

HTTP Dynamic Streaming

Flexible delivery of on-demand and live video streaming

The release of the Adobe® Flash® Player 10.1 and Adobe AIR® 2 runtimes introduces support for HTTP Dynamic Streaming for on-demand and live video streaming online. This new delivery method enables on-demand and live adaptive bitrate video streaming of standards-based MP4 media over regular HTTP connections. This capability gives content creators, developers, and publishers more choice in high-quality media delivery while maintaining the reach of the Adobe Flash Platform. While the Real Time Message Protocol (RTMP) remains the protocol of choice for lowest latency, fastest start, dynamic buffering, and stream encryption, HTTP Dynamic Streaming enables leveraging of existing caching infrastructures (for example, content delivery networks, ISPs, office caching, home networking), and provides tools for integrating content preparation into existing encoding workflows. In addition, robust and flexible content protection is available with [Adobe Flash Access™ 2](#) software.

HTTP Dynamic Streaming

Available in late May 2010

HTTP Dynamic Streaming workflow diagram

Both on-demand and live delivery are supported with HTTP Dynamic Streaming. The content preparation workflow for each is slightly different. On-demand content is prepared through a simple post-encoding step that produces MP4 fragment files along with a manifest file.

WHAT'S NEW

Robust, scalable delivery

Use existing caching infrastructures and standard HTTP server hardware to deliver on-demand and live content on a large scale with maximum quality.

An upgrade from progressive delivery

Enjoy enhanced playback features including adaptive bitrate streaming, live support, DVR functionality, and interactive seeking over HTTP connections.

Supporting Flash Access Server for protected streaming

Protect your valuable content with file encryption and fast play start, while still allowing seamless access for the viewer. Maintain control of your content throughout the production workflow.

Multiple video codecs

Encode your content using high-quality Flash Player compatible codec (VP6/MP3, H.264/AAC), and with a simple processing step, create fragmented files for HTTP Dynamic Streaming delivery.

TOP FEATURES OF HTTP DYNAMIC STREAMING

- HD quality with H.264 and AAC
- Adaptive bitrate
- Content protection with Adobe [Flash Access 2](#)
- Support for standard HTTP delivery systems
- Live streaming with DVR support
- On-demand streaming with enhanced seeking
- Client tracking and reporting (with the OSMF Omniture® plug-in)
- [Open Source Media Framework](#) with [sample player](#)
- Multiplatform browser, desktop, and device support
- Linux and Windows Server® support
- MP4 standard format with open file specification ([F4F](#))

[See feature details](#)

Unparalleled reach

Reach the widest possible audience by delivering content to Adobe Flash Player or Adobe AIR applications, allowing users to stream premium content to Mac OS, Windows®, or Linux® desktops.

Open source file specifications

Achieve a live streaming experience using MP4 fragment format, the industry standard for adaptive bitrate delivery.

Open source, customizable media player framework

Quickly and easily add support for HTTP Dynamic Streaming to existing media players by using Open Source Media Framework (OSMF).
