I. INTRODUCTION

On May 2, 2025, Apple Inc. (“Petitioner”) submitted a petition (Paper 2, “Petition” or “Pet.”) to institute *inter partes* review (“IPR”) of U.S. Patent No. 11,626,904 (EX1001, the “’904 Patent”), challenging Claims 1-20 (the “Challenged Claims”). The Petition asserts that the Challenged Claims are rendered obvious by Certified English translation of International Publication WO 2016/015307 A1 to Liu et al. (EX1012 or “Liu”) in view of Certified English translation of International Publication WO 2016/126099 A1 to Park et al. (EX1010 or “Park”) in further view of US Patent Application Publication No, 20160218778A1 to Ng et al (EX1014 or “Ng”). Pet. at 1.

The Board should deny the Petition for at least the following reasons. First, the Petition does not disclose the claimed “proportional sequency.” Liu merely describes “a reference signal receiving quality (RSRQ), which a POSITA would have recognized is a ratio of RSRP over the received signal strength indicator (RSSI).” Pet. at 29. However, such a ratio is between two separate metrics of channel quality for a single antenna port group and contradicts other claim language that describes “the K channel quality values are Reference Signal Received Powers (RSRPs) or a Signal to Interference plus Noise Ratios (SINRs).” ’904 Patent, Claim 1. Park also only describes computing each of the differentials between the max(RSRP) and individual RSRPs and if a differential is greater than the threshold,

then, and only then, will the UE report such antenna ports. But merely making comparisons between RSRPs is not creating or transmitting [a] ratio(s) of RSRPs.

Second, the Petition and Petitioner's expert declaration provide no evidence for its assertion that, because Park allegedly discloses "general knowledge of using an uplink subframe to information from the UE to the base station" over a PUSCH or PUCCH, a POSITA would have also transmitted first information in a CSI report over a PUSCH or PUCCH.

The Petition is deficient with respect to the '904 Patent's dependent claims and analogues to Claim 1 for the same reasons.

Accordingly, the Board should deny institution of the Petition.

II. THE '904 PATENT

The '904 Patent discloses and claims "a scheme for multi-antenna transmission in a wireless communication system." '904 Patent, at 1:20-21.

The '904 Patent describes why such a scheme is necessary in view of the "urgent problem" of "how to use the information reported by the UE to form the best beam to serve the UE service" where there are a limited number of beams for beam scanning and number of beams reported, as in the prior art:

[T]he base station can perform beam scanning over a period of time resources. The UE selects and reports the beam. However, due to the limitation of air interface resources, the number of beams used for beam scanning and the number of beams reported by the UE are limited.

In addition, due to the uncertainty of the UE location, the beam used for beam scanning does not necessarily include the beam that best serves the UE. How to use the information reported by the UE to form the best beam to serve the UE service is an urgent problem to be solved.

Id. at 1:42-52.

The '904 Patent claims address the aforementioned problem and provide the following advantage:

[T]he advantage of the foregoing method is that the base station may obtain a proportional relationship among reception qualities corresponding to multiple beams, and may generate a more accurate serving beam for the UE according to the proportional relationship, thereby improving transmission quality.

Id. at 2:19-24.

As one example of the advantageous claims, the '904 Patent describes that a first signaling originating from a base station can, in one embodiment of the subject patent specification, comprise quasi-co-located (QCL) information. The UE uses this information to determine K antenna port groups that transmit a wireless signal:

In one embodiment, the first signaling is used to determine the co-located or QCL information.

In one embodiment, the first signaling explicitly indicates the co-located or QCL information.

In one embodiment, the first signaling implicitly indicates the co-located or QCL information.

Id., 6:48-53.

Another aspect of the claimed invention is “a first proportional sequence [that] corresponds to a ratio(ratios) among the K1 channel quality values” and one example of a channel quality value is a Reference Signal Received Power (RSRP). *Id.*, Claim 1. The '904 Patent utilizes channel quality values of RSRP that would create a proportion of one RSRP to all the other RSRPs in the K1 subset of antenna port groups to create a proportional sequence:

In one embodiment, the first proportional sequence includes K1-1 positive real number(s). The K1-1 positive real numbers is(are) a ratio(s) between the channel quality values other than the best channel quality value of the K1 channel quality values and the best channel quality value.

In one embodiment, the first proportional sequence is composed of quantized values corresponding to the K1-1 positive real number(s).

Id., 4:31-38.

In another embodiment, the '904 Patent describes that the claimed sequence consists of the proportions of one RSRP to all the other RSRPs in the K1 subset of antenna port groups. For example, where K1 is equal to 2, the proportional sequence would consist of two values: {1 (the ratio of the first channel quality with itself), the ratio of the second channel quality and the first channel quality}:

The UE receives the first signaling to determine that K1 is equal to 2. The first antenna port group and the second antenna port group are two antenna port groups of the K antenna port groups. The first antenna port group corresponds to the first channel quality. The second

antenna port group is corresponding to the second channel quality. The first channel quality is a best channel quality value of the K channel quality values. The second channel quality is a second best channel quality value of the K channel quality values. The UE reports {the first antenna port group, the second antenna port group, and the first proportional sequence} to the base station. ***The first proportional sequence is composed of 1, ratio of the second channel quality and the first channel quality.***

Id. at 24:26-39.¹

In another embodiment, the '904 Patent also describes a first signaling is used to determine a target threshold, so as to compare a ratio between the second channel quality and first channel quality to the target threshold. *Id.*, Claim 1.

III. CLAIM CONSTRUCTION

For the purposes of this Preliminary Response only, Patent Owner believes that claim construction is not required to resolve any issues. Pet. at 5-6.

IV. LEVEL OF ORDINARY SKILL IN THE ART

For the purposes of this Preliminary Response only, Patent Owner utilizes Petitioner's proposed level of skill in the art: "bachelor's degree in electrical engineering, computer engineering, computer science, or a similar field, along with two years of experience designing or developing wireless networks, which experience including long-term evolution LTE/4G or 5G new radio (NR) cellular technology. Additional years of experience could substitute for an advanced-level

¹ Emphasis added unless otherwise noted.

degree (and vice versa).” Pet. at 4-5 (citations omitted).

**V. PETITIONER HAS NOT DEMONSTRATED A REASONABLE
LIKELIHOOD OF SUCCESS FOR THE GROUNDS
ADVANCED IN THE PETITION, AND THE PETITION
SHOULD BE DENIED**

Anticipation under 35 U.S.C. § 102 is a high bar to meet. A claim is anticipated only if each and every element as set forth in the claim is found, either expressly or inherently described, in a single prior art reference. *Verdegaal Bros., Inc. v. Union Oil Co. of Cal.*, 814 F.2d 628, 631 (Fed. Cir. 1987). The identical invention must be shown in as complete detail as is contained in the claim. *Richardson v. Suzuki Motor Co.*, 868 F.2d 1226, 1236 (Fed. Cir. 1989).

The question of obviousness is resolved on the basis of underlying factual determinations, including: (1) the scope and content of the prior art, (2) any differences between the claimed subject matter and the prior art, (3) the level of skill in the art, and (4) so-called secondary considerations where in evidence. *Graham v. John Deere Co. of Kansas City*, 383 U.S. 1, 17-18 (1966); *KSR Int’l Co. v. Teleflex Inc.*, 550 U.S. 398, 406 (2007). The question is not whether the differences themselves would have been obvious, but whether the claimed invention as a whole would have been obvious. *Stratoflex, Inc. v. Aeroquip Corp.*, 713 F.2d 1530, 1537 (Fed. Cir. 1983).

The Board has held that a failure to identify the differences between the claimed subject matter and the prior art is fatal to an obviousness challenge. *See, Apple, Inc. v. Contentguard Holdings, Inc.*, IPR2015-00355, Decision Denying Institution of *Inter Partes* Review, Paper 9 at 9-10 (P.T.A.B. June 26, 2015) (denying institution for failure to identify the differences between the claimed subject matter and the prior art).

In arriving at an obviousness determination, the Board must sufficiently explain and support the conclusions that the prior-art references disclose all the elements recited in the Challenged Claims and a relevant, skilled artisan not only could have made, but would have been motivated to combine all the prior art references in the way the patent claims and reasonably expected success. *Pers. Web Techs., LLC v. Apple, Inc.*, 848 F.3d 987, 994 (Fed. Cir. 2017). That is, even if all the claim elements are found across a number of references, an obviousness determination must consider whether a person of ordinary skill in the art would have the motivation to combine those references. *Intelligent Bio-Sys., Inc. v. Illumina Cambridge Ltd.*, 821 F.3d 1359, 1368 (Fed. Cir. 2016); *Los Angeles Biomedical Rsch. Inst. at Harbor-UCLA Med. Ctr. v. Eli Lilly & Co.*, 849 F.3d 1049, 1067 (Fed. Cir. 2017) (vacating and remanding an obviousness determination, in part, because the Board did not make factual finding as to whether there was an apparent reason to combine all three prior art references to achieve the claimed invention and whether

a person of skill in the art would have had a reasonable expectation of success from such a combination). This combinability determination, as supported by an articulated motivation to combine, requires a plausible rationale as to why those prior art references would have worked together. *Broadcom Corp. v. Emulex Corp.*, 732 F.3d 1325, 1335 (Fed. Cir. 2013). Absent some articulated rationale, a “common sense” finding is no different than the conclusory statement “would have been obvious.” *In re Van Os*, 844 F.3d 1359, 1361 (Fed. Cir. 2017). Of additional importance, “knowledge of a problem and motivation to solve it are entirely different from motivation to combine particular references” *Innogenetics, N.V. v. Abbott Lab’ys*, 512 F.3d 1363, 1373 (Fed. Cir. 2008).

A. The Petition Fails to Render Obvious Claim 1 in View of Liu and Park and Ng

1. Liu in View of Park and Ng Does Not Render Obvious “a first proportional sequence corresponds to a ratio (ratios) among the K1 channel quality values,” as Required by Claim 1.d5

Claim [1.d5] of the ’904 Patent recites “a first proportional sequence corresponds to a ratio (ratios) among the K1 channel quality values.”

The Petition only discloses that Liu describes “a reference signal receiving quality (RSRQ), which a POSITA would have recognized is a ratio of RSRP over the received signal strength indicator (RSSI).” Pet. at 29 (citing EX1012, 28, 36-39,

22, 32). However, the Petition fails to disclose how such a ratio is also a proportion, because it is between two separate metrics of channel quality for a single antenna port group. Additionally, Liu's RSSI falls squarely outside of the claim language that describes "the K channel quality values are Reference Signal Received Powers (RSRPs) or Signal to Interference plus Noise Ratios (SINRs)." '904 Patent, Claim 1.

Petitioner tacitly recognizes that Liu does not disclose this claim limitation for the reasons above, and therefore relies on Park. However, Petitioner's reliance on Park does not remedy the deficiencies of Liu because, even if Park described creating ratios comparing one RSRP with the maximum RSRP as Petitioner alleges (Pet. at 29-30), Park still does not disclose the claimed "sequence." Park describes that "reporting is limited to the RSRP of the selected antenna ports, namely the RSRP of the ports that fall within a certain range compared to the max (RSRP (r, m)). Namely, the RSRPs of the maximum L antenna ports wherein the RSRP difference is higher than the threshold in terms of the RSRP ratio or dB scale are reported." EX1010, [372]. In other words, Park computes each of the differentials between the max(RSRP) and individual RSRPs and if *a differential* is greater than the threshold, then, and only then, will the UE report such antenna ports. Petitioner confirms that understanding by arguing that "Park's FIG. 12 confirms the comparison of each measured RSRP to the max(RSRP)." Pet. at 30 (citing EX1010, [0376-378], FIG.

12). Merely making comparisons between RSRPs is not creating or transmitting [a] ratio(s) of RSRPs. Therefore, the Petition fails to show how Park discloses the claimed “proportional sequence.”

Therefore, the Petition is deficient because it fails to show that Claim [1.d5] is rendered obvious by the combination of Liu in view of Park and Ng.

2. Liu in View of Park and Ng Does Not Render Obvious “*the first information is used to determine the K1 antenna port groups and the first proportional sequence,*” as Required by Claim [1.d6]

Claim [1.d6] of the '904 Patent recites “the first information is used to determine the K1 antenna port groups and the first proportional sequence.”

As noted above, Liu in combination with Park, does not disclose the claimed “first proportional sequence,” and therefore cannot disclose, teach, or suggest “the first information is used to determine the . . . first proportional sequence.” Specifically, as noted above, Petitioner confirms that the UE of Liu only reports a “maximum of M” ratios that have already met a threshold and not a sequence of all K1 channel quality ratios.

Therefore, the Petition is deficient because it fails to show that Claim [1.d6] is rendered obvious by the combination of Liu in view of Park and Ng.

**3. Liu in View of Park and Ng Does Not Render Obvious
“the first signaling is a RRC (Radio Resource Control)
signaling; the first information is transmitted in a CSI
(Channel State Information) report; the first
information is carried by a PUSCH (Physical Uplink
Shared Channel) or a PUCCH (Physical Uplink
Control Channel),” as Required by Claim [1.d10]**

Claim [1.d10] of the '904 Patent recites “the first signaling is a RRC (Radio Resource Control) signaling; the first information is transmitted in a CSI (Channel State Information) report; the first information is carried by a PUSCH (Physical Uplink Shared Channel) or a PUCCH (Physical Uplink Control Channel).”

The Petition merely glosses over the required limitation that “the first information is carried by a PUSCH (Physical Uplink Shared Channel) or a PUCCH (Physical Uplink Control Channel).” Petitioner even acknowledges that Park only “reveals the general knowledge of using an uplink subframe to information from the UE to the base station where ‘the uplink subframe may be divided in the frequency domain into a control region and a data region.’” Pet. at 44-45 (citing EX1014, [0089]).

But general uplink subframe information is not the same as the claimed first information, that is transmitted in a CSI report. And it does not automatically follow that, because one very general type of information is transmitted over PUSCH or PUCCH, another type of specific information would also be transmitted using the same channels. Realizing this discrepancy, Petitioner, without any support other than

its own expert declaration, argues that a POSITA would simply be motivated to use PUSCH or PUCCH for that information:

It would have been obvious to use one of the PUSCH and PUCCH, as already disclosed in Park, to carry the CSI-RS measurement report, as provided by *supra* [1.c]/[1.d6], so that the base station is apprised of the results of the measurements by the UE. EX1003, ¶¶140-141. A POSITA would have been motivated to inform the base station of the measurement results when the PUSCH and PUCCH channels present ready-to-use uplink channels for feedbacking the first information to the base station. Doing so would have a reasonable expectation of success because using one of the PUSCH and PUCCH channels to carry the CSI-RS measurement report merely involves “the predictable use of prior art elements according to their established functions” to “yield predictable results” while retaining the fundamental operations of Liu’s MIMO system. *KSR*, 550 U.S. 398, 416-417; EX1003, ¶¶141-142.

Pet. at 45. Petitioner’s expert declaration fares no better because it is duplicative of the Petition and it also cites to nothing for its conclusions:

141. It would have been obvious to use one of the PUSCH and PUCCH, as already disclosed in Park, to carry the CSI-RS measurement report, as provided by *supra* [1.c]/[1.d6], so that the base station is apprised of the results of the measurements by the UE. A POSITA would have been motivated to inform the base station of the measurement results when the PUSCH and PUCCH channels present ready-to-use uplink channels for feedbacking the first information to the base station. Doing so would have a reasonable expectation of success because using one of the PUSCH and PUCCH channels to carry the CSI-RS measurement report merely involves “the predictable use of prior art elements according to their established functions” to “yield predictable results” while retaining the fundamental operations of Liu’s MIMO system.

APPLE-1003, ¶ 141. The ipse dixit of Petitioner’s expert should be afforded no weight. As such, the Petition fails to show that the first information is carried by a PUSCH (Physical Uplink Shared Channel) or a PUCCH (Physical Uplink Control Channel).”

Therefore, the Petition is deficient because it fails to show that Claim [1.d10] is rendered obvious by the combination of Liu in view of Park and Ng.

B. Claims 2-20 Are Not Rendered Obvious by Liu in View of Park and Ng

1. Independent Claims 6, 11, and 16 Are Not Rendered Obvious by Liu in View of Park and Ng

Claim 6 recites “[a] method for multi-antenna transmission in a base station” that mirrors the claim limitations of Claim 1, which recites “[a] method for multi-antenna transmission in a user equipment (UE).” In other words, Claim 6 discloses

a method from the perspective of the base station that is in communication with the UE in Claim 1. For at least the same reasons as Claim 1, the Petition fails to show that Liu in view of Park renders obvious Claim 6.

Claim 11 recites “[a] user equipment (UE) for multi-antenna transmission,” which is the apparatus claim of Claim 1. For at least the same reasons as Claim 1, the Petition fails to show that Liu in view of Park renders obvious Claim 11.

Independent Claim 16 recites “[a] base station device for multi-antenna transmission” that mirrors the claim limitations of Claim 11, which recites “[a] user equipment (UE) for multi-antenna transmission.” In other words, Claim 16 discloses the base station device that is in communication with the UE in Claim 11. For at least the same reasons as Claim 11, the Petition fails to show that Liu in view of Park renders obvious Claim 16.

**2. Dependent Claims 2-5, 7-10, 12-15, and 17-20 Are Not
Rendered Obvious by Liu in View of Park and Ng**

Claims 2-5 are dependent on Claim 1, Claims 7-10 are dependent on Claim 6, Claims 12-15 are dependent on Claim 11, and Claims 17-20 are dependent on Claim 16. Therefore, the Petition fails to render obvious Claims 2-5, 7-10, 12-15, and 17-20 for at least the same reasons as Claims 1, 6, 11, and 16, respectively.

VII. CONCLUSION

For the foregoing reasons, Patent Owner respectfully requests that the Board deny institution of the Petition in its entirety.

Respectfully submitted,
