

0:03

Ladies and gentlemen, please welcome VP General Manager Database Services, Bala Kuchibhotla.

0:15

Good morning.

0:16

Good morning everyone.

0:17

Hope you guys had a wonderful time.

0:18

Last night, my friend Satyam took all of us through the journey of future of IT.

0:25

But let me try to impress upon that you have to have a need to go back in time if needed.

0:31

Let us take a look at it.

0:33

Sometimes we all lose data.

0:35

It could be very precious right.

0:39

Now, do you, what does it take?

0:42

Like do you need Infinity stones to get back your data or do you need to do intergalactic gymnastics and quantum realm to get back your data?

0:50

No, all you need is Nutanix Time Machine Era,

0:55

Nutanix Era's time Machine will get, will get back your data with a snap.

1:01

Now, Nutanix Era is not just time machine. It's a comprehensive set of database services.

1:07

We started with provisioning copy data management about six months back, went to GA.

1:12

Thank you to all our early customers.

1:14

It's a tremendous start for us.

1:16

Thank you for trusting your 40 terabyte systems, 60 terabyte systems, buildings, and transportation logistics systems with Nutanix Era.

1:25

Now what's new?

1:26

I'm happy to announce that we are extending the HA capability of provisioning to more engines. That is, SQL Server as well as HA for Postgres.

1:35

That means that you can do your AIG clusters.

1:38

And also, I'm super excited to inform that we are introducing a brand new service, one click patching.

1:46

Yes, it's not just for infrastructure upgrades of Nutanix.

1:50

We're going to extend one click patching for your favorite databases

1:53

And finally, we'll make Nutanix Era RBAC enabled.

1:58

What does it mean is you can assign roles and then confine your users to certain type of functionality and confine them to certain type of data.

2:09

Let's see all of this in a quick demo.

2:20

I am logging in as Bala the super user to the Nutanix Central site the the Eras time machine and dashboard.

2:33

As you can see that you can do 7X space savings.

2:38

If you had to do this, 51 databases, 6 databases and 45 clones, you could have incurred 90 terabytes plus.

2:44

But with Nutanix Era you probably are just incurring around 13 terabytes, right?

2:48

So let me quickly do a provisioning demo and then go to the new features.

2:53

To do the provisioning, all you need to do is go to the source, go to the provisioning, pick your choice of engine, Oracle, and then let's do 4-node clusters.

3:04

We're talking about rack database, 4-node rack cluster on Nutanix.

3:10

Now, everything about Nutanix is all about standardization.

3:13

So let me first set the next cluster name.

3:18

The principles of provisioning is all about standardization.

3:22

We let you create standards and then just use them as you feel like.

3:26

So let's talk about compute profile.

3:28

You can pick your own compute profile.

3:30

You can pick your own network profile.

3:32

You can pick your own software image.

3:34

That means that you can create the gold image and let you use in the provisioning.

3:37

So let's go to the next step.

3:39

Let's create a sales database.

3:43

You need to give the service ID.

3:48

Let me give you the password.

3:54

And look at the size of the database, 2 terabytes.

3:58

One thing that you need to take out from provisioning is we will implement all the best practices for you.

4:03

You don't need to worry about how to re-platform your database on Nutanix.

4:07

We will do all the best practices for you.

4:09

You can put your favorite EM agent as part of the post processing tool.

4:13

Now finally you go to the time machine.

4:15

Again, all standards.

4:17

You can pick your own time machine.

4:19

That means that this is a promise of RPO and RTO for that.

4:21

Here we can do 30 days of continuous recovery region, 30 days of daily backups and so on so forth.

4:27

Let's click on the provisioning.

4:29

That's all it takes for 4-node rack system to be provisioned on Nutanix.

4:35

We will do all the steps that are needed.

4:37

We will create the cluster machines, we will allocate the storage.

4:40

We will deploy the software database, software grid, create the ASMDS groups and so on and so forth.

4:46

Create the database.

4:47

Now let me go back and show you what does it mean to do one click patching.

4:51

So let me go to databases again.

4:55

Let me go to one of those clones.

4:57

This is a CRM database clone that I have created and it seems to be running on July PSU if you see July 2018 PSU.
