	 Home / Reports & Research / Guides DTV Enforcement ★ This page has been archived and is no longer actively maintained by the FCC. www.dtv.gov What Every Consumer Should Know About DTV Congress has mandated that after February 17, 2009, television stations across the country must transmit only in digital signals, and may no longer transmit analog signals. After that date, consumers who rely on antennas (including outside antennas and "rabbit ears") to receive broadcast signals on TV sets having only analog tuners will need to obtain separate digital-to-analog set-top converter boxes to watch over-the-air TV. The Commission's DTV-related enforcement efforts have focused on protecting consumers by enforcing our rules as this transition takes place. To date, the Commission has taken enforcement action in several areas: (1) the prohibition on the importation and shipment of television receivers without integrated digital tuners; (2) the labeling requirement for television receivers incapable of receiving over-the-air digital signals without a converter box; (3) the requirement that digital television receivers possess full V-Chip functionality, including not only the ability to block offensive programming, but also the ability to adjust to a future rating system; and (4) the DTV consumer education requirements for broadcasters, telecom carriers, cable operators, manufacturers, and others. DTV tuner enforcement The Commission's digital tuner rule specifies that as of March 1, 2007 all new television receivers must include digital tuners. This rule prohibits the manufacture, import, or interstate shipment of any device containing an analog tuner, unless it also contains a digital tuner. The Commission receives complaints and monitors U.S. Customs data to determine if companies are importing or shipping equipment with analog-only tuners in violation of this rule. https://www.fcc.gov/reports-research/guides/dtv-enforcement

Claim Limitation	Exemplary Amazon Infringement
	Additionally, Amazon offers a service called Prime Video,² which can be accessed on each of the Amazon ’592 Accused Products. Prime Video includes a service called “Live TV.” Using Live TV, viewers receive digital moving image content (e.g., movies, concerts, sporting events) from outside providers (broadcasters) by using the Prime Video service as a tuner.  DEFS-NLG_0000577 Amazon obtains information from broadcasters whose live (<i>i.e.</i>, linear) content Amazon provides as “Live TV” and tests the reception of the “Live TV” from each broadcaster (e.g., playout facility):

² The phrase “Prime Video” hereinafter refers to versions and apps of Amazon’s Prime Video and Prime Video Life TV software as identified as infringing U.S. Patent No. 9,319,615 in NL Giken’s First Amended Disclosure of the Accused Products served on October 4, 2024.

Claim Limitation	Exemplary Amazon Infringement
	Linear Ingest Information Form The first stage of this process is for the content partner to complete the Linear Ingest Information Form. This form is designed to capture key information about your live feeds, including the point of origin, video format, delivery protocols, and any security requirements. This form should be filled out and returned to the Prime Video Live Linear Integration Team for review prior to the onboarding call. This will allow your Technical Integration Manager / Solution Architect to determine whether or not any additional stakeholders will need to participate in the onboarding call(s). Acquiring the Source Feeds Prior to launching a new linear channel, Prime Video and the content owner must successfully complete an end-to-end test of the signal delivery path from the source's point of origin (playout facility or downlink location) into Prime Video, for encoding, packaging and delivery to customers. This test must include all network infrastructure, signal processing, transport, hardware and software systems, as well as all first and third-party components required to deliver the content to Prime Video. For brand new integrations (as opposed to incremental additions to existing services) Prime Video requires a 4-week stability soak test. DEFS-NLG_0001366 Amazon provides the “Live TV” service according to a pre-set schedule that is predetermined by the provider. For example, the time corresponding to content being displayed (e.g., Play Head) is set by the time corresponding to the recording of the piece of content (e.g., Production edge), which is controlled by the broadcaster:

Linear Ingest Guide

Using this Guide

Prime Video provides access to linear TV stations across more than 13 Marketplaces, delivering a range of high-quality news, sports and entertainment programming for Customers to choose from, both for free and as add-on subscriptions to accompany their Prime benefit.

Our customers in US, UK, DE and AT marketplaces across Freevee and Prime Video, have access to FAST content unlocking vast selection to premium content and content suited to linear format like News and Sports. This benefits non-prime customers as well removing the payment wall.

This guide provides information that will help you get setup to deliver linear feeds into Prime Video. It covers our partner integration process and technical delivery requirements for live channel feeds¹. Illustrative drawings can be found in the Appendix.

Thanks again for choosing to partner with Prime Video, we look forward to working with you!

Partner Integration

Prime Video has a standard process for integrating new partners delivering live video feeds to our service. This process is critical to establishing a high-quality product for Amazon customers. This process consists of four parts:

1. Completion of the Linear Ingest Information Form
2. Onboarding call to align on technical integration details and timelines
3. Establishing connectivity and acquiring the source feeds
4. Soak Testing of source feeds².

Linear Ingest Information Form

The first stage of this process is for the content partner to complete the Linear Ingest Information Form. This form is designed to capture key information about your live feeds, including the point of origin, video format, delivery protocols, and any security requirements. This form should be filled out and returned to the Prime Video Live Linear Integration Team for review prior to the onboarding call. This will allow your Technical Integration Manager / Solution Architect to determine whether or not any additional stakeholders will need to participate in the onboarding call(s).

¹ This guide only provides details on delivering linear content. Prime Video has a separate onboarding process for delivering VOD content which is covered in the Amazon Video Global Content Guide.

² Please refer to Appendix for the criteria to pass the soak testing and soak metrics analyzed from PV side before launch.

	Prime Video Linear Channel Ingest Guide 2024v1.0 contact: dv-linear-integration@amazon.com Onboarding Call Once the Linear Ingest Information Form has been completed and reviewed, your primary point of contact for signal onboarding will be an assigned Technical Integration Manager or Solution Architect. Prime Video encourages content partners to be prepared with any questions they may have regarding the delivery of live feeds. In order to make the process more efficient, all relevant transport or delivery partners must have representation from their technical operations team present on the call. Acquiring the Source Feeds Prior to launching a new linear channel, Prime Video and the content owner must successfully complete an end-to-end test of the signal delivery path from the source's point of origin (playout facility or downlink location) into Prime Video, for encoding, packaging and delivery to customers. This test must include all network infrastructure, signal processing, transport, hardware and software systems, as well as all first and third-party components required to deliver the content to Prime Video. For brand new integrations (as opposed to incremental additions to existing services) Prime Video requires a 4-week stability soak test.

Claim Limitation	Exemplary Amazon Infringement
	Delivery of Live Feeds to Amazon Video Signal Flow Overview Prime Video operates its cloud video processing services within AWS, in multiple global regions; choosing the most appropriate one to use based on proximity to both our Content Partners and Customers. PV has a 99.999³% uptime target for both our internal systems, and partners on whom Customers depend. To achieve these targets, we require partners to deliver multiple redundant feeds of each station, which we process across multiple redundant services within different AWS Regions and Availability Zones. Without this high level of redundancy, we risk poor performance for customers and a high operational burden for both PV and partner teams. Prime Video receives, processes and delivers all redundant feed and considers all to be active, as opposed to primary and backup. Prime Video provides several options for partners to deliver their channel content feed (s) to our delivery endpoints. Broadly, these options are: 1. Cloud sourced delivery from either a playout server, or another cloud-based video processing service 2. On-Premise sourced delivery from the content partner’s playout location or 3rd party location via AWS Direct Connect or other agreed networking solution Under either option PV prefers partners contribute video using the Zixi protocol which provides a high level of protection against network impairments. Once signal delivery is established, any changes to that workflow need to be communicated to the Prime Video Integration Manager with at least 90 days advance notice; any change in delivery cost will be the responsibility of the content owner.

Claim Limitation	Exemplary Amazon Infringement
	Drawings can be found in the Appendix. Cloud Sourced Delivery Prime Video works with a range of partners who operate 1st or 3rd party playout and video processing systems in the cloud. Contribution of linear services from these partners must use the Zixi protocol in order to ensure the feeds are delivered reliably, this can be achieved by either 1) the playout system supporting Zixi protocol 2) the partner supporting Zixi feeder or Zixi Broadcaster within their cloud infrastructure or 3) the partner using Elemental MediaConnect and sharing the signal with Prime Video with Zixi feeds. Sources must come from redundant infrastructure hosted in different AWS Regions or Availability Zones. ³ Equating to less than 26s unplanned downtime per station per month On-Premise Sourced Delivery Prime Video can receive signals directly from the partner playout facility or from several signal acquisition partners (Encompass Digital Media, Softbank, SES and Telstra); we have established Direct Connections into AWS from these partners’ facilities. If your content originates its playout with one of these partners, it makes the most sense to acquire directly from that source playout location. If your content is available via satellite downlink, Prime Video will work with our acquisition partners to downlink the satellite service(s) and transport the feeds over established direct fiber connections into Prime Video. All hardware and/or receivers required to downlink content via satellite, especially if there is any encryption on the source feed(s), will need to be provided in advance to Prime Video by the channel partner. There should be redundant downlinks available. Delivery via IP Prime Video’s preference is to directly connect with the playout or acquisition facility from which the signals are being contributed. If the signal is available in a public data center it may be possible to directly connect with the partner within the data center, or via the data center. If it isn’t possible to connect directly with the partner, under some circumstances Prime Video will support contribution of signals over the internet and/or via AWS site to site VPN. In order to support this, the partner must deliver the source feeds over at least two diverse internet connections. The partner must also support delivery via Zixi protocol in order to ensure that the signals are delivered reliably.

remote controller selects the one of the digital moving image contents by means of selecting the sub provider, and wherein the one of the digital moving image contents is provided by the selected sub provider.	For example, from the discussion above for the limitation 1[PRE], the first provider (Prime Video with Live TV) includes sub-providers that are listed in the program schedule table (one of the sub-providers is indicated by the arrow):  The screenshot displays the Amazon Live TV interface. At the top, there are tabs for 'All', 'Crime', 'News', 'TV shows', 'Movies', 'Holiday', 'Reality', and 'Food'. Below this is a section titled 'Your live and upcoming events' with a grid of program cards. A blue arrow points to the 'Recently watched' section, specifically to the card for 'Once Upon a Main Street' (53 min left, 2:06 PM). Other programs visible include 'Bad Girls All Star Battle', 'CBS News Latest Headlines', 'Midday Rundown', 'The Daily Drew', and 'A Midnight Kiss'.

	For example, from the discussion above for the limitation 1[B], sub-providers provide linear content and undergo an onboarding process to provide live feeds to Amazon Video: Prime Video Linear Channel Ingest Guide 2024v1.0 contact: dv-linear-integration@amazon.com Onboarding Call Once the Linear Ingest Information Form has been completed and reviewed, your primary point of contact for signal onboarding will be an assigned Technical Integration Manager or Solution Architect. Prime Video encourages content partners to be prepared with any questions they may have regarding the delivery of live feeds. In order to make the process more efficient, all relevant transport or delivery partners must have representation from their technical operations team present on the call. Acquiring the Source Feeds Prior to launching a new linear channel, Prime Video and the content owner must successfully complete an end-to-end test of the signal delivery path from the source’s point of origin (playout facility or downlink location) into Prime Video, for encoding, packaging and delivery to customers. This test must include all network infrastructure, signal processing, transport, hardware and software systems, as well as all first and third-party components required to deliver the content to Prime Video. For brand new integrations (as opposed to incremental additions to existing services) Prime Video requires a 4-week stability soak test. Amazon also induces customers to download the Prime Video app onto third-party devices. Amazon additionally induces customers to stream content using Prime Video via a web browser on third-party devices. Such third-party devices with the Prime Video app installed and/or that stream Prime Video via a web browser include a receiving apparatus in the same way as described above.
[12]: The receiving apparatus according to claim 1, wherein the digital moving image contents is provided	In the Amazon ’592 Accused Products the digital moving image contents is provided by the first provider by streaming technology in accordance with the program schedule table.

by the first provider by streaming technology in accordance with the program schedule table.	As explained in the discussion of limitations 1[PRE] and 1[B], the digital moving image contents provided by the first provider (i.e. the broadcaster) via Prime Video with Live TV are provided by streaming technology in accordance with the program schedule table. Amazon also induces customers to download the Prime Video app onto third-party devices. Amazon additionally induces customers to stream content using Prime Video via a web browser on third-party devices. Such third-party devices with the Prime Video app installed and/or that stream Prime Video via a web browser include a receiving apparatus in the same way as described above.
