Launch VeriSite Demo	Our refrigeration control equipment is the standard for many of the leading supermarket chains in the United States and abroad. Our systems provide accurate control and monitoring of parallel and single-unit compressor systems, condensers, and distributed control of display fixtures through our case control system. Virtually every refrigeration manufacturer is familiar with our equipment and can factory install it to minimize your installation costs. Our refrigeration controls may be integrated into our building control and/or leak detection systems to form a comprehensive control system for supermarkets and other facilities with commercial refrigeration equipment.  CPC's state-of-the-art building controls have been applied in a wide variety of building designs. Retail, banks, manufacturing plants, and supermarkets are just a few examples of the types of buildings where our controls save energy and improve comfort. Full distributed control of lighting, packaged HVAC units, and other miscellaneous building loads are easily accomplished with our building control systems.

Controlling refrigerant loss has become a high priority for managers in the refrigeration industry. The high cost of replacements, coupled with the increasing government fines levied against those who release CFCs and HCFCs into the atmosphere, drive the need to invest in high-quality leak detection equipment. CPC manufactures a line of products that accurately detect leaks and take immediate action to notify store personnel. Our systems are proven effective in supermarkets, refrigerated warehouses, industrial plants, and any other facility that is concerned about refrigerant leakage. These systems will stand alone or may be connected to our other controllers for remote monitoring and alarming.

Integrating our control systems is easily accomplished through UltraSite, a Windows™ based program that can be used to configure and monitor single or multiple sites. UltraSite can be used to access both CPC refrigeration and building control systems at the site or remotely through the Internet or dial up access.
