

**IN UNITED STATES DISTRICT COURT
FOR THE EASTERN DISTRICT OF TEXAS
MARSHALL DIVISION**

CROGA INNOVATIONS LTD., Plaintiff, v. CISCO SYSTEMS, INC., Defendant.	Case No. 2:24-cv-00065-JRG (Lead Case) JURY TRIAL DEMANDED
CROGA INNOVATIONS LTD., Plaintiff, v. FORTINET, INC., Defendant.	Case No. 2:24-cv-00206-JRG (Member Case) JURY TRIAL DEMANDED
CROGA INNOVATIONS LTD., Plaintiff, v. PALO ALTO NETWORKS, INC., Defendant.	Case No. 2:24-cv-00208-JRG (Member Case) JURY TRIAL DEMANDED

DEFENDANTS' PRELIMINARY INVALIDITY CONTENTIONS

Pursuant to Local Patent Rules 3-3 and 3-4 and the Court's First Amended Docket Control Order (Dkt. No. 53) Defendants Cisco Systems, Inc. ("Cisco"), Fortinet, Inc. ("Fortinet"), and Palo Alto Networks, Inc. ("PAN") (collectively, "Defendants") hereby set forth their Preliminary Invalidity Contentions concerning U.S. Patent No. 7,738,368 (the "'368 Patent"), U.S. Patent No.

10,601,780 (the “’780 Patent”), and U.S. Patent No. 11,223,601 (the “’601 Patent”) (collectively, the “Asserted Patents”).

For Cisco, Plaintiff Croga Innovations Ltd. (“Croga”) asserts that Cisco infringes claim 1 of the ’368 Patent, claims 1, 3, 9, 10, 11, 13, 19, 20 of the ’780 Patent, and claims 1, 2, 4, 5, 6, 7, 9, 10, 12, 13, 14, 15 of the ’601 Patent (collectively, the “Cisco Asserted Claims”). Cisco contends that each of the Cisco Asserted Claims is invalid under at least one or more of 35 U.S.C. §§ 101, 102, 103, and 112.

For Fortinet, Croga asserts that Fortinet infringes claims 11, 13, 14, and 20 of the ’780 Patent (collectively, “Fortinet Asserted Claims”). Fortinet contends that each of the Fortinet Asserted Claims is invalid under at least one or more of 35 U.S.C. §§ 102, 103, and 112.

For PAN, Croga asserts that PAN infringes claims 1, 2, 4, 5, 6, 7, 9, 10, 12, 13, 14, 15 of the ’601 Patent (collectively, “PAN Asserted Claims”) (collectively the Cisco Asserted Claims, Fortinet Asserted Claims, and PAN Asserted Claims are the “Asserted Claims”). PAN contends that each of the PAN Asserted Claims is invalid under at least one or more of 35 U.S.C. §§ 102, 103, and 112.

These Preliminary Invalidity Contentions: (i) identify each prior art reference that Defendants are currently aware of that either anticipates or renders obvious one or more of the Asserted Claims; (ii) specify whether each such reference anticipates or renders obvious the applicable claims, and in the event a combination with one or more other such references renders obvious the applicable claims, identify each such combination and the motivation to combine such references; (iii) include charts, for illustrative prior art references, citing exemplary disclosures in those references that anticipate or render obvious each of the elements of the applicable claims; and (iv) identify grounds for invalidating asserted claims based on lack of patentable subject matter

under 35 U.S.C. § 101, or indefiniteness, enablement, or written description under 35 U.S.C. § 112. These contentions relate only to invalidity, and do not include any contention or position beyond the issue of invalidity (e.g., non-infringement or claim construction).

Defendants' discovery and investigation in this lawsuit is ongoing, and these contentions are based only on the information Defendants have obtained to date. For example, Defendants have not had the opportunity to complete third-party discovery relating to various third-party prior art and expressly reserves the right to amend these contentions subject to third-party discovery. These third parties may include, without limitation, the authors, inventors, or assignees of prior art references identified in these contentions. Defendants also reserve the right to amend the contentions due to Croga's failure to produce prior art known to it, including prior art identified by its own investigations, other accused infringers or third parties as to the Asserted Patents or related patents. To date, Croga has not produced any prior art to Defendants. Defendants reserve their right to supplement and/or amend these contentions consistent with the Federal Rules of Civil Procedure, the Local Rules, and any orders from the Court.

These Preliminary Invalidity Contentions are based upon Defendants' present understanding of the Asserted Claims, Croga's May 15, 2024 Disclosure of Asserted Claims and Infringement Contentions to each Defendant ("Initial Infringement Contentions"), Croga's July 16, 2024 Supplemental Disclosure of Asserted Claims and Infringement Contentions to Cisco, Croga's June 14, 2024 Supplemental Disclosure of Asserted Claims and Infringement Contentions to Fortinet, and Croga's July 25, 2024 Supplemental Disclosure of Asserted Claims and Infringement Contentions to PAN ("Supplemental Infringement Contentions") (collectively Croga's "Infringement Contentions"). Defendants do not concede that any (apparent) claim constructions are correct. Even though Defendants contend that the Asserted Claims are indefinite,

Defendants have disclosed which prior art render those claims invalid based upon Croga's contention that those claims are definite. Defendants' assertion of prior art is not a concession as to the meaning, definiteness, written description support for, or enablement of any of the Asserted Claims, or that the Asserted Patents properly claim patent eligible subject matter. If Croga amends its Infringement Contentions, Defendants reserve the right to amend its Preliminary Invalidity Contentions, and Defendants note that Croga's Infringement Contentions fail to provide sufficient notice of Croga's infringement theories as required by the Local Rules. Indeed, Cisco and PAN served Croga correspondence explaining how Croga's Infringement Contentions were deficient and Croga's Supplemental Infringement Contentions did not address each of the deficiencies identified by Cisco and PAN.

Defendants take no position on any matter of claim construction in its Preliminary Invalidity Contentions. Any statement herein describing or tending to describe any claim element is provided solely for the purpose of understanding the relevant prior art. Defendants expressly reserve the right to propose any claim construction it considers appropriate and/or to contest any claim construction it considers inappropriate. Moreover, Defendants' Preliminary Invalidity Contentions are made in some instances based upon Croga's apparent interpretation of the Asserted Claims in its Infringement Contentions and should be viewed accordingly. Further, by including in these contentions prior art that would be anticipatory or render a claim obvious based on a particular scope or construction of the claims, Defendants' Preliminary Invalidity Contentions herein are not, and should in no way be seen as, adoptions or admissions as to the accuracy of such scope or construction. The Court has not yet construed the Asserted Claims, and Defendants reserve the right to amend these Preliminary Invalidity Contentions in accordance with the local patent rules, including after the issuance of the Court's claim construction order.

By submitting these Preliminary Invalidity Contentions, Defendants do not waive any of its claims or defenses in this case, including those relating to lack of patentable subject matter, written description, enablement, indefiniteness, anticipation, and obviousness. References not included in these Preliminary Invalidity Contentions, whether known or not now known, may become relevant based on the claim constructions adopted by the Court, based on any amendment or supplement that Croga may be permitted to make to its Infringement Contentions, and/or based on discovery in this case.

I. Priority Dates Of The Asserted Patents And Claims

Croga asserts the following alleged priority dates for the Asserted Patents:

- '368 Patent – Nov. 10, 2005
- '780 Patent – Jan. 27, 2011
- '601 Patent – Sept. 28, 2017

It is Croga's burden to show that each Asserted Claim is entitled to the alleged priority date. Defendants presently contend that Croga has failed to meet its burden to establish its asserted priority dates as outlined below.

a) The '368 Patent is Not Entitled to Priority Earlier Than Its Non-Provisional Application Filing Date.

Croga contends that "[e]ach asserted claim of the '368 Patent is entitled to *at least* a priority date of Nov. 10, 2005." Infringement Contentions Cover Pleading at 8 (emphasis added). Cisco notes that pursuant to Local Patent Rule 3-2(b), Croga was required to disclose with its Infringement Contentions "[a]ll documents evidencing the conception, reduction to practice, design, and development of each claimed invention, which were created on or before the date of application for the patent in suit" Croga's Infringement Contentions and accompanying

document productions fail to identify any evidence corroborating a conception date earlier than the Nov. 10, 2005 non-provisional filing date.

b) The '780 Patent is Not Entitled to Plaintiff's Alleged Priority Date.

Croga asserts that the '780 Patent is entitled to a priority date of Jan. 27, 2011 based on U.S. Provisional Patent Application No. 61/436,932 (the "'932 provisional"). But the '932 provisional fails to disclose adequate support for any Asserted Claim of the '780 Patent sufficient to meet the requirements of 35 U.S.C. § 112. For example, the '932 provisional fails to disclose, as required by 35 U.S.C. § 112, at least the following claim elements:

- “[A] processor and a memory configured to implement network isolation between one or more untrusted network destinations and the networked computer system”;
- “[T]he host system is configured to store data in a host memory space and the virtual system is configured to store data in a virtual memory space that is segregated from the host memory space”; and
- “[T]he one or more applications or processes running in the virtual system are configured to communicate with the one or more untrusted network destinations.”

c) The '601 Patent is Not Entitled to Plaintiff's Alleged Priority Date.

Croga asserts that the '601 Patent is entitled to a priority date of Sept. 28, 2017 based on U.S. Provisional Patent Application No. 62/564,371 (the "'371 provisional"). But the '371 provisional fails to disclose adequate support for any Asserted Claim of the '601 Patent sufficient to meet the requirements of 35 U.S.C. § 112. For example, the '371 provisional fails to disclose, as required by 35 U.S.C. § 112, at least the following claim elements:

- “[A]uthenticate the isolated computing environment with an authentication device”;

- “[S]end data to an untrusted destination from the multi-user interactive software application via a proxy device when the isolated computing environment has been authenticated”;
- “[T]he host-based firewall isolates the system from communicating with one or more other devices on the network”; and
- “[O]ne or more trusted applications communicate with one or more trusted machines via the network.”

II. Invalidity Based Upon Prior Art

Cisco contends that each of the Cisco Asserted Claims is invalid as anticipated under 35 U.S.C. § 102 and/or obvious under 35 U.S.C. § 103. Cisco’s detailed contentions regarding the Asserted Claims in claim chart form are attached as Exhibits A-1 through A-7, B-1 through B-12, C-1 through C-11, and D-1 through D-3. Those charts disclose how each reference, or combination of references, anticipates and/or renders obvious each of the Cisco Asserted Claims.

Fortinet contends that each of the Fortinet Asserted Claims is invalid as anticipated under 35 U.S.C. § 102 and/or obvious under 35 U.S.C. § 103. Fortinet’s detailed contentions regarding the Asserted Claims in claim chart form are attached as Exhibits B-1 through B-12 and D-2. Those charts disclose how each reference, or combination of references, anticipates and/or renders obvious each of the Fortinet Asserted Claims.

PAN contends that each of the PAN Asserted Claims is invalid as anticipated under 35 U.S.C. § 102 and/or obvious under 35 U.S.C. § 103. PAN’s detailed contentions regarding the Asserted Claims in claim chart form are attached as Exhibits C-1 through C-11 and D-3. Those

charts disclose how each reference, or combination of references, anticipates and/or renders obvious each of the PAN Asserted Claims.

Defendants claim charts disclose multiple theories of invalidity in a single chart. For example, each chart directed to an anticipatory publication also discloses how that reference alone or in combination with one or more other references and/or the knowledge of one of ordinary skill in the art renders one or more of the Asserted Claims obvious. Exhibits A-1 through D-3 identify exemplary disclosures within the prior art that teach the relevant claim elements and limitations. While the claim charts have identified citations in the references for the claim limitations, each and every disclosure of the same limitation in the same reference is not necessarily identified. For example, whenever Exhibits A-1 through D-3 include a figure, diagram, table, or drawing, all of the text associated with that figure, diagram, table, or drawing is incorporated by reference (even if that text is not explicitly cited in the exhibit). Similarly, if an exhibit includes the text associated with a figure, diagram, table, or drawing, the described figure, diagram, or drawing is incorporated by reference (even if that figure, diagram, table, or drawing is not explicitly cited). Further, persons of ordinary skill in the art read a prior art reference as a whole, and in the context of other references, publications or literature. Thus, Defendants may also rely on uncited portions of the prior art references, any cited documents within any prior art reference, other references, and the testimony of experts to establish that the limitations of the Asserted Claims are anticipated or rendered obvious and/or that a person of ordinary skill in the art would have been motivated to modify or combine certain of the cited references so as to render the claims obvious.

Defendants base these claim charts in part upon the infringement positions taken by Croga. These claim charts in no way indicate that Defendants agree with or adopt Croga's positions or claim constructions. Defendants reserve the right to propose and argue for different positions and

different constructions of the claim language. Nothing herein should be construed as setting forth or limiting Defendants' claim construction positions. To the extent that any of the prior art references discloses the same feature or functionality of the accused instrumentalities based on Croga's apparent interpretation of the Asserted Claims, Defendants reserve the right to argue that such feature or functionality does not meet any limitation of any of the Asserted Claims of the Asserted Patents.

a) Anticipation

Defendants identify below prior art, including references and systems which anticipate one or more Asserted Claims, and/or render obvious one or more of the Asserted Claims, either alone or in combination with what was known to a skilled artisan at the time and/or one or more other prior art references.

1. Patents and Patent Publications

Abbreviated Name	Patent No. or Publication No.	Country of Origin	Filing Date	Issuance or Publication Date	Claim Chart No.	Production No.

2. Prior Art Systems

The following prior art systems render the Asserted Claims invalid because they were known or used by others in the United States before the priority date of the Asserted Claims, in public use or on sale in the United States more than one year prior to the date of the application for the Asserted Patents in the United States and/or were in public use, on sale, or otherwise available to the public before the effective filing date of the claimed invention. The systems disclosed below are described in various cited publications and other materials, which also independently form a basis for invalidity based upon their publication. Multiple versions or implementations of any of the disclosed systems may exist—Defendants expressly reserve the right to rely upon other versions and implementations of these systems. Defendants expect that third-party discovery will yield more information relating to the disclosed systems and reserves the right to amend or supplement these Preliminary Invalidity Contentions as discovery progresses in this matter. As an example, Defendants expect that discovery may be taken on one or more authors of the invalidating references describing these systems, and Defendants reserve the right

to and anticipate that it will amend these Preliminary Invalidity Contentions after receiving such discovery.

Defendants further reserve the right to rely on any prior art system referenced, embodied, or described in any of the prior art identified herein, or which embodies any of the prior art identified herein. For example, any physical embodiments of the prior art and documents identified above, which physical embodiments were publicly available (e.g., made, used, offered for sale, or sold) before the claimed or actual priority dates of the Asserted Patents, constitute prior art. Defendants are not limited to the identified references, but also may rely on material that expressly identifies any physical embodiment of such references as prior art.

Any citation to one or more of these prior art references and/or documents should be construed to constitute not only a citation to the prior art reference and/or document itself (as a printed publication), but also a reference to the product or system itself. When a reference is a prior public use, offer for sale, or sale, the identified document(s) is(are) being relied upon as exemplary evidence of the prior public use, sale, and/or offer for sale. For the prior art products or systems,

Defendants may rely on additional documents to demonstrate the products or systems, testimony relating to the products or systems, and other information.

Further, Defendants contend that the identified prior art provides evidence of prior invention and making of the invention in the United States by another under pre-AIA 35 U.S.C. § 102(f) and/or 102(g), as evidenced by the named inventor(s), author(s), organization(s), and publisher(s) involved with each such reference, with the circumstances described and reflected in each reference including publications and system implementation references. Defendants therefore reserve the right to contend that one or more of the Asserted Claims is invalid under pre-AIA 35 U.S.C. § 102(f) and/or (g) to the extent that the named inventor did not invent the subject matter in the Asserted Claim(s), and/or the alleged invention was made in this country by another inventor who had not abandoned, suppressed, or concealed it.

Also, to the extent not expressly stated herein, these Preliminary Invalidity Contentions incorporate by reference (1) any and all prior art identified in documents produced by Defendants in this case; (2) any prior art of which a named inventor of the Asserted Claims is aware and/or on which they, and/or Croga contends the alleged invention(s) of the Asserted Claims builds upon or improves; (3) any and all admissions by Croga and/or a named inventor regarding the Asserted Patents including, but not limited to, admissions in the specification of the Asserted Patents the prosecution of the Asserted Patents and related patents and/or patent applications; (4) any prior art cited in the prosecution histories of the '368 Patent, the '780 Patent, the '601 Patent, related patents and applications, and/or any foreign counterparts; and (5) all prior art and/or invalidity contentions that Croga discloses, produces or is aware of in connection with any assertion, transfer of rights or contested proceeding concerning the Asserted Patents and related patents and/or patent applications. Furthermore, Defendants reserve the right to contend that publications and patents

related to the '601 Patent are invalidating prior art if Defendants discover that the related publications and patents fail to meet the requirements of AIA 35 U.S.C. § 102(b)(2)(C) and therefore invalidate the Asserted.

In addition, the prior art identified in Defendants' Preliminary Invalidity Contentions reflects common knowledge and the state of the art at the time of the earliest filing date of the Asserted Patents. Defendants will rely on the references cited in A-1 through D-3 and additional citations, references, expert testimony, fact testimony and other corroborating evidence, and other material to provide context and background illustrating the state of the prior art, knowledge of a person of ordinary skill in the art at the time of the claimed inventions, and/or to aid in understanding the cited portions of the references and/or cited features of the systems. Defendants may also rely on fact or expert testimony explaining relevant portions of references, as well as additional documents, hardware or software products or systems, and other discovery regarding these subject matters, to provide context or to aid in understanding the cited portions of the prior art references and interpreting the teachings of the prior art and to establish bases for combinations of certain cited references that render the Asserted Claims obvious.

b) Obviousness Combinations

The Asserted Claims would have been obvious under 35 U.S.C. § 103 in light of one or more of the references and systems disclosed in Sections II.a), alone or in combination with what was known to a skilled artisan at the time, with one or more of the references cited in the file history of the Asserted Patents, and/or one or more of the references identified below. For example, each claim chart for each of the references and systems identified in Section II.a) explains that each such reference or system alone or in combination with one or more other reference or system renders every Asserted Claim obvious. The references and systems disclosed below all relate to VoIP telephone systems (with respect to the '368 Patent) and virtualization and/or computer and

network security (with respect to the '780 and '601 Patents). The benefits conferred by the references and systems listed below are explained in detail within each reference. A person having ordinary skill in the art of the Asserted Patents would have been motivated to look to the references and systems listed below in order to incorporate the benefits disclosed in those references and systems into the VoIP systems and computer and network systems, including virtualization systems, described in the prior art. Some examples of these conferred benefits would include making feedback-based adjustment of network resources for VoIP telephone calls (with respect to the '368 Patent) and improved separation and isolation of computer systems utilizing virtual computing environments and improved overall network and computer security (with respect to the '780 and '601 Patents). Additionally, a person having ordinary skill in the art of the Asserted Patents would have had a reasonable expectation of successfully implementing the solutions described in the asserted combinations. Each claim chart provides additional detail from the references and systems themselves regarding the motivation and ability of skilled artisans to combine the prior art.

Exhibits D-1 through D-3 compile exemplary disclosures from the references and systems identified below for purposes of demonstrating the combinations that would have rendered each Asserted Claim obvious.¹ When used in such combinations, Exhibits D-1 through D-3 demonstrate how the references and systems listed below render obvious each Asserted Claim. The references and systems cited and relied upon in Exhibits D-1 through D-3 are listed in the tables below. In addition to the prior art listed in these contentions and in charts A-1 through D-3, Defendants expressly reserve the right to rely upon all prior art cited in the prosecution of the Asserted Patents,

¹ Each reference and system identified in Exhibits D-1 through D-3 qualifies as prior art under at least one of pre-AIA 35 U.S.C. §§ 102(a), (b), (e), (g) or AIA 35 U.S.C. §102(a).

and Defendants further expressly reserve the right to rely upon additional references to demonstrate the state of the relevant art. For example, Defendants may rely upon additional references in its forthcoming technical expert reports that demonstrate what was well known in the art and to provide a background to the jury on the relevant art and/or purported inventions of the Asserted Patents. The alleged invention of the Asserted Patents implements well-known prior art systems and devices for using VoIP telephones (with respect to the '368 Patent) and improving overall network and computer security, including through the use of virtualization, firewalls, web proxies, and/or authentication (with respect to the '780 and '601 Patents).

Defendants for which the '780 Patent is asserted also incorporate by reference in their entirety each and every ground for invalidity (and all arguments and documents cited in support of those grounds of invalidity) set forth in Inter Partes Review No. IPR2024-01196 (field July 25, 2024). In addition, Defendants incorporate by reference any expert reports, invalidity contentions, identified prior art, invalidity claim charts or defenses disclosed at any date by any party to any other litigation or U.S. Patent & Trademark Office proceeding involving the Asserted Patents or any related patents.

Croga has not identified any secondary considerations or other objective evidence of non-obviousness. Defendants reserve the right to submit evidence to rebut any secondary considerations or other objective evidence that Croga may later identify.

Defendants hereby incorporate by reference each reference and system identified in Section II.a) as if fully set forth herein.

4. Exemplary '368 Patent Obviousness Combinations

Prior art rendering the Asserted Claims of the '368 Patent obvious, alone or in combination with other references, are identified and discussed throughout these Invalidity Contentions and in the claim charts Exhibits A-1 through A-7 and D-1. Exhibits A-1 through A-7 and D-1 include exemplary claim charts for the '368 Patent, including citations to where in the references the teachings, suggestions, and motivations to combine the references are disclosed. Further reasons to combine the references identified in Exhibits A-1 through A-7 and D-1 include the nature of the problem being solved, the express, implied and inherent teachings of the prior art, the knowledge of POSITAs, that such combinations would have yielded predictable results, and that such combinations would have represented known alternatives to a POSITA.

Below is a list of examples of certain combinations of prior art that a person of ordinary skill in the art would have been motivated to combine around the time of the alleged invention of the '368 Patent. The combinations listed below are meant to provide additional clarity on

motivations to combine some of the references, but is not meant to list every possible combination and is not an admission that unlisted combinations would not have been obvious to a person of ordinary skill in the art. Cisco reserves the right to amend or add exemplary obviousness combinations as discovery continues, pursuant to any orders from the Court, and after any change in Croga's positions.

For example, the alleged invention of the '368 Patent implements well-known prior art systems for making feedback-based adjustments of network resources for VoIP telephone systems. By way of example only, and not exhaustive of all references, citations, and combinations thereof, a POSITA at the time of the alleged inventions would have been aware of the concepts described in each of the prior art described in A-1 through A-7 and D-1. Indeed, such a POSITA would have possessed knowledge of adjusting codecs used in VoIP telephone systems, they would have been well-equipped to design the claimed systems, such as those described in detail by the references explained below and in A-1 through A-7 and D-1.

For example, skilled artisans would have been motivated to combine Everson '998 (or Mundra '860 or Bauer '556 or Shaffer '734 or Shaffer '839 or Kakimoto '749) with H.323 v5 (or OpenH323 or Nishimura '957 or Minhazuddin '414) because H.323 v5 (or OpenH323 or Nishimura '957 or Minhazuddin '414) discloses utilizing a gatekeeper for mid-call codec adjustment. Skilled artisans would have understood that Everson '998 (or Mundra '860 or Bauer '556 or Shaffer '734 or Shaffer '839 or Kakimoto '749) and H.323 v5 (or OpenH323 or Nishimura '957 or Minhazuddin '414) could be readily combined because both relate to VoIP codec adjustment. H.323 v5 (or OpenH323 or Nishimura '957 or Minhazuddin '414) discloses the benefits of utilizing a gatekeeper in the codec adjustment process to most efficiently utilize bandwidth allocation in response to changing network and call conditions. Thus, a skilled artisan

would have been motivated to use the gatekeeper for mid-call codec adjustment disclosed in H.323 v5 (or OpenH323 or Nishimura '957 or Minhazuddin '414) to the VoIP systems disclosed in Everson '998 (or Mundra '860 or Bauer '556 or Shaffer '734 or Shaffer '839 or Kakimoto '749) and would have recognized that the results of this combination were predictable.

For example, skilled artisans would have been motivated to combine Everson '998 (or Shaffer '734 or Shaffer '839) with SIP Standard (or Baumann '846 or Kakimoto '749) because SIP Standard (or Baumann '846 or Kakimoto '749) discloses SIP mid-call signals to change a media session. Skilled artisans would have understood that Everson '998 (or Shaffer '734 or Shaffer '839) and SIP Standard (or Baumann '846 or Kakimoto '749) could be readily combined because both relate to VoIP mid-call signaling. SIP Standard (or Baumann '846 or Kakimoto '749) discloses the benefits of utilizing mid-call signaling to change the media session. Thus, a skilled artisan would have been motivated to use SIP mid-call signaling disclosed in SIP Standard (or Baumann '846 or Kakimoto '749) to the VoIP systems disclosed in Everson '998 (or Shaffer '734 or Shaffer '839) and would have recognized that the results of this combination were predictable.

For example, skilled artisans would have been motivated to combine Bauer '556 (or Shaffer '734 or Shaffer '839) with Everson '998 (or Hepworth '690 or Kumar '515) because Everson '998 (or Hepworth '690 or Kumar '515) discloses a VoIP system where the VoIP telephone sends a call quality signal. Skilled artisans would have understood that Bauer '556 (or Shaffer '734 or Shaffer '839) and Everson '998 (or Hepworth '690 or Kumar '515) could be readily combined because both relate to VoIP mid-call signaling. Everson '998 (or Hepworth '690 or Kumar '515) discloses the benefits of a VoIP telephone sending the signal, to indicate potential call quality issues. Thus, a skilled artisan would have been motivated to use VoIP telephone signaling disclosed in Everson '998 (or Hepworth '690 or Kumar '515) to the VoIP systems

disclosed in Bauer '556 (or Shaffer '734 or Shaffer '839) and would have recognized that the results of this combination were predictable.

For example, skilled artisans would have been motivated to combine Mundra '860 (or OpenH323 or Shaffer '734 or Shaffer '839) with Everson '998 (or Nishimura '957 or SIP Standard or Minhazuddin '414 or Baumann '846) because Everson '998 (or Nishimura '957 or SIP Standard or Minhazuddin '414 or Baumann '846) discloses both VoIP telephones on a call receiving a codec adjustment signal. Skilled artisans would have understood that Mundra '860 (or OpenH323 or Shaffer '734 or Shaffer '839) and Everson '998 (or Nishimura '957 or SIP Standard or Minhazuddin '414 or Baumann '846) could be readily combined because both relate to VoIP mid-call signaling. Everson '998 (or Nishimura '957 or SIP Standard or Minhazuddin '414 or Baumann '846) discloses the benefits of both VoIP telephones on a call receiving a codec adjustment signal, so that both VoIP telephones can adjust their codec accordingly. Thus, a skilled artisan would have been motivated to use VoIP telephone signaling disclosed in Everson '998 (or Nishimura '957 or SIP Standard or Minhazuddin '414 or Baumann '846) to the VoIP systems disclosed in Mundra '860 (or OpenH323 or Shaffer '734 or Shaffer '839) and would have recognized that the results of this combination were predictable.

For example, skilled artisans would have been motivated to combine Mundra '860 (or Bauer '556 or Shaffer '734 or Shaffer '839 or Kakimoto '749) with Minhazuddin '414 (or OpenH323 or H.323 v5 or Surazski '604) because Minhazuddin '414 (or OpenH323 or H.323 v5 or Surazski '604) discloses network topologies which could be utilized in a VoIP system. Skilled artisans would have understood that Mundra '860 (or Bauer '556 or Shaffer '734 or Shaffer '839 or Kakimoto '749) and Minhazuddin '414 (or OpenH323 or H.323 v5 or Surazski '604) could be readily combined because both relate to VoIP systems with connections between various

networking components. Minhazuddin '414 (or OpenH323 or H.323 v5 or Surazski '604) discloses the benefits of utilizing its network topology to provide connections between the various networking components. Thus, a skilled artisan would have been motivated to use network topologies disclosed in Minhazuddin '414 (or OpenH323 or H.323 v5 or Surazski '604) to the VoIP systems disclosed in Mundra '860 (or Bauer '556 or Shaffer '734 or Shaffer '839 or Kakimoto '749) and would have recognized that the results of this combination were predictable.

For example, to the extent a claim limitation is not met by a reference, at least under Plaintiff's apparent interpretation of the Asserted Claims, those limitations were already well known in the art and would have been obvious to a POSITA. For example, before the earliest priority date of the '368 Patent, at least the H.323 and SIP Standards disclosed using gatekeepers for VoIP mid-call signaling and/or codec adjustment in the same way as Plaintiff's apparent interpretation of the Asserted Claims in its Infringement Contentions. *See* Exhibit A-7; *see also* Exhibit D-1. A skilled artisan would appreciate that before the earliest priority date of the '368 Patent, it would have been obvious to combine these Standards within a VoIP system to yield predictable results.

The references identified in Exhibits A-1 through A-7 and D-1 are analogous prior art to the subject matter of the Asserted Claims and are properly combinable. Indeed, the known work in this field of endeavor would prompt variations of it for users within the same field, as the variations were predictable to one of ordinary skill in the art. Therefore, these references provide interrelated teachings and one of ordinary skill would look to the concepts in any of these references when seeking to solve the problems purportedly addressed by the '368 Patent.

5. Exemplary '780 Patent Obviousness Combinations

Prior art rendering the Asserted Claims of the '780 Patent obvious, alone or in combination with other references, are identified and discussed throughout these Invalidity Contentions and in

the claim charts Exhibits B-1 through B-12 and D-2. Exhibits B-1 through B-12 and D-2 include exemplary claim charts for the '780 Patent, including citations to where in the references the teachings, suggestions, and motivations to combine the references are disclosed. Further reasons to combine the references identified in Exhibits B-1 through B-12 and D-2 include the nature of the problem being solved, the express, implied and inherent teachings of the prior art, the knowledge of POSITAs, that such combinations would have yielded predictable results, and that such combinations would have represented known alternatives to a POSITA.

Below is a list of examples of certain combinations of prior art that a person of ordinary skill in the art would have been motivated to combine around the time of the alleged invention of the '780 Patent. The combinations listed below are meant to provide additional clarity on motivations to combine some of the references, but is not meant to list every possible combination and is not an admission that unlisted combinations would not have been obvious to a person of ordinary skill in the art. Cisco and Fortinet reserve the right to amend or add exemplary obviousness combinations as discovery continues, pursuant to any orders from the Court, and after any change in Croga's positions.

For example, the alleged invention of the '780 Patent implements well-known prior art methods and devices for protecting networks and computer systems, including using internal, host, and network firewalls, and virtualization. By way of example only, and not exhaustive of all references, citations, and combinations thereof, a POSITA at the time of the alleged inventions would have been aware of the concepts described in each of the prior art described in B-1 through B-12 and D-2. Indeed, such a POSITA would have possessed knowledge of protecting networks and computer systems through the use of firewalls and virtualization, they would have been well-

equipped to design the claimed systems and methods, such as those described in detail by the references explained below and in B-1 through B-12 and D-2.

For example, skilled artisans would have been motivated to combine the references identified in Exhibits B-1 through B-12 with the references cited in D-2 because the references cited in D-2 disclose virtualization, isolation, and/or security techniques for computer systems and/or networks and the references identified in Exhibits B-1 through B-12 relate to the same area(s) of virtualization and/or computer and network security. Skilled artisans would have understood that the references cited in D-2 could be readily combined with the references identified in Exhibits B-1 through B-12 because they relate to network and computer security, including in virtual environments. Thus, a skilled artisan would have been motivated to use the virtualization, isolation, and/or security techniques for computer systems and/or networks disclosed in the references cited in D-2 with the virtualization and/or computer systems and networks disclosed in the references identified in Exhibits B-1 through B-12 and would have recognized that the results of this combination were predictable.

For example, skilled artisans would have been motivated to combine System z (or Banga '412 or Miller '136 or Thomas '194 or Todorovic '363 or Tremain '079 or Windows Virtualization or XenApp) with Wookey '921 (or vShield or Delco '474 or Gleichauf) because Wookey '921 (or vShield or Delco '474 or Gleichauf '747) discloses virtualization, isolation, and security techniques for computer systems and networks, including at least the use of internal firewalls separating the host system from the virtual system and System z (or Banga '412 or Miller '136 or Thomas '194 or Todorovic '363 or Tremain '079 or Windows Virtualization or XenApp) utilize virtualization, isolation, and security techniques for improved security in computer systems and networks. Skilled artisans would have understood that Wookey '921 (or vShield or Delco '474 or

Gleichauf '747) and System z (or Banga '412 or Miller '136 or Thomas '194 or Todorovic '363 or Tremain '079 or Windows Virtualization or XenApp) could be readily combined because both relate to network and computer security, including in virtual environments. Wookey '921 (or vShield or Delco '474 or Gleichauf '747) disclose the benefits of protecting computers and networks by using virtualizations that are separated and isolated from host systems. Thus, a skilled artisan would have been motivated to use the internal firewalls separating the host system from the virtual system disclosed in Wookey '921 (or vShield or Delco '474 or Gleichauf '747) to the virtualization systems disclosed in System z (or Banga '412 or Miller '136 or Thomas '194 or Todorovic '363 or Tremain '079 or Windows Virtualization or XenApp) and would have recognized that the results of this combination were predictable.

For example, skilled artisans would have been motivated to combine Wookey '921 (or Delco '474 or vShield or System z or Banga '412 or Miller '136 or Thomas '194 or Todorovic '363 or Windows Virtualization or XenApp or xVM) with Tremain '079 (or Jackson '738 or Wesinger '321) because Wookey '921 (or Delco '474 or vShield or System z or Banga '412 or Miller '136 or Thomas '194 or Todorovic '363 or Windows Virtualization or XenApp or xVM) discloses virtualization, isolation, and security techniques for computer systems and/or networks and Tremain '079 (or Jackson '738 or Wesinger '321) discloses network firewall appliances and/or web proxies that comprise processors and memory. Skilled artisans would have understood that Wookey '921 (or Delco '474 or vShield or System z or Banga '412 or Miller '136 or Thomas '194 or Todorovic '363 or Windows Virtualization or XenApp or xVM) and Tremain '079 (or Jackson '738 or Wesinger '321) could be readily combined because both relate to network and computer security. Tremain '079 (or Jackson '738 or Wesinger '321) discloses the benefits of network web proxies and firewall appliances comprising a processor and memory to implement network

isolation from untrusted network destinations. Thus, a skilled artisan would have been motivated to use the network firewall appliance and web proxies with a processor and memory disclosed in Tremain '079 (or Jackson '738 or Wesinger '321) to perform the network firewall functions and/or further increase network security of Wookey '921 (or Delco '474 or vShield or System z or Banga '412 or Miller '136 or Thomas '194 or Todorovic '363 or Windows Virtualization or XenApp or xVM) and would have recognized that the results of this combination were predictable.

For example, to the extent a claim limitation is not met by a reference or system in B-1 through B-12, at least under Plaintiff's apparent interpretation of the Asserted Claims, those limitations were already well known in the art and would have been obvious to a POSITA. For example, before the earliest priority date of the '780 Patent, at least Wookey, Todorovic, and Wesinger disclosed using host-based firewalls to improve computer system and network security by isolating a computer system from the network in the same way as Plaintiff's apparent interpretation of the Asserted Claims in its infringement contentions. *See* Exhibits B-1, B-8; *see also* Exhibit D-2. A skilled artisan would appreciate that before the earliest priority date of the '780 Patent, host-based firewalls were a well-known method for improving computer system and network security and it would have been obvious to combine well-known host-based firewalls (*see, e.g.,* Wookey, Todorovic, and Wesinger) with virtualized computer systems to yield predictable results.

For example, to the extent a claim limitation is not met by a reference or system in B-1 through B-12, at least under Plaintiff's apparent interpretation of the Asserted Claims, those limitations were already well known in the art and would have been obvious to a POSITA. For example, before the earliest priority date of the '780 Patent, it was well known to use container virtualization technology, including at least xVM Solaris zones/containers and the Linux

Operating System features cgroups, seccomp, kernel namespaces, and iptables in the same way as Plaintiff's apparent interpretation of the Asserted Claims in its infringement contentions. *See, e.g.*, iptables: The Linux Firewall Administration Program (CROGA-PA-00002205), Seccomp and sandboxing (CROGA-PA-00001523), Notes from a container (CROGA-PA-00002189), and Shared subtrees (CROGA-PA-00002190); *see also* Exhibits B-12 and D-2. A skilled artisan would appreciate that before the earliest priority date of the '601 Patent, it would have been obvious to combine the well-known container technology, including xVM and Linux Operating System features cgroups, seccomp, kernel namespaces, and iptables (*see, e.g.*, iptables: The Linux Firewall Administration Program (CROGA-PA-00002205), Seccomp and sandboxing (CROGA-PA-00001523), Notes from a container (CROGA-PA-00002189), and Shared subtrees (CROGA-PA-00002190); *see also* Exhibit B-12 and D-2) with computing systems utilizing virtual environments to yield predictable results.

The references identified in Exhibits B-1 through B-12 and D-2 are analogous prior art to the subject matter of the Asserted Claims and are properly combinable. Indeed, the known work in this field of endeavor would prompt variations of it for users within the same field, as the variations were predictable to one of ordinary skill in the art. Therefore, these references provide interrelated teachings and one of ordinary skill would look to the concepts in any of these references when seeking to solve the problems purportedly addressed by the '780 Patent.

6. Exemplary '601 Patent Obviousness Combinations

Prior art rendering the Asserted Claims of the '601 Patent obvious, alone or in combination with other references, are identified and discussed throughout these Invalidity Contentions and in the claim charts Exhibits C-1 through C-11 and D-3. Exhibits C-1 through C-11 and D-3 include exemplary claim charts for the '601 Patent, including citations to where in the references the teachings, suggestions, and motivations to combine the references are disclosed. Further reasons

to combine the references identified in Exhibits C-1 through C-11 and D-3 include the nature of the problem being solved, the express, implied and inherent teachings of the prior art, the knowledge of POSITAs, that such combinations would have yielded predictable results, and that such combinations would have represented known alternatives to a POSITA.

Below is a list of examples of certain combinations of prior art that a person of ordinary skill in the art would have been motivated to combine around the time of the alleged invention of the '601 Patent. The combinations listed below are meant to provide additional clarity on motivations to combine some of the references, but is not meant to list every possible combination and is not an admission that unlisted combinations would not have been obvious to a person of ordinary skill in the art. Cisco and PAN reserve the right to amend or add exemplary obviousness combinations as discovery continues, pursuant to any orders are issued from the Court, and after any change in Croga's positions.

For example, the alleged invention of the '601 Patent implements well-known prior art methods and devices for protecting networks and computer systems, including using internal, host, and network firewalls, and virtualization. By way of example only, and not exhaustive of all references, citations, and combinations thereof, a POSITA at the time of the alleged inventions would have been aware of the concepts described in each of the prior art described in C-1 through C-11 and D-3. Indeed, such a POSITA would have possessed knowledge of protecting networks and computer systems through the use of firewalls and virtualization including with respect to applications executing in an isolated computer environment, they would have been well-equipped to design the claimed systems and methods, such as those described in detail by the references explained below and in C-1 through C-11 and D-3.

For example, skilled artisans would have been motivated to combine the references identified in Exhibits C-1 through C-11 with the references identified in D-3 because the references identified in D-3 disclose virtualization, isolation, and/or security techniques for computer systems and/or networks and the references identified in Exhibits C-1 through C-11 relate to the same area(s) of virtualization and/or computer and network security. Skilled artisans would have understood that the references identified in D-3 could be readily combined with the references identified in Exhibits C-1 through C-11 because they relate to network and computer security, including in virtual environments executing applications. Thus, a skilled artisan would have been motivated to use the virtualization, isolation, and/or security techniques for computer systems and/or networks disclosed in the references identified in D-3 with the virtualization and/or computer systems and networks disclosed in the references identified in Exhibits C-1 through C-11 and would have recognized that the results of this combination were predictable.

For example, skilled artisans would have been motivated to combine Walsh '187 (or Jeffries '189 or Wookey '921 or Austin '964 or System z or Secure Browsing System or MSIP or xVM) with LaBine '999 (or vShield or XenApp or Windows Virtualization or Amiga '972) because LaBine '999 (or vShield or XenApp or Windows Virtualization or Amiga '972) discloses multi-user interactive software applications running in computer systems and/or networks and Walsh '187 (or Jeffries '189 or Wookey '921 or Austin '964 or System z or Secure Browsing System or MSIP or xVM) discloses executing applications in an isolated computing environment within computer systems and/or networks. Skilled artisans would have understood that LaBine '999 (or vShield or XenApp or Windows Virtualization or Amiga '972) could be readily combined with Walsh '187 (or Jeffries '189 or Wookey '921 or Austin '964 or System z or Secure Browsing System or MSIP or xVM) because as of the priority date of the '601 Patent it was trivial to execute

multi-user interactive software applications in an isolated computing environment. *See, e.g.*, Exhibit C-8; Exhibit D-3. Thus, a skilled artisan would have been motivated to use the multi-user interactive software application disclosed in LaBine '999 (or vShield or XenApp or Windows Virtualization or Amiga '972) with the virtualization and/or computer systems and networks disclosed in Walsh '187 (or Jeffries '189 or Wookey '921 or Austin '964 or System z or Secure Browsing System or MSIP or xVM) and would have recognized that the results of this combination were predictable.

For example, skilled artisans would have been motivated to combine Walsh '187 (or Jeffries '189 or System z or Secure Browsing System or MSIP or Windows Virtualization or XenApp) with Wookey '921 (or Austin '964 or vShield or Hoy '780) because Wookey '921 (or Austin '964 or vShield or Hoy '780) discloses using an internal isolation firewall to isolate virtual and host systems and Walsh '187 (or Jeffries '189 or System z or Secure Browsing System or MSIP or Windows Virtualization or XenApp) discloses virtualization, isolation, and security techniques for computer systems and networks. Skilled artisans would have understood that Wookey '921 (or Austin '964 or vShield or Hoy '780) could be readily combined with Walsh '187 (or Jeffries '189 or System z or Secure Browsing System or MSIP or Windows Virtualization or XenApp) because both relate to network and computer security, including in virtual environments. Thus, a skilled artisan would have been motivated to implement the internal isolation firewall disclosed in Wookey '921 (or Austin '964 or vShield or Hoy '780) with the virtualization and/or computer systems and networks disclosed in Walsh '187 (or Jeffries '189 or System z or Secure Browsing System or MSIP or Windows Virtualization or XenApp) to increase computer system and network security and would have recognized that the results of this combination were predictable.

For example, skilled artisans would have been motivated to combine Walsh '187 (or Jeffries '189 or Austin '964 or MSIP or xVM) with Wookey '921 (or vShield or System z or Secure Browser System or XenApp or Windows Virtualization or Hoy '780 or Walker '863 or Todorovic '363) because Wookey '921 (or vShield or System z or Secure Browser System or XenApp or Windows Virtualization or Hoy '780 or Walker '863 or Todorovic '363) discloses using a host-based firewall to increase security of computer systems and networks having isolated computing environments and Walsh '187 (or Jeffries '189 or Austin '964 or MSIP or xVM) discloses virtualization, isolation, and security techniques for computer systems and networks having isolated computing environments. Skilled artisans would have understood that Wookey '921 (or vShield or System z or Secure Browser System or XenApp or Windows Virtualization or Hoy '780 or Walker '863 or Todorovic '363) could be readily combined with Walsh '187 (or Jeffries '189 or Austin '964 or MSIP or xVM) because both relate to network and computer security. Thus, a skilled artisan would have been motivated to implement the host-based firewall in Wookey '921 (or vShield or System z or Secure Browser System or XenApp or Windows Virtualization or Hoy '780 or Walker '863 or Todorovic '363) with the virtualization and/or computer system and networks disclosed in Walsh '187 (or Jeffries '189 or Austin '964 or MSIP or xVM) to restricted communication between networked devices and/or increase computer system and network security and would have recognized that the results of this combination were predictable.

For example, skilled artisans would have been motivated to combine Walsh '187 (or Jeffries '189 or Wookey '921 or Austin '964 or vShield or System z or Secure Browsing System or XenApp or MSIP or Windows Virtualization or xVM) with Ishaya '889 (or Mortman '030 or Malhotra '517 or Benoit '031 or Bloch '502 or Neumann '761 or Broumas '284) because both of

these references describe systems and methods for improving security of computer systems and/or networks, including those that implement isolated computing environments. Skilled artisans would have understood that the authentication methods and devices of Ishaya '889 (or Mortman '030 or Malhotra '517 or Benoit '031 or Bloch '502 or Neumann '761 or Broumas '284) for isolated computing environments could be readily incorporated into the virtualization and/or computer systems and networks of Walsh '187 (or Jeffries '189 or Wookey '921 or Austin '964 or vShield or System z or Secure Browsing System or XenApp or MSIP or Windows Virtualization or xVM) to improve security. Additionally, the inclusion of the authentication methods and devices from Ishaya '889 (or Mortman '030 or Malhotra '517 or Benoit '031 or Bloch '502 or Neumann '761 or Broumas '284) with the isolated computing environments in Walsh '187 (or Jeffries '189 or Wookey '921 or Austin '964 or vShield or System z or Secure Browsing System or XenApp or MSIP or Windows Virtualization or xVM) constitutes routine implementation details and such authentication was routine. *See, e.g.,* Exhibit D-3. Thus, a skilled artisan would have been motivated to implement the authentication methods and devices of Ishaya '889 (or Mortman '030 or Malhotra '517 or Benoit '031 or Bloch '502 or Neumann '761 or Broumas '284) with the virtualization and/or computer systems and networks disclosed in Walsh '187 (or Jeffries '189 or Wookey '921 or Austin '964 or vShield or System z or Secure Browsing System or XenApp or MSIP or Windows Virtualization or xVM) to increase computer system and network security and would have recognized that the results of this combination were predictable.

For example, skilled artisans would have been motivated to combine Walsh '187 (or Wookey '921 or vShield or Austin '964 or Secure Browsing System or xVM) with Jeffries '189 (or System z or VMware vShield or Amiga '972 or LaBine '999) because Jeffries '189 (or System z or VMware vShield or Amiga '972 or LaBine '999) discloses the use of proxy devices to send

data to untrusted destinations to improve security and Walsh '187 (or Wookey '921 or vShield or Austin '964 or Secure Browsing System or xVM) discloses virtualization, isolation, and/or security techniques for computer systems to improve security. Skilled artisans would have combined Walsh '187 (or Wookey '921 or vShield or Austin '964 or Secure Browsing System or xVM) with Jeffries '189 (or System z or VMware vShield or Amiga '972 or LaBine '999) because a skilled artisan would know that sending data to an untrusted destination through a proxy device after authentication increases computer and network security. Thus, a skilled artisan would have been motivated to combine Walsh '187 (or Wookey '921 or vShield or Austin '964 or Secure Browsing System or xVM) with the proxy devices Jeffries '189 (or System z or VMware vShield or Amiga '972 or LaBine '999) to further protect the computer systems and networks from malicious threats and would have recognized that the results of this combination were predictable.

For example, skilled artisans would have been motivated to combine Austin '964 with Walsh '187 (or Jeffries '189 or Bloch '502 or Wookey '921 or Pai or Hoy '780) because Walsh '187 (or Jeffries '189 or Bloch '502 or Wookey '921 or Pai or Hoy '780) discloses virtualization, isolation, and/or security techniques for computer systems and/or networks and Austin '964 discloses virtualization, isolation, and/or security techniques for a host computer. Skilled artisans would have understood that Walsh '187 (or Jeffries '189 or Bloch '502 or Wookey '921 or Pai or Hoy '780) could be readily combined with Austin '964 because both relate to virtualization, isolation, and/or security techniques. Thus, a skilled artisan would have been motivated to combine Austin '964 with the virtualization and/or computer systems and networks disclosed in Walsh '187 (or Jeffries '189 or Bloch '502 or Wookey '921 or Pai or Hoy '780) to further protect the host from malicious threats and would have recognized that the results of this combination were predictable.

For example, to the extent a claim limitation is not met by a reference or system in C-1 through C-11, at least under Plaintiff's apparent interpretation of the Asserted Claims, those limitations were already well known in the art and would have been obvious to a POSITA. For example, before the earliest priority date of the '601 Patent, at least PAN's WildFire disclosed using applications in isolated sandbox environments. *See Findings from WildFire*, Palo Alto Networks (November 8, 2011) <https://www.paloaltonetworks.com/blog/2011/11/findings-from-wildfire> (CROGA-PA-00002254); *Integrated Threat Prevention Datasheet*, Palo Alto Networks (2011) <https://media.paloaltonetworks.com/documents/datasheet-threat-prevention.pdf> (CROGA-PA-00002249); *WildFire Administrator's Guide Version 7.0*, Palo Alto Networks (August 13, 2017) https://docs.paloaltonetworks.com/content/dam/techdocs/en_US/pdf/eol/wildfire-70-admin-guide.pdf (CROGA-PA-00002281); *See also* Exhibit D-3. Indeed, it was well-known prior to the earliest filing date to execute applications in isolated computing environments. *See, e.g., Id.; see also* Golan '549, Abstract ("The present invention is a method of creating a secure sandbox within which a plurality of downloaded software components can execute in a secure manner"). A skilled artisan would appreciate that before the earliest priority date of the '601 Patent, running applications in an isolated sandbox environment was a well-known method for improving computer system and network security and it would have been obvious to combine sandboxing methods and systems in computer systems and networks to yield predictable results.

For example, to the extent a claim limitation is not met by a reference or system in C-1 through C-11, at least under Plaintiff's apparent interpretation of the Asserted Claims, those limitations were already well known in the art and would have been obvious to a POSITA. For example, before the earliest priority date of the '601 Patent, at least VMware vShield, Mortman, Ishaya, Malhotra, Benoit, and Bloch disclosed authenticating remote users and isolated computing

environments, including to authorize usage of a service or application using authentication devices in the same way as Plaintiff's apparent interpretation of the Asserted Claims in its infringement contentions. *See* Exhibit D-3. A skilled artisan would appreciate that before the earliest priority date of the '601 Patent, authentication methods were well-known for improving computer system and network security and it would have been obvious to combine well-known authentication methods (*see, e.g.*, VMware vShield, Mortman, Ishaya, Malhotra, Benoit, and Bloch) in isolated computing environments to yield predictable results.

For example, to the extent a claim limitation is not met by a reference or system in C-1 through C-11, at least under Plaintiff's apparent interpretation of the Asserted Claims, those limitations were already well known in the art and would have been obvious to a POSITA. For example, before the earliest priority date of the '601 Patent, at least capabilities for authentication across different services on a network, by way of identity federation, has been known since as far back as 2003. For example, by 2003, Microsoft developed Windows communications technologies, code-named "Indigo," which provided capabilities for authentication across different services on a network. In 2006, Indigo evolved into "Windows Communication Foundation" ("WCF"), which retained the use of bindings that allowed for authentication of messages across platforms. In 2007, Microsoft launched "Windows Identity Foundation" ("WIF"), a programming model that complemented WCF by providing a uniform framework for authentication across different domains. Prior to 2005, several identity federation standards existed, including SAML 1.1 and Shibboleth—both of which were available as early as 2003. *See* SAML 1.1 (August 2003); Shibboleth (July 2003); *Introduction to Windows Server 2003 Active Directory Application Mode* (published August 11, 2002), <https://web.archive.org/web/20050105211702/http://www.microsoft.com/windowsserver2003/te>

chinfo/overview/adam.msp (CROGA-PA-00002258); *Introduction to Active Directory Application Mode* (published August 2003) <https://web.archive.org/web/20051105015124/http://download.microsoft.com/download/5/7/a/57a8d3ed-89f7-4878-b945-b68c447f288a/Adam.DOC> (CROGA-PA-00002234). By 2009, there were two identity standards: Security Assertion Markup Language and WS-Federation identity standard to ADFS. See Zulfilqar Ahmed, AD FS 1.0 in Identity Solutions, Microsoft J. for Developer MSDN Mag., 50-58 (Nov. 2009); Security Assertion Markup Language V2.0, at 9 (March 25, 2008) <https://docs.oasis-open.org/security/saml/Post2.0/sstc-saml-tech-overview-2.0.html>. (CROGA-PA-00002269) Over the next decade, FIDO2, OpenID, and WebAuthn were launched to unify and spread implementation of password-less authentication and identity federation across web applications. *WebAuthn APIs for passwordless authentication on Windows*, (July 27, 2023) <https://learn.microsoft.com/en-us/windows/security/identity-protection/hello-for-business/webauthn-apis> (CROGA-PA-00002280). A skilled artisan would appreciate that before the earliest priority date of the '601 Patent, authenticating across different services on a network was a well-known method for improving computer system and network security and it would have been obvious to combine sandboxing methods and systems with authentication techniques in computer systems and networks to yield predictable results.

For example, to the extent a claim limitation is not met by a reference or system in C-1 through C-11, at least under Plaintiff's apparent interpretation of the Asserted Claims, those limitations were already well known in the art and would have been obvious to a POSITA. For example, before the earliest priority date of the '601 Patent, at least XenApp, Windows Virtualization, MSIP, Secure Broser System, xVM, and vShield disclosed using container virtualization technology (including at least Docker, Linux Operating System, and/or LXC) in the

same way as Plaintiff's apparent interpretation of the Asserted Claims in its infringement contentions. *See* Exhibits C-4, C-7, C-8, C-9, C-10, C-11; *see also* Exhibit D-3. A skilled artisan would appreciate that before the earliest priority date of the '601 Patent, it would have been obvious to combine well-known systems that use container technology to perform the well-known functions of containers to yield predictable results.

The references identified in Exhibits C-1 through C-11 and D-3 are analogous prior art to the subject matter of the Asserted Claims and are properly combinable. Indeed, the known work in this field of endeavor would prompt variations of it for users within the same field, as the variations were predictable to one of ordinary skill in the art. Therefore, these references provide interrelated teachings and one of ordinary skill would look to the concepts in any of these references when seeking to solve the problems purportedly addressed by the '601 Patent.

III. Invalidity Based Upon Indefiniteness, Lack Of Sufficient Written Description, Lack Of Enablement

a) Indefiniteness

Pre-AIA Paragraph 2 of Section 112 of the Patent Act requires that a patent claim “particularly point[] out and distinctly claim[] the subject matter which the applicant regards as his invention.” Pre-AIA 35 U.S.C. § 112 ¶ 2. Subsection (b) of Section 112 of the Patent Act requires that a patent claim “particularly point[] out and distinctly claim[] the subject matter which the inventor or a joint inventor regards as the invention.” 35 U.S.C. § 112(b). Claim terms that fail to inform those skilled in the art “with reasonable certainty . . . about the scope of the invention” fail the definiteness requirement of pre-AIA paragraph 2 of Section 112 and/or Subsection (b) of Section 112. *Nautilus, Inc. v. Biosig Instruments, Inc.*, 572 U.S. 898, 901 (2014).

Defendants have not yet seen Croga's proposed constructions for terms in the Asserted Claims. At least the Asserted Claims referenced below are invalid as indefinite under pre-AIA

and/or AIA 35 U.S.C. § 112. In particular, the following limitations, read in light of the intrinsic evidence and the apparent scope of the claims alleged by Croga in its Infringement Contentions, fail to inform those skilled in the art with reasonable certainty about the scope of the claimed inventions:

1. '368 Patent

- “a call control gatekeeper, a first interface and a second interface”

At least under Croga’s apparent interpretation of the claim language in its Infringement Contentions, claim 1 of the ’368 Patent is invalid under pre-AIA 35 U.S.C. § 112, ¶ 2 because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the “a call control gatekeeper, a first interface and a second interface” claim limitation. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed “a call control gatekeeper, a first interface and a second interface” because the specification fails to provide guidance as to what would be considered in the scope of “a call control gatekeeper, a first interface and a second interface” under Croga’s apparent application of this limitation.

- “call quality signal”

At least under Croga’s apparent interpretation of the claim language in its Infringement Contentions, claim 1 of the ’368 Patent is invalid under pre-AIA 35 U.S.C. § 112, ¶ 2 because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the “call quality signal” claim limitation. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed “call quality signal” because the specification fails to provide guidance

as to what would be considered in the scope of “call quality signal” under Croga’s apparent application of this limitation.

- “adjustment signal”

At least under Croga’s apparent interpretation of the claim language in its Infringement Contentions, claim 1 of the ’368 Patent is invalid under pre-AIA 35 U.S.C. § 112, ¶ 2 because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the “adjustment signal” claim limitation. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed “adjustment signal” because the specification fails to provide guidance as to what would be considered in the scope of “adjustment signal” under Croga’s apparent application of this limitation.

2. ’780 Patent

- “the virtual system is a separate operating system or a software module operating on the computer system”

At least under Croga’s apparent interpretation of the claim language in its Infringement Contentions, claims 1 and 11 and their dependent claims of the ’780 Patent are invalid under pre-AIA 35 U.S.C. § 112, ¶ 2 because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the “the virtual system is a separate operating system or a software module operating on the computer system” claim limitation. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed “the virtual system is a separate operating system or a software module operating on the computer system” because the specification fails to provide guidance as to what would be considered in the scope of “the virtual system is a separate

operating system or a software module operating on the computer system” under Croga’s apparent application of this limitation.

- “internal firewall configured to separate the host system from the virtual system in the computer system”/“separating the host system from the virtual system using an internal firewall executed on the computer system”

At least under Croga’s apparent interpretation of the claim language in its Infringement Contentions, claims 1 and 11 and their dependent claims of the ’780 Patent are invalid under pre-AIA 35 U.S.C. § 112, ¶ 2 because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the “internal firewall configured to separate the host system from the virtual system in the computer system”/“separating the host system from the virtual system using an internal firewall executed on the computer system” claim limitations. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed “internal firewall configured to separate the host system from the virtual system in the computer system”/“separating the host system from the virtual system using an internal firewall executed on the computer system” because the specification fails to provide guidance as to what would be considered in the scope of “internal firewall configured to separate the host system from the virtual system in the computer system”/“separating the host system from the virtual system using an internal firewall executed on the computer system” under Croga’s apparent application of these limitations.

- “virtual memory space segregated from the host memory space”

At least under Croga’s apparent interpretation of the claim language in its Infringement Contentions, claim 3 of the ’780 Patent is invalid under pre-AIA 35 U.S.C. § 112, ¶ 2 because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill

in the art the scope of the claimed invention with respect to the “virtual memory space segregated from the host memory space” claim limitation. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed “virtual memory space segregated from the host memory space” because the specification fails to provide guidance as to what would be considered in the scope of “virtual memory space segregated from the host memory space” under Croga’s apparent application of this limitation.

3. ’601 Patent

- “workspace”

At least under Croga’s apparent interpretation of the claim language in its Infringement Contentions, claims 1 and 9 and their dependent claims of the ’601 Patent are invalid under 35 U.S.C. § 112(b) because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the “workspace” claim limitation. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed “workspace” because the specification fails to provide guidance as to what would be considered in the scope of “workspace” under Croga’s apparent application of this limitation.

- “a first set of one or more applications or processes”

At least under Croga’s apparent interpretation of the claim language in its Infringement Contentions, claims 1 and 9 and their dependent claims of the ’601 Patent are invalid under 35 U.S.C. § 112(b) because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the “a first set of one or more applications or processes” claim limitation. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed “a first set of

one or more applications or processes” because the specification fails to provide guidance as to what would be considered in the scope of “a first set of one or more applications or processes” under Croga’s apparent application of this limitation.

- “isolated computing environment that uses the host operating system”

At least under Croga’s apparent interpretation of the claim language in its Infringement Contentions, claims 1 and 9 and their dependent claims of the ’601 Patent are invalid under 35 U.S.C. § 112(b) because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the “isolated computing environment that uses the host operating system” claim limitation. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed “isolated computing environment that uses the host operating system” because the specification fails to provide guidance as to what would be considered in the scope of “isolated computing environment that uses the host operating system” under Croga’s apparent application of this limitation.

- “a multi-user interactive software application”

At least under Croga’s apparent interpretation of the claim language in its Infringement Contentions, claims 1 and 9 and their dependent claims of the ’601 Patent are invalid under 35 U.S.C. § 112(b) because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the “a multi-user interactive software application” claim limitation. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed “a multi-user interactive software application” because the specification fails to provide guidance as to what

would be considered in the scope of “a multi-user interactive software application” under Croga’s apparent application of this limitation.

- “internal isolation firewall”

At least under Croga’s apparent interpretation of the claim language in its Infringement Contentions, claims 1 and 9 and their dependent claims of the ’601 Patent are invalid under 35 U.S.C. § 112(b) because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the “internal isolation firewall” claim limitation. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed “internal isolation firewall” because the specification fails to provide guidance as to what would be considered in the scope of “internal isolation firewall” under Croga’s apparent application of this limitation.

- “authenticate[authenticating] the isolated computing environment”

At least under Croga’s apparent interpretation of the claim language in its Infringement Contentions, claims 1 and 9 and their dependent claims of the ’601 Patent are invalid under 35 U.S.C. § 112(b) because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the “authenticate[authenticating] the isolated computing environment” claim limitations. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed “authenticate[authenticating] the isolated computing environment” because the specification fails to provide guidance as to what would be considered in the scope of “authenticate[authenticating] the isolated computing environment” under Croga’s apparent application of these limitations.

- “authentication device”

At least under Croga's apparent interpretation of the claim language in its Infringement Contentions, claims 1 and 9 and their dependent claims of the '601 Patent are invalid under 35 U.S.C. § 112(b) because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the "authentication device" claim limitation. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed "authentication device" because the specification fails to provide guidance as to what would be considered in the scope of "authentication device" under Croga's apparent application of this limitation.

- "send[sending] data to an untrusted destination . . . when the isolated computing environment has been authenticated"

At least under Croga's apparent interpretation of the claim language in its Infringement Contentions, claims 1 and 9 and their dependent claims of the '601 Patent is invalid under 35 U.S.C. § 112(b) because the claim language, when read in light of the intrinsic record, fails to inform a person of ordinary skill in the art the scope of the claimed invention with respect to the "send[sending] data to an untrusted destination . . . when the isolated computing environment has been authenticated" claim limitations. For example, one of ordinary skill in the art cannot ascertain with reasonable certainty the scope of the claimed "send[sending] data to an untrusted destination . . . when the isolated computing environment has been authenticated" because the specification fails to provide guidance as to what would be considered in the scope of "send[sending] data to an untrusted destination . . . when the isolated computing environment has been authenticated" under Croga's apparent application of these limitations.

b) Enablement/Written Description

The Asserted Claims are further invalid under pre-AIA 35 U.S.C. § 112 ¶ 1, and/or 35 U.S.C. § 112(a), because the specification does not contain an adequate written description of the

subject matter of these claims, and would not enable one of skill in the relevant art to make and use the same.

For a claim to be valid, the specification must contain a written description of the invention. *See* pre-AIA 35 U.S.C. § 112, ¶ 1; 35 U.S.C. § 112(a). To fulfill the written description requirement, it “must clearly allow [POSITAs] to recognize that [the inventor] invented what is claimed.” *Ariad Pharms., Inc. v. Eli Lilly & Co.*, 598 F.3d 1336, 1351 (Fed. Cir. 2010) (second alteration in original) (citations and internal quotation marks omitted). “[T]he applicant must ‘convey with reasonable clarity to those skilled in the art that, as of the filing date sought, he or she was in possession of the invention,’ and demonstrate that by disclosure in the specification of the patent.” *Carnegie Mellon Univ. v. Hoffmann-La Roche Inc.*, 541 F.3d 1115, 1122 (Fed. Cir. 2008) (quoting *Vas-Cath Inc. v. Mahurkar*, 935 F.2d 1555, 1563–64 (Fed. Cir. 1991)).

The specification must also describe “the manner and process of making and using [the invention], in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains . . . to make and use the” invention. *Ariad*, 598 F.3d at 1343; *see also* pre-AIA 35 U.S.C. § 112 ¶ 1; 35 U.S.C. § 112(a). “The enablement requirement is satisfied when one skilled in the art, after reading the specification, could practice the claimed invention without undue experimentation.” *AK Steel Corp. v. Sollac & Ugine*, 344 F.3d 1234, 1244 (Fed. Cir. 2003) (citation omitted). “The scope of the claims must be less than or equal to the scope of the enablement.” *Nat’l Recovery Techs., Inc. v. Magnetic Separation Sys., Inc.*, 166 F.3d 1190, 1196 (Fed. Cir. 1999).

At least the Asserted Claims referenced below are invalid under 35 U.S.C. § 112. In particular, the following limitations, read in light of the intrinsic evidence and the apparent scope

of the claims alleged by Croga in its Infringement Contentions, fail to provide adequate written description and/or an enabling disclosure:

1. '368 Patent

- “a call control gatekeeper, a first interface and a second interface”

Claim 1 of the '368 Patent is invalid under pre-AIA 35 U.S.C. § 112, ¶ 1 because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and apparent interpretation of the scope of the claim language, lack adequate written description support for the term “a call control gatekeeper, a first interface and a second interface” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “a call control gatekeeper, a first interface and a second interface,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

- “call quality signal”

Claim 1 of the '368 Patent is invalid under pre-AIA 35 U.S.C. § 112, ¶ 1 because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and apparent interpretation of the scope of the claim language, lack adequate written description support for the term “call quality signal” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “call quality signal,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

- “adjustment signal”

Claims 1 of the '368 Patent is invalid under pre-AIA 35 U.S.C. § 112, ¶ 1 because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and

apparent interpretation of the scope of the claim language, lack adequate written description support for the terms “adjustment signal” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “adjustment signal,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

Additionally, Croga’s Infringement Contentions demonstrate that Croga is interpreting the claim contrary to the purported inventions described in the specification. Based on Defendants’ review and current understanding of Croga’s Infringement Contentions, Croga is attempting to construe the claim in a manner that is inconsistent with the written specification and prosecution history, as well as with the understanding of one of ordinary skill in the art at the time the application that issued as the ’368 Patent was filed. Croga’s allegations are inconsistent with the plain language of the claim, the supporting description, and the prosecution history. Thus, to the extent the asserted claim is found to cover one or more of the accused products in Croga’s Infringement Contentions, the claim is also invalid under 35 U.S.C. § 112 ¶ 1 because its full scope is not supported or enabled by the written description of the ’368 Patent.

For example, to the extent Defendants understand Croga’s deficient infringement contentions, Croga’s apparent interpretation of the Asserted Claim of the ’368 Patent is that the claim requirement “a VoIP service provider system having a call control gatekeeper, a first interface and a second interface” encompasses call admission control as a gatekeeper for controlling the number of calls based on available resources and bandwidth. Further, Croga’s apparent interpretation of the Asserted Claims is that the claim requirement of “the call control gatekeeper configured to receive a call quality signal from the first VoIP telephone and send an adjustment signal based on the call quality signal to the first and second VoIP telephones

instructing the first and second VoIP telephones to communicate using a second codec” encompasses processing a Re-INVITE which functions as a call quality signal message. Based at least on the foregoing examples, under the apparent scope of the asserted claims as proposed by Croga, the Asserted Claims are not supported or enabled by the written description of the ’368 Patent.

2. ’780 Patent

- “the virtual system is a separate operating system or a software module operating on the computer system”

Claims 1 and 11 and their dependent claims of the ’780 Patent are invalid under pre-AIA 35 U.S.C. § 112, ¶ 1 because the claim language, when read in light of the intrinsic record and Croga’s Infringement Contentions and apparent interpretation of the scope of the claim language, lack adequate written description support for the term “the virtual system is a separate operating system or a software module operating on the computer system” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “the virtual system is a separate operating system or a software module operating on the computer system,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

- “internal firewall configured to separate the host system from the virtual system in the computer system”/“separating the host system from the virtual system using an internal firewall executed on the computer system”

Claims 1 and 11 and their dependent claims of the ’780 Patent are invalid under pre-AIA 35 U.S.C. § 112, ¶ 1 because the claim language, when read in light of the intrinsic record and Croga’s Infringement Contentions and apparent interpretation of the scope of the claim language,

lack adequate written description support for the terms “internal firewall configured to separate the host system from the virtual system in the computer system”/“separating the host system from the virtual system using an internal firewall executed on the computer system” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “internal firewall configured to separate the host system from the virtual system in the computer system”/“separating the host system from the virtual system using an internal firewall executed on the computer system,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

- “host-based firewall”

Claims 1 and 11 and their dependent claims of the '780 Patent are invalid under pre-AIA 35 U.S.C. § 112, ¶ 1 because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and apparent interpretation of the scope of the claim language, lack adequate written description support for the terms “host-based firewall” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “host-based firewall,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

- “a network firewall or a web proxy . . . configured to implement network isolation”/“implementing network isolation . . . via the at least one device”

Claims 1 and 11 and their dependent claims of the '780 Patent are invalid under pre-AIA 35 U.S.C. § 112, ¶ 1 because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and apparent interpretation of the scope of the claim language,

lack adequate written description support for the terms “a network firewall or a web proxy . . . configured to implement network isolation”/“implementing network isolation . . . via the at least one device” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “a network firewall or a web proxy . . . configured to implement network isolation”/“implementing network isolation . . . via the at least one device,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

- “virtual memory space segregated from the host memory space”

Claim 3 of the '780 Patent is invalid under pre-AIA 35 U.S.C. § 112, ¶ 1 because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and apparent interpretation of the scope of the claim language, lacks adequate written description support for the term “virtual memory space segregated from the host memory space” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “virtual memory space segregated from the host memory space,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

Additionally, Croga's Infringement Contentions demonstrate that Croga is interpreting the claims contrary to the purported inventions described in the specification. Based on Defendants' review and current understanding of Croga's Infringement Contentions, Croga is attempting to construe the claims in a manner that is inconsistent with the written specification and prosecution history, as well as with the understanding of one of ordinary skill in the art at the time the application that issued as the '780 Patent was filed. Croga's allegations are inconsistent with the plain language of the claims, the supporting description, and the prosecution history. Thus, to the

extent the asserted claims are found to cover one or more of the accused products in Croga's Infringement Contentions, such claims are also invalid under 35 U.S.C. § 112 ¶ 1 because their full scope is not supported or enabled by the written description of the '780 Patent.

For example, to the extent Defendants understand Croga's deficient infringement contentions, Croga's apparent interpretation of the Asserted Claims of the '780 Patent is that the claim requirement "separating the host system from the virtual system using an internal firewall executed on the computer system" encompasses isolating a virtual machine from a host operating system, including through the use of a hypervisor or containerization application. Further, Croga's apparent interpretation of the Asserted Claims is that the claim requirement of "implementing network isolation between the computer system and the network using a host-based firewall executed on the computer system" encompasses restricting accessible network ports through device settings or use of access control lists, or a firewall component on a separate device from "the computer system." Further, Croga's apparent interpretation of the Asserted Claims is that the claim requirement "preventing malware introduced to the computer system from moving to another computer system of the networked computer system" encompasses mitigating future threats (e.g., updating signatures or detection capabilities or black-listing a file from the network). Based at least on the foregoing examples, under the apparent scope of the asserted claims as proposed by Croga, the Asserted Claims are not supported or enabled by the written description of the '780 Patent.

3. '601 Patent

- "a first set of one or more applications or processes"

Claims 1 and 9 and their dependent claims of the '601 Patent are invalid under 35 U.S.C. § 112(a) because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and apparent interpretation of the scope of the claim language, lack

adequate written description support for the terms “a first set of one or more applications or processes” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “a first set of one or more applications or processes” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

- “isolated computing environment that uses the host operating system”

Claims 1 and 9 and their dependent claims of the '601 Patent are invalid under 35 U.S.C. § 112(a) because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and apparent interpretation of the scope of the claim language, lack adequate written description support for the term “isolated computing environment that uses the host operating system” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “isolated computing environment that uses the host operating system,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

- “multi-user interactive software application”

Claims 1 and 9 and their dependent claims of the '601 Patent are invalid under 35 U.S.C. § 112(a) because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and apparent interpretation of the scope of the claim language, lack adequate written description support for the terms “multi-user interactive software application” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “multi-user interactive software application” nor is the provided description sufficient to

one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

- “isolate[isolating] the isolated computing environment from the workspace using an internal firewall”

Claims 1 and 9 and their dependent claims of the '601 Patent are invalid under 35 U.S.C. § 112(a) because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and apparent interpretation of the scope of the claim language, lack adequate written description support for the terms “isolate[isolating] the isolated computing environment from the workspace using an internal firewall” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “isolate[isolating] the isolated computing environment from the workspace using an internal firewall,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

- “authenticate[authenticating] the isolated computing environment”

Claims 1 and 9 and their dependent claims of the '601 Patent are invalid under 35 U.S.C. § 112(a) because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and apparent interpretation of the scope of the claim language, lack adequate written description support for the terms “authenticate[authenticating] the isolated computing environment” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “authenticate[authenticating] the isolated computing environment,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

- “authentication device”

Claims 1 and 9 and their dependent claims of the '601 Patent are invalid under 35 U.S.C. § 112(a) because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and apparent interpretation of the scope of the claim language, lack adequate written description support for the terms “authentication device” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “authentication device,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

- “host-based firewall”

Claims 5 and 13 and their dependent claims of the '601 Patent are invalid under 35 U.S.C. § 112(a) because the claim language, when read in light of the intrinsic record and Croga's Infringement Contentions and apparent interpretation of the scope of the claim language, lack adequate written description support for the terms “host-based firewall” nor is the provided description sufficient to enable one of ordinary skill in the art to implement the claimed “host-based firewall,” nor is the provided description sufficient to one of ordinary skill in the art such that such a person would reasonably conclude that the inventor had possession of the invention at the time of filing.

Additionally, Croga's Infringement Contentions demonstrate that Croga is interpreting the claims contrary to the purported inventions described in the specification. Based on Defendants' review and current understanding of Croga's Infringement Contentions, Croga is attempting to construe the claims in a manner that is inconsistent with the written specification and prosecution history, as well as with the understanding of one of ordinary skill in the art at the time the

application that issued as the '601 Patent was filed. Croga's allegations are inconsistent with the plain language of the claims, the supporting description, and the prosecution history. Thus, to the extent the asserted claims are found to cover one or more of the accused products in Croga's Infringement Contentions, such claims are also invalid under 35 U.S.C. § 112 ¶ 1 because their full scope is not supported or enabled by the written description of the '601 Patent.

For example, to the extent Defendants understand Croga's deficient infringement contentions, Croga's apparent interpretation of the Asserted Claims of the '601 Patent is that the claim requirement "isolate[isolating] the isolated computing environment from the workspace using an internal firewall" encompasses isolating a virtual machine from a host operating system, including through the use of a containerization application that utilizes cgroups, seccomp, and kernel namespaces to separate the host system from the virtual system. Further, Croga's apparent interpretation of the Asserted Claims is that the claim requirement of "implement a host-based firewall, wherein the host-based firewall isolates the system" encompasses a container orchestration system using an iptables software module. Further, Croga's apparent interpretation of the Asserted Claims is that the claim requirement "the workspace enables operation of a first set of one or more applications or processes via a first memory space" encompasses management, logging, configuration, orchestration, and file cleaning running on a Linux host operating system. Further, Croga's apparent interpretation of the Asserted Claims is that the claim requirement of "authenticate the isolated computing environment with an authentication device" encompasses authenticating requests from remote user to authorize usage of the service. Based at least on the foregoing examples, under the apparent scope of the asserted claims as proposed by Croga, the Asserted Claims are not supported or enabled by the written description of the '601 Patent.

IV. Lack Of Patentable Subject Matter

Cisco contends that the '368 Patent is invalid for claiming unpatentable subject matter under 35 U.S.C. § 101. Pursuant to the Court's Standing Order Regarding Subject Matter Eligibility Contentions Applicable to All Patent Infringement Cases Assigned to Chief District Judge Rodney Gilstrap, the detailed factual and legal bases for Cisco's contentions are set forth in Cisco's Preliminary Subject Matter Eligibility Contentions, served concurrently herewith. Cisco reserves the right to later amend its Subject Matter Eligibility Contentions.

V. Invalidity Based Upon Statutory And Obviousness-Type Double Patenting

Defendants reserve the right to assert that the Asserted Claims are invalid for statutory and/or obviousness-type double patenting.

For example, the Asserted Claims of the '601 Patent are invalid for obviousness-type double patenting because the Asserted Claims of the '601 Patent are not patentably distinct from U.S. Patent No. 11,170,096 (the "'096 Patent")² in view of the references identified during prosecution of the '601 Patent, during prosecution of the '096 Patent, and/or the references identified in Section II above.

During prosecution of the application that led to the '601 Patent, the pending claims were "rejected on the ground of nonstatutory double patenting as being unpatentable over claims 1-22 of copending Application No. 16/163884," stating the pending claims "are not patentably distinct from each other" in view of Haq et al teaching "Design and Implementation of Sandbox Technique for Isolated Applications." See '601 Patent File History at May 7, 2020 Non-Final Rejection at 7. The Examiner provided a claim chart with comments showing how claim 1 of the pending application was not patentably distinct from the claims in the '884 Application in view of Haq et

² The '096 Patent issued from Application No. 16/163884 (the "'884 Application").

al., stating “[i]t would have been obvious to modify the mobile device to host computer in order to provide an virtual machine environment for executing untrusted applications.” *See* ’601 Patent File History at May 7, 2020 Non-Final Rejection at 8-10. After the Examiner agreed to hold the double patenting rejection in abeyance, the rejection was not discussed again during prosecution. *See* ’601 Patent File History at Sept. 9, 2020 Final Rejection at 2. The ’884 Application issued as the ’096 Patent on November 9, 2021, while the ’601 Patent was pending. The applicant did not file a terminal disclaimer for the ’884 Application (or the ’096 Patent). However, the Asserted Claims of the ’601 Patent are not patentably distinct from Claims 1, 7, and 12 of the ’096 Patent in view of the references identified during prosecution of the ’601 Patent, during prosecution of the ’096 Patent and/or the references identified in Section II above. As a non-limiting example, Claims 1 and 7 of the ’096 Patent cover each element of Claims 1, 5, 9, and 13 of the ’601 Patent or it would have been obvious to combine Claims 1 and 7 of the ’096 Patent with well-known references disclosing multi-user interactive software applications (*see, e.g.,* LaBine ’999, vShield, XenApp, Windows Virtualization, Amiga ’972; *see also* Exhibit D-3) and communicating over untrusted networks using proxy devices (*see, e.g.,* Jeffries ’189, System z, VMware vShield, Amiga ’972, LaBine ’999; *see also* Exhibit D-3). Additionally, Claim 12 of the ’096 Patent recites “wherein the second set of one or more applications comprises at least one of an Internet browser, an email application, a document editing application, or a social media application,” which at least under Plaintiff’s apparent interpretation of the Asserted Claims, covers the “multi-user interactive software application” element recited in Claims 1, 5, 9, and 13 of the ’601 Patent.

VI. Invalidity Based Upon Improper Inventorship

To date, Croga has not produced any notes or other documents from any of the inventors of the Asserted Patents, and Defendants have not yet deposed the inventors of the Asserted Patents. Defendants plan on conducting discovery regarding the inventorship of the Asserted Patents

consistent with the Court's Docket Control Order, and Defendants reserve their rights to supplement their contention that the Asserted Patents are invalid for improper inventorship as discovery progresses.

VII. Document Production Accompanying Defendants' Invalidity Contentions

Pursuant to Local Patent Rule 3-4(a) and based on their current understanding of Croga's deficient Infringement Contentions, Defendants identify the following documents and materials:

Cisco

- CISCO-CROGA-00000001 to CISCO-CROGA-00003515
- Subject to the terms of the Court's Protective Order (Dkt. No. 50), source code from Cisco is available for inspection at the offices of Desmarais LLP in Washington, D.C.

Fortinet

- Fortinet-Croga_00000541 to Fortinet-Croga_00000708
- Subject to the terms of the Court's Protective Order (Dkt. No. 50), source code from Fortinet is available for inspection at the offices of Duane Morris LLP in Atlanta, Georgia.

PAN

- PAN_CRO-00000001 to PAN_CRO-00008932
- Subject to the terms of the Court's Protective Order (Dkt. No. 50), source code from PAN is available for inspection at the offices of Desmarais LLP in San Francisco, California.

Pursuant to Local Patent Rule 3-4(b), Defendants identify the following documents and materials:

- CROGA-PA00000001 to CROGA-PA-00002377

Dated: August 5, 2024
