Dear Peter,

I was referred to connect with you from James Schuessler. W&Wsens Devices Inc. based in Los Altos California, has developed Silicon and Germanium on Silicon Photodetectors compatible with CMOS technology for high speed, high efficiency optical data communications. Our technology is also applicable to monolithically integrated LiDAR solutions (time-of-flight photo-sensor / 3D imaging). We are currently

Peter Deane

(name of high photo sensor / 3D imaging). We are currently engaging in M&A discussions and are being represented by Bank of America Merrill Lynch headed by Marco Chisari. Please see the attached deck for an outline of our technology and intellectual property portfolio. Feel free to reach out to any of the members listed below to schedule an initial phone conference.

Best Regards,

SY Wang

Attached below are 3 decks (DCI, LiDAR, Integration) outlining W&Wsens Devices break through technology of high speed AND high efficiency Silicon PD / APD using light trapping. Our thin Si PD / APD is fully compatible with standard CMOS / BiCMOS manufacturing enabling single chip integration to reduce costs and improve performance. We would like to meet with you to discuss W&W break through technology further.

Best,

SY Wang

Peter Deane • 1:09 PM

Hi SY

Nice to hear from you again - I'm afraid I'm no longer directly linked with Samsung VC funds but would be happy to forward these on to my contacts who are still there.

Please let me know. Hope you are well

Peter

Peter Deane

Shih-Yuan (SY) Wang • 3:03 PM

Hi Peter,

Ok - great. Thanks for forwarding, and yes doing well - in the process of selling the company. Thanks again.

Best,

SY

Peter Deane • 6:21 PM

Ok will do. If you are selling, I have contacts at Woodside Capital Partners if you would like me to forward to them too? Rudy Berger, Managing partner. Knows semis.

Shih-Yuan (SY) Wang • 6:44 PM

Hi Peter,

Yes that would be great, thank you very much!

Best,

SY

WWSens CIS-Tof deck

To: peter.deane@sbcglobal.net

Sent - Gmail February 20, 2020 at 2:39 PM

Peter,

W&W is the first to demonstrate high efficiency and low jitter in thin silicon photosensors using photon / light trapping technology that is fully compatible with current state of the art CMOS manufacturing.

Extremely low jitter in the 10s of pico seconds allows for high depth resolution in the millimeter range for applications such as 3D imaging and AR/VR and robotics.

W&W has developed an extensive global IP portfolio for light trapping technology in thin silicon photosensors such as PD / APD / SPAD – please see page 6 of our presentation deck.

Lastly, our light trapping technology to enhance IR sensitivity in thin silicon has been corroborated by Sony – paper attached.

Thanks, and we look forward to further discussions with your team.

Best,
Lihan
