A hydraulic fracturing system for fracturing a subterranean formation is described according to various embodiments. In an embodiment, the system can include a multi-plunger hydraulic fracturing pump fluidly connected to a well associated with the subterranean formation, the multi-plunger pump configured to pump fluid into a wellbore associated with the well at a high pressure so that the fluid passes from the wellbore into the subterranean formation and fractures the subterranean formation. In an embodiment, a plurality of motors can be positioned to power the multi-plunger pump, and a planetary gear train can have a plurality of pinion gears in rotational contact with each of the plurality of motors. In an embodiment, a gear ratio of the planetary gear train and a speed at which the plurality of motors operates can be selected so as to limit a maximum pump speed associated with the multi-plunger pump.

**MULTI-PLUNGER PUMPS AND  
ASSOCIATED DRIVE SYSTEMS****CROSS REFERENCE TO RELATED  
APPLICATIONS**

This application is a continuation of U.S. patent application Ser. No. 16/827,166, entitled “Multi-plunger Pumps and Associated Drive Systems,” filed Mar. 23, 2020, which is a continuation of U.S. patent application Ser. No. 16/210,807, entitled “Multi-plunger Pumps and Associated Drive Systems,” filed Dec. 5, 2018, which claims priority to and the benefit of U.S. Provisional Patent Application No. 62/594,912, filed Dec. 5, 2017. The disclosures of the above-referenced priority applications are, hereby incorporated herein by reference.

**BACKGROUND**

## 1. Technical Field

This disclosure relates generally to drive systems for reciprocating plunger-style pumps used in hydraulic fracturing operations, and more particularly to multi-plunger hydraulic fracturing pumps and associated drive systems.

## 2. Background

With advancements in technology over the past few decades, the ability to reach unconventional sources of hydrocarbons has tremendously increased. Horizontal drilling and hydraulic fracturing are two such ways that new developments in technology have led to hydrocarbon production from previously unreachable shale formations. Hydraulic fracturing (fracking) operations typically require powering numerous components in order to recover oil and gas resources from the ground. For example, hydraulic fracturing usually includes pumps that inject fracking fluid down the wellbore, blenders that mix proppant into the fluid, cranes, wireline units, and many other components that all must perform different functions to carry out fracking operations.

Hydraulic fracturing operations commonly use diesel-powered pumps to transmit fluid media down the well bore, the transmissions for the diesel-powered pumps often having seven speeds or more. When one or more pumps go offline during operation, for example due to system failure or for scheduled maintenance, the speed of the remaining operating pumps is increased accordingly. However, many of the top gears in these diesel transmissions provide speeds that are above the critical speed for the associated plunger pumps. Thus, compensating for the downed pump or pumps by up-shifting operation of the remaining pumps to these higher gears, above the critical speed for the pumps, can result in damage to the pumps. There is a need for hydraulic fracturing pumps that are capable of operation at or below the critical speed, without sacrificing pump rate, efficiency, and efficacy.

**SUMMARY**

One of the most common transmissions utilized in hydraulic fracturing pump applications is a nine-speed transmission, often driven by a diesel-powered engine. When this transmission is in fifth gear and the engine is running at 1700 rotations per minute (rpm), for example, the critical speed of 120 rpm on an associated 8-inch stroke pump is reached.

2

Therefore, running the pump with the transmission operating in any of gears six through nine, above the critical speed reached at gear five, could cause pump cavitation and damage accumulation to the fluid end of the pump.

It has historically been believed that pump cavitation is caused by air entering the pump. Through testing and data-gathering, however, Applicants have observed that pump cavitation and damage are caused by the formation of vacuum bubbles as a result of fluid being accelerated too fast through the pump. A heightened speed of operation creates low pressure within the pumps, creating vacuum bubbles. As the pump plungers retract, the vacuum bubbles implode, causing damage (cavitation) to the pump and engine systems. Although the risks of operating the pumps at too great of speeds may be known, concerns about lowered pump rates and lost efficiency resulting from maintaining slower transmission speeds commonly lead to disregard of the risks as an unavoidable consequence of maintaining pump efficiency.

In seeking to avoid such pump damage, Applicants have observed that, by operating transmissions such that pumps are maintained at or below critical pump speeds, such formation of vacuum bubbles and resulting pump cavitation and damage may be avoided. Further still, Applicants have observed that use of electric- or hydraulic-powered pumps may allow for better control of pump speeds at or below the critical speed due to the smaller increments between gear speeds as compared to those of pumps driven by diesel-powered engines.

Operation below critical pump speeds has previously been avoided as being considered inefficient and ineffective for pump usage in fracking, as slower pump speeds are historically believed to be directly tied to pump rates. Applicant has observed, however, that the introduction of multiple electric- or hydraulic-powered motors driving planetary gear trains can provide effective and efficient pumping power, thereby maintaining a consistent pump rate for fluid transfer, while also sustaining a pumping speed at or below the critical speed for the plungers. For example, Applicant discovered that varying pump bore sizes and stroke lengths, as well as number of plungers, allowed for operation at slower pump speeds while maintaining or increasing fluid pump rates. Applicant also discovered, through testing and analysis, that certain bore size, stroke length, and plunger number combinations provided maximum pump rate efficiency at a usable and economically effective overall pump size.

The present disclosure is directed to hydraulic fracturing system for fracturing a subterranean formation, according to various embodiments. In an embodiment, the hydraulic fracturing system can include a multi-plunger hydraulic fracturing pump fluidly connected to a well associated with the subterranean formation, and the multi-plunger pump can be configured to pump fluid into a wellbore associated with the well at a high pressure so that the fluid passes from the wellbore into the subterranean formation and fractures the subterranean formation. In an embodiment, the system can further include a plurality of motors positioned to power the multi-plunger pump, and a planetary gear train having a plurality of input pinion gears in rotational contact with each of the plurality of motors. In an embodiment, a gear ratio of the planetary gear train and a speed at which the plurality of motors operates can be selected so as to limit a maximum pump speed associated with the multi-plunger pump.

3

In an embodiment, the system can include a plurality of speed reduction gearboxes positioned between the plurality of input pinion gears and the plurality of motors so as to achieve a desired pump rate.

In an embodiment, the plurality of motors can include one of a plurality of electric motors or a plurality of hydraulic motors.

In an embodiment, the maximum pump speed can correlate to a critical plunger speed associated with each of the plurality of hydraulic pumps.

In an embodiment, the maximum pump speed can be 5% or less over a critical plunger speed associated with each of the plurality of hydraulic pumps.

In an embodiment, the plurality of hydraulic pumps includes an odd number of plungers greater than or equal to five plungers.

In an embodiment, a stroke length of each of the plungers associated with the plurality of hydraulic pumps can be selected to inversely relate to a pump speed associated with the plurality of hydraulic pumps so as to achieve a predetermined flow rate.

In an embodiment, the system can include a variable frequency drive (VFD) connected to the plurality of motors to control the speed of the plurality of motors. The VFD can be positioned to accelerate or decelerate pump rotational speeds associated with each of the plurality of hydraulic pumps, according to an embodiment.

In an embodiment, the VFD can include a plurality of VFDs, and the plurality of VFDs can be configured to share a load required to power the plurality of hydraulic pumps.

In an embodiment, the plurality of VFDs can be configured to automatically shut off in the event of an overpressure event with respect to the plurality of hydraulic pumps.

The present disclosure is also related to a hydraulic fracturing system for fracturing a subterranean formation, according to an embodiment. In an embodiment, the system can include a multi-plunger hydraulic fracturing pump fluidly connected to a well associated with the subterranean formation, and the multi-plunger pump can be configured to pump fluid into a wellbore associated with the well at a high pressure so that the fluid passes from the wellbore into the subterranean formation and fractures the subterranean formation. In an embodiment, a plurality of motors can be positioned to power the multi-plunger pump. The system can further include a variable frequency drive connected to the plurality of motors to control the speeds of the plurality of electric motors, according to an embodiment. In an embodiment, the system can include a planetary gear train having a plurality of input pinion gears in rotational contact with each of the plurality of motors. In an embodiment, a gear ratio of the planetary gear train and a speed at which the plurality of motors operates can be selected so as to limit a maximum pump speed associated with the multi-plunger pump.

The present disclosure is also directed to a method for pumping fluid into a wellbore associated with a subterranean formation. In an embodiment, the method can include fluidly connecting a multi-plunger hydraulic fracturing pump to a well associated with the subterranean formation such that the multi-plunger pump pumps fluid into the wellbore at a high pressure so that fluid passes from the wellbore into the subterranean formation and fractures the subterranean formation. In an embodiment, the method can include powering the multi-plunger pump with a plurality of motors. In an embodiment, the method can further include providing a planetary gear train having a plurality of input pinion gears in rotational contact with each of the plurality of motors so

4

as to translate power from the plurality of motors into a desired pump rate of the multi-plunger pump.

Other aspects and features of the present disclosure will become apparent to those of ordinary skill in the art after reading the detailed description herein and the accompanying figures.

#### BRIEF DESCRIPTION OF DRAWINGS

Some of the features and benefits of the present invention having been stated, others will become apparent as the description proceeds when taken in conjunction with the accompanying drawings, in which:

FIG. 1 is an exploded schematic example of a planetary gear train having multiple input pinions for direct connection to an electric motor, according to an embodiment.

FIG. 2 is an exploded schematic example of a planetary gear train having a speed reduction gearbox mounting for connection to an electric motor, according to an embodiment.

FIG. 3 is a schematic example of a multi-plunger pump having nine plungers and four electric motors mounted for driving the multi-plunger pump, according to an embodiment.

FIGS. 4A-4D are tables showing calculations of plunger pump critical speeds according to embodiments of the present technology.

FIGS. 5A-5D are tables showing data related to certain pumps and transmissions in an example application, meant to highlight certain embodiments of the present technology.

FIGS. 6A-10D are tables showing additional data related to certain pumps and transmissions in further example applications, meant to further highlight embodiments of the present technology.

While the invention will be described in connection with the preferred embodiments, it will be understood that the included description is not intended to limit the invention to the described preferred embodiments. On the contrary, the description is intended to cover all alternatives, modifications, and equivalents, as may be included within the spirit and scope of the invention as defined by the appended claims.

#### DETAILED DESCRIPTION OF INVENTION

The method and system of the present disclosure will now be described more fully hereinafter with reference to the accompanying drawings in which embodiments are shown. The method and system of the present disclosure may be in many different forms and should not be construed as limited to the illustrated embodiments set forth herein; rather, these embodiments are provided so that this disclosure will be thorough and complete, and will fully convey its scope to those skilled in the art. Like numbers refer to like elements throughout.

It is to be further understood that the scope of the present disclosure is not limited to the exact details of construction, operation, exact materials, or embodiments shown and described, as modifications and equivalents will be apparent to one skilled in the art. In the drawings and specification, there have been disclosed illustrative embodiments and, although specific terms are employed, they are used in a generic and descriptive sense only and not for the purpose of limitation.

Described herein is an example of a method and system for providing reciprocating, plunger-style pumps as part of a multi-plunger system for use in hydraulic fracturing opera-

5

tions. Also described are various drive systems for use with the described reciprocating, plunger-style pumps. In various embodiments, the pumps and drive systems may be utilized by conventionally powered (i.e., diesel engine-driven) hydraulic fracturing pumping systems, or in other embodiments by hydraulically powered or electrically powered hydraulic fracturing pumping systems.

Multi-plunger hydraulic fracturing pumps, though known in the art, are typically limited to either triplex (three plungers) or quintuplex (five plungers) arrangements. Common hydraulic fracturing pumps often utilize 8-inch, 10-inch, and 11-inch stroke triplex and quintuplex hydraulic fracturing pumps. Hydraulic fracturing pumps are commonly driven by an engine (usually a 2500 horsepower (HP) diesel engine) and a multiple speed transmission, usually having seven speeds or more. However, many of the top gears, depending on the manufacturer and gear ratios, provide speeds that are above the critical speed of a plunger pump. FIG. 4 details calculations of such plunger critical speeds.

For example, one of the most common transmissions utilized in hydraulic fracturing pump applications is the Caterpillar model TH55-E90, which is a 9-speed transmission. As shown in FIGS. 5A-5D, when this transmission is in 5<sup>th</sup> gear and the engine is operating at 1700 rpm, the critical speed of 120 rpm on an 8-inch stroke pump is reached. Therefore, running the pump with the transmission in any of gears 6 through 9 could cause pump cavitation and damage accumulation to the fluid end.

Similarly, the common hydraulic fracturing application transmissions known in the art may exhibit the same issues in higher gears, as shown below in FIGS. 6A-10D. For example, as shown in FIGS. 6A-6D and FIGS. 7A-7D, the critical plunger speed is reached in the 3<sup>rd</sup> gear, such that use of gears 4-7 may cause cavitation and damage accumulation. Similarly, as shown in FIGS. 8A-8D and FIGS. 9A-9D, the critical plunger speed is reached in the 4<sup>th</sup> gear, such that use of gears 5-7 may cause cavitation and damage accumulation. In FIGS. 10A-10D, the critical plunger speed is reached in the 4<sup>th</sup> gear, such that use of gears 5-9 may result in cavitation and damage accumulation.

Use of the multi-plunger hydraulic fracturing pumps according to the present disclosure may eliminate the need for a diesel engine and transmission. As shown above, diesel engines and transmissions often include multiple gears that accelerate the plunger speed above critical operating speeds. This elimination of the typical engine and transmission from hydraulic fracturing pump units may enable the pumps to be driven by multiple electric motors, according to some embodiments, or multiple hydraulic motors according to other embodiments. These electric or hydraulic motors may have fewer gears such that operation in gears that increase the plunger speeds above their critical speeds can be avoided. By using multiple motors, whether hydraulic or electric, to drive a single pump, pump rates can be increased without exceeding critical plunger speeds.

Use of electric or hydraulic motors, rather than diesel motors, may also make maintenance, repair, and replacement of the electric motors safer and faster than single or double electric motor-driven pumps. This configuration may prevent the fracturing pumps from being run at speeds higher than the critical plunger speed, which may help to minimize pump cavitation and damage accumulation, thus greatly extending the usable life of the pump fluid ends. For example, as discussed in more detail below, the system could be designed to allow only a slight overspeed of the pumps beyond the identified critical pump speed as a safety margin

6

in the event that one of the fleet's pumps were taken offline for repairs or maintenance, and an additional rate of the remaining online pumps were required to complete the stage being pumped.

In the multiple electric motor-driven embodiment of the present disclosure, the electric motors may directly drive the pump, and the gear ratios of the planetary drive along with the electric motor-rated speeds may be chosen to limit the maximum pump speed, so as to not exceed the plunger critical speed. However, the gear ratios and electric motor-rated speeds may also be chosen to allow only a slight percentage of overspeed (higher than critical plunger speed) as a safe margin to enable a fleet of operating pumps to achieve a desired pump rate, for example when one pump is taken off line, as is often the case in hydraulic fracturing. For example, the gear ratios and electric motor-rated speeds may be chosen to operate 5% or less above the critical plunger speed according to some examples; 10% or less above the critical plunger speed according to some examples; or any other acceptable range as will be readily understood by one having ordinary skill in the art. Repairs or maintenance are generally performed as quickly as possible so that the offline pump is available by the next sequential fracturing stage. This same logic could be applied to the hydraulic motor driven system or the system that utilizes speed reduction gearboxes driving a single ring gear.

By the present disclosure, multi-plunger hydraulic fracturing pumps utilizing higher multiples of plungers, such as 7, 9, 11, 13, etc. (septenplex, novenplex, undenplex, tredenplex, etc.), are described. In some embodiments, more than 13 plungers may be utilized, as will be readily understood by one having ordinary skill in the art. In some embodiments, odd numbers of plungers may be chosen so that the pump flow ripple magnitude is minimized. For example, in multi-plunger hydraulic fracturing pumps having higher numbers of plungers, the plunger ripple frequency may be increased, thereby reducing the amount of time between ripples, which may provide a smoother pressure performance for the pumps.

In some embodiments, longer stroke lengths of the plunger pumps may be utilized to reduce plunger speed. For example, a 10-inch stroke pump of a given plunger size may be run at a slower speed than an 8-inch stroke pump of the same plunger size, in order to accomplish the same flow rate. Slowing the plunger down may also decrease the possibility of pump cavitation. For example, when triplex and quintuplex pumps, as are known in the art, are operated at higher rates, conditions for cavitation to occur are measurably higher. According to an embodiment, a critical pump speed may be 120 rpm of the pump crankshaft. With this pump speed, on the currently used 8-inch stroke pumps, the rotational speed translates to an average linear speed of the plungers at a velocity of 32 inches per second. At higher speeds, with every stroke of the plungers, fluid is accelerated into and out of the pump fluid end, creating a likelihood of low pressure regions within the fluid end that approach or dip below vapor pressure values for the fluid, thereby causing cavitation, and ultimately damage accumulation, to occur. The use of longer stroke plungers accordingly contributes critically to longer fluid end life.

Various drive systems for powering multi-plunger hydraulic fracturing pumps are contemplated. According to an embodiment, multiple electric motors may be utilized to power the multi-plunger hydraulic fracturing pump. The number of motors utilized may be selected based on the output hydraulic horsepower for which the pump is designed, in some examples. In other examples, the number

of motors could be determined on an “n plus 1” basis, in which “n” number of motors would be adequate to provide enough input power according to the output hydraulic horsepower for which the pump is designed, and one (“1”) additional motor would be included to allow for a single motor failure or maintenance situation. In such a situation, the failed motor (or motor purposefully removed for maintenance) could be disconnected from the electrical circuit and allowed to freewheel, while the remaining operational motors would still provide adequate power for the pump, according to an embodiment.

In the example illustrated in FIG. 1, an exploded schematic view shows an embodiment of a planetary gear train 100 in which the multiple input pinion gears 135 are directly connected to the electric motors 130. According to the illustrated embodiment, both ends of the pump crankshaft 105 may be powered with an identical planetary gear train 120 and electric motors 130 to enable the motors 130 to be sized small enough to simplify motor removal and installation as compared to a larger single electric motor, or a double electric motor drive system.

In the illustrated embodiment of FIG. 1, eight electric motors 130 may correspond to and drive eight input pinion gears 135 associated with a single main planetary gear 125. The main planetary gear 125 may in turn drive the sun gear 115 positioned central to three planetary gears 120. The final drive gear 110 may have internal gear teeth positioned to catch the external gear teeth of the three planetary gears 120, which may cause rotation of the pump crankshaft 105. In this way, a plurality of electric motors 130 may provide power to a pump crankshaft 105, which may in turn drive a multi-plunger pump, for example as illustrated in FIG. 3 and discussed in greater detail below.

In another embodiment, multiple hydraulic motors may be utilized to power a multi-plunger hydraulic fracturing pump, in which a planetary gear train system 100 similar to that illustrated in FIG. 1 could also be utilized. In an example, a planetary gear train system may be utilized on one or both ends of the pump crankshaft to allow for smaller hydraulic motors to be utilized.

According to an alternate embodiment, for example as illustrated in FIG. 2, a plurality of electric motors or hydraulic motors 230 each may be mounted to a plurality of speed reduction gearboxes 245. FIG. 2 illustrates an exploded schematic example of a planetary gear train 200 having a plurality of speed reduction gearbox 245 mountings for connection to a plurality of electric motors 230, according to an embodiment. The speed reduction gearboxes 245 may, in turn, power a single ring gear 240 to turn the pump crankshaft 205 at the proper rpm needed to drive the multi-plunger pumps at the desired pump rate. In some examples, this configuration may not require use of a multi-planetary gear train system as described above and illustrated in FIG. 1, for example. For example, as illustrated in the embodiment of FIG. 2, the plurality of electric motors 230 may drive the main planetary gear in the form of a ring gear 240 through speed reduction gearboxes 245, and the ring gear 240 may directly turn the pump crankshaft 205. In such an example additional planetary gears 120, as illustrated in the embodiment of FIG. 1, for example, may not be included.

In an embodiment utilizing multiple electric motors, the fleet of fracturing pumps may be powered by multiple electric motors, and overall electric power may be generated by one or more diesel or gas turbines. When the pumps are being brought online to pump fluids into the well, the power may be switched via appropriate switchgear to the electric motors.

In some embodiments, the speed of the motors may be controlled by one or more variable frequency drives (VFD), which may accelerate or decelerate the pump rotational speeds using an S curve. The pump operator may select the various pump speeds via a human-machine interface (HMI) according to some embodiments, for example from inside a data van, or from a “suitcase,” which is a portable, stand-alone HMI. The HMI or suitcase may allow on/off control of the pumps as well as speed control of the pumps, to allow the pumps to run at speeds from zero crankshaft rpm up to the maximum speed, which would correlate with the plunger critical speed.

According to an embodiment, one of the VFDs may be designated as the master VFD, and the remaining VFDs may be designed to share the load required to power the pump under all load conditions. In the case of an overpressure event, the hydraulic fracturing controls may automatically turn the VFD off using the on/off signal for rapid shutdown, instead of using the rpm command, which uses an S curve to control the acceleration and/or deceleration. A manual emergency shutdown may also be included, which uses an HMI (such as a push button or other HMI, which may be electronic and/or manual) to shut off the VFD using the on/off function. This manual emergency shutdown feature may be configured to shut down all VFDs simultaneously, thereby shutting down the entire site. The emergency shutdown may also be configured to stop the VFD on the blender discharge pumps, and may or may not be tied into the electrical microgrid to open breakers, thereby stopping the flow and/or generation of electricity and/or gas compression.

The HMI may be designed to allow only a slight percentage of overspeed (higher than critical plunger speed) as a safe margin to enable a fleet of operating pumps to achieve a desired pump rate when one pump is taken offline, for example, as is often the case in hydraulic fracturing. Repairs or maintenance are generally performed as quickly as possible so that the offline pump is available by the next sequential fracturing stage. This same logic could be applied to the hydraulic motor driven system or the system that utilizes speed reduction gearboxes driving a single ring gear.

FIG. 3 illustrates a schematic example of a multi-plunger pump 300 with four electric motors mounted to the pump for driving the multi-plunger pump, according to an embodiment. In the illustrated embodiment, the multi-plunger pump 300 may include nine plungers positioned at the multi-plunger fluid end 350 of the multi-plunger pump 300. In other embodiments, various other numbers of plungers may be included, as will be readily understood by one having ordinary skill in the art.

A crankshaft centerline 360 may bisect the multi-plunger pump 300 between the multi-plunger fluid end 350 and the pump power end 355. Two electric motors 330 may be positioned on opposing sides of the multi-plunger pump 300, across the crankshaft centerline 360. The four total electric motors 330 may drive the crankshaft associated with the nine plungers, as described above with respect to FIGS. 1 and 2. For example, in some embodiments the four electric motors 330 may drive the crankshaft via one or more planetary gear trains. In some embodiments, a plurality of speed reduction gearboxes may be positioned between the electric motors 330 and the one or more planetary gear trains so as to control the rotational speed of the one or more planetary gear trains and, ultimately, the pump rate of the plungers.

The present invention described herein, therefore, is well adapted to carry out the objects and attain the ends and advantages mentioned, as well as others inherent therein.

9

While a presently preferred embodiment of the invention has been given for purposes of disclosure, numerous changes exist in the details of procedures for accomplishing the desired results. These and other similar modifications will readily suggest themselves to those skilled in the art, and are intended to be encompassed within the spirit of the present invention disclosed herein and the scope of the appended claims.

What is claimed is:

1. A hydraulic fracturing system for fracturing a subterranean formation, the hydraulic fracturing system comprising:

- a multi-plunger hydraulic fracturing pump configured to pump fluid to a wellbore associated with the subterranean formation, the multi-plunger hydraulic fracturing pump comprising a pump crankshaft;
- a plurality of motors positioned to power the multi-plunger hydraulic fracturing pump; and
- a planetary gear train positioned to translate power from the plurality of motors to the pump crankshaft of the multi-plunger hydraulic fracturing pump, the planetary gear train comprising:
  - a plurality of input pinion gears connected to the plurality of motors; and
  - a final drive gear connected to the pump crankshaft of the multi-plunger hydraulic fracturing pump by a plurality of arms extending from the final drive gear.

2. The hydraulic fracturing system of claim 1, wherein the plurality of motors comprises a plurality of electric motors, and each of the plurality of input pinion gears is connected to a respective one of the plurality of electric motors.

3. The hydraulic fracturing system of claim 1, wherein the multi-plunger hydraulic fracturing pump has three plungers.

4. The hydraulic fracturing system of claim 1, wherein the multi-plunger hydraulic fracturing pump has five plungers.

5. The hydraulic fracturing system of claim 1, wherein the multi-plunger hydraulic fracturing pump has seven plungers.

6. The hydraulic fracturing system of claim 1, wherein the multi-plunger hydraulic fracturing pump has nine plungers.

7. The hydraulic fracturing system of claim 1, further comprising a variable frequency drive (VFD) associated with the plurality of motors and configured to control a pump rotational speed of the multi-plunger hydraulic fracturing pump.

8. The hydraulic fracturing system of claim 1, wherein the planetary gear train comprises a main gear that contacts each of the plurality of input pinion gears, wherein the main gear comprises external gear teeth that mate with external gear teeth of the plurality of input pinion gears.

9. The hydraulic fracturing system of claim 8, wherein the planetary gear train comprises:

- a sun gear connected to the main gear by a shaft extending from the main gear; and
- a plurality of planetary gears that each contact the sun gear and the final drive gear, wherein each of the plurality of planetary gears comprises external gear teeth that mate with external gear teeth of the sun gear and with internal gear teeth of the final drive gear.

10. A hydraulic fracturing method comprising:  
by operation of a multi-plunger hydraulic fracturing pump of a hydraulic fracturing system, pumping fluid to a wellbore associated with a subterranean formation, the multiplunger hydraulic fracturing pump comprising a pump crankshaft;  
powering the multi-plunger hydraulic fracturing pump with a plurality of motors; and

10

translating power from the plurality of motors to the multi-plunger hydraulic fracturing pump through a planetary gear train, wherein translating power through the planetary gear train comprises translating power through:

- a plurality of input pinion gears that are driven by the plurality of motors; and
- a final drive gear that drives the pump crankshaft, wherein the final drive gear is connected to the pump crankshaft by a plurality of arms extending from the final drive gear.

11. The hydraulic fracturing method of claim 10, wherein the plurality of motors comprises a plurality of electric motors, and each of the plurality of input pinion gears is driven by a respective one of the plurality of electric motors.

12. The hydraulic fracturing method of claim 10, wherein the multi-plunger hydraulic fracturing pump has three plungers.

13. The hydraulic fracturing method of claim 10, wherein the multi-plunger hydraulic fracturing pump has five plungers.

14. The hydraulic fracturing method of claim 10, wherein the multi-plunger hydraulic fracturing pump has seven plungers.

15. The hydraulic fracturing method of claim 10, wherein the multi-plunger hydraulic fracturing pump has nine plungers.

16. The hydraulic fracturing method of claim 10, comprising, by operation of a variable frequency drive (VFD), controlling a pump rotational speed of the multi-plunger hydraulic fracturing pump.

17. The hydraulic fracturing method of claim 10, wherein translating power through the planetary gear train comprises translating power through a main gear that contacts each of the plurality of input pinion gears, wherein the main gear comprises external gear teeth that mate with external gear teeth of the plurality of input pinion gears.

18. The hydraulic fracturing method of claim 17, wherein translating power through the planetary gear train comprises translating power through:

- a sun gear connected to the main gear by a shaft extending from the main gear; and
- a plurality of planetary gears that contact the sun gear and the final drive gear, wherein each of the plurality of planetary gears comprises external gear teeth that mate with external gear teeth of the sun gear and with internal gear teeth of the final drive gear.

19. The hydraulic fracturing method of claim 10, comprising limiting a maximum pump speed of the multi-plunger hydraulic fracturing pump, wherein the maximum pump speed is limited by a selection of a gear ratio of the planetary gear train and a speed at which the plurality of motors operate.

20. The hydraulic fracturing method of claim 19, wherein the maximum pump speed correlates with a critical plunger speed of the multi-plunger hydraulic fracturing pump.

21. The hydraulic fracturing method of claim 19, wherein the maximum pump speed is 5% over a critical plunger speed of the multi-plunger hydraulic fracturing pump.

22. A hydraulic fracturing system for fracturing a subterranean formation, the hydraulic fracturing system comprising:

- a plurality of electric motors;
- a planetary gear train connected to the plurality of electric motors, the planetary gear train comprising:
  - a plurality of input pinion gears, each driven by a respective one of the plurality of electric motors;

11

12

a main gear driven by the plurality of input pinion gears, the main gear comprising external gear teeth that mate with external gear teeth of the plurality of input pinion gears;  
a sun gear driven by the main gear and connected to the main gear by a shaft;  
planetary gears driven by the sun gear, the planetary gears each comprising external gear teeth that mate with external gear teeth of the sun gear; and  
a final drive gear driven by the planetary gears, the final drive gear comprising internal gear teeth that mate with the external gear teeth of the planetary gears; and  
a multi-plunger hydraulic fracturing pump that pumps fluid to a wellbore and comprises a pump crankshaft that is driven by the final drive gear of the planetary gear train, the final drive gear connected to the pump crankshaft by a plurality of arms extending from the final drive gear.

23. The hydraulic fracturing system of claim 22, further comprising a variable frequency drive (VFD) associated with the plurality of motors and configured to control a pump rotational speed of the multi-plunger hydraulic fracturing pump.

24. The hydraulic fracturing system of claim 23, wherein the multi-plunger hydraulic fracturing pump comprises seven plungers.

25. The hydraulic fracturing system of claim 23, wherein the multi-plunger hydraulic fracturing pump comprises nine plungers.
