Hi Jim,

Attached below are 3 decks (DCI, LiDAR, Integration) outlining W&Wsens Devices break through technology of high speed AND high efficiency Silicon PD / APD using light trapping. Our thin Si PD / APD is fully compatible with standard CMOS / BiCMOS manufacturing enabling single chip integration to reduce costs and improve performance. We would like to meet with you to discuss W&W break through technology further. Please let us know when you are free to connect, thanks again.

WWSens CIS-ToF deck

To: jim.ting@ssi.samsung.com, Cc: Shih-Yuan Wang

James,

W&W is the first to demonstrate high efficiency and low jitter in thin silicon photosensors using photon / light trapping technology that is fully compatible with current state of the art CMOS manufacturing.

Extremely low jitter in the 10s of pico seconds allows for high depth resolution in the millimeter range for applications such as 3D imaging and AR/VR and robotics.

W&W has developed an extensive global IP portfolio for light trapping technology in thin silicon photosensors such as PD / APD / SPAD – please see page 6 of our presentation deck.

Lastly, our light trapping technology to enhance IR sensitivity in thin silicon has been corroborated by Sony – paper attached.

Thanks, and we look forward to further discussions with your team.

Best,
Lihan

Subject: W&Wsens Devices

Hi Jim,

Thanks for your response - we hope you and your family remain safe and healthy.

Our IP portfolio is very extensive and enforceable because our technology is different from surface texturing such as black silicon (SiOynx) and relies on a completely new invention where the micro holes behave like a low Q resonator with a Q factor ranging from 5 - 50 such that the spectrum is very broad. This allows a single micro hole in a pixel to enhance the sensitivity. This technology is new for CIS and also allows for very low jitter for ToF applications.

At this time many major companies are keen on our technology and we following a path of non-exclusive licensing. It may be in Samsung's best interest to acquire a non-exclusive license from W&Wsens Devices in the event that Samsung uses this technology for their future CIS-ToF IR applications, so that Samsung will not be excluded from using this technology.

However we are also open for Samsung to acquire our IP completely at this point in time.

Best,
Lihan

Wwsens CIS paper

Sent - Gmail

November 30, 2020 at 12:15 PM

[Details](#)

To: jim.ting@ssi.samsung.com, jim.ting@partner.samsung.com, Cc: Shih-Yuan Wang

Hi Jim,

I hope you and your family continue to remain well. Attached please find a pre-print of our CIS paper submitted to IEEE Sensors Journal. The significance of these new results show that a single microhole in a small pixel (either and inverted pyramid or funnel shaped) have optical efficiencies superior than inverted pyramid arrays as disclosed by Sony whos structure is also disclosed in our patent application.

In this paper we made a detailed comparison of pixels with inverted pyramid arrays and pixels with a single microhole of various shapes. As you can see in table 1 a microhole with a cross section shape of a funnel obtained 71% optical efficiency at 850 nm and 62% OE at 940 nm – these results were obtained using the Lumerical program.

The thickness of the Si is 3 microns for pixel size of 1.12 micron x 1.12 micron.

We will be happy to discuss these results with you and your team, thanks.

Best,
Lihan

WWSens Partnerships

To: jim.ting@ssi.samsung.com, Cc: SHIH-YUAN WANG

Hi Jim,

Happy new year - I hope you and your family are well and healthy.

Attached please find our new W&Wsens presentation deck and paper on CMOS image sensors submitted to IEEE sensors journal. Our focus now is on CMOS image sensors, in particular high resolution CIS for pixel sizes about $1\mu\text{m} \times 1\mu\text{m}$, and where a single microhole per pixel can be 220% higher optical efficiency than a comparable flat pixel. Our technology has been corroborated by Sony, Samsung and numerous universities and where we hold an extensive global IP portfolio.

In addition to CIS our technology is applicable to LiDAR and optical interconnects operating at 56Gb/s or higher per PD, and where a PD array can easily achieve 1Tb/s.

We would like to explore with you possible partnership, licensing and / or investment with Samsung in using this technology for CMOS image sensors. As you can see our technology is fully CMOS compatible and where the microhole has a diameter of approximately 700 - 900 nm allowing these pixels to be fabricated at a low technology node. We look forward to hearing from you soon.

Best,
Lihan
