Subject: [thedunckers.jot.com] Ticket 60: Requirements: Springer (29012008)

ID# 60: Requirements: Springer (29012008)

Priority:	asap	Reporter:	Seymour
Severity:	feature_request	Assigned To:	Tyron
Product:	iCharts Studio	Status:	assigned
		Resolution:	open

Description:

These requirements originate from discussions with Springer Autohaus meeting on Jan 29, 2008

1. Manual Entry of Data (Springer)

Often charts are made of very few data points only. Having to set up separate Excel sheets is a step too much, if one wants to be able to set up a chart very fast. Hence a direct, simple data entry capability should exist for manually entering data into an online table should be possible.

2. Administering Presets (Springer)

For Springer administration of presets is critical. Hence we need this capability pretty soon.

3. User Account Assignment to external users with limited capability (Springer)

Springer wants to be able to distribute user accounts to external authors so they can set up charts for articles they are writing already in Springer CI. Those Springer sponsored accounts, however, should not only be limited to create iCharts for Springer use, no general use of iCharts possible. Should the author want to use iCharts for other than Springer purposes he should be able to convert the account to an own account

4. User Accounts with expiration period (Springer)

Springer wants to be able to have self-terminating accounts they can give to external authors where they can set up their charts for a limited period. After that the account should expire.

Updates:
