

JEDEC STANDARD

DDR3 SDRAM Standard

JESD79-3

June 2007

JEDEC SOLID STATE TECHNOLOGY ASSOCIATION

NOTICE

JEDEC standards and publications contain material that has been prepared, reviewed, and approved through the JEDEC Board of Directors level and subsequently reviewed and approved by the JEDEC legal Counsel.

JEDEC standards and publications are designed to serve the public interest through eliminating misunderstandings between manufacturers and purchasers, facilitating interchangeability and improvement of products, and assisting the purchaser in selecting and obtaining with minimum delay the proper product for use by those other than JEDEC members, whether the standard is to be used either domestically or internationally.

JEDEC standards and publications are adopted without regard to whether or not their adoption may involve patents or articles, materials, or processes. By such action JEDEC does not assume any liability to any patent owner, nor does it assume any obligation whatever to parties adopting the JEDEC standards or publications.

The information included in JEDEC standards and publications represents a sound approach to product specification and application, principally from the solid state device manufacturer viewpoint. Within the JEDEC organization, there are procedures whereby a JEDEC standard or publication may be further processed and ultimately become an ANSI standard.

No claims to be in conformance with this standard may be made unless all requirements stated in the standard are met.

Inquiries, comments, and suggestions relative to the content of this JEDEC standard or publication should be addressed to JEDEC at the address below, or call (703) 907-7559 or www.jedec.org.

DDR3 SDRAM Standard

(From JEDEC Board Ballot JCB-06-71, formulated under the cognizance of the JC-42 Committee on Solid State Memories.)

1 Scope

This document defines the DDR3 SDRAM specification, including features, functionalities, AC and DC characteristics, packages, and ball/signal assignments. The purpose of this Specification is to define the minimum set of requirements for JEDEC compliant 512 Mb through 8 Gb for x4, x8, and x16 DDR3 SDRAM devices. This specification was created based on the DDR2 specification (JESD79-2) and some aspects of the DDR specification (JESD79). Each aspect of the changes for DDR3 SDRAM operation were considered and approved by committee ballot(s). The accumulation of these ballots were then incorporated to prepare this JESD79-3 specification, replacing whole sections and incorporating the changes into Functional Description and Operation.

This page left blank.

2 DDR3 SDRAM Package Pinout and Addressing (cont'd)

2.7 Pinout Description

Table 1 — Input / output functional description

Symbol	Type	Function
CK, CK#	Input	Clock: CK and CK# are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of CK#.
CKE	Input	Clock Enable: CKE HIGH activates, and CKE Low deactivates, internal clock signals and device input buffers and output drivers. Taking CKE Low provides Precharge Power-Down and Self-Refresh operation (all banks idle), or Active Power-Down (row Active in any bank). CKE is asynchronous for Self-Refresh exit. After VREFCA and VREFDQ have become stable during the power on and initialization sequence, they must be maintained during all operations (including Self-Refresh). CKE must be maintained high throughout read and write accesses. Input buffers, excluding CK, CK#, ODT and CKE are disabled during power-down. Input buffers, excluding CKE, are disabled during Self-Refresh.
CS#	Input	Chip Select: All commands are masked when CS# is registered HIGH. CS# provides for external Rank selection on systems with multiple Ranks. CS# is considered part of the command code.
ODT	Input	On Die Termination: ODT (registered HIGH) enables termination resistance internal to the DDR3 SDRAM. When enabled, ODT is only applied to each DQ, DQS, DQS# and DM/TDQS, NU/TDQS# (When TDQS is enabled via Mode Register A11=1 in MR1) signal for x4/x8 configurations. For x16 configuration ODT is applied to each DQ, DQSU, DQSU#, DQSL, DQSL#, DMU, and DML signal. The ODT pin will be ignored if MR1 is programmed to disable ODT.
RAS#. CAS#. WE#	Input	Command Inputs: RAS#, CAS# and WE# (along with CS#) define the command being entered.
DM, (DMU), (DML)	Input	Input Data Mask: DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH coincident with that input data during a Write access. DM is sampled on both edges of DQS. For x8 device, the function of DM or TDQS/TDQS# is enabled by Mode Register A11 setting in MR1.
BA0 - BA2	Input	Bank Address Inputs: BA0 - BA2 define to which bank an Active, Read, Write or Precharge command is being applied. Bank address also determines which mode register is to be accessed during a MRS cycle.
A0 - A15	Input	Address Inputs: Provide the row address for Active commands and the column address for Read/Write commands to select one location out of the memory array in the respective bank. (A10/AP and A12/BC# have additional functions, see below). The address inputs also provide the op-code during Mode Register Set commands.
A10 / AP	Input	Auto-precharge: A10 is sampled during Read/Write commands to determine whether Autoprecharge should be performed to the accessed bank after the Read/Write operation. (HIGH: Autoprecharge; LOW: no Autoprecharge). A10 is sampled during a Precharge command to determine whether the Precharge applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by bank addresses.
A12 / BC#	Input	Burst Chop: A12 / BC# is sampled during Read and Write commands to determine if burst chop (on-the-fly) will be performed. (HIGH, no burst chop; LOW: burst chopped). See command truth table for details.
RESET#	Input	Active Low Asynchronous Reset: Reset is active when RESET# is LOW, and inactive when RESET# is HIGH. RESET# must be HIGH during normal operation. RESET# is a CMOS rail to rail signal with DC high and low at 80% and 20% of V _{DD} , i.e. 1.20V for DC high and 0.30V for DC low.
DQ	Input / Output	Data Input/ Output: Bi-directional data bus.

2 DDR3 SDRAM Package Pinout and Addressing (cont'd)

2.7 Pinout Description (Cont.)

Table 1 — Input / output functional description

Symbol	Type	Function
DQU, DQL, DQS, DQS#, DQSU, DQSU#, DQSL, DQSL#	Input / Output	Data Strobe: output with read data, input with write data. Edge-aligned with read data, centered in write data. For the x16, DQSL corresponds to the data on DQL0-DQL7; DQSU corresponds to the data on DQU0-DQU7. The data strobe DQS, DQSL, and DQSU are paired with differential signals DQS#, DQSL#, and DQSU#, respectively, to provide differential pair signaling to the system during reads and writes. DDR3 SDRAM supports differential data strobe only and does not support single-ended.
TDQS, TDQS#	Output	Termination Data Strobe: TDQS/TDQS# is applicable for x8 DRAMs only. When enabled via Mode Register A11 = 1 in MR1, the DRAM will enable the same termination resistance function on TDQS/TDQS# that is applied to DQS/DQS#. When disabled via mode register A11 = 0 in MR1, DM/TDQS will provide the data mask function and TDQS# is not used. x4/x16 DRAMs must disable the TDQS function via mode register A11 = 0 in MR1.
NC		No Connect: No internal electrical connection is present.
V _{DDQ}	Supply	DQ Power Supply: 1.5 V +/- 0.075 V
V _{SSQ}	Supply	DQ Ground
V _{DD}	Supply	Power Supply: 1.5 V +/- 0.075 V
V _{SS}	Supply	Ground
V _{REFDQ}	Supply	Reference voltage for DQ
V _{REFCA}	Supply	Reference voltage
ZQ	Supply	Reference Pin for ZQ calibration
Note: Input only pins (BA0-BA2, A0-A15, RAS#, CAS#, WE#, CS#, CKE, ODT, and RESET#) do not supply termination.

Notes: 1. Page size is the number of bytes of data delivered from the array to the internal sense amplifiers when an ACTIVE command is registered. Page size is per bank, calculated as follows:

$$\text{page size} = 2^{\text{COLBITS}} * \text{ORG} \div 8$$

where

COLBITS = the number of column address bits

ORG = the number of I/O (DQ) bits

3 Functional Description

3.1 Simplified State Diagram

This simplified State Diagram is intended to provide an overview of the possible state transitions and the commands to control them. In particular, situations involving more than one bank, the enabling or disabling of on-die termination, and some other events are not captured in full detail.

Figure 1 — Simplified State Diagram

Table 2 — State Diagram Command Definitions

Abbreviation	Function	Abbreviation	Function	Abbreviation	Function
ACT	Active	Read	RD, RDS4, RDS8	PDE	Enter Power-down
PRE	Precharge	Read A	RDA, RDAS4, RDAS8	PDX	Exit Power-down
PREA	Precharge All	Write	WR, WRS4, WRS8	SRE	Self-Refresh entry
MRS	Mode Register Set	Write A	WRA, WRAS4, WRAS8	SRX	Self-Refresh exit
REF	Refresh	RESET#	Start RESET Procedure	MPR	Multi-Purpose Register

Note: See “Command Truth Table” on page 29 for more details.

3 Functional Description (cont'd)

3.2 Basic Functionality

The DDR3 SDRAM is a high-speed dynamic random-access memory internally configured as an eight-bank DRAM. The DDR3 SDRAM uses a 8n prefetch architecture to achieve high-speed operation. The 8n prefetch architecture is combined with an interface designed to transfer two data words per clock cycle at the I/O pins. A single read or write operation for the DDR3 SDRAM consists of a single 8n-bit wide, four clock data transfer at the internal DRAM core and two corresponding n-bit wide, one-half clock cycle data transfers at the I/O pins.

Read and write operation to the DDR3 SDRAM are burst oriented, start at a selected location, and continue for a burst length of four or eight in a programmed sequence. Operation begins with the registration of an Active command, which is then followed by a Read or Write command. The address bits registered coincident with the Active command are used to select the bank and row to be activated (BA0-BA2 select the bank; A0-A15 select the row; refer to “DDR3 SDRAM Addressing” on page 11 for specific requirements). The address bits registered coincident with the Read or Write command are used to select the starting column location for the burst operation, determine if the auto precharge command is to be issued (via A10), and select BC4 or BL8 mode ‘on the fly’ (via A12) if enabled in the mode register.

Prior to normal operation, the DDR3 SDRAM must be powered up and initialized in a predefined manner. The following sections provide detailed information covering device reset and initialization, register definition, command descriptions and device operation.

3 Functional Description (cont'd)

3.3 RESET and Initialization Procedure

3.3.1 Power-up Initialization Sequence

The following sequence is required for POWER UP and Initialization.

1. Apply power (RESET# is recommended to be maintained below $0.2 \times VDD$, (all other inputs may be undefined). RESET# needs to be maintained for minimum 200 us with stable power. CKE is pulled "Low" anytime before RESET# being de-asserted (min. time 10 ns). The power voltage ramp time between 300 mv to VDDmin must be no greater than 200 ms; and during the ramp, $VDD > VDDQ$ and $(VDD - VDDQ) < 0.3$ volts.
- VDD and VDDQ are driven from a single power converter output, AND
- The voltage levels on all pins other than VDD, VDDQ, VSS, VSSQ must be less than or equal to VDDQ and VDD on one side and must be larger than or equal to VSSQ and VSS on the other side. In addition, VTT is limited to 0.95 V max once power ramp is finished, AND
- Vref tracks VDDQ/2.

OR

- Apply VDD without any slope reversal before or at the same time as VDDQ.
 - Apply VDDQ without any slope reversal before or at the same time as VTT & Vref.
 - The voltage levels on all pins other than VDD, VDDQ, VSS, VSSQ must be less than or equal to VDDQ and VDD on one side and must be larger than or equal to VSSQ and VSS on the other side.
2. After RESET# is de-asserted, wait for another 500 us until CKE becomes active. During this time, the DRAM will start internal state initialization; this will be done independently of external clocks.
 3. Clocks (CK, CK#) need to be started and stabilized for at least 10 ns or 5 tCK (which is larger) before CKE goes active. Since CKE is a synchronous signal, the corresponding set up time to clock (tIS) must be met. Also a NOP or Deselect command must be registered (with tIS set up time to clock) before CKE goes active. Once the CKE registered "High" after Reset, CKE needs to be continuously registered "High" until the initialization sequence is finished, including expiration of tDLLK and tZQinit.
 4. The DDR3 SDRAM will keep its on-die termination in high-impedance state during RESET# being asserted at least until CKE being registered high. Therefore, the ODT signal may be in undefined state until tIS before CKE being registered high. After that, the ODT signal must be keep inactive ("low") until the Power Up initialization sequence is finished, including expiration of tDLLK and tZQinit.
 5. After CKE being registered high, wait minimum of Reset CKE Exit time, tXPR, before issuing the first MRS command to load mode register. ($tXPR = \max(tXS; 5 \times tCK)$)
 6. Issue MRS Command to load MR2 with all application settings. (To issue MRS command for MR2, provide "Low" to BA0 and BA2, "High" to BA1.)
 7. Issue MRS Command to load MR3 with all application settings. (To issue MRS command for MR3, provide "Low" to BA2, "High" to BA0 and BA1.)
 8. Issue MRS Command to load MR1 with all application settings and DLL enabled. (To issue "DLL Enable" command, provide "Low" to A0, "High" to BA0 and "Low" to BA1 – BA2).
 9. Issue MRS Command to load MR0 with all application settings and "DLL reset". (To issue DLL reset command, provide "High" to A8 and "Low" to BA0-2).
 10. Issue ZQCL command to starting ZQ calibration.
 11. Wait for both tDLLK and tZQinit completed.
 12. The DDR3 SDRAM is now ready for normal operation.

3.3 RESET and Initialization Procedure (cont'd)

3.3.1 Power-up Initialization Sequence (cont'd)

Figure 2 — Reset and Initialization Sequence at Power-on Ramping

3 Functional Description (cont'd)

3.3 RESET and Initialization Procedure (cont'd)

3.3.2 Reset Initialization with Stable Power

The following sequence is required for RESET at no power interruption initialization.

1. Asserted RESET below $0.2 \times V_{DD}$ anytime when reset is needed (all other inputs may be undefined). RESET needs to be maintained for minimum 100 ns. CKE is pulled "LOW" before RESET being de-asserted (min. time 10 ns).
2. Follow Power-up Initialization Sequence step 2 to 11.
3. The Reset sequence is now completed, DDR3 SDRAM is ready for normal operation.

Figure 3 — Reset Procedure at Power Stable Condition

3 Functional Description (cont'd)

3.4 Register Definition

3.4.1 Programming the Mode Registers

For application flexibility, various functions, features and modes are programmable in four Mode Registers, provided by the DDR3 SDRAM, as user defined variables and they must be programmed via a Mode Register Set (MRS) command. As the default values of the Mode Registers (MR#) are not defined, contents of Mode Registers must be fully initialized and/or re-initialized, i.e. written, after power up and/or reset for proper operation. Also the contents of the Mode Registers can be altered by re-executing the MRS command during normal operation. When programming the mode registers, even if the user chooses to modify only a sub-set of the MRS fields, all address fields within the accessed mode register must be redefined when the MRS command is issued. MRS command and DLL Reset do not affect array contents, which means these commands can be executed any time after power-up without affecting the array contents.

The mode register set command cycle time, t_{MRD} is required to complete the write operation to the mode register and is the minimum time required between two MRS commands shown in Figure 4.

Figure 4 — t_{MRD} Timing

The MRS command to Non-MRS command delay, t_{MOD} , is required for the DRAM to update the features, except DLL reset, and is the minimum time required from an MRS command to a non-MRS command excluding NOP and DES shown in Figure 5.

Figure 5 — t_{MOD} Timing

The mode register contents can be changed using the same command and timing requirements during normal operation as long as the DRAM is in idle state, i.e. all banks are in the precharged state with t_{RP} satisfied, all data bursts are completed and CKE is high prior to writing into the mode register. The mode registers are divided into various fields depending on the functionality and/or modes.

3 Functional Description (cont'd)

3.4 Register Definition (cont'd)

3.4.2 Mode Register MR0

The mode register MR0 stores the data for controlling various operating modes of DDR3 SDRAM. It controls burst length, read burst type, CAS latency, test mode, DLL reset, WR and DLL control for precharge Power-Down, which include various vendor specific options to make DDR3 SDRAM useful for various applications. The mode register is written by asserting low on CS#, RAS#, CAS#, WE#, BA0, BA1, and BA2, while controlling the states of address pins according to Figure .

*1 : BA2 and A13~A15 are RFU and must be programmed to 0 during MRS.

*2 : WR(write recovery for autoprecharge)min in clock cycles is calculated by dividing tWR(in ns) by tCK(in ns) and rounding up to the next integer: $WR_{min}[\text{cycles}] = \text{Roundup}(tWR[\text{ns}]/tCK[\text{ns}])$. The WR value in the mode register must be programmed to be equal or larger than WRmin. The programmed WR value is used with tRP to determine tDAL.

Figure 6 — MR0 Definition

3.4.2.1 Burst Length, Type and Order

Accesses within a given burst may be programmed to sequential or interleaved order. The burst type is selected via bit A3 as shown in Figure 6. The ordering of accesses within a burst is determined by the burst length, burst type, and the starting column address as shown in Table 3. The burst length is defined by bits A0-A1. Burst length options include fixed BC4, fixed BL8, and 'on the fly' which allows BC4 or BL8 to be selected coincident with the registration of a Read or Write command via A12/BC#.

3.4 Register Definition (cont'd)**3.4.2 Mode Register MR0 (cont'd)****Table 3 — Burst Type and Burst Order**

Burst Length	READ/ WRITE	Starting Column ADDRESS (A2,A1,A0)	burst type = Sequential (decimal) A3 = 0	burst type = Interleaved (decimal) A3 = 1	Notes
4 Chop	READ	0 0 0	0,1,2,3,T,T,T,T	0,1,2,3,T,T,T,T	1, 2, 3
		0 0 1	1,2,3,0,T,T,T,T	1,0,3,2,T,T,T,T	1, 2, 3
		0 1 0	2,3,0,1,T,T,T,T	2,3,0,1,T,T,T,T	1, 2, 3
		0 1 1	3,0,1,2,T,T,T,T	3,2,1,0,T,T,T,T	1, 2, 3
		1 0 0	4,5,6,7,T,T,T,T	4,5,6,7,T,T,T,T	1, 2, 3
		1 0 1	5,6,7,4,T,T,T,T	5,4,7,6,T,T,T,T	1, 2, 3
		1 1 0	6,7,4,5,T,T,T,T	6,7,4,5,T,T,T,T	1, 2, 3
		1 1 1	7,4,5,6,T,T,T,T	7,6,5,4,T,T,T,T	1, 2, 3
	WRITE	0,V,V	0,1,2,3,X,X,X,X	0,1,2,3,X,X,X,X	1, 2, 4, 5
		1,V,V	4,5,6,7,X,X,X,X	4,5,6,7,X,X,X,X	1, 2, 4, 5
8	READ	0 0 0	0,1,2,3,4,5,6,7	0,1,2,3,4,5,6,7	2
		0 0 1	1,2,3,0,5,6,7,4	1,0,3,2,5,4,7,6	2
		0 1 0	2,3,0,1,6,7,4,5	2,3,0,1,6,7,4,5	2
		0 1 1	3,0,1,2,7,4,5,6	3,2,1,0,7,6,5,4	2
		1 0 0	4,5,6,7,0,1,2,3	4,5,6,7,0,1,2,3	2
		1 0 1	5,6,7,4,1,2,3,0	5,4,7,6,1,0,3,2	2
		1 1 0	6,7,4,5,2,3,0,1	6,7,4,5,2,3,0,1	2
		1 1 1	7,4,5,6,3,0,1,2	7,6,5,4,3,2,1,0	2
	WRITE	V,V,V	0,1,2,3,4,5,6,7	0,1,2,3,4,5,6,7	2, 4
Notes: 1. In case of burst length being fixed to 4 by MR0 setting, the internal write operation starts two clock cycles earlier than for the BL8 mode. This means that the starting point for tWR and tWTR will be pulled in by two clocks. In case of burst length being selected on-the-fly via A12/BC#, the internal write operation starts at the same point in time like a burst of 8 write operation. This means that during on-the-fly control, the starting point for tWR and tWTR will not be pulled in by two clocks. 2. 2) 0...7 bit number is value of CA[2:0] that causes this bit to be the first read during a burst. 3. T: Output driver for data and strobes are in high impedance. 4. V: a valid logic level (0 or 1), but respective buffer input ignores level on input pins. 5. X: Don't Care.					

3.4.2.2 CAS Latency

The CAS Latency is defined by MR0 (bits A9-A11) as shown in Figure 6. CAS Latency is the delay, in clock cycles, between the internal Read command and the availability of the first bit of output data. DDR3 SDRAM does not support any half clock latencies. The overall Read Latency (RL) is defined as Additive Latency (AL) + CAS Latency (CL); $RL = AL + CL$. For more information on the supported CL and AL settings based on the operating clock frequency, refer to “Standard Speed Bins” on page 147. For detailed Read operation refer to “READ Operation” on page 54.

3.4.2.3 Test Mode

The normal operating mode is selected by MR0 (bit A7 = 0) and all other bits set to the desired values shown in Figure . Programming bit A7 to a ‘1’ places the DDR3 SDRAM into a test mode that is only used by the DRAM Manufacturer and should NOT be used. No operations or functionality is guaranteed if A7 = 1.

3.4 Register Definition (cont'd)

3.4.2 Mode Register MR0 (cont'd)

3.4.2.4 DLL Reset

The DLL Reset bit is self-clearing, meaning it returns back to the value of '0' after the DLL reset function has been issued. Once the DLL is enabled, a subsequent DLL Reset should be applied. Any time the DLL reset function is used, tDLLK must be met before any functions that require the DLL can be used (i.e. Read commands or ODT synchronous operations).

3.4.2.5 Write Recovery

The programmed WR value MR0 (bits A9, A10, and A11) is used for the auto precharge feature along with tRP to determine tDAL WR(write recovery for auto-precharge)min in clock cycles is calculated by dividing tWR(in ns) by tCK(in ns) and rounding up to the next integer: $WR_{min}[\text{cycles}] = \text{Roundup}(tWR[\text{ns}]/tCK[\text{ns}])$. The WR must be programmed to be equal or larger than tWR(min).

3.4.2.6 Precharge PD DLL

MR0 (bit A12) is used to select the DLL usage during precharge power-down mode. When MR0(A12 = 0), or 'slow-exit', the DLL is frozen after entering precharge power-down (for potential power savings) and upon exit requires tXPLL to be met prior to the next valid command. When MR0(A12 = 1), or 'fast-exit', the DLL is maintained after entering precharge power-down and upon exiting power-down requires tXP to be met prior to the next valid command.

3 Functional Description (cont'd)

3.4 Register Definition (cont'd)

3.4.3 Mode Register MR1

The Mode Register MR1 stores the data for enabling or disabling the DLL, output driver strength, Rtt_Nom impedance, additive latency, Write leveling enable, TDQS enable and Qoff. The Mode Register 1 is written by asserting low on CS#, RAS#, CAS#, WE#, high on BA0 and low on BA1 and BA2, while controlling the states of address pins according to Figure .

* 1 : BA2 and A8, A10, and A13 ~ A15 are RFU and must be programmed to 0 during MRS.

Figure 7 — MR1 Definition

3.4 Register Definition (cont'd)

3.4.3 Mode Register MR1 (cont'd)

3.4.3.1 DLL Enable/Disable

The DLL must be enabled for normal operation. DLL enable is required during power up initialization, and upon returning to normal operation after having the DLL disabled. During normal operation (DLL-on) with MR1 (A0 = 0), the DLL is automatically disabled when entering Self-Refresh operation and is automatically re-enabled upon exit of Self-Refresh operation. Any time the DLL is enabled and subsequently reset, tDLLK clock cycles must occur before a Read or synchronous ODT command can be issued to allow time for the internal clock to be synchronized with the external clock. Failing to wait for synchronization to occur may result in a violation of the tDQSK, tAON or tAOF parameters. During tDLLK, CKE must continuously be registered high. DDR3 SDRAM does not require DLL for any Write operation. For more detailed information on DLL Disable operation refer to “DLL-off Mode” on page 33.

The direct ODT feature is not supported during DLL-off mode. The on-die termination resistors must be disabled by continuously registering the ODT pin low and/or by programming the RTT_Nom bits MR1{A9,A6,A2} to {0,0,0} via a mode register set command during DLL-off mode.

The dynamic ODT feature is not supported at DLL-off mode. User must use MRS command to set Rtt_WR, MR2{A10, A9}={0,0}, to disable Dynamic ODT externally.

3.4.3.2 Output Driver Impedance Control

The output driver impedance of the DDR3 SDRAM device is selected by MR1 (bits A1 and A5) as shown in Figure .

3.4.3.3 ODT Rtt Values

3.4.3.4 Additive Latency (AL)

Additive Latency (AL) operation is supported to make command and data bus efficient for sustainable bandwidths in DDR3 SDRAM. In this operation, the DDR3 SDRAM allows a read or write command (either with or without auto-precharge) to be issued immediately after the active command. The command is held for the time of the Additive Latency (AL) before it is issued inside the device. The Read Latency (RL) is controlled by the sum of the AL and CAS Latency (CL) register settings. Write Latency (WL) is controlled by the sum of the AL and CAS Write Latency (CWL) register settings. A summary of the AL register options are shown in Table .

Table 4 — Additive Latency (AL) Settings

A4	A3	AL
0	0	0 (AL Disabled)
0	1	CL - 1
1	0	CL - 2
1	1	Reserved

Note: AL has a value of CL - 1 or CL - 2 as per the CL values programmed in the MR0 register.

3.4.3.5 Write leveling

For better signal integrity, DDR3 memory module adopted fly by topology for the commands, addresses, control signals and clocks. The fly by topology has benefits from reducing number of stubs and their length but in other aspect, causes flight time skew between clock and strobe at every DRAM on DIMM. It makes it difficult for the Controller to maintain tDQSS, tDSS and tDSH specification. Therefore, the controller should support 'write leveling' in DDR3 SDRAM to compensate the skew. See 4.8 “Write Leveling” on page 38 for more details.

3.4 Register Definition (cont'd)

3.4.3 Mode Register MR1 (cont'd)

3.4.3.6 Output Disable

The DDR3 SDRAM outputs may be enabled/disabled by MR1 (bit A12) as shown in Figure . When this feature is enabled (A12 = 1), all output pins (DQs, DQS, DQS#, etc.) are disconnected from the device removing any loading of the output drivers. This feature may be useful when measuring module power for example. For normal operation, A12 should be set to '0'.

3.4.3.7 TDQS, TDQS#

TDQS (Termination Data Strobe) is a feature of X8 DDR3 SDRAM that provides additional termination resistance outputs that may be useful in some system configurations.

TDQS is not supported in X4 or X16 configurations. When enabled via the mode register, the same termination resistance function is applied to the TDQS/TDQS# pins that is applied to the DQS/DQS# pins.

In contrast to the RDQS function of DDR2 SDRAM, TDQS provides the termination resistance function only. The data strobe function of RDQS is not provided by TDQS.

The TDQS and DM functions share the same pin. When the TDQS function is enabled via the mode register, the DM function is not supported. When the TDQS function is disabled, the DM function is provided and the TDQS# pin is not used. See Table 5 for details.

The TDQS function is available in X8 DDR3 SDRAM only and must be disabled via the mode register A11=0 in MR1 for X4 and X16 configurations.

Table 5 — TDQS, TDQS# Function Matrix

MR1(A11)	DM / TDQS	NU / TDQS
0 (TDQS Disabled)	DM	Hi-Z
1 (TDQS Enabled)	TDQS	TDQS#

- Notes:
1. If TDQS is enabled, the DM function is disabled.
 2. When not used, TDQS function can be disabled to save termination power.
 3. TDQS function is only available for X8 DRAM and must be disabled for X4 and X16.

3 Functional Description (cont'd)

3.4 Register Definition (cont'd)

3.4.4 Mode Register MR2

The Mode Register MR2 stores the data for controlling refresh related features, Rtt_WR impedance, and CAS write latency. The Mode Register 2 is written by asserting low on CS#, RAS#, CAS#, WE#, high on BA1 and low on BA0 and BA2, while controlling the states of address pins according to the table below.

MR2 Programming

* 1 : BA2, A5, A8, A11 ~ A15 are RFU and must be programmed to 0 during MRS.

Figure 8 — MR2 Definition

3.4 Register Definition (cont'd)

3.4.4 Mode Register MR2 (cont'd)

3.4.4.1 Partial Array Self-Refresh (PASR)

Optional in DDR3 SDRAM: Users should refer to the DRAM supplier data sheet and/or the DIMM SPD to determine if DDR3 SDRAM devices support the following options or requirements referred to in this material. If PASR (Partial Array Self-Refresh) is enabled, data located in areas of the array beyond the specified address range shown in Figure will be lost if Self-Refresh is entered. Data integrity will be maintained if tREFI conditions are met and no Self-Refresh command is issued.

3.4.4.2 CAS Write Latency (CWL)

The CAS Write Latency is defined by MR2 (bits A3-A5), as shown in Figure . CAS Write Latency is the delay, in clock cycles, between the internal Write command and the availability of the first bit of input data. DDR3 SDRAM does not support any half clock latencies. The overall Write Latency (WL) is defined as Additive Latency (AL) + CAS Write Latency (CWL); $WL = AL + CWL$. For more information on the supported CWL and AL settings based on the operating clock frequency, refer to “Standard Speed Bins” on page 147. For detailed Write operation refer to “WRITE Operation” on page 62.

3.4.4.3 Auto Self-Refresh (ASR) and Self-Refresh Temperature (SRT)

Optional in DDR3 SDRAM: Users should refer to the DRAM supplier data sheet and/or the DIMM SPD to determine if DDR3 SDRAM devices support the following options or requirements referred to in this material. For more details refer to “Extended Temperature Usage” on page 42. DDR3 SDRAM’s must support Self-Refresh operation at all supported temperatures. Applications requiring Self-Refresh operation in the Extended Temperature Range must use the optional ASR function or program the SRT bit appropriately.

3.4.4.4 Dynamic ODT (Rtt_WR)

DDR3 SDRAM introduces a new feature “Dynamic ODT”. In certain application cases and to further enhance signal integrity on the data bus, it is desirable that the termination strength of the DDR3 SDRAM can be changed without issuing an MRS command. MR2 Register locations A9 and A10 configure the Dynamic ODT settings. If RTT_Nom is disabled by setting MR1 (bits A2, A6, and A9) to “0”, RTT_WR is also disabled; in Write leveling mode, only RTT_Nom is available. For details on Dynamic ODT operation, refer to “Dynamic ODT” on page 87.

3 Functional Description (cont'd)

3.4 Register Definition (cont'd)

3.4.5 Mode Register MR3

The Mode Register MR3 controls Multi purpose registers. The Mode Register 3 is written by asserting low on CS#, RAS#, CAS#, WE#, high on BA1 and BA0, and low on BA2 while controlling the states of address pins according to the table below.

* 1 : BA2, A3 - A15 are RFU and must be programmed to 0 during MRS.

* 2 : The predefined pattern will be used for read synchronization.

* 3 : When MPR control is set for normal operation (MR3 A[2] = 0) then MR3 A[1:0] will be ignored.

Figure 9 — MR3 Definition

3.4 Register Definition (cont'd)

3.4.5 Mode Register MR3 (cont'd)

3.4.5.1 Multi-Purpose Register (MPR)

The Multi Purpose Register (MPR) function is used to Read out a predefined system timing calibration bit sequence. To enable the MPR, a MODE Register Set (MRS) command must be issued to MR3 Register with bit A2 = 1. Prior to issuing the MRS command, all banks must be in the idle state (all banks precharged and tRP/tRPA met). Once the MPR is enabled, any subsequent RD or RDA commands will be redirected to the Multi Purpose Register. When the MPR is enabled, only RD or RDA commands are allowed until a subsequent MRS command is issued with the MPR disabled (MR3 bit A2 = 0). Power-Down mode, Self-Refresh, and any other non-RD/RDA command is not allowed during MPR enable mode. The RESET function is supported during MPR enable mode. For detailed MPR operation refer to “Multi Purpose Register” on page 44.

4 DDR3 SDRAM Command Description and Operation

4.1 Command Truth Table

(a) note 1,2,3,4 apply to the entire Command Truth Table

(b) Note 5 applies to all Read/Write command

[BA=Bank Address, RA=Rank Address, CA=Column Address, BC#=Burst Chop, X=Don't Care, V=Valid]

Table 6 — Command Truth Table

Function	Abbrevia tion	CKE		CS#	RAS#	CAS#	WE#	BA0- BA3	A13- A15	A12- BC#	A10- AP	A0- A9, A11	Notes

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.1 Command Truth Table (cont'd)

Function	Abbrevia tion	CKE		CS#	RAS#	CAS#	WE#	BA0- BA3	A13- A15	A12- BC#	A10- AP	A0- A9, A11	Notes
		Previous Cycle	Current Cycle										
ZQ Calibration Short	ZQCS	H	H	L	H	H	L	X	X	X	L	X	
Notes: 1. All DDR3 SDRAM commands are defined by states of CS#, RAS#, CAS#, WE# and CKE at the rising edge of the clock. The MSB of BA, RA and CA are device density and configuration dependant. 2. RESET# is Low enable command which will be used only for asynchronous reset so must be maintained HIGH during any function. 3. Bank addresses (BA) determine which bank is to be operated upon. For (E)MRS BA selects an (Extended) Mode Register. 4. "V" means "H or L (but a defined logic level)" and "X" means either "defined or undefined (like floating logic level)". 5. Burst reads or writes cannot be terminated or interrupted and Fixed/on the Fly BL will be defined by MRS. 6. The Power Down Mode does not perform any refresh operation. 7. The state of ODT does not affect the states described in this table. The ODT function is not available during Self Refresh. 8. Self Refresh Exit is asynchronous. 9. VREF(Both VrefDQ and VrefCA) must be maintained during Self Refresh operation. 10. The No Operation command should be used in cases when the DDR3 SDRAM is in an idle or wait state. The purpose of the No Operation command (NOP) is to prevent the DDR3 SDRAM from registering any unwanted commands between operations. A No Operation command will not terminate a pervious operation that is still executing, such as a burst read or write cycle. 11. The Deselect command performs the same function as No Operation command. 12. Refer to the CKE Truth Table for more detail with CKE transition.													

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.2 CKE Truth Table

Table 7 — CKE Truth Table

a) Notes 1-7 apply to the entire CKE Truth Table.

b) For Power-down entry and exit parameters See 4.16 “Power-Down Modes” on page 72.

c) CKE low is allowed only if tMRD and tMOD are satisfied.

Current State ²	CKE		Command (N) ³ RAS#, CAS#, WE#, CS#	Action (N) ³	Notes
	Previous Cycle ¹ (N-1)	Current Cycle ¹ (N)			
Power-Down	L	L	X	Maintain Power-Down	14, 15
	L	H	DESELECT or NOP	Power-Down Exit	11,14
Self-Refresh	L	L	X	Maintain Self-Refresh	15,16
	L	H	DESELECT or NOP	Self-Refresh Exit	8,12,16
Bank(s) Active	H	L	DESELECT or NOP	Active Power-Down Entry	11,13,14
Reading	H	L	DESELECT or NOP	Power-Down Entry	11,13,14,17
Writing	H	L	DESELECT or NOP	Power-Down Entry	11,13,14,17
Precharging	H	L	DESELECT or NOP	Power-Down Entry	11,13,14,17
Refreshing	H	L	DESELECT or NOP	Precharge Power-Down Entry	11
All Banks Idle	H	L	DESELECT or NOP	Precharge Power-Down Entry	11,13,14,18
	H	L	REFRESH	Self-Refresh	9,13,18
For more details with all signals See 4.1 “Command Truth Table” on page 29.					10

- Notes:
1. CKE (N) is the logic state of CKE at clock edge N; CKE (N-1) was the state of CKE at the previous clock edge.
 2. Current state is defined as the state of the DDR3 SDRAM immediately prior to clock edge N.
 3. COMMAND (N) is the command registered at clock edge N, and ACTION (N) is a result of COMMAND (N), ODT is not included here.
 4. All states and sequences not shown are illegal or reserved unless explicitly described elsewhere in this document.
 5. The state of ODT does not affect the states described in this table. The ODT function is not available during Self-Refresh.
 6. CKE must be registered with the same value on tCKEmin consecutive positive clock edges. CKE must remain at the valid input level the entire time it takes to achieve the tCKEmin clocks of registration. Thus, after any CKE transition, CKE may not transition from its valid level during the time period of tIS + tCKEmin + tIH.
 7. DESELECT and NOP are defined in the Command Truth Table.
 8. On Self-Refresh Exit DESELECT or NOP commands must be issued on every clock edge occurring during the tXS period. Read or ODT commands may be issued only after tXSDLL is satisfied.
 9. Self-Refresh mode can only be entered from the All Banks Idle state.
 10. Must be a legal command as defined in the Command Truth Table.
 11. Valid commands for Power-Down Entry and Exit are NOP and DESELECT only.
 12. Valid commands for Self-Refresh Exit are NOP and DESELECT only.
 13. Self-Refresh can not be entered during Read or Write operations. For a detailed list of restrictions See 4.15 “Self-Refresh Operation” on page 70 and See 4.16 “Power-Down Modes” on page 72.
 14. The Power-Down does not perform any refresh operations.
 15. “X” means “don’t care” (including floating around VREF) in Self-Refresh and Power-Down. It also applies to Address pins.
 16. VREF (Both Vref_DQ and Vref_CA) must be maintained during Self-Refresh operation.
 17. If all banks are closed at the conclusion of the read, write or precharge command, then Precharge Power-Down is entered, otherwise Active Power-Down is entered.
 18. ‘Idle state’ is defined as all banks are closed (tRP, tDAL, etc. satisfied), no data bursts are in progress, CKE is high, and all timings from previous operations are satisfied (tMRD, tMOD, tRFC, tZQinit, tZQoper, tZQCS, etc.) as well as all Self-Refresh exit and Power-Down Exit parameters are satisfied (tXS, tXP, tXPDLL, etc).

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.3 No Operation (NOP) Command

The No Operation (NOP) command is used to instruct the selected DDR3 SDRAM to perform a NOP (CS# LOW and RAS#, CAS#, and WE# HIGH). This prevents unwanted commands from being registered during idle or wait states. Operations already in progress are not affected.

4.4 Deselect Command

The DESELECT function (CS# HIGH) prevents new commands from being executed by the DDR3 SDRAM. The DDR3 SDRAM is effectively deselected. Operations already in progress are not affected.

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.5 DLL-off Mode

DDR3 DLL-off mode is entered by setting MR1 bit A0 to “1”; this will disable the DLL for subsequent operations until A0 bit set back to “0”. The MR1 A0 bit for DLL control can be switched either during initialization or later. Refer to “Input clock frequency change” on page 36

The DLL-off Mode operations listed below are an optional feature for DDR3. The maximum clock frequency for DLL-off Mode is specified by the parameter tCKDLL_OFF. There is no minimum frequency limit besides the need to satisfy the refresh interval, tREFI.

Due to latency counter and timing restrictions, only one value of CAS Latency (CL) in MR0 and CAS Write Latency (CWL) in MR2 are supported. The DLL-off mode is only required to support setting of both CL=6 and CWL=6.

DLL-off mode will affect the Read data Clock to Data Strobe relationship (tDQSCK), but not the Data Strobe to Data relationship (tDQSQ, tQH). Special attention is needed to line up Read data to controller time domain.

Comparing with DLL-on mode, where tDQSCK starts from the rising clock edge (AL+CL) cycles after the Read command, the DLL-off mode tDQSCK starts (AL+CL - 1) cycles after the read command. Another difference is that tDQSCK may not be small compared to tCK (it might even be larger than tCK) and the difference between tDQSCKmin and tDQSCKmax is significantly larger than in DLL-on mode. tDQSCK(DLL_off) values are vendor specific.

The timing relations on DLL-off mode READ operation have shown at following Timing Diagram (CL=6, BL=8):

Figure 10 — DLL-off mode READ Timing Operation

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.6 DLL on/off switching procedure

DDR3 DLL-off mode is entered by setting MR1 bit A0 to “1”; this will disable the DLL for subsequent operations until A0 bit set back to “0”.

4.6.1 DLL “on” to DLL “off” Procedure

To switch from DLL “on” to DLL “off” requires the frequency to be changed during Self-Refresh outlined in the following procedure:

1. Starting from Idle state (All banks pre-charged, all timings fulfilled, and DRAMs On-die Termination resistors, RTT, must be in high impedance state before MRS to MR1 to disable the DLL.)
2. Set MR1 bit A0 to “1” to disable the DLL.
3. Wait tMOD.
4. Enter Self Refresh Mode; wait until (tCKSRE) is satisfied.
5. Change frequency, in guidance with “Input clock frequency change” on page 36.
6. Wait until a stable clock is available for at least (tCKSRX) at DRAM inputs.
7. Starting with the Self Refresh Exit command, ODT must continuously be registered low and CKE must continuously be registered high until all tMOD timings from any MRS command are satisfied.
8. Wait tXS, then set Mode Registers with appropriate values (especially an update of CL, CWL and WR may be necessary. A ZQCL command may also be issued after tXS)
9. Wait for tMOD, then DRAM is ready for next command.

Figure 11 — DLL Switch Sequence from DLL-on to DLL-off

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.6 DLL on/off switching procedure (cont'd)

4.6.2 DLL “off” to DLL “on” Procedure

To switch from DLL “off” to DLL “on” (with required frequency change) during Self-Refresh:

1. Starting from Idle state (All banks pre-charged, all timings fulfilled and DRAMs On-die Termination resistors (RTT) must be in high impedance state before Self-Refresh mode is entered.)
2. Enter Self Refresh Mode, wait until t_{CKSRE} satisfied.
3. Change frequency, in guidance with "Input clock frequency change" on page 36.
4. Wait until a stable clock is available for at least (t_{CKSRX}) at DRAM inputs.
5. Starting with the Self Refresh Exit command, ODT must continuously be registered low and CKE must continuously be registered high until all t_{DLLK} timing from subsequent DLL Reset command is satisfied.
6. Wait t_{XS} , then set MR1 bit A0 to “0” to enable the DLL.
7. Wait t_{MRD} , then set MR0 bit A8 to “1” to start DLL Reset.
8. Wait t_{MRD} , then set Mode Registers with appropriate values (especially an update of CL, CWL and WR may be necessary. After t_{MOD} satisfied from any proceeding MRS command, a ZQCL command may also be issued during or after t_{DLLK} .)
9. Wait for t_{MOD} , then DRAM is ready for next command (Remember to wait t_{DLLK} after DLL Reset before applying command requiring a locked DLL!). In addition, wait also for t_{ZQoper} in case a ZQCL command was issued.

Figure 12 — DLL Switch Sequence from DLL Off to DLL On

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.7 Input clock frequency change

Once the DDR3 SDRAM is initialized, the DDR3 SDRAM requires the clock to be “stable” during almost all states of normal operation. This means once the clock frequency has been set and is to be in the “stable state”, the clock period is not allowed to deviate except for what is allowed for by the clock jitter and SSC (spread spectrum clocking) specifications.

The input clock frequency can be changed from one stable clock rate to another stable clock rate under two conditions: (1) Self-Refresh mode and (2) Precharge Power-down mode. Outside of these two modes, it is illegal to change the clock frequency.

For the first condition, once the DDR3 SDRAM has been successfully placed in to Self-Refresh mode and t_{CKSRE} has been satisfied, the state of the clock becomes a don't care. Once a don't care, changing the clock frequency is permissible, provided the new clock frequency is stable prior to t_{CKSRX} . When entering and exiting Self-Refresh mode for the sole purpose of changing the clock frequency, the Self-Refresh entry and exit specifications must still be met as outlined in See 4.15 “Self-Refresh Operation” on page 70. The DDR3 SDRAM input clock frequency is allowed to change only within the minimum and maximum operating frequency specified for the particular speed grade. Any frequency change below the minimum operating frequency would require the use of DLL_on- mode -> DLL_off -mode transition sequence, refer to “DLL on/off switching procedure” on page 34.

The second condition is when the DDR3 SDRAM is in Precharge Power-down mode (either fast exit mode or slow exit mode). ODT must be at a logic LOW ensuring R_{tt} is in an off state prior to entering Precharge Power-down mode and CKE must be at a logic LOW. A minimum of t_{CKSRE} must occur after CKE goes LOW before the clock frequency may change. The DDR3 SDRAM input clock frequency is allowed to change only within the minimum and maximum operating frequency specified for the particular speed grade. During the input clock frequency change, ODT and CKE must be held at stable LOW levels. Once the input clock frequency is changed, stable new clocks must be provided to the DRAM t_{CKSRX} before Precharge Power-down may be exited; after Precharge Power-down is exited and t_{XP} has expired, the DLL must be RESET via MRS. Depending on the new clock frequency additional MRS commands may need to be issued to appropriately set the WR, CL, and CWL with CKE continuously registered high. During DLL re-lock period, ODT must remain LOW and CKE must remain HIGH. After the DLL lock time, the DRAM is ready to operate with new clock frequency. This process is depicted in Figure 13 on page 37.

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.7 Input clock frequency change (cont'd)

Figure 13 — Change Frequency during Precharge Power-down

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.8 Write Leveling

For better signal integrity, DDR3 memory module adopted fly by topology for the commands, addresses, control signals and clocks. The fly by topology has benefits from reducing number of stubs and their length but in other aspect, causes flight time skew between clock and strobe at every DRAM on DIMM. It makes it difficult for the Controller to maintain tDQSS, tDSS and tDSH specification. Therefore, the controller should support 'write leveling' in DDR3 SDRAM to compensate the skew.

Write leveling is a scheme to adjust DQS to CK relationship by the controller, with a simple feedback provided by the DRAM. The memory controller involved in the leveling must have adjustable delay setting on DQS to align the rising edge of DQS with that of the clock at the DRAM pin. DRAM asynchronously feeds back CK, sampled with the rising edge of DQS, through the DQ bus. The controller repeatedly delays DQS until a transition from 0 to 1 is detected. The DQS delay established through this exercise would ensure tDQSS, tDSS and tDSH specification. A conceptual timing of this scheme is shown as below.

Figure 14 — Write leveling concept

DQS/DQS# driven by the controller during leveling mode must be terminated by the DRAM based on ranks populated. Similarly, the DQ bus driven by the DRAM must also be terminated at the controller.

One or more data bits should carry the leveling feedback to the controller across the DRAM configurations X4, X8, and X16. On a X16 device, both byte lanes should be leveled independently. Therefore, a separate feedback mechanism should be available for each byte lane. The upper data bits should provide the feedback of the upper diff_DQS(diff_UDQS) to clock relationship whereas the lower data bits would indicate the lower diff_DQS(diff_LDQS) to clock relationship.

4.8.1 DRAM setting for write leveling & DRAM termination function in that mode

DRAM enters into Write leveling mode if A7 in MR1 set 'High' and after finishing leveling, DRAM exits from write leveling mode if A7 in MR1 set 'Low' (Table 8). Note that in write leveling mode, only DQS/DQS# terminations are activated and deactivated via ODT pin not like normal operation (Table 9).

4.8 Write Leveling (cont'd)

4.8.1 DRAM setting for write leveling & DRAM termination function in that mode (cont'd)

Table 8 — MR setting involved in the leveling procedure

Function	MR1	Enable	Disable
Write leveling enable	A7	1	0
Output buffer mode (Qoff)	A12	0	1

Table 9 — DRAM termination function in the leveling mode

ODT pin @DRAM	DQS/DQS# termination	DQs termination
De-asserted	Off	Off
Asserted	On	Off

Note: In Write Leveling Mode with its output buffer disabled (MR1[bit7] = 1 with MR1[bit12] = 1) all RTT_Nom settings are allowed; in Write Leveling Mode with its output buffer enabled (MR1[bit7] = 1 with MR1[bit12] = 0) only RTT_Nom settings of RZQ/2, RZQ/4 and RZQ/6 are allowed.

4.8.2 Procedure Description

Memory controller initiates Leveling mode of all DRAMs by setting bit 7 of MR1 to 1. With entering write leveling mode, the DQ pins are in undefined driving mode. During write leveling mode, only NOP or DESELECT commands are allowed. Since the controller levels one rank at a time, the output of other rank must be disabled by setting MR1 bit A12 to 1. Controller may assert ODT after tMOD, time at which DRAM is ready to accept the ODT signal.

Controller may drive DQS low and DQS# high after a delay of tWLDQSEN, at which time DRAM has applied on-die termination on these signals. After tDQSL and tWLMRD, controller provides a single DQS, DQS# edge which is used by the DRAM to sample CK driven from controller. tWLMRD(max) timing is controller dependent.

DRAM samples CK status with rising edge of DQS and provides feedback on all the DQ bits asynchronously after tWLO timing. There is a DQ output uncertainty of tWLOE defined to allow mismatch on DQ bits; there are no read strobes (DQS/DQS#) needed for these DQs. Controller samples incoming DQ and decides to increment or decrement DQS delay setting and launches the next DQS/DQS# pulse after some time, which is controller dependent. Once a 0 to 1 transition is detected, the controller locks DQS delay setting and write leveling is achieved for the device.

Figure 15 describes the timing diagram and parameters for the overall Write Leveling procedure.

4.8 Write Leveling (cont'd)**4.8.2 Procedure Description (cont'd)**

- Notes:
1. DRAM has the option to drive leveling feedback on a prime DQ or all DQs. If feedback is driven only on one DQ, the remaining DQs must be driven low, as shown in above Figure, and maintained at this state through out the leveling procedure.
 2. MRS: Load MR1 to enter write leveling mode
 3. NOP: NOP or deselect
 4. diff_DQS is the differential data strobe (DQS, DQS#). Timing reference points are the zero crossings. DQS is shown with solid line, DQS# is shown with dotted line
 5. CK/CK# : CK is shown with solid dark line, where as CK# is drawn with dotted line.
 6. DQS needs to fulfill minimum pulse width requirements tDQSH(min) and tDQSL(min) as defined for regular Writes; the max pulse width is system dependent.

Figure 15 — Timing details of Write leveling sequence [DQS is capturing CK low at T1 and CK high at T2]

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.8 Write Leveling (cont'd)

4.8.3 Write Leveling Mode Exit

The following sequence describes how Write Leveling Mode should be exited:

After the last rising strobe (see ~T111) edge, stop driving the strobe signals (see ~T128). Note: From now on, DQ pins are in undefined driving mode, and will remain undefined, until tMOD after the respective MR command (T145).

Drive ODT pin low (tIS must be satisfied) and keep it low. (see T128).

After the RTT is switched off, disable Write Level Mode via MR command (see T132).

4. After tMOD is satisfied (T145), a any valid command may be registered. (MR commands may already be issued after tMRD (T136)).

Figure 16 — Timing details of Write leveling exit

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.9 Extended Temperature Usage

Users should refer to the DRAM supplier data sheet and/or the DIMM SPD to determine if DDR3 SDRAM devices support the following options or requirements referred to in this material:

- Auto Self-refresh supported
- Extended Temperature Range supported
- Double refresh required for operation in the Extended Temperature Range (applies only for devices supporting the Extended Temperature Range)

Table 10 — Mode Register Description

Field	Bits	Description
ASR	MR2(A6)	Auto Self-Refresh (ASR) (Optional) when enabled, DDR3 SDRAM automatically provides Self-Refresh power management functions for all supported operating temperature values. If not enabled, the SRT bit must be programmed to indicate T _{OPER} during subsequent Self-Refresh operation 0 = Manual SR Reference (SRT) 1 = ASR enable (optional)
SRT	MR2(A7)	Self-Refresh Temperature (SRT) Range If ASR = 0, the SRT bit must be programmed to indicate T _{OPER} during subsequent Self-Refresh operation If ASR = 1, SRT bit must be set to 0 _b 0 = Normal operating temperature range 1 = Extended (optional) operating temperature range

4.9.1 Auto Self-Refresh mode - ASR Mode (optional)

DDR3 SDRAM provides an Auto Self-Refresh mode (ASR) for application ease. ASR mode is enabled by setting MR2 bit A6 = 1_b and MR2 bit A7 = 0_b. The DRAM will manage Self-Refresh entry in either the Normal or Extended (optional) Temperature Ranges. In this mode, the DRAM will also manage Self-Refresh power consumption when the DRAM operating temperature changes, lower at low temperatures and higher at high temperatures.

If the ASR option is not supported by the DRAM, MR2 bit A6 must be set to 0_b.

If the ASR mode is not enabled (MR2 bit A6 = 0_b), the SRT bit (MR2 A7) must be manually programmed with the operating temperature range required during Self-Refresh operation.

Support of the ASR option does not automatically imply support of the Extended Temperature Range.

Please refer to the supplier data sheet and/or the DIMM SPD for Extended Temperature Range and Auto Self-Refresh option availability.

4.9.2 Self-Refresh Temperature Range - SRT

SRT applies to devices supporting Extended Temperature Range only. If ASR = 0_b, the Self-Refresh Temperature (SRT) Range bit must be programmed to guarantee proper self-refresh operation. If SRT = 0_b, then the DRAM will set an appropriate refresh rate for Self-Refresh operation in the Normal Temperature Range. If SRT = 1_b then the DRAM will set an appropriate, potentially different, refresh rate to allow Self-Refresh operation in either the Normal or Extended Temperature Ranges. The value of the SRT bit can effect self-refresh power consumption, please refer to the IDD table for details.

For parts that do not support the Extended Temperature Range, MR2 bit A7 must be set to 0_b and the DRAM should not be operated outside the Normal Temperature Range.

4.9 Extended Temperature Usage (cont'd)

4.9.2 Self-Refresh Temperature Range - SRT (cont'd)

Please refer to the supplier data sheet and/or the DIMM SPD for Extended Temperature Range availability.

Table 11 — Self-Refresh mode summary

MR2 A[6]	MR2 A[7]	Self-Refresh operation	Allowed Operating Temperature Range for Self-Refresh Mode
0	0	Self-refresh rate appropriate for the Normal Temperature Range	Normal (0 - 85 °C)
0	1	Self-refresh rate appropriate for either the Normal or Extended Temperature Ranges. The DRAM must support Extended Temperature Range. The value of the SRT bit can effect self-refresh power consumption, please refer to the IDD table for details.	Normal and Extended (0 - 95 °C)
1	0	ASR enabled (for devices supporting ASR and Normal Temperature Range). Self-Refresh power consumption is temperature dependent	Normal (0 - 85 °C)
1	0	ASR enabled (for devices supporting ASR and Extended Temperature Range). Self-Refresh power consumption is temperature dependent	Normal and Extended (0 - 95 °C)
1	1	Illegal	

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.10 Multi Purpose Register

The Multi Purpose Register (MPR) function is used to Read out a predefined system timing calibration bit sequence. The basic concept of the MPR is shown in Figure 17.

Figure 17 — MPR Block Diagram

To enable the MPR, a MODE Register Set (MRS) command must be issued to MR3 Register with bit A2 = 1, as shown in Table 12. Prior to issuing the MRS command, all banks must be in the idle state (all banks precharged and tRP/tRPA met). Once the MPR is enabled, any subsequent RD or RDA commands will be redirected to the Multi Purpose Register. The resulting operation when a RD or RDA command is issued is defined by MR3 bits A[1:0] when the MPR is enabled as shown in Table 13. When the MPR is enabled, only RD or RDA commands are allowed until a subsequent MRS command is issued with the MPR disabled (MR3 bit A2 = 0). Power-Down mode, Self-Refresh, and any other non-RD/RDA command is not allowed during MPR enable mode. The RESET function is supported during MPR enable mode.

Table 12 — MPR MR3 Register Definition

MR3 A[2]	MR3 A[1:0]	Function
MPR	MPR-Loc	
0b	don't care (0b or 1b)	Normal operation, no MPR transaction. All subsequent Reads will come from DRAM array. All subsequent Write will go to DRAM array.
1b	See Table 13	Enable MPR mode, subsequent RD/RDA commands defined by MR3 A[1:0].

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.10 Multi Purpose Register (cont'd)

4.10.1 MPR Functional Description

- One bit wide logical interface via all DQ pins during READ operation.
- Register Read on x4:
 - DQ[0] drives information from MPR.
 - DQ[3:1] either drive the same information as DQ[0], or they drive 0b.
- Register Read on x8:
 - DQ[0] drives information from MPR.
 - DQ[7:1] either drive the same information as DQ[0], or they drive 0b.
- Register Read on x16:
 - DQL[0] and DQU[0] drive information from MPR.
 - DQL[7:1] and DQU[7:1] either drive the same information as DQL[0], or they drive 0b.
- Addressing during for Multi Purpose Register reads for all MPR agents:
 - BA[2:0]: don't care
 - A[1:0]: A[1:0] must be equal to '00'b. Data read burst order in nibble is fixed
 - A[2]: For BL=8, A[2] must be equal to 0b, burst order is fixed to [0,1,2,3,4,5,6,7], *) For Burst Chop 4 cases, the burst order is switched on nibble base A[2]=0b, Burst order: 0,1,2,3 *) A[2]=1b, Burst order: 4,5,6,7 *)
 - A[9:3]: don't care
 - A10/AP: don't care
 - A12/BC: Selects burst chop mode on-the-fly, if enabled within MR0.
 - A11, A13,... (if available): don't care
- Regular interface functionality during register reads:
 - Support two Burst Ordering which are switched with A2 and A[1:0]=00b.
 - Support of read burst chop (MRS and on-the-fly via A12/BC)
 - All other address bits (remaining column address bits including A10, all bank address bits) will be ignored by the DDR3 SDRAM.
 - Regular read latencies and AC timings apply.
 - DLL must be locked prior to MPR Reads.

Note: *) Burst order bit 0 is assigned to LSB and burst order bit 7 is assigned to MSB of the selected MPR agent.

4.10.2 MPR Register Address Definition

Table 13 provides an overview of the available data locations, how they are addressed by MR3 A[1:0] during a MRS to MR3, and how their individual bits are mapped into the burst order bits during a Multi Purpose Register Read.

Table 13 — MPR MR3 Register Address Definition

MR3 A[2]	MR3 A[1:0]	Function	Burst Length	Read Address A[2:0]	Burst Order and Data Pattern
1b	00b	Read Predefined Pattern for System Calibration	BL8	000b	Burst order 0,1,2,3,4,5,6,7 Pre-defined Data Pattern [0,1,0,1,0,1,0,1]
			BC4	000b	Burst order 0,1,2,3 Pre-defined Data Pattern [0,1,0,1]
			BC4	100b	Burst order 4,5,6,7 Pre-defined Data Pattern [0,1,0,1]
1b	01b	RFU	BL8	000b	Burst order 0,1,2,3,4,5,6,7
			BC4	000b	Burst order 0,1,2,3
			BC4	100b	Burst order 4,5,6,7
1b	10b	RFU	BL8	000b	Burst order 0,1,2,3,4,5,6,7
			BC4	000b	Burst order 0,1,2,3
			BC4	100b	Burst order 4,5,6,7
1b	11b	RFU	BL8	000b	Burst order 0,1,2,3,4,5,6,7
			BC4	000b	Burst order 0,1,2,3
			BC4	100b	Burst order 4,5,6,7
Note: Burst order bit 0 is assigned to LSB and the burst order bit 7 is assigned to MSB of the selected MPR agent.					

4.10.3 Relevant Timing Parameters

The following AC timing parameters are important for operating the Multi Purpose Register: tRP, tMRD, tMOD, and tMPRR. For more details refer to “Electrical Characteristics & AC Timing for DDR3-800 to DDR3-1600” on page 143.

4.10.4 Protocol Example

Protocol Example (This is one example):

Read out predetermined read-calibration pattern.

Description: Multiple reads from Multi Purpose Register, in order to do system level read timing calibration based on predetermined and standardized pattern.

Protocol Steps:

- Precharge All.
- Wait until tRP is satisfied.
- MRS MR3, Opcode “A2 = 1b” and “A[1:0] = 00b”
 - Redirect all subsequent reads into the Multi Purpose Register, and load Pre-defined pattern into MPR.
- Wait until tMRD and tMOD are satisfied (Multi Purpose Register is then ready to be read). During the period MR3 A2 =1, no data write operation is allowed.
- Read:
 - A[1:0] = ‘00’b (Data burst order is fixed starting at nibble, always 00b here)
 - A[2] = ‘0’b (For BL=8, burst order is fixed as 0,1,2,3,4,5,6,7)
 - A12/BC = 1 (use regular burst length of 8)
 - All other address pins (including BA[2:0] and A10/AP): don’t care
- After RL = AL + CL, DRAM bursts out the predefined Read Calibration Pattern.
- Memory controller repeats these calibration reads until read data capture at memory controller is optimized.

4.10 Multi Purpose Register (cont'd)

4.10.4 Protocol Example (cont'd)

- After end of last MPR read burst, wait until tMPRR is satisfied.
- MRS MR3, Opcode “A2 = 0b” and “A[1:0] = valid data but value are don’t care”
 - All subsequent read and write accesses will be regular reads and writes from/to the DRAM array.
- Wait until tMRD and tMOD are satisfied.
- Continue with “regular” DRAM commands, like activate a memory bank for regular read or write access,...

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.11 ACTIVE Command

The ACTIVE command is used to open (or activate) a row in a particular bank for a subsequent access. The value on the BA0-BA2 inputs selects the bank, and the address provided on inputs A0-A15 selects the row. This row remains active (or open) for accesses until a precharge command is issued to that bank. A PRECHARGE command must be issued before opening a different row in the same bank.

4.12 PRECHARGE Command

The PRECHARGE command is used to deactivate the open row in a particular bank or the open row in all banks. The bank(s) will be available for a subsequent row activation a specified time (tRP) after the PRECHARGE command is issued, except in the case of concurrent auto precharge, where a READ or WRITE command to a different bank is allowed as long as it does not interrupt the data transfer in the current bank and does not violate any other timing parameters. Once a bank has been precharged, it is in the idle state and must be activated prior to any READ or WRITE commands being issued to that bank. A PRECHARGE command is allowed if there is no open row in that bank (idle state) or if the previously open row is already in the process of precharging. However, the precharge period will be determined by the last PRECHARGE command issued to the bank.

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.13 READ Operation

4.13.1 READ Burst Operation

During a READ or WRITE command, DDR3 will support BC4 and BL8 on the fly using address A12 during the READ or WRITE (AUTO PRECHARGE can be enabled or disabled).

A12 = 0, BC4 (BC4 = burst chop, tCCD = 4)

A12 = 1, BL8

A12 is used only for burst length control, not as a column address.

Figure 25 — READ Burst Operation RL = 5 (AL = 0, CL = 5, BL8)

4.13 READ Operation (cont'd)

4.13.2 READ Timing Definitions

(Applied when the DLL is enabled and locked)

4.13.2.1 DDR3 Clock to Data Strobe relationship

(See Figure 27)

Rising data strobe edge parameters:

- $t_{DQSCk\ min/max}$ describes the allowed range for a rising data strobe edge relative to CK, CK#.
- t_{DQSCk} is the actual position of a rising strobe edge relative to CK, CK#.
- t_{QSH} describes the data strobe high pulse width.

Falling data strobe edge parameters:

- t_{QSL} describes the data strobe low pulse width.

$t_{LZ}(DQS)$, $t_{HZ}(DQS)$ for preamble/postamble (see 4.13.2.3 and Figure 29)

NOTES: Within a burst, rising strobe edge is not necessarily fixed to be always at $t_{DQSCk\ (min)}$ or $t_{DQSCk\ (max)}$. Instead, rising strobe edge can vary between $t_{DQSCk\ (min)}$ and $t_{DQSCk\ (max)}$. The DQS high pulse width is defined by t_{QSH} and the DQS low pulse width is defined by t_{QSL} . Likewise, $t_{LZ}(DQS)_{min}$ and $t_{HZ}(DQS)_{min}$ are not tied to $t_{DQSCk\ min}$ (early strobe case) and $t_{LZ}(DQS)_{max}$ and $t_{HZ}(DQS)_{max}$ are not tied to $t_{DQSCk\ max}$ (late strobe case); However, they will tend to track each other. The minimum pulse width of read preamble is defined by $t_{RPRE\ (min)}$. The minimum pulse width of read postamble is defined by $t_{RPST\ (min)}$.

Figure 27 — Clock to Data Strobe Relationship

4.13.2 READ Timing Definitions (cont'd)

(See Figure 28)

Rising data strobe edge parameters:

- tDQSQ describes the latest valid transition of the associated DQ pins.
- tOH describes the earliest invalid transition of the associated DQ pins.

Falling data strobe edge parameters:

- tDQSQ describes the latest valid transition of the associated DQ pins.
- tQH describes the earliest invalid transition of the associated DQ pins.

tDQSQ; both rising/falling edges of DQS, no tAC defined

Figure 28 — Data Strobe to Data Relationship

tHZ and tLZ transitions occur in the same access time as valid data transitions. These parameters are referenced to a specific voltage level which specifies when the device output is no longer driving tHZ(DQS) and tHZ(DQ), or begins driving tLZ(DQS), tLZ(DQ). Figure 29 shows a method to calculate the point when device is no longer driving tHZ(DQS) and tHZ(DQ), or begins driving tLZ(DQS), tLZ(DQ) by measuring the signal at two different voltages. The actual voltage measurement points are not critical as long as the calculation is consistent. The parameters tLZ(DQS), tLZ(DQ), tHZ(DQS), and tHZ(DQ) are defined as singled ended.

Figure 39 — READ (BL8) to WRITE (BC4) OTF

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.14 WRITE Operation

4.14.1 DDR3 Burst Operation

During a READ or WRITE command, DDR3 will support BC4 and BL8 on the fly using address A12 during the READ or WRITE (AUTO PRECHARGE can be enabled or disabled).

A12 = 0, BC4 (BC4 = burst chop, tCCD = 4)

A12 = 1, BL8

A12 is used only for burst length control, not as a column address.

4.14.2 WRITE Timing Violations

4.14.2.1 Motivation

Generally, if timing parameters are violated, a complete reset/initialization procedure has to be initiated to make sure the DRAM works properly.

However, it is desirable for certain minor violations that the DRAM is guaranteed not to “hang up” and errors be limited to that particular operation. *(for reference: add more motivation here later, or refer to the “Read Synchronization” section if available)*

For the following, it will be assumed that there are no timing violations w.r.t. to the Write command itself (including ODT, etc.) and that it does satisfy all timing requirements not mentioned below.

4.14.2.2 Data Setup and Hold Violations

Should the data to strobe timing requirements (tDS, tDH) be violated, for any of the strobe edges associated with a write burst, then wrong data might be written to the memory location addressed with this WRITE command.

In the example (Figure 4.14.2.4 on page 63), the relevant strobe edges for write burst A are associated with the clock edges: T5, T5.5, T6, T6.5, T7, T7.5, T8, T8.5.

Subsequent reads from that location might result in unpredictable read data, however the DRAM will work properly otherwise.

4.14.2.3 Strobe to Strobe and Strobe to Clock Violations

Should the strobe timing requirements (tDQSH, tDQSL, tWPRE, tWPST) or the strobe to clock timing requirements (tDSS, tDSH, tDQSS) be violated, for any of the strobe edges associated with a Write burst, then wrong data might be written to the memory location addressed with the offending WRITE command. Subsequent reads from that location might result in unpredictable read data, however the DRAM will work properly otherwise.

In the example (Figure 4.14.2.4 on page 63) the relevant strobe edges for Write burst A are associated with the clock edges: T4, T4.5, T5, T5.5, T6, T6.5, T7, T7.5, T8, T8.5 and T9. Any timing requirements starting or ending on one of these strobe edges need to be fulfilled for a valid burst. For Write burst B the relevant edges are T8, T8.5, T9, T9.5, T10, T10.5, T11, T11.5, T12, T12.5 and T13. Some edges are associated with both bursts.

4.14 WRITE Operation(cont'd)

4.14.2 WRITE Timing Violations (cont'd)

4.14.2.4 Write Timing Parameters

This drawing is for example only to enumerate the strobe edges that “belong” to a Write burst. No actual timing violations are shown here. For a valid burst all timing parameters for each edge of a burst need to be satisfied (not only for one edge - as shown).]

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.15 Self-Refresh Operation

The Self-Refresh command can be used to retain data in the DDR3 SDRAM, even if the rest of the system is powered down. When in the Self-Refresh mode, the DDR3 SDRAM retains data without external clocking. The DDR3 SDRAM device has a built-in timer to accommodate Self-Refresh operation. The Self-Refresh-Entry (SRE) Command is defined by having CS#, RAS#, CAS#, and CKE held low with WE# high at the rising edge of the clock.

Before issuing the Self-Refresh-Entry command, the DDR3 SDRAM must be idle with all bank precharge state with tRP satisfied. Also, on-die termination must be turned off before issuing Self-Refresh-Entry command, by either registering ODT pin low “ODTL + 0.5tCK” prior to the Self-Refresh Entry command or using MRS to MR1 command. Once the Self-Refresh Entry command is registered, CKE must be held low to keep the device in Self-Refresh mode. During normal operation (DLL on), MR1(A0 = 0), the DLL is automatically disabled upon entering Self-Refresh and is automatically enabled (including a DLL-Reset) upon exiting Self-Refresh.

When the DDR3 SDRAM has entered Self-Refresh mode, all of the external control signals, except CKE and RESET#, are “don’t care”. For proper Self-Refresh operation, all power supply and reference pins (VDD, VDDQ, VSS, VSSQ, VRefCA and VRefDQ) must be at valid levels. The DRAM initiates a minimum of one Refresh command internally within tCKE period once it enters Self-Refresh mode.

The clock is internally disabled during Self-Refresh Operation to save power. The minimum time that the DDR3 SDRAM must remain in Self-Refresh mode is tCKE. The user may change the external clock frequency or halt the external clock tCKSRE after Self-Refresh entry is registered, however, the clock must be restarted and stable tCKSRX before the device can exit Self-Refresh operation.

The procedure for exiting Self-Refresh requires a sequence of events. First, the clock must be stable prior to CKE going back HIGH. Once a Self-Refresh Exit command (SRX, combination of CKE going high and either NOP or Deselect on command bus) is registered, a delay of at least tXS must be satisfied before a valid command not requiring a locked DLL can be issued to the device to allow for any internal refresh in progress. Before a command which requires a locked DLL can be applied, a delay of at least tXSDLL and applicable ZQCAL function requirements (TBD) must be satisfied.

CKE must remain HIGH for the entire Self-Refresh exit period tXSDLL for proper operation except for Self-Refresh re-entry. Upon exit from Self-Refresh, the DDR3 SDRAM can be put back into Self-Refresh mode after waiting at least tXS period and issuing one refresh command (refresh period of tRFC). NOP or deselct commands must be registered on each positive clock edge during the Self-Refresh exit interval tXS. ODT must be turned off during tXSDLL.

The use of Self-Refresh mode introduces the possibility that an internally timed refresh event can be missed when CKE is raised for exit from Self-Refresh mode. Upon exit from Self-Refresh, the DDR3 SDRAM requires a minimum of one extra refresh command before it is put back into Self-Refresh Mode.

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.15 Self-Refresh Operation (cont'd)

Figure 52 — Self-Refresh Entry/Exit Timing

4 DDR3 SDRAM Command Description and Operation (cont'd)

4.16 Power-Down Modes

4.16.1 Power-Down Entry and Exit

Power-down is synchronously entered when CKE is registered low (along with NOP or Deselect command). CKE is not allowed to go low while mode register set command, MPR operations, ZQCAL operations, DLL locking or read / write operation are in progress. CKE is allowed to go low while any of other operations such as row activation, precharge or auto-precharge and refresh are in progress, but power-down IDD spec will not be applied until finishing those operations. Timing diagrams are shown in Figures 53 through Figures 66 with details for entry and exit of Power-Down.

The DLL should be in a locked state when power-down is entered for fastest power-down exit timing. If the DLL is not locked during power-down entry, the DLL must be reset after exiting power-down mode for proper read operation and synchronous ODT operation. DRAM design provides all AC and DC timing and voltage specification as well proper DLL operation with any CKE intensive operations as long as DRAM controller complies with DRAM specifications.

During Power-Down, if all banks are closed after any in progress commands are completed, the device will be in precharge Power-Down mode; if any bank is open after in progress commands are completed, the device will be in active Power-Down mode.

Entering power-down deactivates the input and output buffers, excluding CK, CK#, ODT, CKE and RESET#. To protect DRAM internal delay on CKE line to block the input signals, multiple NOP or Deselect commands are needed during the CKE switch off and cycle(s) after, this timing period are defined as tCPDED. CKE_low will result in deactivation of command and address receivers after tCPDED has expired.

Table 14 — Power-Down Entry Definitions

Status of DRAM	MRS bit A12	DLL	PD Exit	Relevant Parameters
Active (A bank or more Open)	Don't Care	On	Fast	tXP to any valid command
Pre Charged (All banks Precharged)	0	Off	Slow	tXP to any valid command. Since it is in precharge state, commands here will be ACT, AR, MRS/EMRS, PR or PRA tXPDLL to commands who need DLL to operate, such as RD, RDA or ODT control line.
Pre Charged (All Banks Precharged)	1	On	Fast	tXP to any valid command

Also, the DLL is disabled upon entering precharge power-down (Slow Exit Mode), but the DLL is kept enabled during precharge power-down (Fast Exit Mode) or active power-down. In power-down mode, CKE low, RESET# high and a stable clock signal must be maintained at the inputs of the DDR3 SDRAM, and ODT should be in a valid state but all other input signals are “Don’t Care” (If RESET# goes low during Power-Down, the DRAM will be out of PD mode and into reset state.) CKE low must be maintained until tCKE has been satisfied. Power-down duration is limited by 9 times tREFI of the device.

The power-down state is synchronously exited when CKE is registered high (along with a NOP or Deselect command). CKE high must be maintained until tCKE has been satisfied. A valid, executable command can be applied with power-down exit latency, tXP and/or tXPDLL after CKE goes high. Power-down exit latency is defined at AC spec table of this data sheet.

4.16 Power-Down Modes (cont'd)

4.16.1 Power-Down Entry and Exit (cont'd)

Active Power Down Entry and Exit timing diagram example is shown below. Note, all existing Power Down “entry to exit” timing diagrams using t_{CKE} will be updated to t_{PD} and use the values listed in the above table (including Precharge Power Down drawings). Note, this ballot does not affect the “exit to entry/re-entry” condition which still uses t_{CKE} (shown between states T_n and T_x).

5 On-Die Termination (ODT)

ODT (On-Die Termination) is a feature of the DDR3 SDRAM that allows the DRAM to turn on/off termination resistance for each DQ, DQS, DQS# and DM for x4 and x8 configuration (and *TDQS*, *TDQS#* for X8 configuration, when enabled via *A11=1* in *MR1*) via the ODT control pin. For x16 configuration, ODT is applied to each DQU, DQL, DQSU, DQSU#, DQSL, DQSL#, DMU and DML signal via the ODT control pin. The ODT feature is designed to improve signal integrity of the memory channel by allowing the DRAM controller to independently turn on/off termination resistance for any or all DRAM devices. More details about ODT control modes and ODT timing modes can be found further down in this document:

- The ODT control modes are described in 5.1.
- The ODT synchronous mode is described in 5.2
- The dynamic ODT feature is described in 5.3
- The ODT asynchronous mode is described in 5.4
- The transitions between ODT synchronous and asynchronous are described in 5.4.1 through 5.4.4

The ODT feature is turned off and not supported in Self-Refresh mode.

A simple functional representation of the DRAM ODT feature is shown in Figures 67.

Figure 67 — Functional Representation of ODT

The switch is enabled by the internal ODT control logic, which uses the external ODT pin and other control information, see below. The value of *RTT* is determined by the settings of Mode Register bits (see Figure on page 22). The ODT pin will be ignored if the Mode Register *MR1* is programmed to disable ODT and in self-refresh mode.

5.1 ODT Mode Register and ODT Truth Table

The ODT Mode is enabled if either of *MR1* bits *A2* or *A6* or *A9* are non zero. In this case, the value of *RTT* is determined by the settings of those bits (see Figure on page 22).

Application: Controller sends *WR* command together with ODT asserted.

- One possible application: The rank that is being written to provides termination.
- DRAM turns ON termination if it sees ODT asserted (except ODT is disabled by *MR*).
- DRAM does not use any write or read command decode information.
- The Termination Truth Table is shown in Table 16.

Table 16 — Termination Truth Table

ODT pin	DRAM Termination State
0	OFF
1	ON, (OFF, if disabled by <i>MR1</i> bits <i>A2</i> , <i>A6</i> and <i>A9</i> in general)

5. On-Die Termination (ODT) (cont'd)

5.2 Synchronous ODT Mode

Synchronous ODT mode is selected whenever the DLL is turned on and locked. Based on the power-down definition, these modes are:

- Any bank active with CKE high
- Refresh with CKE high
- Idle mode with CKE high
- Active power down mode (regardless of MR0 bit A12)
- Precharge power down mode if DLL is enabled during precharge power down by MR0 bit A12.

The direct ODT feature is not supported during DLL-off mode. The on-die termination resistors must be disabled by continuously registering the ODT pin low and/or by programming the RTT_Nom bits MR1{A9,A6,A2} to {0,0,0} via a mode register set command during DLL-off mode.

In synchronous ODT mode, RTT will be turned on ODTLon clock cycles after ODT is sampled high by a rising clock edge and turned off ODTLoff clock cycles after ODT is registered low by a rising clock edge. The ODT latency is tied to the write latency (WL) by: $ODTLon = WL - 2$; $ODTLoff = WL - 2$.

5.2.1 ODT Latency and Posted ODT

In Synchronous ODT Mode, the Additive Latency (AL) programmed into the Mode Register (MR1) also applies to the ODT signal. The DRAM internal ODT signal is delayed for a number of clock cycles defined by the Additive Latency (AL) relative to the external ODT signal. $ODTLon = CWL + AL - 2$; $ODTLoff = CWL + AL - 2$. For details, refer to DDR3 SDRAM latency definitions.

Table 17 — ODT Latency

Symbol	Parameter	DDR3-800	DDR3-1066	DDR3-1333	DDR3-1600	Unit
ODTLon	ODT turn on Latency	WL - 2 = CWL + AL - 2				t _{CK}
ODTLoff	ODT turn off Latency	WL - 2 = CWL + AL - 2				

5.2.2 Timing Parameters

In synchronous ODT mode, the following timing parameters apply (see also Figures 68):

ODTLon, ODTLoff, $t_{AON,min,max}$, $t_{AOF,min,max}$.

Minimum RTT turn-on time (t_{AONmin}) is the point in time when the device leaves high impedance and ODT resistance begins to turn on. Maximum RTT turn on time (t_{AONmax}) is the point in time when the ODT resistance is fully on. Both are measured from ODTLon.

Minimum RTT turn-off time (t_{AOFmin}) is the point in time when the device starts to turn off the ODT resistance. Maximum RTT turn off time (t_{AOFmax}) is the point in time when the on-die termination has reached high impedance. Both are measured from ODTLoff.

When ODT is asserted, it must remain high until ODTH4 is satisfied. If a Write command is registered by the SDRAM with ODT high, then ODT must remain high until ODTH4 (BL = 4) or ODTH8 (BL = 8) after the Write command (see Figure 69). ODTH4 and ODTH8 are measured from ODT registered high to ODT registered low or from the registration of a Write command until ODT is registered low.

5.2 Synchronous ODT Mode (cont'd)

5.2.2 Timing Parameters (cont'd)

Figure 68 — Synchronous ODT Timing Example for $AL = 3$; $CWL = 5$;
 $ODT_{Lon} = AL + CWL - 2 = 6.0$; $ODT_{Loff} = AL + CWL - 2 = 6$

Figure 69 — Synchronous ODT example with $BL = 4$, $WL = 7$.

5.2 Synchronous ODT Mode (cont'd)

5.2.2 Timing Parameters (cont'd)

ODT must be held high for at least ODT_{H4} after assertion (T1); ODT must be kept high ODT_{H4} (BL = 4) or ODT_{H8} (BL = 8) after Write command (T7). ODT_H is measured from ODT first registered high to ODT first registered low, or from registration of Write command with ODT high to ODT registered low. Note that although ODT_{H4} is satisfied from ODT registered high at T6 ODT must not go low before T11 as ODT_{H4} must also be satisfied from the registration of the Write command at T7.

5.2.3 ODT during Reads:

As the DDR3 SDRAM can not terminate and drive at the same time, RTT must be disabled at least half a clock cycle before the read preamble by driving the ODT pin low appropriately. RTT may nominally not be enabled until one clock cycle after the end of the post-amble as shown in the example in Figure 70. Note that ODT may be disabled earlier before the Read and enabled later after the Read than shown in this example in Figure 70.

Figure 70 — ODT must be disabled externally during Reads by driving ODT low. (example: CL = 6; AL = CL - 1 = 5; RL = AL + CL = 11; CWL = 5; ODTLon = CWL + AL - 2 = 8; ODTLoff = CWL + AL - 2 = 8)

5 On-Die Termination (ODT) (cont'd)

5.3 Dynamic ODT

In certain application cases and to further enhance signal integrity on the data bus, it is desirable that the termination strength of the DDR3 SDRAM can be changed without issuing an MRS command. This requirement is supported by the “Dynamic ODT” feature as described as follows:

5.3.1 Functional Description:

The Dynamic ODT Mode is enabled if bit (A9) or (A10) of MR2 is set to '1'. The function is described as follows:

- Two RTT values are available: RTT_Nom and RTT_WR.
 - The value for RTT_Nom is preselected via bits A[9,6,2] in MR1.
 - The value for RTT_WR is preselected via bits A[10,9] in MR2.
- During operation without write commands, the termination is controlled as follows:
 - Nominal termination strength RTT_Nom is selected.
 - Termination on/off timing is controlled via ODT pin and latencies ODTLon and ODTLoff.
- When a write command (WR, WRA, WRS4, WRS8, WRAS4, WRAS8) is registered, and if Dynamic ODT is enabled, the termination is controlled as follows:
 - A latency ODTLcnw after the write command, termination strength RTT_WR is selected.
 - A latency ODTLcwn8 (for BL8, fixed by MRS or selected OTF) or ODTLcwn4 (for BC4, fixed by MRS or selected OTF) after the write command, termination strength RTT_Nom is selected.
 - Termination on/off timing is controlled via ODT pin and ODTLon, ODTLoff.

Table 18 shows latencies and timing parameters which are relevant for the on-die termination control in Dynamic ODT mode.

The dynamic ODT feature is not supported at DLL-off mode. User must use MRS command to set Rtt_WR, MR2{A10, A9}={0,0}, to disable Dynamic ODT externally.

When ODT is asserted, it must remain high until ODTL4 is satisfied. If a Write command is registered by the SDRAM with ODT high, then ODT must remain high until ODTL4 (BL = 4) or ODTL8 (BL = 8) after the Write command (see Figure 69). ODTL4 and ODTL8 are measured from ODT registered high to ODT registered low or from the registration of a Write command until ODT is registered low.

Table 18 — Latencies and timing parameters relevant for Dynamic ODT

Name and Description	Abbr.	Defined from	Defined to	Definition for all DDR3 speed bins	Unit
ODT turn-on Latency	ODTLon	registering external ODT signal high	turning termination on	ODTLon = WL – 2	t_{CK}
ODT turn-off Latency	ODTLoff	registering external ODT signal low	turning termination off	ODTLoff = WL – 2	t_{CK}
ODT Latency for changing from RTT_Nom to RTT_WR	ODTLcnw	registering external write command	change RTT strength from RTT_Nom to RTT_WR	ODTLcnw = WL – 2	t_{CK}
ODT Latency for change from RTT_WR to RTT_Nom (BL = 4)	ODTLcwn4	registering external write command	change RTT strength from RTT_WR to RTT_Nom	ODTLcwn4 = 4 + ODTLoff	t_{CK}
ODT Latency for change from RTT_WR to RTT_Nom (BL = 8)	ODTLcwn8	registering external write command	change RTT strength from RTT_WR to RTT_Nom	ODTLcwn8 = 6 + ODTLoff	$t_{CK(avg)}$

5.3 Dynamic ODT (cont'd)**5.3.1 Functional Description (cont'd)****Table 18 — Latencies and timing parameters relevant for Dynamic ODT**

Name and Description	Abbr.	Defined from	Defined to	Definition for all DDR3 speed bins	Unit
minimum ODT high time after ODT assertion	ODTH4	registering ODT high	ODT registered low	ODTH4 = 4	tCK(avg)
minimum ODT high time after Write (BL = 4)	ODTH4	registering Write with ODT high	ODT registered low	ODTH4 = 4	tCK(avg)
minimum ODT high time after Write (BL = 8)	ODTH8	registering Write with ODT high	ODT registered low	ODTH8 = 6	tCK(avg)
RTT change skew	t _{ADC}	ODTLcnw ODTLcwn	RTT valid	t _{ADC(min)} = 0.3 * tCK(avg) t _{ADC(max)} = 0.7 * tCK(avg)	tCK(avg)

Note: tAOF,nom and tADC,nom are 0.5 tCK (effectively adding half a clock cycle to ODTLoff, ODTcnw and ODTLcwn)

5 On-Die Termination (ODT) (cont'd)

5.3 Dynamic ODT (cont'd)

5.3.2 ODT Timing Diagrams

The following pages provide exemplary timing diagrams as described in Table 19:

Table 19 — Timing Diagrams for “Dynamic ODT”

Figure and Page	Description
Figure 71 on page 89	Figure 71, Dynamic ODT: Behavior with ODT being asserted before and after the write.
Figure 1 on page 90	Figure 1, Dynamic ODT: Behavior without write command, AL = 0, CWL = 5.
Figure 72 on page 90	Figure 72, Dynamic ODT: Behavior with ODT pin being asserted together with write command for a duration of 6 clock cycles.
Figure 73 on page 91	Figure 73, Dynamic ODT: Behavior with ODT pin being asserted together with write command for a duration of 6 clock cycles, example for BC4 (via MRS or OTF), AL = 0, CWL = 5.
Figure 74 on page 91	Figure 74, Dynamic ODT: Behavior with ODT pin being asserted together with write command for a duration of 4 clock cycles.

Figure 71 — Dynamic ODT: Behavior with ODT being asserted before and after the write

Note: Example for BC4 (via MRS or OTF), AL = 0, CWL = 5. ODT_{H4} applies to first registering ODT high and to the registration of the Write command. In this example, ODT_{H4} would be satisfied if ODT went low at T8 (4 clocks after the Write command).

5.3 Dynamic ODT (cont'd)

5.3.2 ODT Timing Diagrams (cont'd)

Figure 1 — Dynamic ODT: Behavior without write command, AL = 0, CWL = 5

Note: ODT_{H4} is defined from ODT registered high to ODT registered low, so in this example, ODT_{H4} is satisfied; ODT registered low at T5 would also be legal.

Figure 72 — Dynamic ODT: Behavior with ODT pin being asserted together with write command for a duration of 6 clock cycles

Note: Example for BL8 (via MRS or OTF), AL = 0, CWL = 5. In this example, ODT_{H8} = 6 is exactly satisfied.

5.3.2 ODT Timing Diagrams (cont'd)

Figure 73 — Dynamic ODT: Behavior with ODT pin being asserted together with write command for a duration of 6 clock cycles, example for BC4 (via MRS or OTF), AL = 0, CWL = 5.

Note: ODT_{H4} is defined from ODT registered high to ODT registered low, so in this example, ODT_{H4} is satisfied; ODT registered low at T5 would also be legal.

Figure 74 — Dynamic ODT: Behavior with ODT pin being asserted together with write command for a duration of 4 clock cycles

Note: Example for BC4 (via MRS or OTF), $AL = 0$, $CWL = 5$. In this example, $ODTH4 = 4$ is exactly satisfied.

5 On-Die Termination (ODT) (cont'd)

5.4 Asynchronous ODT Mode

Asynchronous ODT mode is selected when DRAM runs in DLLon mode, but DLL is temporarily disabled (i.e. frozen) in precharge power-down (by MR0 bit A12). Based on the power down mode definitions, this is currently (comment: update editorially after everything is set and done...): Precharge power down mode if DLL is disabled during precharge power down by MR0 bit A12.

In asynchronous ODT timing mode, internal ODT command is NOT delayed by Additive Latency (AL) relative to the external ODT command.

In asynchronous ODT mode, the following timing parameters apply (see Figure 75): $t_{AONPD,min,max}$, $t_{AOFPD,min,max}$. Minimum RTT turn-on time ($t_{AONPD,min}$) is the point in time when the device termination circuit leaves high impedance state and ODT resistance begins to turn on. Maximum RTT turn on time ($t_{AONPD,max}$) is the point in time when the ODT resistance is fully on.

$t_{AONPD,min}$ and $t_{AONPD,max}$ are measured from ODT being sampled high.

Minimum RTT turn-off time ($t_{AOFPD,min}$) is the point in time when the devices termination circuit starts to turn off the ODT resistance. Maximum ODT turn off time ($t_{AOFPD,max}$) is the point in time when the on-die termination has reached high impedance. $t_{AOFPD,min}$ and $t_{AOFPD,max}$ are measured from ODT being sampled low.

Figure 75 — Asynchronous ODT Timings on DDR3 SDRAM with fast ODT transition: AL is ignored

In Precharge Power Down, ODT receiver remains active, however no Read or Write command can be issued, as the respective ADD/CMD receivers may be disabled.

Table 20 — Asynchronous ODT Timing Parameters for all Speed Bins

Symbol	Description	min	max	Unit
t_{AONPD}	Asynchronous RTT turn-on delay (Power-Down with DLL frozen)	1	9	ns
t_{AOFPD}	Asynchronous RTT turn-off delay (Power-Down with DLL frozen)	1	9	ns

5. On-Die Termination (ODT) (cont'd)

5.4 Asynchronous ODT Mode (cont'd)

5.4.1 Synchronous to Asynchronous ODT Mode Transitions

Table 21 — ODT timing parameters for Power Down (with DLL frozen) entry and exit transition period

Description	min	max
ODT to RTT turn-on delay	$\min\{ \text{ODTLon} * t_{\text{CK}} + t_{\text{AONmin}}; t_{\text{AONPDmin}} \}$	$\max\{ \text{ODTLon} * t_{\text{CK}} + t_{\text{AONmax}}; t_{\text{AONPDmax}} \}$
	$\min\{ (\text{WL} - 2) * t_{\text{CK}} + t_{\text{AONmin}}; t_{\text{AONPDmin}} \}$	$\max\{ (\text{WL} - 2) * t_{\text{CK}} + t_{\text{AONmax}}; t_{\text{AONPDmax}} \}$
ODT to RTT turn-off delay	$\min\{ \text{ODTLo}ff * t_{\text{CK}} + t_{\text{AOFmin}}; t_{\text{AOFDPDmin}} \}$	$\max\{ \text{ODTLo}ff * t_{\text{CK}} + t_{\text{AOFmax}}; t_{\text{AOFDPDmax}} \}$
	$\min\{ (\text{WL} - 2) * t_{\text{CK}} + t_{\text{AOFmin}}; t_{\text{AOFDPDmin}} \}$	$\max\{ (\text{WL} - 2) * t_{\text{CK}} + t_{\text{AOFmax}}; t_{\text{AOFDPDmax}} \}$
tANPD	WL -1	

5.4.2 Synchronous to Asynchronous ODT Mode Transition during Power-Down Entry

If DLL is selected to be frozen in Precharge Power Down Mode by the setting of bit A12 in MR0 to “0”, there is a transition period around power down entry, where the DDR3 SDRAM may show either synchronous or asynchronous ODT behavior.

This transition period ends when CKE is first registered low and starts tANPD before that. If there is a Refresh command in progress while CKE goes low, then the transition period ends tRFC after the Refresh command. tANPD is equal to (WL -1) and is counted (backwards) from the clock cycle where CKE is first registered low.

ODT assertion during the transition period may result in an RTT change as early as the smaller of tAONPDmin and (ODTLon*tCK + tAONmin) and as late as the larger of tAONPDmax and (ODTLon*tCK + tAONmax). ODT de-assertion during the transition period may result in an RTT change as early as the smaller of tAOFDPDmin and (ODTLo}ff*tCK + tAOFmin) and as late as the larger of tAOFDPDmax and (ODTLo}ff*tCK + tAOFmax). See Figure 21 and Figure 76. Note that, if AL has a large value, the range where RTT is uncertain becomes quite large. Figure 76 shows the three different cases: ODT_A, synchronous behavior before tANPD; ODT_B has a state change during the transition period; ODT_C shows a state change after the transition period.

5.4 Asynchronous ODT Mode (cont'd)

5.4.2 Synchronous to Asynchronous ODT Mode Transition during Power-Down Entry (cont'd)

Figure 76 — Synchronous to asynchronous transition during Precharge Power Down (with DLL frozen) entry (AL = 0; CWL = 5; tANPD = WL - 1 = 4)

5.4.3 Asynchronous to Synchronous ODT Mode Transition during Power-Down Exit

If DLL is selected to be frozen in Precharge Power Down Mode by the setting of bit A12 in MR0 to “0”, there is also a transition period around power down exit, where either synchronous or asynchronous response to a change in ODT must be expected from the DDR3 SDRAM.

This transition period starts tANPD before CKE is first registered high, and ends tXPDLL after CKE is first registered high. tANPD is equal to (WL - 1) and is counted (backwards) from the clock cycle where CKE is first registered high.

ODT assertion during the transition period may result in an RTT change as early as the smaller of t_{AONPDmin} and $(\text{ODTLon} * t_{\text{CK}} + t_{\text{AONmin}})$ and as late as the larger of t_{AONPDmax} and $(\text{ODTLon} * t_{\text{CK}} + t_{\text{AONmax}})$. ODT de-assertion during the transition period may result in an RTT change as early as the smaller of t_{AOFPDmin} and $(\text{ODTLoff} * t_{\text{CK}} + t_{\text{AOFmin}})$ and as late as the larger of t_{AOFPDmax} and $(\text{ODTLoff} * t_{\text{CK}} + t_{\text{AOFmax}})$. See Table 21.

Note that, if AL has a large value, the range where RTT is uncertain becomes quite large. Figure 77 shows the three different cases: ODT_C, asynchronous response before t_{ANPD} ; ODT_B has a state change of ODT during the transition period; ODT_A shows a state change of ODT after the transition period with synchronous response.

5.4 Asynchronous ODT Mode (cont'd)

5.4.3 Asynchronous to Synchronous ODT Mode Transition during Power-Down Exit (cont'd)

Figure 77 — Asynchronous to synchronous transition during Precharge Power Down (with DLL frozen) exit (CL = 6; AL = CL - 1; CWL = 5; tANPD = WL - 1 = 9)

5 On-Die Termination (ODT) (cont'd)

5.4 Asynchronous ODT Mode (cont'd)

5.4.4 Asynchronous to Synchronous ODT Mode during short CKE high and short CKE low periods

If the total time in Precharge Power Down state or Idle state is very short, the transition periods for PD entry and PD exit may overlap (see Figure 78). In this case, the response of the DDR3 SDRAMs RTT to a change in ODT state at the input may be synchronous OR asynchronous from the start of the PD entry transition period to the end of the PD exit transition period (even if the entry period ends later than the exit period).

If the total time in Idle state is very short, the transition periods for PD exit and PD entry may overlap. In this case the response of the DDR3 SDRAMs RTT to a change in ODT state at the input may be synchronous OR asynchronous from the start of the PD exit transition period to the end of the PD entry transition period. Note that in the bottom part of Figure 78 it is assumed that there was no Refresh command in progress when Idle state was entered.

Figure 78 — Transition period for short CKE cycles with entry and exit period overlapping (AL = 0, WL = 5, tANPD = WL - 1 = 4)

5 On-Die Termination (ODT) (cont'd)

5.5 ZQ Calibration Commands

5.5.1 ZQ Calibration Description

ZQ Calibration command is used to calibrate DRAM Ron & ODT values over PVT. DDR3 SDRAM needs longer time to calibrate Ron & ODT at initialization and relatively smaller time to perform periodic calibrations.

ZQCL command is used to perform the initial calibration during power-up initialization sequence. This command may be issued at any time by the controller depending on the system environment. ZQCL command triggers the calibration engine inside the DRAM and once calibration is achieved the calibrated values are transferred from calibration engine to DRAM IO which gets reflected as updated Ron and ODT values.

The first ZQCL command issued after reset is allowed a timing period of t_{ZQinit} to perform the full calibration and the transfer of values. All other ZQCL commands except the first ZQCL command issued after RESET is allowed a timing period of t_{ZQoper} .

ZQCS command is used to perform periodic calibrations to account for VT variations. A shorter timing window is provided to perform the calibration and transfer of values as defined by timing parameter t_{ZQCS} .

No other activities should be performed on the DRAM channel by the controller for the duration of t_{ZQinit} , t_{ZQoper} or t_{ZQCS} . The quiet time on the DRAM channel helps in accurate calibration of Ron and ODT. Once DRAM calibration is achieved, the DRAM should disable ZQ current consumption path to reduce power.

All banks must be precharged and t_{RP} met before ZQCL or ZQCS commands are issued by the controller.

ZQ calibration commands can also be issued in parallel to DLL lock time when coming out of self refresh. Upon Self-Refresh exit, DDR3 SDRAM will not perform an IO calibration without an explicit ZQ calibration command. The earliest possible time for ZQ Calibration command (short or long) after self refresh exit is t_{XS} .

In dual rank systems that share the ZQ resistor between devices, the controller must not allow any overlap of t_{ZQoper} or t_{ZQinit} or t_{ZQCS} between ranks.

Table 22 — ZQ Calibration Command Truth Table

Function	CKE		CS#	RAS#	CAS#	WE#	BA2-BA0	A15-A13	A12	A10	A11, A9-A0
	Prev Cycle	Next Cycle									
ZQ Calibration Long (ZQCL)	H	H	L	H	H	L	X	X	X	1	X
ZQ Calibration Short (ZQCS)	H	H	L	H	H	L	X	X	X	0	X

5 On-Die Termination (ODT) (cont'd)

5.5 ZQ Calibration Commands (cont'd)

5.5.2 ZQ Calibration Timing

Notes:

ODT must be disabled via ODT signal or MRS during calibration procedure.

*All devices connected to DQ bus should be High impedance during calibration.

Figure 79 — ZQ Calibration Timing

5.5.3 ZQ External Resistor Value and Tolerance

DDR3 DRAM has a 240 ohm +/-1% tolerance external resistor connecting from the DDR3 SDRAM ZQ pin to ground.

The resistor can be used as single DRAM per resistor or shared between a pair of DRAMs in a dual rank DIMM.

6 Absolute Maximum Ratings

6.1 Absolute Maximum DC Ratings

Table 23 — Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	Notes
VDD	Voltage on VDD pin relative to Vss	-0.4 V ~ 1.975 V	V	1,3
VDDQ	Voltage on VDDQ pin relative to Vss	-0.4 V ~ 1.975 V	V	1,3
V _{IN} , V _{OUT}	Voltage on any pin relative to Vss	-0.4 V ~ 1.975 V	V	1
T _{STG}	Storage Temperature	-55 to +100	°C	1,2
Notes: 1. Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability 2. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard. 3. VDD and VDDQ must be within 300 mV of each other at all times;and VREF must be not greater than 0.6 x VDDQ, When VDD and VDDQ are less than 500 mV; VREF may be equal to or less than 300 mV				

6 Absolute Maximum Ratings (cont'd)

6.2 DRAM Component Operating Temperature Range

Table 24 — Temperature Range

Symbol	Parameter	Rating	Units	Notes
T _{OPER}	Normal Operating Temperature Range	0 to 85	°C	1, 2
	Extended Temperature Range (Optional)	85 to 95	°C	1, 3

- Notes:
1. Operating Temperature T_{OPER} is the case surface temperature on the center / top side of the DRAM. For measurement conditions, please refer to the JEDEC document JESD51-2.
 2. The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0 - 85 °C under all operating conditions
 3. Some applications require operation of the DRAM in the Extended Temperature Range between 85 °C and 95 °C case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
 - a) Refresh commands must be doubled in frequency, therefore reducing the Refresh interval tREFI to 3.9 μs. It is also possible to specify a component with 1X refresh (tREFI to 7.8μs) in the Extended Temperature Range. Please refer to supplier data sheet and/or the DIMM SPD for option availability.
 - b) If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0_b and MR2 A7 = 1_b) or enable the optional Auto Self-Refresh mode (MR2 A6 = 1_b and MR2 A7 = 0_b). Please refer to the supplier data sheet and/or the DIMM SPD for Auto Self-Refresh option availability, Extended Temperature Range support and tREFI requirements in the Extended Temperature Range.

7 AC & DC Operating Conditions

7.1 Recommended DC Operating Conditions

Table 25 — Recommended DC Operating Conditions

Symbol	Parameter	Rating			Unit	Notes
		Min	Typ	Max		
V_{DD}	Supply Voltage	1.425	1.5	1.575	V	1, 2
V_{DDQ}	Supply Voltage for Output	1.425	1.5	1.575	V	1, 2

Notes: 1. Under all conditions V_{DDQ} must be less than or equal to V_{DD} .
2. V_{DDQ} tracks with V_{DD} . AC parameters are measured with V_{DD} and V_{DDQ} tied together.

This page left blank.

8 AC and DC Input Measurement Levels

8.1 AC and DC Logic Input Levels for Single-Ended Signals

Table 26 — Single Ended AC and DC Input Levels

Symbol	Parameter	DDR3-800, DDR3-1066, DDR3-1333, DDR3-1600		Unit	Notes
		Min	Max		
VIH(DC)	DC input logic high	Vref + 0.100	TBD	V	1
VIL(DC)	DC input logic low	TBD	Vref - 0.100	V	1
VIH(AC)	AC input logic high	Vref + 0.175	-	V	1, 2
VIL(AC)	AC input logic low	-	Vref - 0.175	V	1, 2
V _{RefDQ(DC)}	Reference Voltage for DQ, DM inputs	0.49 * VDD	0.51 * VDD	V	3, 4
V _{RefCA(DC)}	Reference Voltage for ADD, CMD inputs	0.49 * VDD	0.51 * VDD	V	3, 4
VTT	Termination voltage for DQ, DQS outputs	VDDQ/2 - TBD	VDDQ/2 + TBD		

- Notes:
1. For DQ and DM, Vref = VrefDQ. For input only pins except RESET#, Vref = VrefCA.
 2. See 9.6 "Overshoot and Undershoot Specifications" on page 113.
 3. The ac peak noise on V_{Ref} may not allow V_{Ref} to deviate from V_{Ref(DC)} by more than +/-1% VDD (for reference: approx. +/- 15 mV).
 4. For reference: approx. VDD/2 +/- 15 mV.

The dc-tolerance limits and ac-noise limits for the reference voltages V_{RefCA} and V_{RefDQ} are illustrated in Figure 80. It shows a valid reference voltage V_{Ref(t)} as a function of time. (V_{Ref} stands for V_{RefCA} and V_{RefDQ} likewise).

V_{Ref(DC)} is the linear average of V_{Ref(t)} over a very long period of time (e.g. 1 sec). This average has to meet the min/max requirements in Table 26. Furthermore V_{Ref(t)} may temporarily deviate from V_{Ref(DC)} by no more than +/- 1% VDD.

8 AC and DC Input Measurement Levels (cont'd)

8.1 AC and DC Logic Input Levels for Single-Ended Signals (cont'd)

:

Figure 80 — Illustration of $V_{\text{Ref(DC)}}$ tolerance and V_{Ref} ac-noise limits

The voltage levels for setup and hold time measurements $V_{\text{IH(AC)}}$, $V_{\text{IH(DC)}}$, $V_{\text{IL(AC)}}$ and $V_{\text{IL(DC)}}$ are dependent on V_{Ref} .

“ V_{Ref} ” shall be understood as $V_{\text{Ref(DC)}}$, as defined in Figure 80.

This clarifies, that dc-variations of V_{Ref} affect the absolute voltage a signal has to reach to achieve a valid high or low level and therefore the time to which setup and hold is measured. System timing and voltage budgets need to account for $V_{\text{Ref(DC)}}$ deviations from the optimum position within the data-eye of the input signals.

This also clarifies that the DRAM setup/hold specification and derating values need to include time and voltage associated with V_{Ref} ac-noise. Timing and voltage effects due to ac-noise on V_{Ref} up to the specified limit ($\pm 1\%$ of VDD) are included in DRAM timings and their associated deratings.

8 AC and DC Input Measurement Levels (cont'd)

8.2 AC and DC Logic Input Levels for Differential Signals

Table 27 — Differential AC and DC Input Levels

Symbol	Parameter	DDR3-800, DDR3-1066 DDR3-1333, DDR3-1600		Unit	Notes
		Min	Max		
V_{IHdiff}	Differential input logic high	+ 0.200	-	V	1
V_{ILdiff}	Differential input logic low	-	- 0.200	V	1

Notes: 1. Refer to "Overshoot and Undershoot Specifications" on page 113

8.3 Differential Input Cross Point Voltage

To guarantee tight setup and hold times as well as output skew parameters with respect to clock and strobe, each cross point voltage of differential input signals (CK, CK# and DQS, DQS#) must meet the requirements in Table 28. The differential input cross point voltage V_{IX} is measured from the actual cross point of true and complement signal to the midlevel between of VDD and VSS.

Figure 81 — Vix Definition

Table 28 — Cross point voltage for differential input signals (CK, DQS)

Symbol	Parameter	DDR3-800, DDR3-1066, DDR3-1333, DDR3-1600		Unit	Notes
		Min	Max		
V_{IX}	Differential Input Cross Point Voltage relative to VDD/2	- 150	150	mV	

8 AC and DC Input Measurement Levels (cont'd)

8.4 Slew Rate Definitions for Single Ended Input Signals

8.4.1 Input Slew Rate for Input Setup Time (tIS) and Data Setup Time (tDS)

Setup (tIS and tDS) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of VRef and the first crossing of VIH(AC)min. Setup (tIS and tDS) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of VRef and the first crossing of VIL(AC)max.

8.4.2 Input Slew Rate for Input Hold Time (tIH) and Data Hold Time (tDH)

Hold nominal slew rate for a rising signal is defined as the slew rate between the last crossing of VIL(DC)max and the first crossing of VRef. Hold (tIH and tDH) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of VIH(DC)min and the first crossing of VRef.

Table 29 — Single-ended Input Slew Rate Definition

Description	Measured		Defined by	Applicable for
	from	to		
Input slew rate for rising edge	V _{Ref}	V _{IH(AC)min}	$\frac{V_{IH(AC)min} - V_{Ref}}{\Delta t_{TRS}}$	Setup (t _{IS} , t _{DS})
Input slew rate for falling edge	V _{Ref}	V _{IL(AC)max}	$\frac{V_{Ref} - V_{IL(AC)max}}{\Delta t_{TFS}}$	
Input slew rate for rising edge	V _{IL(DC)max}	V _{Ref}	$\frac{V_{Ref} - V_{IL(DC)max}}{\Delta t_{TFH}}$	Hold (t _{IH} , t _{DH})
Input slew rate for falling edge	V _{IH(DC)min}	V _{Ref}	$\frac{V_{IH(DC)min} - V_{Ref}}{\Delta t_{TRH}}$	

This nominal slew rate applies for linear signal waveforms.

Figure 82 — Input Nominal Slew Rate Definition for Single-Ended Signals

8 AC and DC Input Measurement Levels (cont'd)

8.5 Slew Rate Definitions for Differential Input Signals

Input slew rate for differential signals (CK, CK# and DQS, DQS#) are defined and measured as shown in Table 30 and Figure 83.

Table 30 — Differential Input Slew Rate Definition

Description	Measured		Defined by
	from	to	
Differential input slew rate for rising edge (CK - CK# and DQS - DQS#).	$V_{ILdiffmax}$	$V_{IHdiffmin}$	$\frac{V_{IHdiffmin} - V_{ILdiffmax}}{\Delta TR_{diff}}$
Differential input slew rate for falling edge (CK - CK# and DQS - DQS#).	$V_{IHdiffmin}$	$V_{ILdiffmax}$	$\frac{V_{IHdiffmin} - V_{ILdiffmax}}{\Delta TF_{diff}}$
Note: The differential signal (i.e. CK - CK# and DQS - DQS#) must be linear between these thresholds.			

Figure 83 — Differential Input Slew Rate Definition for DQS, DQS# and CK, CK#

This page left blank.

9 AC and DC Output Measurement Levels

9.1 Single Ended AC and DC Output Levels

Table 31 shows the output levels used for measurements of single ended signals.

Table 31 — Single-ended AC and DC Output Levels

Symbol	Parameter	DDR3-800, 1066, 1333, and 1600	Unit	Notes
$V_{OH(DC)}$	DC output high measurement level (for IV curve linearity)	$0.8 \times V_{DDQ}$	V	
$V_{OM(DC)}$	DC output mid measurement level (for IV curve linearity)	$0.5 \times V_{DDQ}$	V	
$V_{OL(DC)}$	DC output low measurement level (for IV curve linearity)	$0.2 \times V_{DDQ}$	V	
$V_{OH(AC)}$	AC output high measurement level (for output SR)	$V_{TT} + 0.1 \times V_{DDQ}$	V	1
$V_{OL(AC)}$	AC output low measurement level (for output SR)	$V_{TT} - 0.1 \times V_{DDQ}$	V	1
Notes: 1. The swing of $\pm 0.1 \times V_{DDQ}$ is based on approximately 50% of the static single-ended output high or low swing with a driver impedance of 40Ω and an effective test load of 25Ω to $V_{TT} = V_{DDQ}/2$.				

9.2 Differential AC and DC Output Levels

Table 32 shows the output levels used for measurements of differential signals.

Table 32 — Differential AC and DC Output Levels

Symbol	Parameter	DDR3-800, 1066, 1333, and 1600	Unit	Notes
$V_{OHdiff(AC)}$	AC differential output high measurement level (for output SR)	$+ 0.2 \times V_{DDQ}$	V	1
$V_{OLdiff(AC)}$	AC differential output low measurement level (for output SR)	$- 0.2 \times V_{DDQ}$	V	1
Notes: 1. The swing of $\pm 0.2 \times V_{DDQ}$ is based on approximately 50% of the static single-ended output high or low swing with a driver impedance of 40Ω and an effective test load of 25Ω to $V_{TT} = V_{DDQ}/2$ at each of the differential outputs.				

9 AC and DC Output Measurement Levels (cont'd)

9.3 Single Ended Output Slew Rate

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between $V_{OL(AC)}$ and $V_{OH(AC)}$ for single ended signals as shown in Table 33 and Figure 84.

Table 33 — Single-ended Output Slew Rate Definition

Description	Measured		Defined by
	from	to	
Single-ended output slew rate for rising edge	$V_{OL(AC)}$	$V_{OH(AC)}$	$V_{OH(AC)} - V_{OL(AC)}$ DeltaTRse
Single-ended output slew rate for falling edge	$V_{OH(AC)}$	$V_{OL(AC)}$	$V_{OH(AC)} - V_{OL(AC)}$ DeltaTFse
Note: Output slew rate is verified by design and characterization, and may not be subject to production test.			

Figure 84 — Single Ended Output Slew Rate Definition

Table 34 — Output Slew Rate (single-ended)

		DDR3-800		DDR3-1066		DDR3-1333		DDR3-1600		Units

9 AC and DC Output Measurement Levels (cont'd)

9.5 Reference Load for AC Timing and Output Slew Rate

Figure 86 represents the effective reference load of 25 ohms used in defining the relevant AC timing parameters of the device as well as output slew rate measurements.

It is not intended as a precise representation of any particular system environment or a depiction of the actual load presented by a production tester. System designers should use IBIS or other simulation tools to correlate the timing reference load to a system environment. Manufacturers correlate to their production test conditions, generally one or more coaxial transmission lines terminated at the tester electronics.

Figure 86 — Reference Load for AC Timing and Output Slew Rate

9 AC and DC Output Measurement Levels (cont'd)

9.6 Overshoot and Undershoot Specifications

9.6.1 Address and Control Overshoot and Undershoot Specifications

Table 37 — AC Overshoot/Undershoot Specification for Address and Control Pins

(A0-A15, BA0-BA3, CS#, RAS#, CAS#, WE#, CKE, ODT)				
	DDR3-800	DDR3-1066	DDR3-1333	DDR3-1600
Maximum peak amplitude allowed for overshoot area (See Figure 1)	0.4V	0.4V	0.4V	0.4V
Maximum peak amplitude allowed for undershoot area (See Figure 1)	0.4V	0.4V	0.4V	0.4V
Maximum overshoot area above VDD (See Figure 1)	0.67 V-ns	0.5 V-ns	0.4 V-ns	0.33 V-ns

Figure 88 — Clock, Data, Strobe and Mask Overshoot and Undershoot Definition

9 AC and DC Output Measurement Levels (cont'd)

9.7 34 ohm Output Driver DC Electrical Characteristics

A functional representation of the output buffer is shown in Figure 89. Output driver impedance R_{ON} is defined by the value of the external reference resistor R_{ZQ} as follows:

$$R_{ON34} = R_{ZQ} / 7 \text{ (nominal } 34.3 \Omega \pm 10\% \text{ with nominal } R_{ZQ} = 240 \Omega)$$

The individual pull-up and pull-down resistors ($R_{ON_{Pu}}$ and $R_{ON_{Pd}}$) are defined as follows:

$$R_{ON_{Pu}} = \frac{V_{DDQ} - V_{Out}}{|I_{Out}|} \quad \text{under the condition that } R_{ON_{Pd}} \text{ is turned off} \quad (1)$$

$$R_{ON_{Pd}} = \frac{V_{Out}}{|I_{Out}|} \quad \text{under the condition that } R_{ON_{Pu}} \text{ is turned off} \quad (2)$$

Figure 89 — Output Driver: Definition of Voltages and Currents

9 AC and DC Output Measurement Levels (cont'd)

9.7 34 ohm Output Driver DC Electrical Characteristics (cont'd)

Table 39 — Output Driver DC Electrical Characteristics, assuming $R_{ZQ} = 240 \Omega$; entire operating temperature range; after proper ZQ calibration

RON_{Nom}	Resistor	V_{Out}	min	nom	max	Unit	Notes
34 Ω	RON_{34Pd}	$V_{OLdc} = 0.2 \times V_{DDQ}$	0.6	1.0	1.1	$R_{ZQ}/7$	1, 2, 3
		$V_{OMdc} = 0.5 \times V_{DDQ}$	0.9	1.0	1.1	$R_{ZQ}/7$	1, 2, 3
		$V_{OHdc} = 0.8 \times V_{DDQ}$	0.9	1.0	1.4	$R_{ZQ}/7$	1, 2, 3
	RON_{34Pu}	$V_{OLdc} = 0.2 \times V_{DDQ}$	0.9	1.0	1.4	$R_{ZQ}/7$	1, 2, 3
		$V_{OMdc} = 0.5 \times V_{DDQ}$	0.9	1.0	1.1	$R_{ZQ}/7$	1, 2, 3
		$V_{OHdc} = 0.8 \times V_{DDQ}$	0.6	1.0	1.1	$R_{ZQ}/7$	1, 2, 3
Mismatch between pull-up and pull-down, MM_{PuPd}		V_{OMdc} $0.5 \times V_{DDQ}$	-10		+10	%	1, 2, 4

- Notes:
1. The tolerance limits are specified after calibration with stable voltage and temperature. For the behavior of the tolerance limits if temperature or voltage changes after calibration, see following section on voltage and temperature sensitivity.
 2. The tolerance limits are specified under the condition that $V_{DDQ} = V_{DD}$ and that $V_{SSQ} = V_{SS}$.
 3. Pull-down and pull-up output driver impedances are recommended to be calibrated at $0.5 \times V_{DDQ}$. Other calibration schemes may be used to achieve the linearity spec shown above, e.g. calibration at $0.2 \times V_{DDQ}$ and $0.8 \times V_{DDQ}$.
 4. Measurement definition for mismatch between pull-up and pull-down, MM_{PuPd} :
Measure RON_{Pu} and RON_{Pd} , both at $0.5 \times V_{DDQ}$:

$$MM_{PuPd} = \frac{RON_{Pu} - RON_{Pd}}{RON_{Nom}} \times 100$$

9 AC and DC Output Measurement Levels (cont'd)

9.7 34 ohm Output Driver DC Electrical Characteristics (cont'd)

9.7.1 Output Driver Temperature and Voltage sensitivity

If temperature and/or voltage change after calibration, the tolerance limits widen according to Table 40 and Table 41.

$\Delta T = T - T(@\text{calibration})$; $\Delta V = V_{DDQ} - V_{DDQ}(@\text{calibration})$; $V_{DD} = V_{DDQ}$

Note: dR_{ONdT} and dR_{ONdV} are not subject to production test but are verified by design and characterization.

Table 40 — Output Driver Sensitivity Definition

	min	max	unit
$R_{ONPU}@ V_{OHdc}$	$0.6 - dR_{ONdTH} * \Delta T - dR_{ONdVH} * \Delta V $	$1.1 + dR_{ONdTH} * \Delta T + dR_{ONdVH} * \Delta V $	RZQ/7
$R_{ON}@ V_{OMdc}$	$0.9 - dR_{ONdTM} * \Delta T - dR_{ONdVM} * \Delta V $	$1.1 + dR_{ONdTM} * \Delta T + dR_{ONdVM} * \Delta V $	RZQ/7
$R_{ONPD}@ V_{OLDc}$	$0.6 - dR_{ONdTL} * \Delta T - dR_{ONdVL} * \Delta V $	$1.1 + dR_{ONdTL} * \Delta T + dR_{ONdVL} * \Delta V $	RZQ/7

Table 41 — Output Driver Voltage and Temperature Sensitivity

	min	max	unit
dR_{ONdTM}	0	1.5	%/°C

dR_{ONdTH}	0	1.5	%/°C
dR_{ONdVH}	0	TBD	%/mV

These parameters may not be subject to production test. They are verified by design and characterization.

9.8 On-Die Termination (ODT) Levels and I-V Characteristics (cont'd)

9.8 On-Die Termination (ODT) Levels and I-V Characteristics

9.8.1 On-Die Termination (ODT) Levels and I-V Characteristics

On-Die Termination effective resistance RTT is defined by bits A9, A6 and A2 of the MR1 Register.

ODT is applied to the DQ, DM, DQS/DQS# and TDQS/TDQS# (x8 devices only) pins.

A functional representation of the on-die termination is shown in Figure 90. The individual pull-up and pull-down resistors (RTT_{Pu} and RTT_{Pd}) are defined as follows:

$$RTT_{Pu} = \frac{V_{DDQ} - V_{Out}}{|I_{Out}|} \text{ under the condition that } RTT_{Pd} \text{ is turned off} \quad (3)$$

$$RTT_{Pd} = \frac{V_{Out}}{|I_{Out}|} \text{ under the condition that } RTT_{Pu} \text{ is turned off} \quad (4)$$

Figure 90 — On-Die Termination: Definition of Voltages and Currents

9 AC and DC Output Measurement Levels (cont'd)

9.8 On-Die Termination (ODT) Levels and I-V Characteristics (cont'd)

9.8.2 ODT DC Electrical Characteristics

Table 42 provides an overview of the ODT DC electrical characteristics. The values for $RTT_{60Pd120}$, $RTT_{60Pu120}$, $RTT_{120Pd240}$, $RTT_{120Pu240}$, RTT_{40Pd80} , RTT_{40Pu80} , RTT_{30Pd60} , RTT_{30Pu60} , RTT_{20Pd40} , RTT_{20Pu40} are not specification requirements, but can be used as design guide lines:

Table 42 — ODT DC Electrical Characteristics, assuming $R_{ZQ} = 240 \Omega \pm 1\%$ entire operating temperature range; after proper ZQ calibration

Deviation of V _M w.r.t. V _{DDQ} /2, DV _M				-5		+5	%	1) 2) 5) 6)

- Notes:
1. The tolerance limits are specified after calibration with stable voltage and temperature. For the behavior of the tolerance limits if temperature or voltage changes after calibration, see following section on voltage and temperature sensitivity.
 2. The tolerance limits are specified under the condition that $V_{DDQ} = V_{DD}$ and that $V_{SSQ} = V_{SS}$.
 3. Pull-down and pull-up ODT resistors are recommended to be calibrated at $0.5 \times V_{DDQ}$. Other calibration schemes may be used to achieve the linearity spec shown above, e.g. calibration at $0.2 \times V_{DDQ}$ and $0.8 \times V_{DDQ}$.
 4. Not a specification requirement, but a design guide line.

9.8 On-Die Termination (ODT) Levels and I-V Characteristics (cont'd)
9.8.2 ODT DC Electrical Characteristics (cont'd)

5. Measurement definition for R_{TT} :

Apply $V_{IH(ac)}$ to pin under test and measure current $I(V_{IH(ac)})$, then apply $V_{IL(ac)}$ to pin under test and measure current $I(V_{IL(ac)})$ respectively.

$$R_{TT} = \frac{V_{IH(ac)} - V_{IL(ac)}}{I(V_{IH(ac)}) - I(V_{IL(ac)})}$$

6. Measurement definition for V_M and ΔV_M :

Measure voltage (V_M) at test pin (midpoint) with no load:

$$\Delta V_M = \left(\frac{2 \cdot V_M}{V_{DDQ}} - 1 \right) \cdot 100$$

9 AC and DC Output Measurement Levels (cont'd)

9.8 On-Die Termination (ODT) Levels and I-V Characteristics (cont'd)

9.8.3 ODT Temperature and Voltage sensitivity

If temperature and/or voltage change after calibration, the tolerance limits widen according to Table 43 and Table 44.

$DT = T - T(@calibration)$; $DV = VDDQ - VDDQ(@calibration)$; $VDD = VDDQ$

Table 43 — ODT Sensitivity Definition

	min	max	unit
RTT	$0.9 - dR_{TT}dT* \Delta T - dR_{TT}dV* \Delta V $	$1.6 + dR_{TT}dT* \Delta T + dR_{TT}dV* \Delta V $	RZQ/ 2,4,6,8,12

Table 44 — ODT Voltage and Temperature Sensitivity

	min	max	unit
$dR_{TT}dT$	0	1.5	%/°C
$dR_{TT}dV$	0	0.15	%/mV

These parameters may not be subject to production test. They are verified by design and characterization

9 AC and DC Output Measurement Levels (cont'd)

9.9 ODT Timing Definitions

9.9.1 Test Load for ODT Timings

Different than for timing measurements, the reference load for ODT timings is defined in Figure 91.

Figure 91 — ODT Timing Reference Load

9.9.2 ODT Timing Definitions

Definitions for t_{AON} , t_{AONPD} , t_{AOF} , t_{AOFPD} and t_{ADC} are provided in Table 45 and subsequent figures. Measurement reference settings are provided in Table 46.

Table 45 — ODT Timing Definitions

Symbol	Begin Point Definition	End Point Definition	Figure
t_{AON}	Rising edge of CK - CK# defined by the end point of ODTLon	Extrapolated point at VSSQ	Figure 92
t_{AONPD}	Rising edge of CK - CK# with ODT being first registered high	Extrapolated point at VSSQ	Figure 93
t_{AOF}	Rising edge of CK - CK# defined by the end point of ODTLoff	End point: Extrapolated point at VRTT_Nom	Figure 94
t_{AOFPD}	Rising edge of CK - CK# with ODT being first registered low	End point: Extrapolated point at VRTT_Nom	Figure 95
t_{ADC}	Rising edge of CK - CK# defined by the end point of ODTLcwn, ODTLcwn4 or ODTLcwn8	End point: Extrapolated point at VRTT_Wr and VRTT_Nom respectively	Figure 96

Table 46 — Reference Settings for ODT Timing Measurements

10 IDD Specification Parameters and Test Conditions

10.1 IDD Measurement Conditions

Within the tables provided further down, an overview about the IDD measurement conditions is provided as follows:

Table 47 — Overview of Tables providing IDD Measurement Conditions and DRAM Behavior

Table number	Measurement Conditions
Table 51 on page 129	IDD0 and IDD1
Table 52 on page 131	IDD2N, IDD2Q, IDD2P(0), IDD2P(1)
Table 53 on page 133	IDD3N and IDD3P
Table 54 on page 134	IDD4R, IDD4W, IDD7
Table 55 on page 136	IDD7 for different Speed Grades and different tRRD, tFAW conditions
Table 56 on page 137	IDD5B
Table 57 on page 137	IDD6, IDD6ET (optional), IDD6TC (optional)

Within the tables about IDD measurement conditions, the following definitions are used:

- LOW is defined as $V_{IN} \leq V_{ILAC(max.)}$; HIGH is defined as $V_{IN} \geq V_{IHAC(min.)}$.
- STABLE is defined as inputs are stable at a HIGH or LOW level.
- FLOATING is defined as inputs are $V_{REF} = V_{DDQ} / 2$.
- SWITCHING is defined as described in Table 48 and Table 49.

Table 48 — Definition of SWITCHING for Address and Command Input Signals

SWITCHING for Address (row, column) and Command Signals ($\overline{CS}$, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$) is defined as:

Address (row, column):	If not otherwise mentioned the inputs are stable at HIGH or LOW during 4 clocks and change then to the opposite value <u> </u> (e.g. Ax Ax Ax Ax <u>Ax</u> <u>Ax</u> <u>Ax</u> <u>Ax</u> Ax Ax Ax Ax please see each ID Dx definition for details
Bank address:	If not otherwise mentioned the bank addresses should be switched like the row/column addresses - please see each ID Dx definition for details
Command ($\overline{CS}$, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$):	Define $\overline{D} = \{\overline{CS}, \overline{RAS}, \overline{CAS}, \overline{WE}\} := \{HIGH, LOW, LOW, LOW\}$ Define $\overline{D} = \{\overline{CS}, \overline{RAS}, \overline{CAS}, \overline{WE}\} := \{HIGH, HIGH, HIGH, HIGH\}$ Define Command Background Pattern = $\overline{D} \overline{D} \overline{D} \overline{D} \overline{D} \overline{D} \overline{D} \overline{D} \overline{D} \overline{D} \dots$ If other commands are necessary (e.g. ACT for IDD0 or Read for IDD4R), the Background Pattern Command is substituted by the respective $\overline{CS}$, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$ levels of the necessary command. See each ID Dx definition for details and Figure 97 through Figure 99 as examples.

10 IDD Specification Parameters and Test Conditions (cont'd)

10.1 IDD Measurement Conditions (cont'd)

Table 49 — Definition of SWITCHING for Data (DQ)

SWITCHING for Data (DQ) is defined as	
Data (DQ)	Data DQ is changing between HIGH and LOW every other data transfer (once per clock) for DQ signals, which means that data DQ is stable during one clock; see each IDDX definition for exceptions from this rule and for further details. See Figure 97 through Figure 99 as examples.
Data Masking (DM)	NO Switching; DM must be driven LOW all the time

Timing parameters are listed in the following table:

Table 50 — For IDD testing the following parameters are utilized.

Parameter Bin	DDR3-800		DDR3-1066			DDR3-1333			DDR3-1600			Unit
	5-5-5	6-6-6	6-6-6	7-7-7	8-8-8	7-7-7	8-8-8	9-9-9	8-8-8	9-9-9	101010

$t_{FAW}(ADD)$	x4/ x8	40	40	37.5	37.5	37.5	30	30	30	30	30	ns
	x16	50	50	50	50	50	45	45	45	40	40	ns
$t_{RRD}(ADD)$	x4/ x8	10	10	7.5	7.5	7.5	6.0	6.0	6.0	6.0	6.0	ns
	x16	10	10	10	10	10	7.5	7.5	7.5	7.5	7.5	ns
$t_{RFC}(ADD) - 512Mb$	90	90	90	90	90	90	90	90	90	90	90	ns
$t_{RFC}(ADD) - 1Gb$	110	110	110	110	110	110	110	110	110	110	110	ns
$t_{RFC}(ADD) - 2Gb$	160	160	160	160	160	160	160	160	160	160	160	ns
$t_{RFC}(ADD) - 4Gb$	tbd	tbd	tbd	tbd	tbd	tbd	tbd	tbd	tbd	tbd	tbd	ns

The following conditions apply:

1. IDD specifications are tested after the device is properly initialized.
2. Input slew rate is specified by AC Parametric test conditions.
3. IDD parameters are specified with ODT and output buffer disabled (MR1 bit A12).

10 IDD Specification Parameters and Test Conditions (cont'd)
10.1 IDD Measurement Conditions (cont'd)

Table 51 — IDD Measurement Conditions for IDD0 and IDD1

ODT / MR1 bits [A6, A2]	disabled / [0,0]	disabled / [0,0]	disabled / [0,0]	disabled / [0,0]
Burst length	n.a.	n.a.	n.a.	n.a.
Active banks	none	none	none	none
Idle banks	all	all	all	all
Precharge Power Down Mode / MR0 bit A12 ^a	n.a.	Fast Exit / 1 (any valid command after t_{XP}^2)	Slow Exit / 0 Slow exit (RD and ODT commands must satisfy $t_{XPDLL-AL}$)	n.a.

NOTE:

1. In DDR3, the MR0 bit A12 defines DLL on/off behavior ONLY for precharge power down. There are two different Precharge Power Down states possible: one with DLL on (fast exit, bit 12 = 1) and one with DLL off (slow exit, bit 12 = 0).
NOTE:

2. Because it is an exit after precharge power down, the valid commands are: Activate, Refresh, Mode-Register Set, Enter - Self Refresh

I_{DD6TC}^1					mA	Refer to Table 60
I_{DD7}					mA	x4/x8
					mA	x16

NOTE:

1.Users should refer to the DRAM supplier data sheet and/or the DIMM SPD to determine if DDR3 SDRAM devices support the following options or requirements referred to in this material.

Table 59 — I_{DD6} Current Definition

Symbol	Parameter/Condition
I_{DD6}	Normal Temperature Range Self-Refresh Current: $CKE \leq 0.2V$; external clock off, CK and CK# at 0V; Other control and address inputs are FLOATING; Data Bus inputs are FLOATING, PASR disabled. Applicable for MR2 settings A6 = 0 and A7 = 0.
I_{DD6ET}	Extended Temperature Range Self-Refresh Current: $CKE \leq 0.2V$; external clock off, CK and CK# at 0V; Other control and address inputs are FLOATING; Data Bus inputs are FLOATING, PASR disabled. Applicable for MR2 settings A6 = 0 and A7 = 1.

10 IDD Specification Parameters and Test Conditions (cont'd)

10.2 IDD Specifications (cont'd)

Table 59 — I_{DD6} Current Definition

Symbol	Parameter/Condition
I_{DD6TC}	Auto Self-Refresh Current: $CKE \leq 0.2V$; external clock off, CK and CK# at 0V; Other control and address inputs are FLOATING; Data Bus inputs are FLOATING, PASR disabled. Applicable when ASR is enabled by MR2 settings A6 = 1 and A7 = 0.

Table 60 — I_{DD6} Specification

Symbol	Temperature Range	Value	Unit	Notes
I_{DD6}	0 - 85 °C		mA	3,4
I_{DD6ET}	0 - 95 °C		mA	5,6
I_{DD6TC}	0 °C ~ T_a		mA	6,7,8
	$T_b \sim T_y$		mA	6,7,8
	$T_z \sim T_{OPERmax}$		mA	6,7,8

1. Some I_{DD} currents are higher for x16 organization due to larger page size architecture.
2. Max. values for I_{DD} currents considering worst case conditions of process, temperature and voltage.
3. Applicable for MR2 settings A6=0 and A7=0.
4. Supplier data sheets include a max value for I_{DD6} .
5. Applicable for MR2 settings A6=0 and A7=1. I_{DD6ET} is only specified for devices which support the Extended Temperature Range feature.
6. Refer to the supplier data sheet for the value specification method (e.g. max, typical) for I_{DD6ET} and I_{DD6TC} .
7. Applicable for MR2 settings A6=1 and A7=0. I_{DD6TC} is only specified for devices which support the Auto Self Refresh feature.
8. The number of discrete temperature ranges supported and the associated T_a - T_z values are supplier/design specific. Temperature ranges are specified for all supported values of T_{OPER} . Refer to supplier data sheet for more information.

11 Input/Output Capacitance

Table 61 — Input / Output Capacitance

		DDR3-800		DDR3-1066		DDR3-1333		DDR3-1600			
Parameter	Symbol	Min	Max	Min	Max	Min	Max	Min	Max	Units	Notes
Input/output capacitance (DQ, DM, DQS, DQS#, TDQS, TDQS#)	C_{IO}	1.5	3.0	1.5	3.0	1.5	2.5	TBD	TBD	pF	1,2,3
Input capacitance, CK and CK#	C_{CK}	TBD	1.6	TBD	1.6	TBD	TBD	TBD	TBD	pF	2,3,5
Input capacitance delta CK and CK#	C_{DCK}	0	0.15	0	0.15	TBD	TBD	TBD	TBD	pF	2,3,4
Input capacitance (All other input-only pins)	C_I	TBD	1.5	TBD	1.5	TBD	TBD	TBD	TBD	pF	2,3,6
Input capacitance delta, DQS and DQS#	C_{DDQS}	0	0.20	0	0.20	TBD	TBD	TBD	TBD	pF	2,3,12
Input capacitance delta (All CTRL input-only pins)	C_{DI_CTRL}	-0.5	0.3	-0.5	0.3	TBD	TBD	TBD	TBD	pF	2,3,7,8
Input capacitance delta (All ADD/CMD input-only pins)	$C_{DI_ADD_CMD}$	-0.5	0.5	-0.5	0.5	TBD	TBD	TBD	TBD	pF	2,3,9,10
Input/output capacitance delta (DQ, DM, DQS, DQS#)	C_{DIO}	-0.5	0.3	-0.5	0.3	TBD	TBD	TBD	TBD	pF	2,3,11
Notes: 1. TDQS/TDQS# are not necessarily input function but since TDQS is sharing DM pin and the parasitic characterization of TDQS/TDQS# should be close as much as possible, C_{IO} & C_{DIO} requirement is applied (recommend deleting note or changing to "Although the DM, TDQS and TDQS# pins have different functions, the loading matches DQ and DQS#.") 2. This parameter is not subject to production test. It is verified by design and characterization. Input capacitance is measured according to JEP147("PROCEDURE FOR MEASURING INPUT CAPACITANCE USING A VECTOR NETWORK ANALYZER (VNA)") with VDD, VDDQ, VSS, VSSQ applied and all other pins floating (except the pin under test, CKE, RESET# and ODT as necessary). VDD=VDDQ=1.5V, VBIAS=VDD/2 and on-die termination off. 3. This parameter applies to monolithic devices only; stacked/dual-die devices are not covered here 4. Absolute value of C_{CK}-$C_{CK\#}$. 5. The minimum C_{CK} will be equal to the minimum C_I. 6. Input only pins include: ODT, CS, CKE, A0-A15, BA0-BA2, RAS#, CAS#, WE#. 7. CTRL pins defined as ODT, CS and CKE. 8. $C_{DI_CTRL}=C_I(CTRL) - 0.5 * C_I(CLK) + C_I(CLK\#)$ 9. ADD pins defined as A0-A15, BA0-BA2 and CMD pins are defined as RAS#, CAS# and WE#. 10. $C_{DI_ADD_CMD}=C_I(ADD_CMD) - 0.5*(C_I(CLK)+C_I(CLK\#))$ 11. $C_{DIO}=C_{IO}(DQ) - 0.5*(C_{IO}(DQS)+C_{IO}(DQS\#))$ 12. Absolute value of $C_{IO}(DQS) - C_{IO}(DQS\#)$											

This page left blank.

12 Electrical Characteristics & AC Timing for DDR3-800 to DDR3-1600

12.1 Clock Specification

Parameter	Symbol	DDR3-800		DDR3-1066		Units
		min	max	min	max	
Average clock period	tCK(avg)	2500	3333	1875	3333	ps
Clock period	tCK(abs)	tCK(avg)min + tJIT(per)min	tCK(avg)max + tJIT(per)max	tCK(avg)min + tJIT(per)min	tCK(avg)max + tJIT(per)max	ps

Parameter	Symbol	DDR3-1333		DDR3-1600		Units
		min	max	min	max	
Average clock period	tCK(avg)	1500	3333	1250	3333	ps
Clock period	tCK(abs)	tCK(avg)min + tJIT(per)min	tCK(avg)max + tJIT(per)max	tCK(avg)min + tJIT(per)min	tCK(avg)max + tJIT(per)max	ps

tCK(abs) is not subject to production test.

Add Note for tCK(avg)

tCK(avg) is calculated as the average clock period across any consecutive 200 cycle window, where each clock period is calculated from rising edge to rising edge.

$$\left(\sum_{j=1}^N tCK_j \right) / N$$

$$N = 200.$$

Add note for tCK(abs)

tCK(abs) is the absolute clock period, as measured from one rising edge to the next consecutive rising edge.

12 Electrical Characteristics & AC Timing for DDR3-800 to DDR3-1600 (cont'd)

12.2 Clock Jitter Specification

Parameter	Symbol	DDR3-800		DDR3-1066		Units
		min	max	min	max	
Clock period jitter	tJIT(per)	TBD	TBD	TBD	TBD	ps
Clock period jitter during DLL locking period	tJIT(per,lck)	TBD	TBD	TBD	TBD	ps
Cycle to cycle clock period jitter	tJIT(cc)	n/a	TBD	n/a	TBD	ps
Cycle to cycle clock period jitter during DLL locking period	tJIT(cc,lck)	n/a	TBD	n/a	TBD	ps
Cumulative error across n cycles	tERR(nper)	TBD	TBD	TBD	TBD	ps
Average high pulse width	tCH(avg)	TBD	TBD	TBD	TBD	tCK(avg)
Average low pulse width	tCL(avg)	TBD	TBD	TBD	TBD	tCK(avg)
Duty cycle jitter	tJIT(duty)	TBD	TBD	TBD	TBD	ps

Parameter	Symbol	DDR3-1333		DDR3-1600		Units
		min	max	min	max	
Clock period jitter	tJIT(per)	TBD	TBD	TBD	TBD	ps
Clock period jitter during DLL locking period	tJIT(per,lck)	TBD	TBD	TBD	TBD	ps
Cycle to cycle clock period jitter	tJIT(cc)	n/a	TBD	n/a	TBD	ps
Cycle to cycle clock period jitter during DLL locking period	tJIT(cc,lck)	n/a	TBD	n/a	TBD	ps
Cumulative error across n cycles	tERR(nper)	TBD	TBD	TBD	TBD	ps
Average high pulse width	tCH(avg)	TBD	TBD	TBD	TBD	tCK(avg)
Average low pulse width	tCL(avg)	TBD	TBD	TBD	TBD	tCK(avg)
Duty cycle jitter	tJIT(duty)	TBD	TBD	TBD	TBD	ps

Note: The jitter specified is a random jitter meeting a Gaussian distribution. Input clocks violating the min/max values may result in malfunction of the DDR3 SDRAM Device.

12 Electrical Characteristics & AC Timing for DDR3-800 to DDR3-1600 (cont'd)

12.2 Clock Jitter Specification (cont'd)

Add note for tCH(avg) and tCL(avg)

tCH(avg) is defined as the average high pulse width, as calculated across any consecutive 200 high pulses:

$$\left(\sum_{j=1}^N tCH_j \right) / (N \times t_{CK(avg)})$$

N = 200

tCL(avg) is defined as the average low pulse width, as calculated across any consecutive 200 low pulses:

$$\left(\sum_{j=1}^N tCL_j \right) / (N \times t_{CK(avg)})$$

N = 200

Add note for tJIT(duty)

tJIT(duty) is defined as the cumulative set of tCH jitter and tCL jitter. tCH jitter is the largest deviation of any single tCH from tCH(avg). tCL jitter is the largest deviation of any single tCL from tCL(avg). tJIT(duty) is not subject to production test.

tJIT(duty) = Min/max of {tJIT(CH), tJIT(CL)}, where:

tJIT(CH) = {tCH_i - tCH(avg) where i=1 to 200}

tJIT(CL) = {tCL_i - tCL(avg) where i=1 to 200}

Add note for tJIT(per), tJIT(per,lck)

tJIT(per) is defined as the largest deviation of any single tCK from tCK(avg).

tJIT(per) = Min/max of {tCK_i - tCK(avg) where i=1 to 200}

tJIT(per) defines the single period jitter when the DLL is already locked.

tJIT(per,lck) uses the same definition for single period jitter, during the DLL locking period only.

tJIT(per) and tJIT(per,lck) are not subject to production test.

Add note for tJIT(cc), tJIT(cc,lck)

tJIT(cc) is defined as the absolute difference in clock period between two consecutive clock cycles:

tJIT(cc) = Max of {|tCK_{i+1} - tCK_i|}

tJIT(cc) defines the cycle to cycle jitter when the DLL is already locked.

tJIT(cc,lck) uses the same definition for cycle to cycle jitter, during the DLL locking period only.

tJIT(cc) and tJIT(cc,lck) are not subject to production test.

Add note for tERR(nper)

tERR is defined as the cumulative error across n multiple consecutive cycles from tCK(avg). This definition is TBD. tERR(nper) is not subject to production test.

12 Electrical Characteristics & AC Timing for DDR3-800 to DDR3-1600 (cont'd)

12.3 Refresh parameters by device density

Parameter	Symbol		512Mb	1Gb	2Gb	4Gb	8Gb	Units	Notes
REF command to ACT or REF command time	tRFC		90	110	160	300	350	ns	
Average periodic refresh interval	tREFI	$0\text{ }^{\circ}\text{C} \leq T_{\text{CASE}} \leq 85\text{ }^{\circ}\text{C}$	7.8	7.8	7.8	7.8	7.8	μs	
		$85\text{ }^{\circ}\text{C} < T_{\text{CASE}} \leq 95\text{ }^{\circ}\text{C}$	3.9	3.9	3.9	3.9	3.9	μs	1

Notes: 1. Users should refer to the DRAM supplier data sheet and/or the DIMM SPD to determine if DDR3 SDRAM devices support the following options or requirements referred to in this material.

12 Electrical Characteristics & AC Timing for DDR3-800 to DDR3-1600 (cont'd)

12.4 Standard Speed Bins

DDR3 SDRAM Standard Speed Bins include tCK, tRCD, tRP, tRAS and tRC for each corresponding bin.

Table 62 — DDR3-800 Speed Bins

For specific Notes See 12.4.1 “Speed Bin Table Notes” on page 151.								
Speed Bin			DDR3-800D		DDR3-800E		Unit	Notes

12 Electrical Characteristics & AC Timing for DDR3-800 to DDR3-1600 (cont'd)

12.4 Standard Speed Bins (cont'd)

12.4.1 Speed Bin Table Notes

Absolute Specification (T_{OPER} ; $V_{\text{DDQ}} = V_{\text{DD}} = 1.5\text{V} \pm 0.075\text{V}$);

- Notes:
1. The CL setting and CWL setting result in $t_{\text{CK}}(\text{AVG}).\text{MIN}$ and $t_{\text{CK}}(\text{AVG}).\text{MAX}$ requirements. When making a selection of $t_{\text{CK}}(\text{AVG})$, both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.
 2. $t_{\text{CK}}(\text{AVG}).\text{MIN}$ limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard $t_{\text{CK}}(\text{AVG})$ value (2.5, 1.875, 1.5, or 1.25 ns) when calculating $\text{CL} [\text{nCK}] = t_{\text{AA}} [\text{ns}] / t_{\text{CK}}(\text{AVG}) [\text{ns}]$, rounding up to the next 'Supported CL'.
 3. $t_{\text{CK}}(\text{AVG}).\text{MAX}$ limits: Calculate $t_{\text{CK}}(\text{AVG}) = t_{\text{AA}}.\text{MAX} / \text{CLSELECTED}$ and round the resulting $t_{\text{CK}}(\text{AVG})$ down to the next valid speed bin (i.e. 3.3ns or 2.5ns or 1.875 ns or 1.25 ns). This result is $t_{\text{CK}}(\text{AVG}).\text{MAX}$ corresponding to CLSELECTED.
 4. 'Reserved' settings are not allowed. User must program a different value.
 5. 'Optional' settings allow certain devices in the industry to support this setting, however, it is not a mandatory feature. Refer to supplier's data sheet and SPD information if and how this setting is supported.
 6. Any DDR3-1066 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
 7. Any DDR3-1333 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
 8. Any DDR3-1600 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.

13 Electrical Characteristics and AC Timing (cont'd)

13.1 Jitter Notes

(ballot 06-21, 1681.05, added 7/28/2006) integrated into AC Param table/notes on 8/1/2006)

- Specific Note a Unit 'tCK(avg)' represents the actual tCK(avg) of the input clock under operation. Unit 'nCK' represents one clock cycle of the input clock, counting the actual clock edges.ex) tMRD = 4 [nCK] means; if one Mode Register Set command is registered at Tm, another Mode Register Set command may be registered at Tm+4, even if (Tm+4 - Tm) is 4 x tCK(avg) + tERR(4per),min.
- Specific Note b These parameters are measured from a command/address signal (CKE, CS#, RAS#, CAS#, WE#, ODT, BA0, A0, A1, etc.) transition edge to its respective clock signal (CK/CK#) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as the setup and hold are relative to the clock signal crossing that latches the command/address. That is, these parameters should be met whether clock jitter is present or not.
- Specific Note c These parameters are measured from a data strobe signal (DQS(L/U), DQS(L/U)#) crossing to its respective clock signal (CK, CK#) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as these are relative to the clock signal crossing. That is, these parameters should be met whether clock jitter is present or not.
- Specific Note d These parameters are measured from a data signal (DM(L/U), DQ(L/U)0, DQ(L/U)1, etc.) transition edge to its respective data strobe signal (DQS(L/U), DQS(L/U)#) crossing.
- Specific Note e For these parameters, the DDR3 SDRAM device supports tnPARAM [nCK] = RU{ tPARAM [ns] / tCK(avg) [ns] }, which is in clock cycles, assuming all input clock jitter specifications are satisfied. For example, the device will support tnRP = RU{tRP / tCK(avg)}, which is in clock cycles, if all input clock jitter specifications are met. This means: For DDR3-800 6-6-6, of which tRP = 15ns, the device will support tnRP = RU{tRP / tCK(avg)} = 6, as long as the input clock jitter specifications are met, i.e. Pre-charge command at Tm and Active command at Tm+6 is valid even if (Tm+6 - Tm) is less than 15ns due to input clock jitter.
- Specific Note f These parameters are specified per their average values, however it is understood that the following relationship between the average timing and the absolute instantaneous timing holds at all times. (Min and max of SPEC values are to be used for calculations in Table 67.

Table 67 — Min and Max SPEC values

Parameter	Symbol	min	max	Units
Absolute clock period	tCK(abs)	tCK(avg),min + tJIT(per),min	tCK(avg),max + tJIT(per),max	ps
Absolute clock HIGH pulse width	tCH(abs)	tCH(avg),min x tCK(avg),min + tJIT(duty),min	tCH(avg),max x tCK(avg),max + tJIT(duty),max	ps
Absolute clock LOW pulse width	tCL(abs)	tCL(avg),min x tCK(avg),min + tJIT(duty),min	tCL(avg),max x tCK(avg),max + tJIT(duty),max	ps

Example: For DDR3-800, tCH(abs),min = (0.48 x 2500 ps) - 100 ps = 1100 ps, if tCH(avg),min = 0.48 tCK(avg) and tJIT(duty),min = -100 ps

13 Electrical Characteristics and AC Timing (cont'd)

13.2 Timing Parameter Notes

- Notes:
1. Actual value dependant upon measurement level definitions which are TBD.
 2. Commands requiring a locked DLL are: READ (and RAP) and synchronous ODT commands.
 3. The max values are system dependent.
 4. WR as programmed in mode register
 5. Value must be rounded-up to next higher integer value
 6. There is no maximum cycle time limit besides the need to satisfy the refresh interval, tREFI.
 7. For definition of RTT turn-on time tAON See 5.2.2 "Timing Parameters" on page 84.
 8. For definition of RTT turn-off time tAOF See 5.2.2 "Timing Parameters" on page 84.
 9. tWR is defined in ns, for calculation of tWRPDEN it is necessary to round up tWR / tCK to the next integer.
 10. WR in clock cycles as programmed in MR0.
 11. The maximum postamble is bound by tHZDQS(max)
 12. Output timing deratings are relative to the SDRAM input clock. When the device is operated with input clock jitter, this parameter needs to be derated by t.b.d.
 13. Value is only valid for RON34
 14. Single ended signal parameter. Refer to chapter <t.b.d.> for definition and measurement method.
 15. tREFI depends on TOPER
 16. tIS(base) and tIH(base) values are for 1V/ns CMD/ADD single-ended slew rate and 2V/ns CK, CK# differential slew rate. Note for DQ and DM signals, VREF(DC) = VRefDQ(DC). For input only pins except RESET#, VRef(DC) = VRefCA(DC). See 13.3 "Address / Command Setup, Hold and Derating" on page 162
 17. tDS(base) and tDH(base) values are for 1V/ns DQ single-ended slew rate and 2V/ns DQS, DQS# differential slew rate. Note for DQ and DM signals, VREF(DC) = VRefDQ(DC). For input only pins except RESET#, VRef(DC) = VRefCA(DC). See 13.4 "Data Setup, Hold and Slew Rate Derating" on page 168.
 18. Start of internal write transaction is defined as follows:
 - For BL8 (fixed by MRS and on- the-fly): Rising clock edge 4 clock cycles after WL.
 - For BC4 (on- the- fly): Rising clock edge 4 clock cycles after WL.
 - For BC4 (fixed by MRS): Rising clock edge 2 clock cycles after WL.
 19. The maximum preamble is bound by tLZDQS(max)
 20. CKE is allowed to be registered low while operations such as row activation, pre-charge, autoprecharge or refresh are in progress, but power-down IDD spec will not be applied until finishing those operations.
 21. Although CKE is allowed to be registered LOW after a REFRESH command once tREFPDEN(min) is satisfied, there are cases where additional time such as tXP-DLL(min) is also required. See Figure 65 — "Power-Down Entry/Exit Clarifications - Case 2" on page 81
 22. $tJIT(duty) = +/- \{ 0.07 * tCK(avg) - [(0.5 - (\min(tCH(avg), tCL(avg))) * tCK(avg)] \}$. For example, if tCH/tCL was 0.48/0.52, tJIT(duty) would calculate out to +/-125ps for DDR3-800. The tCH(avg) and tCL(avg) values listed must not be exceeded.

13 Electrical Characteristics and AC Timing (cont'd)

13.3 Address / Command Setup, Hold and Derating

(Ballot 06-20, 1627.31 updated 7/28/2006)

For all input signals the total t_{IS} (setup time) and t_{IH} (hold time) required is calculated by adding the data sheet $t_{IS}(\text{base})$ and $t_{IH}(\text{base})$ value (see Table 68) to the Δt_{IS} and Δt_{IH} derating value (see Table 69) respectively.

Example: $t_{IS}(\text{total setup time}) = t_{IS}(\text{base}) + \Delta t_{IS}$

Setup (t_{IS}) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $V_{REF(dC)}$ and the first crossing of $V_{IH(ac)min}$. Setup (t_{IS}) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of $V_{REF(dC)}$ and the first crossing of $V_{IL(ac)max}$. If the actual signal is always earlier than the nominal slew rate line between shaded ' $V_{REF(dC)}$ to ac region', use nominal slew rate for derating value (see Figure 100). If the actual signal is later than the nominal slew rate line anywhere between shaded ' $V_{REF(dC)}$ to ac region', the slew rate of a tangent line to the actual signal from the ac level to dc level is used for derating value (see Figure 102).

Hold (t_{IH}) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $V_{IL(dc)max}$ and the first crossing of $V_{REF(dC)}$. Hold (t_{IH}) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of $V_{IH(dc)min}$ and the first crossing of $V_{REF(dC)}$. If the actual signal is always later than the nominal slew rate line between shaded ' dc to $V_{REF(dC)}$ region', use nominal slew rate for derating value (see Figure 101). If the actual signal is earlier than the nominal slew rate line anywhere between shaded ' dc to $V_{REF(dC)}$ region', the slew rate of a tangent line to the actual signal from the dc level to $V_{REF(dC)}$ level is used for derating value (see Figure 103).

For a valid transition the input signal has to remain above/below $V_{IH/IL(ac)}$ for some time t_{VAC} (see Table 70).

Although for slow slew rates the total setup time might be negative (i.e. a valid input signal will not have reached $V_{IH/IL(ac)}$ at the time of the rising clock transition) a valid input signal is still required to complete the transition and reach $V_{IH/IL(ac)}$.

For slew rates in between the values listed in Table 69, the derating values may obtained by linear interpolation. These values are typically not subject to production test. They are verified by design and characterization.

Table 68 — ADD/CMD Setup and Hold Base-Values for 1V/ns

unit [ps]	DDR3-800	DDR3-1066	DDR3-1333	DDR3-1600	reference

13.4 Data Setup, Hold and Slew Rate Derating

(Ballot 06-19, 1627.28 updated 7/28/2006)

For all input signals the total tDS (setup time) and tDH (hold time) required is calculated by adding the data sheet tDS(base) and tDH(base) value (see Table 71) to the ΔtDS and ΔtDH (see Table 72) derating value respectively.

Example: tDS (total setup time) = tDS(base) + ΔtDS .

Setup (tDS) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $V_{REF(dc)}$ and the first crossing of $V_{IH(ac)min}$. Setup (tDS) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of $V_{REF(dc)}$ and the first crossing of $V_{IL(ac)max}$ (see Figure 104). If the actual signal is always earlier than the nominal slew rate line between shaded ' $V_{REF(dc)}$ to ac region', use nominal slew rate for derating value. If the actual signal is later than the nominal slew rate line anywhere between shaded ' $V_{REF(dc)}$ to ac region', the slew rate of a tangent line to the actual signal from the ac level to dc level is used for derating value (see Figure 106).

Hold (tDH) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $V_{IL(dc)max}$ and the first crossing of $V_{REF(dc)}$. Hold (tDH) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of $V_{IH(dc)min}$ and the first crossing of $V_{REF(dc)}$ (see Figure 105). If the actual signal is always later than the nominal slew rate line between shaded 'dc level to $V_{REF(dc)}$ region', use nominal slew rate for derating value. If the actual signal is earlier than the nominal slew rate line anywhere between shaded 'dc to $V_{REF(dc)}$ region', the slew rate of a tangent line to the actual signal from the dc level to $V_{REF(dc)}$ level is used for derating value (see Figure 107).

For a valid transition the input signal has to remain above/below $V_{IH/IL(ac)}$ for some time t_{VAC} (see Table 73).

Although for slow slew rates the total setup time might be negative (i.e. a valid input signal will not have reached $V_{IH/IL(ac)}$ at the time of the rising clock transition) a valid input signal is still required to complete the transition and reach $V_{IH/IL(ac)}$.

For slew rates in between the values listed in the tables the derating values may obtained by linear interpolation.

These values are typically not subject to production test. They are verified by design and characterization

	0.4	-	-	-	-	-	-	-	-	-	-	-	-	-30	-26	-22	-10

NOTE:

1. Cell contents shaded in red are defined as 'not supported'.

Table 73 — Required time t_{VAC} above $V_{IH}(ac)$ {below $V_{IL}(ac)$ } for valid transition

Slew Rate [V/ns]	t_{VAC} [ps]	
	min	max
> 2.0	75	-
2.0	57	-
1.5	50	-
1.0	38	-
0.9	34	-
0.8	29	-
0.7	22	-
0.6	13	-
0.5	0	-
< 0.5	0	-

13 Electrical Characteristics and AC Timing (cont'd)

13.4 Data Setup, Hold and Slew Rate Derating (cont'd)

Note: Clock and Strobe are drawn on a different time scale.

$$\text{Setup Slew Rate Falling Signal} = \frac{V_{REF(dc)} - V_{IL(ac)max}}{\Delta TF}$$

$$\text{Setup Slew Rate Rising Signal} = \frac{V_{IH(ac)min} - V_{REF(dc)}}{\Delta TR}$$

Figure 104 — Illustration of nominal slew rate and t_{VAC} for setup time t_{DS} (for DQ with respect to strobe) and t_{IS} (for ADD/CMD with respect to clock).

13 Electrical Characteristics and AC Timing (cont'd)

13.4 Data Setup, Hold and Slew Rate Derating (cont'd)

Note: Clock and Strobe are drawn on a different time scale.

$$\text{Hold Slew Rate Rising Signal} = \frac{V_{REF(dc)} - V_{IL(dc) \max}}{\Delta TR}$$

$$\text{Hold Slew Rate Falling Signal} = \frac{V_{IH(dc) \min} - V_{REF(dc)}}{\Delta TF}$$

Figure 105 — Illustration of nominal slew rate for hold time t_{DH} (for DQ with respect to strobe) and t_{IH} (for ADD/CMD with respect to clock).

13 Electrical Characteristics and AC Timing (cont'd)

13.4 Data Setup, Hold and Slew Rate Derating (cont'd)

Note: Clock and Strobe are drawn on a different time scale.

Figure 106 — Illustration of tangent line for setup time t_{DS} (for DQ with respect to strobe) and t_{IS} (for ADD/CMD with respect to clock)

13 Electrical Characteristics and AC Timing (cont'd)

13.4 Data Setup, Hold and Slew Rate Derating (cont'd)

Note: Clock and Strobe are drawn on a different time scale.

Figure 107 — Illustration of tangent line for for hold time t_{DH} (for DQ with respect to strobe) and t_{IH} (for ADD/CMD with respect to clock)

Standard Improvement Form

JEDEC JESD79-3

The purpose of this form is to provide the Technical Committees of JEDEC with input from the industry regarding usage of the subject standard. Individuals or companies are invited to submit comments to JEDEC. All comments will be collected and dispersed to the appropriate committee(s).

If you can provide input, please complete this form (it can be edited in Acrobat Exchange) and return to:

JEDEC

Attn: Publications Department

2500 Wilson Blvd. Suite 220

Arlington, VA 22201-3834

Fax: 703.907.7583

1. I recommend changes to the following:

☐ Requirement, paragraph number _____

☐ Test method number _____ Paragraph number _____

The referenced paragraph number has proven to be:

☐ Unclear ☐ Too Rigid ☐ In Error

☐ Other _____

2. Recommendations for correction:

3. Other suggestions for document improvement:

Submitted by

Name: _____

Phone: _____

Company: _____

E-mail: _____

Address: _____

City/State/Zip: _____

Date: _____
