According to a recent report, Samsung SDI will invest in batteries used for wearable devices like smartwatches and wireless earbuds to become more of an everyday item.

Since launching curved battery cells for smart bands that boast of the industry's greatest power-storage capacity in 2014. The company has released a wide variety of small-sized batteries, including wearable devices for the wearable devices market, reducing its position as a leading company in battery life.

Batteries for wearable devices are made in various forms that reflect the characteristics of the wearable devices we wear in our bodies. Many manufacturers are developing batteries of different sizes based on the wearable products being used.

Samsung SDI tends to invest more in batteries for wearable devices

Currently, more and more electric vehicles are equipped with a large number of smaller batteries, which makes it harder to confirm that it is a [Samsung SDI](#) no. 1 player in the small battery market. But the company has driven the market by developing different types of small batteries.

[Samsung SDI](#) says its battery is mostly used for wearable devices in wireless earbuds. To take advantage of the rapidly growing wireless earbuds market, Samsung SDI is supplying its coin cell battery, which has the advantage of increasing the sp:

capacity which allows device manufacturers to design their gadgets in different sizes. Samsung SDI develops small batteries that can meet market needs and supply them to wearable devices such as Samsung Electronics' Galaxy Buds Live and Galaxy Watch. The company expects that there will be more applications using its smaller batteries for various wearable devices.
