When it comes to choosing the right cloud provider for your firm's data, the choice can be difficult. After all, there are plenty of options available in the market, which can make the task at hand very stressful. If you are thinking about choosing a cloud hosting datacenter provider that offers multiple datacenters, you might have noticed that many other companies are doing the same thing. Many providers are branching out with their datacenters, and for good reason. Decentralizing your firm's through multiple datacenter usage can bring several benefits to an organization.

Please read below about the three big reasons why you should consider choosing multiple datacenters for your business's critical data:

Enhanced Performance – The speed of light limits how quickly your data can be transferred to your computer. This can be significant when you are operating on a regional, national, or even a global level. When data is transferred through multiple router hops, it can slow down traffic quite a bit. However, when you choose to operate in multiple datacenters, you can decrease this time lag and improve your performance by operating out of the datacenter that is closest to your firm's branch or corporate office.

Expand Your Range of Circuit Providers – When you have one datacenter and that center has a large-scale regional outage, you can find yourself at a roadblock as you wait for data circuits to be restored. By using multiple datacenters, you can significantly decrease the chance that your firm's data is offline since it is available at all of the locations.

Shield Yourself From Disaster – If you only have one datacenter that houses all of your firm's information, you could be in serious trouble if a crisis were to occur at that one facility. Both natural and humans disasters can happen with very little warning. For instance, a tornado or a hurricane could severely damage or even destroy a datacenter, rendering your business helpless without its information. Multiple datacenters increase your likelihood that your data will remain safe through redundancy and can minimize the consequences of catastrophes for your company.

If you want to keep your data safe, improve your network's performance, and prepare your business more thoroughly in the event that a disaster strikes, Network Specialists is the right provider for you. For over 20 years now, the NS Team is dedicated to serving your firm's current IT needs as well as being prepared with a complete business continuity plan that utilizes all of our datacenters.
