-168010.

R1-167480 Correction for spatial consistency of indoor distance Ericsson
R1-167623 Corrections on spatial consistency across floors in TR 38.900 ZTE Corporation, ZTE Microelectronics
Agreed in R1-168013 CRxxxx.

Section 7.6.4
R1-168151 Correction of blockage modeling Intel Corporation, Nokia, Alcatel-Lucent Shanghai Bell, Huawei, HiSilicon, InterDigital, Qualcomm, Samsung
Revision of R1-166572
R1-167918 TR38.900_CR_Section_7.6.4 Fraunhofer HHI
Revision of R1-167829
Includes R1-168151. Discuss offline.
Revised in R1-168329.

Section 7.6.6
R1-166571 Correction of time varying Doppler definition Intel Corporation, Samsung, InterDigital
R1-168113 TR38.900_CR_Section_7.6.6 Fraunhofer HHI
Revision of R1-167836
Discuss offline - revisit on Friday.
Revised in R1-168330.

Section 7.7.1, 7.7.2
R1-167237 Correction to the TDL-E and CDL-E Huawei, HiSilicon

Section 7.7.2
R1-167474 Correction for Doppler spectrum of TDLs Ericsson
Revise in R1-168014 with definition of fD and changing "frequency" to "shift".

R1-167477 Correction to MIMO extension of TDLs Ericsson

Section 7.7.3
R1-166810 Draft CR on delay scaling parameters in LLS channel model in TR38.900 Samsung
Discuss offline which values to use, and show the deleted table -> R1-168015.
Agreed in R1-168479.

R1-167830 TR38.900_CR_Section_7.7.3 Fraunhofer HHI

Section 7.7.4
R1-168111 TR38.900_CR_Section_7.7.4 Fraunhofer HHI
Revision of R1-167831
Agreed in R1-168016 with correct figure number references and delete the problem description text.

R1-167238 Correction of angular scaling parameters of CDL models in TR38.900 Huawei, HiSilicon
Superseded by R1-168016.

Section 7.7.5
R1-166811 Draft CR on CDL channel models in TR38.900 Samsung
Covered by R1-167919.
R1-167919 TR38.900_CR_Section_7.7.5 Fraunhofer HHI

Petitioners' Exhibit 1007, p. 1750
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Revision of R1-167832

Section 7.7.6
R1-167473 Identified errors in K-factor scaling for TDL-D/E in TR 38.900 Ericsson
R1-167475 Correction for K-factor scaling of TDL models Ericsson
Agreed in principle; discuss offline the correct terminology for K_{1sttap} -> R1-168017.
Note that a further modification may be considered at RAN1#86bis to show how the formulae in the last table depend on the figures in the previous table.

R1-167242 Correction to K factor scaling in Table 7.7.6-2 Huawei, HiSilicon
Covered by R1-167475.

Section 7.7.5.1
R1-167233 Correction on the translation equation for scaling of angles in TR 38.900 Huawei, HiSilicon
Covered by R1-167919.

Section 7.8
R1-168138 Correction on Calibration Simulation Assumption in TR38.900 Samsung, Intel
Agreed in R1-168480.

Section 7.8.1 & 7.8.2
R1-167579 CR for TR38.900 to capture large and full scale calibration Samsung

Section 7.6.2.1, 7.8.2, 7.8.3
R1-167580 Draft CR for TR38.900 for editorials and minor corrections Samsung
Changes in only sections 7.8.2 and 7.8.3 are agreed in R1-168018. Other changes are already covered elsewhere.
Agreed in R1-168477.

Section 8.4
R1-168112 TR38.900_CR_Section_8.4 Fraunhofer HHI
Revision of R1-167833
Discuss offline how to handle the dependencies with section 7.5 -> R1-168019 **-> R1-168022** - revisit on Friday.

Miscellaneous
R1-167227 General discussion on the TR38.900 Huawei, HiSilicon
Discuss offline any remaining issues and prepare CRs for any remaining corrections that seem agreeable.
2 remaining issues:
1. 2D vs 3D pathloss
2. Multi-frequency simulation clarifications

Prepare a CR for consideration at RAN1#86bis.

R1-168153 TR38.900_CR_Consistent_Equation_Numbering Fraunhofer HHI, CATT, Huawei, HiSilicon, Ericsson

R1-167117 Full calibration for channel model above 6GHz CMCC
R1-168020 E-mail discussion summary on additional feature calibrations Samsung
Revision of R1-167581
Email discussion until 30th September to collect calibration data for additional features.

Other
R1-167310 Sidelink design for NR Qualcomm Incorporated

9 Closing of the meeting

Mr Chair thanked all for really appreciated hard work during the week. Special thanks to V2V team who closed Thursday session very late (23:55).
V2V rapporteur (LGE) asked for taking the floor and thanked Shailesh Patil (Qualcomm) for his work – the best to Shailesh in his future position out of RAN1.
Thanks also to the European Friends of 3GPP for hosting and organizing meeting room facilities for such big meeting.
Mr Chair thanked Vice chairs and all the chair persons who help managing the number of parallel sessions during the course of the week.
Question was raised clarifying the NR scheduling for upcoming meetings

Petitioners' Exhibit 1007, p. 1751
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Mr Chair confirmed that Way Forward (especially on multiple access schemes) are welcome to next meeting. Any contribution submission is welcome but RAN1 chair warned the group that RAN1 had only 3 meetings left before the completion of the NR SI, including January ad-hoc additional meeting. Agenda to next upcoming meetings shall take into account this constraint.
ZTE commented that online discussions do not preclude offline/email discussions to progress further
Ericsson still believe that RAN1 should strive reaching progress online
Meeting was closed at 17:00.
See you all in Lisbon.

Annex F: List of actions

- **Outgoing LS.**

[86-21] Asbjorn (Ericsson)
LS to RAN2 about NE initial access and mobility
Email approval until 1st September to tell the current RAN1 agreements and WA to RAN2
Done: Final LS is agreed in R1-168214 as per Mr Chair's decision posted on Sept 2nd.

- **CR approval**

[86-01] Bob (Motorola Mobility)
R1-167507 Addition of LTE_LATRED_L2-Core Ericsson LM
CR0709 of 36.213 is for email approval until Sept 12th.

[86-02] Suzuki (Panasonic)
R1-167434 Clarification of valid subframe in eMTC Panasonic Corporation
Email discussion/approval until Sep. 1st
Done: CR0725r1 to 36.213 is agreed in R1-168213 as per Mr Chair's decision posted on Sept 2nd.

[86-03] Johan (Ericsson)
CR for PUCCH retuning for BL/CE UE
Email approval until 2nd Sep.

[86-04] Editors
eLAA CRs
Editors will provide updated draft CRs including the agreements and WA until 6th Sep., and email approval until 12th Sep.
Rapporteur will provide agreement lists until 29th August.

[86-05] Editors
V2V CRs
Editors will provide updated draft CRs including the agreements and WA until 6th Sep., and email approval until 12th Sep.
Rapporteur will provide agreement lists until 29th August.

[86-40] Harish (Qualcomm)
HS-SCCH DRX feature
R1-167814 Introduction of HS-SCCH Order for HS-SCCH DRx feature in enhanced Cell Fach Qualcomm Europe Inc.(France)
R1-167815 UE Procedures for HS-SCCH DRx feature in enhanced Cell Fach Qualcomm Europe Inc.(France)

Petitioners' Exhibit 1007, p. 1759
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Email discussion until Sept 9th. on Qualcomm CRs.

- **Text proposal for TS and TR**

None

- **Miscellaneous**

[86-06] Philippe (Huawei)
Threshold values for V2V
Email discussion until 2nd Sept. on the numbers in the brackets

[86-07] Hanbyul (LGE)
Energy measurement in each sub-channel for V2V
Email discussion until 2nd September

[86-08] Stefano (Ericsson)
R1-168348 WF on CBR measurement – Ericsson
Email discussion until 2nd September

[86-09] Stefano (Ericsson)
R1-168080 WF on V2V congestion control - Ericsson
Email discussion until 2nd September

[86-10] Hanbyul (LGE)
Candidate size for V2V
Email discussion until 2nd September

[86-11] Shailesh (Qualcomm)
DCI for V2V
Email discussion to finalize the square-bracketed figure and FFS until 2nd September

[86-12] Philippe (Huawei)
SCI contents for V2V
Email discussion until 2nd September to confirm the working assumption and square-bracketed figures, and the details of joint encoding of frequency location of the other transmission and number of subchannels

[86-13] Hanbyul (LGE)

Petitioners' Exhibit 1007, p. 1760
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

PSD offset for V2V for email approval until September 1st
Done: According to Mr Chair's email dated on Sept 2nd, the PSD offset is fixed to [3] dB in specifications.
Note that exact fixed value can be discussed in the next meeting by seeing more evaluation results and analysis.

[86-14] Mark (Ericsson)
Antenna Port Layouts for FD-MIMO
Email discussion until the next meeting

[86-15] Yi (Huawei)
SLS baseline for NR MA
Email discussion on any other potential parameters until 2nd Sep.

[86-16] Yi (Huawei)
Templates for NR MA
Huawei will provide the initial version of template for preliminary simulation results summary by 9th Sept, and email discussion about this template by 16th Sep

[86-17] Yi (Huawei)
SLS calibration for NR MA
Email discussion until 16th Sep.

[86-18] Yifei (ZTE)
Categorization for NR MA schemes
Email discussion until the next meeting

[86-19] Joseph (Qualcomm)
Use cases discussion for time domain structure for NR
Email discussion where proponents provide further input on use cases with completion by 15th Sep.

[86-20] Ruyue (ZTE)
MIMO calibration for NR
Email discussion until 8th Sep.

[86-22] Kazuaki (NTT DOCOMO)
Target packet drop rate for NR
Email discussion on the two options of the packet size and clarification on Target packet drop rate
as listed in R1-168510 until 1st Sep.

[86-23] Martin (Sony)

Petitioners' Exhibit 1007, p. 1761
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Battery lifetime model for NR
Email discussion on battery lifetime model in R1-168485 until the next meeting

[86-24] Wu Yong (Huawei)
Traffic model for NR
Email discussion on traffic model for urban coverage for massive connection (UL) (until 15th Sep)

[86-25] Haitong (Qualcomm)
Path loss calibration for NR
Email discussion for path loss calibration for 3D UMa at carrier frequency of 700 MHz until 9th Sep.

[86-26] Young-Han (Samsung)
R1-168537 WF on Dense Urban Scenarios
Email approval until 8th September

[86-27] Na (NTT DOCOMO)
R1-168421 WF on Indoor TRP Configuration
Email discussion until 2nd Sep.

[86-28] Young-Han (Samsung)
Additional feature calibration for channel model
Email discussion until 30th September to collect calibration data for additional features

Petitioners' Exhibit 1007, p. 1762

Draft_Minutes_report_RAN1#85_v010.zip (948 kB)

Dear all,

First apologizes for the late posting… first draft of the minutes from Nanjing is attached and can also be downloaded from portal @/tsg_ran/WG1_RL1/TSGR1_85/Report
This version is far from being a clean one as I mainly focused myself on:

- Outputs to others WG and TSG
- Agreed CRs checking
- NR

My plan is now on checking the LTE part and update 3GU with all the LTE-related decisions made last week.
More urgently, short term will be devoted in the preparation to the upcoming plenary…
Any feedback/comment is welcome
BR/P

Subject: [RAN1#85]: Tdocs upload post meeting

Dear all,

Hope you all enjoy a peaceful journey back home…
All available Tdocs (at least those I have) have been uploaded to /tsg_ran/WG1_RL1/TSGR1_85/Docs
I have now started to check the… almost 2000 docs – consequently don't be surprised if all decisions made are not yet properly reflected in 3GU Tdoc list – I work on it !!
BR/P

Göteborg, Sweden, 22nd – 26th August 2016

Table of contents

1 Opening of the meeting 7
1.1 Call for IPR 7
1.2 Competition law statement 7
1.3 Network usage conditions 7
2 Approval of Agenda 7
3 Approval of Minutes from previous meeting 8
4 Incoming Liaison Statements 8
5 UTRA 13
5.1 Maintenance of UTRA Releases 4 – 13 13
5.1.1 FDD 13
5.1.2 TDD 14
5.2 Multi-Carrier enhancements for UMTS - WID in RP-152290. 14
5.2.1 Performance evaluation 14
5.2.2 Other 14
5.3 DTX/DRX enhancements in CELL_FACH - WID in RP-160185. 15
5.3.1 DRX improvements 15
5.3.2 DTX improvements 15
6 E-UTRA 16
6.1 Maintenance of E-UTRA Releases 8 – 13 16
6.1.1 Maintenance of E-UTRA Release 8 – 12 16
6.1.2 Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers 16
6.1.3 Maintenance of Release 13 licensed-assisted access to unlicensed spectrum 16
6.1.4 Maintenance of Release 13 elevation beamforming/full-dimension MIMO for LTE 17
6.1.5 Maintenance of Release 13 further LTE physical layer enhancements for MTC 18
6.1.6 Maintenance of Release 13 NB-IoT 23
6.1.7 Other 29
6.2 LTE Release 14 29
6.2.1 Enhanced Licensed-Assisted Access to Unlicensed Spectrum - *WID in RP-152272.* 29
6.2.2.1 PUSCH design ..... **Error! Bookmark not defined.**
6.2.2.2 SRS design ..... **Error! Bookmark not defined.**
6.2.2.3 Uplink control information on an LAA SCell ..... **Error! Bookmark not defined.**
6.2.2.4 PRACH design ..... **Error! Bookmark not defined.**
6.2.2.5 Channel access framework ..... **Error! Bookmark not defined.**
6.2.2.6 Others ..... **Error! Bookmark not defined.**
6.2.2 Support for V2V services based on LTE sidelink - *WID in RP-160649* ..... **Error! Bookmark not defined.**
6.2.2.1 Enhancement to sidelink physical layer structure ..... **Error! Bookmark not defined.**
6.2.2.1.1 DM-RS for PSCCH and PSSCH ..... **Error! Bookmark not defined.**
6.2.2.1.2 DM-RS for PSBCH ..... **Error! Bookmark not defined.**
6.2.2.1.3 Others ..... **Error! Bookmark not defined.**
6.2.2.2 Sensing with semi-persistent transmission in UE autonomous resource selection mode .... **Error! Bookmark not defined.**
6.2.2.2.1 Details of using SA decoding and energy measurement for sensing ..... **Error! Bookmark not defined.**
6.2.2.2.2 Details of the transmitter UE behaviour in resource selection/reselection . **Error! Bookmark not defined.**
6.2.2.2.3 Details of triggering resource reselection ..... **Error! Bookmark not defined.**
6.2.2.2.4 Priority handling ..... **Error! Bookmark not defined.**
6.2.2.2.5 Others ..... **Error! Bookmark not defined.**
6.2.2.3 Semi-persistent scheduling for sidelink resource in eNB scheduling mode ..... **Error! Bookmark not defined.**
6.2.2.3.1 Details of (E)PDCCH used for SPS ..... **Error! Bookmark not defined.**
6.2.2.3.2 Details of UE reporting ..... **Error! Bookmark not defined.**
6.2.2.3.3 *Others* ..... **Error! Bookmark not defined.**
6.2.2.4 Details of resource pool design ..... **Error! Bookmark not defined.**
6.2.2.5 Scheduling assignment ..... **Error! Bookmark not defined.**
6.2.2.6 Details of coexistence of PC5-based V2V operation and legacy Uu operation .... **Error! Bookmark not defined.**
6.2.2.6.1 Details of prioritizing sidelink transmissions over UL transmissions ..... **Error! Bookmark not defined.**
6.2.2.6.2 Others ..... **Error! Bookmark not defined.**
6.2.2.7 Enhancement to sidelink synchronization procedure ..... **Error! Bookmark not defined.**
6.2.2.7.1 Priority order of synchronization references ..... **Error! Bookmark not defined.**
6.2.2.7.2 Others ..... **Error! Bookmark not defined.**
6.2.2.8 Others ..... **Error! Bookmark not defined.**
6.2.3 Enhancements on Full-Dimension (FD) MIMO for LTE - *WID in RP-160623* ..... **Error! Bookmark not defined.**
6.2.3.1 Reference Signals ..... **Error! Bookmark not defined.**

3GPP TSG RAN WG1 Meeting #86 **R1-16xxxx**
Göteborg, Sweden, 22nd – 26th August 2016

Main facts summary

3GPP TSG WG RAN1 #85 meeting, hosted by the Chinese Friends of 3GPP, was held at Shangri-La Hotel Nanjing, China.
The meeting started at 9:00 on Monday 23rd May and finished at 17:10 on Friday 27th May 2016.
The number of attending delegates, having signed the participants' paper list, was **xxx.**

The schedule of the week was as follows:

- Monday: Common session on Agenda items 1, 2, 3, 4, 5, 7.1.2 (Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers), 7.1.3 (Maintenance of Release 13 LAA) and 7.1.4 (Maintenance of Release 13 EB/FD-MIMO) followed by Study on Latency reduction techniques (AI 7.3.10.1 on Evaluation results, AI 7.3.10.2 on Channel design for shortened TTI)
- Monday afternoon (LTE)
  - Session on NB-IoT (AI 7.2.1) chaired by Matthew Baker.

- Tuesday (NR): chaired by Satoshi Nagata
- Tuesday (LTE session1): chaired by Matthew Baker
  - eMBMS enhancements for LTE (AI 7.3.5), SRS Carrier Based Switching for LTE (AI 7.3.6) and Enhancements on Full-Dimension (FD) MIMO for LTE (AI 7.3.3).
- Tuesday (LTE session2): chaired by Wanshi Chen
  - Rel-13 eMTC CRs (and possibly other CRs (e.g., LAA, MIMO, eCA), Further Indoor Positioning enhancements for UTRA and LTE (AI 7.3.7), Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1) and Support for V2V services based on LTE sidelink (AI 7.3.2).
- Tuesday (LTE session3):
  - Study on channel model for frequency spectrum above 6 GHz (AI 8.2) chaired by Tuomo Säynäjäkangas from Nokia followed by session on NB-IoT (AI 7.2.1) chaired by Brian Classon from Huawei.
- Tuesday (HSPA): Multi-Carrier enhancements for UMTS (AI 6.2) chaired by Carmela Cozzo from Huawei.

- Wednesday (NR): chaired by Satoshi Nagata
- Wednesday (LTE session1): chaired by Matthew Baker
  - Rel-13 CRs Maintenance (AI 7.1), Uplink Capacity Enhancements for LTE (AI 7.3.8), Study on Latency reduction techniques (AI 7.3.10) and Enhancements on Full-Dimension (FD) MIMO for LTE (AI 7.3.3).
- Wednesday (LTE session2): chaired by Wanshi Chen
  - Support for V2V services based on LTE sidelink (AI 7.3.2), Study on LTE-based V2X Services (AI 7.3.9) and Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1).
- Wednesday (LTE session3):
  - Study on channel model for frequency spectrum above 6 GHz (AI 8.2) chaired by Tuomo Säynäjäkangas from Nokia followed by session on NB-IoT (AI 7.2.1) chaired by Brian Classon from Huawei.
- Wednesday (HSPA): DTX/DRX enhancements in CELL_FACH (AI 6.3) chaired by Florent Munier from Ericsson followed by Maintenance.

- Thursday (NR): chaired by Satoshi Nagata
- Thursday (LTE session1): chaired by Matthew Baker
  - Rel-13 CRs Maintenance (AI 7.1), Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1), Study on Latency reduction techniques (AI 7.3.10), Enhancements on Full-Dimension (FD) MIMO for LTE (AI 7.3.3) and Downlink Multiuser Superposition Transmission for LTE (AI 7.3.4).
- Thursday (LTE session2): chaired by Wanshi Chen
  - Rel-13 eMTC CRs (AI 7.1.5), Downlink Multiuser Superposition Transmission for LTE (AI 7.3.4), Study on LTE-based V2X Services (AI 7.3.9), Enhanced Licensed-Assisted Access Using LTE (AI 7.3.1) and Support for V2V services based on LTE sidelink (AI 7.3.2).
- Thursday (LTE session3):
  - Study on channel model for frequency spectrum above 6 GHz (AI 8.2) chaired by Tuomo Säynäjäkangas from Nokia and session on NB-IoT (AI 7.2.1) chaired by Brian Classon from Huawei.

- Friday: Revisions. Continued offline in the morning (eLAA,…).

The list of action points that required RAN1 close follow-up is listed in Annex F (end of document).

The number of contribution documents for this meeting was xxxx, and those documents were categorized as followed.

3GPP TSG RAN WG1 Meeting #86 **R1-16xxxx**
Göteborg, Sweden, 22nd – 26th August 2016

1 Opening of the meeting

Mr Satoshi Nagata (RAN1 Chairman) welcomed the participants of the RAN WG1 85 meeting and opened the meeting at 09:00. Mr Tong Hui from CMCC welcomed the delegates on behalf of the Chinese Friends of 3GPP , CATT, CATR, China Mobile, China Unicom, Coolpad, Huawei, Lenovo, Nokia, Oppo, Qualcomm, Samsung, ZTE and detailed the domestic arrangements for the full week.

1.1 Call for IPR

The attention of the members of this Technical Specification Group was drawn to the fact ***that 3GPP Individual Members have the obligation*** *under the IPR Policies of their respective Organizational Partners to* ***inform their respective*** *Organizational Partners* ***of Essential IPRs they become aware of****.*
The members take note that they are hereby invited:

- *to investigate whether their organization or any other organization owns IPRs which were, or were likely to become Essential in respect of the work of 3GPP.*
- *to notify their respective Organizational Partners of all potential IPRs, e.g., for ETSI, by means of the IPR Information Statement and the Licensing declaration forms (e.g. see the ETSI IPR forms http://webapp.etsi.org/Ipr/).*

1.2 Competition law statement

The Chairman also drew Member's attention to the fact that 3GPP activities are subject to antitrust and competition laws and that compliance with said laws is therefore required of any participant of this WG meeting including the Chairman and Vice Chairmen.
In case of question, please contact your legal counsel.
The present meeting will be conducted with strict impartiality and in the interests of 3GPP.
Furthermore, the Chairman reminded Members that timely submission of work items/contributions in advance of WG meetings is important to allow for full and fair consideration of such matters.

1.3 Network usage conditions

The PCG has laid down the following network usage conditions:

Users shall not use the network to engage in illegal activities. This includes activities such as copyright violation, hacking, espionage or any other activity that may be prohibited by local laws.

Users shall not engage in non-work related activities that consume excessive bandwidth or cause significant degradation of the performance of the network.
Since the **network is a shared resource**, users should exercise some basic etiquette when using the 3GPP network at a meeting. It is understood that high bandwidth applications such as downloading large files or video streaming might be required for business purposes, but delegates should be strongly discouraged in performing these activities for personal use. Downloading a movie or doing something in an interactive environment for personal use essentially wastes bandwidth that others need to make the meeting effective. The meeting chairman should remind end users that the network is a shared resource; the more one user grabs, the less there is for another. Email and its attachments already take up significant bandwidth (certain email programs are not very bandwidth efficient). In case of need the chair can ask the delegates to restrict IT usage to things that are essential for the meeting itself.

1. DON'T place your WiFi device in ad-hoc mode
2. DON'T set up a personal hotspot in the meeting room
3. DO try 802.11a if your WiFi device supports it
4. DON'T manually allocate an IP address
5. DON'T be a bandwidth hog by streaming video, playing online games, or downloading huge files
6. DON'T use packet probing software which clogs the local network (e.g., packet sniffers or port scanners)

2 Approval of Agenda

R1-163960 **Draft Agenda of RAN1#85 meeting** **RAN1 Chair**
Satoshi Nagata (Chairman) proposed the agenda for the meeting, as well the schedule of the week.
Discussion: Vodafone asked clarifying the overlap between NR session and NB-IoT maintenance on Tuesday's afternoon
Chair → it will highly depend on the progress achieved during Monday's afternoon maintenance session.
Decision: The agenda is approved.

Petitioners' Exhibit 1007, p. 1836
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

3 Approval of Minutes from previous meeting

R1-165448 Final Report of 3GPP TSG RAN WG1 #84 bis v2.0.0 ETSI (R1-163961)
The document was presented by Patrick Mérias (ETSI Mobile Competence Center) and provides the outcomes of last meeting in Korea.
Discussion: MCC→ report is revised as one agreement of the email thread [84b-06] was overlooked in R1-163961.
Few typos/editorials also corrected.
Decision: The document is approved.

4 Incoming Liaison Statements

Dual connectivity related

R1-163969 LS on RLM for PSCell in dual connectivity RAN2, Intel
The document was presented by Hong He from Intel and informs RAN1 and RAN4 about discussion that took place related to RLM for PSCell in dual connectivity. RAN2 has the understanding that if eNB does not configure the timers/constants for RLM then the consequence is that RLF due to physical layer failure will never be triggered for the PSCell.
Decision: The document is noted.

R1-164121 Discussion on RLM for PSCell in dual connectivity Intel Corporation
The document was presented by Hong He from Intel and deals with the potential spec changes on the UE behavior of RLM on PSCell in dual connectivity (DC) in order to reduce power consumption.
Discussion: Corresponding draft CR in R1-164122.
Decision: The document is noted.

R1-164122 Draft CR on correction on RLM for PSCell in dual connectivity Intel Corporation
Clarify that the downlink radio link quality of the PSCell of the SCG shall be monitored by the UE for the purpose of indicating out-of-sync/in-sync status to higher layers, only if the UE is configured with a SCG and the parameter *rlf-TimersAndConstantsSCG* provided by the higher layers is not set to release.
Discussion: Qualcomm→ case where UE is not configured should be considered.
Decision: The document is noted. Continue offline discussion.
Friday
R1-165724 Correction on RLM for PSCell in dual connectivity Intel Corporation, Panasonic Rel-13 36.213 13.1.1 LTE_SC_enh_dualC-Core, TEI13 CR0684 F
Decision: The document is agreed.

LAA related

R1-163973 LS to RAN on new RAN4 TR for documenting multi-node tests for LAA RAN4, Ericsson
The document states that a new RAN4 TR can be defined to document the multi-node tests for Rel-13 LAA operation. The same TR can be used to introduce new multi-node tests in future releases also, if needed.
Discussion: No comment.
Decision: The document is noted.

R1-164114 LS regarding 3GPP LTE based technologies operating in the unlicensed bands City of New York (Counsel to the Mayor of)
The document was presented by RAN1 Chair on behalf of NYC. The letter lists a number of WiFi-based applications and use cases the City of New York has committed to deliver to their residents and raises concerns on the potential impact of 3GPP standardizedf LTE-Unlicensed regarding lower level WiFi signals.
The letter also refers to the review of the incoming LS from WiFi Alliance (R1-163388) and IEEE 802 (R1-163375).
Discussion: Qualcomm suggested focusing on the replies to WFA and IEEE and, when ready copy NYC.
Decision: The document is noted.

R1-164393 Draft response LS to 802dot11 regarding LAA Qualcomm Incorporated
The document was presented by Peter Gaal from Qualcomm. Reply to R1-163375.
Discussion: Broadcom → let's review the content of the reply LS offline.
Decision: The document is noted. Continue offline discussion.
Friday
R1-165998 Draft Response LS to IEEE 802.11 regarding LAA Qualcomm
Decision: The document is noted and final LS is agreed in R1-166040.

R1-164394 Draft response LS to WFA regarding LAA Qualcomm Incorporated
The document was presented by Peter Gaal from Qualcomm. Reply to R1-163388.
Discussion: Broadcom → let's review the content of the reply LS offline.
Decision: The document is noted. Continue offline discussion.

Petitioners' Exhibit 1007, p. 1837
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Friday

R1-165999 Draft response LS to WFA regarding LAA Qualcomm Incorporated
Decision: The document is noted and final LS is agreed in R1-166041

R1-165449 Review of 3GPP LAA Specification Rel. 13 IEEE 802 LAN/MAN SC
The document was presented by RAN1 Chair on behalf of IEEE. IEEE 802 would appreciate an acknowledgment from 3GPP RAN that the LAA Rel. 13 specification will not be complete until all outstanding issues raised by all stakeholders, including 3GPP RAN1, IEEE 802 and the Wi-Fi Alliance, have been resolved.
Discussion: Qualcomm → RAN's reply is more appropriate.
Decision: The document is noted. RAN1 understanding is that RAN should reply to IEEE.

eMTC related

R1-163974 LS on continuous uplink transmission in eMTC RAN4, Intel
The document was presented by Debdeep Chatterjee from Intel and asks RAN1 to clarify the expected eMTC UE behaviour:
- Is RAN1 considering the introduction of any mechanism for maintaining frequency and timing accuracy in eMTC, for example similar to the mechanism used in NB-IoT?

Decision: The document is noted.

R1-165224 Discussion on continuous uplink transmissions in eMTC Intel Corporation
The document was presented by Debdeep Chatterjee from Intel.
- Observation 1: Maintaining 0.1ppm of frequency accuracy during prolonged UL transmission bursts spanning multiple seconds can be extremely challenging and expensive, if not impossible, for HD-FDD eMTC UEs.
- Observation 2: Introduction of UL compensation gaps is not expected to impact eMTC UEs in CE mode A or those UEs that only support CE mode A.
- Proposal 1: UL compensation gaps are introduced for eMTC UEs long uplink (i.e. PUSCH/PRACH) transmissions.
  - During the UL gaps, the UE may switch to the DL and performs time/frequency synchronization
  - The UL gap is defined by a gap period (X ms) and gap length (Y ms)
  - The values of X and Y are to be determined by RAN4 and are fixed in the specifications.
- Proposal 2: Send an LS response to RAN4 indicating RAN1 support for the introduction of UL gaps for HD-FDD eMTC UEs with long UL transmissions (of PUSCH and PRACH) and asking them to determine the values of the maximum duration of continuous UL transmission and the UL gap length for eMTC UEs.

Decision: The document is noted.

R1-165225 Draft reply LS on continuous uplink transmissions in eMTC Intel Corporation
Discussion: ZTE's proposal in R1-165133.
Intel→ let's get feedback from RAN4.
Qualcomm, Huawei requested more time for review during the week.
Decision: The document is noted.

R1-165133 Discussion on UL gap for eMTC ZTE
Proposal 1: Mechanism of uplink compensation gaps in NB-IoT can be reused for Rel-13 eMTC.
- *For any PUSCH transmission with duration greater than X ms, a final UL gap of duration Y ms is inserted at the end of the PUSCH transmission.*
- *It is preferable that the value of X and Y equals to the multiples of maximum of Y_{ch}.*

Decision: The document is noted.
Continue offline discussion under AI 6.1.5– (Intel)

NB-IoT related

R1-163963 LS on NB-IoT RRM requirements RAN2, Huawei
The document was presented by Matthew Webb from Huawei.
- RAN2 assumes that RSRQ is only used for cell selection. RAN2 would like to RAN4 to further provide the value range of q-Qual for NB-IoT.
- RAN2 agrees RSRP is used for both cell selection and cell reselection and would like to ask RAN4 to provide range of q-RxLev.
- RAN2 assumes that Pcompensation is used in the cell selection criteria S: Srxlev = Qrxlevmeas – Qrxlevmin – Pcompensation – Qoffsettemp and would like to ask RAN4 whether this in line with RAN4's understanding and if so to provide parameters and the associated value ranges to calculate the Pcompensation.
- RAN2 assumes that NB-IoT supports additionalSpectrumEmission and additionalPmax per band (8 bands), and this is mandatory for the UE. RAN2 would like to ask RAN4 whether this assumption is correct and to provide value ranges for relevant parameters.
- RAN2 would also like to ask RAN4 to provide feedback on whether a NB-IoT carrier is identified by <EARFCN, offset>

Petitioners' Exhibit 1007, p. 1838
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion: No action to RAN1.
Decision: The document is noted.

R1-163964 Reply LS on per-UE configuration to allow exception reporting RAN2, Qualcomm
The document was presented by Peter Gaal from Qualcomm and states that at least one use case for per-UE configuration to allow exception reporting is to prevent abuse of the RRC establishment cause mo-ExceptionData because exception data is handled with priority in the network. RAN2 requests CT1 and SA2 to consider how to prevent applications in the UE from abusing the RRC access cause in the upper layers.
Discussion: No action to RAN1.
Decision: The document is noted.

R1-163965 Reply LS on direct SI update indication for NB-IoT RAN2, Ericsson
The document was presented by Asbjorn Grovlen from Ericsson and confirms that

- The system information change indication (1bit for Systeminfomodification and 1bit for systemInfoModification-eDRX) carried in DCI is supported.
- RAN2 will capture this direct indication bit field for NB-IoT in TS 36.331.

Discussion: Already captured in RAN1 spec.
Decision: The document is noted.

R1-164120 LS on direct indication DCI bits for NB-IoT RAN2, Huawei
The document was presented by Matthew Webb from Huawei and RAN2 agreed to assume that 6 "spare" bits are included in DCI for future use, as shown in the following table:

Table : Direct Indication information

Bit	Field
1	*systemInfoModification*
2	*systemInfoModification-eDRX*
3, 4, 5, 6, 7, 8	Not used, and shall be ignored by category NB UE if received.

Discussion: Already captured in RAN1 spec.
Decision: The document is noted.

R1-163966 Response to LS on questions on CIoT RAN2, Vodafone
The document was presented by RAN1 chair on behalf of Vodafone.
Discussion: No action to RAN1.
Decision: The document is noted.

R1-163967 Reply LS on NB-IoT RAN2, Huawei
The document was presented by Matthew Webb from Huawei and confirms that:

- 2 bits in NB-MIB will be used to indicate the two LSB of HyperSFN,
- Regarding paging and system information, RAN2 is under discussion and would like to inform RAN1 later the decision,
- The NB-SIB1 modification period is 40.96s.

Discussion: Already captured in RAN1 spec.
Decision: The document is noted.

R1-163971 Response LS on Reply LS on questions on NB-IOT RAN3, Nokia
The document was presented by Michel Robert from Nokia and states that RAN3 has agreed the new *NAS PDU Transmission Delay Indicator* IE in the S1AP Initial UE Message message of the attached CR against TS36.413 which is one of the draft RAN3 CRs for cIOT optimization. This IE represents an expected delay for the transmission of the NAS PDU as a factor relative to the delay assumed at the MME without this indication. RAN3 is still considering whether this IE could additionally be introduced for the UP cIOT optimization.
Discussion: No action to RAN1.
Decision: The document is noted.

R1-164119 Reply LS on questions on NB-IOT RAN2, Nokia
The document states that RAN2 agreed not to adjust NAS timers based on the coverage level in NB-IoT. RAN2 agreed that NAS timers should be long enough i.e. taking into account the worst transmission delay in NB-IoT. RAN2 may provide further feedback about transmission delay of the NAS PDU in non-NB-IoT later.
Discussion: No action to RAN1.
Decision: The document is noted.

R1-165417 LS on TB sizes for SI-messages for NB-IoT RAN2, Ericsson

Petitioners' Exhibit 1007, p. 1839
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The document was presented by Asbjorn Grovlen from Ericsson and asks RAN1 to feedback early at RAN1#85 meeting whether adding two new TB sizes of 56 bits and 120 bits for SI messages is possible, and if so, to inform RAN2 which values of ITBS/ISF from TS 36.213 should be used.
Discussion: Contributions available on the topic, for review during the week.
Decision: The document is noted.

UTRA related

R1-163962 Reply LS on Cell FACH DTx/DRx Enhancements signalling RAN2, Qualcomm
The document was presented by Vasanthan Raghavan from Qualcomm and provides the following feedback:
- RAN2 specification does not allow configuring the UE to only listen to one HS-SCCH every FACH DRX cycle.
- RAN2 specification allows configuring the UE to listen to two HS-SCCH sub-frames every FACH DRX cycle in the 2-level FACH DRX mechanism.

Decision: The document is noted.

Mobility enhancement related

R1-163968 LS on the feasibility of mobility enhancement solutions RAN2, ZTE
The document was presented by Zhisong Zuo from ZTE and raises:
- Q1: Would the accuracy of the TA value calculated according to the schemes in the attachment be sufficient for transmitting PUSCH/PUCCH/SRS at the target cell in either synchronous or asynchronous network? (RAN1/RAN4)
- Q2: Assuming the TA value can be calculated accurately, would starting PUCCH/PUSCH/SRS transmission directly (i.e. without power ramping step) be feasible? (RAN1/RAN4)
- Q5: Is it feasible that the UE performs simultaneous transmission to two intra-frequency cells in either synchronous or asynchronous network in the following two cases? (RAN1/RAN4)
  - Case 1: PUSCH/PUCCH/SRS to one intra-frequency cell and PUSCH/PUCCH/SRS/PRACH preamble to another intra-frequency cell
  - Case 2: PUSCH/PUCCH/SRS to one intra-frequency cell and PRACH preamble in the other intra-frequency cell

Decision: The document is noted.

R1-164644 Draft reply LS on the feasibility of mobility enhancement solutions ZTE
The document was presented by Zhisong Zuo from ZTE.
Decision: The document is noted.

R1-165226 Discussion on feasibility of mobility enhancement solutions Intel Corporation
The document was presented by Seunghee Han from Intel.
Discussion: Intel → RAN1 should discuss further based on the discussion in Section 3.
Decision: The document is noted.
R1-165227 DRAFT Reply LS on the feasibility of mobility enhancement solutions Intel Corporation
Decision: The document is withdrawn.

R1-165370 Discussion on the mobility enhancements solutionsNokia, Alcatel-Lucent Shanghai Bell
The document was presented by Jari Lindholm from Nokia and provides views to the questions in R1-163968. Some changes to the physical layer specifications may need to be done. Changes related to RACH-less handover are more straightforward (e.g. modification to SSTD measurement) but further studies are needed for make-before-break type of operation. It should be noted that currently RAN2, RAN3 and RAN4 have TU allocation for this work item but RAN1 does not have, so RAN1 cannot do detailed studies on these issues.
Discussion: Ericsson, Huawei → no TU allocated, further studies needed → that's should be the answer.
Decision: The document is noted. RAN1 will liaise to RAN2 and tell RAN2 that further study is needed in RAN1. Prepare a draft reply LS to RAN2 – (ZTE)
Friday
R1-165986 [Draft]Reply LS on the feasibility of mobility enhancement solutions ZTE
Decision: The document is noted and final LS is agreed in R1-165996.

eLAA related

R1-163970 LS on RAN2 agreements on eLAA RAN2, Huawei
The document was presented by Xiayuan from Huawei.
Decision: The document is noted. For information to RAN1.

V2X related

R1-163975 LS on EPC procedures for providing eNB with V2X authorization information SA2, LGE

Petitioners' Exhibit 1007, p. 1840
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

The document was presented by Hanbyul Seo from LGE and discusses EPC procedures for providing the eNB with V2X authorization information. Following two questions were raised:

- Whether it is required to have an indication to differentiate between a UE and an RSU implemented as a UE (i.e. UE-type RSU) from the PC5 radio resource allocation perspective?
- Whether it is required to have separate indications for different UE types/roles (i.e. Vehicle UE and Pedestrian UE) from the PC5 radio resource allocation perspective?

Discussion: No action to RAN1.
NEC has prepared a reply LS in R1-165452.
Decision: The document is noted.

R1-165414 Reply LS on EPC procedures for providing eNB with V2X authorization information SA1, LGE
The document was presented by Hanbyul Seo from LGE and feedbacks SA1'view whether it is acceptable to distinguish between the UE-type RSU, Vehicle UEs (UE in vehicle or installed in a vehicle) and Pedestrian UEs.

- From service requirements' perspective, there is no need to differentiate UEs.

Discussion: No action to RAN1.
Decision: The document is noted.

R1-165415 Reply LS on V2X message characteristics SA3, TNO
The document was presented by RAN1 chair on behalf of TNO and informs RAN2 that SA3 is studying the security of V2X and will provide the requested size of a possible security overhead in due course.
Discussion: No action to RAN1.
Decision: The document is noted.

NR related

R1-163972 LS on Parameters for WP5D Sharing and compatibility studies RAN4, Ericsson
The document was presented by Stefan Parkvall from Ericsson and asks RAN1 to take note of the intentions of RAN4 to prepare a response to parameters 3 to 7.4 in R1-163390 and to any additional RF parameter of relevance. RAN4 also asks RAN1 to keep RAN4 informed about any progress on NR access scheme parameters, in particular for aspects that are believed to have any direct or indirect impact on RF characteristics such as unwanted emission levels, sensitivity, etc. This includes, but may not be limited to, the following parameters:

- Access technique (No. 1 in the LS)
- Modulation parameters (No. 2 in the LS)
- Channel spacing (No. 3 in the LS)
- Channel bandwidth (No. 4 in the LS)
- Signal bandwidth (No. 5 in the LS)
- Beam forming parameters
- Power dynamic range (No. 6.1 in the LS)
- SINR performance

RAN4 will keep RAN1 updated in its progress on the relevant sharing parameters and plans to send a more detailed LS to RAN1 at the May WG meetings. A first response from RAN1 would be very helpful during the May meetings, followed by a second response in August.
Decision: The document is noted. To be handled under AI 7.1.

R1-164260 Formation of IEEE 1914 Next Generation Fronthaul Interface Working Group IEEE 1914 Next Generation Fronthaul Interface (NGFI) Working Group
The document was presented by RAN1 Chair and informs about the creation of IEEE 1914 Next Generation Fronthaul Interface (NGFI) Working Group to develop IEEE 1914.1 Standard for Packet-based Fronthaul Transport Networks. The scope of this project includes:

- Transport network architecture for the transport of mobile fronthaul traffic (e.g., Ethernet-based), including user data, management and control plane traffic.
- Requirements and definitions for the fronthaul networks, including data rates, timing and synchronization, quality of service etc.

Decision: The document is noted. RAN3 in charge of replying.

R1-164286 LS on Remaining Issues on Path Loss Scenarios New York University Wireless
The document was presented by RAN1 Chair and provides NYU WIRELESS observations regarding the recent RAN1 84Bis channel modeling activity.
Discussion: Further discussion can be handled during the channel model session.
Decision: The document is noted.

The following LS have been received in the course of the week:
R1-165655 LS to RAN1 on RAN2 agreements related to V2X RAN2, LGE

Decision: The document is noted. See AI 7.1.2

5 UTRA

R1-165865 Chairpersons' summary of the UMTS sessions UMTS Session Chairpersons (Huawei, Ericsson)
The document was presented by Carmela Cozzo from Huawei and Florent Munier from Ericsson.
Decision: The document is endorsed and content is incorporated as below.

5.1 Maintenance of UTRA Releases 4 – 13

5.1.1 FDD

R1-164364 Clarifications to DCH enhancements feature Qualcomm Europe Inc.(France)
Decision: The document is noted.

Proposal 1: Disallow multiple "maximum TTI" channels each with a transport format with zero transport blocks.
Proposal 2: Transmit UL TPC on DL when there is UL SRB transmission in the case of single transport channel configurations with 40 ms TTI.
Conclusion: Proposal 2 is agreed. Whether it impacts the specifications is FFS.
Proposal 3: Specify DL synchronization behavior in the context of DCH enhancements.
Proposal 4: When TFCI 0 is indicated UL DPCCH is transmitted on both frames.
Proposal 5: NodeB should transmit TPC command on the first slot after gap.
Proposal 6: Disallow the concurrency of PCA2 and DCH enhancements.
Proposal 7: NodeB shall transmit in 20 ms mode when it doesn't detect UL reliably.
Conclusion: Proposal 7 is agreed. Whether it impacts the specifications is FFS.
Proposal 8: Disallow DCH enhancements with PS mapped to HS or EUL in the absence of CPC for 20 ms only mode.
Email discussion on proposals 2/4/7/8 from R1-164364 until June 8, 2016 – (Qualcomm)

R1-164365 Clarifications on DCH enhancements feature Qualcomm Europe Inc.(France)
Decision: The document is noted. Further revised in R1-165862.

R1-165088 and R1-165330 captured in R1-165507
R1-165507 **Text proposal on impact on specifications and UE implementation Ericsson**
Decision: The document is noted and TP is agreed
R1-165510 **TP on conclusions for the Multicarrier Enhancements for UMTS Huawei**
Decision: The document is noted and TP is agreed

Agreements
In summary, among the new proposed dual carrier solutions (including the DB-DC-HSUPA) 2ms+10ms or 10ms+10ms overall provide benefits depending on how much path loss is present and how much power is allocated to the primary carrier, and may

Petitioners' Exhibit 1007, p. 1843
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

outperform 2ms+2ms DC- and DB-DC HSUPA. However the performance of single carrier is larger than the proposed dual carrier configurations when grant limitation does not occur.

- **Simulations and scenarios:** Scenarios discussions spanned multiple DC-HSUPA and DB-DC-HSUPA scenarios, and also single carrier HSUPA. The scenarios vary in terms of TTI lengths in each subcarrier, power setting per subcarrier and maximum transmitted UE power. Control channel overhead was not taken into consideration in the evaluation (see Section x.x.x). Several companies presented link simulations
- **In good coverage** i.e. when the UE is near the base station, legacy dual carrier 2ms+2ms TTI outperforms both for DB-DC-HSUPA and DC-HSUPA. It is also observed that 10ms+10ms in DC-HSUPA and 2ms+10ms in DB-DC-HSUPA outperform single carrier HSUPA.
- **In medium coverage** dual carrier configurations (i.e., 2ms+2ms and 10ms+10ms DC-HSUPA, as well as 2ms+2ms, 2ms+10ms and 10ms+10ms DB DC-HSUPA) are outperformed by single carrier 2 or 10 ms TTI only when it is possible to allocate the power of the single carrier with a value exceeding the power allocated to the primary uplink frequency of the DC or DB-DC cases. Among the new proposed dual carrier solutions (including the DB-DC-HSUPA) 2ms+10ms or 10ms+10ms overall provide similar benefits depending on how much path loss is present and how much power is allocated to the primary carrier, and outperforms 2ms+2ms DC- and DB-DC HSUPA. The UE-NodeB distance where the legacy 2ms DC-HSUPA (DB-DC-HSUPA) is outperformed by either the single carrier or the proposed dual carrier (i.e. DC or DB-DC HSUPA) configurations depends on the power configuration.
- **In poor coverage** (e.g. near the cell boundary)**,** single carrier configuration with 10ms TTI dominates the overall performance.

R1-165511 LS on RAN1 multi-carrier enhancements for UMTS agreements RAN1
Decision: The document is agreed.

Updated TR in R1-165514.
Email discussion on updated TR25.707 until Monday June 6, 2016 (Huawei)

5.3 DTX/DRX enhancements in CELL_FACH - WID in RP-160185.

5.3.1 DRX improvements

R1-164362 HS-SCCH DRX lite design with enhanced servicing ability Qualcomm Europe Inc.(France)
Decision: The document is noted.
R1-164363 Open Issues on HS-SCCH DRx lite proposal Qualcomm Europe Inc.(France)
Decision: The document is noted.
R1-165332 A view on DRX enhancements in CELL_FACH Ericsson
Decision: The document is noted.

QC proposal for HS-SCCH DRX Lite Design was noted. The following considerations for DRX Improvements are listed:

- Enable the network to schedule the UE in more than one subframe (Rx Burst of e.g. 0.4, 0.8 frames)
- Investigate the possibility of using HS-SCCH control information rather than HS-SCCH orders
- For example Mechanism and reliability
- Enable 640 ms mode in HS-SCCH /HS-DSCH DRX in CELL FACH mode in addition to existing values present in IE *HS-DSCH DRX cycle$_{FACH}$*

R1-165512 LS on HS-SCCH DRx Design in Cell FachRAN1, Qualcomm
Decision: The document is agreed.

Conclusion
Based on the analysis performed, the following observations have been made:

- Observation 1: The proposals made on the "DRX enhancements area" may certainly bring benefits in terms of battery savings based on creating more opportunities for the UE to stay in a sleep period.
- Observation 2: The analysis made in this contribution aims at keeping the impact on the specifications as low as possible, encouraging at the same time the use of the solutions that are already available in the standard.

- Proposal 1: Take observations 1 and 2 on "DRX enhancements" into account, and discuss the technical details within the TSG RAN WG2 since most of it design (i.e., a part from the assessment on the potential gains and the design of the HS-SCCH orders) is connected to the RAN2 specifications.

5.3.2 DTX improvements

R1-165091 Evaluation results for DTX in CELL_FACH Huawei, HiSilicon
Decision: The document is noted.
R1-165092 Further considerations on the design of DTX in CELL_FACH Huawei, HiSilicon
Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1844
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Huawei will come back with revised results with an updated model according to the following:

- Back off timer starts as soon as the buffer of the UE is empty (TEBS)
- Account for blocking rate and noise rise (cell capacity issues).

R1-165333 **An assessment on the potential gains associated to the introduction of DTX in CELL_FACH Ericsson**
Decision: The document is noted.
R1-165334 **On applying DTX on the UL DPCCH prior to an E-DCH retransmission in CELL_FACH Ericsson**
Decision: The document is noted.
R1-165335 **Summary of the potential gains and technical implications of introducing DTX in CELL_FACH Ericsson**
Decision: The document is noted.

Agreement: It may be possible to configure, the "Back-off" timer and the number of "Common E-DCH resources" available in the cell as a function of the CELL_FACH traffic, in order to achieve a trade-off between:

- amount of uplink interference,
- E-DCH resource blocking rate,
- Cell capacity

6 E-UTRA

6.1 Maintenance of E-UTRA Releases 8 – 13

6.1.1 Maintenance of E-UTRA Release 8 – 12

None.

6.1.2 Maintenance of Release 13 LTE carrier aggregation enhancement beyond 5 carriers

R1-164196 **Draft 36.213 CR Clarification on PUCCH format 4/5 resource derivation CATT**
The document (draft CR to 36.213) was presented by Fang Chen Cheng from CATT.
Discussion: Huawei → UE behavior is not correctly captured. Doesn't work.
Decision: The document is noted.

- UE behaviour of TPC mapping is different for PUCCH formats 3, 4, and 5 in Rel-13 compared to that of PUCCH format 3 in Rel-12
  - No spec change is needed

R1-164733 **HARQ-ACK Codebook on PUSCH for TDD Samsung**
The document was presented by Aris Papasakellariou from Samsung.

- Proposal: For TDD and a UE configured with more than 5 cells, the HARQ-ACK codebook in the PUSCH is determined as for FDD.

Discussion: Late change according to Huawei – would like to understand spec impact, may need more time.
Decision: The document is noted. Continue offline discussion – (Samsung)
Friday: Email discussion until June 30th – (Samsung)

R1-164926 **Correction on citations to a DAI bits table ITRI**
The document from ITRI clarifies that the DAI bits should be expressed in Table 5.3.3.1.2-2 but not in Table 5.3.3.1.1-2 which is not existed in the specification.
Decision: The document is noted and CR0205 to 36.212 is agreed.

6.1.3 Maintenance of Release 13 licensed-assisted access to unlicensed spectrum

R1-164395 **Draft CR on CWp adjustment Qualcomm Incorporated**
The document (draft CR to 36.213) was presented by Srinivas Yerramalli from Qualcomm and clarifies that when the contention window size is increased, it is done so for every access priority class.
Discussion: Indication of rev in CR coversheet not needed.
Nokia, Huawei believe the change is not needed.
Decision: The document is noted.
LGE: following document addresses the same topic:
R1-164491 **Correction on CWS update for multiple channel access priority classes LG Electronics**
The document specifies the eNB behavior to adjust CWS for all channel access priority classes at the same time.
Decision: The document is noted. Continue offline discussion (Qualcomm)
Friday:

Petitioners' Exhibit 1007, p. 1845
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-166039 CR on CWp adjustment Qualcomm Incorporated
Decision: The document is noted and CR0687 to 36.213 is agreed.

R1-164396 DCI Format 1C signaling and expected UE behavior Qualcomm Incorporated
The document was presented by Srinivas Yerramalli from Qualcomm and suggests adding the following statement to section 13A of 36.213.
The UE is not expected to monitor PDCCH with CRC scrambled by CC-RNTI outside of the Active Time defined in [8] in order to determine the configuration of occupied OFDM symbols in any subframe within the Active Time.
Discussion: Panasonic → second part of the sentence may be removed.
Decision: The document is noted.
R1-164397 Draft CR on DCI Format 1C signaling and expected UE behavior Qualcomm Incorporated
Discussion: Indication of rev in CR coversheet not needed.
Decision: The document is noted. Continue offline discussion (Qualcomm)
Friday:
R1-165766 [DRAFT] LS on DRX and Reception of PDCCH scrambled by CC-RNTI Panasonic
Decision: The document is noted and final LS is agreed in R1-166038.

R1-164405 Draft CR on clarification for channel sensing Qualcomm Incorporated
The document was presented by Srinivas Yerramalli from Qualcomm and clarifies that the time quanta of re-attempting sensing the medium is a slot of duration 9 µs instead of Td.
Discussion: Indication of rev in CR coversheet not needed.
Decision: The document is noted. Continue offline discussion (Qualcomm)
Friday:
R1-166022 CR on clarification for channel sensing Qualcomm Incorporated
Decision: The document is noted and CR0686 to 36.213 is agreed.

R1-164490 Discussion on CWS update for multiple channel access priority classes LG Electronics
The document was presented by … from LGE.
Suggestion: Option 1 is supported for Rel-13 LAA.
- Option 1: eNB can change the channel access priority every DL transmission burst.
- Option 2: eNB can change the channel access priority class only when the adjusted CWS is the minimum value.
- Note that additional specification work is not necessary to support Option 1.

Discussion: Seems that all are fine with option 1 – no need to capture anything.
Decision: The document is noted.

R1-164492 Clarification on DL ending partial subframe LG Electronics
The document was presented by … from LGE and proposes a TP for section 13A of 36.213 to clarify the UE behaviour for the reception of DL ending partial subframe and discusses the duration of PDCCH in DL ending partial subframe.
Discussion: Panasonic → doesn't see the need for Rel-13, may be addressed in Rel-14.
Decision: The document is noted.

R1-165324 Draft CR on LAA DL Multichannel access BROADCOM LIMITED
The document (draft CR to 36.213) was presented by Sindhu Verma from Broadcom and suggests extending to all the channels in the same sub-band across multiple groups the restriction of 4 slots pause before resuming countdown of the backoff counter on a CAT4 LBT channel.
Decision: The document is noted. Continue offline discussion – (Broadcom)

6.1.4 Maintenance of Release 13 elevation beamforming/full-dimension MIMO for LTE

R1-164123 Evaluation of MU-MIMO performance with Rel-13 DM-RS Intel Corporation
The document was presented by Yuan Zhu from Intel and provides views on the two alternatives for the DM-RS sets of possibly multiplexed DM-RS antenna ports.
Decision: The document is noted.

R1-165105 Clarification of OCC=2 and OCC=4 MU-MIMO Transmission Ericsson
The document was presented by Mark Harrison from Ericsson.
- Clarify the specification of OCC=2 codepoints to either support OCC=2 only coscheduling or mixed OCC=2 and OCC=4 coscheduling.
  - Support mixed OCC=2 and OCC=4 transmission on ports 7, 8, 11, and 13 unless there is consensus among UE vendors that performance is a significant concern given UE implementation, considering that the Rel-12 table is also available.

Petitioners' Exhibit 1007, p. 1846
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Specify UE behaviour as proposed in the first correction shown in section **Error! Reference source not found.**, and in the corresponding CR [R1-165105].
  - Otherwise, specify UE behavior to support OCC=2 only coscheduling on ports 7 and 8, as proposed in [R1-163688].

Decision: The document is noted.

R1-165106 MU-MIMO with Mixed Orthogonal Cover Code Length Ericsson
The document (CR0655 to 36.213) was presented by Mark Harrison from Ericsson.

- When a UE is scheduled with OCC=2 and a single layer on port 7, UE assumptions support PDSCH transmission on port 8 and 13 to other UEs.
- When a UE is scheduled with OCC=2 and a single layer on port 8, UE assumptions support PDSCH transmission on port 7 and 11 to other UEs.

Decision: The document is noted.

R1-164317 Correction on UE assumption on DMRS ports ZTE
The document (draft CR to 36.213) clarifies the UE assumption in case of the new DMRS table in DCI formats 2C and 2D is configured for single-antenna port transmission scheme.
Discussion: Aligned with Intel.
Decision: The document is noted and agreed as CR0672 to 36.213 in R1-165538.

R1-164734 Draft CR on FD-MIMO codebooks (36.213) Samsung
Corrections to ensure alignment with the FD-MIMO codebook agreements made in RAN1#82b and RAN1#83.
Decision: The document is noted and agreed as CR0666 to 36.213 in R1-165528.

R1-164735 Draft CR on CSI-Reporting-Type in TS 36.213 Samsung
The document suggests changing the field name 'CSI-reporting-Type' to 'eMIMO-Type'.
Decision: The document is noted and agreed as CR0667 to 36.213 in R1-165529.

R1-164736 Clarification on non-PMI based CSI reporting in TS 36.213 Samsung
Observation: Two options for UE assumption on precoding matrix for PUSCH mode 3-0/PUCCH mode 2-0 are available.

- *Alternative 1: Remove all assumptions on precoding matrix in non-PMI based CSI reporting mode descriptions.*
- *Alternative 2: Release the assumption that 'a single precoding matrix is selected from the CBSR' and clarify that 'for each subband a preferred precoding matrix is selected from the codebook subset assuming transmission only in the subband' in non-PMI based CSI reporting mode descriptions.*

Proposal: Support both options in observation and revise the corresponding descriptions in the current specification.
Discussion: No consensus.
Decision: The document is noted.
R1-164737 Draft CR on non-PMI based CSI reporting in TS 36.213 Samsung
Decision: The document is not treated.

6.1.5 Maintenance of Release 13 further LTE physical layer enhancements for MTC

R1-165932 Chairman's Notes of Agenda Item 6.1.5 on eMTC CRs Ad-hoc chair (Qualcomm)
The document was presented by Wanshi Chen from Qualcomm and provides the outcomes of eMTC maintenance session.
Decision: The document is endorsed. Contents incorporated below.

Terminology
R1-164833 Correction on the usage of CEModeA and CEModeB for eMTC in TS 36.211 Huawei, HiSilicon
Decision: The document is withdrawn.
R1-165450 Correction on the usage of CEModeA and CEModeB for eMTC in TS 36.213 Huawei, HiSilicon (R1-164834)
Decision: The document is noted and agreed as CR0669 to 36.213 in R1-165531.

PBCH
R1-164402 Remaining issues for eMTC Qualcomm Incorporated
Decision: The document is noted.
R1-165082 Draft CR for clarification of MPDCCH over empty CRS tones in PBCH repetition Qualcomm Incorporated
Decision: The document is noted and agreed as CR0247 to 36.211 in R1-165532.

DCI definition
R1-164835 Correction on the DCI payload size for eMTC in TS 36.212Huawei, HiSilicon

Petitioners' Exhibit 1007, p. 1847
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted and agreed as CR0207 to 36.212 in R1-165533.

R1-165386 **Frequency hopping flag definition in DCI formats for BL/CE UE** **Ericsson**
Decision: The document is noted, revised in and agreed as revision 1 of CR0206 to 36.212 in R1-165540

R1-165392 **Definition of number of MPDCCH repetitions for BL/CE UE** **Ericsson**
Decision: The document is noted and CR0662 to 36.213 is agreed.

MPDCCH

R1-164402 **Remaining issues for eMTC** **Qualcomm Incorporated**
Decision: The document is noted.

R1-165671 **Scrambling sequence initialization for PDSCH** **Qualcomm Incorporated, NTT DOCOMO**
Decision: The document is noted and the CR is endorsed. Final CR0252 to 36.211 is agreed in R1-165703.

R1-164401 **Draft CR for scrambling sequence initialization** **Qualcomm Incorporated**
Decision: The document is noted and agreed as CR0248 to 36.211 in R1-165534.

R1-165081 **Draft CR for clarification on starting subframe for MPDCCH** **Qualcomm Incorporated**
Decision: The document is noted and the CR is endorsed. Final CR0681 to 36.213 is agreed in R1-165672.

R1-164602 **eMTC MPDCCH corrections for 36.213** **Sequans Communications**
Decision: The document is noted and revision 1 of CR0653 to 36.213 is agreed in R1-165746.

R1-164843 **On MPDCCH AL and search space for 8 EREGs per ECCE in TS 36.213.** **Huawei, HiSilicon**
Decision: The document is noted and agreed as CR0670 to 36.213 in R1-165536.

R1-164844 **On MPDCCH AL for 8 EREGs per ECCE in TS 36.211.** **Huawei, HiSilicon**
Decision: The document is noted and the CR is endorsed. Final CR0249 to 36.211 is agreed R1-165623

R1-164916 **draft CR on MPDCCH quasi co-location** **Panasonic Corporation**
Decision: The document is noted and agreed as CR0671 to 36.213 in R1-165537.

R1-165382 **Draft LS on MPDCCH configuration for BL/CE UE** **Ericsson**
Decision: The document is noted. Final LS is approved in R1-165748 with the following update:

~~In case #3 above, the two MPDCCH PRB sets can operate as a single MPDCCH PRB consisting of up to 6 PRBs which means that the two sets share so many properties that RAN1 considers that it might be more efficient from RRC signalling point of view to configure them using a single EPDCCH-SetConfig entity with numberPRB-Pairs-v1310 set to 'n6' instead of two separate entities. The second EPDCCH-SetConfig entity specified in TS 36.331 V13.1.0 would then not be used by BL/CE UEs in Rel-13.~~

~~However, f~~For case #3 above, from RAN1 specification point of view it is necessary to know the PRB indices of the 2 PRBs and the 4 PRBs, respectively. RAN1 notes that if the resourceBlockAssignment-r11 can be used to point out the PRB indices of the 2 PRBs then it is trivial to deduce the PRB indicates of the other 4 PRBs in a 6-PRB narrowband for BL/CE UEs. The second EPDCCH-SetConfig entity specified in TS 36.331 V13.1.0 would then not be used by BL/CE UEs in Rel-13.

R1-165385 **Enable cross-subframe channel estimation for BL/CE UE** **Ericsson**
Decision: The document (CR0246 to 36.211) is noted and revised in:

R1-165802 **Enable cross-subframe channel estimation for BL/CE UE** **Ericsson**
Decision: The document is noted and CR0246 is postponed. Revisit in RAN1#86.

R1-165389 **Overlapping MPDCCH search spaces for BL/CE UE** **Ericsson**
Decision: The document (CR0659 to 36.213) is noted and revised in:

R1-165867 **Overlapping MPDCCH search spaces for BL/CE UE Ericsson**
Decision: The document is noted and CR0659 is postponed. Revisit in RAN1#86.

R1-165390 **MPDCCH search space for random access in connected mode for BL/CE UE** **Ericsson**
Decision: The document (CR0660 to 36.213) is noted and revised in:

R1-165868 **MPDCCH search space for random access in connected mode for BL/CE UE** **Ericsson**
Decision: The document (CR0660rev1 to 36.213) is noted and revised in:

R1-165958 **MPDCCH search space for random access in connected mode for BL/CE UE** **Ericsson**
Decision: The document is noted and revision 2 of CR0660 to 36.213 is for email approval until June 3rd – (Ericsson).

R1-165393 **PRB locations for Type0 MPDCCH search space for BL/CE UE** **Ericsson**
Decision: The document is noted and CR0663 to 36.213 is agreed.

PDSCH

Petitioners' Exhibit 1007, p. 1848
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-164124 **Draft CR on PDSCH scrambling for eMTC** **Intel Corporation**
Decision: The document is noted.
R1-165312 **Scrambling Sequence for paging MPDCCH and PDSCH** **Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document (draftCR to 36.211) is noted and revised in:
R1-165578 **Scrambling Sequence for paging MPDCCH and PDSCH** **Nokia, Alcatel-Lucent Shanghai Bell, Intel, Ericsson**
Decision: The document is noted and the CR is endorsed. Final CR0251 to 36.211 is agreed R1-165686.

R1-164927 **Some corrections for eMTC** **ITRI**
Decision: The document is noted and CR0245 to 36.211 is agreed.

R1-165279 **Correction on PDSCH reception timing for eMTC Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document is noted and the CR is endorsed. Final CR0679 to 36.213 is agreed in R1-165636.

R1-165387 **Starting OFDM symbol for SIB1-BR for BL/CE UE** **Ericsson**
Decision: The document is noted and CR0657 to 36.213 is agreed.
R1-165388 **Collision between SIB1-BR and SI message for BL/CE UE Ericsson**
Decision: The document is noted and CR0658 to 36.213 is agreed.

PUSCH
R1-164124 **Draft CR on PDSCH scrambling for eMTC** **Intel Corporation**
Decision: The document is noted.
R1-164488 **Correction of cyclic hopping term for PUSCH DMRS** **NEC**
Decision: The document is noted.
Conclusion: Regarding the issues discussed in R1-164125 and R1-164488, no CR is necessary.

R1-164402 **Remaining issues for eMTC** **Qualcomm Incorporated**
Proposal 1: Capture the agreement that for R=1 the invalid subframes are overridden for the transmission of PUSCH/PUCCH.
Decision: The document is noted.
R1-165080 **Draft CR for overriding of valid-invalid subframes for R=1** **Qualcomm Incorporated**
Decision: The document is noted and the CR is endorsed. Final CR0250 to 36.211 is agreed in R1-165673.

R1-164842 **Correction on RV determination for PUSCH in TS 36.213. Huawei, HiSilicon**
Decision: The document is noted and the CR is endorsed. Final CR0675 to 36.213 is agreed in R1-165624.

R1-165395 **Correction on collision of dynamically scheduled data and semi-statically scheduled data for Rel-13 eMTC Ericsson**
Conclusion: CR in R1-165395 is agreed in principle. As this CR is intended to replace 36.213 CR0637r1 (agreed in R1-163787 – Ran1#84bis), final CR0637r2 to 36.213 is agreed in R1-165568

Continuous UL transmission
R1-163974 **LS on continuous uplink transmission in eMTC** **RAN4, Intel**
Decision: The document is noted.

Not treated.
R1-165413 Continuous Uplink Transmission in eMTC Sony
R1-165133 Discussion on UL gap for eMTC ZTE
R1-165134 Draft reply LS on continuous uplink transmission in eMTC ZTE

R1-165562 **WF on UL gaps for eMTC** **Intel Corporation, Sony, Sequans, Sierra Wireless, ZTE**
Decision: The document is noted. Revised in:
R1-165681 **WF on UL gaps for eMTC** **Intel Corporation, Sony, Sequans, Sierra Wireless, ZTE, Qualcomm, Ericsson**
Decision: The document is noted. Further revised in:
R1-165874 **WF on UL gaps for eMTC** **Intel Corporation, Sony, Sequans, Sierra Wireless, ZTE, Qualcomm, Ericsson, Nokia, Alcatel-Lucent Shanghai Bell, Samsung, Nordic Semiconductor, Spreadtrum, KT Corporation, Nubia Technology, NEC, InterDigital, CATT**
Decision: The document is noted.

Proposal:
- UL compensation gaps are introduced for HD-FDD eMTC UEs long transmissions PUSCH/PRACH.
  - During the UL gaps, the UE may switch to the DL and performs time/frequency synchronization.

Petitioners' Exhibit 1007, p. 1849
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - Note that the UE is not required to process DL channels during the UL gaps.
  - The UL gap is defined by a gap period (X ms) and gap length (Y ms).
  - The values of X and Y are to be determined by RAN4 and are fixed in the specifications.
    - Note: From RAN1 perspective, it may be beneficial to align the values of X and Y with the maximum frequency hopping granularity
- 1 bit capability signaling is introduced to enable more capable HD-FDD UEs to indicate that they do not need UL gaps during long UL transmissions to maintain the required frequency accuracy.
  - This bit is included in msg3, and also in the capability report of the UE.
- UL compensation gaps are applicable for PRACH and Msg3 transmissions during initial access regardless of the UE capability
  - For PRACH transmission, gaps do not apply if between two PRACH transmissions there is at least Z ms.
    - RAN4 to decide the value of Z
  - Note that for PDCCH ordered PRACH, the UE applies gaps following the capability signaling.
- During the UL gap durations, the corresponding PUSCH/PRACH transmissions are dropped
- Send an LS response to RAN4 and RAN2 informing them of the above and requesting:
  - RAN4 to determine the values of X, Y, and Z for eMTC UEs considering worst case coverage;
  - RAN2 to provide signaling support for the above capability signalling

Objected by: Huawei, HiSilicon
- Reason from Huawei, HiSilicon: it's a new feature, not essential, and there are other ways to approach this situation. Since it impacts multiple work groups, it should be handled at the RAN plenary.

Continue discussion offline, aim for concluding in RAN1 this week.

R1-165953 WF on UL gaps for eMTC Intel Corporation, Sony, Sequans Communications, Verizon, Sierra Wireless, ZTE, Qualcomm, Ericsson , AT&T, Nokia, Alcatel-Lucent Shanghai Bell, Samsung, NTT DoCoMo, SoftBank Mobile, CATT, Panasonic, NEC, KT Corporation, MediaTek, LG Electronics, Nordic Semiconductor, Spreadtrum, Nubia Technology, InterDigital, Virtuosys, Sharp, WILUS Inc.
Decision: The document is noted.

Proposal:
- UL compensation gaps are introduced for HD-FDD eMTC UEs long transmissions PUSCH/PRACH.
  - During the UL gaps, the UE may switch to the DL and perform time/frequency synchronization.
  - Note that the UE is not required to process DL channels during the UL gaps.
  - The UL gap is defined by a gap period (X ms) and gap length (Y ms).
  - The values of X and Y are to be determined by RAN4 and are fixed in the specifications.
    - Note: From RAN1 perspective, it may be beneficial to align the values of X and Y with the maximum frequency hopping granularity
- 1 bit capability signaling is introduced to enable more capable HD-FDD UEs to indicate that they do not need UL gaps during long UL transmissions to maintain the required frequency accuracy.
  - This bit is included in msg3, and also in the capability report of the UE.
- UL compensation gaps are applicable for PRACH and Msg3 transmissions during initial access regardless of the UE capability.
  - For PRACH transmission, gaps do not apply if between two PRACH transmissions there is at least Z ms.
    - RAN4 to decide the value of Z
  - Note that for PDCCH ordered PRACH, the UE applies gaps following the capability signaling.
- During the UL gap durations, the corresponding PUSCH/PRACH transmissions are dropped.
- Send an LS response to RAN4 and RAN2 informing them of the above and requesting:
  - RAN4 to determine the values of X, Y, and Z for eMTC UEs considering worst case coverage;
  - RAN2 to provide signaling support for the above capability signalling

Objected by: Huawei, HiSilicon
- Reason from Huawei, HiSilicon: it's a new feature, not essential, and there are other ways to approach this situation. Since it impacts multiple work groups, it should be handled at the RAN plenary. In addition, RAN4 wishes to study this, and RAN1 should take no action.

Intel: it is NOT a valid concern that the WF would impact multiple working groups
Further discussion till Friday.

Friday

R1-166015 WF on UL gaps for eMTC Intel Corporation, Sony, Sequans Communications, Verizon, Sierra Wireless, ZTE, Ericsson , AT&T, Nokia, Alcatel-Lucent Shanghai Bell, Samsung, NTT DoCoMo, SoftBank Mobile, CATT, Panasonic, NEC, KT Corporation, MediaTek, LG Electronics, Nordic Semiconductor, Spreadtrum, Nubia Technology, InterDigital, Virtuosys, Sharp, WILUS Inc.
Decision: The document is noted.

R1-166035 **WF on UL gaps for eMTC** **Intel Corporation, Sony, Sequans Communications, Verizon, Sierra Wireless, ZTE, Ericsson, Qualcomm, AT&T, Nokia, Alcatel-Lucent Shanghai Bell, Samsung, NTT DoCoMo, SoftBank Mobile, CATT, Panasonic, NEC, KT Corporation, MediaTek, LG Electronics, Nordic Semiconductor, Spreadtrum, Nubia Technology, InterDigital, Virtuosys, Sharp, WILUS Inc.**
Decision: The document is agreed.

R1-165784 **[DRAFT] Reply LS on continuous uplink transmission in eMTC** **Intel**
Decision: The document is noted and final LS is agreed in R1-166042.

Collision between PUCCH and PUSCH
R1-164597 **Collision between PUCCH and PUSCH** **Sequans Communications**
Decision: The document is noted.
R1-164599 **Correction for collision between PUCCH and PUSCH** **Sequans Communications**
Decision: The document is noted.
R1-165280 **Correction on UCI multiplexing on PUSCH** **Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document is noted.
R1-165394 **Multiplexing of UCI and PUSCH for BL/CE UE** **Ericsson**
Decision: The document is noted.
R1-164840 **Correction on collision between PUCCH and PUSCH in TS 36.213** **Huawei, HiSilicon**
Decision: The document is noted.

R1-165708 **Correction on UCI multiplexing on PUSCH** **Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document is noted and the CR0683 to 36.213 is endorsed, with the following update:
- For a BL/CE UE, and remove BL/CE in the sub-bullets
- Double-check whether FDD/TDD or FS1/FS2 is used, and align the terminology if necessary
- The CR in R1-165625 is withdrawn.

Final CR agreed in R1-165767 (CR0683r1), which is further revised and revision 2 is agreed in **R1-165791**

Decision: The document is noted.

PUCCH
R1-164837 **Correction on the supported PUCCH format for CEModeA in TS 36.213** **Huawei, HiSilicon**
Decision: The document is noted and draft CR is endorsed. Final CR in R1-165625 – wihtdrawn according to the conclusion to R1-165767).

R1-164838 **Clarification on collision between SR and PDSCH with repetitions in TS 36.213** **Huawei, HiSilicon**
Decision: The document is noted. Draft CR is postponed till next meeting. Revisit in RAN1#86.

R1-165383 **PUCCH frequency retuning for BL/CE UE** **Ericsson**
Decision: The document is revised in:
R1-165869 **PUCCH frequency retuning for BL/CE UE** **Ericsson**
Decision: The document is noted.
R1-165903 **WF on PUCCH frequency retuning for BL/CE UE** **Ericsson, Qualcomm, NEC, Sequans, Virtuosys, Softbank, NTT DoCoMo, Sierra Wireless, CATT, Sony, Altair, LG Electronics, InterDigital, Huawei, HiSilicon, Verizon, AT&T, ZTE**
Decision: The document is noted.

Proposal:
- Revoke the following RAN1#84 agreement:
  - Shortening of PUCCH 1/1a/1b in the first slot of a subframe is realized by using in the first slot with PUCCH 1/1a/1b resource mapping from symbols 1 through 6 in the first slot while maintaining the existing PUCCH 1/1a/1b DM-RS locations.
- Agree the following proposal:
  - For PUCCH 1/1a/1b, UL retuning gaps are generated by puncturing of the affected SC-FDMA symbols: last symbol and first symbol of the prior and the latter subframe respectively
    - However, if the prior subframe is an SRS subframe, shortened format of legacy behaviour is applied, i.e., shortened format is applied in the prior subframe, and first symbol of the latter subframe is punctured.

Objected by Samsung:
- Reasons: othogonality is broken for multiplexing different UEs, difficult to acheive the target of 10^-3 performance

Further discussion till Friday.

Petitioners' Exhibit 1007, p. 1851
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Friday
Samsung still maintained their opinion – performances will be broken – suggested having an email discussion and revisit at next meeting.
Chair: can we have it as working assumption? Samsung: no
Ericsson→ what will the outcomes of an email discussion be?
NO consensus.

CSI definition
R1-164399 Clarification on CSI measurements Qualcomm Incorporated
Decision: The document is noted.
R1-165542 Clarification of CSI measurements Qualcomm Incorporated (R1-164400)
Decision: The document is noted. Email discussion on the issue raised in R1-164399 and R1-165542 until June 10th

R1-164738 Draft CR on CSI Reporting Samsung
Decision: The document is noted. The first change in R1-164738 is endorsed. Final CR0674 to 36.213 is agreed in R1-165622

R1-164839 Correction on PDSCH transmission scheme assumed for TM9 CSI reference resource in TS 36.213 Huawei, HiSilicon
Decision: The document is noted. The change in R1-164839 is endorsed. Final CR0685 to 36.213 is agreed in R1-165737

R1-164739 Draft CR on A-CSI reporting for TM6 Samsung
Decision: The document is noted and the draft CR endorsed. Final CR0673 to 36.213 is agreed in R1-165621

SRS handling
R1-164841 Correction on SRS frequency location in TS 36.213 Huawei, HiSilicon
Decision: The document is noted. The change in R1-164841 is agreed in principle, further discussion offline especially regarding the wording. Final CR0678 to 36.213 is agreed in R1-165627

R1-165278 Channel interleaver correction for eMTC Nokia, Alcatel-Lucent Shanghai Bell
Decision: The document is noted and the CR is endorsed. Final CR0208 to 36.212 is agreed in R1-165635

Random access
R1-164836 Clarification on Msg3 PUSCH repetition level in TS 36.213 Huawei, HiSilicon
Decision: The document is noted and the CR is endorsed. Final CR0208 to 36.212 is agreed in R1-165626

R1-164865 Correction on the determining PRACH starting subframe in TS 36.211 Huawei, HiSilicon
Decision: The document is noted and the draft CR is postponed. Revisit in RAN1#86.

R1-165314 MCS for Random Access Response Grant Nokia, Alcatel-Lucent Shanghai Bell
Decision: The document is revised in:
R1-165579 MCS for Random Access Response Grant Nokia, Alcatel-Lucent Shanghai Bell
Decision: The document is noted and the draft CR is endorsed. Final CR0682 to 36.213 is agreed in R1-165687.

Paging occasion overlap
R1-164398 Discussion on paging occasion overlap for eMTC Qualcomm Incorporated
Decision: The document is noted and the topic is postponed. Revisit in RAN1#86.

R1-165543 Correction on DCI payload size Qualcomm
Decision: The document is noted.
R1-165646 Correcting configuration parameter for number of PRB-pairs Sequans Communications
Decision: The document is noted and the draft CR is endorsed. Final CR0680 to 36.213 is agreed in R1-165682

Not treated.
R1-165785 Draft 36.211 eMTC CR capturing RAN1 #84bis and #85 agreements Ericsson
R1-165786 Draft 36.212 eMTC CR capturing RAN1 #84bis and #85 agreements Ericsson
R1-165787 Draft 36.213 eMTC CR capturing RAN1 #84bis and #85 agreements Ericsson
R1-165993 CAT-M1 Coverage Enhancement Analysis Sierra Wireless, Ericsson, Sequans

6.1.6 Maintenance of Release 13 NB-IoT

R1-165933 Chairman's Notes of Agenda Item 6.1.6 on NB-IoT CRs Ad-hoc chair (Qualcomm)
The document was presented by Wanshi Chen from Qualcomm and provides the outcomes of NB-IoT maintenance session.
Decision: The document is endorsed. Contents incorporated below.

Petitioners' Exhibit 1007, p. 1852
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165111 Introduction of NB-IoT Motorola Mobility 36.213 13.1.1 CR0656 B
Decision: The document is already agreed (decision taken during email thread [84b-02].
R1-165396 36.201CR0014r1 Introduction of NB-IoT Nokia, Alcatel-Lucent Shanghai Bell 36.201 13.1.0 CR0014r1 B
Decision: The document is already agreed (decision taken during email thread [84b-02].

R1-165754 LS on RRM measurement for NB-IOT RAN4
RAN4 LS providing the definitions of NRSRP and NRSRQ.
Decision: The document is noted.
R1-165753 Reply LS on NB-IoT RRM requirements RAN4
Decision: The document is noted.
R1-165894 Response to LS on uplink transmission gap in NB-IoT RAN4
Decision: The document is noted.
R1-165895 LS on Tx Gaps for Frequency Error Correction RAN4
Decision: The document is noted.

R1-164026 Updated Draft NB-IoT CR to 36.213 post Busan Motorola Mobility Germany GmbH
R1-164305 Introduction of LTE Physical Layer Enhancements for NB-IoT Motorola Mobility Germany GmbH
R1-164662 Introduction of NB-IoT Ericsson
Decision: The document is noted and CR0033 to 36.214 is agreed.

PSS/SSS
R1-164403 Potential issues of NB-SSS in asynchronous deployment Qualcomm Incorporated
Decision: The document is noted.
Conclusion:
- There is no consensus to standardize a solution to address the issue identified in R1-164403 and there is no consensus to send an LS to RAN4.

SI Handling
R1-164863 On TBS values for NB-SI transmission Huawei, HiSilicon
Decision: The document is noted.
R1-165127 Remaining issue on SI messages for NB-IoT ZTE
Decision: The document is noted.
R1-165231 TBS values and resource mapping for SI messages Intel Corporation
Decision: The document is noted.
R1-165602 WF on TBS for NB-IoT SI-messages Huawei, HiSilicon, CATT, Ericsson, Intel, Nokia, ASB, QC, Sony, Vodafone
Decision: The document is noted. Also supported by MediaTek.

Agreement:
- It is feasible to support additional TBS of 56, and 120 bits for SI-messages (not including SIB1-NB)
- Recommend RAN2 to select:
  - $I_{SF} = 1$, $I_{TBS} = 1$ (for 56 bits); and
  - $I_{SF} = 1$, $I_{TBS} = 4$ (for 120 bits)
- Send an LS to RAN2 based on the above bullets, draft LS in R1-165694, agreed in R1-165710

R1-165663 WF on SI messages for NB-IoT ZTE, Nubia Technology
Decision: The document is noted.

NPDCCH
R1-164291 Monitoring of NPDCCH after NPDSCH/NPUSCH transmission Sony
Decision: The document is noted.

Agreement:
- An NB-IoT UE is required to monitor for NB-PDCCH for UL and DL grant 3 ms after the end of the NB-PUSCH transmission.
  - Up to the editor how to capture the bullet

R1-164404 On NPDCCH search space Qualcomm Incorporated
Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1853
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165629 **WF on collision with SI transmission and overlapping NPDCCH search space** **Qualcomm, Ericsson, MediaTek, Huawei, Hisilicon, ZTE**
Decision: The document is noted.

Agreement:
- A UE is not required to monitor an NPDCCH search space that ends later than 4ms before the beginning of the next NPDCCH search space.
  - The above rule also applies to partial NPDCCH search space period.
- Subframes of NPDSCH/NPDCCH for unicast, paging, and RAR that overlap with SI transmission are postponed to the next valid DL subframes

R1-164847 **Clarification on NPDCCH monitoring in 36.213** **Huawei, HiSilicon**
Decision: The document is noted.

Agreement:
- Clarify that "the corresponding NB-PDSCH or NB-PUSCH transmission" includes the ACK/NACK transmission on NPUSCH format 2 scheduled in DCI Format N1.
- An NB-IoT UE that has received a NPDCCH order is not required to monitor NPDCCH for any further DL or UL grant during the time period between the end of the NPDCCH order and the start of the ordered NPRACH transmission.

R1-164877 **Discussion on Scheduling Delay with Transmission Gaps** **CMCC**
Decision: The document is noted.
R1-165139 **Discussion on starting subframe of NPDCCH search space** **MediaTek Inc.**
Decision: The document is noted.
R1-165670 **WF on NPDCCH starting subframe** **MediaTek, LGE, Huawei, HiSilicon**
Decision: The document is noted. Also supported by Samsung.

Agreement:
- The formula for starting subframe of NPDCCH is updated as $(10n_f + \lfloor n_s/2 \rfloor) \bmod T = \lfloor \alpha_{\text{Offset}} T \rfloor$ where
  - α_{offset} is signaled via RRC {0, 1/8, 1/4, 3/8}, i.e., α_{offset} is an UE-specific parameter configured by RRC for USS and cell-specific and PRACH resource specific parameter for CSS for RAR/Msg 3 re-tx/Msg 4

Send an LS to RAN2, draft LS in R1-165695 (to update "two additional parameters", potentially include other possible new parameters) – (Huawei)
R1-165695 **[DRAFT]LS on RRC parameter list for NB-IoT** **Huawei**
Decision: The document is noted, revised in R1-165709, which is endorsed. Final LS is agreed in R1-165906.
R1-165730 **L1 parameters list for NB-IoT** **Huawei**
Decision: The document is noted and included in R1-165906.

R1-165229 **Some remaining issues on NPDCCH related to TS 36.213** **Intel Corporation**
Decision: The document is noted.

Agreements:
- Adopt the recommended changes to Section 16.4.1 and Section 16.6 of TS 36.213 as indicated in Section 2 of R1-165229
- If the higher layer parameter NBIoT-Operation-mode (or operationMode) indicates in-band mode of operation (i.e., set to '00' or '01'), the starting OFDM symbol for NPDCCH ($l_{\text{NPDCCHStart}}$) is given by the higher layer parameter lteControlRegionSize.

PDSCH
R1-165228 **On resource allocation for SIB1-NB in TS 3.213** **Intel Corporation**
Decision: The document is noted.

Agreement: The proposed text change in R1-165228 is endorsed

R1-165230 **On scrambling initialization for NPDSCH** **Intel Corporation**
Decision: The document is noted.

Agreements:
- For NPDSCH carrying SIB1-NB, the scrambling is reinitialized at the first subframe carrying a repetition of the codeword.

Petitioners' Exhibit 1007, p. 1854
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- For NPDSCH carrying SI messages other than SIB1-NB, the scrambling is reinitialized at the first subframe carrying a repetition of the codeword.

A/N Timing

R1-164100 Time reference for A/N transmission Huawei, HiSilicon
Decision: The document is noted.
R1-164126 Time domain resource allocation for NPUSCH with 1-bit A/N feedback Intel Corporation
Decision: The document is noted.
R1-165000 Time Reference for Ack/Nack Transmission Nokia, Alcatel-Lucent Shanghai Bell
Decision: The document is noted.
R1-165124 Remaining issues on UL Transmission reference for NB-IoT ZTE
Decision: The document is noted.

R1-165539 WF on time reference of ACK/NACK of NPDSCH Huawei, HiSilicon, CATT, Intel, Panasonic, u-blox, ZTE
Decision: The document is noted.
R1-165664 WF on time reference of ACK/NACK of NPDSCH Huawei, HiSilicon, CATT, Intel, Panasonic, u-blox, ZTE, Samsung, China Unicom, Astri, NEUL, CATR
Decision: The document is noted. Also supported by China Telecom, Potevio.
R1-165651 WF on Time Reference for Ack/Nack Transmission Ericsson, Nokia, Alcatel-Lucent Shanghai Bell, Sony, Verizon, AT&T, LG, Sierra Wireless
Decision: The document is noted.
R1-165884 WF on Time Reference for Ack/Nack Transmission Ericsson
Decision: The document is noted.

Agreements:

- A/N transmission delay is relative to the end of the corresponding NPDSCH transmission plus 12ms.
- Introduce both odd and even numbers for the time offset for 15 kHz ACK/NACK.
- It is proposed to use the following timing offsets in the DCI instead of {0, 2, 4, 6} ms for 15kHz ACK/NACK transmission.
  - {0 2 4 5}

DL & UL Gap

Decision: The document is noted.
R1-164290 UL Transmission Gap Duration Sony
Decision: The document is noted.
R1-164376 On UL transmission gaps and related RAN4 analysis Huawei, HiSilicon
Decision: The document is noted.
R1-165126 Potential issue on value of DL Gap configuration for NB-IoT ZTE
Decision: The document is noted.
R1-165131 Issues on NPRACH UL Gap configuration ZTE
Decision: The document is noted.
R1-165644 WF on clarification for timing of DL transmission ZTE, MTK, HW, HiSilicon, Sony
Decision: The document is noted.

Agreement: If NPUSCH UL Gap is inserted at the end of NPUSCH transmission, the UE resumes monitoring of N-PDCCH from the end of the UL gap.

R1-165645 WF on NPRACH UL gap ZTE, MTK,Sony
Decision: The document is noted.

Agreement: If a NPRACH UL Gap is inserted at the end of NPRACH opportunity, the start of RAR detecting window is from the end of the UL gap.

RACH

R1-164862 Clarification on UL grant in NB-RAR in 36.213 Huawei, HiSilicon
Decision: The document is noted.

Agreement: When $I_{delay} = 0$ for UL grant in NB-RAR, $k_0 = 13$.

R1-164939 Clarification on repetition and Pseudo-random hopping of NPRACH NEC Corporation
Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1855
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165355 **NB-IoT-NPDCCH ordered PRACH** **Ericsson**
Decision: The document is noted.
R1-165652 **WF on NPDCCH ordered PRACH** **Ericsson**
Decision: The document is noted. Also supported by ZTE.

Agreement:
- Introduce the tone index in DCI format N1 for the NPDCCH ordered PRACH.
- A field of 6 bits in DCI format N1 should be used to indicate the tone index as
  - Indicate the absolute tone index.
  - The tone index in DCI format N1 has to indicate a tone in a PRACH resource matching the PRACH repetitions.
    - A tone outside this PRACH resource is not allowed.

PUSCH
R1-164998 **Handling of cyclic shift in UL DMRS sequence selection** **Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document is noted.
R1-165130 **Comments on NPUSCH format 1 and TP for 36.213** **ZTE**
Decision: The document is noted.

Conclusion: The TP in R1-165130 is endorsed

R1-165128 **Remaining issues on DMRS for NPUSCH format 2** **ZTE**
Decision: The document is noted.

R1-165630 **WF on NB-IoT UL DMRS Hopping** **Qualcomm**
Decision: The document is noted. Also supported by Panasonic.

Agreements:
- To adopt the legacy LTE group hopping, as defined in Sec. 5.5.1.3, TS36.211, for NB-IoT UL DMRS for N-PUSCH format 1:
  - The group hopping pattern is revised from legacy LTE with *30* replaced by M in the following equations
    - $u = \left(f_{gh}(n_s) + f_{ss}\right) \bmod M$
    - $f_{gh}(n_s) = \begin{cases} 0 & \text{if group hopping is disabled} \\ \left(\sum_{i=0}^{7} c(8n_s + i) \cdot 2^i\right) \bmod M & \text{if group hopping is enabled} \end{cases}$
    - $c_{init} = \left\lfloor \frac{n_{ID}^{RS}}{M} \right\rfloor$
    - $f_{ss}^{PUSCH} = \left(N_{ID}^{cell} + \Delta_{ss}\right) \bmod M$
    - $f_{ss}^{PUSCH} = n_{ID}^{RS} \bmod M$
  - In the above, M=30, 14, 12, and 16 for, respectively, 12-tones, 6-tone, 3-tone and single-tone cases.
  - The group-hopping pattern is reset:
    - Every subframe for multi-tone transmission
    - Every RU for single-tone transmission
  - The group-hopping for single-tone transmission only applies to the Hadmard sequence index
  - n_{ID}^{PUSCH} is not defined, and $n_{ID}^{RS} = N_{ID}^{Ncell}$.
- Send an LS to RAN2 (cc-RAN4) to inform the above including the need to have
  - a new cell-specific RRC parameter, Group-hopping-enabled, to enable and disable the group hopping,
  - a new UE-specific RRC parameter, Disable-group-hopping to disable the function despite it is enabled by the cell-specific parameter unless the PUSCH transmission corresponds to a Random Access Response Grant or a retransmission of the same transport block as part of the contention based random access procedure,
  - a new RRC parameter for the offset, Δ_{ss} (the same range of the one in LTE)

Post meeting: It is noticed that LS sent to RAN2 did not include RAN4 – see email thread [85-26].

Collision Handling
R1-164846 **Clarifications on collision handling in 36.211 and 36.213** **Huawei, HiSilicon**
Decision: The document is noted.
R1-164991 **NB-IoT - Collision handling** **Ericsson**
Decision: The document is noted.
R1-165125 **Collision handling for NB-IoT** **ZTE**
Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1856
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165132 **On collision between NPRACH and NPUSCH** **ZTE**
Decision: The document is noted.

General/Multiple
R1-164493 **Discussion on remaining issues on NB-IoT** **LG Electronics**
Decision: The document is noted.

Agreement:
- When a UE is configured with additional PRB in inband where anchor PRB is in guard band
  - If same-PCI indicator is true, the behaviour is defined the same in all cases
  - If same-PCI indicator is not true, the behaviour is defined the same in all cases

R1-164494 **Discussion and comments on NB-IoT CRs** **LG Electronics**
Decision: The document is noted.

Agreement:
- Introduce the following definition in 36.211:
  - N: A constant equal to 2048 for Δf=15kHz , 4096 for Δf=7.5kHz and 8192 for Δf=3.75kHz

R1-164577 **Clarifications for NB-IoT CRs** **Spreadtrum Communications**
Decision: The document is noted. The first change in R1-164577 is to be handled by the editor.

R1-165002 **Non-anchor PRB location for NB-IoT multi-carrier operation** **Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document is noted.
R1-165129 **Comments on UE procedures for NB-IoT and TP for 36.213** **ZTE**
Decision: The document is noted.

Agreement: The TP in R1-165129 is endorsed

Others
R1-164848 **Draft 36.300 section 5 CR for NB-IoT** **Huawei**
Decision: The document is noted.

Agreement:
- The draft CR in R1-164848 is endorsed (removing the changes on changes), send an LS to RAN2 – (Huawei)
- **R1-165600** (the updated CR)
- The draft LS is in R1-165601, with the final LS agreed in R1-165711

R1-164917 **Clarification of antenna port usage of NB-IoT** **Panasonic Corporation**
Decision: The document is noted.

Agreement:
- When the same-PCI indicator is set to true, to use antenna port 0 and 1 for the transmission of NRS, NPDCCH, NPDSCH and NBPCH. When the same-PCI indicator is set to false, to use new antenna port (for example port 1000 and 1001) for the transmission of NRS, NPDCCH, NPDSCH and NBPCH.
  - How to capture the bullet is up to the editor
- A UE may assume the antenna ports 1000 – 1001 of a serving cell are quasi co-located (as currently defined in 36.213 that is to introduced in 36.211) with respect to delay spread, Doppler spread, Doppler shift, average gain, and average delay.
  - How to capture the bullet is up to the editor

R1-165879 **WF on NPDCCH search space monitoring** **MediaTek, Nokia, Huawei, Hisilicon, Qualcomm, Sony, ZTE**
Decision: The document is noted.

Agreement:
- UE is not required to simultaneously monitor CSS for paging and CSS for RAR/Msg 3 re-tx/Msg 4.

R1-165949 **WF on NPUSCH format 2 Phase Rotation** **ZTE**
Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1857
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- ZTE: it is noted for single-tone modulation, the waveform phase transition requirement agreed in previous meeting does not apply for NPUSCH format 2.

Not treated.
R1-165683 On NSSS design and SFN index detection ambiguity Intel Corporation
R1-165747 WF on NB-IoT Multi-PRB operation LG Electronics, Nokia, ASB
R1-165788 WF on NB-IoT UL DMRS Hopping Qualcomm

Friday

R1-165985 WF on UL gaps for NB-IoT Huawei, HiSilicon, Sony, Ericsson, MediaTek, Vodafone, ZTE, Nubia Technology, Spreadtrum, u-blox
Decision: The document is noted. Revised in:
R1-166023 WF on UL gaps for NB-IoT Huawei, HiSilicon, CATT, Ericsson, Intel, MediaTek, Nokia, Samsung, Sony, u-blox, Vodafone, ZTE, Nubia Technologies
Decision: The document is agreed.

R1-166009 [DRAFT]LS on NB-IoT Performance Huawei, HiSilicon, Vodafone, Deutsche Telekom, CMCC, China Telecom, China Unicom, NTT DOCOMO
Decision: The document is noted, revised in R1-166024. Further revised in:
R1-166036 [DRAFT]LS on NB-IoT Performance Huawei, HiSilicon, Vodafone, Deutsche Telekom, CMCC, China Telecom, China Unicom, NTT DOCOMO
Decision: The document is noted and final LS is agreed in R1-166037.

Rapporteur shall submit the list of all agreements by May 30th.
Editors will provide updated NB-IoT CRs to 36.211, 36.212, 36.213 and 36.214 by June 3rd , for email approval by June 7th.

6.1.7 Other

R1-165093 Correction on search space to decode the PDCCH configured by the SC-N-RNTI TD Tech Ltd
36.213 13.1.1 LTE_SC_PTM-Core CR0654 F
If a UE is configured by higher layers to decode PDCCH with CRC scrambled by the SC-N-RNTI, the UE shall monitor common search space to decode the PDCCH with CRC scrambled by the SC-N-RNTI.
Decision: The document is noted and CR0654 to 36.213 is agreed.

R1-165168 Introduction of 60ms periodicity for wideband CQI/PMI reporting Nokia, Alcatel-Lucent Shanghai Bell, Apple, Broadcom, Ericsson, Intel, Mediatek 36.213 13.1.1 TEI13 draftCR B
Tables 7.2.2-1A and 7.2.2-1C are modified so that some of the currently reserved $I_{CQI/PMI}$ values are used to define 60ms CQI/PMI reporting periodicity and associated offsets.
Decision: The document is noted and agreed as CR0668 to 36.213 in R1-165530.

6.2 LTE Release 14

6.2.1 Enhanced Licensed-Assisted Access to Unlicensed Spectrum - *WID in RP-152272*.

R1-165934 Chairman's Notes of Agenda Item 6.2.1 on eLAA Ad-hoc chair (Qualcomm) Ad-hoc chair (Nokia, Ericsson)
The document was presented by Wanshi Chen from Qualcomm and provides the outcomes of the eLAA session.
Decision: The document is endorsed. Contents incorporated below.

Email approval about following yellow colour parts until 6th June – Havish (Ericsson)

Editors will submit draft CRs (201, 211, 212, 213, 214 (if needed)) until 18th August
Rapporteur needs to submit agreement and WA lists until 30th June

6.2.1.1 *PUSCH design*

TPC and PHR
R1-164576 TPC and PHR for UL LAA ZTE
R1-164287 Power headroom report enhancement for eLAA Sony
R1-164742 Discussion on UL power issues for eLAA Samsung
R1-164918 On PUSCH Transmit Power on LAA SCells Nokia, Alcatel-Lucent Shanghai Bell

Petitioners' Exhibit 1007, p. 1858
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165557 WF on Uplink Power Control in eLAA, LGE, ZTE and Nubia

Agreement:
- UE's path-loss calculation for the open loop power control for uplink is based on the CRS in DRS within DMTC
  - Note: There may be no specification impact

Agreement:
- PHR for a subframe shall be calculated based on the scheduled uplink transmissions in LAA SCells regardless of whether the actual transmission is performed or not performed

Resource Allocation for eLAA

R1-164055 Resource allocation for RB interleaved PUSCH for eLAA Huawei, HiSilicon
R1-164128 Remaining details on resource allocation for eLAA PUSCH transmission Intel Corporation
R1-164406 PUSCH design details Qualcomm Incorporated
R1-164408 PUSCH resource allocation granularity Qualcomm Incorporated
R1-164479 Remaining issues on PUSCH resource allocation NEC
R1-164495 PUSCH resource allocation in LAALG Electronics
R1-164574 On UL Resource Allocation for PUSCH ZTE
R1-164740 UL Waveform for PUSCH Samsung
R1-164831 Discussion on equal and non-equal multi-interlace based PUSCH structure Huawei, HiSilicon
R1-164919 PUSCH Resource Allocation Details Nokia, Alcatel-Lucent Shanghai Bell
R1-164993 Resource allocation of PUSCH for eLAA Sharp
R1-165115 Considerations on eLAA PUSCH design Mediatek
R1-165141 Uplink Resource Allocation Design for Enhanced LAA Ericsson
R1-165185 Discussion on PUSCH subframe structure and resource allocation for eLAA UL NTT DOCOMO INC.

R1-165817 Response LS on PUSCH transmission for eLAA RAN4, Nokia

R1-165800 WF on PUSCH resource allocation for eLAA Huawei, HiSilicon, Intel, Qualcomm, NTT DOCOMO, LGE

Agreement
- Confirm the previous working assumption
  - the 10RBs are spaced equally in frequency domain for 20MHz
    - Example for 20MHz eLAA SCell: interlace 0 is composed of RBs 0,10,20,...,90
    - Scheduling 70 UL RBs is not supported

Agreement
- One interlace is composed of 10RB/interlace for 10MHz

Possible agreement:
- Companies are encouraged to provide their preference on the RA alternatives
  - Alt 1: UL resource allocation type 0
  - Alt 2: bitmap based resource allocation
  - Alt 3: predefined resource allocation patterns with the number of bits being same or less than Alt. 1
    - Define all contiguous patterns + the patterns in the set [0+5, 1+6, ….]
    - Define all contiguous patterns + other patterns
      - Examples provided in R1-164055
    - Define some number of patterns based on the number of interlaces allocated
      - More patterns for fewer interlaces
  - Alt 4: RRC configure between Alt 1 and Alt 2

Agreement:
- For LAA uplink, DCI 0B and DCI 4B can schedule PUSCH transmission in maximum N_sf subframes, where N_sf is configurable by UE-specific RRC
  - DCI 0B: DCI format supporting PUSCH multi-subframe scheduling with TM1 for LAA SCell
  - DCI 4B: DCI format supporting PUSCH multi-subframe scheduling with TM2 for LAA SCell
  - N_sf value range is N_min to N_max
  - Value of N_min: 2
  - Value of N_max is 4
  - DCI payload sizes of DCI 0B and DCI 4B are decided by configured N_sf value
  - RRC signalling can enable or disable DCI 0B and DCI 4B independently

Agreement:
- UE may be configured to detect multiple uplink grants which may be chosen without restriction from DCI 0A/4A/0B/4B
  - Maximum number of uplink grants to be transmitted for a single UE in a subframe is 4
  - DCI 0A: DCI format supporting PUSCH single-subframe scheduling with TM1 for LAA SCell
  - DCI 4A: DCI format supporting PUSCH single-subframe scheduling with TM2 for LAA SCell

Working assumption:
- The new DCI formats along with all the applicable legacy DCI formats are subject to the blind decoding reduction mechanisms defined in Rel-13.
  - FFS: Whether any further enhancements to the reduction mechanisms on a per DCI format basis is necessary

R1-166003 Way Forward on managing UE blind decoding for LAA SCells in Rel-14 eLAA Qualcomm

Agreement:
- A single UL grant scheduling multiple subframes can only schedule consecutive subframes for PUSCH transmission

Agreement:
- The following scheduling information in the existing DCI format 0/4 are not included in DCI 0A/4A/0B/4B for LAA when an interlace structure is used
  - frequency hopping, resource allocation type

Possible agreement:

Petitioners' Exhibit 1007, p. 1860
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- RRC signalling can configure whether resource allocation is based on an interlace structure or on legacy structures
- RAN1 recommends that the support of resource allocation based on an interlace resource allocation structure for DCI 0A/4A/0B/4B is mandatory.
- RAN1 recommends that the support of resource allocation based on the legacy resource allocation structure for DCI 0A/4A/0B/4B is optional

Agreement:

- There is only one SRS transmission request per DCI 0A/4A/0B/4B

R1-165822 Second WF on Multi-subframe scheduling in LAA, LGE, ZTE

Agreements:

- DCI format 0B/4B indicates number of scheduled subframes
- DCI format 0B/4B indicates HARQ process IDs for the scheduled subframes by indicating HARQ process ID for a single subframe, and HARQp_ids for other subframes are derived by a given rule
  - the HARQp_ids for other subframes are consecutive with the indicated HARQ process IDs, modulo max number of HARQ processes
- DCI format 0B/4B indicates RVs for the scheduled subframes by indicating a 1-bit RV value per scheduled subframe (regardless of the number of scheduled transport blocks)
  - Can indicate RV 0 or 2

Agreements:

- For MSF DCI format 4B, utilise the current 2-bit SRS triggering field; include SRS subframe indication in the SRS parameter set configuration
- For MSF DCI format 0B, existing SRS triggering bit and 1 additional bit are used for SRS triggering and subframe indication
  - The 4 states are defined in specs as no triggering, first, second or last subframe
- Ending PUSCH DFT-S-OFDM symbol in a DCI format 0B/4B applies only to the last scheduled subframe
- CSI request in DCI format 0B/4B applies to 2nd scheduled subframe if Nmax=2, and otherwise to the penultimate scheduled subframe
- CSI reference subframe is defined according to the existing rules in 36.213 s.7.2.3.
- In case the subframe in which CSI would be transmitted is not transmitted because LBT does not succeed, CSI shall not be transmitted
- MCS for each codeword in DCI format 4B is indicated separately
- Timing offset is counted from subframe N+4+k, and k is signalled with (working assumption 3)bits ([0….7] SFs) (FFS in case of 2-step scheduling)
- Working assumption (automatically confirmed if no problem identified by the end of the meeting): Common MCS value in DCI format 0B/4B applies to the PUSCH containing UCI and/or SRS and/or blanked symbol(s) without special handling

Discuss separately:

- RRC configures the max number of HARQ processes, up to 16

Agreement:

- eNB signals LBT type at least including 25us single slot LBT and Cat4 LBT to the UE at least for PUSCH

R1-165647 WF on eLAA UL/DL scheduling combinations Nokia, Alcatel-Lucent Shanghai Bell, CATT, LG Electronics, NTT DOCOMO, Qualcomm, Intel, Ericsson, ZTE, Fujitsu, ETRI, ITL, Huawei, HiSilicon, Samsung, Kyocera, Panasonic

Agreements:

- **Support UL/DL Scheduling Combination 2: Self-scheduling on DL and cross-carrier scheduling on UL**
  - The UE to monitor for DCI formats scheduling PUSCH of a single eLAA Scell on one UL licensed-band scheduling cell
    - i.e. DCI formats 0A/0B, Formats 4A/4B if configured for TM2
  - The UE to monitor for DCI formats scheduling LAA PDSCH on the LAA SCell
    - i.e. DCI formats 1A/1B/1D/1/2A/2/2B/2C/2D
  - Configuration details of enabling self-scheduling on DL and cross-carrier scheduling on UL are up to RAN2
  - FFS: If UCI cell groups concept is agreed, then whether scheduling is allowed from outside the UCI cell group
  - FFS: Whether cross-carrier transmissions of DCI scheduling on the UL is only applicable to PUSCH scheduling or whether it may be applicable to all the UL DCIs for the UL (e.g. if agreed, DCI for SRS triggering etc).

Petitioners' Exhibit 1007, p. 1861
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

– FFS: How to manage the number of blind decodes at the UE side in general (equally applicable for other scheduling combinations)?

R1-165883 WF on initial signal transmission in LAA, LGE, Huawei, HiSilicon, ZTE

R1-165717 WF on PUSCH transmissions on an LAA Scell and PUCCH transmissions, Ericsson

Agreement:

Timing of 25 us gap immediately before transmission of PUSCH and SRS for 25 us LBT is decided by the eNB and is indicated to the UE

Agreement:

Transmission time for PUSCH and SRS after a Cat. 4 LBT at the UE is decided by the eNB and is indicated to the UE.

- Note: There is no restriction on when the UE starts cat. 4 LBT
- Note: If the UE fails to complete Cat. 4 LBT for the first subframe in a multi-subframe UL grant, it can continue the Cat. 4 LBT procedure and attempt transmission for subsequent subframes.

Possible offline agreement:

Transmission on UL is allowed to start at the following times in a UL subframe

- Start of DFTS-OFDM symbol 0
- Start of DFTS-OFDM symbol 1
- 25 us + TA value after start of DFTS-OFDM symbol 0
- 25 us after start of last DFTS-OFDM symbol of previous subframe
- FFS: 16 us + TA after start of DFTS-OFDM symbol 0
- Note: Gaps may be created by UE subframe timing adjustment instead of using a partial OFDM symbol if a TA offset is dynamically signaled

Other

R1-164411 SRS procedures for eLAA Qualcomm Incorporated
R1-164814 SRS waveform Huawei, HiSilicon

R1-165565 WF on LBT scheme for SRS transmission on LAA SCell LGE, ITL, Sharp Dependent on RCOT WF
- DL grant triggering aperiodic SRS that is not multiplexed with PUSCH signals LBT type for SRS transmission

Petitioners' Exhibit 1007, p. 1862
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

  - LBT type includes at least 25 usec one-shot LBT or Cat 4 LBT.
  - FFS: If aperiodic SRS is followed by PUSCH without gap between SRS and PUSCH, UE performs LBT indicated for the following PUSCH.

- If Cat 3 or Cat 4 LBT is performed for aperiodic SRS that is not multiplexed with PUSCH and without PUSCH in following subframe, the highest LBT priority class with only the minimum contention window size [3] can be considered for LBT purposes.

Proposal:
- Cat 4 LBT with the highest priority is performed for aperiodic SRS that is not multiplexed with PUSCH and without PUSCH in following subframe,

R1-165572 WF on general SRS aspects
Agreement:
- Periodic SRS is NOT supported in Rel-14 eLAA WI
- Cell-specific and UE-specific SRS subframe configuration in RRC signaling for both periodic and aperiodic SRS is not applicable in the current scope of Rel-14 eLAA

Agreement:
- SRS uses the legacy comb structure

Agreement:
- Keep the existing max # SRS RBs for a given system bandwidth
  - No shifting of SRS is used on an LAA SCell

R1-165573 WF on transmission and triggering SRS without PUSCH, Huawei, HiSilicon, Qualcomm, Samsung, ZTE, Intel, ITL, Nokia, ALU, Ericsson
Agreement:
- When SRS without PUSCH is transmitted in DL ending partial subframes, UE transmits SRS in symbol 13

Options for triggering of SRS transmissions:
1) SRS without PUSCH is transmitted in subframe n+4 if the DL grant triggering the SRS transmission is received in subframe n (default if no other options are agreed)
2) SRS is transmitted according to one of the two options
   a. in a DL ending partial subframe n+4 if a DL grant triggering SRS transmission is received in subframe <= n
   b. in a subframe n+4 immediately following a DL subframe, if a DL grant triggering SRS transmission is received in subframe <= n and no DL ending partial subframe is present between the DL grant and subframe n+4
3) SRS without PUSCH is transmitted in subframe n+k if the DL grant triggering the SRS transmission is received in subframe n.
   a. The parameter k is indicated in the DL grant

Proposal:
- Common/Group DCI can be used to trigger a-SRS without PUSCH for a group of UEs on the LAA Scell
- The triggering signaling includes the following fields
  - Subframe timing k. This field will be omitted if subframe timing is predefined.
  - FFS SRS LBT type, e.g., cat.2/cat.4
    - Depends on whether or not the UE knows of the MCOT
  - CIF, if cross carrier indication from PCell is supported
  - UE-specific field: trigger or not
- The group ID/RNTI is configured to the UE via RRC signaling

R1-165152 On Performance of PRACH for Enhanced LAA Ericsson
R1-165189 Discussion on PRACH for eLAA UL NTT DOCOMO, INC.

R1-165498 WF on PRACH Ericsson

Conclusion:
- Several possible approaches have been identified for the PRACH
- PRACH is useful in some use cases
- Enhanced LAA can operate without PRACH at least in scenarios with limited separation between base stations on licensed and unlicensed carriers, if the initial values of timing advance and power control are defined, e.g. if the licensed and unlicensed carriers are in the same TAG

R1-165574 WF on PRACH configuration

6.2.1.5 Channel access framework

R1-164990 Channel Access for LAA UL Nokia, Alcatel-Lucent Shanghai Bell

R1-164073 Contention window size adjustment for UL category 4 LBT for eLAA Huawei, HiSilicon

Possible agreement:
Contention window maintenance for UL Category 4 LBT is done per UE

Options for LBT priority class handling when UE performs Category 4 LBT:
Option 1: Signalling of LBT priority class from eNB to UE determines for its Cat. 4 LBT
- Buffer status report from UE allows eNB to determine what LBT priority class the UE intends to use for its category 4 LBT
- eNB schedules subframes and gaps according to its determination and signals priority class or contention window size (FFS between the two) to the UE
- UE follows the signalled LBT parameters for UL LBT for Category 4 LBT
- UE is allowed to use LCP for the allocated subframes regardless of LBT priority class that was used for UL LBT

Don't like this approach: Mediatek, Broadcom, Intel, Marvell, Cablelabs

Option 2: No signalling of LBT parameters for category 4 LBT at the UE from eNB and UE determines all Cat. 4 LBT parameters
- Buffer status report from UE allows eNB to determine what LBT priority class the UE intends to use for its category 4 LBT
- eNB schedules subframes and gaps according to its determination
- UE determines all category 4 LBT parameters for UL LBT for the allocated UL subframes based on traffic type of the data sent in the allocated subframes and the number of subframes it has been allocated

Don't like this approach: Qualcomm, LG, ZTE, Samsung, ETRI, Sharp

R1-165812 WF on ED threshold Ericsson
- Align the requirement on the energy detection threshold for UL transmission with the corresponding Rel-13 LAA requirements for PDSCH transmission.
  - The maximum transmit power per carrier configured to the UE is used to set the ED threshold

R1-165890 Way Forward on determining UL LBT priority class Mediatek

WF on DL+UL Traffic Multiplexing for eLAA Broadcom, BlackBerry, CableLabs, Orange, Marvell

- *For a ~~DL~~ transmission burst with PDSCH(s) and/or PUSCH(s) scheduled by the eNB for which channel access has been obtained using Channel Access Priority Class P (1…4), E-UTRAN shall ensure the following where ~~a DL~~ transmission burst refers to ~~the continuous~~ DL transmissions from the eNB and all scheduled UL transmissions from the UEs starting after a successful LBT:*
  - *the transmission duration of the ~~DL~~ transmission burst shall not exceed the minimum duration needed to transmit all available buffered traffic corresponding to Channel Access Priority Class(es) ≤ P;*
    NOTE: the buffered traffic includes all ~~the~~ available traffic in DL at the eNB and all traffic available for transmission at all scheduled UEs as per the latest buffer status information from each UE (see [ref 13 in 36.300])
  - *the transmission duration of the ~~DL~~ transmission burst shall not exceed the Maximum Channel Occupancy Time (as defined in Table 15.1.1-1 of [ref 6 in 36.300]) for Channel Access Priority Class P;*
    - *additional traffic corresponding to Channel Access Priority Class(es) > P may only be included in the ~~DL~~ transmission burst once no more ~~data~~ buffered traffic corresponding to Channel Access Priority Class(es) ≤ P is available for transmission and the transmission duration of the transmission burst as defined above has not yet expired. In such cases, E-UTRAN should maximise occupancy of the remaining transmission resources in the ~~DL~~ transmission burst with this additional traffic.*

Note: Additions to the agreements made in Rel 13 LAA are marked in Green while deletions are marked in Red with strikethrough.

R1-165838 LS to RAN1 on RAN2 agreement on eLAA RAN2

R1-165897 WF on the determination of LBT priority class at the UE Nokia, Alcatel-Lucent Shanghai Bell

Agreement:

- When the UE performs Cat. 4 LBT, it uses the priority class signaled by the eNB
  - There is no additional restriction at the UE (other than the multiplexing rules defined in RAN2) on the type of the traffic that can be carried in the scheduled subframes.
  - eNB shall not schedule the UE more subframes than what is needed to transmit all the traffic corresponding to the same LBT priority class or lower (i.e., with a lower number in the LBT priority class table) than the signaled LBT priority class based on the latest BSR and received UL traffic from the UE.
  - The eNB is responsible for making sure that the mapping between QCI and LBT priority class is consistent with section 5.7.1 in TS 36.300.
    - The eNB is expected to take the QCI with the lowest priority in the logical channel group into account when defining the LBT priority class for a logical channel group

R1-165927 WF on UL ED Threshold CableLabs

R1-165121 On priority classes for uplink LBT Mediatek

R1-165948 WF on the CWS adjustment at the UE for Cat-4 LBT Nokia, Alcatel-Lucent Shanghai Bell, Ericsson, Broadcom

R1-165752 WF on CWS adjustment for category 4 UL LBT in eLAA, LG Electronics, Sharp

Possible offline agreement:

- For category 4 LBT for PUSCH transmission on LAA SCell,
  - CWS is managed by eNB and indicated by UL grant.
  - CWS is adjusted per UE based on whether or not reference subframe is successfully decoded.
    - Reference subframe is the starting subframe of the most recent UL transmission burst for which a Cat. 4 LBT was expected to be used, for which DM-RS or SRS transmission from the UE is detected and PUSCH decoding is completed.
  - If at least one of the TBs in the reference subframe is successfully decoded, the CWS is reset for all priority classes; otherwise, it is increased to the next higher value for all priority classes.

Petitioners' Exhibit 1007, p. 1866
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

– The CWS is reset to the minimum value if the maximum CWS is used for K consecutive LBT attempts for transmission only for the priority class for which maximum CWS is used for K consecutive LBT attempts.
  - K is selected by eNB implementation from the set of values from (1, …,8).

Possible offline agreement:

- For category 4 LBT for PUSCH transmission on LAA SCell
  - **The reference scheduled burst** is the most recent set of **contiguous** (i.e. without any gap in between) scheduled UL subframe(s) for the UE that is expected to start after a category 4 LBT and is expected to end at least 4 subframes earlier than the subframe in which the following contention window size adjustment is transmitted
  - **The reference subframe** is the first subframe in the reference scheduled burst where the eNB successfully **decodes** at least one transport block from the UE.
  - The position of the reference subframe within the reference scheduled burst is signaled to the UE in the UL grant in which Cat. 4 LBT is signaled as the LBT type to the UE
    - The eNB can also signal that no reference subframe was detected
  - If the UE first transmitted in the reference scheduled burst earlier than the signaled reference subframe, the CWSs for all the priority classes are increased.
  - If the UE first transmitted in the reference scheduled burst later than the signaled reference subframe, the CWSs for all the priority classes are left unchanged.
  - If the UE first transmitted in the reference scheduled burst in the signaled reference subframe, the CWSs for all the priority classes are reset.
  - The CWS is reset to the minimum value if the maximum CWS is used for K consecutive LBT attempts only for the priority class for which maximum CWS is used for K consecutive LBT attempts.
    - K is selected by eNB and RRC configured to the UE from the set of values from (1, …,8).

Contents incorporated below
Endorsed with following updates

Email approval to RAN2/4 to tell this week agreements and WA until 2nd June – Hanbyul (LGE)

Editors will submit draft CRs (201, 211, 212, 213, 214) until 18th August based on the following list
Rapporteur needs to submit agreement and WA lists until 30th June

R1-165608 Summary of Tuesday offline discussions on V2V LG Electronics

Agreement:

- For PSSCH resource (re)selection when all the PSCCH/PSSCH transmissions have the same priority (FFS whether the initial resource selection needs to be designed differently from the procedure below)
  - Step 1: All the resources are considered available.
  - Step 2: UE excludes resources at least based on SA decoding and additional conditions. Down select one between the following options.
    - Option 2-1: A resource is excluded if it is indicated or reserved by a decoded SA and the received DM RS power in the associated data resource is above a threshold.
    - Option 2-2: A resource is excluded if it is indicated or reserved by a decoded SA and the energy in the associated data resource estimated from the measurement in the SA resource is above a threshold. Additional estimation of energy caused by in-band emission is not precluded.
      - FFS the estimation of the energy in the associated data resource.
      - Measuring energy of SA transmitted from a particular UE may not be accurate enough.
    - The precise definition of "if it is indicated or reserved by a decoded SA" to be discussed later.
    - FFS the details of the thresholds above
  - Step 3: UE selects its transmission resource from the resources not excluded by (Down select one among the following options)
    - Option 3-1:
      - Step 3-1: UE measures and ranks the remaining PSSCH resources based on total received energy and selects a subset
      - Step 3-2: UE compares the energy on the currently selected resource with the energy of the resources the subset. If the energy of the current resource is a threshold above the energy of all the resources in the subset, then UE selects one among the subset of resources.
      - A semi-persistent period before reselection is triggered, UE transmits PSSCH on another resource in the subset identified in step 3-1 and measures the energy of the currently selected resource for step 3-2.
        - Step 3-3: UE randomly selects one resource from the subset
    - Option 3-2:
      - Step 3-1: UE measures and ranks the remaining PSSCH resources based on total received energy and selects a subset
      - Step 3-2: UE randomly selects one resource from the subset
    - Option 3-3:
      - Step 3-1: UE measures and ranks the remaining PSSCH resources based on total received energy and selects a subset
      - Step 3-2: UE selects the resource that minimizes the frequency resource fragmentation from the subset.
    - Option 3-4:
      - Step 3-1: UE measures RX power of PSSCH resource indicated in the decoded SA, sum them as the total RX power

Petitioners' Exhibit 1007, p. 1868
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

of a subframe, and sorts the subframes according to the total RX power.
- Step 3-2: A set of available subframes consists of X subframes with the highest total RX power and Y subframes of the lowest total RX power. UE randomly selects transmission subframe(s) from this set.
- Step 3-3: UE randomly selects frequency from transmission subframe(s).
- FFS how to select resources for a wideband transmission based on the energy/power measurement above.

Agreements:

- Reselection is triggered if any of the following conditions are met
  - A counter meets an expiration condition
    - The counter decrements
    - Working assumption: every TB transmission (can be revisited if a problem is identified with TBs other than every 100 ms)
    - The counter is reset to a value when reselection is triggered for all the semi-persistently selected resources.
      - The value is uniformly randomly selected within a range (which is independent of the TB arrivals) between 5 and 15
  - UE identifies that the TB does not fit within the current resource allocation using the maximum allowed MCS,
  - FFS other triggers that may be defined by RAN2,

R1-165898 Summary of Thursday offline discussions on V2V LG

Agreement:

- For all the PSCCH/PSSCH/SLSS/PSBCH transmissions for V2V in all the resource allocation modes, $N_{TA,SL} = 0$
- FFS in RAN1 on the receiver UE assumption on the reception timing, e.g., whether it can assume that all the transmissions in a single subframe use the same synchronization reference.

R1-165991 Summary of Friday offline discussions on V2V LGE

6.2.2.1 Enhancement to sidelink physical layer structure

R1-165072 Enhancements of sidelink physical layer structure for PC5 V2V communication Intel Corporation

R1-164932 Enhancement to sidelink physical layer structure in supper higfh Doppler case for V2V ITRI
R1-164949 DMRS Enhancements for PSSCH and PSCCH ZTE
R1-165041 Evaluations of DMRS Enhancement for PSCCH and PSSCH Nokia, Alcatel-Lucent Shanghai Bell
R1-165289 link level performance of DM RS for V2V CATR

R1-165658 WF on L1 Format for V2V Communication Intel, ITRI

Agreement:

- Confirm the working assumption that legacy PUSCH RS is used for PSCCH and PSSCH in the four RS symbols.

Agreement:

- Alt 1 + Adapt MCS, the number of RBs, and number of transmission subframes depending on the UE absolute speed and UE synchronization source (e.g. GNSS or eNB)
  - Options for details of PSCCH
    - Working assumption which will be automatically confirmed if no problem is identified during this week
      - DMRS within a TTI for a transmission by a UE are not identical

Petitioners' Exhibit 1007, p. 1869
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- No blind detection of DMRS is introduced
- Details FFS

- Working assumption: 2 consecutive PRB pairs in a subframe are used for each PSCCH if the number of SA bits is less than 64 including CRC. The exact size of SA is FFS including the CRC size and could be larger than 64 bits.
- Options for details of PSSCH
  - Network configuration or preconfiguration can be used to associate the ranges of MCS, RB number for PSSCH, number of retransmission with the condition of the UE absolute speed. Different (pre)configuration and threshold is given for the different type (e.g., eNB, GNSS, UE) of the transmission synchronization reference.
  - RAN1 will study the proper range of these parameters.

R1-165676 WF on PSSCH DMRS and SA ID LG Electronics, ZTE, Qualcomm, Nokia, ASB, Samsung, CATT

R1-165592 WF on Supporting 500kmph for SA Qualcomm, LGE

R1-164755 DMRS design for PSBCH Samsung
R1-164958 DMRS for PSBCH ZTE

R1-165677 WF on PSBCH DMRS LG Electronics, ZTE, Qualcomm, ITL, KRRI

Agreements:

- For PSBCH DM RS symbol location, Option 3 (i.e., symbol #4, #6, #9 for normal CP) is supported.
- Working assumption: PSBCH content size is the same as Rel-12.
- Working assumption: V2V SLSS/PSBCH periodicity is 200 ms.
- If it is agreed that SLSS/PSBCH is used for the purpose of detecting LTE ITS transmissions, this working assumption needs to be revisited.
- Rel-13 D2D synchronization resource configuration principle is reused.

6.2.2.1.3 Others

Including adaptation of MCS, the number of RBs, and number of transmission subframes depending on the UE absolute speed and UE synchronization source (e.g, GNSS or eNB)

R1-164509 Discussion on adaptation of MCS depending on UE speed LG Electronics

R1-165306 Discussion on SA decoding and energy measurement for sensing Sony

R1-165679 WF on sub-channelization LG Electronics, Ericsson, CATT, Intel
Also supported by Lenovo
Proposed agreements:

- Sub-channelization is supported for PSSCH.
  - A sub-channel consists of a group of RBs in a same subframe.
  - The sub-channel size in a resource pool can be configured by eNB or preconfigured.
    - Candidate sub-channel sizes are FFS.
  - Sub-channel size is the same in a resource pool.
  - Different sub-channels have disjoint group of adjacent RBs.
    - FFS whether different formation of sub-channels is needed if multi-cluster transmission is supported.
- Energy sensing granularity of PSSCH is based on the size of sub-channel.
- The UE always (re)selects an integer number of subchannels for transmission.
- The UE always transmits on an integer number of subchannels.

Continue discussion.

R1-165499 Updated WF on sub-channelisation LG

6.2.2.2.2 Details of the transmitter UE behaviour in resource selection/reselection

Including the time duration in which UE performs sensing, the transmission timing of SA and the associated data, and the indication of the intention to reuse the frequency resource for another TB

R1-165698 Way forward on timeline for sensing based UE autonomous resource selection NTT DOCOMO, NEC, Samsung
Also supported by Huawei, HiSilicon, Intel

R1-165740 WF on semi-persistent transmission for mode 2 Ericsson, Qualcomm

Agreement:

- The values of a and b are fixed
  - b > 0
  - Confirm the working assumption "The values a and b are common for V2V UEs"
    - a = 1000 + b
  - All the decoded SA transmissions in TTI [n-a, n-b) are taken into account.
  - A decoded SA which is associated with data transmissions in data resource(s) at any TTI [n-a, n-b) and transmitted earlier than TTI n-a is taken into account.
- FFS: If UE skips sensing on sub-frame m, for e.g.: due to its own transmission in sub-frame m, it excludes resources in subframes at m+100*k in the resource (re)selection (if triggered), until it is able to perform sensing in those sub-frames.
- FFS on the following:
  - c > 0
  - c, d <= 100
  - FFS how to further restrict the selection of c and d, e.g., to fulfill the latency requirement
- FFS on the details of e, e.g., the receiver UE assumption on the transmitter UE behavior in reusing the same resource.

Email approval about above FFSs until 9th June – Hanbyul (LGE)
R1-165909
R1-165904 WF on resource usage indication LG

6.2.2.2.3 Details of triggering resource reselection

R1-165692 WF on UE measurement and reporting Huawei

Agreements:
Send LS to RAN2 to ask them to define the following UE behavior for resource reselection triggering with the following additional agreements:

- eNB implicitly triggers reselection whenever the resource pool configuration is changed
  - Dedicated signalling is used for RRC_Connected UEs and broadcast signalling is used for RRC_Idle UEs
  - FFS whether some information needs to reported from UE to eNB

6.2.2.2.4 Priority handling

R1-164207 Considerations on V2V priority handling CATT
R1-164420 Priority handling for autonomous resource selection Qualcomm Incorporated
R1-164901 Discussion on V2V Priority Handling Beijing Xinwei Telecom Techn.

R1-165561 Way Forward on priority information in SCI Huawei, HiSilicon, Intel, Ericsson, Sharp, LG Electronics, NTT DoCoMo, OPPO , ITRI, Kyocera, Nokia, ASB, Potevio
Also suppoted by Sony, ZTE, III, CATT

Petitioners' Exhibit 1007, p. 1872
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreements:

- Working assumption: PPPP is used to identify which PDCP PDU has which priority level. RAN1 will not use any additional notion of priority.
- Send LS to RAN2 (CC: SA2) to confirm this working assumption. (Shailesh – Qualcomm)

R1-165750 [DRAFT] LS on Priority for V2V Qualcomm
Agreed in R1-165814 with adding SA2 in "CC" and reflecting the changes in the working assumption.

Working assumption:

- SCI explicitly includes priority information.
  - FFS how this priority information is exactly transmitted in SCI.
  - Priority information in a decoded SCI is used in resource (re)selection.
  - Priority information in a decoded SCI is not used as a condition to trigger resource reselection
  - Priority information in a decoded SCI is not used as a condition to drop transmission.
- A measurement metric is specified to reflect the congestion level of a PC5 carrier, e.g., similarly to the channel busy ratio defined in ETSI.
  - This measurement is available to higher layers in the UE.
  - FFS whether the measurement can be reported to eNB.
  - FFS the details of the measurement and the UE behavior, for example:
  - The principle to drop PC5 transmissions as a function of this measurement and priority is supported.
  - The radio adjusts radio parameters (max tx power, nr of retx restriction, MCS range restriction, nr of PRBs restriction) as a function of priority and this measurement.
  - Packets with different priorities are transmitted on the same resource pool
- Revoke the existing working assumption on the resource reselection triggering condition: UE detects resource allocation (including the indication of the intention of reusing the frequency resource as per the existing agreement) of another UE which potentially overlaps with its current resource allocation (including the indication of the intention of reusing the frequency resource as per the existing agreement) and the detected situation meets an FFS condition
  - different conditions for different priorities are not precluded (if any relevant case happens in priority handling from RAN1 point of view).
  - Note that applies to resource reselection triggering only.

R1-165273	Subbands and measurements for sensing for V2V over PC5	Ericsson
R1-165591	WF on Same Subframe SA and Data transmission	Qualcomm, Ericsson, LGE

Agreements:

- Allow resource pool definition where SA and associated Data transmitted on the same subframe are always adjacent in frequency
  - All the PRBs used for the SA and associated data transmissions should be contiguous in frequency.
  - Details FFS

Petitioners' Exhibit 1007, p. 1874
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- For a SA and associated data resource pool it should be (pre)configured whether the SA and associated data transmission by all the UEs using this pool either occur on the same subframe in an adjacent manner, or occur on different subframes, (FFS or occur on the same subframe in a potentially non-adjacent manner).
  - If the FFS part is not supported, this reverts the existing agreement "When SA and the associated data are transmitted in the same TTI, they can be transmitted in non-adjacent RBs."
  - Strive for not increasing the number of SA blind decoding to enable this.

R1-165755 WF on resource pool configuration Huawei, HiSilicon, ZTE, NTT DoCoMo

R1-165745 WF on timing offset between eNB timing and PC5 based V2V Huawei
R1-165744 WF on sync priority for OOC Huawei

Agreements:

- Rel-12 DFN definition is reused.
  - When GNSS is the synchronization reference, DFN is derived from GNSS.
- Details are up to RAN2.
  - For the other cases, DFN is derived according to Rel-12 behavior.

Petitioners' Exhibit 1007, p. 1875
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Working assumption:

Working assumption for the V2V PC5 SLSS:

- At least one value is reserved for SLSS ID used for SLSS transmissions from UEs having GNSS as the synchronization reference.
- FFS whether multiple values need to be reserved.
- The reserved value(s) of the SLSS IDs is(are) pre-defined.
- If it is agreed that SLSS/PSBCH is used for the purpose of detecting LTE ITS transmissions, this working assumption needs to be revisited.

Conclusion:

- Companies are encouraged to consider whether having GNSS as the highest sync priority for OOC UEs have significant impact on in-coverage UE operations.

Working assumption:

- SSSS for V2V uses sequences of subframe-5 SSS
  - If it is agreed that SLSS/PSBCH is used for the purpose of detecting LTE ITS transmissions, this working assumption may need to be revisited.

6.2.3 Enhancements on Full-Dimension (FD) MIMO for LTE

WID in RP-160623

R1-165936 Chairman's Notes of Agenda Item 6.2.3 on FDMIMO Session Chairman (Qualcomm Inc., Nokia, Samsung)
Contents incorporated below
Endorsed with following updates

R1-165447 Proposed work plan for RAN1#85 Samsung, Nokia, CATT

Conclusion:
- RAN1 to aim to conclude on the three "*evaluate and, if needed, specify*" items
- Decide for each of the three items:
  - whether to specify or not to specify
  - if RAN1 decides to specify, decide the scope of specification work
- Based on the decisions, recommend to refine scoping of the WI to RAN plenary

6.2.3.1 Reference Signals

6.2.3.1.1 Non-precoded CSI-RS

For {20, 24, 28, 32} ports with mechanism for overhead reduction

R1-164142 Discussion on CSI-RS for Class A FD-MIMO with overhead reduction Intel Corporation
R1-164214 CSI-RS enhancement for {20,24,28,32} ports CATT
R1-164771 Discussions on CSI-RS enhancements for Class A CSI reporting Samsung
R1-165047 On non-precoded CSI-RS overhead reduction InterDigital

R1-165593 WF on enhancements for non-precoded CSI-RS LG Electronics, Samsung, NEC
R1-165589 WF on NP CSI-RS Aggregation ZTE, Qualcomm, Beijing Xinwei Tech.

Agreement:
- For {20, 24, 28, 32} ports, a CSI-RS resource for class A CSI reporting is aggregated as follows (where M_k is the # of CSI-RS ports in a CSI-RS configuration)
  - For {24, 32} ports, $\sum_k M_k \in \{24, 32\}$, M_k is either 4 or 8, where the same $M_k = M$ used for all k
    - Possible down-selection till RAN1#86 regarding M_k=4 vs. 8
  - For {20, 28} ports, FFS till RAN1#86 (including possible down-selection)
    - Alt 1: $\sum_k M_k \in \{20, 28\}$, M_k is either 4 or 8, where the same $M_k = M$ used for all k
      - Possible down-selection till RAN1#86 regarding M_k=4 vs. 8.
      - If M_k=8 is supported, FFS the details
    - Alt 2: $\sum_k M_k \in \{20, 28\}$, $M_k \in \{4, 8\}$, where M_k may be different for different k
  - FFS port numbering
  - FFS N vs. M

R1-165613 WF on non-precoded CSI-RS Samsung, LGE, NEC
Proposal:
- For {20, 24, 28, 32} ports, CSI-RS RE density can be lower than 1RE/RB/port
  - The chosen scheme(s) will be down-selected/merged among following alternatives
    - FDM
    - Partial port

Continue discussion offline till RAN1#86

R1-165616 Way-forward on CDM-8 for Non-Precoded CSI-RS CATT, Intel, NEC
Proposal:
- At least OCC- 8 is supported for more than 16 ports non-precoded CSI-RS
  - other OCC value not precluded

Conclusion:

Petitioners' Exhibit 1007, p. 1877
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Further discussion till RAN1#86, especially regarding evaluating different alternatives, e.g., using OCC 2/4/8, high reuse of CSI-RS, etc.

6.2.3.1.2 Beamformed CSI-RS

More efficient resource utilization for UE-specific BF CSI-RS, including aperiodic CSI-RS

R1-164428	Enhancements on Beamformed CSI-RS for eFD-MIMO	Qualcomm Incorporated
R1-164523	Beamformed CSI-RS enhancements including aperiodic CSI-RS	LG Electronics
R1-164773	On aperiodic CSI-RS design	Samsung
R1-164845	PDSCH rate matching enhancement for aperiodic NZP and ZP CSI-RS	Huawei, HiSilicon
R1-165406	Dynamic CSI-RS Design and Overhead Reduction	Ericsson

Revision of R1-165095

R1-165585	WF on beamformed CSI-RS enhancements	LG Electronics, Samsung, Qualcomm

Agreement:

- Scheme 1: Aperiodic NZP CSI-RS resource is supported in Rel-14 for Class B eMIMO-Type, where
  - Only PUSCH based A-CSI reporting is supported.
  - A new aperiodic CSI-RS resource allocation/configuration is defined
    - Without *Subframe_config*
  - Aperiodic CSI-RS transmission instance is indicated by UL-related DCI transmitted on a control channel with a CSI request field:
    - Aperiodic CSI-RS transmission is in the same DL subframe as the associated UL-related DCI
    - FFS whether or not the UE may not assume more than one aperiodic NZP CSI-RS resource. If more than one resource is allowed, FFS the signaling details
    - FFS the number of bits for the CSI request field
    - The control channel can be PDCCH or EPDCCH. FFS whether or not the case of EPDCCH can be precluded or with some restrictions/relaxations
  - FFS whether or not periodic CSI-RS can be additionally configured
- Scheme 2: For Class B eMIMO-Type, the following CSI-RS resource configuration mechanism is supported
  - A UE receives an activation/release trigger containing a choice from multiple higher-layer-configured NZP CSI-RS resources for a given CSI process
    - Each NZP CSI-RS resource can be either periodic or, aperiodic CSI-RS resource (if scheme 1 is supported)
    - Details of the activation/release trigger (including the set of NZP CSI-RS resource configuration parameters) are FFS
  - For an activation trigger received in subframe n, the transmission of the associated NZP CSI-RS resource will start no earlier than subframe n+X where X>0
  - For a release trigger received in subframe n, the transmission of the associated NZP CSI-RS resource will stop after subframe n+Y where Y>0
    - FFS the impact of multi-shot configuration, if supported
  - FFS whether or not there are any significant issues regarding the potential misalignment about activation and/or release between eNB and UE, and if so, how to address them

Petitioners' Exhibit 1007, p. 1878
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- FFS whether or not to further enhance rate matching for PDSCH, particularly whether or not aperiodic NZP CSI-RS will not have impact on PDSCH RE mapping
- FFS the QCL details
- Down-selection between scheme 1 and scheme 2 (if any) to be discussed in RAN1#86

R1-165642 WF on Beamformed CSI-RS Huawei, HiSilicon, CATT

R1-164336 CSI-RS Overhead Reduction for Beamformed CSI-RS Transmission Schemes Nokia, Alcatel-Lucent Shanghai Bell
R1-164143 Discussion on CSI-RS overhead reduction schemes for Class B FD-MIMO Intel Corporation

Conclusion:
- Candidate schemes for CSI-RS overhead reduction for Class B eMIMO-Type (2, 4, and 8 ports):
  - Scheme 1: Configurable CSI-RS frequency-domain density
  - Scheme 2: Localized CSI-RS in frequency domain
  - Scheme 3: Configurable RPF pattern
  - Scheme 4: Frequency domain MR
- Companies are encouraged to study the following issues in the next meeting:
  - Backward compatibility
  - UE implementation restriction (for, e.g. channel estimation)
  - Impact on eNB scheduling
  - Impact on CSI reporting
  - PDSCH rate matching

R1-165097 Class A Codebook Design for up to 32 Ports in Rel-14 Ericsson

R1-165594 WF on enhancements on codebook for Rel-14 LG Electronics, ZTE, Qualcomm

Conclusion:
- Class A codebook enhancement:
  - Starting from Rel-13 Class A codebook design structure by enabling different N1 and N2 combinations
- Reduce the number of combinations of codebook parameters (N1, N2, O1, and/or O2)
  - To be concluded in RAN1#86
  - Examples:
    - Down select from 19 (N1,N2) combinations; and/or
    - Reduce the number of (O1,O2) combinations
    - Other possibilities are not excluded

R1-165048 On Hybrid CSI-RS reporting scheme InterDigital

R1-165606 WF on Hybrid CSI Samsung, CATT, Interdigital, LG Electronics, Nokia, ALU Shanghai Bell, Qualcomm, Huawei, HiSilicon
R1-165617 Way Forward on Hybrid CSI Reporting ZTE, NTT DOCOMO, Beijing Xinwei Tech., NEC

Working assumption:
- Mechanism 1: Hybrid CSI is realized by with one CSI process, support at least CLASS A for the 1st eMIMO-Type and CLASS B with K=1 CSI-RS resource for the 2nd eMIMO-Type
  - i_1 is reported while CQI and i_2 are not reported for the 1st eMIMO-Type (CLASS A)
    - FFS: whether RI is reported for CLASS A
  - CQI/PMI/RI are reported for the 2nd eMIMO-Type (CLASS B K=1)
- At least one more mechanism is supported, to be discussed in RAN1#86

R1-164860 Discussion on Joint utilization of different types of CSI-RS Huawei, HiSilicon
R1-164770 Port-based CSI-RS overhead reduction Samsung
R1-164777 Hybrid PMI codebook based CSI reporting and simulation results Samsung
R1-165202 CSI Reporting for Hybrid CSI-RS NTT DOCOMO, INC.

R1-165920 WF on additional hybrid CSI mechanism NTT DOCOMO, LG Electronics, NEC, Qualcomm, Samsung

Conclusion:
- Candidate mechanisms to consider in RAN1#86
  - Mechanism 2A: for hybrid CSI with one CSI process, support CLASS B with K≥1 CSI-RS resources for the 1st eMIMO-Type and CLASS B with K=1 CSI-RS resources for the 2nd eMIMO-Type
    - For the 1st eMIMO-Type, depending on the value of K
      - K=1: CQI/RI are reported. In addition, i_1 is reported for Rel.12 dual-stage codebooks
      - K>1: two options
        - Option 1: CRI is reported

        - Option 2: PMI/RI for each CSI-RS resource are reported
    - For the 2nd eMIMO-Type
        - CQI/PMI/RI are reported
- Mechanism 2B: for hybrid CSI with one CSI process, support CLASS B with K≥1 CSI-RS resources for the 1st eMIMO-Type and CLASS B with K=1 CSI-RS resources for the 2nd eMIMO-Type
    - For the 1st eMIMO-Type, depending on the value of K
        - K=1:
            - Option 1: i_1 is reported for Rel.12 codebooks (when applicable) or i_2 for Rel.13 CLASS B codebooks
            - Option 2: CQI/RI are reported. In addition, PMI is reported for Rel.13 CLASS B codebooks
        - K>1: two options
            - Option 1: CRI is reported
            - Option 2: PMI/RI for each CSI-RS resource are reported
    - For the 2nd eMIMO-Type
        - CQI/PMI/RI are reported
- Mechanism 3: for hybrid CSI with one CSI process, CLASS A or CLASS B K=1 for the 1st eMIMO-Type and CLASS B K>1 for the 2nd eMIMO-Type
    - For the 1st eMIMO-Type: i_1 is reported
    - For the 2nd eMIMO-Type: two options
        - Option 1: CRI and CQI/PMI/RI for the recommended CSI-RS resource are reported
        - Option 2: CQI/PMI/RI for a CSI-RS resource
- Mechanism 4: Hybrid CSI reporting with CSI process pair
    - UE calculates CSI for only one CSI process at a time
- Mechanism 5: the proposal in R1-165617
- Other mechanisms are not precluded

- Down select from the above mechanisms and/or options in RAN1#86
- Each proposal should include clear description on use case(s) and specification impact
    - For CLASS B K=1, proponent needs to clarify whether both codebook options are applicable for not.

6.2.3.3 DMRS-based Open-Loop and Semi-Open-LoopTransmission

Evaluate and, if needed, specify necessary CSI reporting scheme and open-loop (without PMI feedback) as well as semi-open-loop (with reduced PMI feedback) transmission scheme

R1-165102 Email Summary: Use of 3D RMa Channel Model in Semi-Open Loop Evaluations Ericsson

Conclusion:

- No consensus to change RMa channel model assumptions for (semi-)open loop evaluations at present. Implications:
  - 2D RMa currently supported in evaluations is suitable for 1D horizontal arrays.
  - Companies bringing in preliminary results for FD-MIMO (2D) arrays will need to explain how they approximated a 3D model from the 2D ITU model
- Use of 3D RMa may be further discussed in evaluations during specification phase.
- Clarify that 2D RMa can be simulated with 30, 60, 120 kmph, as shown below.
- Amend slide 3 of R1-163832 as follows, leaving the 'UE Speed' row unchanged.

Parameters	Value
Scenarios	3D-UMa ISD 500m ~~(at 30km/h, 60kmph, and/or 120km/h)~~ RMa ISD 1732m~~(120km/h)~~ in ITU-R model [note: this is a 2D model]

R1-164898 Discussion on Semi-Open-loop Transmission Beijing Xinwei Telecom Techn.
R1-165341 Discussions on DMRS based Open/Semi-open loop MIMO schemes CEWiT

R1-165790 WF on the three "evaluate and, if needed, specify" Items Nokia, Alcatel-Lucent Shanghai Bell, Samsung, CATT

Agreements:

- UL DMRS Enhancement
  - Specify enhancement on uplink DMRS to support (more than 2) orthogonal DMRS for MU-MIMO with partially overlapping BWs allocation, i.e. one of IFDMA with OCC2 or new DMRS sequence design
- Advanced CSI

Petitioners' Exhibit 1007, p. 1882
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Specify enhancement on CSI reporting to improve eNB precoding. The specified enhancement is to be selected from the following categories:
  - Enhancements to Rel-13 feedback codebooks (FFS which numbers of antenna ports from the set {8, 12, 16, 20, 24, 28, 32}) that increase CSI resolution through improved beam selection / construction in W1 and/or improved beam/port selection / combining / weighting mechanisms in W2
  - Parameters representing channel coefficients, or some reduced space representation thereof including beam combining / weighting with coefficient quantisation or channel quantisation or channel covariance matrix quantisation
    - Uplink physical channel enhancements to carry the representation of channel coefficients can be included if selected
- Also, interference measurement enhancement can be considered

- DMRS-based semi-open-loop
  - Specify enhancement to support DMRS-based semi-open-loop transmission with the existing numbers of CSI-RS ports as well as the newly supported number of CSI-RS ports, in the following areas
    - CSI reporting scheme with partial PMI feedback, and/or
    - Transmission method with transmit diversity and/or precoder cycling, with possible enhancements to precoder bundling
    - Associated enhancements to DMRS if required
  - Further system level simulations (e.g. considering wideband scheduling and BLER targets at high speed) will be conducted in order to identify the exact scheme to be specified.

Send LS to RAN plenary reflecting the above, with update to WID - R1-165493.

R1-165493 LS on Rel.14 eFD-MIMO WID update Nokia
Agreed in R1-166029

R1-165860 Draft LS on Rel.14 eFD-MIMO WID update Samsung

Agreement:
Change "RAN1 has agreed to request RAN to amend the WID as follows" to "RAN1 has agreed on the following"
The agreed LS is to be prepared in R1-165493 (Min)

6.2.4 Downlink Multiuser Superposition Transmission for LTE

WID in RP-160680
R1-165937 Chairman's Notes of Agenda Item 6.2.4 on MUST Session Chairman (Qualcomm Inc.)
Contents incorporated below
Endorsed

R1-165888 Draft LS on RAN1 Agreements in MUST MediaTek
The draft LS is approved in R1-165984, with the following updates:
- Remove the yellow parts
- Last paragraph is updated to:
  - For exact values of power ratios, although RAN1 concludes that R1-165763 and R1-165797 can be used as examples for further evaluation, RAN1 has not achieved consensus yet and further evaluations are to be performed in RAN1.

6.2.4.1 Superposition transmissions

Down select between single and multiple power ratios, potential power ratios, modulation, etc.
R1-164079 Discussion on power ratios for MUST Huawei, HiSilicon
R1-164282 Performance evaluation of MUST for selection of potential power ratios ZTE
R1-164435 Power ratio set considerations for MUST Qualcomm Incorporated
R1-164529 Discussion on power ratio and modulation order LG Electronics
R1-164977 Selection of Power Ratios and Modulation for MUST PDSCH MediaTek Inc.
R1-164997 On transmission power ratios for MUST Sharp
R1-165831 Discussion on power ratios optimization for MUST scheme NTT DOCOMO, INC.
Revision of R1-165204

R1-165764 WF on modulation order LG Electronics, Intel, MediaTek, NTT DOCOMO, ZTE, Nokia
Agreement:
- For Case 1 and 2 described in MUST WID, Far UE's modulation order is limited to QPSK when it is co-scheduled with near UE in a given subframe.

Petitioners' Exhibit 1007, p. 1883
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165796 Way Forward on MUST Power Ratio MediaTek, China Unicom, CHTTL, Huawei, HiSilicon, HTC, III, Intel, ITRI, LG, NTU, Sharp, Sony, ZTE
Also supported by CMCC
Agreement:

- For MUST Case 1 and Case 2, multiple power ratios are supported at least for some combinations of MUST-near UE and MUST-far UE modulation orders
  - For case 3, FFS

R1-165763 Way Forward on MUST Power Ratio Set Qualcomm
R1-565765 WF on power ratios LG Electronics, ZTE, Nokia
Agreement:

- For Case 1 and 2, and for each combination of modulation order,
  - The number of power ratios generating non-uniform composite constellation should be chosen from 0 (for some combinations, if any), 1, 2 or 3.
    - The details are FFS.
  - Power ratios generating non-uniform composite constellation should be selected from the range [0.7, 0.95].
    - The values of power ratio is FFS.
    - 0.7 should be excluded in case of 64QAM (for near UE) + QPSK (for far UE).

R1-165797 Way Forward on MUST Transmission MediaTek, ASUSTEK COMPUTER (SHANGHAI), CHTTL, Huawei, HiSilicon, HTC, III, ITRI, NTT DOCOMO INC., NTU, Sharp, ZTE
R1-165798 Way Forward on MUST Transmission when MUST-Far UE Has 16QAM MediaTek, CHTTL, Huawei, HiSilicon, HTC, III, ITRI, NTU, Sharp

Conclusion:

- Companies are encouraged to perform more evaluations especially regarding the detailed set of power ratio(s) for each combination (**e.g.**, refer to the WFs in R1-165763, R1-165797 as an example)

R1-164152 Discussion on superposition transmission Intel Corporation

R1-165369 Power ratio and modulation order for MUST with HARQ National Taiwan University

6.2.4.2 Mechanisms for efficient operation

Related to RRC signaling, DCI, UE blind detection, etc.

R1-164153 On downlink control signalling for MUST Intel Corporation
R1-164227 Support of downlink superposition transmission CATT
R1-164345 Discussion on control signalling of MUST Fiberhome Technologies Group
R1-165135 On network assistance and operation of MUST Nokia, Alcatel-Lucent Shanghai Bell
R1-164979 Blind detection evaluation on interference existence for Case 1MediaTek Inc.

R1-165799 Way Forward on Mechanism for MUST operation MediaTek, China Telecom, CHTTL, CMCC, Huawei, HiSilicon, HTC, III, ITRI, NTT DOCOMO INC., NTU, Sharp, Sony, ZTE
Agreement:

- No new TM for MUST
- MUST Case 1 and Case 2 using up to 2Tx is supported in the following TMs
  - TM 2/3/4
  - FFS TM 8/9/10
- A UE is signalled by RRC if it is to be configured for potential MUST operation
- FFS MUST Case 3 using up to 8Tx is supported in the following TMs
  - TM 4/8/9/10
  - Companies are encouraged to perform more evaluations especially using the agreed FTP model
- At least one new DCI is to be monitored by a UE once configured into MUST operation
  - FFS on details

Petitioners' Exhibit 1007, p. 1884
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- FFS MUST-near UE may assume MUST interference presence/absence is consistent among all of its scheduled PRBs for CRS-based TM and DMRS-based TM

R1-165793 Way forward on transmission mode for MUST ZTE, NEC, MediaTek, Sequans
Also supported by Sharp
Agreement:
- For MUST case 1/case 2/case 3, dynamic switching between MUST and non-MUST operation is supported
- Maximum number of spatial layers for MUST
  - For MUST case 1 and case 2, up to 2 spatial layers for each UE are used.
  - For MUST case 3, the maximum number of spatial layers for a UE should be limited, with details FFS.

R1-165615 WF on system information and idle mode reception for eMBMS enhancements Qualcomm, EBU, BBC, Ericsson

R1-165610 Way Forward on longer CP for MBSFN Ericsson, Qualcomm, BBC, EBU
R1-165614 **WF** on numerology supported in MBSFN subframes Huawei, HiSilicon, Orange, Intel, ZTE

R1-165846 eMBMS WF after offline Ericsson, Qualcomm, BBC, EBU, Nokia, ASB, Dish, AT&T, Telstra, Fraunhofer IIS

Proposed agreement

- If a carrier is operated with 100% MBSFN subframe allocation, a single CP longer than or equal to X is supported
  - It is understood 100% MBSFN subframe allocation allows for non-MBSFN subframes set aside for e.g. cell search, SI
  - 100% MBSFN subframe allocation applies to objective b), and objective d) if specified
  - This carrier does not have unicast control in the MBSFN subframes
    - FFS: Where to indicate MCCH change notifaction
- For a carrier that is operated with 100% MBSFN subframe allocation, legacy CPs are supported
  - FFS whether it is needed to have unicast control on this carrier
- FFS whether the longer CP numerology can be supported in carriers with less than 100% MBSFN subframe allocation
- If a carrier supports mixed unicast and MBMS, at least 2 subframes separated by 5ms are non-MBSFN subframes
- eMBMS enhancements do not require changes to any channels and signals needed for MBMS operation except PMCH and MBSFN-RS
  - FFS whether use of more REs, TTI extension and/or change in payload are needed for PBCH coverage enhancements.

Petitioners' Exhibit 1007, p. 1886
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Proposed working assumption: x=100us, need for more evaluation
Email approval about above proposed agreements and proposed working assumptions until 30th June – Alberto (Qualcomm)

Huawei: is first proposal for standalone only? If so it is for study only.
Qualcomm: also applies to objective b), not only for standalone
ZTE, Huawei believe should be only for standalone operation
Telstra emphasizes need for support of large ISD not only for standalone but in existing spectrum
Huawei: What is standalone?
Ericsson: a carrier operating on its own. Currently MBMS on SCell does not work for Telstra because their ISDs are too large.
Huawei: So this is for mixed ISD? Has not been evaluated.
Telstra: Has taken it as given that CP for 15km will be specified, reading from WI
Ericsson: Mixed unicast/MBMS does not have to be evaluated separately. Addressing real operator problem.
Huawei: Can 15km ISD really provide contiguous PCell coverage.
Huawei: Proposes to have more time to evaluate longer CP scenario

Pro: Nokia, ASB, Qualcomm, Ericsson, BBC, EBU, Dish, Fraunhofer, KT, Telstra
Con: Huawei, HiSilicon, ZTE, Orange

6.2.6 SRS Carrier Based Switching for LTE

WID in RP-160676

R1-165939 Chairman's Notes of Agenda Item 6.2.6 on SRS Session Chairman (Qualcomm Inc.)
Contents incorporated below
Endorsed

R1-165054 An additional requirement on SRS switchingSoftBank Corp.
Conclusion:

- Companies are encouraged to check R1-165054, especially considering input from RAN4
- Revisit in RAN1#86

6.2.6.1 SRS Transmission on TDD CCs without PUSCH

Including power control, timing advance, and possible new symbol positions

R1-164107 SRS subframe design for SRS carrier based switchingHuawei, HiSilicon
R1-164228 Considerations on SRS carrier based switching CATT
R1-164444 SRS Transmission on TDD CCs without PUSCH Qualcomm Incorporated
R1-164786 SRS Transmission without PUSCH Samsung
R1-164936 On SRS transmission on TDD CCs without PUSCH Ericsson

R1-165760 Way Forward on SRS Transmission on TDD CCs without PUSCH Huawei, HiSilicon
Agreement:

- Support non-contention based PRACH transmission over SRS Scell without PUSCH
  - Re-using existing procedure
- Timing advance commands are supported for SRS Scell without PUSCH
  - Re-using existing procedure
- Support power control mechanism for SRS transmission in cells without configured PUSCH transmission
  - Specify power control parameters for SRS transmission without PUSCH.
    - Aim for re-using existing parameters. Details FFS
  - Specify closed-loop power control signaling. Details FFS
  - Specify power headroom reports. Details FFS
  - FFS specify dropping/power scaling rules. Details FFS

Agreement:

- As defined in Rel-13, for SRS carrier based switching, the SRS transmission opportunities include:
  - In at least one symbol out of up to 6 symbols in a special subframe
  - In the last symbol of a UL subframe
  - Note: from UE perspective, there may be impact on SRS transmission opportunities due to switching time depending on RAN4 input
- FFS whether or not to further allow more symbol positions for SRS transmissions on a switching-to carrier in special subframes, UL subframes and/or after the control region in MBSFN subframes

Petitioners' Exhibit 1007, p. 1887
AT&T et al v. Asustek Technology & Celerity

R1-164157 Consideration on Support SRS Carrier based Switching Intel Corporation
R1-165281 UL transmission on DL-only carrier for SRS carrier based switching Nokia, Alcatel-Lucent Shanghai Bell

6.2.6.2 Support of Periodic and/or aperiodic SRS

R1-164110 Support of periodic and/or aperiodic SRS Huawei, HiSilicon
R1-164937 On Periodic and aperiodic SRS switching Ericsson
R1-165075 Support of SRS transmission switching Intel Corporation
R1-165282 Discussion on SRS transmission triggering Nokia, Alcatel-Lucent Shanghai Bell

R1-165761 Way Forward on Support of Periodic and/or Aperiodic SRS Huawei, HiSilicon, Softbank
Agreement:

- Aperiodic SRS on a CC without PUSCH is supported for SRS carrier-based switching
  - Details FFS
- Periodic SRS on a CC without PUSCH is supported for SRS carrier-based switching
  - Details FFS
  - Strive for minimizing additional complexity (w.r.t. A-SRS), if any, and additional specification impact for supporting P-SRS

R1-164445 Support of Periodic and/or aperiodic SRS Qualcomm Incorporated
R1-164787 P-SRS and A-SRS Transmission with Carrier Switching Samsung

6.2.6.3 Collision Handling

R1-164446 Collision Handling Qualcomm Incorporated
R1-164788 SRS Collisions due to Carrier Switching Samsung
R1-165283 Collision handling for SRS carrier based switching Nokia, Alcatel-Lucent Shanghai Bell

R1-165762 Way Forward on Collision Handling Huawei, HiSilicon, Qualcomm
Agreement:

- To handle collision due to SRS carrier-based switching
  - Define priority/dropping rules by taking into account the factors including periodic/aperiodic SRS type, channel/UCI type, and PCell/SCell type
    - Rel-13 collision handling rules between SRS and other UL transmissions as baseline, taking into account switching time based on input from RAN4
    - Details FFS
  - FFS shortened PUSCH format and possible mechanisms to mitigate the effect of puncturing (e.g. power control, different beta value for UCI).
  - FFS approaches to help avoid collision, e.g.,
    - Introduction of different HARQ timing (e.g. by introduction of HARQ reference subframes)
    - Introduction of flexible A-SRS transmission timing
    - Group DCI for A-SRS triggering

R1-164111 Collision handling for SRS carrier based switching Huawei, HiSilicon
R1-164938 On collision handling of SRS and channels on other carriers Ericsson

6.2.6.4 Others

R1-164081 SRS carrier based switching for UEs with multiple antennas Huawei, HiSilicon
Conclusion:

- Discuss further for the case when UEs have more than one receiving antenna but only one transmitting antenna at one time, how to handle the transmit antenna for SRS
  - Note: this may be related to UE capability

6.2.7 Further Indoor Positioning enhancements for UTRA and LTE

WID in RP-160538
R1-165940 Chairman's Notes of Agenda Item 6.2.7 on enh_Ind_Pos Session Chairman (Qualcomm Inc.)
Contents incorporated below

Petitioners' Exhibit 1007, p. 1888
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Endorsed

6.2.7.1 OTDOA Enhancements

R1-163976 TP-specific PRS sequence generation for indoor positioning Ericsson
R1-163977 PRS pattern enhancements for indoor positioning Ericsson
R1-163978 Richer RSTD reporting for indoor positioning Ericsson
R1-164350 Draft LS on OTDOA enhancements for indoor positioning Ericsson
R1-164447 Introduction of OTDOA enhancements for the shared Cell-ID scenario Qualcomm Incorporated
R1-164448 Draft CR Introduction of OTDOA enhancements for the shared Cell-ID scenario Qualcomm Incorporated
R1-164449 Introduction of UE inter-frequency RSTD calibration accuracy reporting Qualcomm Incorporated
R1-164661 Adaptive RSTD reporting for indoor positioning Ericsson
R1-164668 OTDOA Enhancement for Same PCI Issue Nokia, Alcatel-Lucent Shanghai Bell
R1-164852 VCID PRS sequence generation Huawei, HiSilicon
R1-165232 OTDOA enhancement Intel Corporation

R1-165553 WF on OTDOA for the same PCI Huawei, HiSilicon, Intel, ZTE
Agreement:

- For OTDOA same PCI, RAN1 decides to:
  - Define $N_{\mathrm{ID}}^{\mathrm{PRS}}$ for PRS sequence/vshift generation per TP
    - With $N_{\mathrm{ID}}^{\mathrm{PRS}}$ values ranging FFS
- Send LS to RAN2 and RAN3 for signaling design (including agreements from last meeting) – Xue Jiantao (HW)
  - Draft LS is in **R1-165835**, approved in R1-165853 with the following update:
    - CC RAN4

6.2.7.2 PRS-based Beacons

R1-163979 On PRS-based beacons for indoor positioning Ericsson
R1-164450 Introduction of PRS based Terrestrial Beacon Systems Qualcomm Incorporated
R1-164451 Way Forward on PRS-based Beacons Qualcomm Incorporated
R1-165825 Way Forward on PRS-based Beacons Qualcomm Incorporated
Agreement:

- For PRS-based TBS, as a starting point for Rel-14 WI, RAN1 decides to prioritize the following:
  - Support PRS-based TBS where the TPs transmit positioning reference signals with the same general design as defined for eNBs in Rel-14.
  - The PRS for the TBS TPs can be configured in up to all 10 subframes within a radio frame.
  - The PRS for the TBS TPs can be configured in up to all radio frames of a DL carrier.

6.2.7.3 E-CID Enhancements

R1-163980 E-CID enhancements for indoor positioning Ericsson
R1-164853 Discussion on the same PCI case for E-CID enhancements Huawei, HiSilicon
R1-164854 Discussion on the UE Rx-Tx measurement over multiple serving cells Huawei, HiSilicon
R1-165552 WF on E-CID for the same PCI Huawei, HiSilicon
R1-165834 WF on E-CID for the same PCI Huawei, HiSilicon
Proposal:

- RAN1 decides to prioritize the following for the same PCI E-CID enhancement
  - Support CSI-RSRP reporting to E-SMLC
    - Note: this is only supported when the UE is configured with CSI-RS based DRS
    - Detailed reporting is up to RAN2/RAN3
  - Send LS to RAN2 and RAN3 for signaling design - Xue Jiantao (HW)
- Note: Other E-CID enhancements are not precluded

R1-165322 New TBS Designs Supporting UL 256QAM Ericsson

R1-165880 WF on UL 256QAM TBS table Huawei, HiSilicon, CMCC, CATR, China Unicom, China Telecom, ZTE, Deutsche Telekom, Sprint, AT&T

Agreements:
- Introduce at least a new TBS index for 256QAM supporting a code rate of around 948/1024
- Principles for design of new TBS entries:
  - Reuse Rel-8-12 design principles, including:
    - Use of same code block sizes for a given entry
    - Max TBS given by 100PRB size
    - Aligned with QPP principle
  - The following MCS/TBS entries are removed:

MCS	MO	TBS
1	2	1
3	2	3
5	2	5
7	2	7
9	2	9
11	4	10
16	4	15
21	6	19
28	6	26

- Introduce 6 MCS values for 256QAM:
  - TBS indices 30, 31, 32, 32A (new), 33, 34 (new)

MCS	Modulation Order	TBS
23	8	30

R1-165815 WF on DL broadcast enhancement for V2X LG Electronics, Deutsche Telekom, III, ITL, KRRI, KT Corporation, LG Uplus, Samsung, SK Telecom, Xinwei
Proposal:

- A set of enhancements concluded as beneficial in RAN1#84bis can be implemented by supporting the following feature:
  - V2X messages are broadcast ~~via TM-10-DM-RS-based PDSCH scheduled by (E)PDCCH~~, e.g. by:~~:~~
    - ~~The current SC-PTM is extended to support TM-10 for broadcast from a single eNB.~~
  - A CP length shorter than extended CP ~~PMCH~~ in the current MBSFN architecture ~~is replaced by this PDSCH~~ for broadcast from multiple eNBs.
  - Issues to be considered to support this include
    - DCI format/content and the search space
    - Quasi-colocation, rate matching, RS sequence generation
    - OL precoding and CSI feedback

R1-164326 Multicast/Broadcast enhancements for V2X Fujitsu

CoMP and MIMO enhancement
R1-164536 Further details on enhancements for multi-cell multicast/broadcast LG Electronics
R1-164791 MIMO support for V2X multicasting Samsung

UE feedback
R1-164057 Uu DL enhancements for V2X Huawei, HiSilicon
R1-164537 Discussion on UE feedback for DL multicast/broadcast LG Electronics

R1-165729 WF on HARQ Feedback LG Electronics, Huawei, ITRI
Conclusion to be captured in the technical part of the TR:

- In the event that HARQ feedback for DL multicast/broadcast transmissions were to be introduced, at least in a single cell, two options are identified for HARQ feedback resource allocation:
  - UE-common resource: Multiple UEs receiving the same DL multicast/broadcast transmission transmit HARQ feedback on the same resource.
  - UE-specific resource: Different UEs receiving the same DL multicast/broadcast transmission transmit HARQ feedback on different resources.

6.2.9.2.2 Enhancements to unicast

Including UL enhancement (e.g., SPS enhancement, SR enhancement)
R1-164538 Discussion on UL SPS for V2X LG Electronics
R1-164580 Discussion on SR Enhancements for V2X Spreadtrum Communications
R1-164971 Uu transport enhance for V2X ZTE
R1-165274 UL SPS and reporting to eNB for V2X Ericsson

6.2.9.2.3 Enhancements to sidelink

Including details of resource selection in pedestrian UEs

Whether to support P UE transmit only
R1-164819 Power consumption analysis of PC5 V2P Huawei, HiSilicon
R1-165275 Discussion on P2x-x2P Ericsson

Observation: the motivation to support random resource selection/partial sensing is at least for power saving purpose.
Note: RAN1 has not evaluated potential cost reduction.

R1-165826 Way Forward on DSRC co-existence Samsung, ZTE, LG Electronics, Sony
R1-165830 WF on DSRC/LTE-based ITS Coexistence Ericsson, Huawei, HiSilicon

R1-165844 WF on DL broadcast enhancement for V2X Huawei, HiSilicon, Ericsson

Agreements:

- RAN1 believes that other radio access technologies and LTE-based ITS transmissions on sidelink can co-exist; some standardization and/or regulatory actions need to be taken in other bodies in order to enable this.
- The possible solutions identified by RAN1 for high level coexistence approaches (long-term basis) between PC5 transport for V2V services and DSRC/IEEE 802.11p services in the same channel are as follows:
  - Geo-location and database.
  - Time sharing between systems based on GNSS timing; this would require some modifications to DSRC.
  - Sensing-based vacate/switching approaches with or without transmission of a predetermined signal(s) (e.g. LTE-ITS preamble, SLSS)
    - Sensing with a predetermined signal(s) would require some modifications to DSRC.
  - RAN1 has not conducted any system-level evaluations for these solutions, although some link-level results have been provided for some solutions.
- RAN1 respectfully asks RAN to provide RAN1 findings to other relevant bodies.

LS containing the above to be sent to RAN plenary – Stefano (Ericsson) - R1-165494 - revisit on Friday.
R1-165494 [DRAFT] LS on high level coexistence approaches between PC5 transport for V2V services and DSRC/IEEE 802.11p services in the same channel Ericsson
Agreed in R1-166033

R1-165270 Proposed TP for 36.885 Conclusions Ericsson
R1-165870 Proposal for SI conclusions LG

R1-165899 Way forward on V2X study conclusion LG Electronics, Huawei, HiSilicon, Samsung, Panasonic, Nokia, ASB, NTT DOCOMO, Ericsson

Agreements:

- The following text is agreed as
  - the conclusion on the feasibility of LTE-based V2X, and
  - the recommendation from RAN1.
- Email discussion is triggered to discuss how to recommend the solutions identified in other WGs.

Text:
The RAN WGs concluded that it is feasible to support transport for V2V, V2I/N and V2P services over Uu. The RAN WGs identified solutions to improve the latency, capacity, and reliability performance of LTE Uu interface and observed that UL enhancements to the SPS protocol and DL enhancement to multicast/broadcast are beneficial from performance perspective. It is recommended to support the following solutions identified in this TR for Uu-based V2X:

- Transmission using a single CP shorter than extended CP, with normal CP as the baseline, with necessary additional study
- HARQ feedback and retransmissions for SC-PTM and MBSFN, with necessary additional study
- Geo-information report from RRC_Connected UEs
  - No additional specification work is needed.
- [TBD on the solutions from other WGs]

The RAN WGs concluded that it is feasible to support V2I and V2P servicesover PC5. It is concluded that V2P services where P-UE sends V2X messages but not receives V2X messages is substantially more power efficient than V2P services where P-UE receives V2X messages from V-UEs. The RAN WGs identified that some changes to the PC5 interface would be beneficial in terms of power consumption and UE complexity in case of P2V transmissions. It is recommended to support following solutions identified in this TR for PC5-based V2X:

- Random resource selection for P-UEs potentially on the resource pool shared with V-UE transmissions, with additional study on sensing operation during a limited time for P-UEs
- [TBD on the solutions from other WGs]

6.2.10 Study on Latency reduction techniques

SID in RP-150465
Focus on this SI in 2Q 2016 will follow approved WF (RP-160650)

Agreed in R1-165913

6.2.10.1 Channel design for shortened TTI

Provide channel design including reference signals for s(E)PDCCH, sPDSCH, sPUSCH, sPUCCH. Provide recommendations on supported sTTI length(s).

R1-164160 Downink control singaling design for shorten TTI Intel Corporation
R1-164233 Design of sPUCCH for shortened TTI CATT
R1-164459 UL channel design for shortened TTI Qualcomm Incorporated
R1-164544 Discussion on sPUSCH design with TTI shortening LG Electronics
R1-164867 CQI feedback overhead reduction in short TTI Huawei, HiSilicon
R1-164923 Simultaneous Transmissions of UL Signals for Shortened TTI Operation Nokia, Alcatel-Lucent Shanghai Bell

R1-165549 Way forward on sTTI length Huawei, HiSilicon, Ericsson
Working assumption:

- It is recommended to support a design that is based on 2-symbol sTTI and 1-slot sTTI for sPDSCH/sPDCCH
- It is recommended to support a design that is based on 2-symbol sTTI, 4-symbol sTTI, and 1-slot sTTI for sPUCCH/sPUSCH
  - During the WI phase, down-selection is not precluded
- The working assumption is automatically confirmed by the end of Thursday if no significant issues are found
- Note: the supported sTTI lengths are not intended to impact discussion on additional subframe types in TDD.

Note: the above working assumption is already confirmed for FDD, and updated for TDD

R1-165544 Way Forward on sPUCCH design LG Electronics, Ericsson , Panasonic, NTT DOCOMO, Sharp, KDDI
Agreement:
- The following sPUCCH formats are recommended to be supported
  - One sPUCCH format for HARQ-ACK and/or SR feedback for a serving cell
  - sPUCCH format(s) for multiple HARQ-ACK bits, e.g. as in CA and frame structure type 2
    - The amount of sPUCCH formats to support is depending on the maximum identified payload size to support
    - sPUCCH format allows for multiplexing of HARQ-ACK and SR
    - FFS: sPUCCH format supports CSI feedback

R1-165550 WF on UL DMRS for sTTI Huawei, HiSilicon, Ericsson,Qualcomm
R1-165545 WF on DM-RS for sPUSCH LG Electronics, CATT, NTT DOCOMO, Samsung
Agreement:
- For DM-RS of sPUSCH, the followings are recommended to be supported:
  - For the case of 1-slot TTI length, reuse the current DM-RS
  - For the case of less than 1-slot TTI length, support DM-RS sharing/multiplexing of consecutive TTIs from one or multiple UEs
    - At least 2 contiguous TTIs can be shared/multiplexed. FFS on sharing /multiplexing of more than 2 contiguous TTIs
    - FFS on how to share/multiplex DM-RS (e.g., CDM, FDM, different BW between RS & data, and hybrid thereof)
    - FFS the DMRS position and whether it is indicated by eNB

R1-165523 sPDCCH Ericsson
R1-165631 Way forward on sPDCCH Ericsson, Nokia, Alcatel-Lucent Shanghai Bell, Mediatek, Sharp, Huawei, HiSilicon, CATT, CATR, Motorola Mobility, ZTE
Agreement:
- Confirm the working assumption
  - Working Assumption:
    - CRS-based sPDCCH is recommended to be supported
      - FFS whether CRS-based sPDCCH can be transmitted in the legacy PDCCH region
    - DMRS-based sPDCCH is recommended to be supported
    - Design of both CRS-based sPDCCH and DMRS-based sPDCCH will be studied further.
- From resource utilization perspective, sPDSCH assigned by a sPDCCH can be mapped to resources that are left unused by any sPDCCH
  - Details are for further study, e.g., FFS whether unused resources is RB or RE level

R1-165548 Way Forward on sPDCCH transmitted in sTTI and legacy PDCCH region ZTE, ZTE Microelectronic

R1-165522 Way forward on sPDSCH Ericsson, Huawei, HiSilicon, Panasonic
Agreement:
- For sPDSCH based on a CRS based transmission scheme the maximum number of supported layers is 4
- For sPDSCH based on a DM-RS based transmission scheme shall be down-selected among the following options
  - the maximum number of supported layers is 2
  - the maximum number of supported layers is 4
  - the maximum number of supported layers is 8
- FFS for sPDSCH based on a DM-RS based transmission scheme it is recommended to increased PRB bundling size compared to PDSCH for at least sTTI lengths shorter than 1-slot

R1-165547 Way forward on latency reduction for TDD ZTE, CMCC, Ericsson, CATT, Sharp, DoCoMo

R1-165551 Way Forward on TDD FS2 for latency reduction Huawei, HiSilicon, Panasonic, CATT, Qualcomm, Nokia, Alcatel-Lucent Shanghai Bell

R1-165892 WF on TDD latency reduction Huawei, HiSilicon, CMCC, Nokia, ASB, Panasonic, Ericsson, ZTE
Agreement:
- Regarding sTTI length:
  - Confirm the working assumption for FS1 FDD
  - Take the following agreement for FS2 TDD
    - It is recommended to support a design that is based on 1-slot sTTI for sPDSCH/sPDCCH/sPUSCH/sPUCCH for FS2 TDD in Rel-14

Petitioners' Exhibit 1007, p. 1898
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- It is recommended to consider enhancements including other shorter sTTI duration(s), and additional DL-UL switching points/ additional subframe types for FS2 TDD latency reduction in Rel-15

R1-165546 WF on UCI transmission on sPUSCH LG Electronics, Ericsson, Intel, Nokia, Alcatel-Lucent Shanghai Bell, NTT DOCOMO, Sharp

Agreement:

- The following principles on sPUSCH are recommended to be supported:
  - UCI transmission on sPUSCH is supported
  - FFS UCI mapping rule, especially considering the impact of DM-RS design
  - FFS on which carrier to multiplex UCI on in case different sTTI lengths are used on different UL CA
  - Note:
    - The UCI herein refers to at least the ones for sTTI operations
    - FFS whether or not the UCI also includes the ones for legacy TTI operations

R1-165524	Way forward on processing timing reduction for sTTI	Ericsson
R1-165707	Way forward on processing timing reduction for sTTI	Ericsson

Agreement:

- It is recommended to reduce the maximum TA for short TTI operation with processing time reduction compared to Rel-13
  - Details are FFS
- A single minimum delay between UL grant and UL data and between DL data and DL HARQ feedback is recommended to be supported for a given sTTI length

R1-165854 Way forward on processing timing reduction for sTTI Ericsson

Agreements:

- The minimum timing for UL grant to UL data and for DL data to DL HARQ is n + k sTTI for short TTI operation;
  - Processing time >= the legacy processing time linearly downscaled with TTI length
    - 4 <= k <= 8
  - FFS whether or not to support processing time is lower than the legacy processing time linearly downscaled with TTI length for at least slot based TTI
    - k < 4 for slot based TTI.
  - Note that sTTI refers to

    - sPUSCH sTTI for the UL grant to UL data timing
    - sPDSCH sTTI for the DL data to DL HARQ feedback timing
  - FFS how to the handle the minimum timing for the case when DL sTTI and UL sTTI have different lengths
- Further study whether or not the eNB would indicate an additional parameter m (Note: the value may be dependent on the discussion on the max TA), resulting in a timing of n + k + m sTTI
  - FFS: semi-static or dynamic configuration of m, if introduced
- The minimum timing for UL grant to UL data and for DL data to DL HARQ is n + k TTI for subframe-long TTI operation and short TTI capable UEs.
  - k = 4 is supported
  - Further study whether a reduced minimum timing is possible, e.g. k = 2, k = 3, and if a reduced maximum TBS is needed to achieve this
- Note: CQI feedback enhancements for short TTI and legacy TTI are not precluded

R1-165518 Updates to Link Level results Ericsson
Conclusion:
- The TP is endorsed, but without the parts concerning the puncturing performance

Petitioners' Exhibit 1007, p. 1901
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165519 Updates to Link Level observations Ericsson
Conclusion:

- The TP is endorsed, except the following:
  - Removing the following:

    One source showed that puncturing of an PDSCH within a subframe long TTI by an short TTI significantly degrades the BLER performance and at ~~16QAM or~~ higher modulation orders makes the PDSCH undecodable. Whether there are any enhancements to PDSCH reception in this case that would allow better reception performance has not been studied.

  - Update the last sentence in the sPUCCH section with the following:
    - For larger payload sizes e.g. 5 to 40 bits, can achieve tolerable performance with a longer sTTI length. Note that there is some coverage impact with shorter TTI lengths with large payload sizes.

R1-165520 Updates to System level results Ericsson
Conclusion:

- The TP is endorsed
  - Note: further update is necessary based on the new results available till midnight Tuesday

R1-165521 Updates to System level observations Ericsson
Conclusion:

- The TP is endorsed, with the following updates in the last paragraph
  - Updating:
    - At least shown by two sources, under a given TDD UL/DL subframe configuration, introducing additional subframe types for a new UE can further reduce the U-plane latency for TDD compared to the case without introducing additional subframe types in the evaluated scenarios.
- Including the impact analysis not limited to additional subframes types – Laetitia (Ericsson)
  - Detailed wording to be worked on offline
- Further discussion offline whether or not to further update the following sentences:
  - Two sources show that the performance of 14OS TTI length with reduced processing time (i.e. with reduced HARQ RTT and UL access delay) comes close to the one of slot based TTI length. However, source 4 shows that if 14OS TTI follows the same TBS assumption as 7OS TTI length, gains of 14OS TTI length with reduced processing time are smaller than the ones of other short TTI lengths.
  - Three sources (R1-16454~~30~~, R1-164637, R1-164823) show that in the most favourable~~ite~~ situation for TTI shortening, introducing short TTI in existing TDD UL/DL configuration without additional subframe type can lead to large user perceived throughput~~performance~~ improvement. ~~and gains are larger with shorter TTI lengths.~~ Four sources (R1-164823, R1-164237, R1-164637, R1-164548) show that in the most favourable~~ite~~ situation for TTI shortening , introducing short TTI with additional subframe type within existing UL/DL configuration can lead to ~~much~~ improved user perceived throughput compared to introducing short TTI without additional subframe type within existing UL/DL configurations, especially for short TTI length as 2OS. One source (R1-164548) shows that significant performance loss in 5th percentile user throughput with shorter TTI length like 2OS both with and without additional subframe type.

R1-165632 TP for inclusion of evaluation assumptions for FS2 Ericsson
Conclusion:

- The TP in R1-165632 is endorsed

R1-165705 Updates to System level results Ericsson
Conclusion:

- The TP in R1-165705 is endorsed

R1-165706 Updates to System level observations Ericsson
Conclusion:

- The TP is endorsed, except the following update:
  - From "There is difficulty to schedule legacy UEs in the additional subframes and therefore the performance of legacy UEs is degraded. How much the degradation for legacy UEs is has not been evaluated in the study item. "
  - To "The performance of legacy UEs is degraded with the introduction of additional subframe type. It has not been evaluated during the SI on how much degradation for legacy UEs. "

7.1 *Study on New Radio Access Technology - SID in* RP-160671

R1-165216 Draft TR 38.802 Study on New Radio (NR) Access Technology - Physical Layer Aspects NTT DOCOMO, INC.
The document was presented by Kazuaki Takeda from NTT DOCOMO.
Decision: The document is endorsed as v0.2.0.

Wednesday
R1-165804 Draft TR 38.802 Study on New Radio (NR) Access Technology - Physical Layer Aspects NTT DOCOMO
The document was presented by Kazuaki Takeda from NTT DOCOMO.
Discussion: Huawei, Qualcomm requested more time for detailed review.
Decision: The document is noted. Continue offline discussion until Thursday –(NTT DOCOMO)

R1-165720 Draft Reply LS on Parameters for WP5D sharing and compatibility studies NTT DOCOMO
Decision: The document is noted. Continue offline discussion about the notes – (NTT DOCOMO)
R1-165805 Draft Reply LS on Parameters for WP5D sharing and compatibility studies NTT DOCOMO
Decision: The document is noted and final LS is agreed in R1-165820.

Thursday
R1-165804 Draft TR 38.802 Study on New Radio (NR) Access Technology - Physical Layer Aspects NTT DOCOMO
Decision: The document is noted. Further revised in:

R1-165882 **Draft TR 38.802 Study on New Radio (NR) Access Technology - Physical Layer Aspects NTT DOCOMO**
Discussion: Huawei → can the meaning of "baseline" used in multiple instances through the TR be clarified? Replaced by "is supported" may be better
DOCOMO: agreed – Terminology "baseline" will be updated in a later version
Decision: The document is noted and endorsed as v0.0.3 in R1-165889, with following update in Section 6.1:
The downlink transmission scheme is based on OFDM ~~using a cyclic prefix.~~

Not treated.
R1-165170 Workplan for Study on Study on New Radio Access Technology NTT DOCOMO, INC.

7.1.1 Forward compatibility for new radio interface

Solutions how to achieve forward compatibility with Phase II specification and beyond.

R1-164046 **Forward compatibility consideration on reference signals and control information/channels Huawei, HiSilicon**
The document was presented by Zukang Shen from Huawei.
- *Proposal 1: The reference signal for cell identification and coarse time/frequency synchronization in NR is not in a fixed frequency location within a carrier.*
- *Proposal 2: A minimum bandwidth shall be defined for the reference signal for RRM measurement in NR. Consider to derive the time/frequency location of the reference signal for RRM measurement based on the reference signal for cell identification and coarse time/frequency synchronization.*
- *Proposal 3: NR shall support orthogonal reference signals among different links (such as downlink, uplink, sidelink, backhaul link).*

Decision: The document is noted.

R1-164242 **NR system design for forward compatibility CATT**
The document was presented by Fang Chen Cheng from CATT.
- *Proposal 1: For forward compatibility of support low cost mMTC, the NR system needs to support the operations of narrowband carrier standalone or embedded in a wideband carrier, single transceiver chain and communication with passive devices.*
- *Proposal 2: For forward compatibility of massive MTC power efficiency, the NR system should support on-demand wakeup for the sleeping device and communication with passive devices.*
- *Proposal 3: The channel coding scheme with extremely high coding gain should be supported for URLLC applications.*
- *Proposal 4: The NR system design should target common design of control channels and reference signals in the frame structure for downlink, uplink and sidelink. The control channel design should support both central and distributed resource allocation and coordination.*
- *Proposal 5: The NR system should support opportunistic access for the operation on dedicated and shared spectrum.*

Decision: The document is noted.

R1-164633 **On forward compatibility Ericsson**
The document was presented by Stefan Parkvall from Ericsson and proposes the following to improve future compatibility:
- Avoid fixed timing relations across subframe borders
- Self-contained transmission where data (and control) transmissions have, e.g., their own reference signals.
- Avoid tying multiple quantities to a single underlying quantity unless there is a clear motivation.

Decision: The document is noted.

R1-165367 **On forward compatibility for NR China Unicom**
The document was presented by Xiao Han from China Unicom.
Observation 1: the blank resources design should enable the Phase 1 UEs successfully receive and decode the UE-specific channels transmitted on adjacent time and frequency resources.
Observation 2: the cell-specific RS should be minimized on resources and configurable for usage scenarios and numerologies and necessary cell-specific RS should be supported.
Observation 3: single TDM and FDM solutions for multiplexing may not sufficient satisfy NR requirements.
Decision: The document is noted.

R1-164552 **Forward compatibility support design of NR LG Electronics**
The document was presented by Yunjung Yi from LGE.
- *Proposal 1: NR design should minimize (semi-)statically configured signal/channels but synchronization signals and system information in the very initial access state may be (semi-) statically and periodically transmitted.*
- *Proposal 2: Flexible and dynamic TDD operation should be enabled in consideration of ICI in NR.*

Petitioners' Exhibit 1007, p. 1905
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- *Proposal 3: Flexible HARQ timing for both DL and UL should be designed in consideration of UE processing capability and latency requirements of NR.*

Decision: The document is noted.

R1-164292 On forward compatibility for new radio interface ZTE

The document was presented by Ruyue Li from ZTE.

- *Proposal 1: The number of symbols per 1 ms is 2m, where m is an integer, since it allows smooth multiplexing of future services and use cases.*
- *Proposal 2: The design of NR numerology and frame structure should prioritize forward compatibility, in order to ensure smooth evolution to accommodate future services and use cases. Within one carrier of a network, numerology adaptation based on changing the number of symbols per subframe is preferred to scaling of subcarrier spacing, since it ensures better forward compatibility and reduces overhead.*
- *Proposal 3: Regarding reference signal design, we propose the following design principles:*
  - *Avoid always-on reference signals*
  - *Avoid periodic reference signals in a non-standalone system*
  - *Use aperiodic reference signals or configurable multi-shot reference signals*
  - *Granularity and overhead of reference signals should be flexibly configured depending on the different requirements of CSI measurement*
  - *Support multi-level CSI-RS with different configurable granularities*
- *Proposal 4: Avoid unnecessary periodic system information. Identify the fundamental system information for UE to access network. The fundamental system information should adapt to different use cases/scenarios.*
- *Proposal 5: Regarding control channel design, we propose the following design principles:*
  - Design of downlink control channel should be flexible to adapt to different application.
  - Multi-level downlink control channel structure should be considered in NR.
- *Proposal 6: Support multi-component and multi-level design in MIMO CSI feedback framework in NR*

Decision: The document is noted.

R1-165603 WF on NR forward compatibility Huawei, HiSilicon

The document was presented by Zukang Shen from Huawei.

- Forward compatibility of NR shall ensure smooth introduction of future services and features with no impact on the access of earlier services and UEs
  - Multiplexing different numerologies within a same NR carrier is supported
  - Reference signal for synchronization is not in a fixed frequency location within a carrier.
  - Transmission of system information is not in a fixed frequency location within a carrier
  - Avoid tying multiple parameters to a same parameter and rely more UE specific parameters as much as possible
  - Common design (e.g. waveform) shall be aimed for various link directions in NR, e.g. downlink, uplink, sidelink, backhaul link

Decision: The document is noted, further revised in R1-165628 as follows:

- Forward compatibility of NR shall ensure smooth introduction of future services and features with no impact on the access of earlier services and UEs
  - Multiplexing different numerologies within a same NR carrier bandwidth (from the network perspective) is supported
  - Reference signal for synchronization and transmission of MIB is not in a fixed frequency location within a NR carrier bandwidth (from the network perspective).
    - The frequency location of MIB is derived from the reference signal for synchronization (e.g. the same frequency location)
  - Avoid tying multiple parameters to a same parameter and rely more UE specific parameters as much as possible
  - Common design should be aimed for various link directions in NR, e.g. downlink, uplink, sidelink, backhaul link

Agreements:

- Forward compatibility of NR shall ensure smooth introduction of future services and features with no impact on the access of earlier services and UEs
  - Multiplexing different numerologies within a same NR carrier bandwidth (from the network perspective) is supported
    - FDM and/or TDM multiplexing can be considered

Possible agreements:

- Reference signal for synchronization and transmission of MIB is not in a fixed frequency location within a NR carrier bandwidth (from the network perspective).

Petitioners' Exhibit 1007, p. 1906
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- The frequency location of MIB is derived from the reference signal for synchronization (e.g. the same frequency location)
- Avoid tying multiple parameters to a same parameter and rely more UE specific parameters as much as possible
- Common design should be aimed for various link directions in NR, e.g. downlink, uplink, sidelink, backhaul link

R1-165607 WF on implicit dependencies assumptions InterDigital, Ericsson, Huawei, HiSilicon

The document was presented by Paul Marinier from InterDigital.

- Implicit (i.e. non-configurable) dependencies between transmissions that exist in LTE design are not by default assumed to be introduced in NR design.
- An identity parameter may tie signals for search/synchronization (e.g. PSS/SSS) to the broadcast transmission of essential system information (e.g. MIB)
  - Name of identity parameter TBD (e.g. cell ID, hypercell ID, system ID)
  - Other dependencies to this identity parameter can be introduced if considered beneficial taking into account forward compatibility, signalling overhead and complexity

Decision: The document is noted.

Possible agreements:

- For NR design, implicit (i.e. non-configurable) dependencies can be introduced if considered beneficial taking into account forward compatibility, signalling overhead and complexity
  - It is not assumed by default that implicit dependencies that exist in LTE design are introduced in NR design

Possible agreements:

- An identity parameter ties signals for search/synchronization to the broadcast transmission of essential system information
  - Name of identity parameter TBD (e.g. cell ID, hypercell ID, system ID)
  - Other dependencies to this identity parameter can be introduced if considered beneficial taking into account forward compatibility, signalling overhead and complexity

Agreements:

- Timing between data transmission and corresponding HARQ A/N is indicated explicitly
  - FFS if implicit indication is supported in some cases
- Essential system information (MIB) should be decodable based on an identity parameter used for generation of search/synchronization signal (e.g. PSS/SSS)
  - Name of identity parameter TBD (e.g. cell ID, hypercell ID, system ID)
  - Other dependencies to this identity parameter are FFS

Wednesday

R1-164674 Channel bandwidth consideration for forward compatibility Qualcomm Incorporated

The document was presented by Tingfang Ji from Qualcomm.

- Proposal 1: NR UE should be allowed to support a subset of NR channel bandwidth.
- Proposal 2: NR channel bandwidth should be defined to allow efficient unlicensed spectrum access.
- Proposal 3: NR UEs should be tested for a limited set of channel bandwidth. Additional Tx/Rx requirements for service multiplexing in frequency domain should be studied for baseband filtering.

Decision: The document is noted.

R1-165806 WF on Supporting different Numerologies in a NR carrier LG Electronics, Huawei, HiSilicon

- It is supported that a NR carrier can be divided into multiple Frequency Resource Groups (FRGs) in frequency domain
  - Different FRGs can have different numerologies
  - Each FRG may have independent synchronization signal(s)
  - Multiple FRGs may share the same synchronization signal(s)
  - Further consider DC subcarrier aspects in a NR carrier comprising multiple FRGs

Decision: The document is noted. Continue offline.

Thursday

R1-165837 WF on Supporting different Numerologies in a NR carrier LG Electronics, Huawei, HiSilicon, Panasonic

Decision: The document is noted.

Possible agreements:

- Contiguous frequency resources using one numerology in a NR carrier is called frequency resource group (FRG)
  - A numerology is defined at least by CP duration and subcarrier spacing
  - One numerology is applied in FRG over T time duration

Petitioners' Exhibit 1007, p. 1907
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- FFS on details of T

– Multiple FRGs in a NR carrier with different numerologies is supported
– Multiple FRGs in discontinuous frequency resources in a NR carrier can use the same or different numerology
– FFS
  - sizes of FRG
  - whether FRG (e.g., size of FRG and T) can change dynamically or semi-statically.
  - whether different FRGs can overlap or not
  - whether/how to handle DC subcarrier aspects in a NR carrier comprising multiple FRGs
– FFS: NR supports the following
  - Each FRG has its own synchronization signal(s)
  - Multiple FRGs share the same synchronization signal(s)

Continue offline discussion until Friday –(LGE)

Friday

R1-166008 WF on Supporting different Numerologies in a NR carrier LG Electronics, Huawei, HiSilicon, Panasonic, Ericsson

Decision: The document is noted and modified as follows:

Agreements:

- For a NR carrier (from network perspective) using multiple numerologies, at least the following is for further study
  - multiple frequency/time portions using different numerologies share a synchronization signal
    - Note: The synchronization signal refers to the signal itself and the time-frequency resource used to transmit the synchronization signal

---

R1-165873 Way Forward on fixed DL physical resource for dynamic operation in NR LG Electronics, Qualcomm, Panasonic, NTT Docomo

- A UE may assume NR has downlink reference signal(s) with a certain periodicity/duration in time at least for the purpose of synchronization.
  – FFS: necessary frequency domain resource for the reference signal(s)
  – FFS: necessary time domain periodicity/duration for the reference signal(s)
  – FFS: whether the UE may assume the reference signal(s) is transmitted with the periodicity irrespective of the UE condition (e.g., already/yet synchronized with LTE/NR)
  – FFS: whether UE may assume a common numerology for this signal
- Downlink physical resources that composes the above downlink reference signal(s) may also comprise downlink reference signal(s) for the purpose of RRM measurement.
  – FFS : the downlink physical resources are contiguous in time
  – FFS : the downlink physical resources are contiguous in frequency
- FFS: other signal(s)/channel(s) necessary in the downlink physical resource.
- Physical resources except for the above downlink physical resources are flexibly utilized either as DL or UL or SL

Decision: The document is noted. Continue offline discussion until Friday – (LGE)

Friday: no progress.

R1-165674 Way forward on forward compatibility for waveform evolution Spreadtrum, CATR, CMCC, Cohere, Deutsche Telekom, InterDigital, Orange, Sony, Telstra, Telefonica, ZTE

- Forward compatibility for waveform evolution should be ensured in system framework design.
  - Downlink, uplink and sidelink share the same framework of physical layer processing.

Discussion: Also supported by Fraunhofer HHI, NTU, Panasonic
Concern from a number of companies
Spreadtrum stressed how forward compatibility can be ensured?
Spreadtrum would like to see it included in the TR
Chair: TP to TR will come at a later stage, let's discuss technical solutions before trying to capture anything

Decision: The document is noted.

Not treated.

R1-163982 Forward compatibility for NR Samsung
R1-164047 General consideration on forward compatibility for new radio interface Huawei, HiSilicon
R1-164172 Forward compatible and low overhead structure for NR Intel Corporation
R1-164387 Forward compatibility considerations on physical layer procedures Huawei, HiSilicon
R1-164471 On forward compatibility of NR Guangdong OPPO Mobile Telecom.
R1-164585 Forward compatibility for waveform evolution Spreadtrum Communications

7.1.2 Remaining issues on evaluation assumptions for new radio interface

R1-163984 Discussion on phase noise modeling Samsung

- *Proposal 1: Use multi-pole/zero model with configurable parameters such as PSD0 and multiple pole/zero frequencies for practical phase noise performance evaluations.*
- *Proposal 2: Study how to decide the model parameters.*
- *Observation 1: Discussion on the relationship between OFDM subcarrier spacing and phase noise is effective only when the CPE of phase noise is compensated properly.*
- *Observation 2: Considering phase noise, large subcarrier spacing can help to enhance EVM performance when large bandwidth up to a few GHz needs to be supported in higher frequencies.*
- *Observation 3: For higher frequencies, the $f_0 * 2^n$ subcarrier spacing set shows too big EVM performance gap between adjacent subcarrier spacing values considering phase noise. On the other hand, the $f_0 * 2^n * 5^m$ subcarrier spacing set with finite integers such that n=0,1,2,3,4,5,6,7,8 and m=0,1,2 seems to be good enough to support large bandwidth up to a few GHz in viewpoint of phase noise impacts.*

Decision: The document is noted.

R1-165944 Chairman's Notes of Agenda Item 7.1.2 on NR eval_assumptions Session Chairman (Nokia, Qualcomm Inc.)

The document was presented by Matthew Baker from Nokia and provides the outcomes of the session.
Decision: The document is endorsed. Contents incorporated below.

R1-165482 Remaining issues on evaluation assumptions NTT Docomo
Decision: The document is noted.

Indoor hotspot
R1-164383 Further discussion on evaluation assumption for eMBB deployment scenarios Huawei, HiSilicon
Decision: The document (Section 2.1) is noted.

R1-165483 Discussion on System-Level Evaluations for NR Samsung (R1-164718)
Decision: The document (Section 2) is noted.
Proposal for indoor open office: optional additional ISD of 40m –~~R1-165489~~
Friday
R1-165850 WF on antenna placement in Indoor scenarios Intel, NTT DoCoMo, Samsung, Ericsson
Decision: The document is agreed.

Traffic model	[50 messages] per 1 second with [60km/h], [10 messages] per 1 second with [15km/h] in TR38.913 Note: This value is tentative. After SA1 input, it can be modified.	[50 messages] per 1 second with absolute average speed of [100-250 km/h] (relative speed: 200 – 500km/h) in TR38.913 Note: This value is tentative. After SA1 input, it can be modified.
Traffic load (Resource utilization)	FFS	FFS
UE distribution	Urban grid model (car lanes and pedestrian/bicycle sidewalks are placed around a road block. 2 lanes in each direction, 4 lanes in total, 1 sidewalk, one block size: 433m x 250m) in TR38.913 Average inter-vehicle distance (between two vehicles' center) in the same lane is [1sec * average vehicle speed] (average speed [15 – 120km/h]) in TR38.913 Vehicle UE location update in TR36.885 should be used for the evaluation of PRR in sidelink or communication interruption in uplink/downlink. Vehicle UE location update may not be assumed for the evaluation of PRR in uplink/downlink Note: Inter-vehicle distance is tentative. After SA1 input, it can be modified. Pedestrian UE distribution: Inter-pedestrian distance 20m, which is tentative. After SA1 input, it can be modified.	Average inter-vehicle distance (between two vehicles' center) in the same lane is [0.5 sec or 1sec * average vehicle speed] (average speed: [100-250 km/h]) in TR38.913 Vehicle UE location update in TR36.885 should be used for the evaluation of PRR in sidelink or communication interruption in uplink/downlink. Vehicle UE location update may not be assumed for the evaluation of PRR in uplink/downlink Note: Inter-vehicle distance is tentative. * After SA1 input, only one value will be selected.
Feedback assumption	FFS	FFS
Channel estimation	Realistic	Realistic
Performance metric	FFS	FFS

Friday: Email discussion on performance metrics, starting from the ones in R1-165612, till August 6th .

Urban Grid
R1-164044 **Evaluation assumption for non-eMBB deployment scenarios** **Huawei, HiSilicon**
Decision: The document (Section 2.3) is noted.

Other mMTC assumptions
R1-165008 **UE battery life evaluation for mMTC use cases** **Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document is noted.

Conclusion:

- Discuss until RAN1#86 to define simple UE energy modelling approach for NR mMTC radio access energy efficiency analysis which is not specific to any particular radio access solution (contact: Karri Ranta-aho)

R1-165696 **WF on evaluation methodologies for mMTC** **LG Electronics, Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document is noted.

Agreements:

- Evaluation methods and relevant evaluation metrics per KPIs for mMTC in RAN1 are as follows:
  - Coverage is evaluated by link budget
  - Connection density is evaluated by SLS and analysis
  - UE battery life is evaluated by analysis
    - Statistics of wake-up time duration of UE in consideration of the number of (re)transmissions
  - Battery life is evaluated in consideration of RAN2 procedure

Other URLLC assumptions
R1-164681 URLLC KPI evaluation assumptions Qualcomm Incorporated
Decision: The document is noted. Discuss these proposals offline, including:

- the exact definition to be used for latency evaluation
- reliability KPI:

Petitioners' Exhibit 1007, p. 1915
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Revisit on Tuesday evening - R1-165487
R1-165487 **WF on URLLC KPIs and Evaluation** **Qualcomm**
Decision: The document is noted.

Proposed Working Assumption for URLLC KPIs:
- URLLC latency and reliability KPIs are defined in conjunction
  - (Latency, Reliability) of (L, R) is met if packet of X bytes is delivered within L ms latency from radio protocol ingress point to egress point with packet error rate < R.
  - E.g., (1ms, 1e-5)

Revisit later in the week.
Friday: To be revisited at next meeting.

Agreements:
The following performance metrics are defined for evaluation and feature selection in RAN1 (FFS the method of evaluation, including whether SLS are required):
- URLLC capacity is defined as delivered traffic given the (L, R) constraint
  - Denoted as C(L,R)
- URLLC/ eMBB multiplexing capacity is defined as the simultaneously delivered URLLC capacity *C(L,R)* and eMBB capacity *T*

FFS until RAN1#86:
- Proposal 1: Single URLLC traffic model should be used evaluate URLLC KPIs
  - Example: Fixed packet size of 32 Bytes, Poisson arrival rate of λ,
  - Example: single directional and bi-directional traffic could be considered
- Proposal 2: Latency metric should capture transmission latency, processing latency, retransmission latency and queuing/scheduling latency
- Proposal 3: Link level BLER evaluation should include control and data channels
  - With and without other cell interference
- Proposal 4: System level evaluation should capture other cell interferences

R1-163988 **Evaluation methodology and KPI for URLLC** **Samsung**
Decision: The document is noted.

V2X
R1-164173 **Discussion on URLLC evaluation assumptions and scenarios** **Intel Corporation**
Decision: The document is noted.

Conclusion: Aim for a single set of assumptions for evaluations of URLLC.

MIMO & antenna modelling
R1-164950 **On new antenna model for NR basestation** **Ericsson**
Decision: The document is noted.

Agreements:
- TXRUs within a panel can be assumed to be synchronized and phase-calibrated (at least to the same level as in LTE).
- It should be possible as one option to assume QCL between ports of two different panels of the same transmission points
- Distances ($d_{g,H}$, $d_{g,V}$) between panels should be limited to at most [FFS] metres.
- NR evaluations may consider both cases of phase-calibration and no phase-calibration between panels

R1-163986 **Remaining details of TRP antenna modeling and TXRU mapping/virtualization** **Samsung**
Discussion: Telecom Italia insists on realistic numbers of antenna elements at lower frequencies.
Decision: The document is noted.

R1-165488 **WF on TRP antenna model** **Samsung, Intel, Ericsson**
Decision: The document is noted. Revisit on Wednesday.

R1-164554 **Proposal for UE antenna model for new RAT** **LG Electronics**
Decision: The document is noted.
R1-165712 **WF on hybrid UE antenna modelling** **Intel, Samsung, LG**

Petitioners' Exhibit 1007, p. 1916
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted.

Companies are requested to check both R1-165488 (->R1-165490) and R1-165712 (->R1-165491) by the end of the morning coffee break; WF owners to provide editable versions (in Word).

R1-165490 Way-forward for TRP antenna modeling Samsung, Intel, Ericson, Qualcomm, Xinwei

Decision: The document is noted.

Agreements on TRP antenna modelling:

- For evaluation, consider the following antenna configurations:
  - Baselines are at least for MIMO-related calibration (and can also be used for other features unless a different baseline is defined for evaluation of a particular feature). Companies are encouraged to evaluate other configurations as well.
  - **At 4GHz:**
    - Dense urban and Urban macro:
      - Baseline: (M,N,P,Mg,Ng) = (8,8,2,1,1), (d_V,d_H) = (0.8, 0.5)λ.
      - Note that for Urban macro, companies are also encouraged optionally to investigate larger panels, e.g. (8,16,2,1,1)
    - Indoor hotspot:
      - FFS
  - **At 30GHz:**
    - Dense urban and Urban macro:
      - Baseline: (M,N,P,Mg,Ng) = (4,8,2,2,2). (d_V,d_H) = (0.5, 0.5)λ. ($d_{g,V}$,$d_{g,H}$) = (2.0, 4.0)λ.
      - Note that companies are also encouraged to investigate a larger panel spacing, e.g. ($d_{g,V}$,$d_{g,H}$) = (4,8) λ
    - Indoor hotspot:
      - FFS
  - **At 70GHz:**
    - Dense urban:
      - Baseline: (M,N,P,Mg,Ng) = (8,16,2,2,2). (d_V,d_H) = (0.5, 0.5)λ. ($d_{g,V}$,$d_{g,H}$) = (4.0, 8.0) λ.
      - Note that companies are also encouraged to investigate a larger panel spacing, e.g. ($d_{g,V}$,$d_{g,H}$) = (8,16) λ
    - Indoor hotspot:
      - FFS

- Consider the following a TXRU to antenna elements mapping as examples
  - **At 4GHz:** the same as TR36.897
  - **At 30GHz and 70GHz:**
    - **Option 1:** a single TXRU is mapped per panel per polarization.
    - **Option 2**: a single TXRU is mapped per panel per subarray per polarization,
      - E.g., where a subarray consists of consecutive M/2 vertical antennas and N/2 horizontal antennas with the same polarization.
      - Other subarray configurations are not precluded.
    - **Option 3**: Fully connected TXRU mapping within a panel per polarization.
      - Other Fully connected TXRU mapping is not precluded.
- For evaluating multi beam based approaches at 30GHz and 70GHz, consider the following:
  - TXRU to antenna mapping weights are adjustable and used to steer the panel beam direction in multi beam based approaches in time domain.
  - Companies should describe TXRU mapping weights for the panel beams

R1-165640 WF on antenna placement in Indoor scenarios Intel, NTT DOCOMO (R1-165587)

Decision: The document is noted. Companies are invited to review this – revisit on Friday.

Agreements on UE antenna modelling:

- For UE with (M_g, N_g) directional antenna panels.
  - Introduce ($\Omega_{mg,ng}$, $\Theta_{mg,ng}$) for orientation of the panel (m_g, n_g), $0 \le m_g < M_g$, $0 \le n_g < N_g$, where the orientation of the first panel ($\Omega_{0,0}$, $\Theta_{0,0}$) is the same as UE orientation, $\Omega_{mg,ng}$ is the array bearing angle and $\Theta_{mg,ng}$ is the array downtilt angle defined in [TR 36.873].
  - For NR MIMO evaluation:
    - Config 1: (M_g, N_g) = (1, 2); $\Theta_{mg,ng}$=90; $\Omega_{0,1}=\Omega_{0,0}+180$; ($d_{gH}$, d_{gV})=(0,0)
    - Config 2: (M_g, N_g) = (1, 4); $\Theta_{mg,ng}$=90; $\Omega_{0,1}=\Omega_{0,0}+90$; $\Omega_{0,2}=\Omega_{0,0}+180$; $\Omega_{0,3}=\Omega_{0,0}+270$; ($d_{gH}$, d_{gV})=(0,0)
    - Other configurations can have panel specific position offset ($d_{gH,\,mg,\,ng}$, $d_{gV,\,mg,\,ng}$). Note in this case the notation of (M_g, N_g) does not leads to rectangular shape.

Field Code Changed

Field Code Changed

Petitioners' Exhibit 1007, p. 1917
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- UE orientation for mobile device ($\Omega_{0,0}$, $\Theta_{0,0}$)=(U(0,360), 90); UE orientation for customer premise equipment (CPE) can be optimized
- Each antenna array has shape $d_H=d_V=0.5\lambda$
  - Config 1 can be used with config a/b; Config 2 can be used with config c/d/e
  - Config a: (M, N, P) = (2, 4, 2), the polarization angles are 0 and 90
  - Config b: (M, N, P) = (4, 4, 1) , the polarization angle for even panel is 0 and for odd panel is 90
  - Config c: (M, N, P) = (2, 2, 2), the polarization angles are 0 and 90
  - Config d: (M, N, P) = (2, 4, 1) , the polarization angle for even panel is 0 and for odd panel is 90
  - Config e: (M, N, P) = (1, 4, 2), the polarization angles are 0 and 90
  - FFS: Other configurations, e.g. (M, N, P) = (4, 4, 2) or (M, N, P) = (4, 8, 1) can be considered for 70GHz band, without exceeding the limit on the maximum number of UE antenna elements
- The antenna elements of the same polarization of the same panel is virtualized into one TXRU
- FFS: one TXRU can connect to different subarrays dynamically
- Note: The channel coefficients for each UE panel can be generated using spatial channel model

- Companies should describe the method used for TRP association with UE-side beamforming

UE PA model

R1-165006 **On the evaluation of PA model** **Nokia, Alcatel-Lucent Shanghai Bell**
Decision: The document is noted.
R1-164721 **On justification of the parameter selection for PA models in link level evaluation** **Huawei, HiSilicon**
Decision: The document is noted.
Conclusion: Discuss further when LS reply is received from RAN4.

Waveform

R1-164586 **LLS assumptions for waveform evaluation in mMTC UL transmissions** **Spreadtrum Communications**
Decision: The document is noted.
R1-165675 **Way forward on Case 5 for waveform LLS evaluation Spreadtrum, Orange, ZTE**
Decision: The document is noted.

R1-164034 **Further evaluation assumptions for waveform** **Huawei, HiSilicon**
Decision: The document is noted. To be revised in R1-165759 – revisit later
R1-165859 **Way forward on further evaluation assumptions for NR waveform** **Huawei, HiSilicon, InterDigital, NTT DOCOMO, LGE**
Decision: The document is agreed.

R1-165914 **WF on further evaluation assumptions for NR waveform 30GHz and beyond** **Nokia, Intel**
Decision: The document is noted. Continue discussion offline
Friday
R1-165989 **Way forward on calibration assumptions for NR waveform** **Huawei, HiSilicon, NTT DOCOMO, Nokia**

- Use an email discussion to collect the calibration results for all agreed simulation cases before RAN1#86 meeting.
  - OFDM/DFT-S-OFDM with CP as baseline for performance reference. (LMMSE receiver assumed)
  - At least BLER vs SNR should be reported for calibration

  Note: This calibration is not for down-select purpose.
  Note: The selection of the parameters on page 3 is only for calibration purpose

Decision: The document is agreed. Email discussion on calibration for NR waveform until June 30th - (Huawei)
R1-166016 **Way forward on email discussion for waveforms** **Huawei, HiSilicon, National Taiwan University, NTT DOCOMO, Nokia**

- Use an email discussion to collect information from each company on the details of their proposed/simulated waveform(s), including
  - used parameters
  - Tx/Rx structure
  - Corresponding performance
- Companies are encouraged to provide inputs to this email discussion as early as possible
- The purpose of this email discussion is to facilitate waveform discussion in future meetings. No conclusion is expected out of this email discussion

Decision: The document is agreed. Email discussion to collect information for NR waveform until August 4th - (Huawei)

R1-166000 **WF on further evaluation assumptions for NR waveform 30GHz and beyond** **Nokia, Alcatel-Lucent Shanghai Bell, Intel, Samsung, Huawei, HiSilicon**
Decision: The document is noted. Revised in:
R1-166028 **WF on further evaluation assumptions for NR waveform 30GHz and beyond** **Nokia, Alcatel-Lucent Shanghai Bell, Intel, Samsung, Huawei, HiSilicon,Qualcomm**

Petitioners' Exhibit 1007, p. 1918
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is agreed.

Multiple Access
R1-163983 **Evaluation assumptions for NR multiple access** **Samsung**
Decision: The document is noted.
R1-164045 **SLS parameters for evaluation scenarios for multiple access evaluation** **Huawei, HiSilicon**
Decision: The document is noted.
R1-165691 **Way forward on remaining issues on multiple access evaluation assumption** **Huawei, HiSilicon**
Decision: The document is noted.

Agreements for SLS parameters for UL mMTC scenario – urban coverage for massive connection:

Attributes	Values or assumptions
Layout	Single layer - Macro layer: Hex. Grid
Inter-BS distance	1732m
Carrier frequency	700MHz
Simulation bandwidth	Companies report simulation bandwidth used in evaluation
Channel model	3D UMa Take 5GCM output into account if applicable.
Tx power	UE: Max 23dBm or optional 10dBm
BS antenna configuration	Rx: 2 and 4 ports (8 as optional)
BS antenna pattern	Follow the modeling of TR36.873
BS antenna height	25m
BS antenna tilt	Companies report tilt
BS antenna element gain + connector loss	8 dBi, including 3dB cable loss
BS receiver noise figure	5 dB
UE antenna elements	1Tx
UE antenna height	1.5m
UE antenna gain	-4dBi
Traffic model	Non-full buffer small packet. Consider future trend of mMTC traffic
UE distribution	20% of users are outdoor in cars (100km/h) or 20% of users are outdoors (3km/h) 80% of users are indoor (3km/h) Users dropped uniformly in entire cell
BS receiver	MMSE-IRC as baseline, Advanced receiver is not precluded
UL power control	Companies report power control scheme
Channel estimation	Realistic

- Notes:
  - The same table is also agreed to be used for general assumption for mMTC for UL
  - Additionally, it was agreed to additionally define the minimum packet size is [20] bytes

Discuss offline remaining slides in R1-165691, including LLS assumptions.
R1-165759 **Way forward on further evaluation assumptions for NR waveform** **Huawei, HiSilicon, InterDigital**
Decision: The document is noted.
R1-165848 **Way forward on mMTC evaluation assumptions**
Decision: The document is noted.
R1-165875 **Way forward on remaining issues on multiple access evaluation assumptions** **Huawei, HiSilicon**
Decision: The document is noted.

Agreement:
- PHY abstraction (L2S mapping) of LLS is encouraged to be provided for calibration purpose
- LLS evaluation with ideal and realistic channel estimation

Proposal:
- Slide 4 in R1-165875 is agreed, with the following updates:
  - BS: 49dBm / 10MHz for FDD and 20MHz for TDD
  - (eNB) 2/4/8 Tx/Rx ports as start point -> more than 2 ports
  - (UE) 1 Tx/2Tx and 2 Rx/4Rx as starting point
  - ~~25%,~~ 50%, 80% (other value is not precluded
  - For TRP spectrum efficiency: full buffer or ftp?
  - Uniform distribution, 10, ~~20 users~~ per TRP or more ~~for full buffer traffic~~

Petitioners' Exhibit 1007, p. 1919
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- UE receiver and/or TRP receiver: Updated to Advanced receiver is not precluded?
- Scheduler?

Continue offline discussion

Friday

R1-166006 WF on remaining issues on SLS parameters for multiple access Huawei, HiSilicon, CATT, Orange, NTT DOCOMO, Vodafone

Decision: The document is noted.

Agreements:

- For multiple access evaluations for eMBB scenarios, both subband and wideband scheduler can be considered
- For multiple access evaluations for eMBB rural scenario:
  - Carrier frequency: 700MHz;
  - ISD: 1732m;
  - BS antenna configuration: 2/4/8 ports
  - UE antenna configuration: 2Tx/1Tx port, 2Rx/4Rx ports;
  - Traffic model:
    - For spectral efficiency: full buffer (NOTE)
    - For user experienced data rate: FTP model 1/3
  - UE density:
    - Full buffer: 10 UE per TRP, other values are not precluded;
  - Traffic load (FTP)
    - 50%, 80%, 25% (optional)
  - NOTE: full buffer evaluation is not used for technical scheme down selection.
- For multiple access evaluations for eMBB dense urban scenario:
  - Layout: Signal layer; Two layers not precluded
  - Carrier frequency: 4 GHz for the single layer
  - BS antenna TXRUs: 4, 8, 16, 32 TXRUs
  - UE antenna TXUs and RXUs: 2/1 TXUs, 2/4 RXUs
  - Traffic model:
    - For spectral efficiency: full buffer (NOTE)
    - For user experienced data rate: FTP model 1/3
  - UE density:
    - Full buffer: 10 UE per TRP, 20 or other values are not precluded;
  - Traffic load (FTP)
    - 50%, 80%, 25% (optional)
  - NOTE: full buffer evaluation is not used for technical scheme down selection
  - Note: Other parameters refer to general assumptions

R1-165916 WF on DL Multiple Access for eMBB MediaTek, Spreadtrum

Decision: The document is noted.

Initial evaluations

R1-166004 Response LS on realistic power amplifier model for NR waveform evaluation RAN4, Nokia

Decision: The document is noted.

R1-166010 WF on power amplifier assumptions for NR wavwform evaluations Nokia, Alcatel Lucent Shanghai Bell

Decision: The document is noted.

Working assumption:

- RAN1 adopts the models provided in RAN4 LS (R1-166004) to the NR UL waveform evaluations

Email discussion and approval about power amplifier assumptions for NR DL waveform evaluations by utilizing R1-166004 and R1-166010 and also email approval to confirm above WA until 9th June – Mihai (Nokia)

R1-165675 Way forward on Case 5 for waveform LLS evaluation Spreadtrum, Orange, ZTE

7.1.3 Waveform and multiple access schemes for new radio interface

7.1.3.1 Waveform

R1-164265 Discussion on FB-OFDM of new waveform for new radio interface ZTE

The document was presented by Yifei Yuan from ZTE.

- *Observation 1: FB-OFDM shares the same baseband signal formulation with some other OFDM-based multi-carrier waveforms including CP-OFDM, CP-OFDM with WOLA, FBMC, FBMC-OQAM and GFDM.*
- *Observation 2: Due to use of polyphase filter, FB-OFDM has the simple implementation in both transmitter and receiver.*
- *Observation 3: FB-OFDM has good flexibility and adaptability in choosing pulse functions and symbol intervals.*
- *Observation 4: Polyphase filter can be used with various OFDM-based multi-carrier waveforms. It is beneficial to make the NR waveform compatible with polyphase filter for the NR forward compatibility.*
- *Observation 5: FB-OFDM has much better OOB performance than CP-OFDM, particularly in the region closing to the edge of transmission band.*
- *Observation 6: FB-OFDM performs better than CP-OFDM when adjacent subbands have different numerologies.*
- *Proposal: To include FB-OFDM with polyphase filter as a waveform scheme in the further NR study.*

Decision: The document is noted.

R1-164619 Flexibly configured OFDM (FC-OFDM) waveform ORANGE

The document was presented by Hao Lin from Orange.

- Proposal 1: Study FC-OFDM as a solution to enable multiple configuration modes' 'multiplexing in frequency domain, allowing necessary flexibility for the NR to support different use cases.
- Proposal 2: Study FC-OFDM as a solution for window design in time domain bringing advantages in terms of support of flexible numerology, coexistence of sync/non-sync transmission, spectral confinement.

Decision: The document is noted.

R1-165011 OFDM based Waveform for 5G new radio interface Nokia, Alcatel-Lucent Shanghai Bell

The document was presented by Karri Ranta-aho from Nokia.

- *Proposal 1: Zero prefix with short sub-band wise filter should be considered when multiplexing different numerologies at low bands.*
- *Proposal 2: PA model needs to be considered into final evaluation of sub-band wise filtered waveforms.*

Petitioners' Exhibit 1007, p. 1921
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- *Proposal 3: UL/DL symmetric CP-OFDMA should be used for eMBB optimized frequency band 3-40 Ghz.*
- *Proposal 4: Single carrier without carrier aggregation should be considered for frequency bands over 40 Ghz*
- *Proposal 5: Replacement of CP by zero value which are part of the symbol itself needs to be considered.*

Decision: The document is noted.

R1-164355 Circularly Pulse Shaped OFDM-based Waveform Idaho National Laboratory

The document was presented by Ramon Khalona from INL.

- *Proposal: DFT-S-OFDM should be considered as the baseline waveform for the uplink due its PAPR performance.*
- *Proposal: Filtering/windowing techniques must be added to the DFT-S-OFDM to improve its OOBE characteristics.*
- *Observation: To meet the NR requirements such as improving battery life of the mMTC and D2D devices new functionalities must be added to improve the existing OFDM-based DFT-S-OFDM waveform.*
- *Observation: Circular Pulse Shaping provides significant gain of at least 1.2dB and at least 3.2dB over DFT-S-OFDM and OFDM respectively.*
- *Proposal: RAN1 should consider SC-CPS-FDMA because of its improved PAPR performance over SC-FDMA while still providing all the benefits of SC-FDMA.*
- *Observation: SC-CPS-OFDM is amicable to MIMO technologies and provides greater flexibility for CFO compensation.*

Decision: The document is noted.

R1-165035 [NR] 5G waveforms PAPR and out of channel emissions measurements Skyworks Solutions Inc.

The document was presented by Dominique Brunel from Skyworks.

- Proposal 1: Refocus efforts on reduced PAPR for the 5G NR UL, whether
  - Retaining the present PAPR performance of single-carrier SC-FDMA as in LTE-A,
  - Revisiting encoding and multiple access schemes that enable PAPR reduction, and
  - Explore alternative means to guarantee out-of-channel emissions than simply to rely on native PA linearity at significant DC current consumption penalty for the UE.
- Proposal 2
  - LTE and Wi-Fi PA measurements results with candidate waveforms shall serve as the benchmark for modelling.
  - Impact of memory effect for higher frequencies and wider bandwidths as intended by NR/5G shall be assessed for power amplifier modelling.
- Observation 1
  - For a fully allocated channel, at the output of the PA, initial waveform localization properties are lost and out-of-channel spectral emissions are degraded to the same values limited by the PA nonlinearity.
  - For a fully allocated channel, higher PAPR waveforms result in lower transmitted power and reduced DC efficiency
- Observation 2
  - For a partially allocated channel, at the output of the PA initial waveform localization properties are lost and out-of-channel emissions are degraded to the same values limited by the PA nonlinearity
  - For a partially allocated channel, higher PAPR waveforms result in lower transmitted power and reduced DC efficiency
- Observation 3: Both LTE high band and Wi-Fi 5GHz high performance PAs are good candidates for modelling and testing NR waveforms at less than 6GHz frequencies for channel bandwidths at least equal to 200MHz.
- Observation 4: Simple AM/AM + AM/PM model is not representative of power amplifier non linear behaviour for wide bandwitdth and/or frequencies higher than 6GHz. Models accounting for memory effects, bias network bandwidth limitations, etc. should be studied in order to refine the accuracy and predictability of such models. Application of PA models for mm Wave will also need to be inclusive of additional parasitics and test method limitations.

Decision: The document is noted.

R1-165113 OFDM-Based Waveform With Precoding Techniques National Taiwan University

The document was presented by … from NTU.

- Proposal: For any OFDM-based waveform, both frequency-domain precoding and time-domain filtering techniques for low OOBE shall be considered.
- Observation: GFDM can be regarded as a precoded-OFDMA waveform that meets the objective of this study item [1]:
  - Fundamental physical layer signal structure for new RAT
    - Waveform based on OFDM, with potential support of non-orthogonal waveform and multiple access

Decision: The document is noted.

R1-165257 Link level evaluation of waveforms for open-loop synchronized Uplink KDDI Corporation

The document was presented by … from KDDI.

- *Observation 1: In an open-loop synchronized Uplink scenario, ZT-OFDM presents performance close to the case with zero delay for moderate SNR and reaches an error floor (below BLER = 1e-2 for 16-QAM) at high SNR.*

Petitioners' Exhibit 1007, p. 1922
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- *Observation 2: In an open-loop synchronized Uplink scenario, the use of low power tail truncation, in addition to providing potential energy saving gains, appears beneficial to the performance when performed at a local minimum of the low power tail of the time-domain waveform.*
- *Proposal: We suggest that in future evaluations, the case in which the ratio of IDFT and DFT sizes at the transmitter is an integer may be considered, as it results in specific time-domain characteristics of the ZT-OFDM waveform with the potential to increase the performance gain obtained by truncation of the low power tail.*

Decision: The document is noted.

R1-164028 Link-level evaluation results for UW-DFT-s-OFDM Mitsubishi Electric Co.

The document was presented by Cristina Ciochina-Duchesne from Mitsubishi.

- Observation 1: UW DFT-s-OFDM has superior OoB suppression performance with respect to SC-FDMA.
- Observation 2: UW-DFT-s-OFDM and SC-FDMA have the same PAPR performance.
- Observation 3: DFT-FDE-IDFT modules in LTE-SC-FDMA can be used for UW-DFT-s-OFDM and CP removal module is not needed
- Observation 4: UW serves as CP and sufficient FER performance can be obtained by controlling length of UW
- Observation 5: At the OOBE target 26.3dB, UW DFT-s-OFDM outperforms SC-FDMA at SNR below 30dB in the ETU channel. In the EPA channel, UW DFT-s-OFDM outperforms SC-FDMA.
- Observation 6: UW-DFT-s-OFDM is robust against interference from adjacent channels
- Observation 7: UW-DFT-s-OFDM is a waveform with suppressed OOBE, robust performance in multipath fading and tolerance against adjacent channel interference.
- Proposal 1: Investigate UW-DFT-s-OFDM as a potential waveform candidate
- Proposal 2: Investigate location and length of UW for UW-DFT-s-OFDM to achieve the best tradeoff

Decision: The document is noted.

R1-165620 Performance Results for OTFS Modulation Cohere Technologies

The document was presented by … from Cohere and provides performance comparisons showing the superior performance of OTFS especially in the high mobility (high speed train) use case; 6 dB improvement or more is seen at vehicle speeds of 500 Km/h. This kind of improvement can allow high throughput operation in high mobility cases without requiring increasing the subcarrier spacing and incurring the increased CP overhead associated with a larger subcarrier spacing.

Decision: The document is noted.

R1-165108 Waveform candidates for NR Motorola Mobility

The document was presented by … from MotM.

- RAN1 should consider additional criteria/metrics for evaluation of waveforms for downlink and uplink, such as complexity/efficiency of pilot signal generation/channel estimation, integration/pairing with MIMO, latency/efficiency of short-packets transmission / reception, time/frequency synchronization robustness.
  - A metric may have a different degree of importance for sub-6Hz and >6GHz frequency bands.
- The criteria/metrics should be used to study benefits of new waveforms over LTE OFDM/SC-FDM waveform with improved (e.g., 95%) bandwidth occupancy.

Decision: The document is noted.

R1-165648 WF on OFDM based waveform in NR Samsung

- The following OFDM-based waveform variants should be evaluated for RAN1 NR waveform candidates
  - OFDM with guard interval (e.g., CP, ZP, …)
  - DFT-s-OFDM with guard interval
    - SC-FDE with guard interval can be considered as a special case of DFT-s-OFDM
  - Note: Each company should provide details on the DFT-spreading, filtering/windowing applied to OFDM waveform for evaluation
    - RAN1 strives for minimization of the number of waveform(s) supported in NR considering performance, specification impact, and UE/eNB complexity

Discussion: Huawei → no real progress compared to what has been already agreed.

Decision: The document is noted.

Possible agreements:

- The following OFDM-based waveform variants should be evaluated for RAN1 NR waveform candidates
  - OFDM with guard interval (e.g., CP, ZP, …)
  - DFT-s-OFDM with guard interval
    - SC-FDE with guard interval can be considered as a special case of DFT-s-OFDM
  - Filtering and/or windowing on OFDM/DFT-s-OFDM with guard interval
  - Note: Each company should provide details on the DFT-spreading, filtering/windowing applied to OFDM waveform for evaluation

Petitioners' Exhibit 1007, p. 1923
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- RAN1 strives for minimization of the number of waveform(s) supported in NR considering performance, specification impact, and UE/eNB complexity

Wednesday:

Agreements:

- The following OFDM-based waveforms should be used as RAN1 NR waveform performance reference:
  - OFDM with CP
  - DFT-s-OFDM with CP
- All waveform in RAN1 #84bis/#85 meeting can be evaluated based on agreed assumptions
  - Note: Each company should provide details on the DFT-spreading, guard interval, Tx/Rx filtering and/or windowing applied to OFDM waveform for evaluation

R1-165665 WF on definition of OFDM based waveform Spreadtrum, Orange, Sony, Cohere, NTU

The document was presented by Jinhui Chen from Spreadtrum.

- Definition: An OFDM-based waveform is a waveform based on IDFT(IFFT) operation.
  - Includes at least CP-OFDM, OFDM-WOLA, f-OFDM, FB-OFDM, UFMC, GFDM, W-OFDM, FBMC-OQAM, FC-OFDM, UW DFT-S-OFDM, GI DFT-S-OFDM, DFT-S-OFDM, variants of DFT-S-OFDM, OTFS, etc.

Discussion: Spreadtrum very upset and stressed for targetting to select/narrow-down options without much evaluation results been presented yet.

Decision: The document is noted.

R1-165666 Way forward on categorization of IFFT-based waveform candidates Orange, Spreadtrum, InterDigital, ZTE, Cohere, Telstra

Categorization of IFFT-based waveform candidates can be summarized as:

	time domain windowing	**time domain filtering**	**w.o. windowing/filtering**
multi-carrier (MC)	FBMC-OQAM FB-OFDM FC-OFDM GFDM W-OFDM OTFS*	f-OFDM FCP-OFDM UF-OFDM OTFS*	CP-OFDM OTFS
single-carrier (SC)	DFT spreading + TDW MC candidates	DFT spreading + TDF MC candidates	

* Application of time domain windowing or filtering to OTFS is FFS

Decision: The document is noted.

Thursday

R1-165857 Summary and observations on simulation results in Cases 1a, 1b and 2 Spreadtrum, Orange, National Taiwan University, ZTE

- Observation: Under the given simulation assumptions, most new waveforms discussed so far outperform CP-OFDM/DFT-S-OFDM(SC-FDMA) for Case 1a, 1b, 2.

Decision: The document is noted.

Not treated.

7.1.3.2 Multiple access scheme

R1-163992 Non-orthogonal multiple access candidate for NR Samsung

The document was presented by … from Samsung.

- *Observation 1: The aforementioned NoMA schemes have potential to accommodate more users with limited resource, which is subject to the availability of well-designed codebooks or code sequences. It may be challenging to provide well-designed code resources for multiplexing large number of UEs in one dimension with a view to future proof.*
- *Observation 2: To bring NoMA supporting large number of UEs into reality, multi-user detection (MUD) with practically feasible complexity MUST be viable, which needs further careful verification.*
- *Observation 3: IGMA provides flexibility to choose bit level interleavers and/or grid mapping pattern to separate users. With the abundant source generated by bit-level interleavers and grid mapping patterns, the scalability to support different connection densities could be easily supported.*
- *Observation 4: The symbol-level interleaving randomizes the symbol sequence order, which may further bring benefit in terms of combating frequency selective fading and inter-cell interference.*
- *Observation 5: The IGMA scheme could apply relatively low-complexity multi-user detector and sparse grid mapping pattern could further reduce detection complexity.*
- *Proposal 1: the interleaver-based multiple access scheme (IGMA) should be evaluated as a candidate multiple access scheme for NR.*
- *Proposal 2: The proposed NoMA schemes should be evaluated taking into account their performance improvements, impact on receiver complexity, and feasibility of required specification support.*

Decision: The document is noted.

R1-164329 Initial LLS results for UL non-orthogonal multiple access Fujitsu

The document was presented by … from Fujitsu.

- *Observation 1: LDS CDMA seems to be a simple and effective multiple access scheme.*
- *Observation 2: RE mapping across RBs has the potential to save reference signals and gain from diversity.*
- *Observation 3: User signature vector extension by transforming two signature vectors into a larger vector has a potential to further exploit diversity gain.*
- *Proposal 1: Consider RE mapping across RBs for LDS (low density spreading) types of multiple access.*
- *Proposal 2: User signature vector extension can be considered for performance enhancement.*
- *Proposal 3: Consider LDS CDMA as a candidate multiple access scheme.*

Decision: The document is noted.

R1-164656 Consideration on the Non-Orthogonal Multiple Access for NR Sony

The document was presented by … from Sony.

- Proposal 1: The power domain NOMA and the code domain NOMA, which includes the “Spreading”, “Scrambling” and/or “Interleaving” functions, should be considered.
- Proposal 2: RAN1 should consider new specific information which all superposed UEs can know without assistance information to ease the use of NOMA technologies.

Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1925
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165019 Non-orthogonal multiple access for New Radio Nokia, Alcatel-Lucent Shanghai Bell

The document was presented by … from Nokia.

- Proposal 1: Both spreading and non-spreading based non-orthogonal multiple access shall be considered, targeting for diversified NR usage scenarios and use cases.
- Proposal 2: The design of the non-orthogonal multiple access needs to joint consider: the supported number of connections, the receiver complexity, the flexibility of resource allocation, the PAPR impact, the standard impact.
- Proposal 3: Non-orthogonal coded access (NOCA) using LTE defined low correlation sequences is taken as the baseline for spreading based non-orthogonal multiple access.

Decision: The document is noted.

R1-165021 Performance of Interleave Division Multiple Access (IDMA) in combination with OFDM family waveforms Nokia, Alcatel-Lucent Shanghai Bell

Proposal: Investigate IDMA and its combination with OFDM family waveforms w.r.t. frequency diversity gain, complexity and its potential in uplink in conjunction with service requirements (such as suitability for machine type communication with relaxed timing alignment).

Decision: The document is noted.

R1-165004 Contention based multiple access for NR uplink Sharp

The document was presented by … from Sharp.

- Multiple access scheme candidates should be categorized based on the principle of access scheme, e.g., code, or power.
- Multiple access scheme candidates should be studied considering their pros and cons, their ability to maximize KPIs for the NR RAT, and whether KPIs can be enhanced by combining aspects of these schemes.

Proposals:

- Each company is encouraged to report the receiver assumption and whether time-domain partial contention occurs or not in the evaluation.
- RAN1 should clarify not only system bandwidth but also transmission bandwidth of mMTC UEs for evaluations.

Decision: The document is noted.

R1-164869 Low code rate and signature based multiple access scheme for New Radio ETRI

The document was presented by … from ETRI.

- *Proposal 1: Non-orthogonal multiple access with asynchronous transmission should be investigated/evaluated for the uplink of mMTC.*
- *Proposal 2: At least for mMTC, LSSA can be considered as a candidate for non-orthogonal multiple access scheme, supporting massive connectivity and low power consumption.*

Decision: The document is noted.

R1-165653 WF on scenarios for non-orthogonal multiple access CATT

The document was presented by Yanping Xing from CATT.

- Besides the study of DL transmission from single TP, study multiple data streams from different TPs transmitting to a UE with non-orthogonal multiple access scheme for eMBB
- Evaluate the above scheme in the following scenarios
  - dense urban with two-layers
  - Indoor hotspot

Decision: The document is noted. Continue offline discussion.
Wednesday: CATT suggested continuing until next meeting.

R1-165618 WF on categorizing candidate multiple access schemes for NR CMCC, Huawei, HiSilion, CATT

The document was presented by … from CMCC.

- The Non-orthogonal MA can be categorized based on their way to superpose users:
- Category 1: Spreading based (e.g., MUSA, PDMA, SCMA etc)
  - Subcategories for the above categories are FFS.
- Category 2: Non-spreading based (e.g., NOMA etc)
- NR MA should support flexible selection and / or adjustment between orthogonal MA and non-orthogonal MA depending on specific conditions.

Discussion: Purpose for categorizing unclear (Ericsson)
ZTE→ purpose is to assess performances for each categories
Decision: The document is noted.

Possible observations:

Petitioners' Exhibit 1007, p. 1926
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- More than 10 non-orthogonal MA schemes are proposed in the contribution of RAN-1 #85.
- Most proposed non-orthogonal MA schemes are Spreading based schemes.

Possible agreements:

- From preliminary LLS results presented in the extensive contributions of RAN-1 #85, non-orthogonal MA has been proved to have gain over orthogonal MA, especially in overloaded transmission scenarios.
  - The Non-orthogonal MA can be categorized based on their way to superpose users:
    - Category 1: Spreading based (e.g., MUSA, PDMA, SCMA etc)
      - Subcategories for the above categories are FFS.
    - Category 2: Non-spreading based (e.g., NOMA etc)
  - NR MA should support flexible selection and / or adjustment between orthogonal MA and non-orthogonal MA depending on specific conditions.

R1-165596 WF on categorization for multiple access schemes ZTE, ZTE Microelectronics, Qualcomm Inc.

The document was presented by Yifei Yuan from ZTE.

- For uplink mMTC scenario, the scheme categorization can be based on the way UEs' data are separated
  - Category 1: Spreading using random-like sequences or patterns
    - Examples as MUSA, RSMA, NCMA, NOCA, low code rate spreading
  - Category 2: Structured-codebook based
    - Examples as SCMA, PDMA
  - Category 3: Interleaving based
    - Examples as IGMA, IDMA

Decision: The document is noted.

R1-165702 WF on categorizing candidate multiple access schemes for NR CMCC, ZTE, Huawei, HiSilicon, CATT, Intel, INTERDIGITAL

- Non-orthogonal multiple access schemes can be categorized based on the ways to separate different users:
  - Category 1: Code domain based
  - Category 2: Interleaver based
  - Category 3: Power domain based
  - Schemes that have features of combined categories are not precluded.

Discussion: Intel withdrew their support.
Also supported by Qualcomm, Spreadtrum.
LGE: at least an answer regarding their concern should be provided – what are the motivations of these categorizations?
DOCOMO: concern how the simulation results can/will be exploited?
Decision: The document is noted. Continue offline discussion.

R1-165595 WF on scenarios for multiple access ZTE, ZTE Microelectronics, InterDigital, Qualcomm Inc., Spreadtrum

The document was presented by Yifei Yuan from ZTE.

- Autonomous/grant-free/contention based UL non-orthogonal multiple access has the following characteristics
  - A transmission from UE does not need the dynamic and explicit scheduling grant from eNB
  - Each time in transmission, a UE randomly chooses a code/sequence or a pattern of interleaver from a pool known to eNB and UE before hand
  - Multiple UEs can share the same time and frequency resources
- For autonomous/grant-free/contention based UL non-orthogonal multiple access, the following should be studied
  - Collision of code/sequence/interleaver pattern from different UEs but on the same resource
  - Potentially relaxed requirement for UL synchronization (DL synchronization assumed)
    - Case 1: Timing offsets between UEs are within a cyclic prefix
    - Case 2: Timing offsets between UEs can be greater than a cyclic prefix, FFS the exact model of timing offsets
  - Potentially relaxed requirement for power control, i.e., no closed-loop
    - Case 1: Perfect open-loop power control, i.e., equal average SNR between UEs
    - Case 2: Realistic open-loop power control with certain alpha and P0 values
    - Case 3: no power control

Discussion: Also supported by ETRI.
Decision: The document is noted, modified and agreed as follows:

Agreements:

- Autonomous/grant-free/contention based UL non-orthogonal multiple access has the following characteristics
  - A transmission from UE does not need the dynamic and explicit scheduling grant from eNB
  - Multiple UEs can share the same time and frequency resources
- For autonomous/grant-free/contention based UL non-orthogonal multiple access, the following should be studied

- Collision of time/frequency resources from different UEs, solutions potentially including
  - E.g., code, sequence, interleaver pattern
- UL synchronization (DL synchronization assumed)
  - Case 1: Timing offsets between UEs are within a cyclic prefix
  - Case 2: Timing offsets between UEs can be greater than a cyclic prefix, FFS the exact model of timing offsets
- Requirement for power control
  - Case 1: Perfect open-loop power control, i.e., equal average SNR between UEs for potentially link level calibration
  - Case 2: Realistic open-loop power control with certain alpha and P0 values
  - Case 3: Close-loop power control
- Receiver impact

R1-165656 WF on multItiplke access scheme for NR Uplink NTT DOCOMO, Panasonic, LG

The document was presented by Ryosuke Osawa from NTT DOCOMO.

- Synchronous/UL grant-based orthogonal multiple access should be considered as the baseline UL transmission scheme at least for eMBB
  - Note: Synchronous means that timing offset between UEs is within cyclic prefix by e.g. timing alignment

Decision: The document is noted and agreed as follows:

Agreements:

- NR supports at least synchronous/scheduling-based orthogonal multiple access for DL/UL transmission schemes, at least targeting for eMBB
  - Note: Synchronous means that timing offset between UEs is within cyclic prefix by e.g. timing alignment

Wednesday

R1-165816 WF on considerations for multiple access LG Electronics, Ericsson

- For the study on multiple access,
  - Benefits of multiple access schemes should be assessed in considerations of other features especially MIMO aspect with larger number of antenna ports as below:
    - at least 8 at eNB side
    - at least 4 at UE side for eMBB usage scenario

Decision: The document is noted.

7.1.4 Numerology and frame structure for new radio interface

R1-165112 NR Numerology Design Principles Qualcomm Incorporated

The document was presented by Jing Jiang from Qualcomm and proposes the following Way Forward:

- In RAN1 #85, RAN1 could agree on the scaling methodology in frequency:
  - The subcarrier spacing for the NR scalable numerology should scale as
    - $f_{sc} = f_0 * 2^m$
    - where
      - f_0 is FFS
      - m is an integer chosen from a set of possible values
- In RAN1 #86, RAN1 could agree on the specific values of
  - f_0 and m

Decision: The document is noted.

R1-164692 Numerology and TTI multiplexing for NR Forward Compatibility Analysis Qualcomm Incorporated

- Proposal 1: NR should support multiplexing of services of different numerologies in the same carrier.
- Proposal 2: NR should support short subframes by scaling the number of symbols.
- Proposal 3: NR should support low latency services with short subframes by scaling up SCS (i.e., scaling down symbol duration).
- Proposal 4: scaled numerology should have multi-symbol unit aligned with the symbol boundary of the original numerology for efficient numerology multiplexing.
- Proposal 5: subframe interval and boundary should aligned irrespective of the underlying PHY numerology for efficiency and simplicity.
- Proposal 6: power of 2 symbols numerology should be considered jointly with NR frame structure, URLLC forward compatibility design.

Decision: The document is noted.

R1-164271 Overview of numerology candidates ZTE

The document was presented by Thorsten Schier from ZTE.

- Observation 1: Alt 1 (NCP) 15 kHz and Alt 3 17.07 kHz have similar performance, also for very long DS. Alt 3 outperforms Alt 1 when achieving low-latency subframes (0.125 ms) at very long DS.
- Observation 2: Mixed-radix DFT complexity is not more than 28% higher than FFT. Mixed-radix DFT provides additional flexibility.
- Observation 3: Alt 2-4 have better forward compatibility for a smooth evolution to fewer symbols per subframe.
- Proposal 1: A mixed-radix DFT approach should be adopted, so that a smooth introduction of future features and services that may require new unscaled CP durations is ensured, without changing the unscaled symbol durations or the frame structure.
- Observation 4: All numerology candidates offer co-existence with LTE and NB-IoT.
- Proposal 2: A numerology with 2^m symbols (m is an integer) per subframe is adopted in NR.
- Proposal 3: NR adopts numerologies based on Alt 3.

Decision: The document is noted.

R1-164031 Analysis and comparison on numerology candidates Huawei, HiSilicon

The document was presented by David Mazzarese from Huawei and provides the comparison of 15kHz family and 17.5kHz family summarized in Table4, and considering the performance in **Error! Reference source not found.**R1-164030] which shows 15kHz outperforms 17.5kHz family, 15kHz family subcarrier spacing is proposed for NR.
Discussion: Qualcomm does not agree with "For NR using 15kHz, there is no interference between NR and NB-IOT"
Decision: The document is noted.

Qualcomm suggested more offline discussion on:
How to achieve reduced latency?
How to achieve multiplexing efficiency?
How to align TTI/ symbol boundary
How to fix overhead for normal CP?

Petitioners' Exhibit 1007, p. 1929
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-164622 **NR numerology Ericsson**

The document was presented by Stefan Parkvall from Ericsson.

- RAN1 concludes on alternative 1 (Subcarrier-spacing values include 15 kHz subcarrier-spacing (i.e., "LTE-based" numerology)) as the baseline for the NR numerology
- RAN1 concludes on scale factors N =2^n as the baseline for the NR numerology.

Decision: The document is noted.

R1-165439 **Views on numerology for NR** **NTT DOCOMO, INC.**

The document was presented by Fred Takeda from NTT DOCOMO.

- Observation 1: Possible subcarrier spacing is determined by f_0*2^m where m is an integer.
  - f_0=15kHz and m is an integer.
- Observation 2: Fixed CP overhead ratio for different subcarrier-spacing would be sufficient as normal CP operation.

The following table is proposed as a starting point.

	Set 1	Set 2	Set 3	Set 4	Set 5	Set 6	Set 7	Set z
SC-spacing (kHz)	15	30	60	120	240	480	960	...
CC BW (MHz)	X	2X	4X	8X	16X	32X	64X	...
Symbol length (us)	66.67	33.33	16.67	8.33	4.17	2.08	1.04	...
CP-length (us)	4.69	2.34	1.17	0.59	0.29	0.15	0.07	...
SF length (ms)	TBD after identifying detailed scheduling operations in NR							
Frame length (ms)	Periodicity of fixed DL resources can be a starting value							
Note	At least it is necessary to cover X = 20, and it is beneficial to cover X=40 FFS further wider bandwidth							

Decision: The document is noted.

R1-165525 **Discussion on NR numerology** **KT Corp., Verizon Wireless**

The document was presented by Hyojin Lee from KT.

Proposal 1:

- *LTE based numerology including 15 kHz subcarrier-spacing should be the baseline for NR design*
- *Alternative proposals have to be justified based on concrete use cases and significant benefits in performance or implementation perspective*

Observation 1: Taking into account available BW for NR, there are some deployment cases that cannot be efficiently supported only with 2^m scaling values for subcarrier spacing

Observation 2:

- *The scalable way as agreed in RAN1#84bis would be beneficial for different carrier frequencies since a basic frame structure and design can be easily re-used*
- *However, it is quite difficult to find any reason why the scaling to support different carrier frequencies should be restricted in 2^m values.*

Observation 3:

- *Since the basic NR system operation would be for eMBB services in most cases, it would be a sufficient design requirement that subcarrier spacing values for URLLC and mMTC should be multiplies or divisors of the one for eMBB rather than 2^m scaling relationship*
- *More important design factors should be the requirements derived for different use cases in [TR 22.891] and [*TR 38.913*]*

Proposal 2: The scalable numerologies should be designed under the assumption of linear scaling values rather than being restricted in 2^m scaling values taking into account the following three aspects:

- *To efficiently utilize available 5G bandwidths*
- *To cover wide range of target frequency up to 100GHz*
- *To support multiple use cases in the same carrier frequency*

Decision: The document is noted.

R1-165517 **WF on scaling of subcarrier spacing in NR** **Samsung, Intel, KT Corp., Verizon Wireless, Fiberhome**

Petitioners' Exhibit 1007, p. 1930
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- $f_{sc} = f_0 * M$ *(Alt. 2)* should be taken into account as the scaling method of subcarrier spacing in NR SI where $f_0 = 15$ *kHz.*
- Subcarrier spacing values to be studied in NR SI include at least
  - *{15, 30, 60, 75, 120, 150, 240, 300} kHz*

Decision: The document is noted.

Working assumption

- RAN1 concludes on alternative 1 (15 kHz) as the baseline design assumption for the NR numerology
- RAN1 concludes on scale factors N =2^n for subcarrier spacing as the baseline design assumption for the NR numerology.

Supported by Ericsson, MediaTek, Fujitsu, Panasonic, Nokia, ASB, LGE, Huawei, HiSilicon, NTT DOCOMO, Sharp, CATT, ETRI, ITRI
CMCC: object to the working assumption
Qualcomm: does not agree with 1st bullet
KT: this represents a majority's view, no consensus - should not be taken as a working assumption
Ericsson: it can always be revisited at next meeting if deemed necessary
NTT DOCOMO: if WA is to be rediscussed, should be wise to define a deadline for bringing any critical issues up – otherwise we enter in an endless discussion

Possible working assumption (CMCC, Qualcomm, KT)

- RAN1 concludes on scale factors N =2^n as the baseline design assumption for the number of OFDM symbols per 1ms

Continue offline: CMCC

Possible conclusions:

- If RAN1 finds issues about above WA including the following criteria, RAN1 should compare WA and "scale factors N = 2^n as the baseline design assumption for the number of OFDM symbols per 1 msec" by Wednesday
  - Design complexity
  - Compatibility of different numerology from time domain and frequency domain
  - Latency
  - Multiplexing efficiency
  - TTI/symbol boundary alignment
  - Overhead of Normal CP
  - Coexistence with NB-IoT and LTE
  - Scalable set of supportable CC BW

R1-165583 WF on Scalable Numerology Symbol Boundary Alignment Qualcomm, ZTE, ETRI, NEC, OPPO , Panasonic, DoCoMo, Deutsch Telecom, Convida Wireless,
Decision: The document is noted. Continue offline discussion until Wednesday

---

Wednesday
R1-165821 WF on Scalable Numerology Symbol Boundary Alignment Panasonic, InterDigital, Ericsson, Fujitsu, NTT DOCOMO
Decision: The document is noted.

Possible agreements:

- In case of F0=15 kHz, with Fs=15 kHz symbol boundary of normal CP is aligned with LTE.
- For scaled numerology Fs = F0*M, in the case where Base numerology contains N symbols per ms and scaled numerology contains N*M symbols per ms
  - Each symbol length (including CP) of base numerology (w/ SCS = F0) equals the sum of the corresponding M symbols of scaled numerology (w/ SCS = Fs)
  - Each symbol may not necessarily be of the same length (e.g. in LTE numerology, symbol0 is long than symbol 1, 2, … 6)
  - Multiple CP durations per each numerology is not precluded:
    - For each CP family (NCP or ECP), each symbol length (including CP) of base numerology (w/ SCS = F0) equals the sum of the corresponding M symbols of scaled numerology (w/ SCS = Fs)
- Above is not related to synchronization among multiple transmitters like network synchronization, synchronization among UEs, different NR carrier bandwidth and so on.

Continue offline discussion until Thursday – Suzuki (Panasonic)

Thursday
R1-165886 WF on Scalable Numerology Symbol Boundary Alignment Panasonic, Intel, Samsung, NTT DOCOMO, Qualcomm, Huawei, Mediatek
Decision: The document is noted.

Working assumption:

Petitioners' Exhibit 1007, p. 1931
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- In the case of subcarrier spacing 15 kHz and 14 symbols per 1ms, the following applies:
  - Baseline: Symbol boundary is aligned with LTE of normal CP

Agreement: For the numerology with 15 kHz and larger subcarrier spacing ,1 msec alignment is supported

---

R1-165841 **WF on NR CP type Huawei, HiSilicon, Intel, LGE, CATT, IITH, CEWiT, Reliance-jio, Tejas Networks, Samsung, NEC, Sony, Fujitsu, Vodafone**

- Multiple CP types should be allowed for each NR subcarrier spacing

Discussion: Qualcomm → concern on complexity – why not start with 1CP, optimize it and then decide
Nokia: clearly RAN1 should concentrate on normal CP, should take design decisions that do not prevent using any future extended CP.
Erricsson: Agree with Nokia – should not preclude having multiple CPs
Huawei: believes the need for multiple CP is already there
Decision: The document is noted.

Possible agreement: Multiple CP types/lengths without having scaling subcarrier spacing should be allowed
Continue offline discussion until Thursday – David (Huawei)

Thursday

R1-165878 **WF on further step on numerology study Huawei, CMCC, National Instruments, Ericsson, Orange, Vodafone, Panasonic**

- RAN1 should investigate the impact of supporting the following non-mutually exclusive options:
  - Multiple CP lengths by scaling subcarrier spacing using a single CP type/option, and enabling OFDM symbol alignment among scaled numerologies (R1-165821)
  - Multiple CP types/options without scaling subcarrier spacing (R1-165841)
  - Multiple network configuration options where the system can operate with different CP overheads (R1-165719)

Decision: The document is noted.

R1-164674 **see 7.1.1**
R1-164632 **Flexible bandwidth in NR Ericsson**
Decision: The document is noted.

Agreements:

- NR should support of flexible NW and UE channel bandwidth
- FFS: NR carrier bandwidth should consider to allow efficient unlicensed spectrum access
- The NR physical-layer design should allow for fine granularity in terms of NR carrier bandwidth
- The NR physical-layer design should be such that devices with different bandwidth capabilities can efficiently access the same NR carrier regardless of the NR carrier bandwidth
  - FFS: minimum bandwidth
- FFS: There should not be an assumption that devices necessarily support the same set of bandwidths for transmission and reception
- FFS: There should not be an assumption that the network carrier bandwidth is necessarily the same for downlink and uplink

---

Wednesday

R1-165731 **Way forward on Numerology LG Electronics, NTT DOCOMO, Sprints, LGU+**
Decision: The document is noted.
R1-165660 **WF on Scalable NCP Qualcomm Incorporated, ZTE**
Decision: The document is noted.
R1-165719 **Discussion on frequency-domain initiated numerology and time-domain initiated numerology CMCC**
Decision: The document is noted.

Possible conclusions:

- RAN1 will evaluate CP length(s) for different deployments scenarios and different services
- RAN1 should carefully make decision on such kind of key parameters and design principle than dependent on more studies and evaluation. Especially full comparison from different aspects should be done to guarantee we are on the right way. Based on above observation. we propose to do some comparison from following aspects(not limited to):
  - Design complexity and future design effort
  - Overall performance
  - Compatibility of different numerology from time domain and frequency domain

Petitioners' Exhibit 1007, p. 1932
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Multiplexing efficiency
- Latency
- Coexistence with NB-IoT and LTE
- Scalable set of supportable CC BW

Continue offline discussion.

Thursday

R1-165842 Proposals for evaluation of CP requirements in NR CMCC

- To evaluate what is the minimal CP length in NR considering existed knowledge on delay spread
  - Scaled CP and Scaled numerologies Vs Unscaled CP and Scaled numerologies
  - Unscale CP assumes two values for comparison
    - Comparable NCP used in LTE, e.g., for 2^N SCS scheme, 4.71us, for 2^N OS scheme 5.36us
    - Half of Comparable NCP used in LTE, e.g., for 2^N SCS scheme, about 2.36us, for 2^N OS scheme about 2.68us

Decision: The document is noted.

Conclusion: For CP based scheme, companies are encouraged to evaluate/investigate necessary CP lengths for different numerologies

---

R1-165734 WF on subcarrier spacing in NR Verizon Wireless, KT Corp., Reliance-jio, CHTTL, Samsung, Intel, Potevio, Fiberhome, IITH, CEWiT, Tejas Neworks

- Working Assumption discussed on Monday should be revisited to resolve the issues identified with 2^m scaling
- Take the following as the revised working assumption on subcarrier spacing:
  - *Working assumptions*
    - *RAN1 concludes on alternative 1 (15 kHz) as the baseline design assumption for the NR numerology*
    - *RAN1 concludes on scale factors N =2^n for subcarrier spacing as the baseline design assumption for the NR numerology*
    - *RAN1 should include the subcarrier spacing {75} kHz for different CC BW support*

Discussion: Objection from Qualcomm, Nokia, ASB, Huawei, HiSilicon, Fujitsu adding the third bullet in the WA

Decision: The document is noted.

Thursday

R1-165891 WF on subcarrier spacing in NR Verizon Wireless, KT Corp., Reliance-jio, CHTTL, China Telecom, Samsung, Intel, Potevio, Fiberhome, IITH, CEWiT, Tejas Neworks, Straight Path, ITL, WILUS

- *Working assumptions*
  - *RAN1 concludes on alternative 1 (15 kHz) as the baseline design assumption for the NR numerology*
  - *RAN1 concludes on scale factors N =2^n for subcarrier spacing as the baseline design assumption for the NR numerology*
  - *RAN1 include 75 kHz for subcarrier spacing as the additional baseline design assumption for the NR numerology*

Decision: The document is noted.

Conclusion: RAN1 will continue investigations on how to achieve effective use for variable bandwidths until the next meeting

Observations: Some companies proposed followings

- introducing a complementary scale factor leading to subcarrier spacing of 75 kHz for support of 100 MHz (in R1-165891)
- f0 = 17.5 kHz subcarrier spacing (R1-165112)
- f0 = 17.07 kHz subcarrier spacing (R1-164271)

R1-165807 Way forward on timing relations for NR Frame Structure CMCC, CATT, OPPO, MediaTek, Lenovo

Decision: The document is noted. Revised in:

R1-165871 Way forward on timing relations for NR Frame Structure CMCC, CATT, OPPO, MediaTek, Lenovo, Huawei, HiSilicon

- NR should at least support common design of timing relation for TDD and FDD (i.e., duplex agnostic timing relation design) in the following aspects,
  - Timing relations between DL assignment and the corresponding DL data transmission
  - Timing relations between DL data and the corresponding DL data acknowledgement
  - Timing relations between UL grant and the corresponding UL data transmission
  - Timing relations between UL data and the corresponding UL data transmission
- The common design shall consider, e.g.,
  - The indication of the timing relation, e.g., DCI and/or RRC and/or others, shall be duplex agnostic.
- Note: this does not preclude any optimization for either TDD only or FDD only

Petitioners' Exhibit 1007, p. 1933
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted.

Agreements:
- RAN1 strives for maximizing commonality between TDD and FDD
  - It is preferable that mechanisms to indicate the timing relation are duplex agnostic
  - Note: This does not preclude any optimization either for FDD only or TDD only

---

R1-165456 Summary of email discussion on frame structure Qualcomm Incorporated

The document was presented by Joseph Soriaga from Qualcomm.

- Potential Agreement 1: NR frame structure should defined using two basic types of time intervals: time interval A which would be expressed as multiple of symbols, and time interval B which is expressed as absolute time (nominally 1ms). An integer scaling relationship between these two time intervals may follow from the numerology for subcarrier spacing.
- Observation 1: When the time interval A is shortened/extended, the frequency granularity is also scaled to wider/narrower. One atomic block size is defined dimensioned by one time interval A and one frequency granularity.
- Potential Agreement 2: An atomic block size is basically common between paired and unpaired spectrum. Specific optimization for paired and unpaired spectrum is not precluded.
- Observation 2: There was commonality in defining time interval A to have up to one switch between DL and UL.
- Potential Agreement 3: Consideration of baseline frame structures in Table 1, but FFS multiple gaps within time interval A with respect to forward compatibility.
- Potential Agreement 4: The RS used to demodulate a data transmission is located FFS near before and/or within a time interval A. FFS whether a time interval A always has the RS used to demodulate a data transmission.
- Potential Agreement 5: The NR design should strive to reduce the time between the assignment to the corresponding data and the time between the data to the corresponding acknowledgement. FFS whether the time can be short enough so that the exchange is confined within time interval A.
- Potential Agreement 6: The scaling of time interval A is realized by the changing the number of the symbols without changing the numerology, or by the keeping the number of the symbols with changing the numerology.

Decision: The document is noted.

R1-165685 WF on Phase Noise Modeling Nokia, Alcatel-Lucent Shanghai Bell, NTT DoCoMo, Samsung, Qualcomm, Ericsson, Intel, InterDigital

PN model should be developed for evaluation of NR systems for above 6GHz with the following principles

- Proposal #1:
  - Phase noise model for UE should be considered for the evaluation by default.
  - Implementation cost, complexity and power consumption at the UE should be taken into account.
  - The PN modelling in eNB is FFS.
- Proposal #2:
  - Realistic PN model should consider total oscillator PSD including the impact of reference clock, loop filter noise and VCO sub-components. (e.g. PLL-based model, multi-pole/zero model)
  - Each company should provide the model and the parameters used for the evaluation.
- Proposal #3:
  - The oscillator PSD level increases by 20dBc/Hz per decade of increase of the carrier frequency. (Baseline)
  - A different parameter set of phase noise model can be defined for specific target frequency.
- Proposal #4:
  - Companies are encouraged to provide link level evaluation result with the phase noise model. Following phase noise models are provided as examples.
    - UE model in R1-164041
    - Proposed WF in R1-165005
    - Model A in R1-163984
    - mmMagic high and low model
  - Other phase noise model is not precluded.
  - Companies should provide which phase noise model is applied for the evaluation.

Decision: The document is noted and modified as follows:

Agreements:
- Companies should use following PN model principles for evaluation of NR for above 6GHz
  - Phase noise model for UE should be considered for the evaluation by default.
  - Implementation cost, complexity and power consumption at the UE should be taken into account.
  - The PN modelling in TRP is FFS.

Petitioners' Exhibit 1007, p. 1934
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Realistic PN model should consider total oscillator PSD including the impact of reference clock, loop filter noise and VCO sub-components. (e.g. PLL-based model, multi-pole/zero model)
- Each company should provide the model and the parameters used for the evaluation.
- The oscillator PSD level increases by 20dB per decade of increase of the carrier frequency as a baseline to scale PSD level
- A different parameter set of phase noise model can be defined for specific target frequency.
- Companies are encouraged to provide link level evaluation result with the phase noise model. Following phase noise models are provided as examples which are captured in R1-165685 (in page 5 – 8)
  - UE model in R1-164041
  - Proposed WF in R1-165005
  - Model A in R1-163984
  - mmMAGIC high and low model
- Other phase noise model is not precluded.
- Companies should provide which phase noise model is applied for the evaluation.

R1-165575 Way Forward On Frame Structure Qualcomm, Ericsson, Panasonic, NTT Docomo, ZTE, Convida, Nokia, ASB, Sony, Intel

The document was presented by Joseph Soriaga from Qualcomm.

- At least the following is studied in NR in order to reduce decoding latency
  - RS used to demodulate a data transmission is located at the beginning of the time interval to which the data and associated RS for demodulation is physically mapped

Discussion: Also supported by InterDigital.
Decision: The document is noted, agreed as follows:

Agreements:

- At least the following is studied for NR in order to reduce decoding latency
  - RS used to start to demodulate a data transmission is located at the beginning of the time interval to which the data and associated RS for demodulation is physically mapped
- Other additional RS design associated with data demodulation is not precluded

R1-165669 Way Forward On Frame Structure Qualcomm, OPPO, MediaTek, Intel, CATT, DOCOMO, InterDigital, Samsung, Sony, ZTE, Ericsson, Panasonic, ITRI, ETRI

- At least the following should be supported for NR
  - A time interval X which can contain one or more of the following
    - DL transmission part
    - Guard
    - UL transmission part
  - Dynamic and Semi-static operations are studied
  - Furthermore, the following is supported
    - The DL transmission part of time interval X to contain downlink control information and/or downlink data transmissions and/or reference signals
    - The UL transmission part of time interval X to contain uplink control information and/or uplink data transmissions and/or reference signals
  - FFS length(s) of time interval X
  - Note: The usage of DL and UL does not preclude other deployment scenarios e.g., sidelink, backhaul, relay

Decision: The document is noted and modified as follows:

Agreements:

- At least the following should be supported for NR in a frequency portion
  - A time interval X which can contain one or more of the following
    - DL transmission part
    - Guard
    - UL transmission part
  - FFS which combinations are supported and whether they are indicated dynamically and/or semi-statically
  - Furthermore, the following is supported
    - The DL transmission part of time interval X to contain downlink control information and/or downlink data transmissions and/or reference signals
    - The UL transmission part of time interval X to contain uplink control information and/or uplink data transmissions and/or reference signals
  - FFS length(s) of time interval X
  - FFS: other characteristics of time interval X
  - Note: The usage of DL and UL does not preclude other deployment scenarios e.g., sidelink, backhaul, relay

Petitioners' Exhibit 1007, p. 1935
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165662 **WF on NR frame structure** **Samsung, Mediatek, Intel, NTT DOCOMO, CMCC, Panasonic, Sony, ITRI, Interdigital, LG Electronics**

- At least the following is supported for NR frame structure
  - Following timing relationships are indicated to a UE dynamically and/or semi-statically
    - Timing relationship between DL data reception and corresponding acknowledgement
    - Timing relationship between UL assignment and corresponding UL data transmission
  - Following timing relationship is FFS whether fixed and/or dynamically and/or semi-statically indicated
    - Timing relationship between DL assignment and corresponding DL data reception
  - For above two sub-bullets
    - Potential values for each timing relationship has to be studied further considering e.g., UE processing capability, gap overhead, UL coverage, and etc.
    - Default value, if any, for each timing relationship is FFS.

Decision: The document is noted and the WF is agreed.

R1-165700 **Way Forward on Frame Structure Timing Relations** **Ericsson, Qualcomm, ZTE, NTT DOCOMO**
Decision: The document is noted.
R1-165739 **NR Frame Structure Timing Relations** **Ericsson**
Decision: The document is noted.

Agreements:

- NR design should strive at least to enable the possibility for
  - Corresponding acknowledgement reporting shortly (in the order of X μs) after the end of the DL data transmission
  - Corresponding uplink data transmission shortly (in the order of Y μs) after reception of UL assignment
  - Note: may depend on e.g. UE capability/category, payload size, etc
  - FFS: X and Y in the order of a few tens of or hundreds of micro sec is feasible
- Other mechanisms/configurations in addition to fast/short corresponding acknowledgement are needed
  - For example to provide coverage or enable TD-LTE coexistence
- Note: RAN1 will continue investigations about UE complexity, implementation processing time, interleaving applicability

---

Thursday
R1-165818 **Way Forward on frame structure for NR** **LG Electronics, CATT, ETRI, Lenovo**
Decision: The document is noted. Revised in:
R1-165896 **Way Forward on frame structure for NR** **LG Electronics, CATT, ETRI, Lenovo**
Decision: The document is noted.
R1-165931 **Way Forward on time interval for NR** **LG Electronics, CATT**

- Following type of time interval is needed in NR
  - UE-common time interval
    - This is to be known by the UE for access to network for a given numerology
    - FFS on the length of this time interval
    - FFS on the relationship between this time interval and the time interval X, in terms of the length

Decision: The document is noted.

R1-165840 **Way Forward on NR frame structure with asynchronous UL HARQ** **ZTE, Qualcomm, Ericsson, DOCOMO, ETRI**

- NR should at least support asynchronous hybrid ARQ in the UL to avoid fixed timing relationship between initial transmission and re-transmission

Decision: The document is noted and modified as follows:

Agreement: NR should support at least asynchronous hybrid ARQ in the DL and UL to avoid fixed timing relationship between initial transmission and re-transmission

R1-165872 **WF on minimum HARQ Timing** **LG Electronics, Panasonic**
Decision: The document is noted. Revised in:
R1-165887 **WF on minimum HARQ Timing** **LG Electronics, Panasonic, Qualcomm, NTT DOCOMO**
Decision: The document is noted, modified as follows:

Agreements:

- NR design should strive to enable the possibility for
  - Corresponding retransmission shortly (in the order of Z μs) after the end of acknowledgement reporting

Petitioners' Exhibit 1007, p. 1936
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- FFS: Z in the order of a few tens of or hundreds of micro sec is feasible

R1-165955 **WF on time interval X Huawei, HiSilicon, Qualcomm, Nokia, ASB**

- At least the following combinations with time order for time interval X should be supported
  - Combination 1: DL transmission part, a possible guard
  - Combination 2: A possible guard, uplink transmission part
  - Combination 3: A DL transmission part, a guard, and an UL transmission part

Decision: The document is noted and modified as follows:

Possible agreements:

- At least the following combinations for time interval X should be supported
  - Combination 1: DL transmission part, possible guard(s)
  - Combination 2: Possible guard(s), uplink transmission part
  - FFS: Combination 3: A DL transmission part, a guard, and an UL transmission part

Continue offline discussion until Friday – (Huawei)

Friday

R1-166013 **WF on time interval X Huawei, HiSilicon, Qualcomm, Nokia, ASB**

Decision: The document is noted.

R1-165877 **WF on wireless relay/backhaul for NR Samsung, AT&T, Ericsson**

Decision: The document is noted.

R1-165902 **WF on wireless backhaul for NR Samsung, AT&T, Ericsson, Intel, IITH, CEWiT, Tejas Networks, Reliance-jio, Straight Path**

- NR should allow for efficient same frequency operation between the access link and backhaul link.
- NR should also allow for efficient operation when the backhaul link and access link are on different frequencies. This includes:
  - Operation of backhaul link and access link on different frequencies in the same band
  - Operation of backhaul link and access link in different bands
- Note: The term 'backhaul link' does not make any assumption on NR RAN architecture design options

Decision: The document is agreed.

Friday

R1-165990 **WF on Frame Structure and Evaluation Qualcomm, Huawei, HiSilicon, NTT DOCOMO, Ericsson**

Decision: The document is noted. Also supported by ZTE, Panasonic. Revised in:

R1-166027 **WF on Frame Structure and Evaluation Qualcomm, Panasonic, NTT DOCOMO, KT Corp, MediaTek, Intel**

Decision: The document is noted and modified as follows:

Agreements:

- At least the following time domain structures should be studied/evaluated for NR
  - DL transmission region (containing data assignments and data), guard region, UL transmission region (containing UCI)
  - DL transmission region (containing data assignments), guard region, UL transmission region (containing data, UCI)
  - Other structures not precluded
  - Note: there is no assumption between the relationship of assignments and data in the above
  - FFS: there can be guard region after the uplink transmission region.
- FFS: Study candidate solutions where 1 structure spans at most a time interval of 1 ms
- FFS: Metrics for study/evaluation
- Note: This does not preclude the same structure could span multiple 1 msecs

Not treated.

7.1.5 Channel coding and modulation for new radio interface

R1-165945 Chairman's Notes of Agenda Item 7.1.5 on Ch_Coding Ad-hoc chair (Nokia)
The document was presented by Matthew Baker from Nokia and provides the outcomes of the session.
Decision: The document is endorsed. Contents incorporated below.

7.1.5.1 Channel coding

R1-164245 Discussion on link-level evaluation assumptions for channel coding CATT

Comparisons
General
R1-165641 Comparison of coding schemes for NR Intel Corporation
Revision of R1-164182
R1-164277 Evaluation on performance and complexity of channel coding for NR ZTE
R1-164704 Channel coding evaluation assumptions - performance and complexity Qualcomm Incorporated
R1-164564 Performance and complexity comparison of existing Turbo and LDPC codes LG Electronics

eMBB
R1-164812 Preliminary evaluation results on new channel coding scheme for NR - LDPC code for high throughput Samsung
R1-164360 Analysis of Candidate Code Types for Long Block Length Ericsson
R1-164377 Performance of channel coding schemes for eMBB scenario Huawei, HiSilicon
R1-165060 Performance Evaluation of Channel Coding for eMBB INTERDIGITAL COMMUNICATIONS
R1-165357 Performance of eMBB channel coding candidates Nokia, Alcatel-Lucent Shanghai Bell
R1-165360 Selection of the eMBB channel coding scheme Nokia, Alcatel-Lucent Shanghai Bell

R1-165657 WF on channel coding for eMBB Nokia, ASB
Proposal:
- Conclusion:
  - At least LDPC and Polar can support the high code rate and high throughput scenarios
- Further study:
  - Study further whether modified Turbo or Polar codes can satisfy the high code rate and high throughput scenarios; working assumption may be revisited if so
  - Implementation details should be provided for the decoding algorithms used in the simulation results for other eMBB coding candidates, i.e. Turbo and Polar
    - E.g. : Survey on the existing implementation efforts

R1-165637 Way Forward on Channel Coding Scheme for New Radio Samsung, Nokia, Qualcomm, Intel, ZTE
Also supported by Sharp
Proposed conclusions:
- All candidate channel coding schemes for eMBB application show comparable link performance in most cases

Petitioners' Exhibit 1007, p. 1939
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Observations on LTE turbo code for high code rates
  - LTE turbo code requires higher decoder computational complexity compared to LDPC code
  - LDPC code is superior to LTE turbo code in terms of latency and high data throughput
  - ~~LTE turbo code starts generating error floor between BLER=10^{-2} and 10^{-3} for high code rates and for some large information block lengths (e.g. some sizes ≥1000 bits)~~
- ~~LDPC code can be designed to meet the flexibility required for application scenarios in NR systems~~

Observations:
- At least in AWGN channels:
  - For large information block sizes, all candidate channel coding schemes show comparable link performance
- Further study is required on all potential coding schemes in order to determine which coding scheme(s) should be supported, including:
  - Implementation details should be provided for the decoding algorithms used in the simulation results, e.g. survey on the existing implementation efforts

FFS:
- At least in AWGN channels:
  - [For small information block sizes, performance of Polar codes is comparable to or better than other candidate schemes depending on the Polar decoding technique and code rate]
- [At least LDPC can support the high code rate and high throughput scenarios]
- [At least Polar codes can support the high code rate and high throughput scenarios]
- Compared to LTE turbo code:
  - [At high code rates and high throughputs, LTE turbo code requires higher decoder computational complexity compared to LDPC code]
  - [Considering all code rates and all information block sizes and HARQ requirements, LTE turbo code has comparable decoder computational complexity compared to LDPC code]
- [Flexibility requirements and feasibility]

R1-165598 WF on small block length Huawei, HiSilicon, Interdigital, Mediatek, Qualcomm
Proposal:
- Observation - From the evaluation results
  - TBCC and polar codes show best performance for (K=20,40)
  - For K larger than 100 and lower than 1000, polar outperforms TBCC for all choices of code rate and list-size
- Proposal
  - At least for mMTC and URLLC, For small information block lengths ~~(e.g. 200 bits)~~, at least Polar codes and TBCC Codes are considered as candidate schemes.
    - FFS what is meant by "small"
  - Further evaluation of performance and complexity/latency needs to be done

R1-165726 Code type for small info block length in NR Ericsson, Nokia, ASB
Proposal:
- Observation
  - For short info block lengths and low code rate, TBCC and Turbo code perform well compared to LDPC and Polar codes
- Proposal
  - Baseline ~~C~~channel code type for short info block lengths (including at least: DL control channel and mMTC DL) in NR is tail-biting convolutional code (TBCC)
    - Can be revisited if problems are identified

R1-165741 WF on further study of complexity of channel code LG, Ericsson, Orange
Agreement:
As one potential input to the decisions on channel coding:
- Companies are encouraged to bring evaluations of the complexity of channel coding / HARQ schemes including at least:
  - Energy efficiency (J/bit)
  - Area efficiency (Gbps/mm^2)
- FEC complexity supporting the full range of info block lengths and code rates with reasonable (details FFS) granularity should be compared instead of single info block length with some code rate
  - Companies should provide details of the range of info block lengths and code rates for which their complexity evaluations are conducted

Petitioners' Exhibit 1007, p. 1940
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165959 WF on channel coding simulation data sharing Qualcomm
Agreement:
- Include file format of results with contribution
  - Use excel file template provided in ExampleResults.xlsx
  - Multiple columns for
    - QAM, Rate, Info. Blocklength, Es/N0, Eb/N0, BLER
  - Separate tab to provide context
    - Contribution#, name of code, decoder implementation, #iterations or list size, brief details of code construction, brief details of rate matching algorithm, #CRC bits, and other parameters
    - The referenced accompanying contribution should provide enough details to enable other companies to repeat the simulations
- Companies encouraged to submit with their contribution for RAN1 #86

R1-165399 Consideration on LDPC HARQ Combining and Coding MediaTek

R1-165643 WF on LDPC schemes for NR ZTE, ZTE Microelectronics, Nokia, Qualcomm, InterDigital, MediaTek, Intel, Samsung
Also supported by Sharp
Agreement:
- For the purpose of study and comparisons, quasi-cyclic like LDPC codes are defined as follows:
  - The Parity check matrix of Quasi-cyclic like LDPC Codes is defined at least by a matrix H of size $(mb \times z) \times (nb \times z)$, which consists of sub-block matrices of size $z \times z$, where each sub-block matrix is composed by circularly shifted matrices or zero matrices. Wherein, mb, nb and z are integers larger than 1.
    - The values of mb, nb and z are FFS.
- Companies providing evaluations or proposals for LDPC codes are encouraged to show how:
  - Multiple code rates and multiple code sizes would be supported,
  - Suitable granularity of information block size and code rate would be supported,
  - How to support HARQ with/without IR.

R1-165919 WF on modulation for NR InterDigital

7.1.6 Multi-antenna scheme for new radio interface

Discuss initial views on multi-antenna scheme including enhanced massive MIMO analog/digital/hybrid beam-forming

R1-164013 **Framework for beamformed access** **Samsung**
- *Observation 1: Relying solely on digital precoding to compensate for the additional path-loss in higher frequencies will lead to excessive implementation burden.*

Petitioners' Exhibit 1007, p. 1942
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- *Proposal 1: Adopt hybrid beamforming as a baseline MIMO/beamforming scheme for higher frequencies in NR.*
- *Proposal 2: For beamformed access, introduce beam sweeping for providing basic coverage in NR.*
  - *Strive for minimizing the overhead related to the beam sweeping.*
- *Proposal 3: Study beam-sweeping based designs for initial access in NR: at least for synchronization signals, broadcast channel and random access channel.*
- *Proposal 4: Study beam-sweeping based designs for RRM measurements in NR.*

Decision: The document is noted.

R1-164372 Coverage Issues of Massive MIMO in NR Huawei, HiSilicon

Observation 1: Additional gain is needed for NR to achieve similar coverage as LTE.
Observation 2: Beam based scheme outperforms repetition based scheme in terms of coverage performance.
Proposal 1: Investigate SFN as a complementary solution for coverage improvement in NR.
Proposal 2: Investigate power boosting solution to improve the coverage of NR.
Proposal 3: Investigate beam based access to improve the coverage of NR.
Proposal 4: The following principles need to be considered for the enhancements on coverage limited signals (such as synchronization and broadcast signals):

- *The signal design should take into account the performance, overhead , complexity and reliability.*
  - *Impacts from phase noise should be considered in system design for HF bands.*
- *The signal design should consider the adopted numerology and multiple access schemes.*

Decision: The document is noted.

R1-164925 Considerations of digital beam forming on multi antenna scheme MTI

- Observation#1: Clearly, DBF has the high performance, and give best operational flexibility with slightly higher cost. The DBF is put the complexity at the cell side, and minimize the complexity and power constraints at UE.
- Observation#2: The cost of DBF is mainly coming from parallel channels of IFP that convert signals from digital domain to IF domain. The IFP may be expensive when design with discrete components, but would be substantially lower cost when implemented with digital IC and RFIC, and when produced at high quantity.
- Proposal 1: Digital beamforming which adopts digital precoding to adjust the beam direction and operating sub band should be considered as well for NR.
- Proposal 2: RAN1 should discuss the design aspects and architecture for DBF, especially considering the maximization of orthogonality and relative blind decoding.

Decision: The document is noted.

R1-165179 Discussion on NR MIMO NTT DOCOMO, INC.

Proposal 1: Following requirements should be considered for NR MIMO design.

- *Feasible overhead for DL/UL RSs and feedback*
- *Versatile technology for different*
  - *Antenna configurations (e.g., number/arrangement of antenna elements and virtualization)*
  - *Frequency bands (e.g., low frequency to mmWave*
  - *Duplex schemes, e.g., FDD/TDD/eTDD*

Proposal 2: Beamforming, SU-MIMO and MU-MIMO should be studied for higher frequency NR together with optimization for massive array and reciprocal systems.
Proposal 3: Following issues should be studied for higher frequency.

- *Impact of blockage effect and possible solutions*
- *Effect of multi-cell association technology*
- *Interference measurement schemes (e.g., flush-light effect and measurement for reciprocal systems)*

Proposal 4: For higher frequency, effect of beamforming on common channels/signals should be studied together with other potential technologies such as repetition, power boosting and SFN transmission.
Proposal 5: Multi-antenna technologies for NR should be applicable for hybrid beamforming (or analogue beamforming).
Proposal 6: For frequencies below 6 GHz, beamforming can be applied both for common and data-plane channels/signals, although details should be discussed together with the design for over 6 GHz.

Decision: The document is noted.

R1-164191 UL MIMO for new radio interface Intel Corporation

- Proposal 1:
  - For below 6GHz band, consider both digital and hybrid antennas at eNB and omni-directional antenna at UE in the NR design.
  - For above 6GHz band, consider multiple hybrid antennas at eNB and multiple hybrid antennas at UE, e.g. two and facing opposite direction, in the NR design.

Petitioners' Exhibit 1007, p. 1943
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Proposal 2:
  - For below 6GHz band, both sub-array and fully connected virtualization for TRP can be supported by using LTE FD-MIMO framework.
  - For above 6GHz band, prioritize the 2D sub-array based virtualization for eNB/UE in the NR design.
  - It is worth to clarify whether TXRU can be connected to different antenna arrays dynamically at UE.
- Proposal 3:
  - eNB/UE vendors to state intra-array antenna calibration and inter-array antenna calibration assumption for the NR design.
  - NR system design should be flexible enough for different antenna calibration assumptions.
- Proposal 4:
  - Design UL NR MIMO assuming the listed scenarios in Figure 1. UL NR MIMO should support stand-alone operation for all possible bands, however, optimization of the capacity booster layer at middle/high band assuming a coverage layer using LTE or NR at low band can also be considered.
  - Proposal 5:
  - Strive to have a unified uplink NR MIMO framework for all NR bands.
  - Have a relatively independent uplink beam management procedure to downlink
  - Have a beam management framework which can address various scenarios including inter-TRP and intra-TRP beam mobility scenarios.
  - Design uplink physical channels considering the hybrid antennas at both sides of the link.
  - Apply relevant NR MIMO scenarios for various uplink physical channels/signals.
  - Study uplink power control scheme in a beam centric environment.
  - NR at low band should target the same SU-MIMO dimension and higher MU-MIMO dimension than LTE. SRS and DMRS should be designed to be compatible with other system design aspects and better support reciprocity based operation.

Decision: The document is noted.

R1-164892 **General Views on Reference Signal Design** **CMCC**

- Proposal 1: At least NR_SS, NR_CSI-RS and NR_DMRS should be considered for downlink reference signals of NR.
- Proposal 2: A two-stage CSI feedback and corresponding CSI-RS design could be considered in NR
- Proposal 3: NR_SRS and NR_DMRS, whose functionalities are analogous to SRS and DMRS in LTE, could be considered for uplink reference signals of NR.
- Proposal 4: The design of NR_SRS should try to improve its capacity to ensure the accuracy of channel reciprocity in TDD system.

Decision: The document is noted.

R1-164116 **Consideration on muti-antenna schemes for new radio** **Beijing Xinwei Telecom Techn.**

- *Observation 1: Reduction of broadcast signal is also beneficial from perspective of large scale MIMO.*
- *Observation 2: Channel reciprocity in TDD should be carefully invoked, considering the problem of RS contamination and fewer digital chains than antenna elements.*
- *Proposal 1: A universal MIMO framework should be established in the study item for the compatibility of the two-phase standardization process.*
  - *The universal framework should accommodate requirements for different scenarios, including over-6GHz and sub-6GHz deployment.*
- *Proposal 2: Antenna modelling within the NR MIMO framework should not limit the possibility of applying other types of antennas besides URPA.*
- *Proposal 3: The possibility of multiple TXRUs fully connected to the same subarray should not be precluded.*
- *Proposal 4: Novel access and data transmission procedure should be designed with as few broadcast signal as possible and facilitate the usage of spatial information.*
- *Proposal 5: Spatial sparsity of channels could be leveraged to reduce RS overhead.*
- *Proposal 6: RS for spatial information is also beneficial in TDD system.*
- *Proposal 7: Feedback based on RS measurement should be considered as the baseline for NR. Other form of feedback should compared with the baseline on overhead, complexity and performance.*
- *Proposal 8: For antenna array besides URPA, measurement and feedback framework based on beamformed reference signal should be studied.*
- *Proposal 9: Distributed large scale MIMO should be natively supported and facilitated in the NR MIMO framework.*
- *Proposal 10: For distributed large scale MIMO, distributed MRT based scheme should be considered as the baseline for further study.*

Decision: The document is noted.

R1-164117 **Overview of Massive MIMO for NR National Instruments Corp.**

- Observation 1: Massive MIMO beamforms to a point, conventional beamforming beamforms to a direction.
- Observation 2: Reciprocity based TDD NR MIMO is a scalable solution from CSI estimation overhead perspective, for all antenna sizes.
- Observation 3: Canonical Massive MIMO can work with many flexible antenna configuration and has relaxed antenna calibration requirements.
- Observation 4: The subframe duration of a TDD NR M-MIMO subframe should no longer than the channel coherence time for the given deployment scenario.
- Observation 5: Benefits of Massive MIMO are only apparent with 8-10x the number of transceiver chains at eNB as number of UEs in the cell where each transceiver chain is a digital beamforming element.
- Observation 6: Reciprocity Calibration is necessary. Level of calibration and optional support of over the air signaling for calibration is FFS.
- Observation 7: Reciprocity calibration can be performed within the eNB, with no necessity of signaling between eNB and UE.
- Proposal 1: Use Massive MIMO using channel reciprocity as a framework for TDD NR M-MIMO.
- Proposal 2: Adopt TDD NR M-MIMO as primary MIMO mode for larger number of antenna ports at eNB (especially for >= 64 antenna ports).
- Proposal 3: Study improvements in UL Sounding Pilot signaling to support at least 32 UEs in UL.
- Proposal 4: Support a flexible grant duration for TDD NR M-MIMO subframe to be smaller than the channel coherence time.
- Proposal 5: Support fully digital beamforming for up to at least 64 antenna ports at the eNB.

Decision: The document is noted.

R1-165313 **Need for study on In-Band Full Duplex communication CEWiT**

Proposal 1: To consider in-band full duplex communication in conjunction with massive MIMO systems.

Proposal 2: To consider and study other potential network wide applications and standardization impact of in-band full duplex communication.

Decision: The document is noted.

R1-164955 **Reciprocity based MIMO in NR Ericsson**

- Efficient reciprocity-based transmission schemes need to be standardized as in some use cases they will have significantly better performance compared to normal resolution closed loop schemes (as has been specified for smaller arrays, e.g. LTE)
- Coherent reciprocity allows for efficient acquisition of explicit channel knowledge even for very large arrays, thus enabling frequency-selective precoding and nullforming
- Achieving coherent reciprocity imposes several additional requirements, e.g., on antenna calibration
  - Whether there is standard impact (RAN1 or RAN4) is FFS
- Study proposals to support reciprocity based MIMO in NR:
  - RAN1 should study Sounding Reference Signal design and the necessary quality of the estimates
    - Study SRS sequences and SRS density for enabling high-quality channel estimates, to reduce the effects of channel aging and pilot contamination
  - RAN1 should study Interference acquisition schemes for reciprocity based operation
    - for the purpose of scheduling and link adaptation

Decision: The document is noted.

R1-165559 **WF on Supported NR OperationsSamsung, Nokia, Alcatel Lucent Shanghai Bell**

The document was presented by Young Han Nam from Samsung.

- RAN1 to strive for both beam-centric operation and non-beam-centric operation in a single unified framework
  - Beam-centric operation
    - In beam-centric operation, multiple beams are used for covering a DL/UL coverage area of a TRP/a UE.
    - One example of beam-centric operation is beam sweeping:
      - When beam sweeping is applied for a signal (or a channel), the signal (the channel) is transmitted on multiple beams, which are on multiple time instances in a constant time duration.
  - Non-beam-centric operation
    - In non-beam-centric operation, a single beam can be used for covering a DL/UL coverage area of a TRP/a UE, similarly as for LTE cell-specific channels/RS.
- For beam-centric operation, study the application of beam sweeping at least for:
  - Initial-access signals (synchronization signals and random access channels)
  - System-information delivery (broadcast channels)
  - RRM measurement

Petitioners' Exhibit 1007, p. 1945
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

– CSI measurement

Decision: The document is noted.

Possible agreements:

- Following three types of beamforming are to be studied in NR
  - Analog beamforming
  - Digital beamforming
  - Hybrid beamforming
- RAN1 studies both beamforming based approaches and non-beamforming based approaches for these channels/signals/measurement/feedback
  - Initial-access signals (synchronization signals and random access channels)
  - System-information delivery (broadcast channels)
  - RRM measurement/feedback
  - L1 control channel
  - FFS: Note: The physical layer procedure design for NR should be agnostic as much as possible to the beamforming type employed at TRP
- Beamforming based approaches
  - In beamforming based approaches, multiple beams are used for covering a DL coverage area and/or UL coverage distance of a TRP/a UE
  - One example of beamforming based approaches is beam sweeping:
    - When beam sweeping is applied for a signal (or a channel), the signal (the channel) is transmitted/received on multiple beams, which are on multiple time instances in finite time duration
      - Multiple beams can be transmitted/received in a single time instance
  - Others are FFS
- Non-beamforming based approaches
  - In non-beamforming based approaches, each time invariant beam can be used for covering a DL/UL coverage area of a TRP/a UE, similarly as for LTE cell-specific channels/RS
- For both beamforming and non-beamforming based approaches, RAN1 can consider following examples
  - Power boosting
  - SFN
  - Repetition
  - Beam diversity (only for beamforming approach)
  - Antenna diversity
  - Other approaches are not precluded
- Combinations of non-beamforming based and beamforming based approaches are not precluded

Agreements:

- Following three implementations of beamforming are to be studied in NR
  - Analog beamforming
  - Digital beamforming
  - Hybrid beamforming
  - Note: The physical layer procedure design for NR can be agnostic to UE/TRP with respect to the beamforming implementations employed at TRP/UE, but it may pursue beamforming implementation specific optimization not to lose efficiency
- RAN1 studies both multi-beam based approaches and single-beam based approaches for these channels/signals/measurement/feedback
  - Initial-access signals (synchronization signals and random access channels)
  - System-information delivery
  - RRM measurement/feedback
  - L1 control channel
  - Others are FFS
  - Note: The physical layer procedure design for NR can be unified as much as possible whether multi-beam or single-beam based approaches are employed at TRP at least for synchronization signal detection in stand-alone initial access procedure
  - Note: single beam approach can be a special case of multi beam approach
  - Note: Individual optimization of single beam approach and multiple beam approach is possible
- Multi-beam based approaches
  - In Multi-beam based approaches, multiple beams are used for covering a DL coverage area and/or UL coverage distance of a TRP/a UE
  - One example of multi-beam based approaches is beam sweeping:
    - When beam sweeping is applied for a signal (or a channel), the signal (the channel) is transmitted/received on multiple beams, which are on multiple time instances in finite time duration

Petitioners' Exhibit 1007, p. 1946
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- Single/multiple beam can be transmitted/received in a single time instance
  - Others are FFS
- Single-beam based approaches
  - In single-beam based approaches, the single beam can be used for covering a DL coverage area and/or UL coverage distance of a TRP/a UE, similarly as for LTE cell-specific channels/RS
- For both single-beam and multi-beam based approaches, RAN1 can consider followings in addition
  - Power boosting
  - SFN
  - Repetition
  - Beam diversity (only for multi-beam approach)
  - Antenna diversity
  - Other approaches are not precluded
- Combinations of single-beam based and multi-beam based approaches are not precluded

R1-165563 **WF on NR beamforming Huawei, HiSilicon**

The document was presented by … from Huawei.

- Following three types of beamforming are to be studied in NR
  - Analog beamforming
  - Digital beamforming
  - Hybrid beamforming
- Study coverage improvement techniques for control channels / signals for NR
  - Beamforming-based coverage improvement
    - Beam sweeping and beam selection techniques
  - Non-beamforming based approaches such as
    - Power boosting
    - SFN
    - Repetition
  - Combinations of non-beamforming based and beamforming based approaches are not precluded
  - Other methods are not precluded

Note: The physical layer procedure design for NR should be agnostic as much as possible to the beamforming type employed at TRP.

Decision: The document is noted.

Possible agreements:

- For Non-beam-centric operation, RAN1 can consider following examples
  - Power boosting
  - SFN
  - Repetition
  - Combinations of non-beamforming based and beamforming based approaches are not precluded

Note: The physical layer procedure design for NR should be agnostic as much as possible to the beamforming type employed at TRP.

Tuesday

R1-165564 **WF on UE beamforming and beam management Nokia, Samsung, Intel, Interdigital, Alcatel-Lucent Shanghai Bell**

Decision: The document is noted.

Agreements:

- RAN1 to study the beamforming procedures and their system impacts at least for multi beam based approach
  - Physical layer procedures for beamforming optimizing different metrics such as overheads and latencies in multi beam and single beam based approaches
  - Physical layer procedures in multi beam based approach that require beam training, i.e. steering of transmitter and/or receiver beams
    - E.g. Periodic/Aperiodic downlink/uplink TX/RX beam sweeping signals, where periodic signals may be semi-statically or dynamically configured (FFS)
    - E.g. UL sounding signals
    - Other example is not precluded

R1-165684 **WF on beamforming procedures Nokia**

Decision: The document is noted.

Petitioners' Exhibit 1007, p. 1947
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Agreements:

- Both intra-TRP and inter-TRP beamforming procedures are considered.
- Beamforming procedures are considered with/without TRP beamforming/beam sweeping and with/without UE beamforming/beam sweeping, according to the following potential use cases:
  - UE movement, UE rotation, beam blocking:
    - Change of beam at TRP, same beam at UE
    - Same beam at TRP, change of beam at UE
    - Change of beam at TRP, change of beam at UE
  - Other cases are not precluded

R1-165650 WF on the antenna port and QCL assumption study in NR Intel, Ericsson
Decision: The document is noted.
Possible agreements:
As a starting point for NR study RAN1 assumes the following definition of antenna port and corresponding antenna port transmission assumptions:

- The antenna port in NR is used for transmission of a physical channel or signal, where an antenna port is defined such that the channel over which a symbol on the antenna port is conveyed can be inferred from the channel over which another symbol on the same antenna port is conveyed.
- For antenna port transmitted in different time occasions (e.g. different subframes or TTIs) by default assumption the channel on the antenna port in one time occasion can't inferred from the channel on the same antenna port in another time occasion
- For antenna port transmitted in the same time occasion on different frequency resource units (blocks), by default assumption the channel in one frequency resource unit/block on one antenna port can't inferred from the channel on the same antenna port in another frequency resource unit/block in the same time occasion

The assumptions on antenna ports that are different from the above should be studied in RAN1 and if needed recommended for NR specification (e.g. fixed in the specification or signaled by network explicitly or implicitly)
Possible agreements:
As a starting point for NR study RAN1 assumes the following definition of QCL and corresponding QCL assumptions:

- Two antenna ports in NR are said to be quasi co-located if the large-scale properties of the channel over which a symbol on one antenna port is conveyed can be inferred from the channel over which a symbol on the other antenna port is conveyed. The large-scale properties include one or more of delay spread, Doppler spread, Doppler shift, average gain, and average delay.
- For antenna ports corresponding to different RS types (e.g. DM-RS and CSI-RS) or multiple RS of the same type (e.g. two NZP CSI-RS) by default assumption UE can't assume QCL-ion between the antenna ports wrt to delay spread, Doppler spread, Doppler shift, average gain, and average delay.
- For antenna ports corresponding to the same type (e.g. DM-RS antenna ports), by default assumption UE can't assume QCL-ion between antenna ports wrt to delay spread, Doppler spread, Doppler shift, average gain, and average delay.

The assumptions on QCL that are different from the above should be studied in RAN1 and if needed recommended for NR specification (e.g. fixed in the specification or signaled by network explicitly or implicitly)
Continue offline discussion – (Intel)
Thursday
R1-165905 **WF on the antenna port and QCL assumption study in NR** **Intel, Ericsson**
Decision: The document is noted. Revised in:
R1-165947 **WF on the antenna port and QCL assumption study in NR** **Intel, Ericsson, ZTE, LGE, Samsung, Nokia, ASB, CATT**
Decision: The document is noted.

Agreement: Study the necessity of QCL and measurement assumptions for antenna ports in NR

R1-165588 **WF on hybrid UE antenna modelling** **Intel, Samsung**
Decision: The document is noted. Revised in:
R1-165712 **WF on hybrid UE antenna modelling** **Intel, Samsung**
Decision: The document is noted.

R1-165654 **WF on CSI Acquisition Framework in NR** **Huawei, HiSilicon, NTT DOCOMO, Intel, China Telecom, ZTE, China Unicom, Deutsche Telecom, Softbank, ETRI, Ericsson, Nokia**
Decision: The document is noted. Also supported by CATR, ASB.

Agreements:

- In NR multi-antenna schemes, studies on CSI acquisition framework include:

Petitioners' Exhibit 1007, p. 1948
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- CSI reporting schemes
  - Implicit CSI feedback
    - Parameters indicating channel quality based on a set of transmission and receiving hypotheses associated with one particular UE, e.g. CQI, PMI, RI, CRI
  - Explicit CSI feedback: for both quantized and unquantized/analog CSI feedback
    - Parameters representing channel coefficients or some reduced-space representation thereof
  - Reciprocity-based feedback
    - For example, take into account interference and/or receiver hypothesis can be included
  - Note: including aperiodic, periodic and semi-persistent, and single/wide band and sub-band feedback
  - Mixed feedback is not precluded
- Interference measurement
- FFS: CSI measurement and/or reporting and/or triggering can be 'self-contained' in at least time domain

Possible agreements:

- In NR multi-antenna schemes, studies on CSI acquisition framework include
  - CSI acquisition
    - based on hybrid RS
      - E.g., hybrid non-precoded and beamformed RS
      - E.g., hybrid different types of beamformed RS
    - based on beamformed/precoded RS (e.g., CSI-RS, Demodulation RS)
    - based on non-precoded RS
    - based on reciprocity (e.g., SRS design, UL SRS Transmission in DL band)
    - Note: including measurement over aperiodic/periodic/semi-persistent RS
    - Note: Subband RS is not precluded

Continue offline discussion until Wednesday – (Huawei)

R1-165541 **WF on CSI reporting framework for NR Samsung, Interdigital, Ericsson**
Decision: The document is noted.
R1-165701 **WF on RS design for CSI measurements in NR Samsung, ZTE, ZTE Microelectronics, Intel, Ericsson**
Decision: The document is noted. Continue offline discussion until Wednesday – (Samsung)

Wednesday

R1-165843 **WF on CSI Acquisition in NR Huawei, HiSilicon, Samsung**

- In NR multi-antenna schemes, studies on CSI acquisition include;
  - based on RS for UE-specific use case
    - Note: mutiple-stage RS is not precluded
    - e.g., beamformed CSI-RS, Demodulation RS
  - based on RS for non-UE-specific use case
    - Note: mutiple-stage RS is not precluded
    - e.g., beamformed CSI-RS, Non-precoded CSI-RS
  - based on hybrid RS
    - E.g., hybrid RS for UE-specific and Non-UE-specific use cases
  - based on reciprocity (e.g., SRS design, UL SRS Transmission in DL band)
  - Note: including measurement over aperiodic/periodic/semi-persistent RS
  - Note: Subband RS is not precluded

Decision: The document is noted, modified as follows:

Agreements:

- In NR multi-antenna schemes, studies on RS design and CSI acquisition considering following use cases
  - Non-UE-specific RS use case for CSI measurement
  - UE-specific RS use case for CSI measurement
    - Note: functionally may be analogous e.g.: to R13/14 UE-specific beamformed CSI-RS (with dynamic beamforming)
    - Note: maybe relevant to UE receiving beam sweeping
  - Use of a joint operation among multiple RS from the same or different use cases
  - RS for interference measurement use cases
  - RS for channel reciprocity use cases
  - Other use cases is not precluded
- Note: including measurement over aperiodic/periodic/semi-persistent RS
- Note: Subband RS is not precluded

Petitioners' Exhibit 1007, p. 1949
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165590 **WF on aperiodic CSI for NR ZTE, ZTE Microelectronics, ASTRI, Ericsson, Samsung**

- Study aperiodic CSI reporting in conjunction with aperiodic RS (including multi-shot RS) transmission
  - UE measures/reports CSI and TRP transmits RS for CSI measurement only when needed
  - Study self-contained scheme to support CSI triggering, CSI measurement and CSI feedback in a subframe
  - Study RS design for CSI measurement e.g. CSI-RS, demodulation RS.
    - Others are not precluded

Decision: The document is noted. Also supported by Interdigital. The WF is updated as follows:

Agreements:

- Study aperiodic CSI reporting in conjunction possibly with aperiodic RS (e.g. one-shot, multi-shot RS) transmission
  - Aperiodic RS can be used for CSI measurement including channel measurement (e.g. using CSI-RS) and/or interference measurement (e.g. using IMR)
  - Study on demand UE measurement/reports and TRP RS transmission for CSI measurement only when needed
  - Study aperiodic CSI procedure to support CSI triggering, CSI measurement and CSI feedback in certain time interval(s). These three steps can happen in the same or different time interval.
  - Study aperiodic CSI procedure using RS for CSI measurement e.g. CSI-RS, demodulation RS.
    - Others are not precluded

R1-165808 **WF on NR UL MIMO Intel, NTT DOCOMO, Ericsson**

Decision: The document is noted.

Agreements:

- The following techniques are studied for NR UL MIMO
  - Uplink transmission/reception schemes for data channels
    - Non reciprocity based UL MIMO (e.g. PMI based)
    - Reciprocity based UL MIMO. E.g. UE derives precoder based on downlink RS measurement (including partial reciprocity)
    - Support of MU-MIMO
    - Open-loop/Close-loop single/Multi point spatial multiplexing
      - e.g. for multi point SM, multi layer is received either jointly or independently by different TRPs
      - Note: for multi point SM, multiple point may have coordination
    - Single/Multi panel spatial diversity
    - Uplink antenna/panel switching (UE side)
    - UL beamforming management for analog implementation
    - Combination of above techniques
  - UL RS design considering the below functions
    - Sounding
    - Demodulation
    - Phase noise compensation
  - UL transmit power/timing advance control in the context of UL MIMO
  - Transmission scheme(s) for carrying UL control information
  - Other UL MIMO and related techniques are not precluded

Possible agreements:

- Study beam determination procedure (e.g. TRP beam(s) and/or UE beam(s) determination)
  - Option 1: In the initial access procedure
  - Option 2: Not in the initial access procedure
- For beam change after initial beam determination, study the following two procedures:
  - Procedures different from initial beam determination procedure
    - E.g. L1 or L2 based approach
  - Procedures with the same procedure as initial beam procedure
- Note: A common procedure may be applied to initial beam determination and beam change.
- Note: Different procedures may be applied to different frequency resources
- For multi beam and single beam based approaches at TRP, companies should state the assumptions on UE beamforming for the agreed system aspects
  - E.g. how many UE beams and UE beam patterns

Continue offline discussion until Friday – Yuan (Intel)

R1-166030 WF on beam management Intel, Ericsson, Nokia, Qualcomm, Samsung, ZTE, NTT DoCoMo, Huawei, Xinwei, CATT, MTK

R1-165946 **WF on DL multi-antenna transmissions for NR** **LG Electronics, CATT, Intel, Samsung**
Decision: The document is noted, modified and agreed as follows:

Agreements:

- The following DL multi-antenna transmissions to be studied for NR
  - Closed-loop/(Semi)Open-loop spatial multiplexing
  - Single/Multi-point transmissions
  - SU/MU-MIMO
  - Transmit diversity,
    - e.g., Single/Multi panel spatial diversity
  - Combination of above techniques
- Other DL multi-antenna transmissions and related techniques are not precluded
- This does not imply that used transmission technique needs to be known to the UE

R1-165929 **WF on beamforming for message transmission in NR** **Qualcomm, Ericsson, Intel, Nokia, CATT, Samsung**
Decision: The document is noted.

Possible agreements:

- RAN1 to study beamforming for transmitting control message in the multi-beam based approach for NR
  - Beamforming that is specific to a UE or group of UEs when transmitting control message (i.e. control transmission)
    - Procedures for determining (e.g., through beam training) and changing the beam used for the control transmission
      - Procedures may or may not be same as the procedure for determining/changing the beam for data transmission
    - Control transmissions may be in both UL or DL direction
  - Procedures when transmitting common control message (e.g. beam sweeping, wide beam)

Continue offline discussion until Friday – Sundar (Qualcomm)

7.2 Study on channel model for frequency spectrum above 6 GHz - SID in RP-151606

R1-164025 Chairman's Notes of Agenda Item 7.2 on Channel model for >6 GHz Nokia
The document was presented by Tuomo Säynäjäkangas from Nokia and provides the outcomes of AI7.2.
Decision: The document isendorsed. Contents incorporated below.

Remaining issues

R1-164606 List of open issues for channel modelling SI Nokia, Samsung
Discussion:
Decision: The document is noted

R1-165372 Notation of log-normal distributed random variables Fraunhofer HHI
Proposal 1: Adopt the following notation for mean ($\mu_{\lg X} = \mathrm{mean}\{\log_{10}(X)\}$) and standard deviation ($\sigma_{\lg X} = \mathrm{std}\{\log_{10}(X)\}$) of logarithmized parameters.
Proposal 2: When presenting mean values of logarithmized parameters in linear scale, clarify whether $10^{\mu_{\lg X}}$ or μ_X is given.
Discussion:
Samsung: Has this been used in previous channel model work or is this a new one?
Fraunhofer: This is an old problem. We should avoid misunderstanding.
Samsung: We could agree in principle and think about the wording for a TR.
Decision: The document is agreed

TR update

R1-164607 TP for TR38.900 on Section 7.2 Nokia, Samsung
Discussion:
Ericsson: 38.953 mention indoor car users to be reflected too.
Fraunhofer: Then we need to add more details on that model. 7.2.1 table to be corrected.
Huawei: Table 7.2.2 values are already agreed.
We should agree this TP first. It captures agreement from last meeting. Modifications can be added for the next version.
Decision: The document is agreed

R1-164608 TP for TR38.900 on Section 7.4 Nokia, Samsung
Discussion:
Nokia: More clarifications are needed for O2I section in this meeting.
Fraunhofer: We need to decide parameter d. PL equations are modified. It is not clear what frequencies are meant. General note of units and equations needs clarifications.
NTT DOCOMO: Rural macro scenario frequency range is not clear.
Nokia: It is up to 7 GHz.
Decision: The document is agreed

R1-164609 TP for TR38.900 on Section 7.5 Nokia, Samsung
Discussion:
LGE: Steps 2 and 3 should be corrected.
Fraunhofer: Some parameters needs further clarifications.
NTT DOCOMO: Table 7.5 unit of distance needs further clarifications.
Decision: The document is agreed

R1-164610 TP for TR38.900 on Section 7.6 Nokia, Samsung
Discussion:
Motorola: Equation and impulse response corrections are needed. Why impulse response is a function of f?
Decision: The document is agreed

R1-164611 TP for TR38.900 on Section 7.7 Nokia, Samsung

Petitioners' Exhibit 1007, p. 1953
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion:
Huawei: There are couple of issues to be corrected.
Samsung: There are some errors not captured but discussed in email discussions.
Ericsson: We agreed also K-factor scaling for LOS.
Decision: The document is agreed

R1-164612 **TP for TR38.900 on Section 7.8 Nokia, Samsung**
Discussion:
Decision: The document is agreed

R1-164613 **TP for TR38.900 on Section 8 Nokia, Samsung**
Discussion:
Decision: The document is agreed

R1-164614 **WF on TR clean up Nokia, Samsung, AT&T, Ericsson, ETRI, Huawei, HiSilicon, Intel, KT Corporation, NTT DOCOMO, Qualcomm**

- *Proposal-1: For all the parameter values in bracket, remove the brackets (confirm the value in bracket) if no proposals of other value are received in RAN1#85.*
- *Proposal-2: Address all FFS points in the TR in RAN1#85.*
- *Proposal-3: Section 7.2, every scenario has a sentence like: "Other parameters are FFS". Remove the FFS sentences for each scenario with the understanding of "other parameters can be considered"*

Discussion:
Fraunhofer: "Other parameter can be considered" has a different meaning. Missing parameters are FFS.
Nokia: Intention is not to replace the sentence but to remove "*Other parameters are FFS".*
ZTE: We are OK with intention but safer way would be to mention numbers can be revised if problems are found.
Nokia: Every parameters can be revised if issues are found.
Decision: The document is agreed

R1-164615 **Detailed parameters for RMa scenario description Nokia, Samsung, AT&T, Ericsson, ETRI, Huawei, HiSilicon, Intel, KT Corporation, NTT DOCOMO, Qualcomm**
Use below table in section 7.2 for RMa scenario description
Discussion:
LGE: Is BS-UT distance 2d or 3d?
Nokia: 2d
Fraunhofer: In car users are mentioned but why are we not considering pedestrians at all?
Nokia: This is in line with NR SI
Huawei: Other scenarios mention also UE mobility. Should that be considered also for RMa?
Nokia: 3D CM mention reasonable UE speed. Our proposal is to remove that from all scenarios.
Fraunhofer: How to do simulations then?
Nokia: That can be done in separate WI like FD-MIMO.
Motorola: Range of speed could be add on assumption.
Ericsson: It is not mandated for simulations but meant for calibration purposes.
Huawei: We need to clarify the speed for the in car users.
Decision: The document is agreed

R1-165465 **TP for TR38.900 Nokia, Samsung**
Discussion:
Decision: The document is agreed

R1-165757 **Applicability of TR38.900 channel models Huawei, HiSilicon**
Discussion:
Samsung: Some of these are already understood. There is no confusion to correct.
Fraunhofer: RMa scenario should be applicable to up to 7 GHz.
Nokia: We should not this document. RMa is a new and special scenario.
LGE: No need to approve.
Huawei: Don't we need to evaluate whether the model fulfil the requirements?
Samsung: Additional features are already specified in TR.
Decision: The document is noted

R1-165758 **Discussion on the channel model names and abbreviations Huawei, HiSilicon**

Petitioners' Exhibit 1007, p. 1954
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion:
Samsung: We don't support HF. E.g. NR could be better.
Ericsson: We support NR
LGE: 5G or NR.
Nokia: NR is OK even it is a technology.
Rapporteur could implement the name change by using some acronym in TR abbreviations. Discuss by Friday lunch time. If no agreement then the current names are used.
Decision: The document is noted.
Friday: Current names are used for >6GHz channel model study (TR38.900)

R1-165478 **Corrections for CIR Equations** **Fraunhofer HHI, Motorola Mobility, Lenovo**
Discussion:
LGE: No strong concerns but clarifications needed for proposals 1 and 2. Why we have to change?
Fraunhofer: To avoid misunderstandings. Sometimes people don't realize if we are in time domain or not.
Samsung: Everybody know these models used in the past so need to change. What is actually proposal 3?
Fraunhofer: Change from + to – sign. Lambda f is not defined anywhere. We want to make clear what is coefficient and what is CIR.
Samsung: Rapporteur can do the editorial changes.
Huawei: This is not only editorial change. Equations are different.
Motorola: Errors has to be corrected.
Decision: The document is revised in 5774

R1-165774 **Corrections for CIR Equations** **Fraunhofer HHI, Motorola Mobility, Lenovo, CATT, Huawei, HiSilicon**
Discussion:
Samsung cannot agree. Equations and been used for long time, also in 3D CM. There is no strong reason to change.
Samsung: As compromise delay correction in Proposal 3 can be agreed in principle
ZTE has concerns on proposal 3. Same should be done also for hybrid model.
Delay correction in Proposal 3 can be agreed
Decision: The document is noted

Friday
R1-165775 **WF for TR clean-up** **Nokia, Samsung, Huawei, Hisilicon, Intel, NTT DOCOMO, Qualcomm, AT&T, KT Corporation, Alcatel-Lucent Shanghai Bell, ZTE, Interdigital**
- Remove all brackets in the TR38.900

Discussion:
Decision: The document is noted as working assumption

Agreement: Use 3D distance in RMa path loss

R1-165768 **TR38.900 v0.4.0** **Samsung, Nokia**
Discussion:
Decision: The document is return.
Friday: The document is agreed in principle, and email approval to check the consistency with the agreements reached in RAN1#84bis and RAN1#85 meetings until June 2nd – (Samsung)

Offline session notes

R1-165457 **Minutes of offline session on Tue** **Nokia**
Discussion:
Decision: The document is noted

R1-165467 **Minutes of offline session on Wed** **Samsung**
Discussion:
Decision: The document is noted

Friday
Email discussions

Email discussion until the next meeting for full calibration – R1-165770

Petitioners' Exhibit 1007, p. 1955
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

[85-19] Email discussion until June 10th for updating results for large scale calibration (Samsung)
[85-20] Email discussion until June 25th for full calibration results (Samsung)
[85-21] Email discussion until June 25th for additional feature calibration (Samsung)
[85-22] Email discussion until August 10th for approval of the summary related to all the calibration results and updated TP (Samsung)

7.2.1 Remaining details on large scale modelling for >6GHz

Path loss modeling

R1-164729 WF on Pathloss clean up Huawei, HiSilicon, Nokia, Samsung, AT&T, Ericsson, Intel, KT Corporation, NTT DOCOMO, Qualcomm, ETRI

- *For UMa, UMi Street Canyon, Indoor office and RMa, limit the NLOS pathloss by LOS pathloss. (same as 36.873)*
- *NLOS Pathloss is defined as the Max(PL_LOS, PL_NLOS):*
  where PL_NLOS and PL_LOS are LOS and NLOS PL formula in current TR

Discussion:
ZTE: We are OK but do we need to redo calibration?
Samsung: We don't need to redo calibration as we have good enough match between companies already.
Fraunhofer: What about RMa calibration? It would be important to include also that.
Samsung: That is different scenario discussed in NR session. No need for that calibration.
Nokia: No need to have another calibration campaign but companies can update their results if they want.
ZTE: This propose max for all scenarios.
Decision: The document is agreed

Penetration loss

R1-164569 Remaining issues on large scale modeling LG Electronics

Proposal 1: Whether to use high or low loss model should be UE-specific.
Proposal 2: The 2D indoor distance, d_in, should be common for sectors of an eNB but differently generated for different (non-collocated) eNBs.
Proposal 3: O-to-I penetration loss deviation should be common for 3 sectors of an eNB but different one for different eNB, and it should replace shadow fading of path loss.
Proposal 4: The clarifications on (1) high vs. low loss model, (2) d_in, and (3) O-to-I penetration loss deviation should be included into large scale modeling section of the TR rather than calibration assumption section.

Discussion:
Decision: The document is not treated

R1-164617 Clarifications on O-I implementation Nokia, AT&T, Ericsson, ETRI, Huawei, HiSilicon, Intel, KT Corporation, NTT DOCOMO, Qualcomm, Samsung

- *Clarify the implementation of O-I in TR38.900 as following:*
  - *The selection of high loss or low loss O-I model is UE specific*
  - *O-I deviation is an add-on term to SF.*
    - *Change the standard deviation to 4.4 and 6.5 for low loss and high loss penetration model separately (see below table from R1-163256)*
    - *O-I deviation is UE specific random variable.*
  - *d_in is an UE specific random variable*

Discussion:
LGE: We have prepared another WF on this issue.
Decision: The document is revised in 5458

R1-165458 Clarifications on O-I implementation Nokia, AT&T, Ericsson, ETRI, Huawei, HiSilicon, Intel, KT Corporation, NTT DOCOMO, Qualcomm, Samsung
Discussion:
Decision: The document is withdrawn.

R1-165451 WF on O-to-I penetration modeling LG Electronics, CATT, CHTTL, Intel, ITRI
Discussion:
Straight Path: Modeling should be site specific. UE specific is not a good approximation e.g. what comes to correlation. Deviations are depended to angle.
Nokia: Site specific was our original proposal but after discussing with other companies we believe US specific is more close to reality.
Straight Path: There are penetration coming from the 4 side of the UE. Those should be site specific.

Petitioners' Exhibit 1007, p. 1956
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Ericsson: Propagation is typically coming from the closest wall. This increases the correlation. Shadow fading is link specific and should be accounted for also.
Samsung: Can we agree Proposal 1 Option 2 and proposal 2.
LGE prefers option 1.
CATT: We prefer option 1.
Straight Path: We prefer option 1.
Decision: The document is revised in 5464

R1-165464 **WF on O-to-I penetration modeling LG Electronics, Straight Path, Ericsson, Samsung, Nokia, Alcatel-Lucent Shanghai Bell, ETRI, CHTTL, NTT DOCOMO, Huawei, HiSilicon**
Discussion:
Decision: The document is agreed

R1-165463 **WF on O2I Penetration Loss Model Mix for Urban Scenarios Huawei, HiSilicon, CATT**
Discussion:
Decision: The document is agreed

R1-165849 **WF on clarification on O2I penetration modeling for RMa LG Electronics, Ericsson, ETRI, Samsung, Straight Path, NTT DOCOMO, Intel, Nokia, Alcatel-Lucent Shanghai Bell, CHTTL**

- *For RMa scenario, the indoor 2D distance ($d_{2D\text{-}in}$) for indoor UE is generated in the same manner agreed in R1-165464.*
  - *$d_{2D\text{-}in}$ is UE-specific and generated as the minimum of two independent uniform RVs between 0 and 25 m.*
  - *Other channel modeling steps that should utilize $d_{2D\text{-}in}$ follow the same calculation for $d_{2D\text{-}in}$.*
- *The correlation distance for cluster/ray specific random variables for RMa O2I scenario is 15m.*
  - *Note that this value is the same as one for UMa/UMi-Street Canyon O2I.*

Discussion:
Intel: Also correlation distance for the indoor-outdoor stage should be added with the value of 50 m.
Agreed with the addition: For the RMa scenario correlation distance for the indoor-outdoor state should be added with the value of 50 m.
Decision: The document is agreed

R1-164804 **Discussion on recommended split of low and high penetration loss for NR Samsung**

Proposal: For UMi, the low-loss model is used 80% probability and the high-loss model is used 20% probability; for UMa, the low-loss model is used 90% probability and the high-loss model is used 10% probability.

Discussion:
Ericsson: Having different probabilities in UMa and UMi is not in line with NR work.
Samsung: NR scenario don't have UMa and UMi mix. We should make suggestion to NR delegates.
Ericsson: BS above rooftop is UMa, below rooftop it is UMi.
Huawei: We are confused why we are discussing this. Channel model task is not to decide high or low loss.
Nokia: We sympathize the intention of this proposal but we should not have different probabilities for UMa and UMi.
CATT: We have similar view than Huawei.
Ericsson: We also agree with Huawei and CATT. One way could be to capture the recommendation. In the end this is simulation assumption.
Straight Path: There are reasons for the loss numbers in reality.
Decision: The document is revised in 5459

R1-165459 **Discussion on recommended split of low and high penetration loss for NR Samsung**
Discussion:
Decision: The document is withdrawn.

R1-165398 **Additional Considerations on Building Penetration Loss Modeling for 5G System Performance Evaluation Straight Path Communications**

Two options to model the mix of high-loss and low-loss building penetration models:
Proposal 1: The low loss model should be used with 80% probability, the high loss model should be used with 10% probability, and a medial loss model (the average of the high-loss and the low-loss model) should be used for 10% of the probability.
Proposal 2: The low loss model should be used with 80% probability and the high loss model should be used with 20% probability for Urban Micro; the low loss model should be used with 90% probability and the high loss model should be used with 10% probability for Urban Macro.
We request RAN1 to select one of these two proposals for New Radio (NR) system performance evaluation purposes.

Petitioners' Exhibit 1007, p. 1957
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion:
Decision: The document is not treated

Rural Macro model

R1-164712 Penetration loss measurements for RMa settings Qualcomm Incorporated

Proposal: Adopt the low-loss model from R1-161636 [4] to capture the shadow fading standard deviation for building penetration in an RMa setting, as suggested in R1-163909 [1].

Discussion:
Decision: The document is not treated

R1-164975 New measurements at 24 GHz in a rural macro environment Telstra Corporation Limited, Ericsson

Proposal: Extend the applicability of the new RMa path loss model in R1-163909 ***Error! Reference source not found.*** *to 24 GHz*

Proposal: Consider extending the applicability of the new RMa fast fading model in R1-163909 ***Error! Reference source not found.*** *to 24 GHz*

Discussion:
Fraunhofer: Lot of parameters are not investigated for this frequency range. This proposal is based on single measurements only.
Huawei: Scope of RMa is below 7 GHz.
Telstra: We want to challenge that approach.
Straight Path: We agree with Telstra. In the end the channel model does not matter. You need to design your system up to 100 GHz.
Huawei: ITU considered above 24 GHz.
Telstra: We did measurement on 24 GHz but that can be updated also to higher frequencies.
Fraunhofer: We don't have not enough data to conclude this.
Nokia: Figure 2, what is the difference between rural and suburban areas?
Ericsson: This is single measurement campaign but not much less than others like urban macro model.
CMCC: It is good to see results. We should match with practical deployments.
Decision: The document is revised in 5732

R1-165732 Way Forward for RMa model frequency range Telstra Corporation Limited, Ericsson

Discussion:
CMCC: This is not good way to extend the model based on only one measurement results.
Ericsson: Urban macro has been changed based on 2 measurements. This is more reasonable than UMa.
Huawei: How well the measurement results correlate with the low frequency of the IMT-A?
Ericsson: Parameters are the same than < 7 GHz.
Huawei: IMT-A was defined based on one measurements in Tyrnävä near to Oulu, Finland which is the flat terrain.
Telstra: We are surprised with this discussion.
Ericsson: If IMT-A was based on single measurement could we do the same also for this.
CMCC: There were lot of measurements for IMT-A e.g. in Winner.
Nokia: Do we intend to add a note to PL model?
Ericsson: Model is valid up to 30 GHz. It is only for the PL model.
Decision: The document is revised in 5769

R1-165769 Way Forward for RMa model frequency range Telstra Corporation Limited, Ericsson

Proposal: Extend the applicability of the RMa model to 30 GHz for pathloss, noting that:

- *All fast fading aspects remain applicable to 7 GHz*
- *Pathloss model validation above 7 GHz is based on a single measurement campaign conducted at 24 GHz*
  - *This sentence will be captured as a footnote to the pathloss table in the TR*

Discussion:
Huawei: This version is better now.
Decision: The document is agreed.

R1-165344 WF on O2I penetration for the RMa scenario Ericsson, AT&T, ETRI, Huawei, HiSilicon, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung

Proposal 1: Adopt a car penetration loss of 9 dB on average with a 5 dB standard deviation
Note: This model is valid for at least 0.6-60 GHz

Proposal 2: Include an optional car penetration loss model for metallized windows with 20 dB on average with a 5 dB standard deviation

Proposal 3: Adopt the low loss model for building penetration in the RMa scenario

Discussion:

Petitioners' Exhibit 1007, p. 1958
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

LGE: Proposal 2. When the option would apply?
Ericsson: Optional in the future SI/WIs.
Huawei: Why frequency range upper limit is 60 GHz? Is this frequency dependent?
Ericsson: It mean at least 60 GHz.
Qualcomm: We also have measurement results in our document.
Straight Path: Optional model is a good idea but situation may change with mixed windows.
CMCC: It is good to have optional model.
Fraunhofer: In car penetration model up to 60 GHz are specific to RMa.
Decision: The document is agreed

Correlations

R1-165343 Clarifications on channel model correlations Ericsson, AT&T, ETRI, Huawei, HiSilicon, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung

Proposal 1: UEs on different floors have uncorrelated LSPs
Proposal 2: LSPs for links from different sites to same UE are uncorrelated
– Clarify this directly in the TR rather than by reference
– Applies also to LOS/NLOS state but not indoor/outdoor state
Proposal 3: LSPs for links from co-sited sectors to same UE are fully correlated
– Clarify this directly in TR rather than by reference
– The outcome of steps 1-9 should be identical for all sectors

Discussion:
Decision: The document is agreed

R1-165350 Clarifications on frequency correlation Ericsson, AT&T, ETRI, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung

Proposal: Cluster delays and angles are frequency-independent

Discussion:
Huawei: In many cases you can see similar delays but they are not always frequency independent. This is important topic but maybe too simplified approach.
Nokia: We don't have procedure to address this proposal in TR.
Ericsson: This may be simplification but pretty close to reality.
Samsung: We need to see what parameters are meant to be frequency-independent.
LGE: We agree with Samsung. This is too high level.
Fraunhofer: Cluster delay could vary over frequency.
Ericsson: Delay spread is in a way a dispersion of the channel.
Straight Path: We understand the intention but also agree with Samsung.
Decision: The document is noted

R1-165481 WF on frequency correlation Ericsson, ETRI, Telstra Corporation Limited

- *Proposal 1: Step 1 is identical for all frequencies, except:*
  - *1d Antenna patterns and array geometries*
  - *1g System centre frequency and bandwidth*
- *Proposal 2: Step 2 is identical for all frequencies,*
  - *Note: Soft LOS states may be different due to frequency dependent function*
- *Proposal 3: If blocking is modeled, the positions of blockers are the same for all frequencies*
  - *Note: The blocking loss may be different*
- *Proposal 4: Step 4 is identical for all frequencies, except for possibly frequency-dependent scaling of e.g. delay spread and angular spreads according to the LSP tables*
- *Proposal 5: The cluster delays and angles resulting from steps 5-7 are same for all frequency bands*
- *Proposal 6: Per-cluster shadowing (Zn in step 6) is independent for different frequency bands*
- *Proposal 7: Cluster powers in step 6 ~~are derived from the delay and angle spreads and~~ may be frequency-dependent*
- *Proposal 8: Steps 8-11 are independent for different frequency bands*

Discussion:
ZTE: WE are basically fine except with proposal 7.
Ericsson: We could change the wording like shown above in these minutes
Samsung: We need more time to look this late contribution.
Decision: The document is agreed with the modifications by red text above.

7.2.2 Remaining details on fast fading modelling for >6 GHz

Rural macro channel model

Petitioners' Exhibit 1007, p. 1959
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-164386 **Discussion on Rma channel model** **Huawei, HiSilicon**

The following problems are necessary to be further investigated:

Problem1: the difference on the surrounding may bring difference on the ZSA for RMa.
Problem2: the difference between the RMa and UMa environment may bring disorder on the inside correlation when combine the RMa azimuth and UMa zenith cross-correlation parameters together.
Problem3: the difference on the surrounding may bring difference on the cluster ZSA for RMa.
Problem4: the difference between RMa and UMi and UMa may bring difference on the correlation distance in zenith domain for RMa.

Discussion:
Decision: The document is not treated

Large scale parameters

R1-164049 **Discussion on removal of square bracket for LSP** **Huawei, HiSilicon, Samsung**

Proposal1: the square bracket on the frequency dependent LSP in **Error! Reference source not found.** *except K-factor can be removed.*
Proposal2: Modify the K-factor parameters to reuse the values from M.2135 as in Table 1 and remove the square bracket.

Discussion:
ZTE: K-factor change is not only frequency dependent. This is fundamental change. Motivation is not clear.
Huawei: In some cases K-factor can be negative. Most of the cases the K-factor shall be positive.
Ericsson: We don't agree with having frequency dependent parameters.
Decision: The document is noted

R1-164730 **Cross-correlation on LSP for Indoor office** **Huawei, HiSilicon, AT&T, Ericsson, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung**

Alternative 1: the cross-correlation on LSP for indoor office in Table 2 will be adopted.
Alternative 2: the cross-correlation on LSP for indoor office in Table 3 will be adopted.
Proposal 1: Adopt Alternative 1 or Alternative 2 for cross-correlation on LSP for indoor office.

Discussion:
Huawei prefers alternative 1.
LGE prefers alternative 1.
Ericsson prefer alt 2 but also OK with alt 1.
Samsung prefer alt 2 but also OK with alt 1.
Agreement: Alternative 1: the cross-correlation on LSP for indoor office in Table 2 will be adopted.
Decision: The document is noted.

R1-164570 **Remaining issues on fast fading modeling** **LG Electronics**

Proposal 1: Choose either approach 1 or 2 for the cross-correlation matrix in UMa and UMi-Street canyon O-to-I scenarios. In case approach 1 is preferred, the table in Appendix A can be used for revising the current cross-correlation matrix.
Approach 1: Adjusting cross-correlation values to ensure that the cross-correlation matrix is positive definite.
Approach 2: Reusing the cross-correlation matrix from TR 36.873 [2].
Proposal 2: Reuse the ZSD and ZoD offset parameters from TR 36.873 for necessary parameters above 6 GHz.
Proposal 3: After determination of the ZSD and ZoD offset parameters, the scaling factor should be defined based on the determination.
Proposal 4: Reuse the mean and standard deviation of XPR from TR 36.873 for necessary parameters above 6 GHz.

Discussion:
Decision: The document is not treated

R1-164805 **Remaining issues on UMi/UMa large-scale parameters** **Samsung, AT&T, Ericsson, Huawei, HiSilicon, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, ETRI**

Proposal 1: Reuse the mean and standard deviation of XPR parameters from TR36.873 model
Proposal 2: Adopt the cluster DS as fixed number, 5 for LoS and 11 for O2I
Proposal 3: Modify the per-cluster SF parameters to 3 dB for both UMi LoS and NLoS adopting from TR36.873
Proposal 4: Reuse ZoD spread and ZoD offset for UMi O2I and UMa O2I from UMi O2O and UMa O2O, respectively
Proposal 5: Adopt the revised cross-correlation parameters for O2I scenarios in Table 4
Proposal 6: Remove square brackets in Table 1 UMi channel parameters, if there is no other proposal to update

Petitioners' Exhibit 1007, p. 1960
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Discussion:
Ericsson: Proposal 6 means other proposals in this meeting.
Decision: The document is agreed

R1-165345 **WF on RMa LSPs** **Ericsson, AT&T, ETRI, Huawei, HiSilicon, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung**

Proposal 1: For in-car and indoor users, reuse LSPs for outdoor users according to the working assumption
– Note: These parameters are in Appendix A in R1-163909
– Note: Car and building penetration loss should be added for these users
Proposal 2: Adopt the following revised cross-correlation entries for LOS
– ZSD vs DS: 0
– ZSD vs ASA: 0
– ZSA vs ASA: 0

Discussion:
LGE: Parameters for indoor UEs?
Ericsson: We use outdoor parameters.
Decision: The document is agreed

R1-165569 **WF on ZoD offset for Indoor office** **Huawei, HiSilicon, Ericsson, Nokia, NTT DOCOMO, NTT, Samsung**

The ZoD offset for indoor office can be set as 0 for both LOS and NLOS cases

Discussion:
Decision: The document is agreed

Small scale parameters

R1-164388 **Discussion on removal of square bracket for cluster level SSP** **Huawei, HiSilicon, AT&T, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung**

Proposal 1: the square bracket on the cluster level SSP in **Error! Reference source not found.** *can be removed.*
Proposal 2: the scaling factors for AOA, AOD generation in TR 36.837 can be reused for InH.
Proposal 3: the scaling factors for ZOA, ZOD generation in InH can be adopted as in **Error! Reference source not found.**.

Discussion:
Ericsson: 4 clusters are far too low.
Huawei: This value is based on results from different companies.
Samsung: What is alternative?
Ericsson: Clusters as in IMT-A, 15 clusters. We have tdoc 5353.
ZTE: We support Ericsson proposal. Number of 4 do not match with link level simulations.
Huawei: IMT-A values are based on below 6 GHz.
Samsung: We don't have all parameters in place in IMT-A.
Decision: The document is revised in 5460

R1-165460 **Discussion on removal of square bracket for cluster level SSP** **Huawei, HiSilicon**

Discussion:
NTT DOCOMO: We have measurement results supporting this.
Decision: The document is agreed

Frequency dependency

R1-164732 **Discussion on frequency dependent channel characteristics for InH and UMi** **Huawei, HiSilicon, CMCC, ETRI, Intel, Samsung, Nokia**

Proposal: Frequency dependent channel characteristics should be included in the model of this SI, e.g. for delay spread and angular spread.

Discussion:
Decision: The document is revised in 5570

R1-165570 **Discussion on frequency dependent channel characteristics for InH and UMi** **Huawei, HiSilicon, CMCC, ETRI, Intel, Samsung, Nokia**

Proposal: Frequency dependent channel characteristics should be included in the model of this SI, e.g. for delay spread and angular spread.

Discussion:
Ericsson: All measurements are not fully comparable.

Petitioners' Exhibit 1007, p. 1961
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is revised in 5461

R1-165351 Frequency-dependence of LSPs Ericsson, Telstra

Proposal: Use frequency-independent or weakly frequency-dependent functions for modeling LSPs

Discussion:
Huawei: We compared from different data sources independently. Those are comparable.
Ericsson: We and Fraunhofer gave reasoning in last meeting on the comparability of the measurement.
Huawei: Ericsson showed in other contribution that delays and angles are quite similar with different power levels.
Ericsson: There may be some sort of dependency but it is not linear.
Huawei: Even with same measurement campaign seems to lead to different findings.
Decision: The document is revised in 5480

R1-165461 WF on frequency dependent LSP Huawei, HiSilicon, Samsung, NTT DOCOMO

Discussion:
Ericsson: This is only for indoor. What about other scenarios?
Huawei: In this we address only indoor. We have agreement for other scenarios.
Ericsson: We have brackets in other scenarios. We are fine in principle with this but we should apply the same also for other scenarios.
Huawei: Other scenarios can be modified in other contributions.
Ericsson: We would prefer linear domain instead, not logarithmic. It would be easier to compare plots.
Decision: The document is revised in 5475

R1-165475 WF on frequency dependent LSP for indoor office Huawei, HiSilicon, Samsung, NTT DOCOMO

Discussion:
Ericsson: It is not only the slope change but also average value change. We do have a solution for this in 5480.
Nokia: We could remove all the brackets from LSP values in TR.
Ericsson don't agree with that approach.
Samsung: We need to solve this issue. Only 2 companies (Ericsson, Telstra) object.

Chair: How many companies can agree on removing the brackets from LSP for indoor and UMi? => Nokia, Samsung, Huawei, KT, LGE, ETRI, Alcatel Lucent Shanghai Bell, NTT DOCOMO (8 companies)

Ericsson could agree to remove brackets from indoor.
Nokia: UMi still in brackets?
Ericsson: Half dependency for UMi
Samsung: Apply Ericsson proposal for indoor and remove brackets from UMi.
Nokia: We can compromise with Samsung proposal.
Ericsson: As compromise we could take half the dependency for all the parameters.
Decision: The document is noted

R1-165480 WF on frequency-dependent LSPs Ericsson, Telstra

Proposal 1: Use the compromise solution between frequency-dependent and frequency-independent for all scenarios
Proposal 2: Change the frequency-dependent LSPs such that the value at 6 GHz equals the legacy value, and mandate that the LSP value is constant below 6 GHz
Proposal 3: Change frequency-independent LSPs to the legacy values

Discussion:
Nokia: proposal 1 say all the scenario but we already have agreements for UMa. This reopen parameters for some scenarios. We don't support to change agreements at this late phase. We should focus on parameters in brackets now.
Ericsson: We are open to change only some of the parameters. Proposal 3 also apply to all scenarios and parameters, not just one with brackets.
Huawei: We share the Nokia concerns on re-opening the parameters which are based on measurements.
Samsung: We have similar view than Nokia and Huawei.
Ericsson: Huawei have raised concern that models are inconsistent but not willing to change those.
Huawei: We agree there are inconsistencies but we have measurements results for high frequencies what is the focus on this SI. We agree with the problem but not with the solution.
Ericsson: This is only solution propose to this issue. If we don't agree we will stuck with this.
Huawei: This is a new approach making parameters for <6GHz based on higher frequency measurements.
Nokia: We share the Huawei view. Target is to make realistic CM for >6 GHz.
Ericsson: This is not a new feature. It is already included in the white paper and done also earlier.
KT: We agree with Huawei, Nokia and Samsung.
Telstra: This is pragmatic approach to make model consistent.
Decision: The document is noted

Petitioners' Exhibit 1007, p. 1962
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Time varying parameters

R1-165218 Time-Varying Delays and Angles Keysight

Proposal 1: Replace the factor $\exp(j2\pi v_{n,m} \cdot t)$ *with* $\exp(j2\pi \sum_{k=0}^{K}(v_{n,m}(k\Delta T) \cdot \Delta T))$ *in the channel coefficient equation*

- *where* $t = k\Delta T$, ΔT *is the time sampling interval and* k *is a positive integer*

Proposal 2: Proposal 1 needs only to be considered in case the Doppler frequencies are time-varying. This could be due to:

- *Non-linear UE movement*
- *Time-varying angles of arrival due to spatial consistency modeling*

Discussion:
Ericsson: This is almost identical with our proposal. This is more complex. Does it also mean delta T need to be updated?
Decision: The document is noted

R1-165346 WF on modifying channel coefficient equation for time-varying Doppler frequencies Ericsson, AT&T, ETRI, Huawei, HiSilicon, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung

- *Proposal 1: Replace the factor* $exp\ j2\pi vn,m \cdot t$ *with* $exp\ j2\pi vn,m\ t \cdot t - ti\ exp\ j2\pi vn,m\ ti \cdot ti$ *in the channel coefficient equation*
  - *The phase shift at time* ti *is established as an anchor point and an incremental phase shift is applied*
  - *The anchor point should be updated sufficiently often so that* $vn,m\ ti+1 - vn,m\ ti \ll 1$
- *Proposal 2: Proposal 1 needs only to be considered in case the Doppler frequencies are time-varying. This could be due to:*
  - *Non-linear UE movement*
  - *Time-varying angles of arrival due to spatial consistency modeling*

Discussion:
Decision: The document is agreed

Clusters

R1-165352 On number of clusters and paths within clusters Ericsson, AT&T, ETRI, Huawei, HiSilicon, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung

Proposal: The observations in this contribution should be taken into account when deciding on the number of clusters and paths within clusters

Discussion:
Samsung: Do you have a specific proposal for the number? This is high level proposal.
Ericsson: We should have at least 400. For the high resolution maybe 1000 or 10000 would be required.
Samsung: We already agreed numbers for the other cases.
Huawei: Is this proposal for all scenarios?
Ericsson: Yes.
Huawei: Changing the number of clusters now is a major change. Proposed numbers are based on only these measurements. What kind of post processing was used in these measurements? Do you measure 10000 rays at the same time? Is the environment fixed?
Ericsson: 2 GHz BW with large antenna array was used.
Decision: The document is noted

R1-165474 WF on number of MPCs Ericsson, NTT DOCOMO

Discussion:
Huawei: There are many good aspects but we have also concerns. E.g. equation for AoD leads easily less than 1. It should never go below 3GPP 3D CM. Equations may also lead to very high number which means more complicated simulations.
Ericsson: We say the minimum value is 20. It may be good to have maximum value as well.
Huawei: There are 3 dimensions, how to spread those to delay, azimuth and elevation?
Ericsson: This WF is only for the number of paths.
Huawei: Some upper limit should be defined to reduce the simulation complexity.
Decision: The document is noted

R1-165476 WF on number of MPCs Huawei, HiSilicon

Discussion:
Samsung: Regarding the number we need to consider also simulation complexity.
Huawei: We think it is good to add some upper limit to reduce complexity.
Nokia: We could leave the number as simulation parameter. Companies could decide the value they use.
Huawei: No strong opinion on that but we need to remind the complexity.
Ericsson: We could give guideline on simulation parameter.

Petitioners' Exhibit 1007, p. 1963
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is revised in 5771

R1-165771 WF on number of MPCs Huawei, HiSilicon
Discussion:
Nokia: Will this be in addition feature section?
Huawei: This is additional text to DCM for large BW and large array.
LGE: How about calibration?
Decision: The document is agreed with the addition: For calibration Nmax is 40.

7.2.3 Remaining details on modelling of additional features for >6GHz channel model

7.2.3.1 Remaining details on blockage modelling

R1-164193 Remaining details for blockage modeling Intel Corporation
Discussion:
Decision: The document is revised in 5405

R1-165405 Remaining details for blockage modeling Intel Corporation

Proposal 1: The additional shadowing of one blocker should consider the link between the transmitter and the blocker for indoor scenario as in equation (2-1).
Proposal 2: When calculating the additional shadowing on the LoS channel cluster, the blocker model including center and span, can still be built in the receiver's polar coordinate system. Then the blocker model in the transmitter's coordinate system can be derived by center ($\boldsymbol{\varphi_{Rx} - \pi, \pi - \theta_{Rx}, r_{Tx}}$), azimuth angular span $\boldsymbol{A_{Rx} r_{Tx}/r_{Rx}}$, zenith angular span $\boldsymbol{Z_{Rx} r_{Tx}/r_{Rx}}$.
Proposal 3: For NLoS channel cluster, a virtual transmitter can be assumed at the extension line of AoA/ZoA.
Proposal 4: The additional shadowing on the NLoS channel cluster can be calculated based on the link between virtual transmitter and receiver in the same way as LoS channel cluster.
Proposal 5: The distance between the virtual transmitter and the blocker can be randomly generated in the range of $[r_{Rx} \quad d_{Tx\to Rx} - r_{Rx}]$.
Proposal 6: The definition of LoS/Shadow region can be clarified, e.g. using figure 3, for knife edge model.
Proposal 7: The existent period of hand-held blockage can be modelled as a random variable with exponential distribution or uniform distribution. Or for simplicity, the existence/absence of hand-held blockage can be modelled as a discrete event for a given UE during the whole traffic transmission of this UE.
Proposal 8: The coherent distance to generate spatially consistent blockers need to be defined. It can be generated as the scenario dependent value, e.g. [5] meter for indoor scenario, and [10] meter for UMi/UMa/RMa.

Discussion:
Qualcomm: Proposal 1 is fine in principle. Simulations support shorter distances.
Samsung: In principle we agree with proposal 1. We have slightly different calculation method.
Ericsson: On proposal 7, how would we parametrise such a model?
Decision: The document is noted

R1-164713 Advantages of stochastic blockage model Qualcomm Incorporated

Document highlight the main advantages of the stochastic approach and provide a text proposal

Discussion:
Fraunhofer: Reasoning for K-values is confusing.
Samsung: Step c is FFS in TP. Do you have any specific proposal? This method may require too many parameters.
Qualcomm: We could modify the attenuation loss.
Decision: The document is noted

R1-164808 Remaining details on blockage modelling for above 6 GHz channel model Samsung

Proposal 1: Proposal B3 is preferred.
Proposal 2: Azimuth angles of blocking screens should be generated with spatial consistency, i.e. interpolation using correlated random variables. Elevation angles of blocking screens should be computed according to geometry.
Proposal 3: Sizes of angular blocking regions should be determined by Eq. (2)-(6).
Proposal 4: The number of blockage regions is modelled by a Poisson distributed random variable as Eq. (7).
Proposal 5: Proposal B5, i.e., knife edge based model should be used to compute attenuation of blockage.
Proposal 6: Proposal A7 is preferred.
Proposal 7: The blockage attenuation is constant during the blockage period. Linear transition periods of 0.01s are introduced at both sides of the blockage period. The average blocking period should be used in the simulation. The average blocking period is determined by Eq. (9)

Discussion:

Petitioners' Exhibit 1007, p. 1964
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Ericsson: We don't agree with the complexity. We can use the same approach for blockers as for users.
Qualcomm: We need to consider also other parameters which increase the complexity.
Decision: The document is noted

R1-165347 WF on Blockage modeling Ericsson, AT&T, ETRI, Huawei, HiSilicon, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung

- Both approaches have their use cases
  - A (stochastic model) when a generic and computationally efficient blocking scenario is needed
  - B (geometric model) when a specific and more realistic blocking scenario is needed
- Proposal: Adopt both A and B as optional blocking models

Discussion:
ZTE: Approach A still has some parameters as FFS.
Nokia: We had to address all FFS points in this meeting so we propose this to be conditionally agreed
Ericsson: What is we can agree points only for one model?
Samsung agrees with Nokia.
Decision: The document is agreed

R1-165462 WF on dynamic blockage Qualcomm Incorporated, Intel, Samsung, Ericsson
Discussion:
Ericsson: We can agree but we need to note that parameter values on stochastic approach need further clarifications.
ZTE: We prefer the single solution but also OK with this approach. Companies should provide a TP in this meeting.
Qualcomm: We are working on that.
LGE: You just generate random distance. We are in general fine with option A.
Nokia: It is difficult to find different with already agreed WF. We could go directly for the TPs.
Decision: The document is noted.

7.2.3.2 Remaining details on spatial consistency modelling

Remaining issues

R1-164809 Remaining details on spatial consistency for above 6 GHz channels Samsung

Proposal 1: Use the proposed channel generation steps for user dropping.
Observation 1: The modelling of spatial consistency in the user mobility case may require recalculation of antenna patterns, which increases the complexity of channel simulation.
Proposal 2: If spatial consistency in mobility is considered, Method 1 or Method 2 should be used. Also, Method 2 is slightly preferred.
Under the working assumption of interpolation with correlated random variables, a method was proposed in [7], which is denoted as Method 1
Propose a new method (denoted as Method 2) to update channel parameters over time.

Discussion:
Ericsson: Proposal 1, companies may implement this differently. Method 2 is problematic approach.
Huawei: How about angle spreads in Method 1? Is it possible to merge these proposals?
Samsung: No
Decision: The document is noted

Time evolution

R1-164050 Dynamic modeling for time evolution Huawei, HiSilicon

Proposal 1: Adopt the model of time-variant angles given by equations (1)~(5) under the framework of spatial consistency model in [3].

Discussion:
Decision: The document is not treated

R1-164389 Cluster delay with time evolution Huawei, HiSilicon

Proposal 1: Adopt the correlation matrix method in (1) to slow down the varying rate of cluster delay

Discussion:
Decision: The document is not treated

R1-164726 Discussion on spatial consistency in 5G channel model in time variant case Huawei, HiSilicon

Petitioners' Exhibit 1007, p. 1965
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Proposal 1: Considering these results we may define a maximum distance of movement for the time evolution before a new spatially consistent realization is drawn. The max. movement maybe in the range of a few meters, e.g. 5m. This distance however may depend on the distance d_{2D}.
Proposal 2: Consider an asymmetric behaviour for the angular changes to model local cluster angular change rates.
Discussion:
Decision: The document is not treated

Calibration

R1-164194 Calibration methodology for spatial consistency Intel Corporation

- Proposal 1: Spatial consistency can be calibrated as:
  - For each dropped UE, create one pair of positions according to **Error! Reference source not found.**. The first position is the dropped UE's position. The second position has fixed distance, e.g. 1 meter, from the first position.
  - Collect statistics from channel realization on each pair of positions.
  - For LOS/NLOS state spatial consistency, collect CDF of the LOS/NLOS state delta.
  - For cluster level spatial consistency, collect CDF of the mean channel angle difference using equation (1-2) for AOD/ZOD/AOA/ZOA.
- Proposal 2: For drop based MU-MIMO simulation, use the baseline model for spatial consistency.
- Proposal 3: If improvement of mobility based simulation is needed, use baseline model for initial UE dropping, followed by updating cluster delay using equation (5-1) and updating cluster angle with the limit of equation (5-2).
- Proposal 4: If moving between different channel states is modelled, define soft LOS/NLOS and indoor/outdoor states, and then path loss and fast fading channel are defined as a function of soft LOS/NLOS and indoor/outdoor states as in equation (7-1) and (7-2).

Discussion:
Huawei: The scope of this document is not clear. Only proposal 1 is for calibration. Is mobility also considered?
Intel: This propose also other details than calibration. Mobility relation is not agreed yet.
Nokia: We are OK in principle with dropping part for calibration.
Samsung is also OK with dropping part.
Huawei: WE have joint contribution in different agenda item
Decision: The document is noted

Further enhancements

R1-165233 WF on correlation distance for spatial consistency in RMa Intel, Ericsson, AT&T, ETRI, Huawei, HiSilicon, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung

- *The correlation distance for cluster/ray specific random variables for RMa is according to the table below*
- *The correlation distance for LoS state is [60m] for RMa*

	RMa	
	LOS	NLOS
Correlation distance (m) for cluster/ray specific random variables	[50]	[60]

Discussion:
Nokia: We should remove the brackets.
Samsung: Same comment.
Chair: Brackets can be removed when implementing text into TR.
Decision: The document is agreed

R1-165234 WF on mobility enhancement for spatial consistency Intel, Ericsson, AT&T, ETRI, Huawei, HiSilicon, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung

Proposal 1: Both alternatives are captured in TR 38.900
- *Alternative 1: based on R1-163480, details described in the following slides*
- *Alternative 2: based on R1-163248, details described in the following slides*

Proposal 2: Modify the below text by adding the red text into the current TP
- *The cluster specific random variables include:*
  - » *Cluster specific random delay in step 5;*
  - » *Cluster specific shadowing in step 6; and*
  - » *Cluster specific offset for AoD/AoA/ZoD/ZoA in step 7.*
  - » *Cluster specific sign for AoD/AoA/ZoD/ZoA in step 7*

Petitioners' Exhibit 1007, p. 1966
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

- *The procedure shall apply to each cluster before sorting the delay. Cluster specific sign for AoD/AoA/ZoD/ZoA in step 7 shall be generated once kept unchanged per simulation drop if UE position changes during simulation. The ray specific random variables include:*

Discussion:
Samsung: Alternative 1, would it be possible to update cluster angles?
Ericsson: Alternatives are different in scope. We are fine with capturing both in TR but we need to consider how to do that.
Decision: The document is agreed

R1-165348 **WF on O2I spatial consistency Ericsson, AT&T, ETRI, Huawei, HiSilicon, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung**

- Proposal 1: Determine the "building type" using a spatially consistent random variable with correlation distance [50 m]
  - The building type is determined by comparing the random variable with P1 and P2
- Proposal 2: Determine the indoor distance from a spatially consistent uniform random variable in the interval 0-25 m, with correlation distance [25 m]
- Proposal 3: Make the penetration loss variability sP a spatially consistent random variable with correlation distance [10m]

Discussion:
Fraunhofer: What is the value in proposal 3?
Ericsson: Same as the Shadow fading.
Decision: The document is agreed

R1-165354 **WF on further enhancements for spatial consistency Ericsson, Intel, AT&T, ETRI, Huawei, HiSilicon, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung**

- Proposal 1: Soft LoS states are modeled in spatial consistency modeling
  - Soft LoS state is a float number between 0 (NLoS) and 1 (LoS)
  - Soft LoS state generating method is according to the appendix
    - dLoS is [20]
  - Define path loss and channel matrix to be a function of soft LoS state
    - $PLLOSsoft = PLLOS \cdot LOSsoft + PLNLOS \cdot (1 - LOSsoft)$
    - $HLOSsoft = HLOS \cdot LOSsoft + HNLOS \cdot 1 - LOSsoft$
  - Note: Not restricted to mobility simulations only
- Proposal 2: Soft indoor/outdoor states are not modeled in spatial consistency modeling
  - Note: The model thus doesn't support move between indoor/outdoor states in mobility simulation

Discussion:
LGE: Agreement from last meeting was different.
Ericsson: This is a shared view from sourcing companies.
Samsung: We shall remove the brackets when implementing this in TR.
Decision: The document is agreed

R1-165773 **TP for blockage Qualcomm, Intel, Samsung, Ericsson**
Discussion:
Fraunhofer: have you considered if you move the screen and elevation change?
Straight Path: Situation is different in NLOS case.
Decision: The document is noted.

7.2.3.3 Remaining details on large antenna array modelling

R1-164727 **Discussion on remaining details on large antenna array modeling Huawei, HiSilicon**

Proposal 1: The following aspects on large array support should be discussed in the channel model SI: spherical wave, high angular resolution, 3D correlation issue, and non-stationarity.
Proposal 2: The spherical wave modeling introduced in this document should be taken into account in the channel model SI.

Discussion:
Ericsson: What do you mean by 3D correlation issue?
Huawei: Contribution [6] discuss that.
Samsung: Do you have concrete proposals?
Huawei: Spherical way proposal is in this document. Other issues are ongoing except non-stationary. That can be discussed this week further.
Ericsson: Would it be in space domain?
Huawei: Yes.
Ericsson not comfort able with proposal 2.

Petitioners' Exhibit 1007, p. 1967
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Decision: The document is noted

R1-165183 **Implementation of cluster delay and angle spread NTT DOCOMO, INC., AT&T, Ericsson, Huawei, HiSilicon, Intel, KT Corporation, Nokia, Qualcomm, Samsung**

Alternative 1: Implementation for narrow BW based on sub-cluster information of 3GPP 3D model
Alternative 2: Implementation for large BW and/or large antenna arrays using generating step of cluster delays and angles in the 3GPP 3D channel model
Alternative 2a: Method using generating step of cluster delays and angles in the 3GPP 3D channel model
Alternative 2b: New method
Proposals 1: Adopt Alternative 1 for low complexity simulations where narrow BW
Proposals 2: Down select from Alternative 2a and Alternative 2b for large BW and/or large arrays

Discussion:
NTT DOCOMO support 2a.
Ericsson support 2b.
ZTE support 2b.
Decision: The document is revised in 5466

R1-165466 **WF on implementation of cluster delay and angle spread NTT DOCOMO, Huawei, HiSilicon, Intel, Nokia, Qualcomm, Samsung**

Proposal 1: Alternative 1 is adopt for low complexity simulations where narrow BW
Proposal 2: Alternative 2a is adopt for large BW and/or large arrays

Discussion:
Ericsson: Alternative 2a is based on number of paths not in line with other WF. We like to see the scaling.
ZTE: Proposal is quite high level. It would be better to provide TP.
Decision: The document is revised in 5477

R1-165477 **TP for implementation of cluster delay and angle spread in TR38.900 on Clause 7.5 NTT DOCOMO, Huawei, HiSilicon, Intel, Nokia, Qualcomm, Samsung**

Discussion:
LGE: Comments on 3 issues. How to use scaling factor? How to implement cluster delays in section 7.5? This is a new feature for large antenna array. How RAN1 us this new feature?
NTT DOCOMO: We will assume arrays. Clause belongs for rapporteur to handle.
Samsung: We prefer to capture in 7.6 instead.
LGE: New delay offset for narrow BWs.
ZTE: 2 values are not defined yet. Who will provide those definitions? Scaling factor is non-linear optimisation factor. Companies are not sure about realization.
Fraunhofer: What to do with sub path powers?
Ericsson: Which agreement in Busan this is referring to? We could re-use agreed TP for the hybrid model.
NTT DOCOMO: WF in this meeting.
Decision: The document is revised in 5772

Friday

R1-165772 **WF on implementation of cluster delay and angle spread Ericsson, NTT DOCOMO, ZTE Corp, ZTE Microelectronics**

Discussion:
Decision: The document is agreed.

R1-166025 **WF on AoA, ZoA, ZoD Angular Scaling Huawei, HiSilicon, NTT DOCOMO**

- Agree the following example values for scaling:
  - AoA spread (ASA) for each CDL model: {30, 45, 60} degrees.
  - ZoA spread (ZSA) for each CDL model: {5, 10, 15} degrees.
  - ZoD spread (ZSD) for each CDL model: {1, 3, 5} degrees.

Decision: The document is agreed.

R1-165353 **Indoor Highly Resolved Channel Measurements at 60 GHz Ericsson, Telstra**

Observation 1: 1000-10000 MPCs needed to account for 95% of power
Observation 2: 100 strongest MPCs account for 10-70% of power
Observation 3: Number of observed clusters are at the order of 10-20
Observation 4: More clusters and MPCs needed in NLOS than in LOS

Petitioners' Exhibit 1007, p. 1968
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Proposal: The observations in this contribution are taken into account when deciding on the number of clusters and paths within clusters

Discussion:
Huawei: BW is 2 GHz with very large array. How did you consider the impact of that?
Ericsson: Broadening the clusters.
Decision: The document is noted.

7.2.3.4 Remaining details on modelling of other additional features

R1-164353 **Text proposal to update oxygen absorption loss ZTE**
Discussion:
Decision: The document is agreed

7.2.4 Remaining details on link-level channel models

Remaining issues

R1-164724 **Discussion on the link level channel models Huawei, HiSilicon**
Proposal 1: CDL-A/TDL-A two last tap powers adjusted 19.0 to -19.9 and -33.1 to -29.7.
Proposal 2: CDL-D/CDL-E/TLD-D/TDL-E delay spread is adjusted by multiplying all delays by a constant value to obtain 1.0000 rms delay spread.
Proposal 3: Correct the editorial error of CDL-D.
Discussion:
Decision: The document is agreed

TPs and WFs

R1-164051 **Text proposal to TR 38.900 to add link level channel model for LoS scenario Huawei, HiSilicon**
Discussion:
Decision: The document is agreed

R1-164052 **Text proposal to TR 38.900 to add antenna filtering for link level channel model Huawei, HiSilicon**
Discussion:
Fraunhofer: We had email discussions where we said there is something wrong in this. Filter has to be changed.
Huawei: This is a copy of agreed WF from Busan.
Decision: The document is revised in 5468

R1-165468 **Text proposal to TR 38.900 to add antenna filtering for link level channel model Huawei, HiSilicon**
Discussion:
Samsung: We have not got time to check.
Decision: The document is return.
Friday: The proposed TP is just noted.

R1-164257 **Text Proposal on the purpose of link-level channel modes for 38.900 CATT**
Discussion:
Samsung: This is more a guideline for NR, not for channel model work.
CATT: WE have used similar statement also earlier SCM channel model work.
LGE: We are not sure why we have to capture this in a TR.
Huawei: This is not necessary text in a TR. It is up to RAN1 to decide which model to use.
Ericsson: This is not something we should mandate. We could have recommendation or guideline.
Decision: The document is noted

R1-164725 **Text proposal to TR 38.900, corrections and clarifications to the link level channel models Huawei, HiSilicon**
Discussion:
LGE: Comment on CDL table delay.
Huawei: Delay is normalised to 1 s.
CMCC: Do we have to align the numbers with system simulation parameters?
Huawei: These are different models agreed before system simulation model due to time pressure.
Decision: The document is agreed

Petitioners' Exhibit 1007, p. 1969
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-164731 **Scaling of the K-factor of the link level channel models** **Huawei, HiSilicon, Nokia, Samsung, AT&T, CMCC, Ericsson, Intel, KT Corporation, NTT DOCOMO, Qualcomm**
Discussion:
Decision: The document is revised in 5440

R1-165440 **Scaling of the K-factor of the link level channel models** **Huawei, HiSilicon, Ericsson, Nokia, Samsung, Intel, Qualcomm, NTT DOCOMO, AT&T, KT Corporation**
Proposal: The above procedure for K factor scaling and example K-factor values is added into the TR 38.900.
Discussion:
Decision: The document is agreed

R1-165349 **WF on link level models for MIMO simulations** **Ericsson, AT&T, CMCC, ETRI, Huawei, HiSilicon, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung**
Discussion:
Decision: The document is revised in 5402

R1-165402 **WF on link level models for MIMO simulations** **Ericsson, AT&T, ETRI, Huawei, HiSilicon, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung**
- Proposal 1: Introduce angular translation and angular spread scaling to the agreed CDLs
  - A method for scaling and translation to be described in the TR
  - Guidelines on selecting scaling and translation parameters to be captured in the TR
  - Note: This can be done with a similar approach as the delay scaling
- Proposal 2: Introduce correlation matrices to be used together with the TDLs
  - The correlation matrix construction method from 36.101/36.104 can be reused
  - Guidelines on selecting correlation parameters to be captured in the TR
  - Note: This approach can be applied to TDLs derived from spatially filtered CDLs according to R1-163490 to emulate hybrid BF

Discussion:
Samsung: Are we going to capture the content in the TR? Angular spread need to be modified.
Ericsson: Typo need to be fixed.
Huawei: There should be example scaling factor values in proposal 1. We are preparing WF for that. Proposal 2 for channel or cluster correlation matrix? How it is defined for very large array? 4x4 MIMO leads to 16x16 correlation matrix. We could have 256x256 MIMO and the matrix will be huge.
Ericsson: It can be used for both. Per channel may be better but we are open for both. We don't need to write out the matrices.
Samsung: Proposal 2 2nd bullet needs clarification.
Ericsson: It is defined in the 3rd bullet.
Decision: The document is revised in 5470

R1-165470 **WF on link level models for MIMO simulations** **Ericsson, AT&T, ETRI, Huawei, HiSilicon, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung, InterDigital**
Discussion:
Decision: The document is agreed

R1-165756 **WF on Angular Scaling** **Huawei, HiSilicon, Ericsson**
Agree the Proposal 1 of R1-165402.
Agree the following example values for AoD spread (ASD) for each CDL model: {5, 10, 15, 25} degrees.
Scaling of other angular parameters (ZSD, ASA, ZSA) are FFS.
Discussion:
Samsung: Did you address the zenith angle?
Huawei: That is quite limited case. The scalability of that is not important.
Samsung: We should define the upper limit. We should not have FFS anymore.
ZTE: Is the scaled number already normalized.
Huawei: Proposal was to first normalise, then scale.
Samsung: We should complete FFS and zenith angle during this week.
Decision: The document is agreed.

7.2.5 Channel modelling calibration results

R1-165184 **Further Discussion on O-to-I Parameters** **NTT DOCOMO, INC.**
Discussion:
Decision: The document is revised in 5427

Petitioners' Exhibit 1007, p. 1970
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165427 **Further Discussion on O-to-I Parameters NTT DOCOMO, INC.**

Proposal 1: Use the UE-specific in d_{in}, i.e. UE to all the sectors has the same d_{in}.

Proposal 2: Replace the O-to-I shadow fading with O-to-I standard deviation.

Discussion:

Decision: The document is noted

R1-165770 **WF on calibration Nokia, Samsung**

- *Setup 3 email threads for collecting calibration results*
  - *For updating results for large scale calibration: Until June 10th*
  - *For full calibration results: Until June 25th*
  - *For additional feature calibration: Until July 25th*
- *Companies can decide which option(s) to calibrate for those additional features with multiple options*
  - *Rapporteur will provide separate excel templates for different options*
- *Capture the [reference tdoc # containing the excel sheet(s)] into TR38.900 similarly to 3D channel model calibration process*
  - *TP for capturing the results can be approved in the email discussion*

Discussion:

Decision: The document is agreed.

7.2.5.1 Large-scale calibration

Email discussion summary

R1-164802 **E-mail discussion summary of the large scale calibration Samsung, Nokia**

Large-scale calibration is completed, and the calibration results in the latest version of the excel sheet in the ftp folder are captured in the TR.

- *In the TR, average cdf plots will be provided for the calibration parameters with citing rapporteur's calibration summary tdoc similarly as done for TR36.873.*
- *In the rapporteur's calibration summary tdoc, the below table on the O2I parameters is included.*

For the full calibration, companies continue discuss how to align the three O2I parameters in [84b-17].

Discussion:

Decision: The document is agreed

Calibration discussions

R1-164715 **Initial results on large scale calibration and concerns on calibration specifications** **Qualcomm Incorporated**

Proposal 1: Baselines on which large and full scale calibration are to be made need to be specified completely and in as much detail as possible in the TP to avoid ambiguities and mismatches in calibration curves.
Proposal 2: UE-specific, link-specific, eNB-specific and sector-specific quantities need to be appropriately defined.
Proposal 3: Quantities that are to be correlated across sectors, across eNBs and across links need to be specified. In particular, assumptions on the following quantities need to be specified: Outdoor/indoor determination random variable, penetration loss determination random variable, d_In, shadow fading factors for LOS/NLOS, and shadow fading factors for penetration loss.

Discussion:
Decision: The document is noted

R1-164894 **Discussion on large-scale calibration results** **CHTTL**

Proposal 1: RAN1 should clarify whether it's UE-specific or link-specific for Building penetration loss through external wall, O-to-I penetration loss standard deviation, and Indoor distance d2D-in to improve the convergence of calibration results.

Discussion:
Decision: The document is noted

7.2.5.2 Full calibration

Discussion:
Decision: The document is not treated

Calibration discussions

R1-164048 **Discussion on additional feature calibration** **Huawei, HiSilicon, AT&T, Ericsson, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung**
Discussion:
Decision: The document is revised in 5441

Petitioners' Exhibit 1007, p. 1972
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

R1-165441 **Discussion on additional feature calibration** **Huawei, HiSilicon, AT&T, Ericsson, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung**

Proposal 1: adopt assumptions in Table 1 for calibration of oxygen absorption.
Proposal 2: adopt assumptions in Table 2 for calibration of large bandwidth and large antenna array.
Proposal 3: adopt assumptions in Table 3 for calibration of spatial consistency.
Proposal 4: adopt assumptions in Table 4 for calibration of blockage.

Discussion:
Decision: The document is revised in 5469

R1-165469 **Discussion on additional feature calibration** **Huawei, HiSilicon, AT&T, Ericsson, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung**

Proposal 1: adopt assumptions in Table 1 for calibration of oxygen absorption.
Proposal 2: adopt assumptions in Table 2 for calibration of large bandwidth and large antenna array.
Proposal 3: adopt assumptions in Table 3 for calibration of spatial consistency.
Proposal 4: adopt assumptions in Table 4 for calibration of blockage.

Discussion:
Nokia: There are quite many scenarios to calibrate. We should try to down select the scenarios and metrics.
LGE: Which spatial consistency dropping method is intended? Large antenna array have 64 elements. Distance of the panels will be more than 3.5 lambda. We have too many metrics to calibrate.
Huawei: In stationary case we drop multiple users at the same time. We could consider down selection.
Decision: The document is revised in 5471

R1-164900 **Discussion on full calibration** **Beijing Xinwei Telecom Techn.**

Proposal 1: Companies are encouraged to adjust cross correlation values based on measurement data to make the cross correlation matrix positive definite.
Proposal 2: Reuse the same ZSD and ZoD offset parameters for UMa and UMi-Street Canyon LOS O-I scenarios as those values for UMa and UMi-Street Canyon LOS scenarios, as listed in Table 1 and Table 2 .
Proposal 3: Reuse the same ZSD and ZoD offset parameters for UMa and UMi-Street Canyon NLOS O-I scenarios as those values for UMa and UMi-Street Canyon NLOS scenarios, as listed in Table 1 and Table 2 .
Proposal 3: For indoor-office scenario, ZoD offset in LOS condition can be zero, and in NLOS condition, it should be a function that takes d2D or d3D as a variable.
Proposal 4: Constant C for the number of clusters equals to 4, 10 or 11 should be defined based on measurement data.
Proposal 5: For calibration purpose, whether O-I penetration loss is high or low is UE-specific, indoor distance is UE-specific, and replace shadow fading term by standard deviation which is link-specific and the same for three sectors of an eNodeB and different for different eNodeBs.

Discussion:
Decision: The document is noted

R1-165471 **Discussion on additional feature calibration** **Huawei, HiSilicon, AT&T, Ericsson, Intel, KT Corporation, Nokia, NTT DOCOMO, Qualcomm, Samsung**

Discussion:
Decision: The document is agreed

7.2.6 Consistent extension of the additional features to < 6GHz

R1-164716 **Considerations on link and system model extension to < 6GHz** **Qualcomm Incorporated**

Observation 1: Typically, when a UE is close to the base station it is more likely to experience a relatively lower delay spread, compared to that of a UE that is in the cell-edge.
Proposal 1: Perform link-level evaluations of different numerology proposals under a geometry-based scaled multi-path channel model.

Discussion:
Decision: The document is not treated

R1-164728 **Discussion on the extensions of the channel model to below 6GHz** **Huawei, HiSilicon, Intel, Qualcomm**

Proposal: TR38.900 is applicable to 6 - 100 GHz only.

Discussion:
Ericsson: RMa would then be valid only between 6 – 7 GHz.
Huawei: It would be valid for lower frequencies too. One way would be to include RMa in 3D CM.
Nokia: RMa is anyway exceptions as it is only for up to 7 GHz.
Samsung: How can solve the discrepancy between models at 6 GHz?
Huawei: We can adjust higher frequency PL or modify 3D CM PL. We prefer option 1 to modify 5G CM PL.
Ericsson: Observation 4 shows additional features are important also for < 6 GHz.
Nokia: We don't think the PL discontinuity is a critical issue.

Petitioners' Exhibit 1007, p. 1973
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Ericsson: NR evaluation has such scenario combining both frequency ranges. Having different models is not a good solution.
Telstra: <6GHz range is important. 2 models is not a good approach.
Huawei: Basically we agree it would be good to have only 1 model but we have very limited time schedule. We would need more time to study all implications.
Decision: The document is noted

R1-164806 Discussion on using new channel model also below 6 GHz Samsung, AT&T, Ericsson, KT Corporation, ETRI
Discussion:
Decision: The document is revised in 5400

R1-165400 Discussion on using new channel model also below 6 GHz Samsung, Ericsson, ETRI, KT Corporation, Telstra
This contribution made the following observations:

- *If two incompatible pathloss models are adopted according to Alt 1, pathloss discontinuities occur at 6 GHz.*
- *Alt 1 can introduce another problem of how to handle the range of 3.5-6GHz frequency band.*
- *The new channel models are proposed based on the dataset including both below and above 6 GHz measurement/ray-tracing.*
- *Following Alt 1, there is no 3D channel model for InH and RMa scenarios below 6 GHz; With Alt 2, 3D channel model is available for all prioritized scenarios and frequency bands.*
- *There was a precedence to make a full transition from one channel model to another – TR 25.996 SCM to ITU channel models during 3GPP RAN1 LTE advanced SI.*
- *Alt 2 can improve the accuracy of MU-MIMO simulations below 6 GHz.*
- *Alt 2 may be more attractive from the point of view of ITU-R*

Discussion:
Huawei: PL model is shown as reasoning but the same can be used also another way around. Do we need to redo all the simulations?
Samsung: Interference limited scenario was considered in 3D CM work. PL change doesn't affect the results so much. We saw in calibration results that we have Interference limited scenario in NR as well.
Huawei: We should consider different levels in NR study. The impact on PL will be more significant.
Decision: The document is noted

R1-164807 Discussion on consistent pathloss model between below 6GHz and above 6GHz Samsung
Proposal 1:
– *Considering the simplicity and the consistency in pathloss models, Solution #2 should be taken into TR38.900*
Proposal 2:
– *Alt 2 : New channel model in TR38.900 is applicable to 0.5 - 100 GHz in R1-164616 should be down-selected*
Discussion:
Decision: The document is not treated

R1-164616 On the applicability range of new channel model Nokia, AT&T, Ericsson, ETRI, Huawei, HiSilicon, Intel, KT Corporation, NTT DOCOMO, Qualcomm, Samsung
RAN1 should down-select between the two alternatives
– *Alt.1: New channel model in TR38.900 is applicable to 6 - 100 Ghz*
– *Alt.2: New channel model in TR38.900 is applicable to 0.5 - 100 Ghz*
Discussion:
ZTE: There is also 3rd alternative.
Decision: The document is noted

R1-165472 WF on the applicability range of new channel model Nokia
Discussion:
Decision: The document is withdrawn

R1-165479 WF on the applicability range of the new channel model Ericsson, Samsung, Telstra, ETRI, KT, LGE, Straight Path
Proposal: New channel model in TR38.900 is applicable to 0.5 - 100 GHz
Discussion:

Petitioners' Exhibit 1007, p. 1974
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Nokia: It is hard to find a compromise for the question yes or no. We could capture the new CM is applicable to at least 6-100 GHz.
Ericsson: There are colleagues in NR session planning to use this model for < 6GHz.
Huawei: We checked NR colleagues. If model is stable they can use it also, otherwise they use something else.
Ericsson: What is Huawei view? Is the model valid for <6 GHz or not?
Huawei: It is not valid for < 6 GHz.
CATT: Model is not valid for < 6 GHz. NR evaluations will start in the next meeting.
Nokia: There is no consensus for the values < 6GHz. We capture now what we have in a TR and add a sentence in the TR and close the SI.
Ericsson: That would be extremely confusing for NR evaluations. We need to solve this before closing the SI.
Huawei: NR assumption says also 3D model can be used. Title of the SI is > 6 GHz so this is very clear.
Ericsson: Why do you draft WF for link level which is mandatory for < 6 GHz?
Samsung: Current TR have different description for different features and applicability range. Link level is OK. It would be much nicer to use the 5G CM for the whole range of NR.
CMCC: We have not got enough time to evaluate parameters for < 6 GHz. If to cover also that then extension of the SI should be further discussed.
Samsung: There is no issue to use this for < 6GHz. There is no CM agreed for all NR simulation cases.
Telstra: This is important issue to solve.
Samsung: What is Huawei solution for indoor?
Huawei: Using 3D CM or ITU model.
Samsung: ITU model is not 3D.
Ericsson: Partial solution would be to agree extension to UMa and RMa.
Huawei: What is the reason to extend if UMa is according to 3D CM and RMa according to ITU?
Ericsson: We have re-used parameters and added some more parameters.
Samsung: Compromise could be to have applicability range in brackets and let NR to decide.
Huawei: RAN plenary discussed this range. We proposed then to cover the full range but it was objected by many companies. The whole SI focus have been >6 GHz only.
Samsung: We are not changing any opinion but consider extending to <6GHz as discussed in the plenary.
Ericsson: There are many issues to solve for <6GHz.
Ericsson: We have proposed solution to solve this issue. Blocking is not constructive.
CATT: We have not seen solution for extension.
Conclusion: 2 alternatives were discussed on the applicability frequency range either 0.5-100 GHz or 6-100 GHz but consensus was not reached.
Decision: The document is noted.

7.2.7 Map-based methodology

R1-164351 Evaluations of map-based hybrid channel model ZTE, Keysight

Proposal 1: RAN1 confirms the working assumption on map-based hybrid model in TR38.900

Discussion:
Huawei: Did you verify the spatial consistency between 2 closely located users? It seems to be good match between parameters. Why the SF is lower?
ZTE: Not in this document but we have done that earlier.
NTT DOCOMO: Question on Figure 2 calibrated PL decrease.
Ericsson: Do you think table 2 shows a good correspondence?
ZTE: On reason for the difference is the layout. Ray tracing results will be smaller than stochastic model. Hybrid model works with different maps.
Ericsson: Is the different from the map only?
ZTE: Yes. There are differences in results also in stochastic model.
Decision: The document is agreed

R1-164352 Text proposal for remaining issues in map-based hybrid model ZTE, Keysight

Discussion:
Decision: The document is revised in 5667

R1-165667 Text proposal for remaining issues in map-based hybrid model ZTE, Keysight

Proposal 1: The modeling of large bandwidth and large antenna array in map-based hybrid channel model is based on the splitting of whole bandwidth into multiple frequency bins, and has channel coefficients per bin given by (1) and corresponding delays given by (2).
Proposal 2: The modeling of blockage and UT rotation in map-based hybrid channel model obeys maximum similarity to those determined in stochastic-only model.
Proposal 3: To update the section 8 of TR38.900 with the attached TP.

Discussion:

Petitioners' Exhibit 1007, p. 1975
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Ericsson: Dividing the BW. Is this applicable to both models?
ZTE: In theory yes but the intention is to have that only in hybrid model.
Ericsson: If to have it in both models then more time is needed to evaluate.
Decision: The document is agreed.

8 Closing of the meeting

Thanks to the Chineese Friends of 3GPP for hosting and organizing such big meeting. High attendnace will surely becomes an issue for the upcoming meetings in Europe.
Mr Chair thanked all the chair persons who help managing the number of parallel sessions during the course of the week. Good progress was achieved with the closing of NB-IoT work and other WI/SI as well.
Mr Chair then wished all a relaxing summer break.
Meeting was closed at 17:10.
See you all in Göteborg.

R1-165722	Reply LS on questions on NB-IOT	CT1, Nokia	Rel-13	NB_IOT-Core, CIoT-CT	R3-161032	RAN3, RAN2, SA2	RAN1, CT4	C1-162926	
R1-165723	LS to RAN1 on SPS	RAN2, LGE	Rel-14	LTE_SL_V2V-Core		RAN1		R2-164359	
R1-165727	LS on V2V transmission path selection	RAN2, Huawei	Rel-14	LTE_SL_V2V-Core		SA2, RAN1, RAN3		R2-164356	
R1-165753	Reply LS on NB-IoT RRM requirements	RAN4, Huawei	Rel-13	NB_IoT-Core	R2-163046	RAN2	RAN1	R4-164085	
R1-165754	LS on RRM measurement for NB-IOT	RAN4, Ericsson	Rel-13	NB_IoT-Core		RAN1, RAN2		R4-164454	
R1-165817	Response LS on PUSCH transmission for eLAA	RAN4, Nokia	Rel-14	LTE_eLAA-Core		RAN1		R4-164678	
R1-165838	LS to RAN1 on RAN2 agreement on eLAA	RAN4, Nokia	Rel-14	LTE_eLAA-Core		RAN1		R2-164489	
R1-165894	Response to LS on uplink transmission gap in NB-IoT	RAN4, Sony	Rel-13	NB_IoT-Core	R1-162069	RAN1	RAN2	R4-164459	
R1-165895	LS on Tx Gaps for Frequency Error Correction	RAN4, Qualcomm	Rel-13	NB_IoT-Core		RAN2	RAN1	R4-164532	
R1-166004	Response LS on realistic power amplifier model for NR waveform evaluation	RAN4, Nokia	Rel-14	FS_NR_newRAT		RAN1		R4-164542	

Petitioners' Exhibit 1007, p. 1982
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Annex D: List of Approved updated WIDs

None

Petitioners' Exhibit 1007, p. 1983
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

3GPP TSG RAN WG1 Meeting #86 **R1-16xxxx**
Göteborg, Sweden, 22nd – 26th August 2016

Annex E: **List of draft TSs/TRs agreed at RAN1 #85**

Tdoc Number	Title	Source	Conclusion/Decision

Petitioners' Exhibit 1007, p. 1984
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Annex F: List of actions

- **Outgoing LS.**

[85-07] Hanbyul (LGE)
V2V LS (summarizing all the agreements/working assumptions made during the week) to RAN2/4 for email approval until June 2nd
Done: Final LS is agreed, according to Mr Chair's email posted on June 3rd, as follows:
R1-165965 LS on RAN1 agreements potentially related to RAN2 in sidelink-based V2V RAN1, LGE

[85-26] Matthew (Huawei)
LS to RAN4 about UL DM-RS for NB-IoT for email approval until June 2nd
During the meeting, we agreed to to send LS to RAN 2 and cc-RAN 4 on UL DMRS hopping, but agreed LS did not include RAN4
Done: Final LS is agreed, according to Mr Chair's email posted on June 3rd, as follows:
R1-166043 LS on UL DM-RS for NPUSCH format 1 RAN1, Huawei

[85-27] Sorour (Ericsson)
UL category for UL capacity enhancement for email approval until June 2nd
There was a typo that UL Category 15 instead of 17 in the RAN1 agreements as well as the LS R1-166034 to RAN2.
Done: Final LS is agreed, according to Mr Chair's email posted on June 3rd, as follows:
R1-166044 LS on Uplink Capacity Enhancements for LTE RAN1, Ericsson
R1-166044 supersedes the former agreed LS in R1-166034.

- **CR approval**

[85-02] Johan (Ericsson)
R1-165958 MPDCCH search space for random access in connected mode for BL/CE UE Ericsson
Email approval until June 3rd
Done:

[85-04] Editors/Rapporteur
NB-IoT CRs - Editors should provide updated CRs to 36.211, 36.212, 36.213, 36.214 by June 3rd , for approval by June 7th
Rapporteur shall submit a summary of all agreements by May 30th
Done:

[85-06] Editors/Rapporteur
eLAA CRs
Editors will submit draft CRs (201, 211, 212, 213, 214 (if needed)) until 18th August
Rapporteur needs to submit agreement and WA lists until 30th June

Petitioners' Exhibit 1007, p. 1985
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

[85-08] Editors/Rapporteur
V2V CRs
Editors will submit draft CRs (201, 211, 212, 213, 214) until 18th August based on the following list
Rapporteur needs to submit agreement and WA lists until 30th June

- **Text proposal for TS and TR**

[85-32] Peter (Huawei)
TR25.707
Email discussion on updated TR25.707 until Monday June 6, 2016.
Done: .

- **Miscellaneous**

[85-30] Harish (Qualcomm)
Clarifications to DCH enhancements feature Email discussion on proposals 2/4/7/8 from R1-164364 until June 8, 2016

[85-31] Gerardo (Ericsson)
R1-165336 Clarification on UL DPCH 10ms Mode
Email approval until June 8, 2016

[85-01] Aris (Samsung)
R1-164733 HARQ-ACK Codebook on PUSCH for TDD
Email discussion until 30th June

[85-03] Hao (Qualcomm)
Clarification on CSI measurements for eMTC
Email discussion on the issue raised in R1-164399 and R1-165542 till 10th June

[85-5-1] Scheduling aspects for eLAA, Joon (LGE)
Scheduling aspects including BD reduction and working assumptions on some fields
Email approval until 6th June

[85-5-2] Resource allocation aspects for eLAA, Srinivas (Qualcomm)
Resource allocation aspects including resource allocation type alternatives and applicability of fields for legacy vs. interlaced resource allocation
Email approval until 6th June

Petitioners' Exhibit 1007, p. 1986
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

[85-5-3] PUSCH structure, Havish (Ericsson)
Start times of PUSCH transmission including within first OFDM symbol and means to achieve this
Email approval until 6th June

[85-5-4] SRS aspects, Xia Yuan (Huawei)
SRS aspects including triggering of SRS without PUSCH with DL grants and common/group DCI
Email approval until 6th June

[85-5-5] UCI on an LAA SCell, Havish (Ericsson)
Further discussion on transmission of HARQ-ACKs on an LAA SCell
Email approval until 6th June

[85-5-6] Channel access framework, Sorour (Ericsson)
Channel access aspects including Cat. 4 LBT parameters, CW adjustments for Cat. 4 LBT, Signaling of LBT type, ED threshold, DL-UL traffic multiplexing and LBT parameters for SRS
Email approval until 6th June

[85-5-7] RRC parameters, Havish (Ericsson), Xia Yuan (Huawei)
RRC parameter list for eLAA
Email approval until 6th June

[85-09] Hanbyul (LGE)
Semi-persistent transmission for mode 2 for V2V
Email approval about above FFSs until 9th June

[85-10] Joerg (Ericsson)
R1-165438 Simulation assumptions for eMBMS
Email approval until 30th June

[85-11] Alberto (Qualcomm)
eMBMS proposal
Email approval about above proposed agreements and proposed working assumptions until 30th June

[85-12] Hanbyul (LGE)
TP for V2V
Email approval of TP for TR including approval of next version of TR and updated simulation results by 2nd June

Petitioners' Exhibit 1007, p. 1987
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

[85-13] Alexei (Intel)
Antenna model for NR
Email approval about brackets in R1-166026 until 9th June

[85-14] Hasegawa (Mitsubishi)
R1-166001 Evaluation assumptions for high speed train scenario for NR
Email approval until 8th June about brackets and FFS parts

[85-15] Youngtae (LGE)
Performance metrics for NR
Email discussion on performance metrics, starting from the ones in R1-165612, till 8th June

[85-16] Frank (Huawei)
Calibration for NR waveform
Email discussion until 30th June

[85-17] Frank (Huawei)
Collect information for NR waveform
Email discussion until 4th August

[85-18] Mihai (Nokia)
PA assumption for NR
Email discussion and approval about power amplifier assumptions for NR DL waveform evaluations by utilizing R1-166004 and R1-166010 and also email approval to confirm above WA until 9th June

[85-19] Young-Han Nam (Samsung)
Large scale calibration for channel model
For updating results for large scale calibration: Until June 10th

[85-20] Young-Han Nam (Samsung)
Full calibration for channel model
For full calibration results: Until June 25th

[85-21] Young-Han Nam (Samsung)
Additional feature calibration for channel model
For additional feature calibration: Until July 25th

[85-22] Young-Han Nam (Samsung)

Petitioners' Exhibit 1007, p. 1988
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

TP for channel model
For approval of the summary for all the calibration results and updated TP: Until Aug 10th

[85-23] Young-Han (Samsung)
TR38.900 for channel model
Email approval to check the consistency with the agreements in this meeting and the previous meeting until 2nd June

[85-24] Hanbyul (LGE)
RRC parameter lists for V2V
Email approval until 2nd June

[85-25] Taeyoung (Samsung)
UE noise figure for NR for email approval until 2nd June
Done: As per Mr chair's email decision posted on June 3rd, the following clarification is agreed:

- **The agreed noise figures (baseline performance: 13dB, high performance: 10dB) for evaluation of NR above 6GHz apply for both "Dense urban" and "Urban macro".**

3GPP TSG RAN WG1 Meeting #86 **R1-16xxxx**
Göteborg, Sweden, 22nd – 26th August 2016

Annex G: List of participants at RAN1 #85

Please see excel file attached to this report

Petitioners' Exhibit 1007, p. 1990
AT&T et al v. Asustek Technology & Celerity
IPR2024-01121

Annex H: **TSG RAN WG1 meetings in 2016 – 2017**

TITLE	TYPE	DATES	LOCATION	CTRY
3GPPRAN1#86	WG	22 – 26 Aug 2016	Goteborg	Sweden
3GPPRAN1#86bis	WG	10 – 14 Oct 2016	Lisbon	Portugal
3GPPRAN1#87	WG	14 – 18 Nov 2016	TBD	US
3GPPRAN1#88	WG	13 – 17 Feb 2017	Athens	Greece
3GPPRAN1#88bis	WG	03 – 07 Apr 2017	TBD	US
3GPPRAN1#89	WG	15 – 19 May 2017	TBD	China
3GPPRAN1#90	WG	21 – 25 Aug 2017	Berlin (TBC)	Germany
3GPPRAN1#90bis	WG	09 – 13 Oct 2017	Prague (TBC)	Rep Czech
3GPPRAN1#91	WG	27 Nov – 01 Dec 2017	TBD	US

MEETING TYPES	
AH = Ad Hoc	CM = Chairmen's meeting
JM = Joint	OR = Ordinary
PM = Preparatory Meeting	RG = Rapporteurs Group
RM = Resolution Meeting	SG = Steering Group
ST = Startup Meeting	TG = Task Group
WG = Working Group	XO = Extraordinary
