A mesh STA uses a mesh peering instance controller to manage all mesh peering instances.

The mesh peering instance controller performs the following functions:

- Create and delete MPM finite state machines and AMPE finite state machines
- Manage instance identifiers for each mesh peering instance
- Manage mesh TKSAs for each mesh peering instance when dot11MeshSecurityActivated is true
- Preprocess the incoming mesh peering Management frames and pass the frames to the finite state machine with matching instance identifier
- Pass internal commands to the finite state machine with matching instance identifier

A mesh peering instance is identified by a mesh peering instance identifier. The mesh peering instance identifier is the set of localLinkID, localMAC, and peerMAC.

A mesh peering instance consists of its identifier (the localLinkID, localMAC, peerMAC), a peerLinkID (an integer generated by the peer mesh STA or candidate peer mesh STA), and the configuration and capability negotiated and agreed upon by exchanging Mesh Peering Open frames (see 9.6.16.2 (Mesh Peering Open frame format)) and Mesh Peering Confirm frames (see 9.6.16.3 (Mesh Peering Confirm frame format)). If dot11MeshSecurityActivated is true, the mesh peering instance also contains a PMKID identifying the shared PMKSA, a localNonce chosen by the mesh STA and a peerNonce chosen by the peer mesh STA or candidate peer mesh STA.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The localMAC is the MAC address of the mesh STA that is managing this mesh peering instance. The peerMAC is the MAC address of the peer mesh STA or the candidate peer mesh STA. The localLinkID is an integer generated by the mesh STA. The localLinkID shall be unique among all existing link identifiers used by the mesh STA for its MPM finite state machines. The mesh STA selects the localLinkID to provide high assurance that the same number has not been used to identify a recent MPM finite state machine. The peerLinkID is the localLinkID of the peer mesh STA or candidate peer mesh STA and is supplied in the Mesh Peering Management element (see 9.4.2.102 (Mesh Peering Management element)) of the Mesh Peering Open and Mesh Peering Confirm frames.

A mesh peering instance is controlled by an MPM finite state machine (see Table 14-2 (MPM finite state machine)) or an AMPE finite state machine (see Table 14-3 (AMPE finite state machine)).

14.3.4.2 Creating a new mesh peering instance

The mesh peering instance controller creates a new mesh peering instance after either of the following two events:

— The receipt of a Mesh Peering Open frame from a candidate peer mesh STA according to the rules of 14.3.5 (Mesh peering instance selection)
— The receipt of an MLME-MESHPEERINGMANAGEMENT.request primitive with a Mesh Peering Open frame

A unique localLinkID shall be generated for the mesh peering instance. If the mesh peering instance is established by AMPE, a random local nonce shall also be generated.

A mesh STA may create multiple mesh peering instances to establish a peering with the same candidate peer mesh STA.

14.3.4.3 Deleting mesh peering instances

The mesh peering instance controller deletes a mesh peering instance after either:

— Expiration of a holding timer (see 14.4.4 (Timers)).
— The acceptance of a peer's response to an existing request to close the peering (see 14.4.3 (Events and actions)).
— Indication from the SME that the peer mesh STA, or candidate peer mesh STA, has deauthenticated.

When the deletion occurs, the mesh TKSA that is bound to the mesh peering shall be deleted.

14.3.5 Mesh peering instance selection

The content of a mesh peering Management frame received from a candidate peer mesh STA, and the set of mesh peering instances in the mesh peering instance controller determine whether

— A new mesh peering instance is created (see 14.3.4.2 (Creating a new mesh peering instance)); or,
— An existing mesh peering instance is updated

If dot11MeshSecurityActivated is true and the mesh STA shares a PMK with the candidate peer mesh STA but the Mesh Peering Protocol Identifier field in the Mesh Peering Management element of the frame indicates "mesh peering management protocol," the frame shall be silently discarded.

If dot11MeshSecurityActivated is true and the mesh STA shares a PMK with the candidate peer mesh STA but either the Mesh Peering element or the MIC element are not present in the frame, the frame shall be silently discarded.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If dot11MeshSecurityActivated is false but the Mesh Peering Protocol Identifier field in the Mesh Peering Management element of the received frame indicates "authenticated mesh peering exchange," the frame shall be silently discarded.

If dot11MeshSecurityActivated is false but either the Mesh Peering element or the MIC element is present in the frame, the frame shall be silently discarded.

If the frame contains a group address in TA or RA, it shall be silently discarded.

If the incoming mesh peering Management frame is for AMPE and the Chosen PMK from the received frame contains a PMKID that does not identify a valid mesh PMKSA, the frame shall be silently discarded.

If the mesh peering Management frame has not been silently discarded, the mesh peering instance controller attempts to locate a matching mesh peering instance identifier. A match is determined by comparing the contents of the mesh peering Management frame with each peering instance. A match is found if all of the following conditions are true:

— The transmitter's MAC address (Address 2) is the same as the peerMAC of the mesh peering instance
— The receiver's MAC address (Address 1) is the same as the localMAC of the mesh peering instance
— The value of the Peer Link ID field is the same as the localLinkID of the mesh peering instance

If the incoming frame is a Mesh Peering Open frame and no matching peering instance was found, a new mesh peering instance is created (and a new Mesh TSKA if dot11MeshSecurityActivated is true). See 14.3.4.2 (Creating a new mesh peering instance).

If the incoming frame is a Mesh Peering Confirm or Mesh Peering Close frame and no matching mesh peering instance is found, it shall be silently discarded.

If the incoming mesh peering Management frame is for AMPE and has not been discarded it shall be further processed as follows:

— If the Peer Nonce field is present in the received frame, and the localNonce in the mesh peering instance is different from the Peer Nonce field of the received frame, the frame shall be dropped.
— If the peerNonce in the mesh peering instance exists and is different from the Local Nonce field of the received frame, the frame shall be dropped.

14.3.6 Mesh peering open

14.3.6.1 Generating Mesh Peering Open frames

A Mesh Peering Open frame is generated as a result of a sendOpen() action (see 14.4.3 (Events and actions)).

The contents of the frame are described in 9.6.16.2.2 (Mesh Peering Open frame details).

14.3.6.2 Mesh Peering Open frame processing

The mesh STA checks that the Mesh ID element and Mesh Configuration element of the Mesh Peering Open frame is identical to its own mesh STA configuration as specified in 14.2.3 (Mesh profile) and 14.2.4 (Mesh STA configuration). If a mismatch is found the frame shall be rejected with a reason code of MESH-CONFIGURATION-POLICY-VIOLATION and the mesh peering establishment attempt shall be terminated.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When the mesh STA has established a mesh PMKSA with the candidate peer mesh STA, the mesh peering instance controller shall silently discard the Mesh Peering Open frame in the following two conditions:

— The Mesh Peering Open frame supports MPM protocol and the negotiated active authentication is SAE, or

— The Mesh Peering Open frame supports AMPE but the PMKID in the Chosen PMK field in the Authenticated Mesh Peering Exchange element does not identify a mesh PMKSA.

If the Mesh Peering Open frame is not discarded, the mesh peering instance controller actively rejects or accepts the mesh peering open request (see 14.4 (Mesh peering management finite state machine (MPM FSM))). If dot11MeshAcceptingAdditionalPeerings is set to 0 the Mesh Peering Open request shall be rejected with reason code MESH-MAX-PEERS.

If the peerLinkID in the mesh peering instance has not been set, the Local Link ID field of the Mesh Peering Open request shall be copied into the peerLinkID in the mesh peering instance. If the incoming Mesh Peering Open frame is for AMPE and the peerNonce in the mesh peering instance has not been set, the Local Nonce field in the incoming Mesh Peering Open frame shall be copied into the peerNonce in the mesh peering instance.

The mesh peering open request may be rejected due to an internal reason with a reason code of MESH-PEERING-CANCELED.

NOTE—Example internal reasons to reject new mesh peering request could be the mesh STA is configured to reject mesh peering request from another specific peer mesh STA.

If the Mesh Peering Open request is rejected, the REQ_RJCT event shall be passed with the specified reason code to the protocol finite state machine to actively reject the mesh peering open request.

14.3.7 Mesh peering confirm

14.3.7.1 Generating Mesh Peering Confirm frames

A Mesh Peering Confirm frame is generated as a result of a sendConfirm() action (see 14.4.3 (Events and actions)).

The contents of the frame are described in 9.6.16.3.2 (Mesh Peering Confirm frame details).

14.3.7.2 Mesh Peering Confirm frame processing

The mesh STA shall check that the Mesh ID element and Mesh Configuration element of the Mesh Peering Confirm frame match its own mesh STA configuration as specified in 14.2.3 (Mesh profile) and 14.2.4 (Mesh STA configuration). If a mismatch is found, the frame shall be rejected with the reason code of MESH-INCONSISTENT-PARAMETERS.

If the Mesh Peering Confirm frame is rejected, the REQ_RJCT event shall be passed with the specified reason code to the protocol finite state machine to actively reject the mesh peering confirm.

Otherwise, the mesh STA accepts the Mesh Peering Confirm frame and performs the actions described in 14.4 (Mesh peering management finite state machine (MPM FSM)).

If the peerLinkID in the mesh peering instance has not been set, the Local Link ID field of the Mesh Peering Confirm request shall be copied into the peerLinkID in the mesh peering instance. If the incoming Mesh Peering Confirm frame is for AMPE and the peerNonce in the mesh peering instance has not been set, the Local Nonce field in the incoming Mesh Peering Confirm frame shall be copied into the peerNonce in the mesh peering instance.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.3.8 Mesh peering close

14.3.8.1 Generating Mesh Peering Close frames

A Mesh Peering Close frame is generated as a result of a sendClose() action (see 14.4.3 (Events and actions)).

The contents of the frame are described in 9.6.16.4.2 (Mesh Peering Close frame details).

When the Mesh Peering Close is generated as a result of a CNCL event, the reason code is MESH-PEERING-CANCELED. When the Mesh Peering Close is generated as a result of a CLS_ACPT event, the reason code is MESH-CLOSE-RCVD.

14.3.8.2 Mesh Peering Close frame processing

The mesh STA shall reject the Mesh Peering Close frame if the value in the Mesh ID element is not the same as the mesh STA's mesh profile. Otherwise, the mesh STA accepts the Mesh Peering Close frame and performs the actions described in 14.4 (Mesh peering management finite state machine (MPM FSM)).

14.4 Mesh peering management finite state machine (MPM FSM)

14.4.1 General

Each mesh peering instance, including its states and resource, are managed by a mesh peering management finite state machine (MPM FSM). The MPM FSM uses MLME primitives to control the mesh STA to send and receive mesh peering Management frames.

14.4.2 States

The MPM FSM uses the following six states:

— IDLE—IDLE state is a terminal state. In the IDLE state, the MPM FSM is ready to start a new mesh peering instance by either passively listening for an incoming Mesh Peering Open frame or actively initiating a mesh peering instance.

— OPN_SNT—In the OPN_SNT state, the finite state machine has sent a Mesh Peering Open frame and is waiting for a Mesh Peering Open frame and Mesh Peering Confirm frame from the candidate peer mesh STA.

— CNF_RCVD—In the CNF_RCVD state, the finite state machine has received a Mesh Peering Confirm frame, but has not received a Mesh Peering Open frame. The mesh STA has not sent the corresponding Mesh Peering Confirm frame yet.

— OPN_RCVD—In the OPN_RCVD state, the finite state machine has received only the Mesh Peering Open frame but not the Mesh Peering Confirm. The mesh STA has also sent a Mesh Peering Confirm frame upon receiving a Mesh Peering Open frame.

— ESTAB—In the ESTAB state, the finite state machine has received both the Mesh Peering Open and Mesh Peering Confirm frames. The mesh STA has also sent both the Mesh Peering Open frame and Mesh Peering Confirm frame. The mesh peering is established and configured for exchanging frames with the peer mesh STA in the ESTAB state.

— HOLDING—In the HOLDING state, the finite state machine is closing the mesh peering instance with the peer mesh STA or the candidate peer mesh STA.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.4.3 Events and actions

The finite state machine uses three types of events: 1) events for state machine transitions; 2) external events generated by frame processing; and 3) events associated with internal timers.

The events for state machine transitions are as follows:

— CNCL(localLinkID, peerMAC, ReasonCode)—Used to instruct the mesh peering instance to cancel the mesh peering with the peer mesh STA. localLinkID identifies the MPM FSM for the corresponding mesh peering instance. peerMAC is the MAC address of the peer mesh entity. ReasonCode is used to inform the reason to cancel the mesh peering instance. See 14.3.8.2 (Mesh Peering Close frame processing).

— ACTOPN(peerMAC, localLinkID)—The SME uses this event to create a new mesh peering instance to actively initiate the mesh peering establishment with the candidate peer mesh STA whose MAC address is peerMAC. localLinkID identifies the MPM FSM.

The events generated by frame processing are as follows:

— OPN_ACPT—PeeringOpen_Accept(peerMAC, peerLinkID) event indicates that a Mesh Peering Open frame meeting the correctness criteria of 14.3.6 (Mesh peering open) has been received from peerMAC for the mesh peering instance identified by peerLinkID.

— OPN_RJCT—PeeringOpen_Reject(peerMAC, peerLinkID, meshConfiguration, reasonCode) event indicates that a Mesh Peering Open frame from peerMAC for the mesh peering instance identified by peerLinkID is rejected due to incomplete or erroneous mesh STA configuration (see 14.2.4 (Mesh STA configuration)), as indicated by meshConfiguration, with reasonCode being the specific reason for rejection of the Mesh Peering Open frame. See 14.3.6.2 (Mesh Peering Open frame processing).

— CNF_ACPT—PeeringConfirm_Accept(peerMAC, localLinkID, peerLinkID) event indicates that a Mesh Peering Confirm frame meeting the correctness criteria of 14.3.7 (Mesh peering confirm) has been received from peerMAC for the mesh peering instance identified by localLinkID and peerLinkID.

— CNF_RJCT—PeeringConfirm_Reject(peerMAC, localLinkID, peerLinkID, reasonCode) event indicates that a Mesh Peering Confirm frame from peerMAC for the mesh peering instance identified by localLinkID and peerLinkID is rejected due to incomplete or erroneous configuration, and reasonCode is the specific reason for rejection of the Confirm frame. See 14.3.7.2 (Mesh Peering Confirm frame processing).

— CLS_ACPT—PeeringClose_Accept(peerMAC, localLinkID, peerLinkID, reasonCode) event indicates that a Mesh Peering Close frame meeting the correctness criteria of 14.3.8 (Mesh peering close) has been received from peerMAC for the mesh peering instance identified by localLinkID and peerLinkID. The reasonCode specifies the reason that caused the generation of the Mesh Peering Close frame. See 14.3.8.2 (Mesh Peering Close frame processing).

— REQ_RJCT—PeeringRequest_Reject(peerMAC, peerLinkID, reasonCode) event indicates a special incidence that the mesh STA rejects the incoming Mesh Peering Open frame requesting to set up a new mesh peering for some specified reason. The incoming request is identified by the peerMAC, peerLinkID is the peerLinkID received from the Mesh Peering Open frame, and reasonCode is the specific reason for rejection of the Mesh Peering Open frame. See 14.3.6.2 (Mesh Peering Open frame processing).

The finite state machine may take an action triggered by an event. It uses two types of actions: sending a mesh peering Management frame and handling a timer.

Actions related to sending a mesh peering Management frame are as follows:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- sndOPN—sendOpen(peerMAC, localLinkID, meshConfiguration) is the action that the mesh STA takes to send its localLinkID and mesh STA Configuration in a Mesh Peering Open frame to the candidate peer mesh STA, whose MAC address is peerMAC. The MLME-MESHPEERINGMANAGEMENT.request primitive shall be invoked to send the frame to the peer mesh entity.
- sndCNF—sendConfirm(peerMAC, localLinkID, peerLinkID, meshConfiguration) is the action that the mesh STA takes to send its localLinkID and meshConfiguration in a Mesh Peering Confirm frame to the candidate peer mesh STA, whose MAC address is peerMAC. peerLinkID is the peerLinkID received from the Mesh Peering Open frame. The MLME-MESHPEERINGMANAGEMENT.request primitive shall be invoked to send the frame to the peer mesh entity.
- sndCLS—sendClose(peerMAC, localLinkID, peerLinkID, reasonCode) is the action that the mesh STA takes to send its localLinkID in a Mesh Peering Close frame to the peer mesh STA or candidate peer mesh STA, whose MAC address is peerMAC. peerLinkID is the peerLinkID received from the Mesh Peering Open frame, and reasonCode is the specific reason for closing the mesh peering. The MLME-MESHPEERINGMANAGEMENT.request primitive shall be invoked to send the frame to the peer mesh entity.

14.4.4 Timers

The following three timers are used by the finite state machine:

a) The retryTimer triggers a resend of the Mesh Peering Open frame when a Mesh Peering Confirm frame was not received as a response. The retryTimer is set to the dot11MeshRetryTimeout.
b) The confirmTimer signals that a link establishment attempt should be aborted because a Mesh Peering Confirm frame responding to a Mesh Peering Open frame was never received. The confirm-Timer is set to dot11MeshConfirmTimeout.
c) The holdingTimer signals that its mesh peering instance may be completely closed and facilitates graceful shutdown. The holdingTimer is set to dot11MeshHoldingTimeout.

The events associated with internal timers are represented in the state machine table as acronyms that indicate timer expiration. With each timer event there is an associated action.

- TOR1—This event indicates that the retryTimer has expired and dot11MeshMaxRetries has not been reached. The Mesh Peering Open frame shall be resent, an action represented in the state machine table by setR.
- TOR2—This event indicates that the retryTimer has expired and dot11MeshMaxRetries has been reached. The mesh peering instance shall be closed when TOR2 occurs.
- TOC—This event indicates that the confirmTimer has expired. When TOC event occurs, the mesh peering instance shall be closed, an action represented in the state machine table as setC.
- TOH—This event indicates that the holdingTimer has expired. When TOH occurs, the mesh peering instance shall be closed and the finite state machine shall transition to IDLE state, an action represented in the state machine table as setH.

14.4.5 State transitions

Table 14-2 (MPM finite state machine) and Figure 14-2 (Finite state machine of the MPM protocol) summarize the state transitions for the MPM protocol.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In Table 14-2 (MPM finite state machine), each row represents state transitions from the state to all other states. A blank entry indicates an impossible transition.

Table 14-2—MPM finite state machine

		To State					
		IDLE	OPN_SNT	CNF_RCVD	OPN_RCVD	ESTAB	HOLDING
From State	IDLE	REQ_RJCT / sndCLS	ACTOPN / (sndOPN, setR)		OPN_ACPT / (sndOPN, sndCNF, setR)		
	OPN_SNT		TOR1 / (sndOPN, setR)	CNF_ACPT / (clR, setC)	OPN_ACPT / (sndCNF)		CLS_ACPT, OPN_RJCT, CNF_RJCT, TOR2, CNCL / (sndCLS, clR, setH)
	CNF_RCVD					OPN_ACPT / (clC, sndCNF)	CLS_ACPT, OPN_RJCT, CNF_RJCT, CNCL / (sndCLS, clC, setH) TOC / (sndCLS, setH)
	OPN_RCVD				OPN_ACPT / sndCNF TOR1 / (sndOPN, setR)	CNF_ACPT / clR	CLS_ACPT, OPN_RJCT, CNF_RJCT, TOR2, CNCL / (sndCLS, clR, setH)
	ESTAB					OPN_ACPT / sndCNF	CLS_ACPT, OPN_RJCT, CNF_RJCT, CNCL / (sndCLS, setH)
	HOLDING	TOH / —, CLS_ACPT / clH					OPN_ACPT, CNF_ACPT, OPN_RJCT, CNF_RJCT / sndCLS

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In Figure 14-2 (Finite state machine of the MPM protocol), each arrow represents a state transition.

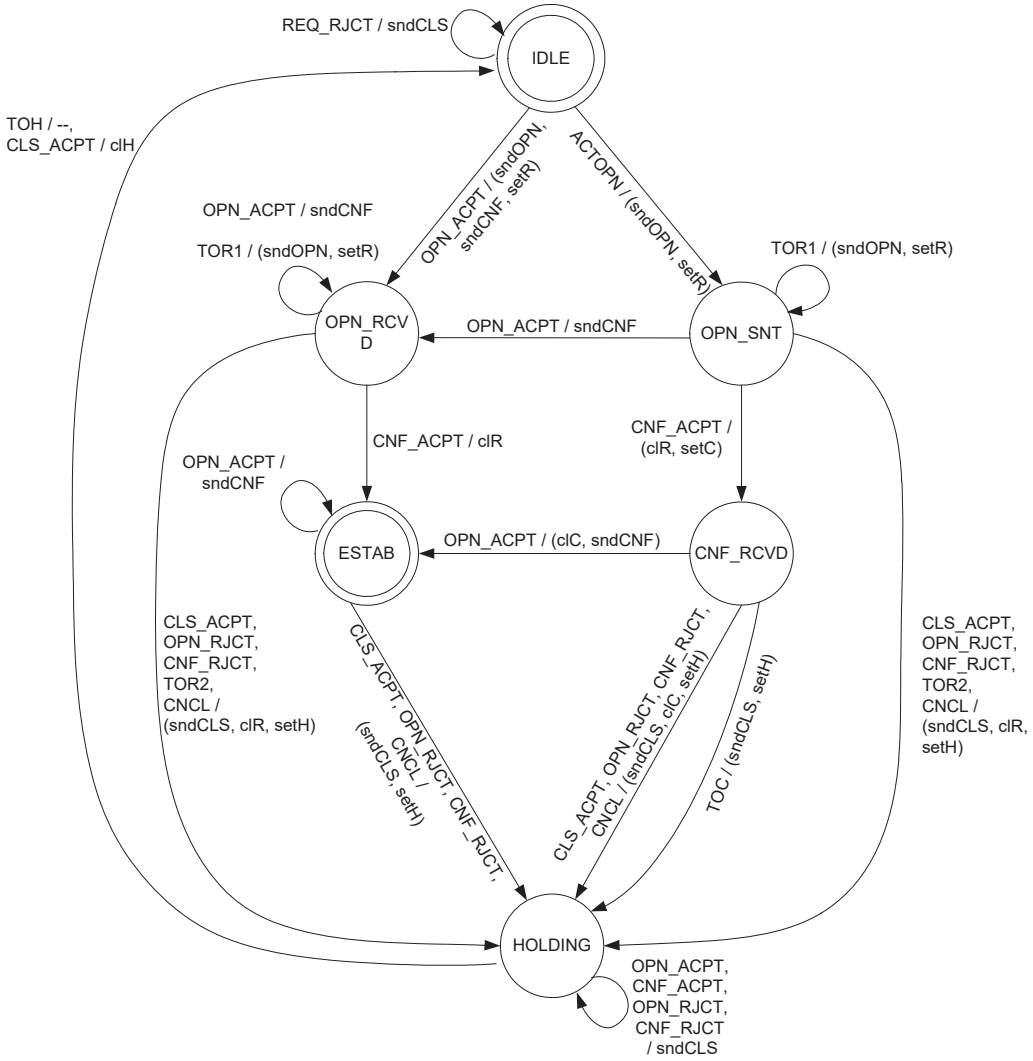

Figure 14-2—Finite state machine of the MPM protocol

The event/action representation is defined as the following. “E/A” string represents that the action A is taken given that the event E occurs. “E1, E2/A” string represents that the action A is taken given that the event E1 or event E2 occurs. “E/(A1, A2)” string represents that the action A1 and A2 are taken at a time when event E occurs.

Note that Table 14-2 (MPM finite state machine) and Figure 14-2 (Finite state machine of the MPM protocol) are used for illustration purposes. The protocol behavior is in the following subclauses.

14.4.6 IDLE state

IDLE is a quiescent state the finite state machine enters prior to establishing a new mesh peering.

When ACTOPN event occurs, the mesh STA shall set the retryCounter to 0, and perform a sndOPN action. The retryTimer shall be set and the finite state machine shall transition to OPN_SNT state.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When an OPN_ACPT event occurs, the mesh STA shall perform a sndOPN action and sndCNF action, and set the retryTimer. The finite state machine shall transition to OPN_RCVD state.

When an REQ_RJCT event occurs, a Mesh Peering Close frame shall be sent to reject the mesh peering open request. The reason code in the Mesh Peering Close frame shall be set to the reason code in REQ_RJCT event. The finite state machine shall stay in the IDLE state.

All other events are ignored in this state.

14.4.7 OPN_SNT state

In the OPN_SNT state, the mesh STA waits for a Mesh Peering Confirm frame. In this state, the retryTimer is set.

When a CNCL event occurs, the mesh STA shall clear the retryTimer, perform a sndCLS using the reason code specified by the CNCL event, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

When a CLS_ACPT event occurs, the mesh STA shall clear the retryTimer, perform a sndCLS using the reason code specified by the CLS_ACPT event, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

When an OPN_ACPT event occurs, the mesh STA shall send perform a sndCNF action. The finite state machine shall transition to OPN_RCVD state.

NOTE—The retryTimer is still in effect after the state transition.

When an OPN_RJCT event occurs, the mesh STA shall clear the retryTimer, perform a sndCLS using the reason code specified by the OPN_RJCT event, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

When a CNF_ACPT event occurs, the mesh STA shall clear the retryTimer and shall set the confirmTimer and the finite state machine shall transition to CNF_RCVD state.

When a CNF_RJCT event occurs, the mesh STA shall clear the retryTimer, perform a sndCLS action using the reason code specified by the CNF_RJCT event, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

When a TOR1 event occurs, the Mesh STA shall perform a sndOPN action and the retryCounter shall be incremented. The retryTimer shall be and the finite state machine shall stay in the OPN_SNT state.

When a TOR2 event occurs, the mesh STA shall perform a sndCLS action using the reason code MESH-MAX-RETRIES. The holdingTimer shall be set, and the finite state machine shall transition to HOLDING state.

All other events shall be ignored in this state.

14.4.8 CNF_RCVD state

In the CNF_RCVD state, the mesh STA has received a Mesh Peering Confirm frame and is waiting for a Mesh Peering Open frame.

When a CNCL event occurs, the mesh STA shall clear the confirmTimer, perform a sndCLS action using the reason code MESH-PEERING-CANCELED, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When a CLS_ACPT event occurs, the mesh STA shall clear the confirmTimer, perform a sndCLS using the reason code MESH-CLOSE-RCVD, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

When an OPN_ACPT event occurs, the mesh STA shall clear the confirmTimer and shall perform a sndCNF action. The finite state machine shall transition to ESTAB state.

When an OPN_RJCT event occurs, the mesh STA shall clear the confirmTimer, perform a sndCLS action using the reason code as specified by the OPN_RJCT event, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

When a CNF_RJCT event occurs, the mesh STA shall clear the confirmTimer, perform a sndCLS action using the reason code as specified by the CNF_RJCT event, and set the holdingTimer The finite state machine shall transition to HOLDING state.

When TOC event occurs, the mesh STA shall perform a sndCLS action using the reason code MESH-CONFIRM-TIMEOUT and set the holdingTimer. The finite state machine shall transition to HOLDING state.

All other events shall be ignored in this state.

14.4.9 OPN_RCVD state

In the OPN_RCVD state, the mesh STA has received a Mesh Peering Open frame and sent a Mesh Peering Open frame and the corresponding Mesh Peering Confirm frame. An incoming Mesh Peering Confirm is expected.

When a CNCL event occurs, the mesh STA shall clear the retryTimer, perform a sndCLS action using the reason code MESH-PEERING-CANCELED, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

When a CLS_ACPT event occurs, the mesh STA shall clear the retryTimer, perform a sndCLS action, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

When an OPN_ACPT event occurs, the mesh STA shall perform a sndCNF action. The finite state machine shall stay in the OPN_RCVD state.

When an OPN_RJCT event occurs, the mesh STA shall clear the retryTimer, perform a sndCLS action using the reason code as specified by the OPN_RJCT event, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

When a CNF_ACPT event occurs, the retryTimer shall be cleared. The finite state machine shall transition to ESTAB state.

When a CNF_RJCT event occurs, the mesh STA shall clear the retryTimer, perform a sndCLS action using the reason code as specified by the CNF_RJCT event, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

When a TOR1 event occurs, the Mesh STA shall perform a sndOPN action, increment the retryCounter, and set the retryTimer. The finite state machine shall stay in the OPN_RCVD state.

When a TOR2 event occurs, the mesh STA shall perform a sndCLS action using the reason code MESH-MAX-RETRIES. The holdingTimer shall be set, and the finite state machine shall transition to HOLDING state.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

All other events shall be ignored in this state.

14.4.10 ESTAB state

In the ESTAB state, mesh peering has been successfully established with the peer mesh STA.

When a CNCL event occurs, the mesh STA shall perform a sndCLS action using the reason code MESH-PEERING-CANCELED, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

When a CLS_ACPT event occurs, the mesh STA shall perform a sndCLS action using the reason code MESH-CLOSE-RCVD, and set the holdingTimer. The finite state machine shall transition to HOLDING state.

When an OPN_ACPT event occurs, the mesh STA shall respond by performing a sndCNF action. The finite state machine shall stay in the ESTAB state.

All other events shall be ignored in this state.

14.4.11 HOLDING state

In HOLDING state, the mesh STA is closing the mesh peering. The holdingTimer has been set according to the value of dot11MeshHoldingTimeout.

When a CLS_ACPT event occurs, the holdingTimer shall be cleared. The finite state machine shall transition to IDLE state.

When any of the following four events occurs—OPN ACPT, CNF_ACPT, OPN_RJCT, CNF_RJCT—the mesh STA shall send a Mesh Peering Close frame. The finite state machine shall stay in the HOLDING state.

When a TOH event occurs, the finite state machine shall transition to IDLE state.

All other events are ignored in this state.

14.5 Authenticated mesh peering exchange (AMPE)

14.5.1 Overview

The authenticated mesh peering exchange (AMPE) establishes an authenticated mesh peering between the mesh STAs, under the assumption that mesh PMKSA has already been established before the initiation of the protocol. An authenticated mesh peering includes a mesh peering, corresponding mesh TKSA, and the two mesh STAs mesh GTKSAs.

The AMPE is also used to establish an authenticated peering between two APs that support the AP PeerKey protocol (as defined in 12.11 (AP PeerKey support)) under the assumption that a PMK and PMKID have already been established before the initiation of the AMPE exchange.

The AMPE uses mesh peering Management frames. Parameters are exchanged via the RSNE, the Authenticated Mesh Peering Exchange element, and the MIC element.

The major functions provided by AMPE are security capabilities selection, key confirmation, and key management.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The security capabilities selection function (specified in 14.5.2 (Security capabilities selection)) is performed by agreeing on the security parameters used for the protocol instance.
— Key confirmation using the shared PMK is performed by verifying that the protection on the mesh peering Management frame is correct.
— Key management (specified in 14.5.7 (Keys and key derivation algorithm for the authenticated mesh peering exchange (AMPE))) is performed by the derivation of the temporal key in the mesh TKSA and the exchange of each mesh STA's MGTK.

During the AMPE handshake, the mesh STAs generate nonces and transmit them via mesh peering Management frames. The mesh STA shall generate a random value for its localNonce, as specified in 12.7.5 (Nonce generation). The candidate peer mesh STA is expected to generate a random value for the peerNonce, which the mesh STA receives from the candidate peer mesh STA in Confirm and Close Action frames.

Mesh peering Management frames used in the AMPE are protected using the deterministic authenticated encryption mode of AES-SIV (IETF RFC 5297).

14.5.2 Security capabilities selection

14.5.2.1 Instance Pairwise Cipher Suite selection

Pairwise cipher suite selectors WEP-40, WEP-104, and TKIP shall not be used as the pairwise cipher suite when dot11MeshSecurityActivated, dot11ProtectedTXOPNegotiationActivated, or dot11ProtectedQLoadReportActivated is true.

If the pairwise cipher suite has not been selected, a STA shall attempt to reach the agreement on the pairwise cipher suite using the following procedure in four steps:

a) The STA shall announce the list of pairwise cipher suites it supports using an ordered list in the RSNE in the Mesh Peering Open frame. The first value in the list is the STA's most preferred cipher suite, and the last value the least preferred.
b) If the STA receives a Mesh Peering Open frame from the candidate peer STA, the STA shall make its decision on the selected pairwise cipher suite based on the intersection of its own ordered list and the received ordered list.
    1) If the intersection is empty, the pairwise cipher suite selection fails and the STA generates the failure reason code MESH-INVALID-SECURITY-CAPABILITY and then takes the corresponding actions specified in 14.5.6 (AMPE finite state machine).
    2) If the intersection contains more than one value, the selected cipher suite shall be the entry in the intersection list most preferred by the STA that has the largest MAC address in the lexicographic ordering.
c) If the STA receives a Mesh Peering Confirm frame from the candidate peer STA before receiving a Mesh Peering Open frame, the STA shall verify that it supports the pairwise cipher suite chosen by the candidate peer STA. Otherwise, the selection fails and the STA shall generate the failure reason code MESH-INVALID-SECURITY-CAPABILITY.
Furthermore, upon receiving a Mesh Peering Open frame, the STA shall verify that the accepted selected pairwise cipher suite matches the pairwise cipher suite chosen in step b). If they do not match, the selection fails and the STA shall generate the failure reason code MESH-INVALID-SECURITY-CAPABILITY. Otherwise, the pairwise cipher suite selection succeeds, and the STA shall proceed to step d).
d) If the STA is generating a Mesh Peering Confirm frame, it shall set the Selected Pairwise Cipher Suite to the selected pairwise cipher suite upon successful pairwise cipher suite selection.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.5.2.2 Group cipher suite selection

Group cipher suite selectors WEP-40, WEP-104, and TKIP shall not be used as the group cipher suite when dot11MeshSecurityActivated is true.

The mesh STA shall not use a different group cipher suite than the one used by the peer mesh STA or candidate peer mesh STA in the same MBSS.

A mesh STA shall announce in a Mesh Peering Open frame the group cipher suite it uses for broadcast protection. When it receives a Mesh Peering Open frame from a candidate peer, it shall verify that it supports the candidate's announced group cipher suite. In addition, if the mesh STA receives a Mesh Peering Confirm frame, it shall verify that it supports the group cipher suite listed in that frame. If either selection fails, the mesh STA shall issue the appropriate reply frame with the MESH-INVALID-SECURITY-CAPABILITY reason code.

14.5.3 Construction and processing AES-SIV-protected mesh peering Management frames

AES-SIV performs deterministic authenticated encryption and takes additional data that is authenticated but not encrypted (AAD). When encrypting and authenticating, AES-SIV takes a key, plaintext data to protect, and multiple distinct components of AAD, to produce a synthetic initialization vector and a cipher text. When verifying encrypted and authenticated data AES-SIV takes a key, a synthetic initialization vector, cipher text data to decrypt and verify, and AAD, to produce either plaintext or the symbol "FAIL," indicating failure to decrypt and verify. Note that the AAD used in the encryption process shall be identical to the AAD used in the decryption process and the synthetic initialization vector produced by the encryption process shall be used in the decryption process.

When the mesh STA constructs a mesh peering Management frame, it shall follow the following procedure:

- The input key shall be the AEK
- The input plaintext shall be the Authenticated Mesh Peering element (see 9.6.16.2 (Mesh Peering Open frame format), 9.6.16.3 (Mesh Peering Confirm frame format), 9.6.16.4 (Mesh Peering Close frame format))
- The input AAD shall be three distinct components consisting of
  1) The localMAC
  2) The peerMAC
  3) The contents of the mesh peering Management frame from the category (inclusive) to the MIC element (exclusive)
- The output synthetic initialization vector shall be copied into the MIC field of the MIC element in the mesh peering Management frame
- The output cipher text shall become the remainder of the mesh peering Management frame after the MIC element

When the mesh STA verifies a mesh peering Management frame, it shall follow the following procedure:

- The input key shall be the AEK
- The input synthetic initialization vector shall be the MIC field of the MIC element in the mesh peering Management frame
- The input cipher text shall be the part of the mesh peering Management frame following the MIC element
- The input AAD shall be three distinct components consisting of
  1) The peerMAC
  2) The localMAC

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

3) The contents of the mesh peering Management frame from the category (inclusive) to the MIC element (exclusive)

— If AES-SIV returns the symbol "FAIL" processing of the frame shall be deemed a failure with a behavior dependent on the type of mesh peering Management frame

— If AES-SIV returns plaintext it shall be treated as the components of the mesh peering Management frame and processed accordingly

14.5.4 Distribution of group transient keys in an MBSS

The MGTK shall be a random or pseudorandom number. The mesh STA shall distribute the MGTK to the peer mesh STA using the Mesh Peering Open frame during the AMPE. Upon successful completion of AMPE, each mesh STA shall establish states for the peer mesh STA's mesh GTKSA. The GTKData subfield in the Authenticated Mesh Peering Exchange element shall contain the MGTK concatenated by the Key RSC and the GTKExpirationTime (as specified in 9.4.2.118 (Authenticated Mesh Peering Exchange element)).

When dot11RSNAProtectedManagementFramesActivated is true, a mesh STA shall distribute the IGTK to the peer mesh STA using the Mesh Peering Open frame during the AMPE. Upon successful completion of AMPE, each mesh STA shall establish an IGTKSA (see 12.6.1.1.9 (IGTKSA)) with the mesh peer.

14.5.5 Mesh peering Management frames for AMPE

14.5.5.1 General

The AMPE is inclusive of the mesh peering management (MPM) protocol. mesh peering Management frames for AMPE have additional processing and construction requirements on top of those for mesh peering Management frames.

The mesh peering Management frames shall be generated with additional information using the RSNE and the Authenticated Mesh Peering Exchange element to support AMPE.

14.5.5.2 Mesh peering open for AMPE

14.5.5.2.1 Generating Mesh Peering Open frames for AMPE

In addition to contents for establishing a mesh peering as specified in 14.3.6.1 (Generating Mesh Peering Open frames), the Mesh Peering Open frame, when used for the AMPE, shall contain the following:

— In the Mesh Peering Management element, the Mesh Peering Protocol Identifier shall be set to 1 "authenticated mesh peering exchange protocol."

— In the Mesh Peering Management element, the Chosen PMK field shall be set to PMKID that identifies the mesh PMKSA the mesh STA established with the candidate peer mesh STA.

— The RSNE shall be identical to the RSNE in the STA's Beacon and Probe Response frames.

— In the Authenticated Mesh Peering Exchange element:

  — The Selected Pairwise Cipher Suite field shall be set to the first cipher suite selector in the Pairwise Cipher Suite List field in RSNE.

  — The Local Nonce field shall be set to the localNonce value generated by the mesh STA for identifying the current mesh peering instance.

  — The Peer Nonce field shall be set to 0.

  — If dot11MeshSecurityActivated is true, the GTKdata field shall be present and shall contain the data for the mesh STA's MGTK. The GTKdata field shall not be present when AMPE is being used as part of the AP PeerKey protocol (12.11.2 (AP PeerKey protocol)). The components of the GTKdata field are specified in 14.5.4 (Distribution of group transient keys in an MBSS).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Mesh Peering Open frame shall be protected using AES-SIV as specified in 14.5.3 (Construction and processing AES-SIV-protected mesh peering Management frames).

14.5.5.2.2 Processing Mesh Peering Open frames for AMPE

On receiving a Mesh Peering Open frame, the mesh STA shall verify the received frame. If AES-SIV returns the symbol "FAIL" the OPN_RJCT event shall be invoked to the corresponding AMPE finite state machine and the reason code "MESH-INVALID-GTK" is generated. Otherwise, processing continues.

The received frame shall be rejected if the security capability selection fails (see 14.5.2 (Security capabilities selection)). The OPN_RJCT event shall be invoked to the corresponding AMPE finite state machine.

The peer mesh STA's MGTK extracted from the Mesh Peering Open frame shall be added to the Receive MGTK SA in which the peer's MAC address equals the MGTK Source mesh STA MAC address.

If all operations succeed, the mesh STA shall proceed to process the Mesh Peering Open frame on basic parameters as specified in 14.3.6.2 (Mesh Peering Open frame processing).

14.5.5.3 Mesh peering confirm for AMPE

14.5.5.3.1 Generating Mesh Peering Confirm frames for AMPE

In addition to contents for establishing a mesh peering as specified in 14.3.7.1 (Generating Mesh Peering Confirm frames), the Mesh Peering Confirm frame, when used with the AMPE, shall contain the following:

- In the Mesh Peering Management element, the Mesh Peering Protocol Identifier shall be set to 1 "authenticated mesh peering exchange protocol."
- The RSNE shall be the same as sent in the Mesh Peering Open frame.
- In the Authenticated Mesh Peering Exchange element:
  - The Selected Pairwise Cipher Suite field shall be set to the cipher suite selector that indicates the successfully selected pairwise cipher suite (specified in 14.5.2.1 (Instance Pairwise Cipher Suite selection)).
  - The Peer Nonce field shall be set to the nonce value chosen by the peer mesh STA as received in the Local Nonce field in the Mesh Peering Open frame from the candidate peer mesh STA.
  - The GTKdata field shall not be present.
  - The IGTKdata field shall not be present.
  - The rest of fields are set to the same values sent in the Mesh Peering Open frame.

The Mesh Peering Confirm frame shall be protected using AES-SIV as specified in 14.5.3 (Construction and processing AES-SIV-protected mesh peering Management frames).

14.5.5.3.2 Processing Mesh Peering Confirm frames for AMPE

On receiving a Mesh Peering Confirm frame, the mesh STA shall verify the received frame. The received frame shall be discarded if AES-SIV returns the symbol "FAIL."

If AES-SIV returns plaintext, the following operations shall be performed in order:

a) The Selected Pairwise Cipher Suite is checked. If the security capability selection has been done and the received value from Chosen Pairwise Cipher Suite field is not the same as the agreed pairwise cipher suite, the STA shall reject the received frame and the CNF_RJCT event is invoked to the corresponding AMPE finite state machine with the failure reason code MESH-INVALID-SECURITY-CAPABILITY.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

b) If dot11MeshSecurityActivated is true the group cipher suite is checked. If the received group cipher suite is not supported by the mesh STA, the mesh STA shall reject the received Mesh Peering Confirm frame and the CNF_RJCT event is invoked to the corresponding AMPE finite state machine with the failure reason code MESH-INVALID-SECURITY-CAPABILITY.

If none of the cases is true, the mesh STA shall proceed to process the Mesh Peering Confirm Action frame on basic parameters as specified in 14.3.7.2 (Mesh Peering Confirm frame processing).

14.5.5.4 Mesh peering close for AMPE

14.5.5.4.1 Generating Mesh Peering Close frames for AMPE

In addition to contents for closing a mesh peering as specified in 14.3.8.1 (Generating Mesh Peering Close frames), the Mesh Peering Close frame, when used for the AMPE, shall contain the following:

- In the Mesh Peering Management element, the Mesh Peering Protocol Identifier shall be set to 1 "authenticated mesh peering exchange protocol."
- In the Mesh Peering Management element, the Chosen PMK field shall be set to the same value as sent in the Mesh Peering Open frame.
- In the Authenticated Mesh Peering Exchange element:
  - The Selected Pairwise Cipher Suite field shall be set to the same value as sent in the Mesh Peering Open frame.

    NOTE—If the reason for sending the Mesh Peering Close is the pairwise cipher suite selection failure, the information in this field is used to inform the candidate peer mesh STA what was announced by the mesh STA for the mesh peering instance.

  - The Local Nonce field shall be set to the same value as sent in the Mesh Peering Open frame.
  - The Peer Nonce field shall be set to the same value as received in the Local Nonce field of the Authenticated Mesh Peering Exchange element of the incoming mesh peering Management frame from the candidate peer mesh STA.

The Mesh Peering Close frame shall be protected using AES-SIV as specified in 14.5.3 (Construction and processing AES-SIV-protected mesh peering Management frames).

14.5.5.4.2 Processing Mesh Peering Close frames for AMPE

On receiving a Mesh Peering Close frame, the mesh STA shall verify the received frame. The received frame shall be discarded if AES-SIV returns the symbol "FAIL."

If AES-SIV returns plaintext, the mesh STA shall proceed to process the Mesh Peering Close frame on basic parameters as specified in 14.3.8.2 (Mesh Peering Close frame processing).

14.5.6 AMPE finite state machine

14.5.6.1 Overview

The finite state machine for AMPE supports all of the states, events, and actions defined for the finite state machine for the MPM protocol. In addition, new events, actions, and state transitions are added to specify the security functions for AMPE.

When a finite state machine is generated and activated for an AMPE instance, the localNonce shall be generated and used together with a new localLinkID to identify the instance.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.5.6.2 Additional events and actions to MPM FSM

All events for rejecting or ignoring received Action frames shall report the corresponding reason code related to AMPE functions as described in 14.5.5 (Mesh peering Management frames for AMPE).

In addition, there is one new event as follows:

— TOR3—This event indicates that the retryTimer has expired, the dot11MeshMaxRetries has been reached, the AMPE is enabled, but the mesh STA failed to confirm the selection of the shared mesh PMKSA. When this event triggers, the protocol instance shall be closed, but no Mesh Peering Close frame shall be sent.

The actions of sending mesh peering Management frames are updated as the following:

— sndOPN—Generate a Mesh Peering Open frame for the current AMPE protocol instance (as specified in 14.5.5.2.1 (Generating Mesh Peering Open frames for AMPE)) and send it to the candidate peer mesh STA.
— sndCNF—Generate a Mesh Peering Confirm frame for the current AMPE protocol instance (as specified in 14.5.5.3.1 (Generating Mesh Peering Confirm frames for AMPE)) and send it to the candidate peer mesh STA.
— sndClose—Generate a Mesh Peering Close frame for the current AMPE protocol instance (as specified in 14.5.5.4.1 (Generating Mesh Peering Close frames for AMPE)) and send it to the candidate peer mesh STA.

14.5.6.3 State transitions

All state transitions specified in MPM FSM shall be used for AMPE finite state machine.

In OPN_SNT state, the following are additional state transitions and actions:

When TOR3 event occurs, the retryTimer shall be cleared and the holdingTimer shall be set. The finite state machine shall transition to HOLDING state.

In OPN_RCVD state, the following are the additional actions:

When CNF_ACPT event occurs, in addition to the actions for MPM protocol, the mesh STA shall signal the completion of key management by utilizing the MLME-SETKEYS.request primitive to configure the agreed-upon mesh temporal pairwise key into the IEEE Std 802.11 MAC and by calling the MLME-SETPROTECTION.request primitive to enable its use.

In CNF_RCVD state, the following are the additional actions:

When OPN_ACPT event occurs, in addition to the actions for MPM protocol, the mesh STA shall signal the completion of key management by utilizing the MLME-SETKEYS.request primitive to configure the agreed-upon mesh temporal pairwise key into the IEEE Std 802.11 MAC and received MGTK and by calling the MLME-SETPROTECTION.request primitive to enable the usage.

Table 14-3 (AMPE finite state machine) and Figure 14-3 (Finite state machine of the AMPE protocol) specify the state transitions of the finite state machine for AMPE.

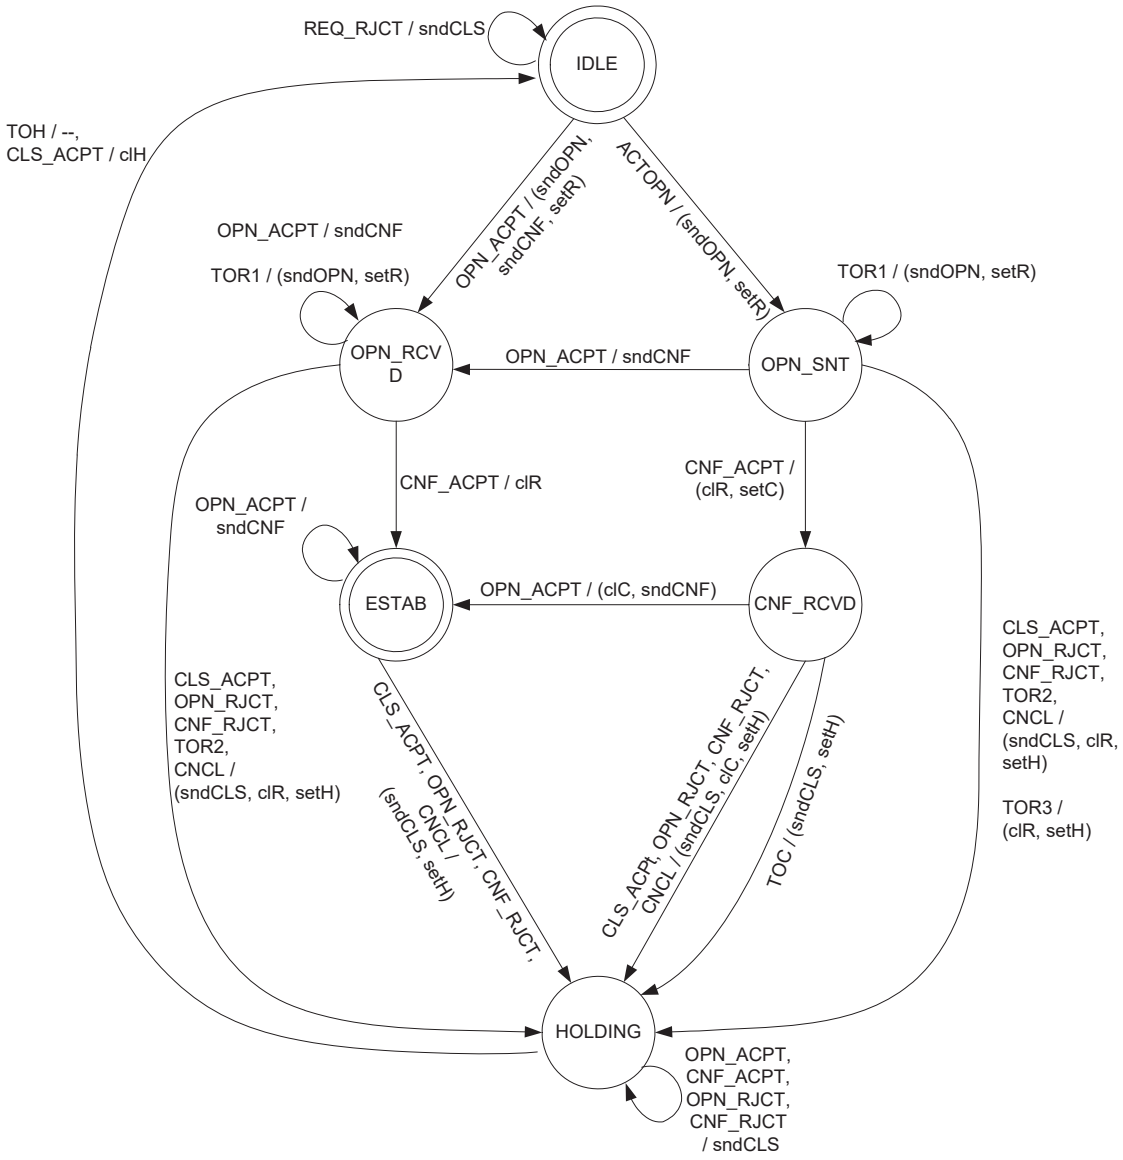

Figure 14-3—Finite state machine of the AMPE protocol

14.5.7 Keys and key derivation algorithm for the authenticated mesh peering exchange (AMPE)

To execute the AMPE and mesh group key handshake with a candidate peer STA, the local STA shall derive an authenticated encryption key (AEK) and a mesh temporal key (MTK) using the PMK it shares with the candidate peer STA.

The AEK is derived statically from the shared PMK. The MTK is derived from the shared PMK and dynamic information provided by the STA and candidate peer STA.

The AEK is mutually derived by the local STA and the peer STA once a new PMK has been selected. The AEK shall be derived from the PMK by

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

AEK ← KDF-Hash-256(PMK, "AEK Derivation", Selected AKM Suite ||
min(localMAC, peerMAC) || max(localMAC, peerMAC))

where

KDF-Hash-256 is the key derivation function defined in 12.7.1.7.2 (Key derivation function (KDF)) using the hash algorithm identified by the AKM suite selector (see Table 9-133 (AKM suite selectors))

Selected AKM Suite is a four octet string formed by concatenating the OUI or CID and suite type

The temporal key (MTK) shall be derived from the PMK by

MTK ← KDF-Hash-Length(PMK, "Temporal Key Derivation", min(localNonce, peerNonce) || max(localNonce, peerNonce) || min(localLinkID, peerLinkID) || max(localLinkID, peerLinkID) || Selected AKM Suite || min(localMAC, peerMAC) || max(localMAC, peerMAC))

where

KDF-Hash-Length is the key derivation function defined in 12.7.1.7.2 (Key derivation function (KDF)) using the hash algorithm identified by the AKM suite selector (see Table 9-133 (AKM suite selectors))

Length is cipher-suite dependent and is defined by the TK_bits value in Table 12-4 (Cipher suite key lengths).

Selected AKM Suite is a four octet string formed by concatenating the OUI or CID and suite type

"min" and "max" operations for IEEE 802 addresses are with the address converted to a positive integer, treating the first transmitted octet as the most significant octet of the integer as specified in 12.7.1.3 (Pairwise key hierarchy)

"min" and "max" operations for nonces are encoded as specified in 9.2.2 (Conventions)

"min" and "max" operations for LinkIDs select the minimum and maximum, respectively, of the two unsigned integers.. In the KDF context, LinkIDs are encoded as 16-bit unsigned integers, represented using the bit ordering conventions of 9.2.2 (Conventions).

The MTK is used to protect communications between two peer STAs. The local STA and peer STA derive an MTK per peering instance and may rekey the MTK using AMPE.

14.6 Mesh group key handshake

14.6.1 General

The mesh group key handshake may be used by either mesh STA, after a secure mesh peering has been established, to update the MGTK that it uses to protect group addressed MPDUs that it transmits to its peer mesh STAs.

The mesh STA may update its MGTK when a mesh peering is terminated.

To update the MGTK, the mesh STA shall execute the mesh group key handshake with each of its current peer mesh STAs. The "MGTK source" is the mesh STA that is sending the MGTK to a peer mesh STA using this protocol. A "MGTK recipient" is a mesh STA receiving the MGTK being sent by the MGTK Source.

The mesh group key handshake shall include the following two messages:

— Message 1: Mesh Group Key Inform frame

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— Message 2: Mesh Group Key Acknowledge frame

Mesh Group Key Inform frame and Mesh Group Key Acknowledge frame are conventionally referred to as "mesh group key handshake frames."

The mesh STA shall do an AMPE handshake before a mesh group key handshake if both are required to be done.

NOTE—It is impossible that the MGTK source initiates the mesh group key handshake before the AMPE completes successfully.

14.6.2 Protection on mesh group key handshake frames

Mesh group key handshake frames used in mesh group key handshake are protected using the deterministic authenticated encryption mode of AES-SIV (IETF-RFC 5297) when dot11MeshSecurityActivated is true.

When constructing protection on mesh group handshake frames, the following procedure shall be used:

— The key shall be the AEK from the current active security association with the peer mesh STA that receives the mesh group key handshake frame.
— The input plaintext shall be the AMPE Authenticated Mesh Peering element (see 9.6.16.5 (Mesh Group Key Inform frame format) and 9.6.16.6 (Mesh Group Key Acknowledge frame format)).
— The plaintext shall be the Authenticated Mesh Peering Exchange element.
— AAD shall be three distinct components as follows:
  1) The localMAC
  2) The peerMAC
  3) The contents of the mesh group key handshake frame from the category (inclusive) to the MIC element (exclusive)
— The synthetic initialization vector produced by AES-SIV shall be copied into the MIC field of the MIC element in the frame.
— The produced cipher text shall become the remainder of the mesh group key handshake frame after the MIC element.

When verifying the protection on the mesh group handshake frames, the following procedure shall be used:

— The key shall be the AEK from the current active security association with the peer mesh STA that receives the mesh group key handshake frame.
— AAD shall be three distinct components as follows:
  1) The peerMAC
  2) The localMAC
  3) The contents of the mesh group key handshake frame from the category (inclusive) to the MIC element (exclusive)
— The synthetic initialization vector shall be the MIC field of the MIC element in the frame.
— The cipher text shall be the content after the MIC element in the frame.
— If AES-SIV validation function takes above input.
  — If the function returns the special symbol "FAIL," the frame shall be discarded.
  — If the plaintext is returned successfully, the produced plaintext shall be treated as the contents after the MIC element in the frame.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.6.3 Mesh Group Key Inform frame construction and processing

Mesh Group Key Inform frame shall be constructed as follows:

- The Authenticated Mesh Peering Exchange element shall be set as the following:
  - The Selected Pairwise Cipher Suite field shall be set to four octets of zero.
  - The Local Nonce field shall be set to the same value as sent in the Mesh Peering Open frame that established the mesh peering instance.
  - The Peer Nonce field shall be set to the same value as received in the Local Nonce field of the Authenticated Mesh Peering Exchange element of the incoming Mesh Peering Open frame that established the peering instance.
  - The Key Replay Counter field shall be set to the mesh STA's local replay counter value, incremented by 1, for the mesh peering. After setting this field, the local replay counter shall also be incremented by 1.
  - The GTKdata field shall be present and shall contain the data for the MGTK from MGTK source. The components of the GTKdata are specified in 14.5.4 (Distribution of group transient keys in an MBSS).
  - If management frame protection is used, the IGTKdata field shall be present and shall contain the data for the IGTK from IGTK source. The components of the IGTKdata are specified in 9.4.2.118 (Authenticated Mesh Peering Exchange element).
- The MIC element shall be set according to the protection mechanism in 14.6.2 (Protection on mesh group key handshake frames).

The construction of AES-SIV protection on Mesh Group Key Inform frame shall use the construction procedure as in 14.6.2 (Protection on mesh group key handshake frames).

The MGTK source sends the Mesh Group Key Inform frame to the MGTK recipient.

On reception of Mesh Group Key Inform frame, the MGTK recipient shall use the verification procedure in 14.6.2 (Protection on mesh group key handshake frames) to validate the AES-SIV construction.

- If the validation recovers the plaintext successfully, the MGTK recipient shall proceed with the following procedure:
  - Verify that values in the Local Nonce field and the Peer Nonce field in the Authenticated Mesh Peering Exchange element are the same as in the current valid mesh TKSA that the MGTK recipient established with the sender of the Mesh Group Key Inform frame. If there is any mismatch, the received Mesh Group Key Inform frame shall be discarded and no further action shall be taken.
  - Verify that the Key Replay Counter has not yet been seen before, i.e., its value is strictly larger than that in any other mesh Group Key Inform frame received thus far during this security association. If this verification fails, the received Mesh Group Key Inform frame shall be discarded and no further action shall be taken.
  - Use the MLME-SETKEYS.request primitive to configure the temporal MGTK into its IEEE Std 802.11 MAC.
  - Respond by constructing and sending mesh group key handshake acknowledge to the MGTK source and incrementing the replay counter.

  NOTE—The MGTK source increments and uses a new Key Replay Counter field value on every Mesh Group Key Inform frame, even retries, because the Mesh Group Key Acknowledge frame responding to an earlier Mesh Group Key Inform frame might have been lost. If the MGTK source did not increment the replay counter, the MGTK receiver discards the retry, and no responding Mesh Group Key Acknowledge frame will ever arrive.

- If the AES-SIV validation returns a special symbol "FAIL," the Mesh Group Key Inform frame shall be discarded. No further action shall be taken.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.6.4 Mesh Group Key Acknowledge frame construction and processing

Mesh Group Key Acknowledge frame shall be constructed as follows:

- The Authenticated Mesh Peering Exchange element shall be set as follows:
  - The Selected Pairwise Cipher Suite field shall be set to four octets of zero.
  - The Local Nonce field shall be set to the same value as sent in the Mesh Peering Open frame that established the mesh peering instance.
  - The Peer Nonce field shall be set to the same value as received in the Local Nonce field of the Authenticated Mesh Peering Exchange element of the incoming Mesh Peering Open frame that established the peering instance.
  - The Key Replay Counter shall be set to the same value as received in the Mesh Group Key Inform frame.
  - The GTKdata field shall not be present.
  - The IGTKdata field shall not be present.
- The MIC element shall be set according to the protection mechanism in 14.6.2 (Protection on mesh group key handshake frames).

The construction of AES-SIV protection on Mesh Group Key Acknowledge frame shall use the construction procedure as in 14.6.2 (Protection on mesh group key handshake frames).

The MGTK recipient sends the Mesh Group Key Acknowledge frame to the MGTK source.

On reception of Mesh Group Key Acknowledge frame, the MGTK source shall use the verification procedure in 14.6.2 (Protection on mesh group key handshake frames) to validate the AES-SIV construction.

- If the validation recovers the plaintext successfully, the MGTK source shall set the content of the Authenticated Mesh Peering Exchange element using the recovered plaintext and proceed with the following procedure:
  - Verify that values in the Local Nonce field and the Peer Nonce field in the Authenticated Mesh Peering Exchange element are the same as in the current valid mesh TKSA that the MGTK source established with the sender of the Mesh Group Key Acknowledge frame. If there is any mismatch, the received Mesh Group Key Acknowledge frame shall be discarded and no further action shall be taken.
  - Verify that the Key Replay Counter value matches the one that it has used for the mesh group key handshake. If this verification fails, the received Mesh Group Key Acknowledge frame shall be discarded and the MGTK source may invoke a retry to send a new Mesh Group Key Inform frame with a new Key Replay Counter value.
- If the validation returns a special symbol “FAIL,” the Mesh Group Key Acknowledge frame shall be discarded and the MGTK source may invoke a retry to send a new Mesh Group Key Inform frame with a new Key Replay Counter value.

14.6.5 Mesh group key implementation considerations

If the MGTK source does not receive a Mesh Group Key Acknowledge frame to its Mesh Group Key Inform frames, it shall attempt dot11MeshConfigGroupUpdateCount additional transmissions of the Mesh Group Key Inform frame. The retransmit timeout value shall be 100 ms for the first timeout, half the listen interval for the second timeout, and the listen interval for subsequent timeouts. If there is no listen interval or the listen interval is zero, then 100 ms shall be used for all timeout values. If it still has not received a response after this, then the MGTK source shall tear down the mesh peering and mesh TKSA with this MGTK recipient, by generating a CNCL event for the peering instance, and pass the event to the mesh peering instance controller.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.7 Mesh security

During the AMPE, the peers negotiate, and agree upon, a pairwise ciphersuite and a group cipher suite. They also establish a mesh TKSA and mesh GTKSA to be used with the pairwise cipher suite and group cipher suite, respectively.

When dot11MeshSecurityActivated is true, all individually addressed mesh Data frames and individually addressed robust Management frames (see 12.2.8 (Requirements for robust management frame protection)) shall be protected by the mesh TKSA, and all group addressed Data frames and group addressed Action frames that are indicated as "Group Addressed Privacy" in Table 9-47 (Category values) shall be protected by the mesh GTKSA.

When dot11RSNAProtectedManagementFramesActivated is true, group addressed robust Management frames that are not protected by the mesh GTKSA shall be protected using BIP (see 11.13 (Group addressed robust management frame procedures)).

14.8 Mesh path selection and metric framework

14.8.1 General

The term *mesh path selection* is used to describe selection of multi-hop paths between mesh STAs at the link layer. Mesh path selection creates forwarding information that is utilized for MSDU/MMPDU forwarding as described in 10.35 (Mesh forwarding framework).

14.8.2 Extensible path selection framework

This standard allows for alternative and flexible implementations of path selection protocols and metrics.

A mesh STA may include multiple protocol implementations (that is, the default protocol, vendor-specific protocols, etc.) as well as multiple metric implementations, but only one path selection protocol and only one path selection metric shall be used by a mesh STA at a time.

As described in 14.2.3 (Mesh profile) and 14.2.7 (Candidate peer mesh STA), mesh STAs use the Mesh Configuration element (9.4.2.98 (Mesh Configuration element)) to announce the active path selection protocol and active path selection metric of the MBSS. This allows a neighbor mesh STA to identify if it should become a member of the MBSS and how it should establish mesh peerings with its members. This standard does not force an existing MBSS that is using a protocol other than the default protocol to switch to the default protocol when a new mesh STA requests mesh peering establishment. While it is possible, in principle, to implement such behavior, an algorithm to coordinate such reconfiguration is beyond the scope of this standard.

Path selection protocol and path selection metric are identified by a unique identifier as defined in 9.4.2.98.2 (Active Path Selection Protocol Identifier) and 9.4.2.98.3 (Active Path Selection Metric Identifier), respectively. Also, each path selection protocol and each path selection metric specifies the following:

— Data type of metric values
— Length of the metric field
— Operator for aggregation of link metrics to a path metric; the symbol $\oplus$ is used to identify an arbitrary operator for aggregation
— Comparison operator for determining a better or worse path; how this is performed depends on the actual comparison operator
— Initial value of the path metric (path selection metric only)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The standard defines a default path selection protocol (HWMP, 14.10 (Hybrid wireless mesh protocol (HWMP))) and a default path selection metric (airtime link metric, 14.9 (Airtime link metric)). Both shall be implemented on all mesh STAs.

14.8.3 Link metric reporting

A mesh STA may submit a link metric report to or request a link metric report from its neighbor peer mesh STA by transmitting a Mesh Link Metric Report frame. A mesh STA receiving a Mesh Link Metric Report element with the Request subfield of the Flags field equal to 1 shall reply with a Mesh Link Metric Report frame containing the link metric value for the corresponding link.

Upon reception of a Mesh Link Metric Report frame, the mesh STA may update its local link metric information using the link metric information received. The procedure to update the local link metric information with the link metric information received from a neighbor peer mesh STA is outside the scope of the standard.

14.9 Airtime link metric

This subclause defines a default link metric that may be used by a path selection protocol to identify an efficient radio-aware path. The extensibility framework allows this metric to be overridden by any path selection metric as specified in the mesh profile.

Airtime reflects the amount of channel resources consumed by transmitting the frame over a particular link. This measure is approximate and designed for ease of implementation and interoperability.

The airtime for each link is calculated as follows:

$$c_a = \left[O + \frac{B_t}{r}\right]\frac{1}{1 - e_f}$$

where

O and B_t	are constants listed in Table 14-4 (Airtime cost constants)
input parameter r	is the data rate (in Mb/s)
input parameter e_f	is the frame error rate for the test frame size B_t
rate r	represents the data rate at which the mesh STA would transmit a frame of standard size B_t based on current conditions, and its estimation is dependent on local implementation of rate adaptation
frame error rate e_f	is the probability that when a frame of standard size B_t is transmitted at the current transmission bit rate r, the frame is corrupted due to transmission error; its estimation is a local implementation choice. Frame failures due to exceeding Mesh TTL should not be included in this estimate as they are not correlated with link performance.

The airtime link metric shall be encoded as an unsigned integer in units of 0.01 TU.

Table 14-4—Airtime cost constants

Parameter	Recommended value	Description
O	Varies depending on PHY	Channel access overhead, which includes frame headers, training sequences, access protocol frames, etc.
B_t	8192	Number of bits in test frame

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 14-5 (Parameters of the airtime link metric for extensible path selection framework) gives the parameters of the airtime link metric for the extensible path selection framework.

Table 14-5—Parameters of the airtime link metric for extensible path selection framework

Parameter	Notes
Path Selection Metric ID	See Table 9-218 (Active Path Selection Metric Identifier field values) in 9.4.2.98.3 (Active Path Selection Metric Identifier)
Data type	Unsigned integer, 0 ≤ metric value < 4 294 967 296
Length of metric field	4 octets
Operator for metric aggregation	addition (+)
Comparison operator	*less than, equal to, greater than* as used with integers — metric *a* is *better than* metric *b* iff $a < b$ — metric *a* is *equal to* metric *b* iff $a = b$ — metric *a* is *worse than* metric *b* iff $a > b$
Initial value of path metric	0

An example of the airtime link metric is shown in S.5 (Airtime link metric usage example).

14.10 Hybrid wireless mesh protocol (HWMP)

14.10.1 General

The hybrid wireless mesh protocol (HWMP) is a mesh path selection protocol that combines the flexibility of on-demand path selection with proactive topology tree extensions. The combination of reactive and proactive elements of HWMP enables efficient path selection in a wide variety of mesh networks (with or without access to the infrastructure).

HWMP uses a common set of protocol elements, generation and processing rules inspired by Ad Hoc On-Demand Distance Vector (AODV) protocol (IETF RFC 3561 [B37]) adapted for MAC address-based path selection and link metric awareness. HWMP is completely specified herein and does not require reference to AODV specifications or descriptions.

HWMP supports two modes of operation depending on the configuration. These modes provide different levels of functionality as follows:

— On-demand mode: The functionality of this mode is always available, independent of whether a root mesh STA is configured in the MBSS or not. It allows mesh STAs to communicate using peer-to-peer paths.

— Proactive tree building mode: In this mode, additional proactive tree building functionality is added to the on-demand mode. This can be performed by configuring a mesh STA as root mesh STA using either the proactive PREQ mechanism or proactive RANN mechanism. The proactive PREQ mechanism creates paths from the mesh STAs to the root, using only group addressed communication. The RANN mechanism creates paths between the root and each mesh STA using acknowledged communication.

These modes are not exclusive. On-demand and proactive modes are used concurrently, because the proactive modes are extensions of the on-demand mode.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—One example of concurrent usage of on-demand and proactive mode is for two mesh STAs that are part of the same mesh BSS (or STAs that are proxied by mesh STAs in the same MBSS) to begin communicating using the proactively built tree but subsequently to perform an on-demand discovery for a direct path. This type of concurrent usage of the proactive and on-demand modes allows communication to begin immediately (by forwarding all traffic to the root, which knows all mesh STAs and addresses proxied by mesh STAs in the MBSS) while an on-demand discovery finds a shorter path between two mesh STAs (or STAs that are proxied by mesh STAs in the same MBSS).

All HWMP modes of operation utilize common processing rules and primitives. HWMP elements are the PREQ (path request) element, PREP (path reply) element, PERR (path error) element, and RANN (root announcement) element. The metric cost of the links determines which paths HWMP builds. In order to propagate the metric information between mesh STAs, a Metric field is used in the PREQ, PREP, and RANN elements.

Path selection in HWMP uses a sequence number mechanism to enable mesh STAs to distinguish current path information from stale path information at all times in order to maintain loop-free connectivity. Each mesh STA maintains its own HWMP SN, which is propagated to other mesh STAs in the HWMP elements. Rules for maintaining HWMP SNs are given in 14.10.8.3 (HWMP sequence numbering).

14.10.2 Terminology

This subclause describes terminology for HWMP, especially for the process of path discovery. Terms such as Path Originator or Path Target designate very specific entities within the path discovery process. They stay with the same assigned entity for the whole path discovery process and other procedures related to this path discovery. Figure 14-4 (Illustration of definitions) illustrates an example utilizing this terminology.

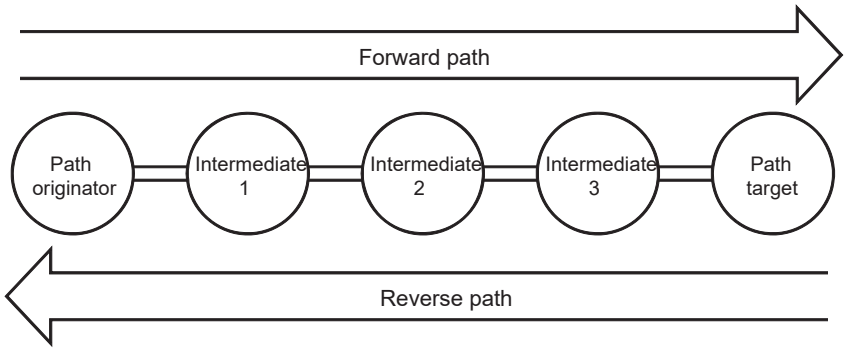

Figure 14-4—Illustration of definitions

NOTE 1—Both the path target and path originator are a path destination for the forward path and the reverse path respectively.

The following terms are used within the context of a single PREQ element / PREP element pair, a so-called HWMP path discovery:

- **path originator:** The path originator is the mesh STA that triggers the path discovery.
- **path originator address:** The MAC address of the path originator.
- **path target:** The path target is the entity to which the path originator attempts to establish a path.

  NOTE 2—When an originator mesh STA initially attempts to establish a path to a target, it does not know whether the target is a mesh STA in the mesh BSS or not. Only when the Originator receives a PREP element does it learn if the target is a mesh STA in the mesh BSS or not. If the target is in the mesh BSS, it is referred to as a target mesh STA. If the target is outside the mesh BSS, the term target proxy mesh gate refers to the mesh gate proxying for the target.

- **path target address:** The MAC address of the path target.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- **intermediate mesh STA:** The intermediate mesh STA is the mesh STA that participates in path selection and is neither path originator nor path target.
- **intermediate mesh STA address:** The MAC address of the intermediate mesh STA.
- **forward path:** The forward path is the mesh path to the path target, set up at the path originator and intermediate mesh STAs.
- **reverse path:** The reverse path is the mesh path to the path originator, set up at the path target and intermediate mesh STAs.
- **HWMP sequence number (HWMP SN):** Each mesh HWMP path selection element contains an HWMP SN that allows recipients to distinguish newer from stale information. An HWMP SN is specific to a mesh STA. See also 14.10.8.3 (HWMP sequence numbering).
- **forwarding information:** The forwarding information maintained by an originator mesh STA, an intermediate mesh STA, or a target mesh STA that allows the mesh STA to perform its path selection and forwarding functions.
  The terminology used when discussing forwarding information is relative to the mesh STA (reference mesh STA, given mesh STA or local mesh STA) and a particular mesh destination of the path. The following terms are specific to a given instance of the forwarding information:
  - **destination mesh STA:** The end station (mesh STA) of a (forward or reverse) path.
  - **destination mesh STA address:** The MAC address of the destination mesh STA.
  - **destination HWMP SN:** The HWMP SN of the destination mesh STA.
  - **next-hop mesh STA:** The next-hop mesh STA is the next peer mesh STA on the mesh path to the destination mesh STA.
  - **next-hop mesh STA address:** The MAC address of the next-hop mesh STA.
  - **precursor mesh STA:** A precursor mesh STA is a neighbor peer mesh STA on the mesh path that identifies a given mesh STA as the next-hop mesh STA to the destination mesh STA.
  - **precursor mesh STA address:** The MAC address of the precursor mesh STA.
  - **lifetime:** The time during which forwarding information remains active (see 14.10.8.4 (Forwarding information))
- **unreachable destination:** A destination mesh STA is considered unreachable by a source mesh STA or an intermediate mesh STA if the link to the next hop of the mesh path to this destination mesh STA, as derived from its forwarding information, is no longer usable.
- **element time to live (Element TTL)**: An integer number that is used to limit the number of hops an HWMP element may be processed and propagated. Note that this Element TTL is different from the Mesh TTL in the Mesh Control field (see 9.2.4.7.3 (Mesh Control field)).
- **root mesh STA:** A root mesh STA is configured to originate proactive PREQ elements or RANN elements. It is the root of a path selection tree.

Table 14-6 (Precursor and next hop examples (forward path)) and Table 14-7 (Precursor and next hop examples (reverse path)) show the roles of the various mesh STAs in the forward path and reverse path generated as a result of the full PREQ element and PREP element processing as shown in Figure 14-4 (Illustration of definitions). Each row in the table contains the roles of a forward/reverse path from the reference mesh STA's perspective.

14.10.3 On-demand path selection mode

If a source mesh STA needs to find a path to a destination mesh STA using the on-demand path selection mode, it broadcasts a PREQ element with the path target specified in the list of targets and the metric field initialized to the initial value of the active path selection metric.

When a mesh STA receives a new PREQ element, it creates or updates its path information to the originator mesh STA and propagates the PREQ element to its neighbor peer mesh STAs if the PREQ element contains a greater HWMP SN, or the HWMP SN is the same as the current path and the PREQ element offers a better metric than the current path. Each mesh STA may receive multiple copies of the same PREQ element that originated at the originator mesh STA, each PREQ element traversing a unique path.

Whenever a mesh STA propagates a PREQ element, the metric field in the PREQ element is updated to reflect the cumulative metric of the path to the originator mesh STA.

If the mesh STA that received a PREQ element is the target mesh STA, it sends a PREP element back to the originator mesh STA after creating or updating a path to the originator mesh STA.

The PREQ element provides the TO (Target Only) subfield that allows path selection to take advantage of existing paths to the target mesh STA by allowing an intermediate mesh STA to return a PREP element to the originator mesh STA. If the TO (Target Only) subfield is 1, only the target mesh STA responds with a PREP element. The effect of setting the TO (Target Only) subfield to 0 is the quick establishment of a path using the PREP element generated by an intermediate mesh STA, allowing the forwarding of MSDUs with a low path selection delay. In order to select (or validate) the best path during the path selection procedure, the intermediate mesh STA that responded with a PREP element propagates the PREQ element with the TO (Target Only) subfield set to 1. This prevents all other intermediate mesh STAs on the way to the target from sending a PREP element.

Intermediate mesh STAs create a path to the target mesh STA on receiving the PREP element, and also forward the PREP element toward the originator. When the originator receives the PREP element, it creates

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

a path to the target mesh STA. If the target mesh STA receives further PREQ elements with a better metric, then the target updates its path to the originator with the new path and also sends a new PREP element to the originator along the updated path. A bidirectional, best metric end-to-end path is established between the originator and target mesh STA.

14.10.4 Proactive tree building mode

14.10.4.1 General

There are two mechanisms for proactively disseminating path selection information for reaching the root mesh STA. The first method uses a *proactive* PREQ element and is intended to create paths between all mesh STAs and the root mesh STA in the network proactively. The second method uses a RANN element and is intended to distribute path information for reaching the root mesh STA but there is no forwarding information created.

A mesh STA configured as root mesh STA sends either proactive PREQ elements or proactive RANN elements periodically.

14.10.4.2 Proactive PREQ mechanism

The PREQ tree building process begins with a proactive PREQ element sent by the root mesh STA, with the Target Address set to all 1s and the TO subfield set to 1. The PREQ element contains the path metric (set to the initial value of the active path selection metric by the root mesh STA) and an HWMP SN. The proactive PREQ element is sent periodically by the root mesh STA, with increasing HWMP SNs.

A mesh STA receiving a proactive PREQ element creates or updates its forwarding information to the root mesh STA, updates the metric and hop count of the PREQ element, records the metric and hop count to the root mesh STA, and then transmits the updated PREQ element. Information about the presence of and distance to available root mesh STA(s) is disseminated to all mesh STAs in the network.

Each mesh STA may receive multiple copies of a proactive PREQ element, each traversing a unique path from the root mesh STA to the mesh STA. A mesh STA updates its current path to the root mesh STA if and only if the PREQ element contains a greater HWMP SN, or the HWMP SN is the same as the current path and the PREQ element offers a better metric than the current path to the root mesh STA. The processing of the proactive PREQ element is the same as the processing of the PREQ element in the on-demand mode described in 14.10.3 (On-demand path selection mode).

If the proactive PREQ element is sent with the Proactive PREP subfield set to 0, the recipient mesh STA may send a proactive PREP element. A proactive PREP element is necessary, for example, if the mesh STA has data to send to the root mesh STA, thus requiring the establishment of a forward path from the root mesh STA. During the time the forward path is required, the recipient mesh STA shall send a proactive PREP element even if the Proactive PREP subfield is set to 0. Guidance on controlling the generation of proactive PREQ elements in such a case is given in S.6 (Generation of proactive PREP elements in the proactive PREQ mechanism of HWMP).

If the PREQ element is sent with a Proactive PREP subfield set to 1, the recipient mesh STA shall send a proactive PREP element. The proactive PREP element establishes the path from the root mesh STA to the mesh STA.

14.10.4.3 Proactive RANN mechanism

The root mesh STA periodically propagates a RANN element into the network. The information contained in the RANN element is used to disseminate path metrics to the root mesh STA, but reception of a RANN element does not establish a path.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Upon reception of a RANN element, each mesh STA that has to create or refresh a path to the root mesh STA sends an individually addressed frame containing a PREQ element to the root mesh STA via the mesh STA from which it received the RANN element.

The root mesh STA sends a PREP element in response to each PREQ element. The individually addressed frame containing a PREQ element creates the reverse path from the root mesh STA to the originator mesh STA, while the PREP element creates the forward path from the mesh STA to the root mesh STA.

14.10.5 Collocated STAs

HWMP terminology strictly refers to a STA whose address is used for destination mapping (i.e., the originator address, the intermediate mesh STA address, or the target address). HWMP terminology does not make any assumption about the address used for communication over the WM (i.e., the Transmitter Address and the Receiver Address). For example, there is no requirement that the Path Originator or the Path Target of an HWMP path are the same as the address used for transmitting the first and receiving the last (respectively) HWMP Mesh Path Selection frame containing a PREQ element.

The corollary to this is that the first hop of a PREQ element may have a transmitter address that is not the same as the Originator address in the PREQ element and that the first hop may have a transmitter address that is not the same as the source address. In order to determine whether a transmission is a first hop or not, mesh STAs should not compare the source and transmitter addresses. Instead, this determination can be made by looking at the hop count field of the PREQ element (which is not used as an acceptance criterion).

14.10.6 Parameters for extensible path selection framework

Table 14-8 (Parameters of HWMP for extensible path selection framework) gives the parameters of HWMP for the extensible path selection framework (see 14.8.2 (Extensible path selection framework)).

Table 14-8—Parameters of HWMP for extensible path selection framework

Parameter	Notes
Path Selection Protocol ID	See Table 9-217 (Active Path Selection Protocol Identifier field values) in 9.4.2.98.2 (Active Path Selection Protocol Identifier)
Data type of metric field	As defined by active path selection metric
Length of metric field	4 octets
Operator for metric aggregation	As defined by active path selection metric
Comparison operator	As defined by active path selection metric
Initial value of path metric	As defined by active path selection metric

14.10.7 Addressing of HWMP Mesh Path Selection frame

All HWMP elements are sent in an HWMP Mesh Path Selection frame (see 9.6.17.3 (HWMP Mesh Path Selection frame format)). The RANN element may also be sent in a Beacon frame. “Cases” refer to the different conditions that trigger the transmission of an HWMP Mesh Path Selection frame. PREQ element cases are specified in 14.10.9.3 (Conditions for generating and sending a PREQ element). PREP element cases are specified in 14.10.10.3 (Conditions for generating and sending a PREP element). PERR element cases are specified in 14.10.11.3 (Conditions for generating and sending a PERR element). RANN element cases are specified in 14.10.12.3 (Conditions for generating and sending a RANN element).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Note that the PREQ Addressing Mode subfield in the Flags field identifies the propagation mode of the PREQ element; an Addressing Mode subfield equal to 0 indicates that the PREQ element is group addressed, an Addressing Mode subfield equal to 1 indicates that the PREQ element is individually addressed.

The addresses of the HWMP Mesh Path Selection frame shall be as follows:

- PREQ element group addressed—Addressing Mode subfield = 0 [Case A: Path Discovery (Original transmission), Case B: Path Maintenance (Original transmission), Case C: Proactive PREQ element (Original transmission), and Case E: PREQ element Propagation]:
  - Address 1: Group address
  - Address 2: Address of the mesh STA sending the PREQ element
  - Address 3: Same as Address 2
- PREQ element individually addressed—Addressing Mode subfield = 1 [Case D: Root Path Confirmation (Original transmission)]:
  - Address 1: Address 2 of the frame containing the RANN element that triggered the PREQ element
  - Address 2: Address of the mesh STA sending the PREQ element
  - Address 3: Same as Address 2
- PREQ element individually addressed—Addressing Mode subfield = 1 [Case E: PREQ element Propagation]:
  - Address 1: Next-hop MAC address to the mesh STA identified as the Target MAC address in the PREQ element
  - Address 2: Address of the mesh STA sending the PREQ element
  - Address 3: Same as Address 2
- PREP element Case A: Original transmission, Case C: Intermediate reply, Case D: Proactive PREP element in Proactive PREQ element mode:
  - Address 1: Address of the next hop to the Originator Mesh STA Address in the PREQ element that triggered the PREP element
  - Address 2: Address of the mesh STA sending the PREP element
  - Address 3: Same as Address 2
- PREP element Case B: PREP element Propagation:
  - Address 1: Address of the next hop to the Originator Mesh STA Address in the PREP element that triggered the PREP element
  - Address 2: Address of the mesh STA sending the PREP element
  - Address 3: Same as Address 2
- PERR element individually addressed [Case A: Original transmission—next hop is unusable]:
  - Address 1: Address of each one of the precursors for which the active forwarding information has been invalidated [see Case A, 14.10.11.3 (Conditions for generating and sending a PERR element)]
  - Address 2: Address of the mesh STA sending the PERR element
  - Address 3: Same as Address 2
- PERR element individually addressed [Case B: Original transmission—missing forwarding information]:
  - Address 1: Address of the transmitter of the frame that triggered the PERR element (see Case B, 14.10.11.3 (Conditions for generating and sending a PERR element))
  - Address 2: Address of the mesh STA sending the PERR element
  - Address 3: Same as Address 2
- PERR element individually addressed [Case C: Original transmission (proxy information is unusable)]:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

  - Address 1: Address of each one of the neighbor peer mesh STAs
  - Address 2: Address of the mesh STA sending the PERR element
  - Address 3: Same as Address 2
- PERR element individually addressed [Case D: PERR element propagation]:
  - Address 1: Address of each one of the precursors for which the active forwarding information has been invalidated (see 14.10.11.4.3 (Effect of receipt))
  - Address 2: Address of the mesh STA sending the PERR element
  - Address 3: Same as Address 2
- PERR element group addressed [all cases]:
  - Address 1: Group address
  - Address 2: Address of the mesh STA sending the PERR element
  - Address 3: Same as Address 2
- RANN element all cases:
  - Address 1: Group address
  - Address 2: Address of the mesh STA sending the RANN element
  - Address 3: Same as Address 2

Multiple HWMP elements may be sent in the same HWMP Mesh Path Selection frame if they share the same intended Address 1.

14.10.8 General rules for processing HWMP elements

14.10.8.1 General

This subclause describes the rules for the processing of the following components of the HWMP elements:

- HWMP SN
- Element TTL
- Metric

14.10.8.2 HWMP propagation

The term *propagate* is used to describe the means by which elements are not transmitted "as is" across the network but are processed and modified along the way. Many HWMP elements are intended to be processed and propagated across an MBSS by mesh STAs. Each propagation is subject to certain rules or limitations as explained in the following subclauses. Certain parameters in the HWMP elements are updated during the propagation. See 14.10.9 (Path request (PREQ) mechanism), 14.10.10 (Path reply (PREP) mechanism), 14.10.11 (Path error (PERR) mechanism), and 14.10.12 (Root announcement (RANN) mechanism).

The originator of an HWMP element sets the initial value of the Element TTL. The mesh STA that receives the HWMP element shall propagate it if the received value of Element TTL is greater than 1. Before propagating the HWMP element, the mesh STA decrements the Element TTL value.

In general, the propagation of an HWMP element is not subject to a delay. Exception exists for the RANN element as described in 14.10.12 (Root announcement (RANN) mechanism).

14.10.8.3 HWMP sequence numbering

HWMP uses sequence numbers to prevent the creation of path loops and to distinguish stale and fresh path information. Each mesh STA keeps its own HWMP SN that it increments, uses in HWMP elements, and processes according to the HWMP rules. HWMP SNs for other mesh STAs are maintained in the forwarding information (see 14.10.8.4 (Forwarding information)).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An HWMP SN is included in the PREQ, PREP, PERR, and RANN elements. The HWMP SN in the forwarding information is updated whenever a mesh STA receives new (i.e., not stale) information about the HWMP SN from a PREQ, PREP, or PERR element that may be received relative to that originator mesh STA, target mesh STA, or destination mesh STA.

HWMP depends on each mesh STA in the network to own and maintain its HWMP SN to guarantee the loop-freedom of all paths toward that mesh STA. A mesh STA increments its own HWMP SN in the following two circumstances:

— If it is an originator mesh STA, it shall increment its own HWMP SN immediately before it starts a path discovery. This prevents conflicts with previously established reverse paths toward the originator mesh STA. However, it might be advantageous not to increment the HWMP SN too frequently. An optional mechanism for achieving this is described in 14.10.8.6 (Limiting the rate of HWMP SN increments).

— If it is a target mesh STA, it shall update its own HWMP SN to maximum (current HWMP SN, target HWMP SN in the PREQ element) + 1 immediately before it generates a PREP element in response to a PREQ element. The target HWMP SN of the PREQ element is relevant when a link was broken along the path and the stored sequence number was increased at an intermediate mesh STA.

Comparing HWMP SNs is done using a circular modulo 2^{32} comparison.

In general, when a mesh STA receives an element with an HWMP SN that is less than the HWMP SN in the corresponding forwarding information, it discards the received element. If they are the same, the outcome (element processed or not) depends on the type of the element and some additional conditions. These cases are noted in the applicable element descriptions.

The only circumstance in which a mesh STA may change the HWMP SN of another mesh STA in the forwarding information independently of the reception of an HWMP element originated by this mesh STA is in response to a broken or no longer usable link to the next hop toward that destination mesh STA. The mesh STA determines which destinations use a particular next hop by consulting its forwarding information. In this case, for each destination that uses the next hop, the mesh STA increments the HWMP SN in the forwarding information and marks the path as invalid (see also 14.10.11 (Path error (PERR) mechanism)). Whenever any forwarding information containing an HWMP SN greater than the recorded HWMP SN for an affected destination is received by a mesh STA that has marked that recorded forwarding information as invalid, the mesh STA shall update its forwarding information according to the information contained in the update.

14.10.8.4 Forwarding information

In addition to the parameters contained in the basic forwarding information as described in 10.35.2 (Forwarding information), the forwarding information to a destination defined by HWMP also contains at least the destination HWMP SN, the path metric, and the number of hops.

PREQ elements and PREP elements create or update the forwarding information of the mesh STAs that process these elements as follows:

— The mesh STA may create or update its forwarding information to the transmitter of the element if the path metric improves.

— The mesh STA shall create or update its forwarding information to the originator mesh STA, if it received a PREQ element, and one of the following conditions is met:

  — The Originator HWMP SN > HWMP SN in the forwarding information for this originator mesh STA, or

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- The Originator HWMP SN = HWMP SN in the forwarding information for this originator mesh STA AND the updated path metric is better than the path metric in the forwarding information.

— The mesh STA shall create or update its forwarding information to the target mesh STA, if it received a PREP element, and one of the following conditions is met:

- The Target HWMP SN > HWMP SN in the forwarding information for this target mesh STA, or
- The Target HWMP SN = HWMP SN in the forwarding information for this target mesh STA AND the updated path metric is better than the path metric in the forwarding information.

Table 14-9 (Data for creation and update of forwarding information due to PREQ element and PREP element) defines the values to be stored in the different fields of the forwarding information after a PREQ element or PREP element has been received.

Table 14-9—Data for creation and update of forwarding information due to PREQ element and PREP element

Field of forwarding information	Received PREQ element		Received PREP element	
	Forwarding information for transmitter of PREQ element	Forwarding information for originator mesh STA	Forwarding information for transmitter of PREP element	Forwarding information for target mesh STA
HWMP SN	Invalid if created, no change if updated	PREQ element field Originator HWMP Sequence Number	Invalid if created, no change if updated	PREP element field Target HWMP Sequence Number
Next hop	Transmitter address of the Management frame containing the PREQ element	Transmitter address of the Management frame containing the PREQ element	Transmitter address of the Management frame containing the PREP element	Transmitter address of the Management frame containing the PREP element
Path metric	Accumulation of the initial value of the path metric with the metric of the link to the transmitter of the PREQ element	Accumulation of the value of PREQ element field Metric with the metric of the link to the transmitter of the PREQ element	Accumulation of the initial value of the path metric with the metric of the link to the transmitter of the PREP element	Accumulation of the value of PREP element field Metric with the metric of the link to the transmitter of the PREP element
Number of hops	1	Value of PREQ element field Hop Count + 1	1	Value of PREP element field Hop Count + 1
Precursor list	No change	No change except in case of an intermediate reply [see 14.10.9.4.3 (Effect of receipt) step f)]	No change	See 14.10.10.4.3 (Effect of receipt) step d)

Table 14-9—Data for creation and update of forwarding information due to PREQ element and PREP element *(continued)*

Field of forwarding information	Received PREQ element		Received PREP element	
	Forwarding information for transmitter of PREQ element	Forwarding information for originator mesh STA	Forwarding information for transmitter of PREP element	Forwarding information for target mesh STA
Lifetime	The longer one of the lifetime of the stored forwarding information and the value of PREQ element field Lifetime	The longer one of the lifetime of the stored forwarding information and the value of PREQ element field Lifetime	The longer one of the lifetime of the stored forwarding information and the value of PREP element field Lifetime	The longer one of the lifetime of the stored forwarding information and the value of PREP element field Lifetime

Changes to the forwarding information in other situations, for instance, when processing a PERR element (see 14.10.11 (Path error (PERR) mechanism)), are described in the corresponding clauses.

14.10.8.5 Repeated attempts at path discovery

Repeated attempts by a mesh STA at path discovery toward a single target shall be limited to dot11MeshHWMPmaxPREQretries. The minimum waiting time for the repeated attempt at path discovery to a single target is 2 × dot11MeshHWMPnetDiameterTraversalTime. For each attempt, the HWMP SN is incremented and a new Path Discovery ID is chosen.

14.10.8.6 Limiting the rate of HWMP SN increments

In order to improve path stability (and further reduce overhead), a mesh STA may use the same originator HWMP SN for a certain time interval. In this case, the originator HWMP SN shall not be incremented until at least dot11MeshHWMPnetDiameterTraversalTime has elapsed since the previous increment. This mechanism prevents mesh STAs from changing the path frequently to the originator mesh STA every time the originator mesh STA sends a burst of PREQ elements within a very short time. This element of the protocol allows an originator mesh STA to immediately initiate on-demand path discovery to a new target without affecting recently refreshed paths to the originator in other mesh STAs.

14.10.9 Path request (PREQ) mechanism

14.10.9.1 General

This subclause describes the function, generation, and processing of the PREQ element.

14.10.9.2 Function

The PREQ element, described in 9.4.2.113 (PREQ element), is used for the following purposes:

— Discovering a path to one or more target mesh STAs
— Maintaining a path (optional)
— Building a proactive (reverse) path selection tree to the root mesh STA
— Confirming a path to a target mesh STA (optional)

This is an unapproved IEEE Standards Draft, subject to change.

14.10.9.3 Conditions for generating and sending a PREQ element

A mesh STA shall send a PREQ element in an HWMP Mesh Path Selection frame, as defined in 9.6.17.3 (HWMP Mesh Path Selection frame format), in the following cases:

Case A: Path Discovery (Original Transmission)

All of the following conditions apply:

— The mesh STA needs to establish an on-demand path to one or more targets for which there is no ongoing path discovery initiated by this mesh STA.

— The mesh STA has not sent a PREQ element for the target mesh STAs less than dot11MeshHWMPpreqMinInterval TUs ago. If this is the case, the transmission of the PREQ element has to be postponed until this condition becomes true.

— The mesh STA has not made more than (dot11MeshHWMPmaxPREQretries – 1) repeated attempts at path discovery toward the target of the PREQ element.

The content of a PREQ element in Case A shall be as shown in Table 14-10 (Contents of a PREQ element in Case A).

Table 14-10—Contents of a PREQ element in Case A

Field	Value
Element ID	Value given in Table 9-77 (Element IDs) for the PREQ element
Length	26 + N × 11 (if Bit 6 (AE subfield) in the Flags field = 0) 32 + N × 11 (if Bit 6 (AE subfield) in the Flags field = 1)
Flags	Bit 0: 0 (gate announcement not applicable) Bit 1: 0 (group addressed) Bit 2: 0 (no proactive PREP element applicable) Bit 3–5: Reserved Bit 6: (1 – if external address present, 0 – otherwise) Bit 7: Reserved
Hop Count	0
Element TTL	Maximum number of hops allowed for this element, e.g., dot11MeshHWMPnetDiameter.

Table 14-10—Contents of a PREQ element in Case A *(continued)*

Field		Value
Path Discovery ID		New unique Path Discovery ID, for instance, previous Path Discovery ID + 1
Originator Mesh STA Address		MAC address of the path originator
Originator HWMP Sequence Number		Previous Originator HWMP SN + 1. See 14.10.8.6 (Limiting the rate of HWMP SN increments)
Originator External Address		Present only if Bit 6 in Flags field = 1. This value is set to the external address, which is the source address of the MSDU (from outside the mesh BSS) that triggered the path discovery at the originator.
Lifetime		The time for which mesh STAs receiving the PREQ element consider the forwarding information to be valid, e.g., dot11MeshHWMPactivePathTimeout.
Metric		Initial value of active path selection metric
Target Count		N (N ≥ 1)
Per Target	Per Target Flags	Bit 0 (TO): dot11MeshHWMPtargetOnly Bit 1: Reserved Bit 2 (USN): 0 if forwarding information for Target Address with valid HWMP SN exists, 1 otherwise Bit 3–7: Reserved
	Target Address	MAC address of requested target
	Target HWMP Sequence Number	If Per Target Flags Bit 2 (USN) is 0, the latest HWMP SN stored by the originator mesh STA for the target mesh STA from the forwarding information (see 14.10.8.4 (Forwarding information)). Otherwise, reserved.

Case B: Path Maintenance (Original Transmission) (optional)

All of the following conditions apply:

— The mesh STA has a path to a given target mesh STA that is not a root mesh STA.
— The last PREQ element to this target was sent dot11MeshHWMPmaintenanceInterval TUs (or more) ago.

The content of a PREQ element in Case B shall be as shown in Table 14-11 (Contents of a PREQ element in Case B).

Table 14-11—Contents of a PREQ element in Case B

Table 14-11—Contents of a PREQ element in Case B *(continued)*

Field		Value
Flags		Bit 0: 0 (gate announcement not applicable) Bit 1: 0 (group addressed) Bit 2: 0 (no proactive PREP element applicable) Bit 3–5: Reserved Bit 6: 0 (no address extension) Bit 7: Reserved
Hop Count		0
Element TTL		Maximum number of hops allowed for this element, e.g., dot11MeshHWMPnetDiameter
Path Discovery ID		New unique Path Discovery ID, for instance, previous Path Discovery ID + 1
Originator Mesh STA Address		MAC address of the originator of the PREQ element
Originator HWMP Sequence Number		Originator HWMP SN + 1. See 14.10.8.6 (Limiting the rate of HWMP SN increments)
Originator External Address		Field not present
Lifetime		The time for which mesh STAs receiving the PREQ element consider the forwarding information to be valid, e.g., dot11MeshHWMPactivePathTimeout.
Metric		Initial value of active path selection metric
Target Count		N (N ≥ 1)
Per Target	Per Target Flags	Bit 0 (TO): 1 (target only) Bit 1: Reserved Bit 2 (USN): 0 Bit 3–7: Reserved
	Target Address	MAC Address of target mesh STA
	Target HWMP Sequence Number	The latest HWMP SN for this target known to the originator mesh STA.

Case C: Proactive PREQ element (Original Transmission)

All of the following conditions apply:

— The root mesh STA is configured as root mesh STA using proactive PREQ elements ([dot11MeshHWMProotMode = proactivePREQnoPREP (2)] OR [dot11MeshHWMProotMode = proactivePREQwithPREP (3)]).

— The root mesh STA sent its previous proactive PREQ element dot11MeshHWMProotInterval TUs ago.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The contents of a PREQ element in Case C shall be as shown in Table 14-12 (Contents of a PREQ element in Case C).

Table 14-12—Contents of a PREQ element in Case C

Field		Value
Element ID		Value given in Table 9-77 (Element IDs) for the PREQ element
Length		37
Flags		Bit 0: 1 if dot11MeshGateAnnouncements is true (gate announcement), 0 otherwise Bit 1: 0 (group addressed) Bit 2: 0 if dot11MeshHWMProotMode = proactivePREQnoPREP(2), 1 if dot11MeshHWMProotMode = proactivePREQwithPREP(3) (proactive PREP) Bit 3–5: Reserved Bit 6: 0 (no address extension) Bit 7: Reserved
Hop Count		0
Element TTL		Maximum number of hops allowed for this element, e.g., dot11MeshHWMPnetDiameter.
Path Discovery ID		New unique Path Discovery ID, for instance, previous Path Discovery ID + 1
Originator Mesh STA Address		MAC address of the root mesh STA
Originator HWMP Sequence Number		Originator HWMP SN + 1. See 14.10.8.6 (Limiting the rate of HWMP SN increments)
Originator External Address		Field not present
Lifetime		dot11MeshHWMPactivePathToRootTimeout
Metric		Initial value of active path selection metric
Target Count		1
Per Target	Per Target Flags	Bit 0 (TO): 1 Bit 1: Reserved Bit 2 (USN): 1 Bit 3–7: Reserved
	Target Address	Broadcast address
	Target HWMP Sequence Number	0

Case D: Root Path Confirmation (Original Transmission)

One of the following conditions applies:

— The mesh STA has received a RANN element and the metric (RANN metric ⊕ metric to the transmitter of the RANN element) is better than the metric to the root in the current forwarding information.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The mesh STA has a path to a root mesh STA and the last PREQ element to the root mesh STA was sent dot11MeshHWMPconfirmationInterval TUs (or more) ago.

The content of a PREQ element in Case D shall be as shown in Table 14-13 (Contents of a PREQ element in Case D).

Table 14-13—Contents of a PREQ element in Case D

Field		Value
Element ID		Value given in Table 9-77 (Element IDs) for the PREQ element
Length		As required
Flags		Bit 0: 0 (gate announcement not applicable) Bit 1: 1 (individually addressed) Bit 2: 0 (no proactive PREP element applicable) Bit 3–5: Reserved Bit 6: 0 (no address extension) Bit 7: Reserved
Hop Count		0
Element TTL		Maximum number of hops allowed for this element, e.g., dot11MeshHWMPnetDiameter
Path Discovery ID		Not used
Originator Mesh STA Address		MAC address of the originator mesh STA
Originator HWMP Sequence Number		Originator HWMP SN + 1. See 14.10.8.6 (Limiting the rate of HWMP SN increments)
Originator External Address		Field not present
Lifetime		The time for which mesh STAs receiving the PREQ element consider the forwarding information to be valid, e.g., dot11MeshHWMPactivePathToRootTimeout.
Metric		Initial value of active path selection metric
Target Count		1
Per Target	Per Target Flags	Bit 0 (TO): 1 Bit 1: Reserved Bit 2 (USN): 0 Bit 3–7: Reserved
	Target Address	Root mesh STA MAC Address
	Target HWMP Sequence Number	The latest HWMP SN for this target known to the originator mesh STA

Case E: PREQ element Propagation

Case E1 (target count = 1, no PREP element generation as intermediate mesh STA):

All of the following conditions apply:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The mesh STA has received and accepted a PREQ element—see 14.10.9.4.2 (Acceptance criteria).
— dot11MeshForwarding is true.
— [The active forwarding information for the Originator Mesh STA was created or updated according to the rules defined in 14.10.8.4 (Forwarding information)] OR [{the Originator HWMP SN of the accepted PREQ element = HWMP SN in the forwarding information for this originator mesh STA} AND {the mesh STA has not previously received a PREQ element with the same Originator Mesh STA Address and the same Path Discovery ID}].
— The Element TTL field is greater than 1—see 14.10.8.2 (HWMP propagation).
— Target Count = 1.
— [The mesh STA is not the target of the PREQ element)]
OR
[the target of the PREQ element is the MAC broadcast address (all 1s)].
— The mesh STA is not the proxy of the target address.
— [The TO (Target Only) subfield of the target in the PREQ element is set (TO = 1)]
OR
[{the TO (Target Only) subfield of the target in the PREQ element is not set (TO = 0)} AND {mesh STA has no active forwarding information for the requested target}].

The content of a PREQ element in Case E1 shall be as shown in Table 14-14 (Contents of a PREQ element in Case E1).

For the per target fields (Per Target Flags, Target Address, Target HWMP Sequence Number) assume the following:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— Target #A: If target A would have been the only requested target, it would generate a PREQ element for propagation according to case E1.
— Target #B: If target B would have been the only requested target, it would generate a PREQ element for propagation according to case E2.

14.10.9.4 PREQ element processing

14.10.9.4.1 General

Received PREQ elements are subject to certain acceptance criteria. Processing and actions taken depend on the contents of the PREQ element and the information available to the receiving mesh STA. See also 14.10.8 (General rules for processing HWMP elements).

14.10.9.4.2 Acceptance criteria

The PREQ element shall not be accepted (and shall not be processed as described in 14.10.9.4.3 (Effect of receipt)) if any of the following is true:

— (The target address of the PREQ element is neither the recipient MAC address, broadcast address, nor an external MAC address proxied by the recipient) AND (dot11MeshForwarding is false)
— (Bit 1 (Addressing Mode subfield) of the Flags field in the PREQ element is equal to 1) AND (there is no valid forwarding information with the destination mesh STA address equal to the Target Address of the PREQ element)

Otherwise, the PREQ element is accepted. See also 14.10.8 (General rules for processing HWMP elements).

14.10.9.4.3 Effect of receipt

A mesh STA receiving a PREQ element according to the acceptance criteria in 14.10.9.4.2 (Acceptance criteria) shall record the Path Discovery ID and the Originator Mesh STA Address. The receiving mesh STA shall create or update the active forwarding information it maintains for the originator mesh STA of the PREQ element according to the rules defined in 14.10.8.4 (Forwarding information).

If the active forwarding information for the Originator Mesh STA was created or updated according to the rules defined in 14.10.8.4 (Forwarding information) or if the Target HWMP SN of the PREQ element is the same as the HWMP SN in the forwarding information for the Target Mesh STA and there has been no record of the Originator Mesh STA and Path Discovery ID, the following applies:

a) If the mesh STA is the target of the PREQ element or is the proxy of the target MAC address it shall initiate the transmission of a PREP element to the originator mesh STA (14.10.10.3 (Conditions for generating and sending a PREP element) Case A). If the PREQ element carries an external address (indicated by the AE subfield in the Flags field), the mesh STA shall update its proxy information with the Originator External Address as external address, the PREQ element Originator Mesh STA Address as the corresponding proxy, the HWMP Sequence Number as proxy information sequence number, and for the proxy lifetime the longer one of the value of the PREQ element Lifetime field and the proxy lifetime if the proxy information already exists (see also 14.11.4.3 (Proxy update (PXU))).
b) If step a) was not applicable for the mesh STA and the AE subfield in the Flags field in the PREQ element is 1, the mesh STA may update its proxy information with the Originator External Address as external address, the PREQ element Originator Mesh STA Address as the corresponding proxy, the HWMP Sequence Number as proxy information sequence number, and for the proxy lifetime the longer one of the value of the PREQ element Lifetime field and the proxy lifetime if the proxy information already exists (see also 14.11.4.3 (Proxy update (PXU))).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

c) If the mesh STA has valid forwarding information to any of the requested targets and the TO (Target Only) subfield for such a target is not set (TO = 0), it initiates the transmission of a PREP element for each of these targets (see 14.10.10.3 (Conditions for generating and sending a PREP element) Case C).

d) If the mesh STA is initiating a PREP element transmission on behalf of another target according to step c) (intermediate reply), it shall process all of the following:
   - Update the precursor list in its forwarding information for the target mesh STA with the next hop from the forwarding information of the originator mesh STA.
   - Update the lifetime for this precursor that is the longer one of the lifetime of the forwarding information of the target mesh STA.
   - Update the lifetime of the precursor list entry in case it already exists.
   - Update the precursor list in its forwarding information for the originator mesh STA with the next hop toward the target mesh STA.
   - Update the lifetime for this precursor that is the longer one of the lifetime of the forwarding information of the originator mesh STA.
   - Update the lifetime of the precursor list entry in case it already exists.

e) If the received PREQ element is a proactive PREQ element [target address is set to all 1s, TO subfield is set (TO = 1)], the mesh STA generates a proactive PREP element to the root mesh STA (see 14.10.10.3 (Conditions for generating and sending a PREP element) Case D) depending on the setting of the Proactive PREP subfield. If the Proactive PREP subfield is 1, a proactive PREP element is generated, if it is 0, a proactive PREP element is generated only if a bidirectional path to the root mesh STA is required (see S.6 (Generation of proactive PREP elements in the proactive PREQ mechanism of HWMP)).

f) If there are individually addressed targets in the PREQ element that have not been processed in step a) or that have been processed in step c) or in step e), the receiving mesh STA shall propagate the PREQ element as defined in 14.10.9.3 (Conditions for generating and sending a PREQ element) Case E.

14.10.10 Path reply (PREP) mechanism

14.10.10.1 General

Subclause 14.10.10 (Path reply (PREP) mechanism) describes the function, generation, and processing of the PREP element.

14.10.10.2 Function

The PREP element is transmitted in individually addressed frames and is described in 9.4.2.114 (PREP element). The purpose of the PREP element is as follows:

- To establish the forward path to a target mesh STA or target proxy mesh gate.
- To confirm the reverse path to the originator.

14.10.10.3 Conditions for generating and sending a PREP element

A mesh STA sends out a PREP element in an HWMP Mesh Path Selection frame, as defined in 9.6.17.3 (HWMP Mesh Path Selection frame format), in the following cases:

Case A: Path Discovery (Original Transmission)

A PREP element is transmitted if the mesh STA has received and accepted a PREQ element (see 14.10.9.4.2 (Acceptance criteria)) fulfilling any one of the following conditions:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The Target Address of the PREQ element is the same as MAC address of the receiving mesh STA.
— The Target Address of the PREQ element is an external address currently proxied by the mesh STA.

The content of the generated PREP element in Case A shall be as shown in Table 14-17 (Contents of a PREP element in Case A).

Table 14-17—Contents of a PREP element in Case A

Field	Value
Element ID	Value given in Table 9-77 (Element IDs) for the PREP element
Length	As required
Flags	Bit 0–5: Reserved Bit 6 (AE): (1 = external address present, 0 = otherwise) Bit 7: Reserved
Hop Count	0
Element TTL	Maximum number of hops allowed for this element
Target Mesh STA Address	MAC address of the target mesh STA or target proxy mesh gate
Target HWMP Sequence Number	HWMP SN of the target mesh STA or target proxy mesh gate after it has been updated according to 14.10.8.3 (HWMP sequence numbering)
Target External Address	External target address on behalf of which the PREP element is sent. Present only if Bit 6 (AE subfield) in the Flags field is 1
Lifetime	As per the PREQ element that triggered the transmission of this PREP element
Metric	Initial value of active path selection metric
Originator Mesh STA Address	MAC address of the originator mesh STA
Originator HWMP Sequence Number	HWMP SN of the originator mesh STA

Case B: PREP element propagation

A PREP element is propagated if all of the following conditions apply:

— The mesh STA has received and accepted the PREP element—see 14.10.10.4.2 (Acceptance criteria).
— The mesh STA is not the path originator.

The contents of a PREP element element in Case B shall be as shown in Table 14-18 (Contents of a PREP element in Case B).

Table 14-18—Contents of a PREP element in Case B

Case C: Intermediate reply (Original Transmission)

A PREP element is transmitted if the mesh STA has received a PREQ element fulfilling all of the following conditions:

— The TO (Target Only) subfield in the corresponding Per Target Flags field in the PREQ element is not set (TO = 0)

— The receiving mesh STA has active forwarding information with

a)A destination that is the same as the Target Address of the PREQ element

b)An HWMP SN that is greater than or equal to the Target HWMP SN of the PREQ element

c)A nonzero lifetime

The content of the generated PREP element in Case C shall be as shown in Table 14-19 (Contents of a PREP element in Case C).

Table 14-19—Contents of a PREP element in Case C

Table 14-19—Contents of a PREP element in Case C *(continued)*

Field	Value
Target HWMP Sequence Number	HWMP SN of the stored forwarding information of the Target of the PREQ element
Target External Address	Not present
Lifetime	As per the PREQ element that triggered the transmission of this PREP element
Metric	Value of path metric taken from the active forwarding information for the target address of the PREQ element
Originator Mesh STA Address	MAC address of the originator mesh STA
Originator HWMP Sequence Number	HWMP SN of the originator mesh STA

Case D: Proactive PREP element in Proactive PREQ element mode (Original Transmission)

One of the following conditions applies:

— The mesh STA has received a proactive PREQ element with the Proactive PREP subfield set to 0 AND the mesh STA needs to establish or update a bidirectional path to the root mesh STA.
— The mesh STA has received a proactive PREQ element with the Proactive PREP subfield set to 1.

Note that a proactive PREQ element is a PREQ element with a Target Address set to all 1s and its TO subfield set (TO=1).

The content of the generated PREP element in Case D shall be as shown in Table 14-20 (Contents of a PREP element in Case D).

14.10.10.4 PREP element processing

14.10.10.4.1 General

Received PREP elements are subject to certain acceptance criteria. Processing and actions taken depend on the contents of the PREP element and the information available to the receiving mesh STA.

14.10.10.4.2 Acceptance criteria

The PREP element element shall not be accepted (and shall not be processed as described in 14.10.10.4.3 (Effect of receipt)) if any of the following is true:

— (The Originator Mesh STA Address of the PREP element is neither the recipient MAC address nor an external MAC address proxied by the recipient) AND (dot11MeshForwarding is false).

Otherwise, the PREP element shall be accepted.

14.10.10.4.3 Effect of receipt

A mesh STA receiving a PREP element according to the acceptance criteria in 14.10.10.4.2 (Acceptance criteria) shall create or update the active forwarding information it maintains for the target mesh STA of the PREP element (according to the rules defined in 14.10.8.4 (Forwarding information)). If the conditions for creating or updating the forwarding information have not been met in those rules, no further steps are applied to the PREP element.

If the active forwarding information was created or updated according to the rules defined in 14.10.8.4 (Forwarding information), the following apply:

a) If the receiving mesh STA is not the final destination of the PREP element (originator mesh STA) and the field Element TTL > 1, the PREP element is propagated as defined in 14.10.10.3 (Conditions for generating and sending a PREP element) Case B.

b) If the receiving mesh STA is the final destination of the PREP element (originator mesh STA) and its AE subfield in the Flags field is 1, the mesh STA shall store the Target External Address, the Target Mesh STA Address, and the HWMP Sequence Number as proxy information sequence number in its proxy information. The proxy lifetime is the longer one of the value of the PREP element Lifetime field and the proxy lifetime if the proxy information already exists (see also 14.11.4.3 (Proxy update (PXU))).

c) If the receiving mesh STA is not the final destination of the PREP element (originator mesh STA) and its AE subfield in the Flags field is 1, the mesh STA may store the Target External Address, the Target Mesh STA Address, and the HWMP Sequence Number as proxy information sequence number in its proxy information. The proxy lifetime is the longer one of the value of the PREP

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

element Lifetime field and the proxy lifetime if the proxy information already exists (see also 14.11.4.3 (Proxy update (PXU))).

d) If the mesh STA propagates the PREP element, the precursor list for the Target Mesh STA Address is updated by adding the next-hop mesh STA to which the PREP element is propagated. In addition, at the mesh STA the precursor list for the originator mesh STA address is updated by adding the next-hop mesh STA toward the Target Address. The lifetimes of these entries in the precursor lists are the values of the lifetimes of the corresponding forwarding information.

14.10.11 Path error (PERR) mechanism

14.10.11.1 General

Subclause 14.10.11 (Path error (PERR) mechanism) describes the function, generation, and processing of the PERR element.

14.10.11.2 Function

The PERR element is used for announcing one or more unreachable destination(s). The announcement is sent to all traffic sources that have a known active path to the destination(s). The active forwarding information associated with the unreachable destination(s) should no longer be used for forwarding.

A PERR element may be either group addressed (if there are many precursors), individually addressed (if there is only one precursor), or individually addressed iteratively to all precursors (see 14.10.7 (Addressing of HWMP Mesh Path Selection frame), item “PERR element individually addressed”). The PERR element is processed as a single element when iteratively individually addressed to several precursors. The PERR element contains the destinations that are unreachable.

A PERR element is propagated by mesh STAs receiving a PERR element if certain conditions are met.

A mesh STA generating or receiving a PERR element may attempt to establish paths to unreachable destinations using any of the available HWMP mechanisms.

14.10.11.3 Conditions for generating and sending a PERR element

A mesh STA shall send out a PERR element in an HWMP Mesh Path Selection frame, as defined in 9.6.17.3 (HWMP Mesh Path Selection frame format), in the following cases:

Case A: Original transmission (next hop is unusable)

The mesh STA has not sent a PERR element less than dot11MeshHWMPperrMinInterval TUs ago, and the following condition applies:

— The mesh STA determines that the link to the next hop of an active path in its forwarding information is no longer usable.

NOTE—The detection might be triggered by the fact that a mesh STA is unable to forward an MSDU/MMPDU to a next-hop mesh STA.

The HWMP SN in the forwarding information of all unreachable destinations announced in this PERR element is incremented by 1. The forwarding information for each unreachable destination announced in this PERR element is invalidated.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The contents of a PERR element in Case A shall be as shown in Table 14-21 (Contents of a PERR element in Case A).

Table 14-21—Contents of a PERR element in Case A

Field	Value
Element ID	Value given in Table 9-77 (Element IDs) for the PERR element
Length	$2 + N \times 13$
Element TTL	The maximum number of hops the element is propagated before being discarded.
Number of Destinations	Number of announced unreachable destinations in the PERR element.
Flags #1	Bit 0–5: Reserved Bit 6 (AE): 0 Bit 7: Reserved
Destination Address #1	MAC address of unreachable destination #1.
HWMP Sequence Number #1	HWMP SN for Destination Address #1 from the forwarding information after above increment.
Reason Code #1	"MESH-PATH-ERROR-DESTINATION-UNREACHABLE" (see 9.4.1.7 (Reason Code field)).
...	...

Case B: Original transmission (missing forwarding information)

The mesh STA has not sent a PERR element less than dot11MeshHWMPperrMinInterval TUs ago, and one of the following conditions applies:

— The mesh STA receives an individually addressed frame with a destination address not matching its own MAC address for which it has no forwarding information.

— The mesh STA receives an individually addressed frame with a destination address not matching its own MAC address and dot11MeshForwarding is false.

The contents of a PERR element in Case B shall be as shown in Table 14-22 (Contents of a PERR element in Case B).

Case C: Original transmission (proxy information is unusable)

The mesh STA has not sent a PERR element less than dot11MeshHWMPperrMinInterval TUs ago, and the following condition applies:

— The mesh STA is a proxy mesh gate and determines that an active proxy information where the mesh STA is the proxy mesh gate is no longer usable.

Case D: PERR element propagation

The mesh STA has not sent a PERR element less than dot11MeshHWMPperrMinInterval TUs ago, and all of the following conditions apply:

— The mesh STA received a PERR element from a neighbor peer mesh STA.
— A destination in the PERR element is the same as one of the destinations in the active forwarding information of the mesh STA where the next hop is the transmitter of the received PERR element, and the forwarding information or the proxy information has been invalidated according to conditions in 14.10.11.4.3 (Effect of receipt) case b), case c), or case d).
— dot11MeshForwarding is true.
— The Element TTL field in the received PERR element is greater than 1.

The contents of a PERR element in Case D shall be as shown in Table 14-24 (Contents of a PERR element in Case D).

Table 14-24—Contents of a PERR element in Case D

Field	Value
Element ID	Value given in Table 9-77 (Element IDs) for the PERR element
Length	if AE subfield = 0: 2 + N × 13 if AE subfield = 1: 2 + N × 19
Element TTL	Element TTL in received PERR element – 1
Number of Destinations	1 ≤ number of destinations in the PERR element ≤ received value Received number of destinations less the number of received destinations for which the transmitter of the PERR element is not the next hop
Flags #1	As received
Destination Address #1	MAC address of unreachable destination #1, as received
HWMP Sequence Number #1	If Reason Code #1 = "MESH-PATH-ERROR-NO-FORWARDING-INFORMATION" and received value = 0, then HWMP SN for Destination Address #1 from the forwarding information after the increment of 14.10.10.4.3 (Effect of receipt) step b). Otherwise, as received.
Destination External Address #1	As received This field is present if Bit 6 (AE subfield) of the Flags field #1 is 1; it is not present otherwise.
Reason Code #1	As received
...	...

14.10.11.4 PERR element processing

14.10.11.4.1 General

Received PERR elements are subject to certain acceptance criteria. Processing and actions taken depend on the contents of the PERR element and the information available to the receiving mesh STA. See also 14.10.8 (General rules for processing HWMP elements).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.10.11.4.2 Acceptance criteria

The PERR element shall be accepted (and shall be processed as described in 14.10.11.4.3 (Effect of receipt)) if the following applies:

- The mesh STA that receives the PERR element has forwarding information stored where
  - The destination is contained in the list of unreachable destinations of the PERR element and
  - The next hop is the transmitter of the received PERR element

Otherwise, the PERR element shall be discarded.

14.10.11.4.3 Effect of receipt

The following applies only to a PERR element that was accepted according to the acceptance criteria in 14.10.11.4.2 (Acceptance criteria):

a) The mesh STA creates a list of unreachable destinations consisting of those destinations from the received PERR element for which the next hop in the local active forwarding information is the transmitter of the PERR element. Step b) through step e) are applied to the destinations in this list.

b) If the Reason Code is "MESH-PATH-ERROR-NO-FORWARDING-INFORMATION" and the HWMP Sequence Number is 0, the receiving mesh STA increments the HWMP SN in the forwarding information of the listed unreachable destination by 1 and invalidates the forwarding information.

c) If the Reason Code is "MESH-PATH-ERROR-NO-FORWARDING-INFORMATION" and the HWMP Sequence Number is not 0 or the Reason Code is "MESH-PATH-ERROR-DESTINATION-UNREACHABLE" and the received HWMP SN for a listed unreachable destination is higher than the current HWMP SN in the forwarding information for that destination, the receiving mesh STA shall consider that destination unreachable and shall set the HWMP SN in the forwarding information to the HWMP SN received in the PERR element and shall invalidate the forwarding information associated with this unreachable destination.

d) If the Reason Code is "MESH-PATH-ERROR-NO-PROXY-INFORMATION," the receiving mesh STA shall consider the corresponding Destination External Address unreachable and shall invalidate the proxy information associated with this unreachable external destination (proxy mesh gate is the Destination Address of the PERR element, external MAC address is the Destination External Address of the PERR element, proxy information sequence number is the HWMP Sequence Number).

e) A PERR element is propagated according to the conditions defined in 14.10.11.3 (Conditions for generating and sending a PERR element) Case D "PERR element propagation."

14.10.12 Root announcement (RANN) mechanism

14.10.12.1 General

Subclause 14.10.12 (Root announcement (RANN) mechanism) describes the function, generation, and processing of the RANN element.

14.10.12.2 Function

The RANN element, described in 9.4.2.112 (RANN element), is used for announcing the presence of a mesh STA configured as root mesh STA using the proactive RANN mechanism. RANN elements are sent out periodically by the root mesh STA.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The RANN element propagates path metric information across the network so that each mesh STA can select a best metric path to the announced root mesh STA. This mechanism allows bidirectional trees to be built, using a robust procedure based on individually addressed frames initiated by the mesh STAs. This procedure makes the root mesh STA aware of all mesh STAs.

A receiving mesh STA shall propagate the RANN element as described in 14.10.12.3 (Conditions for generating and sending a RANN element) Case B.

14.10.12.3 Conditions for generating and sending a RANN element

A mesh STA sends out a RANN element in an HWMP Mesh Path Selection frame, as defined in 9.6.17.3 (HWMP Mesh Path Selection frame format), in the following cases:

Case A: Original transmission

All of the following conditions apply:

— The mesh STA is configured as a root mesh STA using the proactive RANN mechanism [dot11MeshHWMProotMode = rann (4)].
— The root mesh STA sent its previous RANN element dot11MeshHWMPrannInterval TUs ago.

The contents of a RANN element in Case A shall be as shown in Table 14-25 (Contents of a RANN element in Case A).

Table 14-25—Contents of a RANN element in Case A

Field	Value
Element ID	Value given in Table 9-77 (Element IDs) for the RANN element
Length	21
Flags	Bit 0: set to 1 if dot11MeshGateAnnouncements is true, set to 0 otherwise. Bit 1–7: Reserved
Hop Count	0
Element TTL	Maximum number of hops allowed for this element
Root Mesh STA Address	MAC address of the root mesh STA
HWMP Sequence Number	Last used HWMP SN of the root mesh STA + 1
Interval	dot11MeshHWMPrannInterval
Metric	Initial value of active path selection metric

Case B: Propagation

All of the following conditions apply:

— The mesh STA has valid forwarding information to a root mesh STA using the proactive RANN mechanism [dot11MeshHWMProotMode = rann (4)].
— The mesh STA sent its previous RANN element dot11MeshHWMPrannInterval TUs ago.
— dot11MeshForwarding is true.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The Element TTL field is greater than 1—see 14.10.8.2 (HWMP propagation).

The contents of a RANN element in Case B shall be as shown in Table 14-26 (Contents of a RANN element in Case B).

Table 14-26—Contents of a RANN element in Case B

Field	Value
Element ID	Value given in Table 9-77 (Element IDs) for the RANN element

Flags	As received
Hop Count	As received + 1
Element TTL	As received – 1
Root Mesh STA Address	As received
HWMP Sequence Number	As received
Interval	As received
Metric	As received ⊕ own link metric toward the transmitting mesh STA

14.10.12.4 RANN element reception

14.10.12.4.1 General

Received RANN elements are subject to certain acceptance criteria. Processing and actions taken depend on the content of the RANN element and the forwarding information maintained by the receiving mesh STA. See also 14.10.8 (General rules for processing HWMP elements).

14.10.12.4.2 Acceptance criteria

The RANN element shall not be accepted (and shall not be processed as described in 14.10.12.4.3 (Effect of receipt)) if any of the following is true:

— The HWMP Sequence Number < previous HWMP SN from this originating root mesh STA
— (The HWMP Sequence Number = previous HWMP SN) AND (updated path metric is *worse than* previous path metric)

Otherwise, the RANN element shall be accepted.

14.10.12.4.3 Effect of receipt

The following applies only to a RANN element that was accepted according to the acceptance criteria in 14.10.12.4.2 (Acceptance criteria):

a) The receiving mesh STA shall set dot11MeshHWMPrannInterval to the value of the Interval field of the received RANN element.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

b) The receiving mesh STA may initiate a PREQ element / PREP element exchange with the root mesh STA to set up or update a path to the root mesh STA. See 14.10.9.3 (Conditions for generating and sending a PREQ element) Case D.

c) The receiving mesh STA may record the Root Mesh STA Address, together with the HWMP Sequence Number, Hop Count, and Metric in order to assist in executing 14.10.9.3 (Conditions for generating and sending a PREQ element) Case D.

The receiving mesh STA shall transmit a RANN element if the conditions defined in 14.10.12.3 (Conditions for generating and sending a RANN element) Case B are true.

14.10.13 Considerations for support of STAs without mesh functionality

The verification, by the mesh STA collocated with the AP, of disjunct MAC addresses between a non-AP STA without mesh functionality and mesh STAs during authentication/association of the non-AP STA without mesh functionality (see 11.3.6 (Additional mechanisms for an AP collocated with a mesh STA)) may be done by issuing a PREQ element for the MAC address of the non-AP STA without mesh functionality by the mesh STA collocated with the AP. The TO (Target Only) subfield of the Per Target Flags field of the PREQ element shall be set to 1.

The MAC address of the non-AP STA already exists in the MBSS if the AP with mesh functionality receives a PREP element for the MAC address of the non-AP STA and it can be derived from the PREP element that the requested MAC address is originated from a mesh STA. (The AE subfield of the Flags field of the PREP element is set to 0; see 9.4.2.114 (PREP element).)

14.11 Interworking with the DS

14.11.1 Overview of interworking between a mesh BSS and a DS

A mesh STA that has access to a DS is called a mesh gate. Mesh STAs in an MBSS access the DS via the mesh gate. An MBSS functions like an IEEE 802 LAN segment that is compatible with IEEE Std 802.1D. The MBSS appears as a single access domain.

An MBSS may contain two or more mesh gates. When multiple mesh gates in an MBSS have access to the same DS, the MBSS has more than one “port” (in the sense of IEEE Std 802.1D-2004, for example) through which it accesses the DS. Accordingly, broadcast loops may occur. Therefore, mesh gates should implement a loop preventing protocol in the DS.

NOTE 1—In the DS a typical implementation uses the Rapid Spanning Tree Protocol (RSTP) as specified in IEEE Std 802.1D-2004. With RSTP the resulting active DS topology forms a tree. Then, even if multiple mesh gates connect with the same DS, the MBSS only accesses the DS through a single mesh gate.

When dot11MeshGateAnnouncements is true, the mesh gate announces its presence to other mesh STAs in the MBSS. The mesh gate uses the gate announcement protocol (see 14.11.2 (Gate announcement (GANN))) or alternatively one of the HWMP proactive path selection methods with the Gate Announcement field equal to 1:

— The proactive PREQ mechanism (see 14.10.4.2 (Proactive PREQ mechanism)), with the Gate Announcement field equal to 1 (see 14.10.9.3 (Conditions for generating and sending a PREQ element))

— The proactive RANN mechanism (see 14.10.4.3 (Proactive RANN mechanism)), with the Gate Announcement field equal to 1 (see 14.10.12.3 (Conditions for generating and sending a RANN element))

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When the mesh gate uses one of the HWMP proactive path selection methods, the gate announcement protocol is not used.

A mesh STA discovers the presence of a mesh gate with access to the external network by receiving GANN elements (or PREQ element and RANN element with the Gate Announcement field equal to 1 if using such mechanisms). Mesh STAs propagate these elements to neighbor mesh STAs in order to propagate the information throughout the MBSS.

NOTE 2—The decision to set dot11MeshGateAnnouncements to true is beyond the scope of the standard. In general, the mesh gate announces that it has access to a broader network beyond the MBSS, using gate announcement protocol or HWMP proactive path selection methods with the Gate Announcement field equal to 1. One example of this configuration is that the mesh gate has access to a portal through the DS.

When a mesh gate has access to IEEE 802 STAs outside the mesh BSS (a mesh STA collocated with an AP, another mesh STA that belongs to another MBSS, etc.), the mesh gate acts as an intermediary for the IEEE 802 STAs outside the MBSS so that the forwarding information inside the MBSS only contains addresses that belong to the MBSS. The mesh gate acting as an intermediary for external STAs is termed proxy mesh gate. When the end station of an IEEE 802 communication is an external STA, mesh STAs handle addresses of the end-to-end IEEE 802 communication as depicted in Figure 9-64 (Example addressing for a mesh Data frame). Proxy mesh gate operation is described in 14.11.4 (Proxy information and proxy update).

14.11.2 Gate announcement (GANN)

14.11.2.1 General

Subclause 14.11.2 (Gate announcement (GANN)) describes the function, generation, and processing of the GANN element.

14.11.2.2 Function

The GANN element, described in 9.4.2.111 (GANN element), is used to announce the presence of a mesh gate with dot11MeshGateAnnouncements equal to true in the mesh BSS. Gate announcements allow mesh STAs to discover such a mesh gate and, if necessary, to build a path toward it.

14.11.2.3 Conditions for generating and sending a GANN element

A mesh STA shall send a GANN element in a Gate Announcement frame, as defined in 9.6.17.4 (Gate Announcement frame format), in the following cases:

Case A: Original transmission

The mesh STA is a mesh gate not sending PREQ element or RANN element with the Gate Announcement field equal to 1 and dot11MeshGateAnnouncements is true. The mesh STA shall transmit the Gate Announcement frame at every dot11MeshGateAnnouncementInterval.

The content of a GANN element in Case A shall be as shown in Table 14-27 (Contents of a GANN element in Case A).

Table 14-27—Contents of a GANN element in Case A

Field	Value
Element ID	Value given in Table 9-77 (Element IDs) for the GANN element
Length	15

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 14-27—Contents of a GANN element in Case A

Field	Value
Flags	Reserved
Hop Count	0
Element TTL	Maximum number of hops allowed for the gate announcement
Mesh Gate Address	Mesh STA MAC address
GANN Sequence Number	Previous GANN sequence number + 1
Interval	dot11MeshGateAnnouncementInterval

The mesh gate shall assign the GANN Sequence Number from a single modulo 2^{32} counter, starting at 0 and incrementing by 1 for each GANN element transmission.

Case B: Propagation

All of the following conditions are met:

— The mesh STA has received and accepted a gate announcement.
— The decremented Element TTL of the gate announcement is greater than or equal to 1.
— dot11MeshForwarding is true.

The content of a GANN element in Case B shall be as shown in Table 14-28 (Contents of a GANN element in Case B).

Table 14-28—Contents of a GANN element in Case B

Field	Value
Element ID	Value given in Table 9-77 (Element IDs) for the GANN element
Length	15
Flags	As received
Hop Count	As received + 1
Element TTL	As received – 1
Mesh Gate Address	As received
GANN Sequence Number	As received
Interval	As received

14.11.2.4 GANN element processing

14.11.2.4.1 General

A received gate announcement is subject to certain acceptance criteria. Processing depends on the contents of the gate announcement and the information available at the receiving mesh STA.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.11.2.4.2 Acceptance criteria

The GANN element shall not be accepted (and shall not be processed as described in 14.11.2.4.3 (Effect of receipt)) if the GANN Sequence Number of the gate announcement is equal or lower than the GANN Sequence Number of the most recently accepted gate announcement with the same Mesh Gate Address.

14.11.2.4.3 Effect of receipt

The following applies only to a GANN element that was accepted according to the acceptance criteria in 14.11.2.4.2 (Acceptance criteria). The receiving mesh STA shall transmit a gate announcement as described in 14.11.2.3 (Conditions for generating and sending a GANN element), Case B.

The Mesh Gate Address field of the GANN contains the address of the mesh gate, and may be stored for the purpose of determining paths to the mesh gates. Paths to mesh gates allow mesh STAs to forward MSDUs to addresses for which no path could be determined (see 10.35.8 (MSDU forwarding and unknown destination)).

14.11.3 Data forwarding at proxy mesh gates

14.11.3.1 General

Forwarding of MSDUs from the DS into the MBSS by a proxy mesh gate follows the procedures given in 10.35.2 (Forwarding information).

Forwarding of MSDUs from the MBSS into the DS by a proxy mesh gate follows the procedures that apply for the specific collocated network.

A proxy mesh gate learns the addresses of the other proxy mesh gates in the MBSS and of external addresses proxied by them through the receipt of path selection messages and messages carrying proxy information (for example, see 9.4.2.116 (PXU element)).

14.11.3.2 Forwarding of MSDUs from the MBSS to the DS

On receipt of an individually addressed mesh Data frame from the MBSS with Address Extension Mode equal to “Address5&6” (see Table 9-20 (Valid values for the Address Extension Mode subfield)), a proxy mesh gate shall perform the following:

— If Address 5 is a known destination MAC address in the proxy information (external address) and proxied by the proxy mesh gate, the proxy mesh gate forwards the MSDU to the external address through the DS.

— If Address 5 is a known destination MAC address in the proxy information (external address) and proxied by a different proxy mesh gate, the MSDU is forwarded through the MBSS to the proxy mesh gate that proxies the external address. The MSDU is sent into the MBSS according to the procedures in 10.35.3.1 (At source mesh STAs (individually addressed)) as an individually addressed mesh Data frame with Address 3 set to the MAC address of the proxy mesh gate of the proxy information proxying Address 5, Address 4 set to the MAC address of this proxy mesh gate, and Address 5 and Address 6 kept unchanged.

— If Address 5 is unknown to the proxy mesh gate, the mesh gate forwards the MSDU to the DS. The mesh gate may send an error notification to the mesh source of the MSDU. In HWMP, this is done by sending a PERR element as described in 14.10.11.3 (Conditions for generating and sending a PERR element) Case C.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

On receipt of group addressed mesh Data frame from the MBSS with Address Extension Mode equal to "Address4" (see Table 9-20 (Valid values for the Address Extension Mode subfield)), a proxy mesh gate shall forward the MSDU to the DS using a group addressed frame.

14.11.3.3 Forwarding of MSDUs from the DS to the MBSS

On receipt of an individually addressed MSDU from the DS, a proxy mesh gate shall perform the following depending on the possible destination:

a) If the destination of the MSDU is a mesh STA address that the mesh gate knows to be inside the MBSS, the mesh gate forwards the MSDU according to the procedures for frame addressing and data forwarding at source mesh STAs in an MBSS (10.35.3.1 (At source mesh STAs (individually addressed))). The MSDU shall be transmitted using a frame with the four-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to "Address5&6" (see Table 9-20 (Valid values for the Address Extension Mode subfield))), where the Mesh Address Extension subfield in the Mesh Control field carries the addresses of the end stations, as specified in row "Mesh Data (proxied, individually addressed)" of Table 9-42 (Valid address field usage for Mesh Data and Multihop Action frames). The address fields are set as follows:
   - Address 1: The address of the next-hop mesh STA (toward the destination mesh STA according to the forwarding information—see 10.35.2 (Forwarding information))
   - Address 2: The address of the proxy mesh gate
   - Address 3: The address of the destination mesh STA
   - Address 4: The address of the proxy mesh gate
   - Address 5: The address of the destination end mesh STA that is the same as Address 3
   - Address 6: The address of the source end mesh STA that is the source address of the MSDU received from the DS

b) If the destination of the MSDU is an external address that is proxied by another proxy mesh gate in the MBSS, the mesh gate forwards the MSDU according to the procedures for frame addressing and data forwarding at source mesh STAs in an MBSS (10.35.3.1 (At source mesh STAs (individually addressed))). The MSDU shall be transmitted using a frame with the four-address MAC header format [with the Address Extension Mode subfield in the Mesh Control field set to "Address5&6" (see Table 9-20 (Valid values for the Address Extension Mode subfield))], where the Mesh Address Extension subfield in the Mesh Control field carries the addresses of the end stations, as specified in row "Mesh Data (proxied, individually addressed)" of Table 9-42 (Valid address field usage for Mesh Data and Multihop Action frames). The address fields are set as follows:
   - Address 1: The address of the next-hop mesh STA (toward the proxy mesh gate of the destination of the MSDU as derived from the proxy information (see 14.11.4.2 (Proxy information)) and according to the forwarding information—10.35.2 (Forwarding information))
   - Address 2: The address of this proxy mesh gate
   - Address 3: The address of the proxy mesh gate of the destination of the MSDU as derived from the proxy information (see 14.11.4.2 (Proxy information))
   - Address 4: The address of this proxy mesh gate
   - Address 5: The address of the destination end mesh STA that is the destination address of the MSDU received from the DS
   - Address 6: The address of the source end mesh STA that is the source address of the MSDU received from the DS

c) If the MSDU has a destination address that is unknown to the mesh gate, the mesh gate forwards the MSDU to other known mesh gates in the MBSS as an individually addressed frame according to the procedures for frame addressing and data forwarding of individually addressed frames at source mesh STAs in an MBSS (10.35.3.1 (At source mesh STAs (individually addressed))). The MSDU shall be transmitted using a frame with the four-address MAC header format [with the Address Extension Mode subfield in the Mesh Control field set to "Address5&6" (see Table 9-20 (Valid val-

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

ues for the Address Extension Mode subfield))], where the Mesh Address Extension subfield in the Mesh Control field carries the addresses of the end stations, as specified in row "Mesh Data (proxied, individually addressed)" of Table 9-42 (Valid address field usage for Mesh Data and Multihop Action frames). The address fields are set as follows:

— Address 1: The address of the next-hop mesh STA (toward the other known mesh gate in the MBSS according to the forwarding information—see 10.35.2 (Forwarding information))
— Address 2: The address of this proxy mesh gate
— Address 3: The address of the other known mesh gate in the MBSS
— Address 4: The address of this proxy mesh gate
— Address 5: The address of the destination end mesh STA that is the unknown destination address of the MSDU received from the DS
— Address 6: The address of the source end mesh STA that is the source address of the MSDU received from the DS

Note that the procedure to determine that an address is unknown depends on the active path selection protocol. It might require an attempt to establish a path to the destination (see 14.8 (Mesh path selection and metric framework)).

On receipt of a group addressed MSDU from the DS, the mesh gate forwards the MSDU according to the procedures for frame addressing and data forwarding of group addressed frames at source mesh STAs in an MBSS (10.35.4.1 (At source mesh STAs (group addressed))). The MSDU shall be transmitted using a frame with the three-address MAC header format [with the Address Extension Mode subfield in the Mesh Control field set to "Address4" (see Table 9-20 (Valid values for the Address Extension Mode subfield))], where the Mesh Address Extension subfield in the Mesh Control field carries the address of the source end stations, as specified in row "Mesh Data (proxied, group addressed)" of Table 9-42 (Valid address field usage for Mesh Data and Multihop Action frames). The address fields are set as follows:

— Address 1: The group address
— Address 2: The address of the proxy mesh gate
— Address 3: The address of the proxy mesh gate
— Address 4: The address of the source external STA

14.11.4 Proxy information and proxy update

14.11.4.1 General

Forwarding information of mesh STAs only contains addresses of mesh STAs that belong to the MBSS. However, the end station of the IEEE 802 communication may be an IEEE 802 station outside the MBSS, and such station is called external STA. Examples of external STAs are as follows:

— STAs that are associated with an AP that is collocated with a mesh STA
— STAs that are behind a mesh gate

Mesh STAs forward MSDUs to external STAs by treating MAC addresses of the external STAs as external addresses. The mesh STAs that are the destination mesh STAs of the messages destined to external STAs are called proxy mesh gates, and their MAC addresses are called proxy addresses.

NOTE—External STAs are reached using mesh services solely, i.e., they are not part of an MBSS. The mechanism by which the proxy mesh gate bridges the MBSS and the external STAs is beyond the scope of the standard. However, the standard describes the method by which mesh STAs use the external addresses that are discovered and bridged by the proxy mesh gate.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.11.4.2 Proxy information

Proxy mesh gates and source mesh STAs of MSDUs destined to external STAs maintain proxy information. Proxy information contains the external address, the corresponding proxy address, the sequence number of the proxy information, and the corresponding proxy information lifetime.

Mesh STAs can learn the addresses of proxy mesh gates and of the external stations proxied by these proxy mesh gates through the receipt of proxy update messages or path selection messages carrying proxy information. Particularly, proxy information is updated in the following circumstances:

— A mesh STA receives and processes a proxy update (see 14.11.4.3 (Proxy update (PXU)))

— A mesh STA receives and processes an element of the active path selection protocol containing proxy information. In HWMP, these are PREQ elements (see 14.10.9.4.3 (Effect of receipt)), PREP elements (see 14.10.10.4.3 (Effect of receipt)), and PERR elements (see 14.10.11.4.3 (Effect of receipt))

Additionally, proxy mesh gates may also proactively maintain proxy information on external STAs.

When the proxy information lifetime is specified, a mesh STA shall maintain the proxy information as valid information until the lifetime expires. Details of the lifetime are described in 14.11.4.3.4 (Effect of receipt of a PXU element).

The sequence number of the proxy information and the proxy mesh gate address define a chronological order of the proxy information of an external STA at a specific proxy mesh gate.

When the proxy information is created at the proxy mesh gate, the proxy sequence number is initialized to an arbitrary value. The proxy information sequence number in the proxy information at the proxy mesh gate is incremented by 1 before the transmission of the proxy information to another mesh station. The proxy information sequence number shall be incremented if the proxy information is invalidated.

If proxy information is transmitted in HWMP elements (PREQ, PREP, and PERR), the proxy information sequence number is set to the HWMP SN of the HWMP element containing this proxy information.

Comparison of the proxy information sequence numbers is performed using a circular modulo 2^{32} comparison.

Valid proxy information is used to determine and set Address 5 and Address 6 in individually addressed mesh Data frames, or Address 4 in group addressed mesh Data frames.

14.11.4.3 Proxy update (PXU)

14.11.4.3.1 General

Subclause 14.11.4.3 (Proxy update (PXU)) describes the function, generation, and processing of the PXU element.

14.11.4.3.2 Function

A mesh STA generates a PXU element to inform a destination mesh STA about proxy information of external addresses that are reachable through the proxy mesh gate specified in the PXU element.

NOTE—Typically, a proxy mesh gate generates and sends a PXU element to another proxy mesh gate in the MBSS or a mesh STA that originates traffic to the external stations proxied by the proxy mesh gate. However, the standard also allows other usage of the PXU element.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The PXU element is transmitted in a Proxy Update frame (an individually addressed frame). The Proxy Update frame may contain multiple PXU elements when needed (for instance, the proxy mesh gate has a large number of proxy information).

14.11.4.3.3 Conditions for generating and sending a PXU element

A proxy mesh gate may transmit a PXU when it adds, updates, or deletes an external address to (or from) its proxy information. A proxy mesh gate may also transmit a PXU at periodic intervals.

A mesh STA that holds proxy information of a proxy mesh gate in the MBSS may also transmit a PXU.

A mesh STA may retransmit the same PXU element repeatedly until the mesh STA receives a PXUC element from the destination mesh STA. See 14.11.4.4 (Proxy update confirmation (PXUC)).

The content of a PXU element shall be as shown in Table 14-29 (Contents of a PXU element).

Table 14-29—Contents of a PXU element

Field		Value/description
Element ID		Value given in Table 9-77 (Element IDs) for the PXU element
Length		8 + length of N Proxy Information fields
PXU ID		Previous PXU ID + 1
PXU Originator MAC Address		MAC address of the originator of the PXU
Number of Proxy Information (N)		Number of proxy information reported to the destination mesh STA ($N \geq 1$).
Per Proxy Information	Flags	Bit 0: 0: add proxy information; 1: delete proxy information Bit 1: 0: Proxy MAC Address field present; 1: Proxy MAC Address = PXU Originator MAC Address, Proxy MAC Address field not present Bit 2: 0: Proxy Information Lifetime field not present; 1: Proxy Information Lifetime field present. If Bit 0 is 1, Bit 1 shall be set to 0. Bit 3–7: Reserved
	External MAC Address	MAC address of the STA proxied by the proxy mesh gate.
	Proxy Information Sequence Number	Proxy information sequence number of the proxy information after being incremented. See 14.11.4.2 (Proxy information).
	Proxy MAC Address	MAC address of the proxy mesh gate. This field is present if Bit 1 of the Flags field is 0; it is not present otherwise.
	Proxy Information Lifetime	The proxy information lifetime of this proxy information as taken from the proxy information of the originator of the PXU.

The proxy mesh gate shall assign the PXU ID from a single modulo 256 counter, starting at 0 and incrementing by 1 for each PXU element.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.11.4.3.4 Effect of receipt of a PXU element

A mesh STA that receives the PXU element shall update its proxy information with the list of proxy information reported in the PXU under the following conditions:

— Proxy information for the external MAC address and the proxy mesh gate reported in the Proxy Information field of the PXU does not exist at the mesh STA.

— Proxy information for the external MAC address and the proxy mesh gate reported in the Proxy Information field of the PXU does exist at the mesh STA and the value of the Proxy Information Sequence Number subfield in the received PXU is larger than the value of the proxy information sequence number in the proxy information at the mesh STA.

When multiple PXU elements are contained in the received Proxy Update frame, the recipient mesh STA shall process all of the PXU elements in the frame.

The MAC address of the proxy mesh gate is taken from the Proxy MAC Address subfield in the Proxy Information field when bit 1 in the Flags subfield is equal to 0, and from the PXU Originator MAC Address field in the PXU element when bit 1 in the Flags subfield is equal to 1.

The MAC address of the external STA is taken from the External MAC Address subfield of the corresponding Proxy Information field in the received PXU element.

The sequence number of the proxy information is taken from the Proxy Information Sequence Number subfield of the corresponding Proxy Information field in the received PXU element.

If the Proxy Information Lifetime subfield is present (the Lifetime subfield in the Flags subfield is 1) and there is already proxy information stored for the proxy mesh gate and external address reported in the proxy information of the PXU element, the mesh STA shall set the proxy lifetime to the larger one of the proxy lifetime reported by the PXU and the stored proxy information.

If the Proxy Information Lifetime subfield is present (bit 2 of the Flags subfield is 1) and there is proxy information stored for the proxy mesh gate and external address reported in the proxy information of the PXU element, the mesh STA shall set the proxy information lifetime to the value in the Proxy Information Lifetime subfield.

If the Proxy Information Lifetime subfield is not present, the lifetime of the proxy information is the same as the lifetime of the path to the proxy address. Alternatively, the lifetime of the proxy information may be set to a value representing infinity.

The destination mesh STA that received the PXU shall send a PXUC element to the originator mesh STA of the PXU as described in 14.11.4.4.3 (Conditions for generating and sending a PXUC element).

14.11.4.4 Proxy update confirmation (PXUC)

14.11.4.4.1 General

Subclause 14.11.4.4 (Proxy update confirmation (PXUC)) describes the function, generation, and processing of the PXUC element.

14.11.4.4.2 Function

A PXUC element is generated by the destination mesh STA of a PXU to inform the sender of the PXU that the PXU has been properly received.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The PXUC element is transmitted in a Proxy Update Confirmation frame (an individually addressed frame). The Proxy Update Confirmation frame may contain multiple PXUC elements in order to confirm the reception of multiple PXU elements to the destination of the Proxy Update Confirmation frame.

14.11.4.4.3 Conditions for generating and sending a PXUC element

The destination mesh STA of a Proxy Update frame containing a PXU element shall send a PXUC element to the originator mesh STA of the PXU element.

The content of a PXUC element shall be as shown in Table 14-30 (Contents of a PXUC element).

Table 14-30—Contents of a PXUC element

Field	Value/description
Element ID	Value given in Table 9-77 (Element IDs) for the PXUC element
Length	7
PXU ID	PXU ID of the PXU that is being confirmed
Destination mesh STA Address	MAC address of the originator of the PXUC

14.11.4.4.4 Effect of receipt of PXUC element

If a mesh STA receives a PXUC element in a PXUC frame in response to a PXU element it originated, the mesh STA shall no longer send any PXUs with the same PXU ID as given in the received PXUC element.

14.11.5 Mesh STA collocation

A mesh STA collocated with another STA shall use a MAC address that is different from the one used by the collocated STA. This precludes ambiguities relating to the presence of the Mesh Control field in the Frame Body (see 9.2.4.7 (Frame Body field)), GTK use (see 12.6.1.1.10 (Mesh GTKSA)), and proxy information (see 14.11.4.2 (Proxy information)).

Path selection with collocated mesh STAs using HWMP is described in 14.10.5 (Collocated STAs).

14.12 Intra-mesh congestion control

14.12.1 General

Intra-mesh congestion control is based on the following three main mechanisms:

a) Local congestion monitoring and congestion detection
b) Congestion control signaling
c) Local rate control

A mesh STA shall activate a congestion control protocol specified by dot11MeshActiveCongestionControlMode. At any given time, there is only one congestion control protocol active in a particular MBSS, signaled in the Congestion Control Mode Identifier field of the Mesh Configuration element. This standard specifies the congestion control signaling protocol that shall be available in any MBSS with an activated congestion control.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—This standard allows for inclusion of more advanced or alternative congestion control schemes through the Congestion Control Mode Identifier in the Mesh Configuration element.

14.12.2 Congestion control signaling protocol

When dot11MeshActiveCongestionControlMode is congestionControlSignaling (1), the mesh STA activates the congestion control signaling protocol. The congestion control signaling protocol specifies the signaling messages used with intra-mesh congestion control. Specific algorithms for local congestion monitoring and congestion detection are beyond the scope of the congestion control signaling protocol.

The congestion control signaling protocol is triggered after congestion is detected at a mesh STA. A mesh STA that detects congestion, and the traffic destination causing this congestion, may transmit a Congestion Control Notification frame to the mesh STAs of the traffic source and other neighboring mesh STAs. The frame contains one or more Congestion Notification elements, each of which specifies the traffic destination causing the congestion and the expected duration of the congestion per AC per mesh destination as estimated by the congested mesh STA.

Upon receipt of a Congestion Notification frame a mesh STA may stop forwarding, or reduce the rate of forwarding, traffic to the destinations listed in the Congestion Notification elements via the mesh STA reporting congestion for the duration specified in the Congestion Notification element. It may also send its own Congestion Control Notification frame to mesh STAs that are the source of the reported congestion, and other neighboring mesh STAs. Any time difference between receipt of the original Congestion Control Notification frame and the transmission of this new Congestion Control Notification frame should be reflected in the duration indicated in the new congestion control notification in such a way that any timers set by mesh STAs in response to the first report of congestion for a given destination all expire at the same time.

If the Destination MAC Address field in a received Congestion Notification element is the group address, it should be interpreted to mean that communication with the transmitter of this frame should be stopped, or reduced, for the duration specified in the Congestion Notification element. This event should not result in the transmission of a Congestion Notification element with a Destination MAC Address field set to the group address to any neighbor mesh STAs.

When the duration of a traffic congestion report has expired, a mesh STA should resume forwarding traffic to the destinations that were listed in the traffic congestion report via the mesh STA that reported congestion.

NOTE 1—Local policies/mechanisms implemented in a mesh STA might be required to achieve timely transmission of the congestion control signaling messages and to avoid transmission of stale messages that might reduce network efficiency.

NOTE 2—A mesh STA that receives a Congestion Control Notification frame might choose to adjust its frame rate, defined by the number of transmitted frames per a unit of time, to the sender of the Congestion Control Notification frame in the identified congested AC(s) for the duration specified in the Congestion Notification element. The reduction of the frame rate to a congested mesh STA avoids waste of the mesh resources for transmission of packets that with high probability will not be handled/forwarded by the congested mesh STA.

14.13 Synchronization and beaconing in MBSSs

14.13.1 TSF for MBSSs

A mesh STA shall initialize and update its TSF timer according to the MBSS's active synchronization method. Each mesh STA shall maintain a TSF timer as described in 11.1.3.1 (General), and comply with the TSF timer accuracy as described in 11.1.3.9 (TSF timer accuracy).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.13.2 Extensible synchronization framework

14.13.2.1 General

This standard introduces an extensible framework to enable the implementation of multiple synchronization methods for mesh STAs. Within the extensible synchronization framework, the neighbor offset synchronization method is defined as the default mandatory synchronization method in order to enable minimal synchronization capabilities and interoperability between mesh STAs that use MCCA, MBCA, or operate in light or deep sleep mode. The framework allows the integration of other synchronization methods into MBSSs. A vendor may implement any synchronization method using this framework to meet special application needs. Although a mesh STA may include multiple implementations of synchronisation methods, only one synchronization method at a time shall be used by a mesh STA. All mesh STAs in an MBSS use the same synchronisation method; see 14.2.7 (Candidate peer mesh STA) item a). The MBSS's active synchronization method is controlled by the SME and given to the MLME by dot11MeshActiveSynchronizationMethod.

A mesh STA shall announce the MBSS's active synchronization method using the Synchronization Method Identifier field in the Mesh Configuration element in their Beacon and Probe Response frames.

14.13.2.2 Neighbor offset synchronization method

14.13.2.2.1 General

When dot11MeshActiveSynchronizationMethod is neighborOffsetSynchronization (1), the mesh STA shall use the neighbor offset synchronization method as its active synchronization method, and maintain the timing offset value between its own TSF timer and the TSF timer of each neighbor STA with which it synchronizes. The mesh STA shall set the Synchronization Method Identifier field in the Mesh Configuration element to 1.

The mesh STA shall maintain synchronization with all of its neighbor peer mesh STAs up to dot11MeshNbrOffsetMaxNeighbor mesh STAs. The mesh STA should maintain synchronization with additional neighbor mesh STAs that are in the same MBSS up to a total of dot11MeshNbrOffsetMaxNeighbor mesh STAs and also, additional neighbor mesh STAs that are outside of the MBSS up to a total of dot11MeshNbrOffsetMaxNeighbor mesh STAs.

Upon receipt of an MLME-MESHNEIGHBOROFFSETSYNCSTART.request primitive, the MLME shall start synchronization using the neighbor offset synchronization method with the specified peer STA. Upon receipt of an MLME-MESHNEIGHBOROFFSETSYNCSTOP.request primitive, the MLME shall stop synchronization using the neighbor offset synchronization method with the specified peer STA.

A mesh STA that utilizes the neighbor offset synchronization method may start its TSF timer independently of other mesh STAs. The mesh STA shall calculate the timing offset value with respect to the neighbor STA with which it maintains synchronization, as described in 14.13.2.2.2 (Timing offset calculation). The mesh STA shall adjust its TSF timer based on time stamps received in Beacon or Probe Response frames from neighbor STAs with which it maintains synchronization, as described in 14.13.2.2.3 (Clock drift adjustment).

When the mesh STA alternates awake state and doze state, it might not always listen to the Beacon frames of a neighbor mesh STA with which it maintains synchronization. However, it shall comply with the clock drift compensation procedures and TSF jitter allowance as described in 14.13.2.2.3 (Clock drift adjustment). See S.3.6 (Synchronization maintenance of mesh STAs in deep sleep mode) for more guidelines.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.13.2.2.2 Timing offset calculation

When dot11MeshActiveSynchronizationMethod is neighborOffsetSynchronization (1), the mesh STA shall calculate the timing offset value with respect to the neighbor STA with which it maintains synchronization. The calculation of the timing offset value is based on time stamps from the received Beacon and Probe Response frames as follows:

$$T_{offset} = T_t - T_r$$

where

T_{offset} is the timing offset value
T_t is the value in the Timestamp field in the received frame
T_r is the frame reception time measured in the TSF timer of the mesh STA

The offset value is represented as a signed integer. The unit of the offset value is μs. The mesh STA shall keep the T_{offset} value calculated from the latest Beacon or Probe Response frame received from each neighbor STA with which it maintains synchronization.

A mesh STA may translate the time measured in the TSF of the neighbor STA into the time base of its own TSF as follows:

$$T_{self} = T_{neighbor} - T_{offset}$$

where

T_{self} is the translated time in its own TSF
$T_{neighbor}$ is the time measured in the TSF timer of the neighbor STA

Upon receipt of an MLME-MESHNEIGHBOROFFSETCALCULATE.request primitive, the MLME shall receive a Beacon or Probe Response frame from the specified neighbor STA, calculate the T_{offset} from the received frame, and report the calculated T_{offset} to the SME by responding with an MLME-MESHNEIGHBOROFFSETCALCULATE.confirm primitive. T_{offset} is used to provide the timing reference of neighbor STAs.

14.13.2.2.3 Clock drift adjustment

When dot11MeshActiveSynchronizationMethod is neighborOffsetSynchronization (1), the mesh STA shall examine the reception time of the Beacon frames from neighbor STAs with which it maintains synchronization and adjust its TSF timer to compensate the relative timing error among neighbor mesh STAs caused by the clock drift. The mesh STA adjusts its TSF so that its TSF counting is aligned to the most delayed neighbor STA.

When the mesh STA receives a Beacon frame or a Probe Response frame from one of the neighbor STAs with which it maintains synchronization, the mesh STA shall perform the following measurement procedure:

a) The mesh STA checks if the transmitter of the Beacon frame or Probe Response frame is in the process of the TBTT adjustment (see 14.13.4.4.3 (TBTT scanning and adjustment procedures)). If the received frame contains the Mesh Configuration element and the TBTT Adjusting subfield in the Mesh Configuration field is 1, the mesh STA shall invalidate the T_{offset} value for this neighbor STA and shall not perform the following steps.
b) The mesh STA checks if it has a valid T_{offset} value obtained from the previous Beacon or Probe Response frame reception from the transmitter of the received frame. If it does not have the valid T_{offset} value, it shall not perform the following steps.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

c) The mesh STA calculates the clock drift amount $T_{ClockDrift}$ by comparing the $T_{offset,p}$,the offset value obtained previously for this neighbor STA, and the $T_{offset,c}$, the offset value obtained from the current frame reception.

$$T_{ClockDrift} = T_{offset,\,p} - T_{offset,\,c}$$

where

$T_{ClockDrift}$ is the clock drift amount in μs represented as a signed integer.

d) The mesh STA shall compare the $T_{ClockDrift}$ value with the $T_{MaxClockDrift}$, the largest $T_{ClockDrift}$ value obtained from other neighbor STA within this beacon period. If the $T_{ClockDrift}$ value for this neighbor STA is greater than the $T_{MaxClockDrift}$ value, the mesh STA replaces the $T_{MaxClockDrift}$ value with the $T_{ClockDrift}$ value, in order to determine the largest $T_{ClockDrift}$ value among neighbor STAs.

When the previous $T_{ClockDrift}$ values have been stable for a neighbor mesh STA, the mesh STA may substitute the previous $T_{ClockDrift}$ value for the $T_{ClockDrift}$ value in the measurement procedure and process the step d), at the time of a TBTT of the neighbor STA, without receiving a Beacon frame.

Before the mesh STA transmits a Beacon frame, it shall perform the following adjustment procedure:

— The mesh STA checks if the current $T_{MaxClockDrift}$ value is greater than zero. If the $T_{MaxClockDrift}$ value is greater than zero, it shall continue the following steps. Otherwise, it shall initialize the $T_{MaxClockDrift}$ with zero and shall not perform the following step.

— If the $T_{MaxClockDrift}$ value is smaller than 0.04% of its beacon interval, the mesh STA shall adjust its TSF timer so that the next TBTT will be delayed for the duration of the $T_{MaxClockDrift}$ and initialize the $T_{MaxClockDrift}$ value with zero. Otherwise, it shall adjust its TSF timer so that the next TBTT will be delayed for the duration of 0.04% of its beacon interval and subtract the value of 0.04% of its beacon interval from the $T_{MaxClockDrift}$.

The mesh STA may adjust its TSF timer only to slow the counting. The mesh STA may adjust its TSF timer within the range of 0.04% in a beacon period.

When the delay amount at each beacon period is not stable, the mesh STA should frequently listen to neighbor STAs' Beacon frames. An implementation might reduce TSF timer jitter caused by the adjustment procedure by making additional adjustments to the $T_{MaxClockDrift}$, as long as the mesh STA's TSF count is aligned to the most delayed neighbor mesh STA. The means of making these additional adjustments is beyond the scope of this standard.

NOTE—This clock drift compensation procedure does not intend to maintain a strict synchronization. It aims to stop TBTT drifting away among neighbor mesh STAs, allowing some jitter of TSF timer.

14.13.3 Beaconing

14.13.3.1 Beacon generation in MBSSs

A mesh STA transmits Beacon frames that are specific to an MBSS. Beacon frames for MBSS, infrastructure BSS, or IBSS are differentiated by the Capability Information field in the Beacon frame as specified in 9.4.1.4 (Capability Information field). A mesh STA that collocates with an AP generates Beacon frames for the MBSS independently of the AP.

The mesh STA shall define a series of TBTTs exactly dot11BeaconPeriod TUs apart. Time zero is defined to be a TBTT with the Beacon frame containing a DTIM. At each TBTT, the mesh STA shall schedule a Beacon frame as the next frame for transmission according to the medium access rules specified in Clause 10 (MAC sublayer functional description).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—To achieve this requirement, the mesh STA suspends any pending transmissions until the beacon has been transmitted. In the case of a DTIM, the mesh STA also suspends any pending individually addressed transmissions until any pending group addressed transmissions have been performed (see 14.14.5 (TIM types)).

The beacon period is included in Beacon and Probe Response frames.

The mesh STA shall start beaconing upon the receipt of the MLME-START.request primitive.

14.13.3.2 Beacon reception for mesh STA

A mesh STA shall use information from the Timestamp field without regard to the BSSID or Mesh ID in order to obtain information necessary for synchronization, if the mesh STA maintains synchronization with the transmitter of the Beacon frame. A mesh STA may use information from the Beacon Interval field and the Beacon Timing element without regard for the Mesh ID in order to obtain information necessary for MBCA, if the mesh STA maintains synchronization with the transmitter of the Beacon frame and dot11MBCAActivated is true. A mesh STA may use information from the MCCAOP Advertisement Overview element and MCCAOP Advertisement element without regard for the Mesh ID in order to obtain information necessary for MCCA, if the mesh STA maintains synchronization with the transmitter of the Beacon frame and dot11MCCAActivated is true.

A mesh STA in a mesh BSS shall use information that is not in the CF Parameter Set element, the Timestamp field, the Beacon Interval field, the Beacon Timing element, the MCCAOP Advertisement Overview element, or the MCCAOP Advertisement element in received Beacon frames only if the mesh STA maintains a mesh peering with the transmitter of the Beacon frame.

14.13.4 Mesh beacon collision avoidance (MBCA)

14.13.4.1 Overview

Mesh STAs use the mesh beacon collision avoidance (MBCA) protocol to detect and mitigate collisions among Beacon frames transmitted by other STAs (including mesh STAs, IBSS APs, and IBSS STAs) on the same channel within the range of 2 hops. MBCA mitigates hidden node problems with respect to Beacon frames.

NOTE—Beacon frames are transmitted without acknowledgment and might collide with other frames. In a mesh BSS, multiple STAs transmit Beacon frames periodically, and mesh STAs might be located out of range of each other. This implies that Beacon frames might suffer from the so-called hidden node problem and might not be received by neighbor STAs. Once Beacon frames from hidden STAs start to collide, Beacon frames keep on colliding if these hidden STAs transmit Beacon frames at the same beacon interval that is a typical operation. MBCA provides a set of rules to mitigate this problem.

When dot11MBCAActivated is true, the mesh STA shall set the MBCA Enabled subfield in the Mesh Capability field of the Mesh Configuration element to 1.

MBCA is composed of beacon timing advertisements, TBTT selection, and TBTT adjustment. When dot11MBCAActivated is true, the mesh STA advertises the TBTT and beacon interval of its neighbor STAs through the Beacon Timing element as described in 14.13.4.2 (Beacon timing advertisement). Upon reception of the Beacon Timing element, the mesh STA obtains the beacon timing information of its neighbor mesh STAs and uses this information for its TBTT selection and TBTT adjustment as described in 14.13.4.3 (TBTT selection) and 14.13.4.4 (TBTT adjustment). The mesh STA may also perform additional procedures described in 14.13.4.5 (Frame transmission across reported TBTT) and 14.13.4.6 (Delayed beacon transmissions).

When dot11MBCAActivated is true, the mesh STA that alternates awake state and doze state should listen to Beacon frames from its neighbor STAs, with which it maintains synchronization, often, in order to advertise and obtain the recent TBTT information.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.13.4.2 Beacon timing advertisement

14.13.4.2.1 General

When dot11MBCAActivated is true, the mesh STA shall contain Beacon Timing element in Beacon and Probe Response frames in order to advertise its beacon timing information. The mesh STA calculates the TBTT of its neighbor STAs with which it maintains synchronization as described in 14.13.4.2.2 (Calculation of neighbor STA's TBTT), and composes beacon timing information as described in 14.13.4.2.3 (Beacon timing information). The mesh STA collects the beacon timing information from each neighbor STA with which it maintains synchronization. The collection of the beacon timing information is termed "beacon timing information set." The mesh STA contains whole or part of the beacon timing information set in the Beacon Timing element as described in 14.13.4.2.5 (Transmitter's procedure). The mesh STA also maintains the status number of the beacon timing information set and contains the status number in the Beacon Timing element as described in 14.13.4.2.4 (Maintenance of the status number). The receiver of the Beacon Timing element uses the received beacon timing information as described in 14.13.4.2.6 (Receiver's procedure).

14.13.4.2.2 Calculation of neighbor STA's TBTT

When a Beacon frame is received from one of its neighbor STAs with which the mesh STA maintains synchronization, the mesh STA shall calculate the TBTT of the received Beacon frame as follows:

$$T_{TBTT} = T_r - (T_t \bmod (T_{BeaconInterval} \times 1024))$$

where

T_{TBTT}	is the calculated TBTT
T_r	is the frame reception time measured in the TSF timer of the receiving mesh STA
T_t	is the value in the Timestamp field in the received frame
$T_{BeaconInterval}$	is the value in the Beacon Interval field in the received frame

The T_{TBTT} is used as described in 14.13.4.2.3 (Beacon timing information).

Further, the mesh STA shall calculate the time difference between the TBTT of the received Beacon frame and the time predicted from the past TBTT as follows:

$$T_{Delta} = | T_{TBTT,\,c} - (T_{TBTT,\,p} + (T_{BeaconInterval} \times N_{Count})) |$$

where

T_{Delta}	is the time difference
$T_{TBTT,\,c}$	is the TBTT calculated from the received Beacon frame
$T_{TBTT,\,p}$	is the TBTT calculated for the first time after the latest status number update (see 14.13.4.2.4 (Maintenance of the status number))
$T_{BeaconInterval}$	is the value in the Beacon Interval field in the received Beacon frame
N_{Count}	is the number of TBTTs since $T_{TBTT,\,p}$ has been calculated

T_{Delta} is used to maintain the status number described in 14.13.4.2.4 (Maintenance of the status number).

14.13.4.2.3 Beacon timing information

The mesh STA shall keep the latest T_{TBTT} together with the beacon interval contained in the received frame and the identifier of the neighbor STA as the beacon timing information with respect to the neighbor STA.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When the elapsed time since the latest Beacon frame reception is smaller than 524 288 TU, the beacon timing information is valid.

NOTE—The beacon timing information provides the time reference for a series of the TBTTs of the corresponding STA. Using the beacon timing information, a mesh STA is able to predict future TBTTs by adding the reported beacon interval to the reported TBTT.

The mesh STA shall collect the valid beacon timing information from each neighbor STA with which it maintains synchronization and keep the collection as the beacon timing information set. The beacon timing information set is advertised to its neighbor mesh STAs through the Beacon Timing element as described in 14.13.4.2.5 (Transmitter's procedure).

When the amount of neighbors, for which valid beacon timing information is kept, is large, the beacon timing information set may be divided into multiple tuples of beacon timing information. In such case, a tuple of beacon timing information is included in the Beacon Timing element (see 14.13.4.2.5 (Transmitter's procedure)).

14.13.4.2.4 Maintenance of the status number

The mesh STA shall maintain the status number of the beacon timing information set. The status number is set to a value from a single modulo 16 counter, starting at 0 and incrementing by 1 for each transmission of a frame containing the Beacon Timing element after the mesh STA encountered any of the following events:

a) It starts or stops maintaining synchronization with a neighbor STA.
b) It receives a Beacon frame from a neighbor STA with which it maintains synchronization and the calculated T_{Delta} (see 14.13.4.2.2 (Calculation of neighbor STA's TBTT)) is larger than 255 μs.
c) It completes the TBTT adjustment procedure described in 14.13.4.4.3 (TBTT scanning and adjustment procedures).

The mesh STA shall set the Status Number subfield in the Report Control field in the Beacon Timing element to the status number. The Status Number subfield in the Report Control field facilitates the detection of the changes in the beacon timing information set.

14.13.4.2.5 Transmitter's procedure

When dot11MBCAActivated is true, the mesh STA shall report the TBTT and beacon interval of its neighbor STAs through the Beacon Timing element as described in this subclause.

The Beacon Timing element reports on timing information of the Beacon frames that are received from the neighbor STAs with which the mesh STA maintains synchronization on the operating channel. The mesh STA shall include the Beacon Timing element in Probe Response frames and in TBTT Adjustment Request frames. The mesh STA shall also include the Beacon Timing element in Beacon frames as specified by dot11MeshBeaconTimingReportInterval and dot11MeshBeaconTimingReportMaxNum. The Beacon Timing element is present in a Beacon frame when the DTIM Count value in the Beacon frame is zero or equal to an integer multiple of dot11MeshBeaconTimingReportInterval.

The maximum number of Beacon Timing Information fields contained in a Beacon Timing element is limited to dot11MeshBeaconTimingReportMaxNum for Beacon frames, or is limited by the maximum element size for other frames. When the number of neighbors, for which valid beacon timing information is kept, is equal or smaller than the limit, the mesh STA shall include all the beacon timing information in a single Beacon Timing element, setting both Beacon Timing Element Number and More Beacon Timing Elements subfield in the Report Control field to 0. When the number of neighbors, for which valid beacon timing information is kept, exceeds the limit, the mesh STA shall divide the beacon timing information set into multiple tuples and assign each tuple with an index number starting from 0. When the beacon timing information set is divided, the mesh STA shall include the successive tuples of beacon timing information in

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the Beacon Timing elements. In this case, the mesh STA shall set the Beacon Timing Element Number subfield in the Report Control field to the index number of the tuple. The mesh STA shall set the More Beacon Timing Elements subfield in the Report Control field to 1 when it has one or more beacon timing information tuples with a larger index number. The mesh STA shall divide the beacon timing information set into no more than N_{info} tuples, where

$N_{info} = \lceil N_v / N_{max} \rceil$,
N_v is the number of valid beacon timing information fields
N_{max} is the maximum number of Beacon Timing Information fields in the Beacon Timing element

The mesh STA may update the combination of the tuples only when the status number described in 14.13.4.2.4 (Maintenance of the status number) is updated. The mesh STA shall include newly updated beacon timing information (i.e., beacon timing information that causes an update of the status number as described in 14.13.4.2.4 (Maintenance of the status number)) in the tuple with a smaller index number. When the status number is updated, the mesh STA shall include the tuple of beacon timing information indexed as 0 in the Beacon Timing element in the subsequent Beacon frame. Successive tuples shall be transmitted in ascending order of the index number in the successive Beacon frames.

NOTE—The standard does not impose mesh STAs to advertise a fragmented beacon timing information set sequentially in its Beacon frames at all times. This implies that the mesh STA might advertise tuples with a smaller index number more frequently, which is useful to notify new beacon timing information efficiently.

When the mesh STA receives a Probe Request frame containing a Beacon Timing element ID in its Request element, it shall respond with a Probe Response frame containing the Beacon Timing element. If all beacon timing information cannot be contained in a Beacon Timing element, the mesh STA shall include multiple Beacon Timing elements containing successive tuples of beacon timing information in the order of the Request element (see Table 9-34 (Probe Response frame body)) so that all tuples are transmitted.

14.13.4.2.6 Receiver's procedure

A mesh STA with dot11MBCAActivated equal to true that receives a Beacon Timing element obtains the beacon timing information of its neighbor mesh STA and uses it for its TBTT selection and TBTT adjustment as described in 14.13.4.3 (TBTT selection) and 14.13.4.4 (TBTT adjustment).

When a mesh STA receives a Beacon frame with a Beacon Timing element that contains only a subset of the beacon timing information set, the mesh STA may transmit a Probe Request frame containing a Beacon Timing element ID in its Request element to the transmitter of the Beacon Timing element, in order to request the rest of the beacon timing information.

NOTE 1—The Report Control field in the Beacon Timing element facilitates the detection of the missing beacon timing information.

NOTE 2—Once the entire beacon timing information set with a particular Status Number is obtained, the mesh STA does not need to retrieve beacon timing information as long as the Status Number remains the same.

A mesh STA that receives the Beacon Timing element shall record the reported TBTT and its successive TBTTs as neighbor's essential beacon reception timing if the MSB of the Neighbor STA ID field in the corresponding Beacon Timing Information field is 0. The essential beacon reception timing is used to control the transmission of frames as described in 14.13.4.5 (Frame transmission across reported TBTT).

A mesh STA can also check if its neighbor mesh STAs received its Beacon frame successfully by checking whether the Beacon Timing elements received from its neighbor mesh STAs contain beacon timing information of the mesh STA. When the Beacon Timing element is received from one of the peer mesh STAs, the mesh STA checks if the MSB of the Neighbor STA ID subfield is set to 0 and the rest of the field matches with the 7 LSBs of the AID value assigned to the mesh STA through the mesh peering

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

establishment. When the Beacon Timing element is received from a nonpeer mesh STA, the mesh STA checks if the MSB of the Neighbor STA ID subfield is set to 1 and the rest of the field matches with the 7 LSBs of its own MAC address (taking the I/G bit as the MSB). If the matching is verified, the corresponding beacon timing information represents the correct beacon reception by the neighbor mesh STA.

If a Beacon frame is received from a neighbor peer mesh STA that is either in active mode or in light sleep mode, the Beacon Timing element is present in the frame, and all beacon timing information is contained in the Beacon Timing element, the mesh STA shall verify whether the neighbor peer mesh STA received its Beacon frame. If the Beacon Timing element does not contain beacon timing information of the mesh STA or the Neighbor TBTT subfield of the corresponding beacon timing information does not reflect the recent TBTT of the mesh STA, the mesh STA considers the previous Beacon frame was not received by the neighbor peer mesh STA.

14.13.4.3 TBTT selection

When dot11MBCAActivated is true, the mesh STA performs the TBTT selection described herein before it starts beaconing (see 14.2.8 (Establishing or becoming a member of a mesh BSS)). The mesh STA selects its TBTTs and its beacon interval so that its Beacon frames do not collide with Beacon frames transmitted by other STAs in its 2 hop range.

Before the mesh STA starts beaconing, it performs scanning and discovered neighbor STAs are reported through an MLME-SCAN.confirm primitive (see 14.2.6 (Scanning mesh BSSs)). Using TimeStamp, Local Time, and Beacon Period in the BSSDescriptionSet parameter provided by the MLME-SCAN.confirm primitive, the mesh STA shall obtain the TBTT and beacon interval of its neighbor STAs operating on the same channel as the mesh STA starts to operate. The mesh STA shall also collect the beacon timing information contained in the Beacon Timing elements received on the channel through Beacon Timing in the BSSDescriptionSet parameter provided by the MLME-SCAN.confirm primitive, in order to obtain the TBTT and beacon interval of STAs in 2 hop range. After obtaining this information, the mesh STA shall look for a timing of its beacon transmissions so that its Beacon frames are likely not to collide with Beacon frames transmitted by other STAs in its 2 hop range. The mesh STA shall update its TSF timer and select its beacon interval to set its TBTTs to the appropriate timing, and then it shall start beaconing using the MLME-START.request primitive.

14.13.4.4 TBTT adjustment

14.13.4.4.1 Self-determined TBTT adjustment

When dot11MBCAActivated is true, the mesh STA checks if it does not transmit Beacon frames during the beacon transmissions of other STAs within its 2 hop range using the Beacon Timing element received from its neighbor peer mesh STA.

When the mesh STA discovers that its Beacon frames repeatedly collide with the Beacon frames of a neighbor or a neighbor's neighbor and its TBTT comes later than the TBTT of the colliding STA at the time of collision, it shall perform the TBTT scanning procedure described in 14.13.4.4.3 (TBTT scanning and adjustment procedures). If the mesh STA finds an alternative TBTT, it shall start the TBTT adjustment procedure as described in 14.13.4.4.3 (TBTT scanning and adjustment procedures).

14.13.4.4.2 Requested TBTT adjustment

When a mesh STA discovers that Beacon frames from two or more neighbor STAs are colliding repeatedly or a series of TBTTs are close enough to trigger frequent beacon collisions, the mesh STA may transmit a TBTT Adjustment Request frame to the neighbor mesh STA of which the TBTT comes last at a particular collision timing in order to request this neighbor mesh STA to adjust its TBTT. The TBTT Adjustment Request frame may be transmitted only if the following conditions hold:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— The recipient of the TBTT Adjustment Request frame is a peer mesh STA and has set the MBCA Enabled subfield in the Mesh Capability field of the Mesh Configuration element to 1.

— The other colliding STA does not include the Mesh Configuration element in its Beacon frames or the TBTT Adjusting field in the Mesh Configuration element is 0.

When dot11MBCAActivated is true, the mesh STA that receives a TBTT Adjustment Request frame shall perform the TBTT scanning procedure described in 14.13.4.4.3 (TBTT scanning and adjustment procedures), and determine if it can find an appropriate alternative timing for its TBTTs. After the completion of the TBTT scanning procedure, the mesh STA that receives the TBTT Adjustment Request frame shall respond with a TBTT Adjustment Response frame containing the result of the TBTT scanning in the Status Code field. If the mesh STA finds an alternative TBTT, it shall agree with the request. If it agrees with the request, the Status Code field is set to SUCCESS in the TBTT Adjustment Response frame, and it shall complete the TBTT adjustment procedure described in 14.13.4.4.3 (TBTT scanning and adjustment procedures). If it does not agree with the request, it shall indicate the reason in the Status Code field in the TBTT Adjustment Response frame. A mesh STA may set the Status Code to either SUCCESS, REFUSED_REASON_UNSPECIFIED, or CANNOT_FIND_ALTERNATIVE_TBTT in the TBTT Adjustment Response frame.

14.13.4.4.3 TBTT scanning and adjustment procedures

When a mesh STA is in need of TBTT adjustment, it tries to find an alternative TBTT first. The mesh STA shall perform the TBTT scanning procedure as follows:

— The mesh STA checks if its beacon timing information and collected neighbor's beacon timing information are sufficiently new. If the mesh STA did not receive a Beacon frame from a neighbor STA with which it maintains synchronization at the latest TBTT, it shall receive a Beacon or Probe Response frame from the neighbor STA and obtain the TBTT of the neighbor STA and the beacon timing information contained in the Beacon Timing element.

NOTE 1—This is particularly important if the mesh STA is in deep sleep mode for a neighbor peer mesh STA.

— Using the latest TBTT of its neighbor STAs and the latest beacon timing information of neighbor mesh STAs, the mesh STA shall look for an alternative TBTT that does not cause beacon collision among the STAs in its 2 hop range.

If an alternative TBTT is not available, the mesh STA terminates the procedure. If an alternative TBTT is available, the mesh STA shall start the TBTT adjustment procedure as follows:

— The mesh STA shall set the TBTT Adjusting field in the Mesh Configuration element to 1 in order to announce that the TBTT adjustment procedure is ongoing.

— The mesh STA shall suspend its TSF timer for a period of time, no longer than half of the Group Delivery Idle Time (defined in 14.14.5 (TIM types)) within a single beacon period, to slow its TSF.

— The mesh STA shall adjust TBTT information of the neighbor STAs (see 14.13.4.2.3 (Beacon timing information)), that are to be contained in the Beacon Timing element, accordingly by subtracting the delay amount.

— When dot11MCCAActivated is true, the mesh STA shall adjust the MCCAOP reservations accordingly by modifying the MCCAOP Offset of each MCCAOP reservation. See 10.23.3.3 (MCCAOP reservations).

— The mesh STA shall repeat suspending its TSF timer over multiple beacon periods until its TBTT is set to the alternative TBTT.

— Upon completion of the TBTT adjustment, the mesh STA shall update the status number as described in 14.13.4.2.4 (Maintenance of the status number) and shall set the TBTT Adjusting field in the Mesh Configuration element to 0.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 2—A mesh STA in deep sleep mode might interpret its neighbor mesh STA's TBTT adjustment as a large TSF jitter. When a mesh STA in deep sleep mode observes a large TSF jitter and the Status Number in the Report Control field in the Beacon Timing element of the received Beacon frame (or Probe Response frame) has been updated, the mesh STA in deep sleep mode should not take this jitter as clock drift and listen to the next Beacon frame to verify if the clock drift is large.

14.13.4.5 Frame transmission across reported TBTT

When dot11MBCAActivated is true, the mesh STA should not extend its transmissions across TBTT of its neighbor STAs with which it maintains synchronization. Further, the mesh STA should not extend its transmissions, other than Beacon frames, across all essential beacon reception timing (see 14.13.4.2.6 (Receiver's procedure)) reported from its neighbor mesh STAs with which it maintains synchronization. This operation helps in reducing the hidden STA interference with beacon reception at its neighbor mesh STAs. When both dot11MBCAActivated and dot11MCCAActivated are true, the mesh STA shall not extend its transmissions across TBTT of its neighbor STAs with which it maintains synchronization. Further, the mesh STA shall not extend its transmissions, other than Beacon frames, across all beacon reception timing reported from its neighbor mesh STAs with which it maintains synchronization.

After silencing for dot11MeshAverageBeaconFrameDuration μs from the reported neighbor's TBTT, the mesh STA may start transmitting frames again.

14.13.4.6 Delayed beacon transmissions

A mesh STA may occasionally delay its Beacon frame transmission from its TBTT for a pseudorandom time. This attribute is specified by dot11MeshDelayedBeaconTxInterval, dot11MeshDelayedBeaconTxMinDelay, and dot11MeshDelayedBeaconTxMaxDelay. When dot11MeshDelayedBeaconTxInterval is set to nonzero value, the mesh STA shall delay its Beacon frame transmission from TBTT, once every dot11MeshDelayedBeaconTxInterval. When the mesh STA transmits a Beacon frame with delay from its TBTT, the delay time shall be randomly selected between dot11MeshDelayedBeaconTxMinDelay and dot11MeshDelayedBeaconTxMaxDelay μs.

NOTE—Delayed beacon transmission allows mesh STAs to discover Beacon frames that are transmitted from multiple mesh STAs with TBTTs close to each other. It is recommended to set dot11MeshDelayedBeaconTxMaxDelay to a time longer than the typical duration of Beacon frames.

14.14 Power save in a mesh BSS

14.14.1 General

A mesh STA may use mesh power management modes to reduce its power consumption. A mesh STA manages each of its mesh peerings with a peer-specific mesh power management mode as described in 14.14.2.2 (Peer-specific mesh power management modes). A mesh STA may set the mesh power management mode for a mesh peering independently of the mesh power management modes for its other mesh peerings. A mesh STA also manages a nonpeer mesh power management mode as described in 14.14.2.3 (Nonpeer mesh power management modes). When a mesh STA is in light sleep mode or in deep sleep mode for a mesh peering, the mesh STA shall maintain its mesh awake window as described in 14.14.6 (Mesh awake window).

A mesh STA shall have the capability to buffer frames and to perform mesh power management mode tracking for the peer-specific mesh power management modes of its peer mesh STAs, as described in 14.14.7 (Power save support). A mesh STA shall use mesh peer service periods for individually addressed frame transmissions to neighbor peer mesh STAs that are either in light sleep mode or in deep sleep mode toward this mesh STA, as described in 14.14.9 (Mesh peer service periods). A mesh STA transmits group addressed frames after the Beacon frame containing DTIM when any of its peer mesh STAs is in light sleep mode or deep sleep mode for the mesh peering with the mesh STA (see 14.14.4 (TIM transmissions in an MBSS) and 14.14.5 (TIM types)). These capabilities are referred to as support for power save.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.14.2 Mesh power management modes

14.14.2.1 General

The manner in which a mesh STA transitions between power states is determined by its peer-specific mesh power management modes and its nonpeer mesh power management mode. A mesh STA shall be in awake state if any of the conditions specified in 14.14.8.6 (Conditions for doze state) is not fulfilled. A mesh STA maintains peer-specific mesh power management modes for each of its mesh peerings as described in 14.14.2.2 (Peer-specific mesh power management modes). A mesh STA may have a different peer-specific mesh power management mode for each mesh peering. A mesh STA maintains a nonpeer mesh power management mode for nonpeer mesh STAs that is described in 14.14.2.3 (Nonpeer mesh power management modes). An example illustration of the use of peer specific and nonpeer mesh power management modes is shown in Figure 14-5 (An example of mesh power management mode usage).

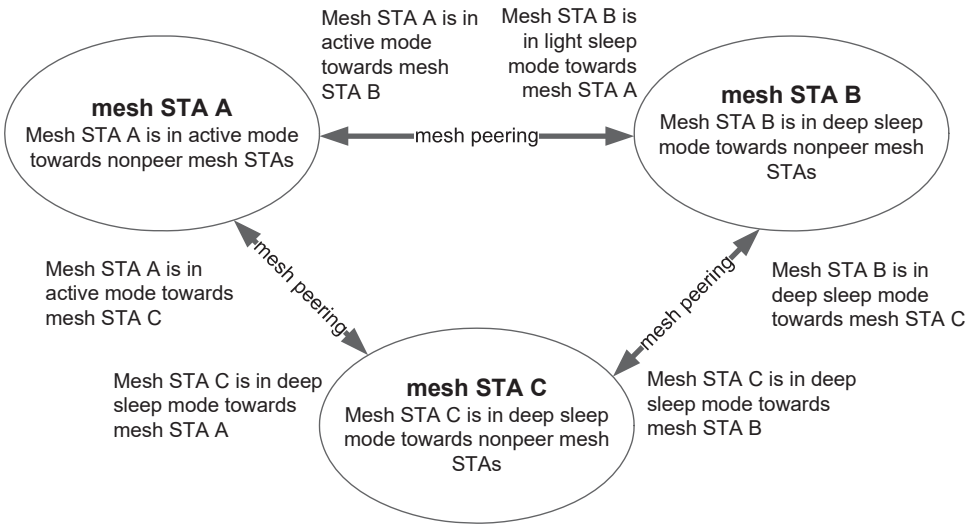

Figure 14-5—An example of mesh power management mode usage

14.14.2.2 Peer-specific mesh power management modes

The peer-specific mesh power management mode specifies the activity level of the mesh STA for the corresponding mesh peering. Three mesh power management modes are defined: active mode, light sleep mode, and deep sleep mode. The peer-specific mesh power management modes are defined as follows:

— *Active mode:* The mesh STA shall be in awake state all the time.

— *Light sleep mode:* The mesh STA alternates between awake state and doze state, as specified in 14.14.8.4 (Operation in light sleep mode for a mesh peering). The mesh STA shall listen to all of the Beacon frames from the corresponding peer mesh STA.

— *Deep sleep mode:* The mesh STA alternates between awake state and doze state, as specified in 14.14.8.5 (Operation in deep sleep mode for a mesh peering). The mesh STA may choose not to listen to the Beacon frames from the corresponding peer mesh STA.

The combination of the Power Management subfield in the Frame Control field and the Mesh Power Save Level subfield in the QoS Control field contained in mesh Data frames indicates the peer-specific mesh

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

power management mode as shown in the Table 14-31 (Peer-specific mesh power management mode definition).

Table 14-31—Peer-specific mesh power management mode definition

Activity level	Peer-specific mesh power management mode	Power Management subfield	Mesh Power Save Level subfield
Highest ↑ Lowest	Active mode	0	Reserved
	Light sleep mode	1	0
	Deep sleep mode	1	1

14.14.2.3 Nonpeer mesh power management modes

The nonpeer mesh power management mode indicates the mesh power management mode of the mesh STA toward the nonpeer mesh STAs. Two nonpeer mesh power management modes are defined: active mode and deep sleep mode. The nonpeer mesh power management mode is indicated by the Power Management subfield in the Frame Control field in group addressed frames, Management frames transmitted to nonpeer neighbor STAs, and in Probe Response frames. When the Power Management subfield in the Frame Control field is set to 1, the nonpeer mesh power management mode is deep sleep mode. When the Power Management subfield in the Frame Control field is set to 0, the nonpeer mesh power management mode is active mode.

A mesh STA may send Probe Request and Mesh Peering Open Request frames to a nonpeer mesh STA that sets its nonpeer mesh power management mode to deep sleep mode only during the mesh awake window of the mesh STA.

14.14.3 Mesh power management mode indications and transitions

14.14.3.1 General

When a mesh STA is in active mode for a mesh peering, it shall set the Power Management subfield in the Frame Control field to 0 in all individually addressed Mesh Data or QoS Null frames transmitted to the corresponding peer mesh STA.

When a mesh STA is in light sleep mode for a mesh peering, it shall set the Power Management subfield in the Frame Control field to 1 and the Mesh Power Save Level subfield in the QoS Control field to 0 in all individually addressed Mesh Data or QoS Null frames transmitted to the corresponding peer mesh STA.

When a mesh STA is in deep sleep mode for a mesh peering, it shall set the Power Management subfield in the Frame Control field to 1 and the Mesh Power Save Level subfield in the QoS Control field to 1 in all individually addressed Mesh Data or QoS Null frames transmitted to the corresponding mesh STA.

When a mesh STA is in deep sleep mode for any of its mesh peerings, the Mesh Power Save Level subfield in the QoS Control field in group addressed mesh Data frames and the Mesh Power Save Level subfield in the Mesh Capability field in the Mesh Configuration element shall be set to 1. When a mesh STA is not in deep sleep mode for any of its mesh peerings, these subfields shall be set to 0.

To change peer-specific mesh power management modes, a mesh STA shall inform its peer mesh STAs through a successful frame exchange initiated by the mesh STA. The Power Management subfield in the

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Frame Control field and the Mesh Power Save Level subfield in the QoS Control field of the frame sent by the mesh STA in this exchange indicates the peer-specific mesh power management mode that the STA shall adopt upon successful completion of the entire frame exchange.

The algorithm to trigger the change of a peer-specific mesh power management mode is beyond the scope of this standard.

The nonpeer mesh power management mode is determined by the peer-specific mesh power management modes of the mesh STA. When a mesh STA is in light sleep mode or deep sleep mode for at least one mesh peering, it shall set the nonpeer mesh power management mode to deep sleep mode.

When a mesh STA is in active mode for nonpeer STAs, it shall set the Power Management subfield in the Frame Control field to 0 in group addressed frames, in Management frames transmitted to nonpeer mesh STAs, and in Probe Response frames.

When a mesh STA is in deep sleep mode for nonpeer STAs, it shall set the Power Management subfield in the Frame Control field to 1 in group addressed frames, in Management frames transmitted to nonpeer mesh STAs, and in Probe Response frames.

14.14.3.2 Transition to a higher activity level

A mesh STA may use group addressed or individually addressed Mesh Data or QoS Null frames to change its mesh power management mode to a higher activity level, for example; from deep sleep to light sleep or to active mode; or from light sleep to active mode.

Individually addressed frames may be used to temporarily raise the activity level of the mesh STA for a mesh peering.

NOTE—This is useful in cases when a link temporarily requires efficient data transmission with the peer mesh STA and the mesh STA is attempting to transit back to lower activity level without performing the mesh power management mode transition signaling with all peer mesh STAs.

14.14.3.3 Transition to a lower activity level

A mesh STA shall use acknowledged individually addressed Mesh Data or QoS Null frames to change its peer-specific mesh power management mode to a lower activity level, for example; from active mode to light or deep sleep mode; or from light sleep to deep sleep mode.

14.14.4 TIM transmissions in an MBSS

The TIM element identifies the peer mesh STAs for which traffic is pending and buffered in the reporting mesh STA. This information is coded in a partial virtual bitmap, as described in 9.4.2.6 (TIM element). In addition, the TIM contains an indication whether group addressed traffic is pending. Every neighbor peer mesh STA is assigned an AID by the reporting mesh STA as part of the mesh peering establishment process (see 14.3.1 (General)). The mesh STA shall identify those peer mesh STAs for which it is prepared to deliver[50] buffered MSDUs and MMPDUs by setting bits in the TIM's partial virtual bitmap that correspond to the appropriate AIDs.

14.14.5 TIM types

There are two different TIM types: TIM and DTIM. A mesh STA shall transmit a TIM with every Beacon frame. Every DTIMPeriod, a TIM of type DTIM is transmitted with a Beacon frame. After transmitting a Beacon frame containing a DTIM, the mesh STA shall send the buffered group addressed MSDUs and

[50]How the AP or mesh STA determines the traffic is prepared to deliver is outside the scope of this standard.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

MMPDUs, before transmitting any individually addressed frames. The More Data subfield of each group addressed frame shall be set to indicate the presence of further buffered group addressed MSDUs and MMPDUs. The mesh STA sets the More Data subfield to 0 in the last transmitted group addressed frame following the transmission of the DTIM Beacon frame.

While waiting to receive a group addressed frame that was previously indicated in a TIM element or More Data subfield, a mesh STA that detects CCA is IDLE for the duration of the PHY specific Group Delivery Idle Time may assume that no more frames destined to group addresses will be transmitted and may return to doze state. The Group Delivery Idle Time is identical to the TXOP limit for AC_VI specified by the default EDCA Parameter Set shown in Table 9-137 (Default EDCA Parameter Set element parameter values if dot11OCBActivated is false).

14.14.6 Mesh awake window

A mesh STA shall be in awake state when its mesh awake window is active. A mesh awake window is active after the Beacon and Probe Response frames containing the Mesh Awake Window element. A mesh STA shall include the Mesh Awake Window element in its DTIM Beacon frames and may include the Mesh Awake Window element in its TIM Beacon and Probe Response frames. A mesh STA that operates in light sleep mode or deep sleep mode for any of its mesh peerings shall include the Mesh Awake Window element in its Beacon frame if the Beacon frame indicates buffered traffic for at least one peer mesh STA. The start of the mesh awake window is measured from the end of the Beacon or Probe Response frame transmission. The duration of the mesh awake window period is specified by dot11MeshAwakeWindowDuration. A mesh STA shall set the Mesh Awake Window field in the Mesh Awake Window element to dot11MeshAwakeWindowDuration. If the Mesh Awake Window element is not contained in the Beacon frame of a mesh STA, the duration of the mesh awake window period following this beacon is zero.

If the mesh STA that has its mesh awake window active transmits frames destined to group addresses, the duration of the mesh awake window is extended by an additional PostAwakeDuration. The PostAwakeDuration follows the group address frame, and the mesh STA that has its mesh awake window active shall stay in awake state until it has transmitted all of its group addressed frames and the PostAwakeDuration has expired. The PostAwakeDuration is equal to duration of the mesh awake window.

A mesh STA may send a frame to a peer mesh STA that is in light sleep mode or deep sleep mode for the corresponding mesh peering during the mesh awake window of this peer mesh STA. When a peer trigger frame is successfully transmitted it initiates a mesh peer service period as described in 14.14.9 (Mesh peer service periods).

A mesh STA may send Class 1 or Class 2 frames, such as Probe Request or Mesh Peering Open frames, to a nonpeer mesh STA that is in deep sleep mode for nonpeer mesh STAs during the mesh awake window of this nonpeer mesh STA.

14.14.7 Power save support

As described in 14.14.2 (Mesh power management modes), a mesh STA indicates its peer-specific mesh power management modes and performs mesh power management mode tracking of the peer-specific mesh power management modes of its peer mesh STAs. A mesh STA shall not arbitrarily transmit frames to mesh STAs operating in a light or deep sleep mode, but shall buffer frames and only transmit them at designated times.

A mesh STA may transmit frames to a mesh STA operating in a light or deep sleep mode if the recipient mesh STA is in the awake state as defined in 14.14.8.4 (Operation in light sleep mode for a mesh peering), 14.14.8.5 (Operation in deep sleep mode for a mesh peering), and 14.14.9 (Mesh peer service periods); otherwise, the mesh STA shall not transmit frames and shall buffer frames.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

As described in 14.14.4 (TIM transmissions in an MBSS), a mesh STA indicates the presence of buffered traffic in TIM elements for all peer mesh STAs that operate in light or deep sleep mode toward the mesh STA. The mesh STA sets the bit for AID 0 (zero) in the Bitmap Control field of the TIM element to 1 when group addressed traffic is buffered, according to 9.4.2.6 (TIM element). As described in 14.14.5 (TIM types), a mesh STA transmits its group addressed frames after its DTIM beacon if any of its peer mesh STA is in light or deep sleep mode toward the mesh STA.

As described in 14.14.9 (Mesh peer service periods), mesh peer service periods are used for frame transmissions toward a mesh STA that operates in light or deep sleep mode. Mesh peer service periods are not used in frame exchanges toward active mode mesh STAs.

A mesh STA may initiate a mesh peer service period with a peer mesh STA in deep or light sleep mode by transmitting a peer trigger frame when the mesh awake window of the peer mesh STA is active.

14.14.8 Operation in peer-specific and nonpeer mesh power management modes

14.14.8.1 General

Detailed operations of mesh STA in each mesh power management mode are described in the following subclauses. Figure 14-6 (Mesh power management operation) depicts example power state transitions of mesh STAs, when three mesh STAs are in the mesh power management modes shown in the Figure 14-5 (An example of mesh power management mode usage).

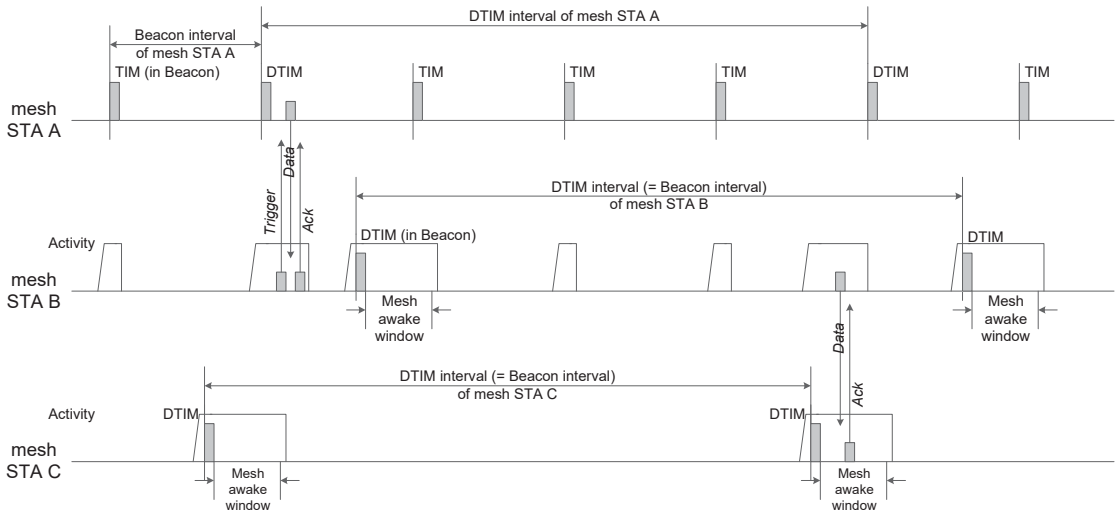

Figure 14-6—Mesh power management operation

14.14.8.2 Operation in active mode

When a mesh STA is in active mode for a mesh peering or for nonpeer mesh STAs, it shall be in awake state. Mesh peer service periods are not used in frame exchanges toward mesh STAs that are in active mode.

An active mode mesh STA may receive peer trigger frames from a peer mesh STA in light or deep sleep mode when there is no mesh peer service period ongoing between the peer mesh STAs.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.14.8.3 Operation in deep sleep mode for nonpeer mesh STAs

If a mesh STA is in deep sleep mode for nonpeer mesh STAs, it shall enter the awake state prior to every TBTT of its own and shall remain in awake state after the beacon transmission for the duration of the mesh awake window and the duration of its group addressed frame transmissions. The mesh STA may receive frames during its mesh awake window as described in 14.14.6 (Mesh awake window).

When receiving a frame initiating a mesh peering management procedure, an authentication procedure, or a passive scanning procedure, a mesh STA in deep sleep mode for nonpeer mesh STAs shall operate in awake state at least until the completion of the mesh peering management procedure (see 14.3 (Mesh peering management (MPM)) and 14.5 (Authenticated mesh peering exchange (AMPE))), until the completion of the authentication procedure (see 14.3.1 (General) and 14.3.3 (Mesh authentication)), or the transmission of the Probe Response frame.

If a mesh STA receives a peer trigger frame initiating a mesh peer service period from a peer mesh STA, the mesh STA shall remain in awake state until the mesh peer service period is terminated as defined in 14.14.9.4 (Termination of a mesh peer service period).

A mesh STA may return to doze state after its mesh awake window if no frame initiating a response transaction or a mesh peer service period is received during the mesh awake window.

14.14.8.4 Operation in light sleep mode for a mesh peering

If a mesh STA is in light sleep mode for a mesh peering, it shall enter the awake state prior to every TBTT of the corresponding peer mesh STA to receive the Beacon frame from the peer mesh STA. The mesh STA may return to the doze state after the beacon reception from this peer mesh STA, if the peer mesh STA did not indicate buffered individually addressed or group addressed frames. If an indication of buffered individually addressed frames is received, the light sleep mode mesh STA shall send a peer trigger frame with the RSPI field set to 1 to initiate a mesh peer service period with the mesh STA that transmitted the Beacon frame (see 14.14.9.2 (Initiation of a mesh peer service period)). If an indication of buffered group addressed frames is received, the light sleep mode mesh STA shall remain in awake state after the DTIM Beacon reception to receive group addressed frames The mesh STA shall remain awake state until the More Data subfield of a received group addressed frame is set to 0 or if no group addressed frame is received within the PHY specific Group Delivery Idle Time. (See 14.14.5 (TIM types).)

NOTE—When a mesh STA is in light sleep mode for a mesh peering, it sets its nonpeer mesh power management mode to deep sleep mode. This implies that a mesh STA operating in light sleep mode a mesh peering is required to comply with the rules described in 14.14.8.3 (Operation in deep sleep mode for nonpeer mesh STAs).

14.14.8.5 Operation in deep sleep mode for a mesh peering

A mesh STA operating in deep sleep mode for a mesh peering might not receive Beacon frames from the corresponding peer mesh STA. The logic of how the mesh STA in deep sleep mode maintains synchronization among neighbors is beyond the scope of this standard. Guidance for the synchronization maintenance by the mesh STA in deep sleep mode is given in S.3.6 (Synchronization maintenance of mesh STAs in deep sleep mode).

NOTE—When a mesh STA is in deep sleep mode for a mesh peering, it sets its nonpeer mesh power management mode to deep sleep mode. This implies that a mesh STA operating in deep sleep mode for a mesh peering is required to comply with the rules described in 14.14.8.3 (Operation in deep sleep mode for nonpeer mesh STAs).

14.14.8.6 Conditions for doze state

A mesh STA may enter doze state if all of the following conditions are fulfilled:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

- The mesh STA operates in light sleep mode or deep sleep mode for all of its mesh peerings, as described in 14.14.8.4 (Operation in light sleep mode for a mesh peering) or 14.14.8.5 (Operation in deep sleep mode for a mesh peering)
- The mesh STA has no mesh peer service period ongoing, as described in 14.14.9 (Mesh peer service periods)
- The mesh STA has no pending transaction of mesh peering management, authentication, nor passive scanning (see 14.14.8.3 (Operation in deep sleep mode for nonpeer mesh STAs))
- The mesh awake window indicated by the mesh STA has expired, as described in 14.14.6 (Mesh awake window)
- The mesh STA has terminated its group addressed frames delivery sequence after its DTIM Beacon frame, as described in 14.14.5 (TIM types)

Guidance for using the power save in mesh BSS and default parameter values are given in S.3 (Power save parameters selection).

14.14.9 Mesh peer service periods

14.14.9.1 General

Mesh peer service periods are used for individually addressed frame exchanges between neighbor peer mesh STAs in which at least one of the mesh STAs is in light or deep sleep mode for the corresponding mesh peering. A mesh peer service period is a period of time during which one or more individually addressed frames are transmitted between two peer mesh STAs. Within a mesh peer service period, a mesh STA may obtain multiple TXOPs. A mesh peer service period is directional. One mesh STA is the owner of the mesh peer service period. It obtains TXOPs in order to transmit Data frames or Management frames to the recipient in the mesh peer service period. At the end of the frame transmissions, the owner of the mesh peer service period terminates the mesh peer service period. The other mesh STA operates as the recipient of the mesh peer service period and does not obtain TXOPs for transmitting Data frames or Management frames to the owner of the mesh peer service period. A mesh STA may have multiple mesh peer service periods concurrently toward multiple neighbor peer mesh STAs. At most, one mesh peer service period is set up in each direction with each peer mesh STA.

A mesh peer service period is initiated by a peer trigger frame. A peer trigger frame may initiate two mesh peer service periods. This enables both the transmitter and the receiver of the peer trigger frame to become the owner of a mesh peer service period. An example mesh peer service period between two mesh STAs in light or deep sleep mode is shown in Figure 14-7 (Mesh peer service period). The numbering on the left-hand-side describes the phase of the operation: 1 indicates the Initiation phase, 2 indicates the data transmission phase, and 3 indicates the termination phase of the mesh peer service period.

14.14.9.2 Initiation of a mesh peer service period

A mesh Data frame or a QoS Null frame that requires acknowledgment are used as a peer trigger frame. The RSPI and the EOSP subfields in the QoS Control field control the initiation of a mesh peer service period. Table 14-32 (Mesh peer service period triggering with RSPI and EOSP subfield combinations in peer trigger frame) lists how mesh peer service periods shall be initiated with different combinations of RSPI and EOSP subfield values.

Mesh peer service periods are not used in frame transmissions toward active mode mesh STAs.

The mesh peer service period may be initiated in the following cases:

- A mesh STA in light or deep sleep mode receives a peer trigger frame during its mesh awake window as described in 14.14.6 (Mesh awake window)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

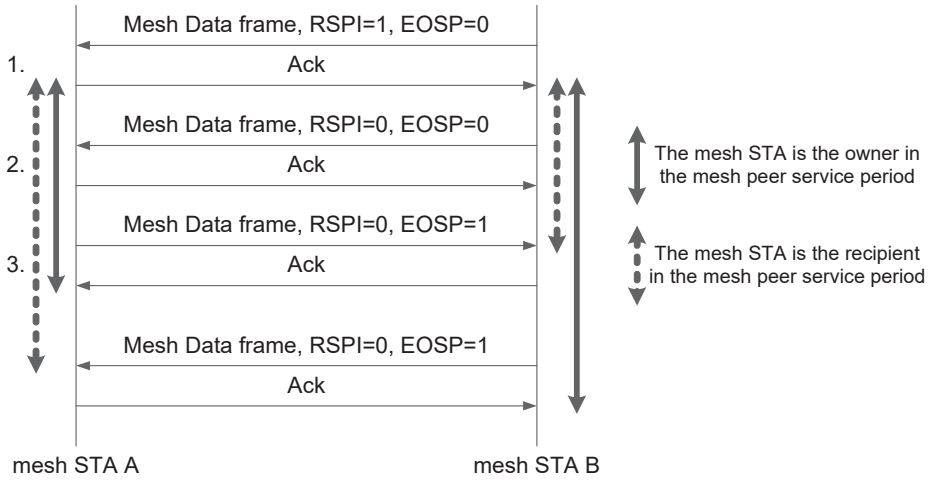

Figure 14-7—Mesh peer service period

Table 14-32—Mesh peer service period triggering with RSPI and EOSP subfield combinations in peer trigger frame

RSPI	EOSP	Mesh peer service period triggering
0	0	One mesh peer service period is initiated. The transmitter of the trigger frame is the owner in the mesh peer service period.
0	1	No mesh peer service period is initiated.
1	0	Two mesh peer service periods are initiated. Both mesh STAs are owners in a mesh peer service period.
1	1	One mesh peer service period is initiated. The receiver of the trigger frame is the owner in the mesh peer service period.

— A mesh STA in active mode receives a peer trigger frame from the peer mesh STA in light or deep sleep mode as described in 14.14.8.2 (Operation in active mode)

— A mesh STA receives a peer trigger frame from the peer mesh STA in light sleep mode as described in 14.14.8.4 (Operation in light sleep mode for a mesh peering)

In addition, when a mesh STA uses MCCA with a neighbor peer mesh STA while in a light sleep mode for the corresponding mesh peering, a scheduled service period begins at the each MCCAOP start time as described in 14.14.10 (MCCA use by power saving mesh STA). A mesh STA in a light or deep sleep mode shall enter the awake state prior to the start time of scheduled service period.

14.14.9.3 Operation during a mesh peer service period

During the mesh peer service period, the owner and the recipient of the mesh peer service period shall operate in awake state. The mesh peer service period may contain one or more TXOPs.

Reverse direction grant (RDG) shall not be used when the receiver of the TXOP operates in light or deep sleep mode for the link and there is no mesh peer service period ongoing toward the TXOP holder.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

14.14.9.4 Termination of a mesh peer service period

The mesh peer service period is terminated after a successfully acknowledged QoS Null or mesh Data frame with the EOSP subfield set to 1 from the owner of the mesh peer service period.

If the mesh STA does not receive an acknowledgment to a frame that requires an acknowledgment and that is sent with the EOSP subfield set to 1, the mesh STA shall retransmit that frame at least once within the same mesh peer service period, subject to applicable retry or lifetime limits. The maximum number of retransmissions within the same mesh peer service period is the lesser of the Max Retry Limit and dot11MeshSTAMissingAckRetryLimit.

NOTE—If an acknowledgment to the retransmission of this last frame in the same mesh peer service period is not received, the mesh STA might use the next mesh peer service period to further retransmit that frame subject to the applicable retry or lifetime limit.

14.14.10 MCCA use by power saving mesh STA

When dot11MCCAActivated is true and the mesh STA establishes MCCAOPs, the mesh STA shall be in active mode or light sleep mode toward the neighbor peer mesh STAs with which it has established MCCAOPs.

A scheduled mesh peer service period begins at the MCCAOP start time, if the MCCAOP responder operates in light sleep mode for the MCCAOP owner. The MCCAOP owner is the owner of the scheduled mesh peer service period. The MCCAOP responder is the recipient of the scheduled mesh peer service period. Scheduled mesh peer service periods are not used if the MCCAOP responder is in active mode for the MCCAOP owner.

The scheduled mesh peer service period continues until it is successfully terminated by the acknowledged QoS Null or mesh Data frame with the EOSP subfield set to 1 from the owner of the mesh peer service period to the recipient of the mesh peer service period as described in 14.14.9 (Mesh peer service periods).

15. DSSS PHY specification for the 2.4 GHz band designated for ISM applications

15.1 Overview

15.1.1 General

The PHY for the DSSS system is described in this clause. The RF LAN system is aimed for the 2.4 GHz band designated for ISM applications.

The DSSS system provides a WLAN with both a 1 Mb/s and a 2 Mb/s data payload communication capability. The DSSS system uses baseband modulations of differential binary phase shift keying (DBPSK) and differential quadrature phase shift keying (DQPSK) to provide the 1 Mb/s and 2 Mb/s data rates, respectively.

15.1.2 Scope

The PHY services provided to the IEEE Std 802.11 WLAN MAC by the 2.4 GHz DSSS system are described in this clause. The DSSS PHY consists of the following protocol functions:

a) A function that defines a method of mapping the IEEE Std 802.11 MPDUs into a framing format suitable for sending and receiving user data and management information between two or more STAs.

b) A function that defines the characteristics of, and method of transmitting and receiving data through, a WM between two or more STAs each using the DSSS system.

15.1.3 DSSS PHY functions

15.1.3.1 General

The 2.4 GHz DSSS PHY architecture is depicted in the reference model shown in Figure 4-19 (Portion of the ISO/IEC basic reference model covered in this standard) (in 4.9 (Reference model)). The DSSS PHY contains two functional entities: the PHY function and the layer management function. Each of these functions is described in detail in the following subclauses.

The DSSS PHY service shall be provided to the MAC through the PHY service primitives described in Clause 8 (PHY service specification).

15.1.3.2 PLME

The PLME performs management of the local PHY functions in conjunction with the MLME.

15.1.4 Service specification method and notation

The models represented by figures and state diagrams are intended to be illustrations of functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation.

The service of a layer or sublayer is a set of capabilities that it offers to a user in the next-higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

15.2 DSSS PHY specific service parameter list

15.2.1 Introduction

The architecture of the IEEE Std 802.11 MAC is intended to be PHY independent. Some PHY implementations require medium management state machines running in the MAC sublayer in order to meet certain PHY requirements. These PHY-dependent MAC state machines reside in a sublayer defined as the MLME. In certain PHY implementations, the MLME may need to interact with the PLME as part of the normal PHY SAP primitives. These interactions are defined by the PLME parameter list currently defined in the PHY service primitives as TXVECTOR and RXVECTOR. The list of these parameters, and the values they may represent, are defined in the specific PHY specifications for each PHY. Subclause 15.2 (DSSS PHY specific service parameter list) addresses the TXVECTOR and RXVECTOR for the DSSS PHY.

15.2.2 TXVECTOR parameters

15.2.2.1 General

The parameters in Table 15-1 (TXVECTOR parameters) are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive.

15.2.2.2 TXVECTOR LENGTH

The LENGTH parameter provided in the TXVECTOR is in octets and is converted to microseconds for inclusion in the PHY LENGTH field.

15.2.2.3 TXVECTOR DATARATE

The DATARATE parameter describes the bit rate at which the PHY shall transmit the PSDU. Its value takes any of the rates defined in Table 15-1 (TXVECTOR parameters).

15.2.2.4 TXVECTOR SERVICE

The SERVICE parameter shall be null.

15.2.2.5 TXVECTOR TXPWR_LEVEL_INDEX

The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to 8. This parameter is used to indicate which of the available TxPowerLevel attributes defined in the MIB shall be used for the current transmission.

15.2.2.6 TXVECTOR TIME_OF_DEPARTURE_REQUESTED

The allowed values are false or true. A parameter value of true indicates that the MAC sublayer is requesting that the PHY entity provides measurement of when the first frame energy is sent by the transmitting port and reporting within the PHY-TXSTART.confirm(TXSTATUS) primitive. A parameter value of false indicates that the MAC sublayer is requesting that the PHY entity not provide time of departure measurement nor reporting in the PHY-TXSTART.confirm(TXSTATUS) primitive.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

15.2.2.7 TXVECTOR TX_ANTENNA

Selects the antenna used by the PHY for transmission (when diversity is disabled), in the range 1 to 256.

Table 15-1—TXVECTOR parameters

Parameter	Value
LENGTH	0 to $2^{12} - 1$
DATARATE	1, 2 Mb/s
SERVICE	Null
TXPWR_LEVEL_INDEX	1 to 8
TIME_OF_DEPARTURE_REQUESTED	false, true. When true, the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port; when false, the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.
TX_ANTENNA	1 to 256

15.2.3 RXVECTOR parameters

15.2.3.1 General

The parameters listed in Table 15-2 (RXVECTOR parameters) are defined as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

15.2.3.2 RXVECTOR LENGTH

The MPDU length in octets (calculated from the LENGTH field in microseconds).

15.2.3.3 RXVECTOR RSSI

This parameter is a measure by the PHY of the energy observed at the antenna used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power.

15.2.3.4 RXVECTOR SIGNAL

SIGNAL shall represent the data rate at which the current PPDU was received.

15.2.3.5 RXVECTOR SERVICE

The SERVICE parameter shall be null.

15.2.3.6 RXVECTOR RCPI

The allowed values for the RCPI parameter are in the range 0 to 255, as defined in 9.4.2.38 (RCPI element). This parameter is a measure by the PHY of the received channel power. The performance requirements for the measurement of RCPI are defined in 15.4.6.6 (Received Channel Power Indicator Measurement).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

15.2.3.7 RXVECTOR SQ

SQ provides to the MAC entity the signal quality of the DSSS PHY PN code correlation. The SQ shall be sampled when the DSSS PHY achieves code lock and shall be held until the next code lock acquisition.

The SQ may be used in conjunction with RSSI as part of a CCA scheme.

15.2.3.8 RXVECTOR RX_ANTENNA

RX_ANTENNA reports the antenna used by the PHY for reception of the most recent packet.

Table 15-2—RXVECTOR parameters

Parameter	Value
LENGTH	0 to $2^{12} - 1$
RSSI	0–255
SIGNAL	1, 2 Mb/s
SERVICE	1, 2 Mb/s
RCPI (see NOTE)	0–255
SQ	0–255
RX_ANTENNA	1–256
RX_START_OF_FRAME_OFFSET	0 to $2^{32} - 1$. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC. NOTE—Parameter is present only when dot11RadioMeasurementActivated is true.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

15.2.4 TXSTATUS parameters

15.2.4.1 General

The parameters listed in Table 15-3 (TXSTATUS parameters) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm primitive.

Table 15-3—TXSTATUS parameters

Parameter	Value
TIME_OF_DEPARTURE	0 to 2^{32}– 1. The locally measured time when the first frame energy is sent by the transmitting port, in units equal to 1/ TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TIME_OF_DEPARTURE_ClockRate	0 to 2^{16}– 1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TX_START_OF_FRAME_OFFSET	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the frame was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC.

15.2.4.2 TXSTATUS TIME_OF_DEPARTURE

The allowed values for the TIME_OF_DEPARTURE parameter are integers in the range 0 to 2^{32}- 1. This parameter is used to indicate when the first frame energy is sent by the transmitting port in units equal to 1/ TIME_OF_DEPARTURE_ClockRate. TIME_OF_DEPARTURE may be included in the transmitted frame in order for recipients on multiple channels to determine the time differences of air propagation times between transmitter and recipients and hence to compute the location of the transmitter.

15.2.4.3 TXSTATUS TIME_OF_DEPARTURE_ClockRate

TIME_OF_DEPARTURE_ClockRate indicates the clock rate used for TIME_OF_DEPARTURE.

15.3 DSSS PHY

15.3.1 Overview

Subclause 15.3 (DSSS PHY) provides a convergence procedure in which MPDUs are converted to and from PPDUs. During transmission, the MPDU shall be prepended with a PHY preamble and header to create the PPDU. At the receiver, the PHY preamble and header are processed to aid in demodulation and delivery of the MPDU.

15.3.2 PPDU format

Figure 15-1 (PPDU format) shows the format for the PPDU including the DSSS PHY preamble, the DSSS PHY header, and the MPDU. The PHY preamble contains the following fields: SYNC and SFD. The PHY header contains the following fields: Signaling (SIGNAL), Service (SERVICE), length (LENGTH), and CRC-16 (CRC). Each of these fields is described in detail in 15.3.3 (PHY field definitions).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

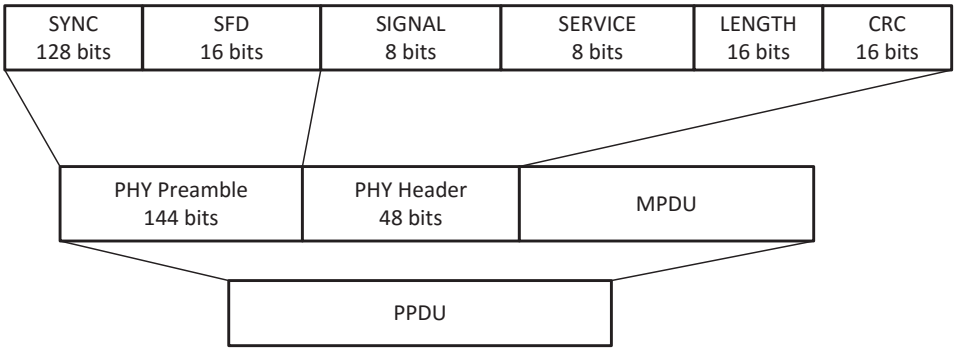

Figure 15-1—PPDU format

15.3.3 PHY field definitions

15.3.3.1 General

The entire PHY preamble and header shall be transmitted using the 1 Mb/s DBPSK modulation described in 15.4.5 (PHY transmit specifications). All transmitted bits shall be scrambled using the feedthrough scrambler described in 15.3.4 (PHY/DSSS PHY data scrambler and descrambler).

15.3.3.2 PHY SYNC field

The SYNC field shall consist of 128 bits of scrambled 1s. This field shall be provided so that the receiver can perform the necessary operations for synchronization.

15.3.3.3 PHY SFD

The SFD shall be provided to indicate the start of PHY-dependent parameters within the PHY preamble. The SFD shall be a 16-bit field, X'F3A0' (MSB to LSB). The LSB shall be transmitted first in time.

15.3.3.4 PHY SIGNAL field

The 8-bit SIGNAL field indicates to the PHY the modulation that shall be used for transmission (and reception) of the MPDU. The data rate shall be equal to the signal field value multiplied by 100 kb/s. The DSSS PHY currently supports two mandatory modulation services given by the following 8-bit words, where the LSB shall be transmitted first in time:

a) X'0A' (MSB to LSB) for 1 Mb/s DBPSK
b) X'14' (MSB to LSB) for 2 Mb/s DQPSK

The DSSS PHY rate change capability is described in 15.3.5 (PHY data modulation and modulation rate change). This field shall be protected by the CRC-16 FCS described in 15.3.3.7 (PHY CRC field).

15.3.3.5 PHY SERVICE field

The 8-bit SERVICE field is reserved for future use; it shall be set to 0 on transmission and ignored on reception. The LSB shall be transmitted first in time. This field shall be protected by the CRC-16 FCS described in 15.3.3.7 (PHY CRC field).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

15.3.3.6 PHY LENGTH field

The PHY LENGTH field shall be an unsigned 16-bit integer that indicates the number of microseconds required to transmit the MPDU. The transmitted value shall be determined from the LENGTH parameter in the TXVECTOR issued with the PHY-TXSTART.request primitive described in 8.3.5.5 (PHY-TXSTART.request). The LENGTH field provided in the TXVECTOR is in octets and is converted to microseconds for inclusion in the PHY LENGTH field. The LSB shall be transmitted first in time. This field shall be protected by the CRC-16 FCS described in 15.3.3.7 (PHY CRC field).

15.3.3.7 PHY CRC field

The SIGNAL, SERVICE, and LENGTH fields shall be protected with a CRC-16 FCS. The CRC-16 FCS shall be the 1s complement of the remainder generated by the modulo 2 division of the protected PHY fields by the polynomial:

$$x^{16} + x^{12} + x^5 + 1$$

The protected bits shall be processed in transmit order. All FCS calculations shall be made prior to data scrambling.

As an example, the SIGNAL, SERVICE, and LENGTH fields for a DBPSK signal with a packet length of 192 μs (24 octets) would be given by the following:

0101 0000 0000 0000 0000 0011 0000 0000 (leftmost bit transmitted first in time)

The 1s complement FCS for these protected PHY preamble bits would be the following:

0101 1011 0101 0111 (leftmost bit transmitted first in time)

Figure 15-2 (CRC-16 implementation) depicts this example.

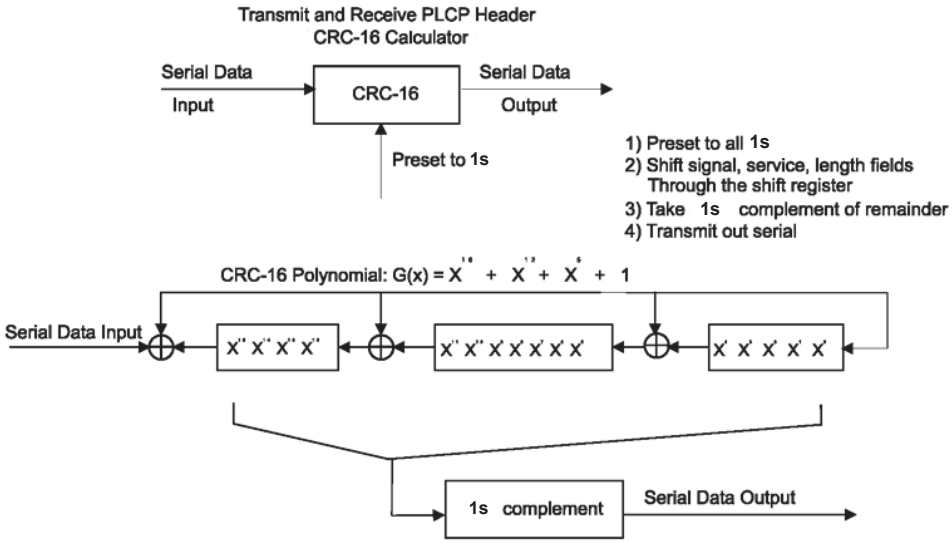

Figure 15-2—CRC-16 implementation

Figure 15-3—Example CRC calculation

15.3.4 PHY/DSSS PHY data scrambler and descrambler

The polynomial $G(z) = z^{-7} + z^{-4} + 1$ shall be used to scramble all bits transmitted by the DSSS PHY. The feedthrough configuration of the scrambler and descrambler is self-synchronizing, which requires no prior knowledge of the transmitter initialization of the scrambler for receive processing. Figure 15-4 (Data scrambler) and Figure 15-5 (Data descrambler) show typical implementations of the data scrambler and descrambler, but other implementations are possible.

The scrambler should be initialized to any state except all 1s when transmitting.

15.3.5 PHY data modulation and modulation rate change

The PHY preamble shall be transmitted using the 1 Mb/s DBPSK modulation. The SIGNAL field shall indicate the modulation that shall be used to transmit the MPDU. The transmitter and receiver shall initiate the modulation indicated by the SIGNAL field starting with the first symbol (1 bit for DBPSK or 2 bits for DQPSK) of the MPDU. The MPDU transmission rate shall be set by the DATARATE parameter in the TXVECTOR issued with the PHY-TXSTART.request primitive described in 15.2.2 (TXVECTOR parameters).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

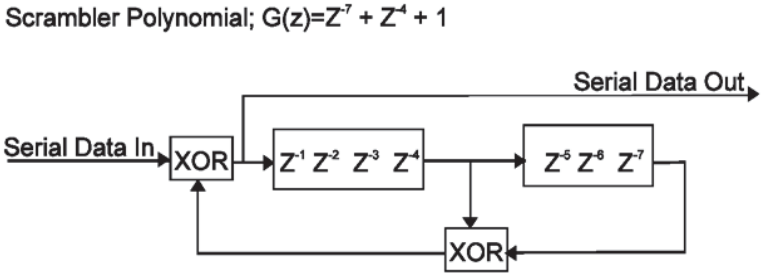

Figure 15-4—Data scrambler

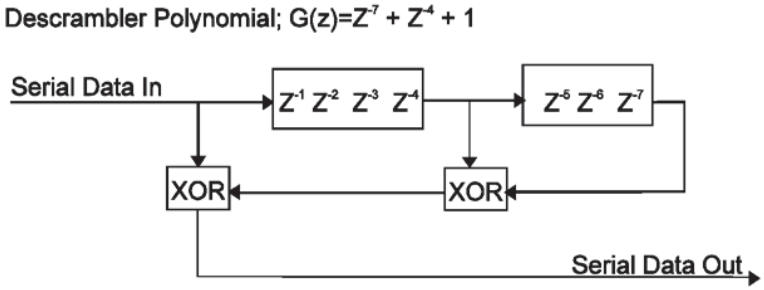

Figure 15-5—Data descrambler

15.3.6 Transmit PHY

The transmit PHY is shown in Figure 15-6 (Transmit PHY).

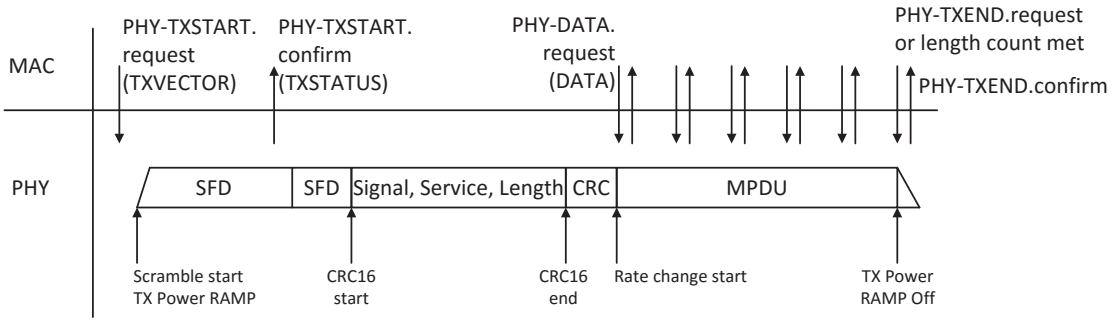

Figure 15-6—Transmit PHY

In order to transmit data, PHY-TXSTART.request primitive shall be issued so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate channel through STA management via the PLME. Other transmit parameters such as DATARATE, TX antenna, and TX power are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive as described in 15.2.2 (TXVECTOR parameters).

Based on the state of CCA indicated by the PHY-CCA.indication primitive, the MAC assesses that the channel is clear. A clear channel shall be indicated by a PHY-CCA.indication(IDLE) primitive. If the channel is clear, transmission of the PPDU shall be initiated by issuing the PHY-TXSTART.request(TXVECTOR)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are the PHY header parameters SIGNAL (DATARATE), SERVICE, LENGTH, TX_ANTENNA, TXPWR_LEVEL_INDEX, and TIME_OF_DEPARTURE_REQUESTED. The PHY header parameter LENGTH is calculated from the TXVECTOR element by multiplying by 8 for 1 Mb/s and by 4 for 2 Mb/s.

The PHY is configured with the TXVECTOR elements TX_ANTENNA, DATARATE, and TXPWR_LEVEL_INDEX. The PHY entity shall immediately initiate data scrambling and transmission of the PHY preamble based on the parameters passed in the PHY-TXSTART.request primitive. The time required for transmit power-on ramp described in 15.4.5.8 (Transmit power-on and power-down ramp) shall be included in the PHY SYNC field.

Once the PHY preamble transmission is complete, data shall be exchanged between the MAC and the PHY by a series of PHY-DATA.request(DATA) primitives issued by the MAC and PHY-DATA.confirm primitives issued by the PHY. The modulation rate change, if any, shall be initiated with the first data symbol of the MPDU as described in 15.3.5 (PHY data modulation and modulation rate change). The PHY proceeds with MPDU transmission through a series of data octet transfers from the MAC. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by the issuance of the PHY-TXEND.request primitive. Normal termination occurs after the transmission of the final bit of the last MPDU octet according to the number supplied in the TXVECTOR LENGTH field. The packet transmission shall be completed and the PHY entity shall enter the receive state (i.e., PHY-TXSTART shall be disabled). It is recommended that chipping continue during power-down. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A typical state machine implementation of the transmit PHY is provided in Figure 15-7 (PHY transmit state machine).

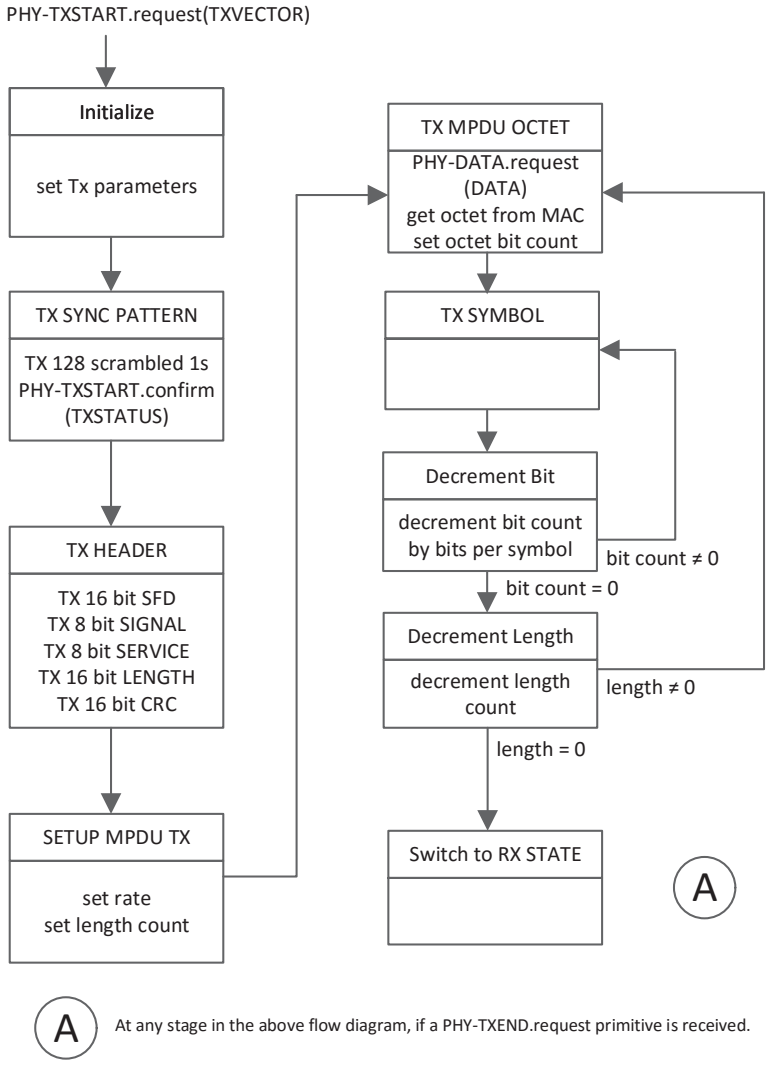

Figure 15-7—PHY transmit state machine

15.3.7 Receive PHY

The receive PHY is shown in Figure 15-8 (Receive PHY).

In order to receive data, PHY-TXSTART.request primitive shall be disabled so that the PHY entity is in the receive state. Further, through STA management via the PLME, the PHY is set to the appropriate channel and the CCA method is chosen. Other receive parameters such as RSSI, RCPI, signal quality (SQ), and indicated DATARATE may be accessed via the PHY SAP.

Upon receiving the transmitted energy, according to the selected CCA mode, A PHY-CCA.indication(BUSY) primitive shall be issued for energy detection (ED) and/or code lock prior to correct reception of the PHY header. The PHY measures the RSSI and SQ and the parameters are reported to the MAC in the RXVECTOR.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

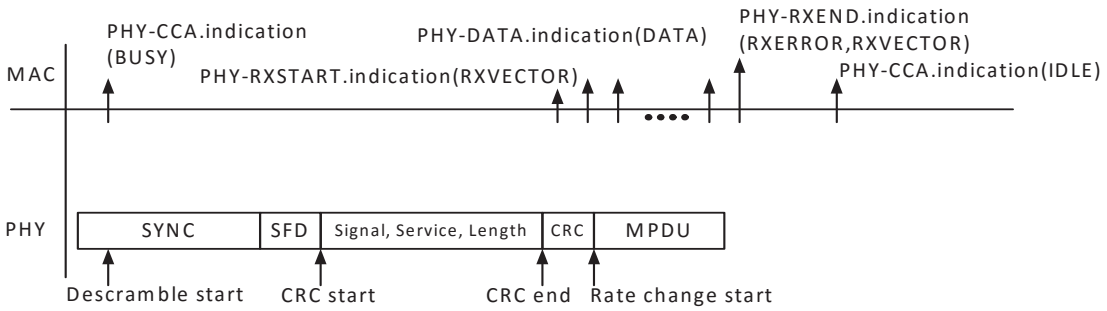

Figure 15-8—Receive PHY

After a PHY-CCA.indication primitive is issued, the PHY entity shall begin searching for the SFD field. Once the SFD field is detected, CRC-16 processing shall be initiated and the PHY SIGNAL, SERVICE and LENGTH fields are received. The CRC-16 FCS shall be processed. If the CRC-16 FCS check fails, the PHY receiver shall return to the RX IDLE state as depicted in Figure 15-9 (PHY receive state machine). Should the status of CCA return to the IDLE state during reception prior to completion of the full PPDU processing, the PHY receiver shall return to the RX IDLE state.

If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. If dot11TimingMsmtActivated is true, the PHY shall do the following:

— Complete receiving the PHY header and verify the validity of the PHY Header.

— If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 15.2.3 (RXVECTOR parameters)).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.57 (Timing measurement) in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the SIGNAL field, the SERVICE field, the MPDU length in octets (calculated from the LENGTH field in microseconds), the antenna used for receive (RX_ANTENNA), RSSI, RCPI, and SQ.

The received MPDU bits are assembled into octets and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. The rate change indicated in the SIGNAL field shall be initiated with the first symbol of the MPDU as described in 15.3.5 (PHY data modulation and modulation rate change). The PHY proceeds with MPDU reception. After the reception of the final bit of the last MPDU octet, as indicated by the PHY preamble LENGTH field, the receiver shall be returned to the RX IDLE state as shown in Figure 15-9 (PHY receive state machine). A PHY-RXEND.indication(NoError) primitive shall be issued. A PHY-CCA.indication(IDLE) primitive shall be issued following a change in PHY carrier sense (PHYCS) and/or PHY energy detection (PHYED) according to the selected CCA method.

In the event that a change in PHYCS or PHYED would cause the status of CCA to return to the IDLE state before the complete reception of the MPDU, as indicated by the PHY LENGTH field, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive. The CCA of the DSSS PHY shall indicate a busy medium for the intended duration of the transmitted packet.

If the PHY header is successful, but the indicated rate in the SIGNAL field is not receivable, a PHY-RXSTART.indication primitive shall not be issued. The PHY shall indicate the error condition by issuing a PHY-RXEND.indication(UnsupportedRate) primitive. If the PHY header is successful, but the SERVICE

Copyright © 2016 IEEE. All rights reserved.

field is out of IEEE Std 802.11 DSSS specification, a PHY-RXSTART.indication primitive shall not be issued. The PHY shall indicate the error condition by issuing a PHY-RXEND.indication(FormatViolation) primitive. Also, in both cases, the CCA of the DSSS PHY shall indicate a busy medium for the intended duration of the transmitted frame as indicated by the LENGTH field. The intended duration is indicated by the LENGTH field (length $\times 1$ μs).

Figure 15-9 (PHY receive state machine) shows the flow of a typical state machine implementation of the receive PHY.

15.4 DSSS PLME

15.4.1 PLME SAP sublayer management primitives

Table 15-4 (MIB attribute default values/ranges) lists the MIB attributes that may be accessed by the PHY entities and intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, and PLME-RESET primitives defined in Clause 6 (Layer management).

15.4.2 DSSS PHY MIB

All DSSS PHY MIB attributes are defined in Clause 8 (PHY service specification), with specific values defined in Table 15-4 (MIB attribute default values/ranges).

Table 15-4—MIB attribute default values/ranges

15.4.4 PHY operating specifications, general

15.4.4.1 General

Subclause 15.4.4 (PHY operating specifications, general) provides general specifications for the DSSS PHY sublayer. These specifications apply to both the Receive and the Transmit functions and general operation of a DSSS PHY.

15.4.4.2 Operating frequency range

The DSSS PHY shall operate in the frequency range of 2.4 GHz to 2.4835 GHz as allocated by regulatory bodies in the China, United States and Europe or in the 2.471 GHz to 2.497 GHz frequency band as allocated by regulatory authority in Japan.

15.4.4.3 Channel Numbering of operating channels

When dot11OperatingClassesRequired is true, channel numbering shall be as specified in 17.3.8.4.2 (Channel numbering) and channelization shall be as specified in 17.3.8.4.3 (Channelization). When dot11OperatingClassesDefined is false or not defined, the channel center frequencies and CHNL_ID numbers shall be as shown in Table 15-6 (DSSS PHY frequency channel plan).

In a multiple cell network topology, overlapping and/or adjacent cells using different channels can operate simultaneously without interference if the distance between the center frequencies is at least 30 MHz.

15.4.4.4 Spreading sequence

The following 11-chip Barker sequence shall be used as the PN code sequence:
+1, –1, +1, +1, –1, +1, +1, +1, –1, –1, –1

The leftmost chip shall be output first in time. The first chip shall be aligned at the start of a transmitted symbol. The symbol duration shall be exactly 11 chips long.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 15-6—DSSS PHY frequency channel plan

CHNL_ID	Frequency (MHz)
1	2412
2	2417
3	2422
4	2427
5	2432
6	2437
7	2442
8	2447
9	2452
10	2457
11	2462
12	2467
13	2472
14	2484

15.4.4.5 Modulation and channel data rates

Two modulation formats and data rates are specified for the DSSS PHY: a *basic access rate* and an *enhanced access rate*. The basic access rate shall be based on 1 Mb/s DBPSK modulation. The DBPSK encoder is specified in Table 15-7 (1 Mb/s DBPSK encoding table). The enhanced access rate shall be based on 2 Mb/s DQPSK. The DQPSK encoder is specified in Table 15-8 (2 Mb/s DQPSK encoding table). (In the tables, $+j\omega$ shall be defined as counterclockwise rotation.)

Table 15-7—1 Mb/s DBPSK encoding table

Bit input	Phase change ($+j\omega$)
0	0
1	π

15.4.4.6 Transmit and receive in-band and out-of-band spurious emissions

The DSSS PHY shall comply with in-band and out-of-band spurious emissions as set by the appropriate regulatory bodies.

15.4.4.7 TX-to-RX turnaround time

The TX-to-RX turnaround time shall be less than 10 μs, including the power-down ramp specified in 15.4.5.8 (Transmit power-on and power-down ramp).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 15-8—2 Mb/s DQPSK encoding table

Dibit pattern (d0,d1) d0 is first in time	Phase change (+jω)
00	0
01	π/2
11	π
10	3π/2 (–π/2)

The TX-to-RX turnaround time shall be measured on the WM from the trailing edge of the last transmitted symbol to valid CCA detection of the incoming signal. The CCA should occur within 25 μs (10 μs for turnaround time plus 15 μs for energy detect) or by the next slot boundary occurring after 25 μs has elapsed (refer to 15.4.6.5 (CCA)). A receiver input signal 3 dB above the ED threshold described in 15.4.6.5 (CCA) shall be present at the receiver.

15.4.4.8 RX-to-TX turnaround time

The RX-to-TX turnaround time shall be measured at the MAC/PHY interface, using the PHY-TXSTART.request primitive and shall be ≤ 5 μs. This includes the transmit power-on ramp described in 15.4.5.8 (Transmit power-on and power-down ramp).

15.4.4.9 Slot time

The value of the slot time is found in Table 15-5 (DSSS PHY characteristics).

15.4.4.10 Transmit and receive antenna connector impedance

The impedance at the transmit and receive antenna connector(s) shall be 50 Ω if the connector is exposed.

15.4.5 PHY transmit specifications

15.4.5.1 Introduction

The transmit functions and parameters associated with the PHY sublayer are described in 15.4.5.2 (Transmit power levels) to 15.4.5.10 (Transmit modulation accuracy).

15.4.5.2 Transmit power levels

The maximum allowable output power is measured in accordance with practices specified by the appropriate regulatory bodies.

15.4.5.3 Minimum transmitted power level

The minimum transmitted power shall be no less than 1 mW.

15.4.5.4 Transmit power level control

Power control shall be provided for transmitted power greater than 100 mW. A maximum of four power levels may be provided. At a minimum, a radio capable of transmission greater than 100 mW shall be capable of switching power back to 100 mW or less.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

15.4.5.5 Transmit spectrum mask

The transmitted spectral products shall be less than –30 dBr (decibel relative to the SINx/x peak) for f_c – 22 MHz < f < f_c –11 MHz, f_c +11 MHz < f < f_c + 22 MHz, –50 dBr for f < f_c –22 MHz, and f > f_c + 22 MHz, where f_c is the channel center frequency. The transmit spectral mask is shown in Figure 15-10 (Transmit spectrum mask). The measurements shall be made using 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

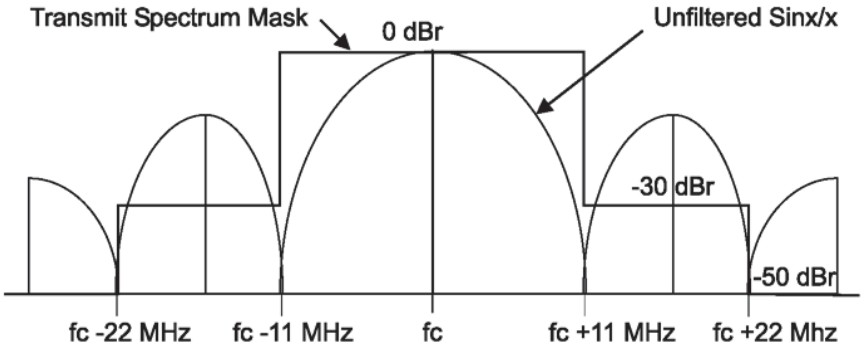

Figure 15-10—Transmit spectrum mask

Channel 14 is unique. The Japanese standard ARIB RCR-STD 33 (5.0) [B7] states that B90/2π normalized to the 'transmission speed of modulation signal' shall be > 10, where B90 is the 90% occuiped channel bandwidth. Therefore, for channel 14, B90/2π > 13.75 MHz for CCK spreading and >10.0 MHz for Barker spreading.

15.4.5.6 Transmit center frequency tolerance

The transmitted center frequency tolerance shall be ±25 ppm maximum.

15.4.5.7 Chip clock frequency tolerance

The PN code chip clock frequency tolerance shall be ±25 ppm maximum.

15.4.5.8 Transmit power-on and power-down ramp

The transmit power-on ramp for 10% to 90% of maximum power shall be no greater than 2 μs. The transmit power-on ramp is shown in Figure 15-11 (Transmit power-on ramp).

The transmit power-down ramp for 90% to 10% maximum power shall be no greater than 2 μs. The transmit power-down ramp is shown in Figure 15-12 (Transmit power-down ramp).

The transmit power ramps shall be constructed such that the DSSS PHY emissions comply with the spurious frequency product specification defined in 15.4.4.6 (Transmit and receive in-band and out-of-band spurious emissions).

15.4.5.9 RF carrier suppression

The RF carrier suppression, measured at the channel center frequency, shall be at least 15 dB below the peak sin(x)/x power spectrum. The RF carrier suppression shall be measured while transmitting a repetitive 01 data sequence with the scrambler disabled using DQPSK modulation. A 100 kHz resolution bandwidth shall be used to perform this measurement.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

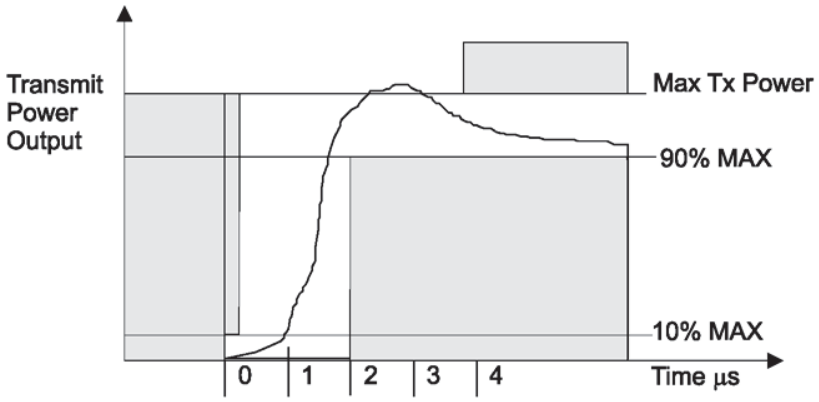

Figure 15-11—Transmit power-on ramp

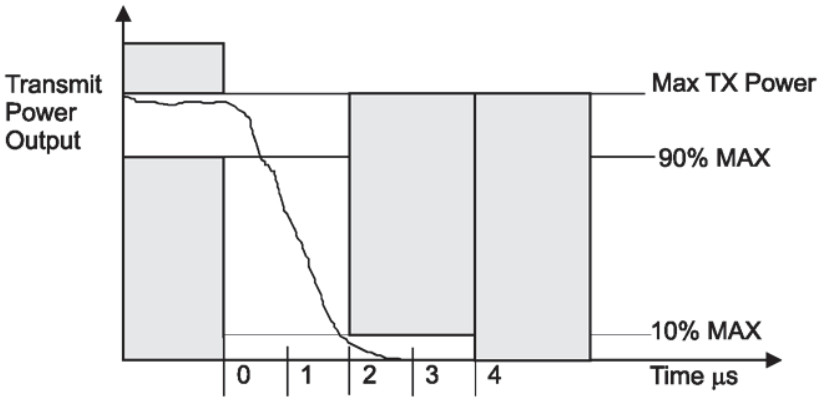

Figure 15-12—Transmit power-down ramp

15.4.5.10 Transmit modulation accuracy

The transmit modulation accuracy requirement for the DSSS PHY shall be based on the difference between the actual transmitted waveform and the ideal signal waveform. Modulation accuracy shall be determined by measuring the peak vector error magnitude measured during each chip period. Worst-case vector error magnitude shall not exceed 0.35 for the normalized sampled chip data. The ideal complex I and Q constellation points associated with DQPSK modulation (0.707, 0.707), (0.707, –0.707), (–0.707, 0.707), (–0.707, –0.707) shall be used as the reference. These measurements shall be from baseband I and Q sampled data after recovery through a reference receiver system.

Figure 15-13 (Modulation accuracy measurement example) illustrates the ideal DQPSK constellation points and range of worst-case error specified for modulation accuracy.

Error vector measurement requires a reference receiver capable of carrier lock. All measurements shall be made under carrier lock conditions. The distortion induced in the constellation by the reference receiver shall be calibrated and measured. The test data error vectors described below shall be corrected to compensate for the reference receiver distortion.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

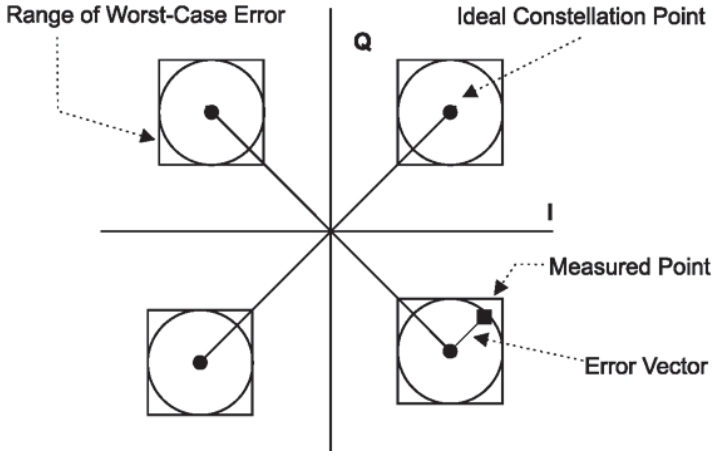

Figure 15-13—Modulation accuracy measurement example

The IEEE Std 802.11 vendor compatible radio shall provide an exposed TX chip clock, which shall be used to sample the I and Q outputs of the reference receiver.

The measurement shall be made under the conditions of continuous DQPSK transmission using scrambled all 1s.

The eye pattern of the I channel shall be used to determine the *I* and *Q* sampling point. The chip clock provided by the vendor radio shall be time delayed such that the samples fall at a 1/2 chip period offset from the mean of the zero crossing positions of the eye (see Figure 15-14 (Chip clock alignment with baseband eye pattern)). This is the ideal center of the eye and might not be the point of maximum eye opening.

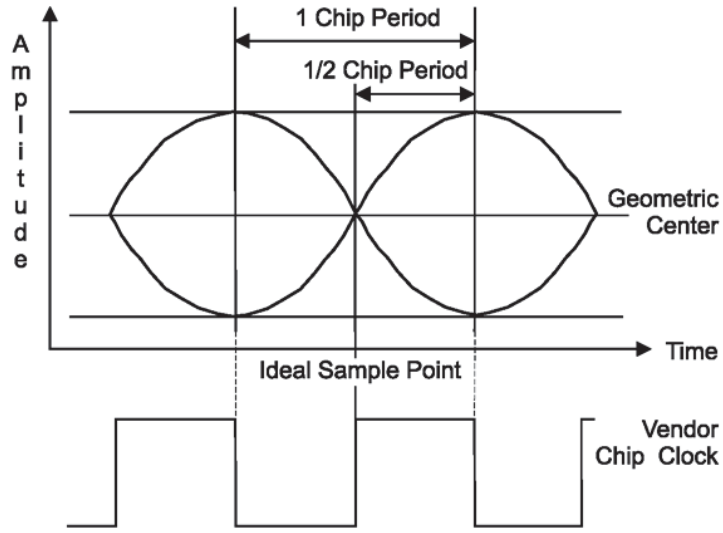

Figure 15-14—Chip clock alignment with baseband eye pattern

Using the aligned chip clock, 1000 samples of the *I* and *Q* baseband outputs from the reference receiver are captured. The vector error magnitudes shall be calculated as follows:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Calculate the dc offsets for I and Q samples.

$$I_{\text{mean}} = \sum_{n=1}^{1000} I(n) / 1000$$

$$Q_{\text{mean}} = \sum_{n=1}^{1000} Q(n) / 1000$$

Calculate the dc corrected I and Q samples for all n =1000 sample pairs.

$$I_{\text{dc}}(n) = I(n) - I_{\text{mean}}$$

$$Q_{\text{dc}}(n) = Q(n) - Q_{\text{mean}}$$

Calculate the average magnitude of I and Q samples.

$$I_{\text{mag}} = \sum_{n=1}^{1000} \left| I_{\text{dc}}(n) \right| / 1000$$

$$Q_{\text{mag}} = \sum_{n=1}^{1000} \left| Q_{\text{dc}}(n) \right| / 1000$$

Calculate the normalized error vector magnitude for the $I_{\text{dc}}(n)/Q_{\text{dc}}(n)$ pairs.

$$V_{err}(n) = [\{\left| I_{dc}(n) \right| - I_{mag}\}^2 + \{\left| Q_{dc}(n) \right| - Q_{mag}\}^2]^{1/2}$$

where
the average power of the constellation is 1

NOTE—A correction factor might be needed to compensate for the error induced by a test reference receiver system.

For all n =1000 samples, the following condition shall be met:

$$V_{err}(n) < 0.35$$

15.4.5.11 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is $22 \times 10^6 \left(1 + \left\lceil \frac{f_{\text{H}} - f_{\text{L}}}{22\ \text{MHz}} \right\rceil\right)$ sample/s

where
f_{H} is the nominal center frequency in Hz of the highest channel in the channel set

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

f_L is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which frames providing measurements are transmitted, the channel set comprises channels uniformly spaced across $f_H - f_L \geq 50$ MHz

— FIRST_TRANSITION_FIELD is the SYNC field.

— SECOND_TRANSITION_FIELD is the SFD field.

— TRAINING_FIELD is the concatenation of the SYNC and SFD fields, using a chip pulse that should approximate a rectangular pulse of duration 1/ 11 MHz convolved with a brick-wall low pass filter of bandwidth 11 MHz.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated chip pulse applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

15.4.6 PHY receiver specifications

15.4.6.1 Introduction

The receive functions and parameters associated with the PHY sublayer are described in 15.4.6.2 (Receiver minimum input level sensitivity) to 15.4.6.5 (CCA).

15.4.6.2 Receiver minimum input level sensitivity

The FER shall be less than 8×10^{-2} at an MPDU length of 1024 octets for an input level of –80 dBm measured at the antenna connector. This FER shall be specified for 2 Mb/s DQPSK modulation. The test for the minimum input level sensitivity shall be conducted with the ED threshold set ≤ –80 dBm.

15.4.6.3 Receiver maximum input level

The receiver shall provide a maximum FER of 8×10^{-2} at an MPDU length of 1024 octets for a maximum input level of –4 dBm measured at the antenna. This FER shall be specified for 2 Mb/s DQPSK modulation.

15.4.6.4 Receiver adjacent channel rejection

Adjacent channel rejection is defined between any two channels with ≥ 30 MHz separation in each channel group defined in 15.4.4.3 (Channel Numbering of operating channels).

The adjacent channel rejection shall be ≥ 35 dB with an FER of 8×10^{-2} using 2 Mb/s DQPSK modulation described in 15.4.4.5 (Modulation and channel data rates) and an MPDU length of 1024 octets.

The adjacent channel rejection shall be measured using the following method:

Input a 2 Mb/s DQPSK modulated signal at a level 6 dB greater than specified in 15.4.6.2 (Receiver minimum input level sensitivity). In an adjacent channel (≥ 30 MHz separation as defined by the channel numbering), input a signal modulated in a similar fashion that adheres to the transmit mask specified in 15.4.5.5 (Transmit spectrum mask) to a level 41 dB above the level specified in 15.4.6.2 (Receiver minimum input level sensitivity). The adjacent channel signal shall be derived from a separate signal source. It shall not be a frequency shifted version of the reference channel. Under these conditions, the FER shall be less than or equal to 8×10^{-2}.

15.4.6.5 CCA

The DSSS PHY shall provide the capability to perform CCA according to both:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A — at least one of the following options:

- — *CCA Mode 1:* Energy above threshold. CCA shall report a busy medium upon detection of any energy above the ED threshold.
- — *CCA Mode 2:* CS only. CCA shall report a busy medium only upon detection of a DSSS signal. This signal may be above or below the ED threshold.
- — *CCA Mode 3:* CS with energy above threshold. CCA shall report a busy medium upon detection of a DSSS signal with energy above the ED threshold.

and

B — *CCA Mode 6:* CCA shall report a busy medium upon detection of any energy above –62 dBm.

A busy channel shall be indicated by issuing a PHY-CCA.indication(BUSY) primitive.

A clear channel shall be indicated by issuing a PHY-CCA.indication(IDLE) primitive.

The value of dot11CCAModeSupported shall indicate the appropriate operation modes. The PHY shall be configured according to dot11CurrentCCAMode.

The CCA shall indicate a clear channel if there is no energy detect or CS. The CCA parameters are subject to the following criteria:

a) The ED threshold shall be ≤ –80 dBm for TX power > 100 mW, –76 dBm for 50 mW < TX power ≤ 100 mW, and –70 dBm for TX power ≤ 50 mW.

b) With a valid signal (according to the CCA mode of operation) present at the receiver antenna within 5 μs of the start of a MAC slot boundary, the PHY-CCA.indication(BUSY) primitive shall be generated before the end of the slot time. Refer to Figure 10-19 (DCF timing relationships) (in 10.3.7 (DCF timing relations)) and Figure 10-26 (EDCA mechanism timing relationships) for a definition of slot boundary.

c) In the event that a correct PHY header is received, the DSSS PHY shall not generate a PHY-CCA.indication (IDLE) primitive until the end of the PPDU as determined by TXTIME in 16.4.7.

Compliance to DSSS PHY CCA shall be demonstrated by applying a DSSS signal, above the appropriate ED threshold (item a), so that all conditions described in item b and item c are demonstrated.

15.4.6.6 Received Channel Power Indicator Measurement

The RCPI is a measure of the received RF power in the selected channel for a received frame. This parameter shall be a measure by the PHY of the received RF power in the channel measured over the entire received frame or by other equivalent means that meet the specified accuracy.

The encoding of received power to RCPI is defined in 9.4.2.38 (RCPI element).

RCPI shall equal the received RF power within an accuracy of ±5 dB (95% confidence interval) within the specified dynamic range of the receiver. The received RF power shall be determined assuming a receiver noise equivalent bandwidth equal to the channel bandwidth multiplied by 1.1.

15.4.6.7 DSSS PHY TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated according to the following equations:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$\text{TXTIME} = \text{PreambleLength} + \text{PHYHeaderTime} + \left\lceil \frac{\text{LENGTH} \times 8}{\text{DATARATE}} \right\rceil$$

where

LENGTH and DATARATE	are values from the TXVECTOR parameter of the corresponding PLME-TXTIME.request primitive
LENGTH	is in units of octets
DATARATE	is in units of Mb/s
The value of PreambleLength	is 144 μs
The value of PHYHeaderTime	is 48 μs.

16. High rate direct sequence spread spectrum (HR/DSSS) PHY specification

16.1 Overview

16.1.1 General

This clause specifies the high rate extension of the PHY for the DSSS system (see Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications)), hereinafter known as the HR/DSSS PHY for the 2.4 GHz band designated for ISM applications.

This extension of the DSSS system builds on the data rate capabilities, as described in Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), to provide 5.5 Mb/s and 11 Mb/s payload data rates in addition to the 1 Mb/s and 2 Mb/s rates. To provide the higher rates, 8-chip complementary code keying (CCK) is employed as the modulation scheme. The chipping rate is 11 MHz, which is the same as the DSSS system described in Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), thus providing the same occupied channel bandwidth. The basic new capability described in this clause is called HR/DSSS. One mode of the HR/DSSS PHY uses the same PHY preamble and header as the DSSS PHY, so both PHYs can co-exist in the same BSS and can use the rate switching mechanism as provided.

In addition to providing higher speed extensions to the DSSS system, a number of optional features allow the performance of the RF LAN system to be improved as technology allows the implementation of these options to become cost effective.

Another optional mode is provided that allows data throughput at the higher rates (2, 5.5, and 11 Mb/s) to be significantly increased by using a shorter PHY preamble. This mode is called HR/DSSS/short. This short preamble mode can coexist with DSSS, HR/DSSS under limited circumstances, such as on different channels or with appropriate CCA mechanisms.

16.1.2 Scope

This clause specifies the PHY entity for the HR/DSSS extension and explains how this standard accommodates the HR/DSSS PHY.

The HR/DSSS PHY consists of the following two protocol functions:

a) A PHY function that defines a method for mapping the MPDUs into a framing format suitable for sending and receiving user data and management information between two or more STAs. The PHY exchanges PPDUs that contain PSDUs. The MAC uses the PHY service, so each MPDU corresponds to a PSDU that is carried in a PPDU.

b) A function that defines the characteristics of, and method of transmitting and receiving data through, a WM between two or more STAs, each using the HR/DSSS PHY system.

16.1.3 HR/DSSS PHY functions

16.1.3.1 General

The HR/DSSS PHY contains two functional entities: the PHY function and the layer management function. Each of these functions is described in detail in 16.2 (HR/DSSS PHY) and 16.3 (HR/DSSS PLME).

The HR/DSSS PHY service shall be provided to the MAC through the PHY service primitives described in Clause 8 (PHY service specification).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

16.1.3.2 PLME

The PLME performs management of the local PHY functions in conjunction with the MLME.

16.1.4 Service specification method and notation

The models represented by figures and state diagrams are intended to be illustrations of functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation.

The service of a layer or sublayer is a set of capabilities that it offers to a user in the next-higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

16.2 HR/DSSS PHY

16.2.1 Overview

Subclause 16.2 (HR/DSSS PHY) provides a convergence procedure for the 2 Mb/s, 5.5 Mb/s, and 11 Mb/s specification, in which PSDUs are converted to and from PPDUs. During transmission, the PSDU shall be appended to a PHY preamble and header to create the PPDU. Two different preambles and headers are defined: the mandatory supported long preamble and header, which interoperates with the current 1 Mb/s and 2 Mb/s DSSS specification, and an optional short preamble and header. At the receiver, the PHY preamble and header are processed to aid in demodulation and delivery of the PSDU.

The optional short preamble and header provides maximum throughput when interoperability with legacy and nonshort-preamble-capable STAs is not a consideration. That is, it is expected to be used only in networks of STAs that support the optional mode.

16.2.2 PPDU format

16.2.2.1 General

Two different preambles and headers are defined: the mandatory supported long preamble and header, which is interoperable with the current 1 Mb/s and 2 Mb/s DSSS specification, and an optional short preamble and header.

16.2.2.2 Long PPDU format

Figure 16-1 (Long PPDU format) shows the format for the interoperable (long) PPDU, including the HR/DSSS PHY preamble, the HR/DSSS PHY header, and the PSDU. The PHY preamble contains the following fields: SYNC and SFD. The PHY header contains the following fields: signaling (SIGNAL), service (SERVICE), length (LENGTH), and CRC-16. Each of these fields is described in detail in 16.2.3 (PPDU field definitions). The format for the PPDU, including the long HR/DSSS PHY preamble, the long HR/DSSS PHY header, and the PSDU, does not differ from the format for 1 Mb/s and 2 Mb/s. The only exceptions are:

a) The encoding of the rate in the SIGNAL field;
b) The use of a bit in the SERVICE field to resolve an ambiguity in PSDU length in octets, when the length is expressed in whole microseconds;
c) The use of a bit in the SERVICE field to indicate that the transit frequency and bit clocks are locked.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

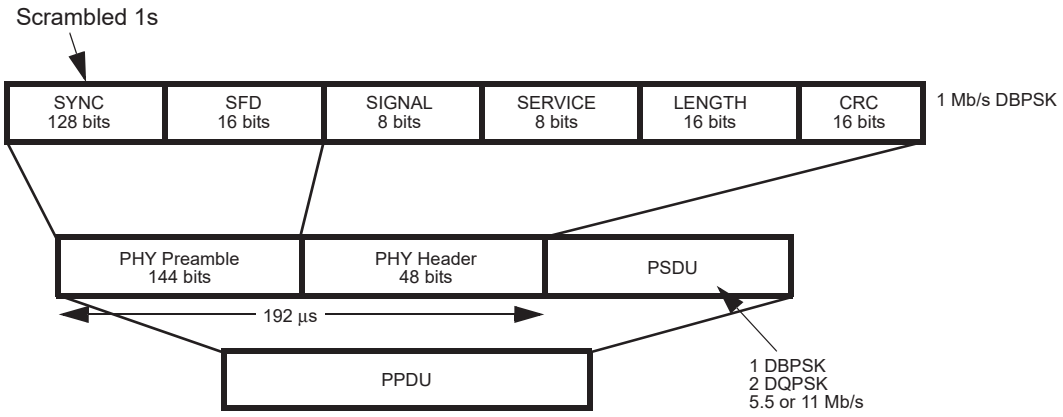

Figure 16-1—Long PPDU format

16.2.2.3 Short PPDU format

The short PHY preamble and header (HR/DSSS/short) is optional. The short preamble and header may be used to minimize overhead and, thus, maximize the network data throughput. The format of the PPDU, with HR/DSSS/short, is depicted in Figure 16-2 (Short PPDU format). A Clause 18 (Extended Rate PHY (ERP) specification) STA shall support the short PPDU format.

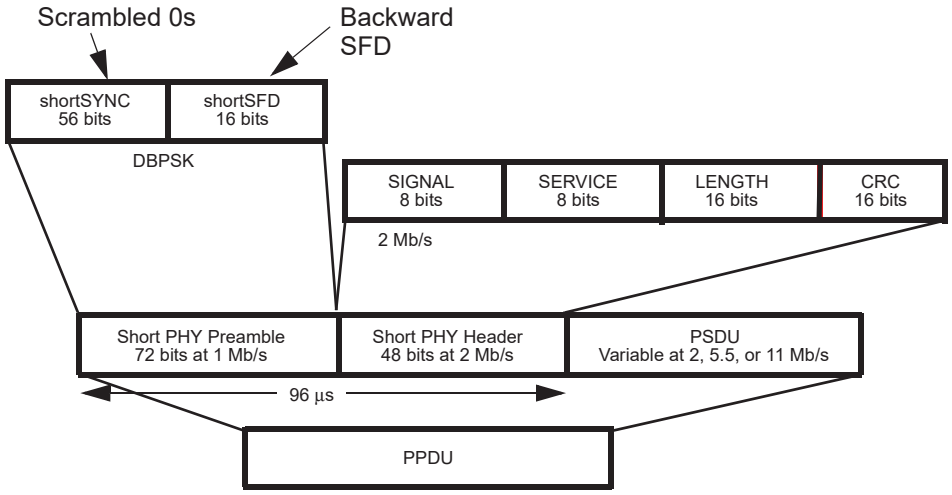

Figure 16-2—Short PPDU format

A transmitter using the short PPDU is interoperable with only another receiver that is also capable of receiving this short PPDU. To interoperate with a receiver that is not capable of receiving a short preamble and header, the transmitter shall use the long PHY preamble and header. The short PHY preamble uses the 1 Mb/s Barker code spreading with DBPSK modulation. The short PHY header uses the 2 Mb/s Barker code spreading with DQPSK modulation, and the PSDU is transmitted at 2 Mb/s, 5.5 Mb/s, or 11 Mb/s.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

16.2.3 PPDU field definitions

16.2.3.1 General

In the PHY field definition subclauses (16.2.3.2 (Long PHY SYNC field) to 16.2.3.15 (Short PHY data modulation and modulation rate change)), the definitions of the long (Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications)) PHY fields are given first, followed by the definitions of the short PHY fields. The names for the short PHY fields are preceded by the term *short*.

16.2.3.2 Long PHY SYNC field

The SYNC field shall consist of 128 bits of scrambled 1 bits. This field is provided so the receiver can perform the necessary synchronization operations. The initial state of the scrambler (seed) shall be [1101100], where the leftmost bit specifies the value to put in the first delay element (Z^1) in Figure 16-5 (Data scrambler) (in 16.2.4 (PHY/HR/DSSS PHY data scrambler and descrambler)), and the rightmost bit specifies the value to put in the last delay element in the scrambler.

To support the reception of DSSS signals generated with implementations based on Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), the receiver shall also be capable of synchronization on a SYNC field derived from any nonzero scrambler initial state.

16.2.3.3 Long PHY SFD

The SFD shall be provided to indicate the start of PHY-dependent parameters within the PHY preamble. The SFD shall be a 16-bit field, [1111 0011 1010 0000], where the rightmost bit shall be transmitted first in time.

16.2.3.4 Long PHY SIGNAL field

The 8-bit SIGNAL field indicates to the PHY the modulation that shall be used for transmission (and reception) of the PSDU. The data rate shall be equal to the SIGNAL field value multiplied by 100 kb/s. The high rate PHY supports four mandatory rates given by the following 8-bit words, which represent the rate in units of 100 kb/s, where the LSB shall be transmitted first in time:

a) X'0A' (MSB to LSB) for 1 Mb/s;
b) X'14' (MSB to LSB) for 2 Mb/s;
c) X'37' (MSB to LSB) for 5.5 Mb/s;
d) X'6E' (MSB to LSB) for 11 Mb/s.

The HR/DSSS PHY rate change capability is described in 16.2.3.15 (Short PHY data modulation and modulation rate change). This field shall be protected by the CRC-16 FCS described in 16.2.3.7 (PHY CRC (CRC-16) field).

16.2.3.5 Long PHY SERVICE field

Two bits have been defined in the SERVICE field to support the high rate extension; see Table 16-1 (SERVICE field definitions). The rightmost bit (bit 7) shall be used to supplement the LENGTH field described in 16.2.3.6 (Long PHY LENGTH field). Bit 2 shall be used to indicate that the transmit frequency and symbol clocks are derived from the same oscillator. This locked clocks bit shall be set by the PHY based on its implementation configuration. The SERVICE field shall be transmitted B0 first in time, and shall be

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

protected by the CRC-16 FCS described in 16.2.3.7 (PHY CRC (CRC-16) field). B0, B1, B3, B4, B5, and B6 are reserved and shall be set to 0 on transmission and ignored on reception.

Table 16-1—SERVICE field definitions

B0	B1	B2	B3	B4	B5	B6	B7
Reserved	Reserved	Locked clocks bit 0 = not locked 1 = locked	Reserved	Reserved	Reserved	Reserved	Length extension bit

16.2.3.6 Long PHY LENGTH field

The PHY LENGTH field shall contain an unsigned 16-bit integer that indicates the number of microseconds required to transmit the PSDU. The transmitted value shall be determined from the LENGTH and DATARATE parameters in the TXVECTOR issued with the PHY-TXSTART.request primitive described in 16.3.5 (Vector descriptions).

The LENGTH field provided in the TXVECTOR is in octets and is converted to microseconds for inclusion in the PHY LENGTH field. The LENGTH field is calculated as follows. Because there is an ambiguity in the number of octets that is described by a length in integer microseconds for any data rate over 8 Mb/s, a length extension bit is present in the SERVICE field to indicate when the smaller potential number of octets is correct as follows:

a) 5.5 Mb/s CCK $\quad \text{LENGTH} = \left\lceil \text{number of octets} \times \frac{8}{5.5} \right\rceil$.

b) 11 Mb/s CCK $\quad \text{LENGTH} = \left\lceil \text{number of octets} \times \frac{8}{11} \right\rceil$; the length extension bit shall be set to 0 if (LENGTH – (number of octets × 8/11)) < 8/11 and shall be set to 1 otherwise.

The length extension bit is reserved when the data rate is not 11 Mb/s.

At the receiver, the number of octets in the MPDU is calculated as follows:

a) 5.5 Mb/s CCK $\quad \text{number of octects} = \left\lfloor \text{LENGTH} \times \frac{5.5}{8} \right\rfloor$.

b) 11 Mb/s CCK $\quad \text{number of octects} = \left\lfloor \text{LENGTH} \times \frac{11}{8} \right\rfloor$, minus 1 if the length extension bit is a 1.

An example for an 11 Mb/s calculation described in pseudocode form is shown below. At the transmitter, the values of the LENGTH field and length extension bit are calculated as follows:

LENGTH' = (number of octets × 8) / R

LENGTH = ⌈LENGTH'⌉

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If
(R = 11) and ((LENGTH–LENGTH') ≥ 8/11)

then
length extension = 1

else
length extension = 0

where
R is the data rate (Mb/s)

At the receiver, the number of octets in the MPDU is calculated as follows:

$$\text{number of octets} = \left\lfloor \frac{\text{LENGTH} \times R}{8} \right\rfloor - \text{length extension}$$

where
R is the data rate (Mb/s)

Table 16-2 (Example of LENGTH calculations for CCK) shows an example calculation for several packet lengths of CCK at 11 Mb/s.

Table 16-2—Example of LENGTH calculations for CCK

TX octets	$\frac{\text{Octets} \times 8}{11}$	LENGTH	Length extension bit	$\frac{\text{LENGTH} \times 11}{8}$	$\left\lfloor \frac{\text{LENGTH} \times 11}{8} \right\rfloor$	RX octets
1023	744	744	0	1023	1023	1023
1024	744.7273	745	0	1024.375	1024	1024
1025	745.4545	746	0	1025.75	1025	1025
1026	746.1818	747	1	1027.125	1027	1026

This example illustrates why normal rounding or truncation of the number does produce the right result. The LENGTH field is defined in units of microseconds and corresponds to the actual length, and the number of octets is exact.

The LSB shall be transmitted first in time. This field shall be protected by the CRC-16 FCS described in 16.2.3.7 (PHY CRC (CRC-16) field).

16.2.3.7 PHY CRC (CRC-16) field

The SIGNAL, SERVICE, and LENGTH fields shall be protected with a CRC-16 FCS. The CRC-16 FCS shall be the 1s complement of the remainder generated by the modulo 2 division of the protected PHY fields by the polynomial

$$x^{16} + x^{12} + x^5 + 1$$

The protected bits shall be processed in transmit order. All FCS calculations shall be made prior to data scrambling. A schematic of the processing is shown in Figure 16-3 (CRC-16 implementation).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

As an example, the SIGNAL, SERVICE, and LENGTH fields for a DBPSK signal with a PPDU length of 192 μs (24 octets) would be given by the following:

0101 0000 0000 0000 0000 0011 0000 0000 [leftmost bit (B0) transmitted first in time]

B0.....B48

The 1s complement FCS for these protected PHY preamble bits would be the following:

0101 1011 0101 0111 [leftmost bit (B0) transmitted first in time]

B0.....B16

Figure 16-3 (CRC-16 implementation) depicts this example.

An illustrative example of the CRC-16 FCS using the information from Figure 16-3 (CRC-16 implementation) is shown in Figure 16-4 (Example of CRC calculation).

Figure 16-4—Example of CRC calculation

16.2.3.8 Long PHY data modulation and modulation rate change

The long PHY preamble and header shall be transmitted using the 1 Mb/s DBPSK modulation. The SIGNAL field indicates the rate that is used to transmit the PSDU. The transmitter and receiver shall initiate the rate indicated by the SIGNAL field, starting with the first octet of the PSDU. The PSDU transmission rate shall be set by the DATARATE parameter in the TXVECTOR, issued with the PHY-TXSTART.request primitive described in 16.3.5 (Vector descriptions).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

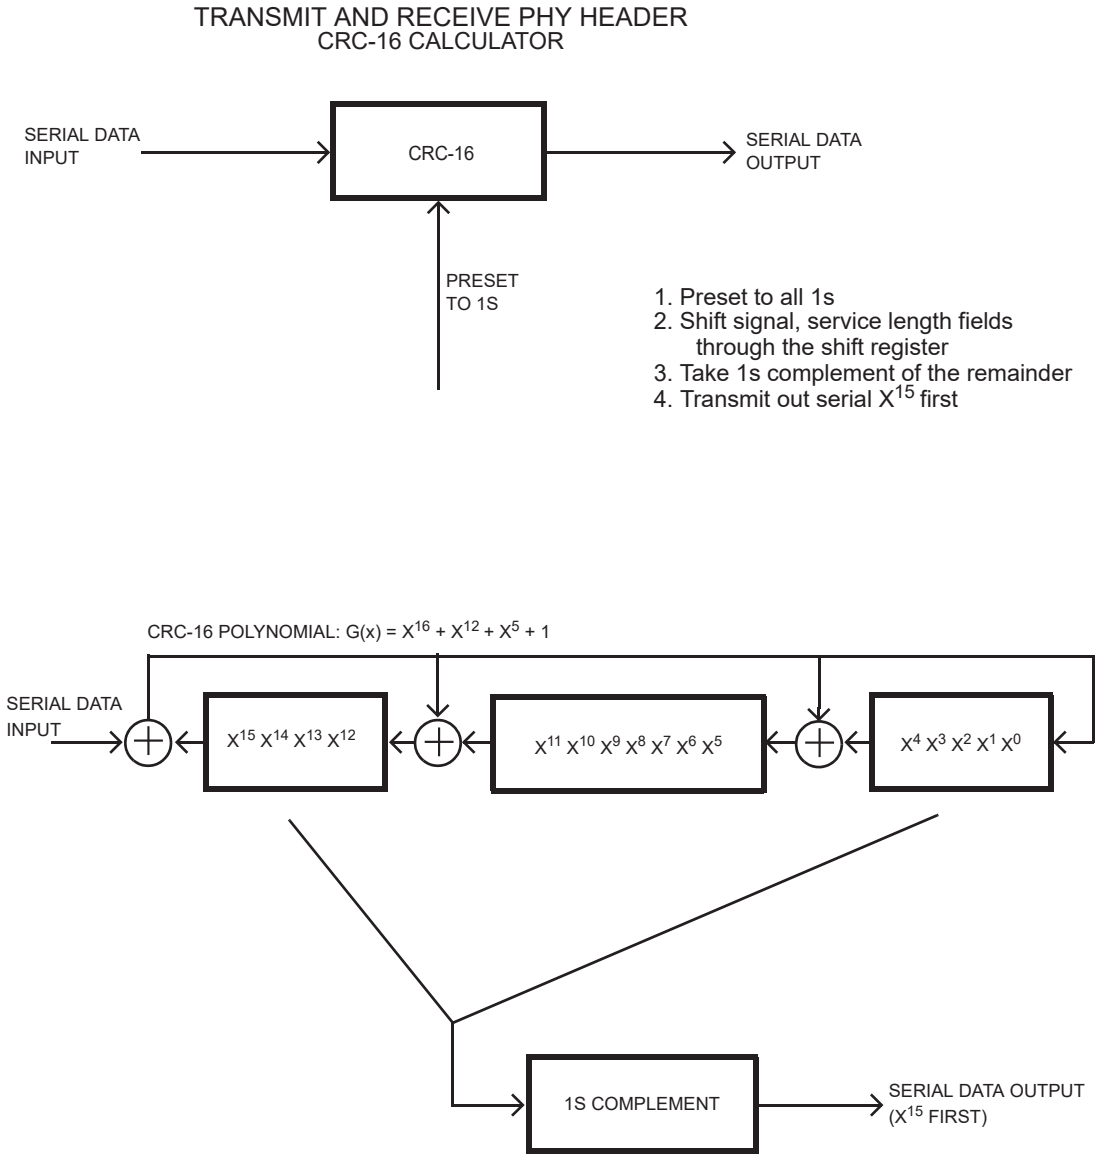

Figure 16-3—CRC-16 implementation

16.2.3.9 Short PHY synchronization (shortSYNC)

The shortSYNC field shall consist of 56 bits of scrambled 0 bits. This field is provided so the receiver can perform the necessary synchronization operations. The initial state of the scrambler (seed) shall be [001 1011], where the left end bit specifies the value to place in the first delay element (Z^1) in Figure 16-5

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(Data scrambler) (in 16.2.4 (PHY/HR/DSSS PHY data scrambler and descrambler)), and the right end bit specifies the value to place in the last delay element (Z^7).

16.2.3.10 Short PHY SFD field (shortSFD)

The shortSFD shall be a 16-bit field and be the time reverse of the field of the SFD in the long PHY preamble (16.2.3.3 (Long PHY SFD)). The field is the bit pattern 0000 0101 1100 1111. The right end bit shall be transmitted first in time. A receiver not configured to use the short header option does not detect this SFD.

16.2.3.11 Short PHY SIGNAL field (shortSIGNAL)

The 8-bit SIGNAL field of the short header indicates to the PHY the data rate that shall be used for transmission (and reception) of the PSDU. A PHY operating with the HR/DSSS/short option supports three mandatory rates given by the following 8-bit words, where the LSB shall be transmitted first in time and the number represents the rate in units of 100 kb/s:

a) X'14' (MSB to LSB) for 2 Mb/s;
b) X'37'(MSB to LSB) for 5.5 Mb/s;
c) X'6E' (MSB to LSB) for 11 Mb/s.

16.2.3.12 Short PHY SERVICE field (shortSERVICE)

The SERVICE field in the short header shall be the same as the SERVICE field described in 16.2.3.5 (Long PHY SERVICE field).

16.2.3.13 Short PHY LENGTH field (shortLENGTH)

The LENGTH field in the short header shall be the same as the LENGTH field described in 16.2.3.6 (Long PHY LENGTH field).

16.2.3.14 Short CRC-16 field (shortCRC)

The CRC in the short header shall be the same as the CRC field defined in 16.2.3.7 (PHY CRC (CRC-16) field). The CRC-16 is calculated over the shortSIGNAL, shortSERVICE, and shortLENGTH fields.

16.2.3.15 Short PHY data modulation and modulation rate change

The short PHY preamble shall be transmitted using the 1 Mb/s DBPSK modulation. The short PHY header shall be transmitted using the 2 Mb/s modulation. The SIGNAL field indicates the rate that is used to transmit the PSDU. The transmitter and receiver shall initiate the rate indicated by the SIGNAL field, starting with the first octet of the PSDU. The PSDU transmission rate shall be set by the DATARATE parameter in the TXVECTOR, issued with the PHY-TXSTART.request primitive described in 16.3.5 (Vector descriptions).

16.2.4 PHY/HR/DSSS PHY data scrambler and descrambler

The polynomial $G(z) = z^{-7} + z^{-4} + 1$ shall be used to scramble all bits transmitted. The feedthrough configuration of the scrambler and descrambler is self-synchronizing, which requires no prior knowledge of the transmitter initialization of the scrambler for receive processing. Figure 16-5 (Data scrambler) and Figure 16-6 (Data descrambler) show typical implementations of the data scrambler and descrambler, but other implementations are possible.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

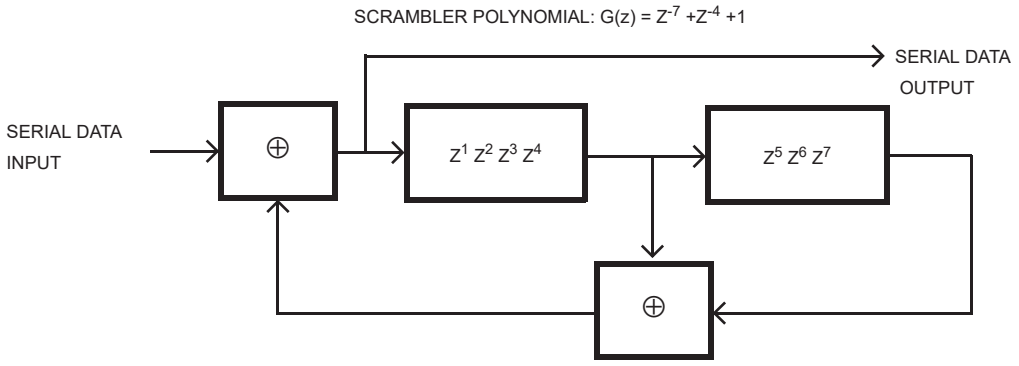

Figure 16-5—Data scrambler

The scrambler shall be initialized as specified in 16.2.3.9 (Short PHY synchronization (shortSYNC)) for the short PPDU format and 16.2.3.2 (Long PHY SYNC field) for the long PPDU format. For a long preamble, this shall result in the scrambler registers Z^1 to Z^7 in Figure 16-5 (Data scrambler) having the data pattern [1101100] (i.e., Z^1= 1... Z^7= 0) when the scrambler is first started. The scrambler shall be initialized with the reverse pattern [0011011] when transmitting the optional short preamble.

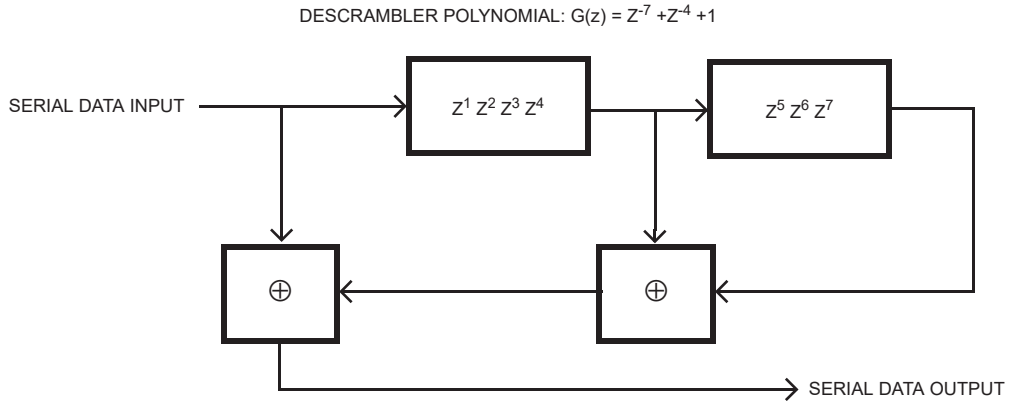

Figure 16-6—Data descrambler

16.2.5 Transmit PHY

The transmit procedures for a HR/DSSS PHY using the long PPDU format are the same as the transmit procedures described in 15.3.6 (Transmit PHY) and 15.3.7 (Receive PHY) and do not change apart from the ability to transmit 5.5 Mb/s and 11 Mb/s.

The procedures for a transmitter employing HR/DSSS/short are the same except for length and rate changes. The decision to use the long or short PPDU format is beyond the scope of this standard.

The transmit PHY is shown in Figure 16-7 (Transmit PHY).

A PHY-TXSTART.request(TXVECTOR) primitive is issued by the MAC to start the transmission of a PPDU. In addition to parameters DATARATE and LENGTH, other transmit parameters such as PREAMBLE_TYPE are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

described in 16.3.5 (Vector descriptions). The SIGNAL, SERVICE, and LENGTH fields of the PHY header are calculated as described in 16.2.3 (PPDU field definitions).

The PHY is configured with the TXVECTOR elements TX_ANTENNA, DATARATE, and TXPWR_LEVEL_INDEX. The PHY entity shall immediately initiate data scrambling and transmission of the PHY preamble based on the parameters passed in the PHY-TXSTART.request primitive. The time required for transmit power-on ramp, described in 16.3.7.7 (Transmit power-on and power-down ramp), shall be included in the PHY SYNC field.

Once the PHY preamble transmission is complete, data shall be exchanged between the MAC and the PHY by a series of PHY-DATA.request(DATA) primitives issued by the MAC and PHY-DATA.confirm primitives issued by the PHY. The modulation and rate change, if any, shall be initiated with the first data symbol of the PSDU, as described in 16.2.3.8 (Long PHY data modulation and modulation rate change) and 16.2.3.15 (Short PHY data modulation and modulation rate change). The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by the issuance of the PHY-TXEND.request primitive. Normal termination occurs after the transmission of the final bit of the last PSDU octet, calculated from the number supplied in the PHY preamble LENGTH and SERVICE fields using the equations specified in 16.2.3.6 (Long PHY LENGTH field). The PPDU transmission shall be completed and the PHY entity shall enter the receive state (i.e., PHY-TXSTART shall be disabled). It is recommended that modulation continue during power-down to prevent radiating a continuous wave carrier. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.

16.2.6 Receive PHY

The receive procedures for receivers configured to receive the mandatory and optional PHYs, rates, and modulations are described in this subclause. A receiver that supports this high rate extension of the standard is capable of receiving 5.5 Mb/s and 11 Mb/s, in addition to 1 Mb/s and 2 Mb/s. If the PHY implements the short preamble option, it shall detect both short and long preamble formats and indicate which type of preamble was received in the RXVECTOR. The receiver shall implement the CCA procedure as defined in 16.3.8.5 (CCA). Upon receiving a PPDU, the receiver shall distinguish between a long and short header format by the value of the SFD, as specified in 16.2.2 (PPDU format). The receiver shall demodulate a long PHY header using BPSK at 1 Mb/s. The receiver shall demodulate a short PHY header using QPSK at 2 Mb/s. The receiver shall use the SIGNAL and SERVICE fields of the PHY header to determine the data rate and modulation of the PSDU.

The receive PHY is shown in Figure 16-8 (Receive PHY). In order to receive data, the PHY-TXSTART.request primitive shall be disabled so that the PHY entity is in the receive state. Further, through station management via the PLME, the PHY shall be set to the appropriate channel and the CCA method chosen. Other receive parameters, such as RSSI, RCPI, SQ, and indicated DATARATE, may be accessed via the PHY SAP.

Upon receiving the transmitted energy, according to the selected CCA mode a PHY-CCA.indication(BUSY) primitive shall be issued for ED and/or code lock prior to correct reception of the PHY header. The PHY measures the SQ, RSSI, and RCPI parameters and these are reported to the MAC in the RXVECTOR.

After a PHY-CCA.indication primitive is issued, the PHY entity shall begin searching for the SFD field. Once the SFD field is detected, CRC-16 processing shall be initiated and the PHY SIGNAL, SERVICE, and LENGTH fields shall be received. The CRC-16 FCS shall be processed. If the CRC-16 FCS check fails, the PHY receiver shall return to the RX IDLE state, as depicted in Figure 16-9 (PHY receive state machine). Should the status of CCA return to the IDLE state during reception prior to completion of the full PPDU processing, the PHY receiver shall return to the RX IDLE state.

This is an unapproved IEEE Standards Draft, subject to change.

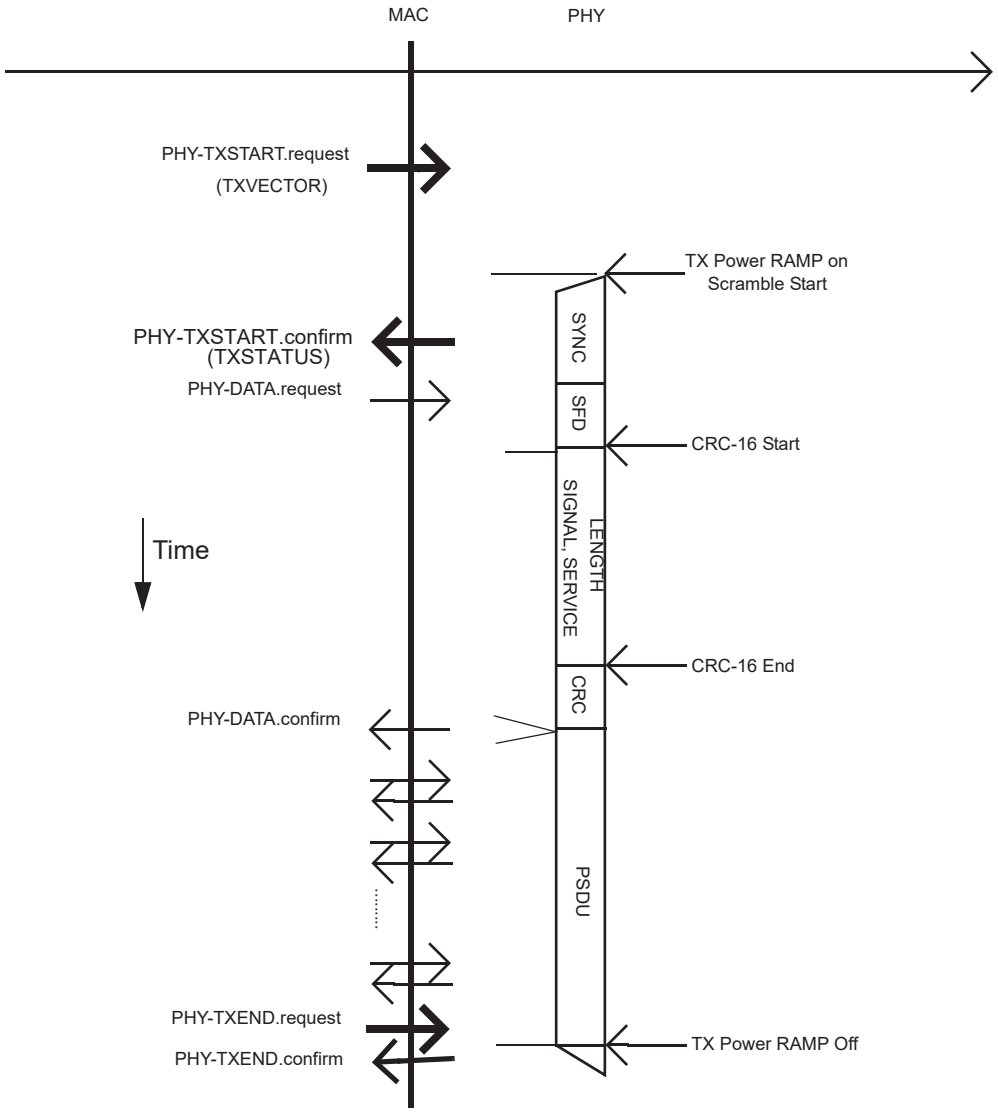

Figure 16-7—Transmit PHY

If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes:

a) The SIGNAL field

b) The SERVICE field

c) The PSDU length in octets (calculated from the LENGTH field in microseconds and the DATARATE in Mb/s, in accordance with the formula in 16.2.3.6 (Long PHY LENGTH field))

d) RXPREAMBLE_TYPE (which is an enumerated type taking on values SHORTPREAMBLE or LONGPREAMBLE)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

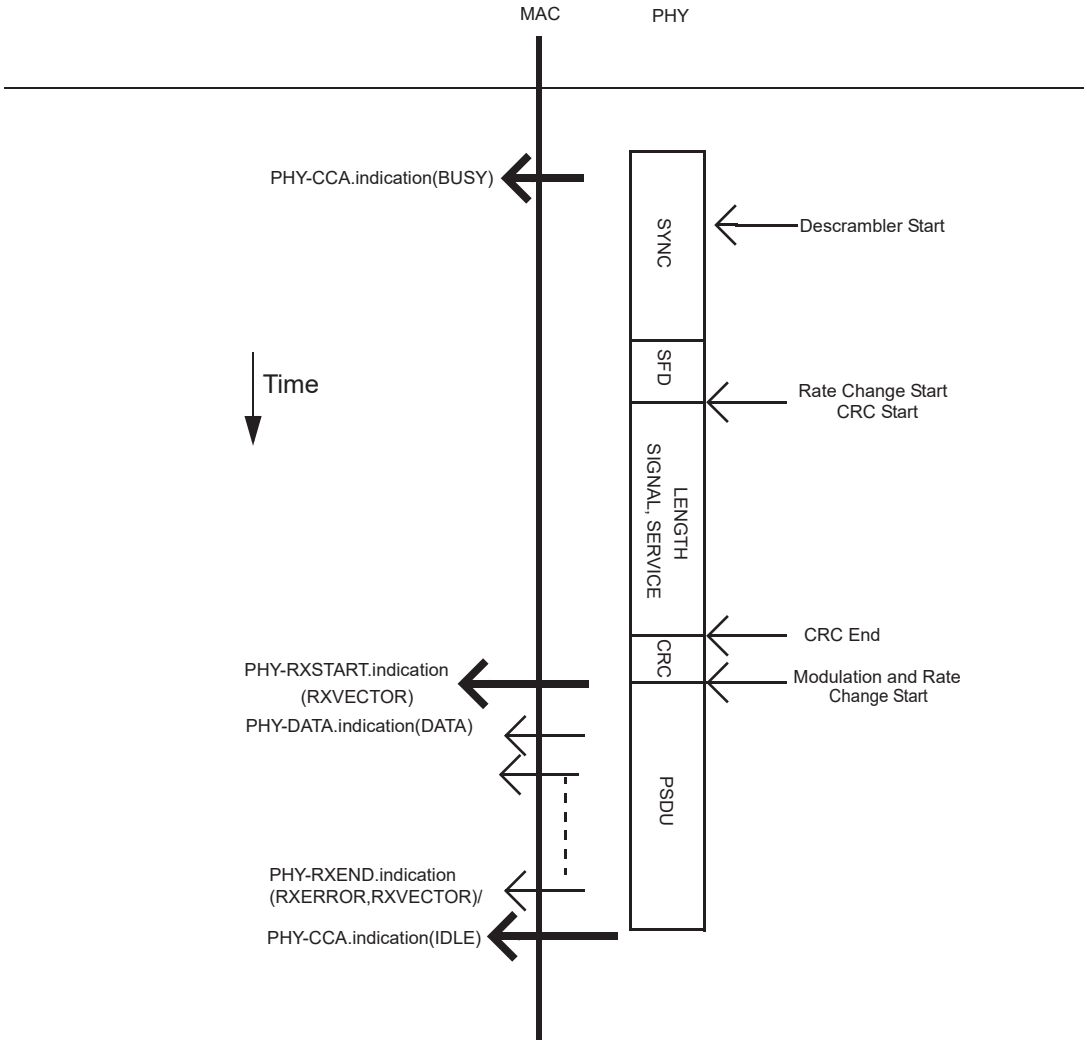

Figure 16-8—Receive PHY

e) ANT_STATE (the antenna used for receive), RSSI, RCPI, and SQ

If dot11TimingMsmtActivated is true, the PHY shall do the following:

— Complete receiving the PHY header and verify the validity of the PHY Header.

— If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 16.3.5 (Vector descriptions)).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.57 (Timing measurement) in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

The received PSDU bits are assembled into octets and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. The rate and modulation change indicated in the SIGNAL field shall be initiated with the first symbol of the PSDU, as described in 16.2.5 (Transmit PHY). The PHY proceeds with PSDU reception. After reception of the final bit of the last PSDU octet, as indicated by the

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

PHY preamble LENGTH field, the receiver shall be returned to the RX IDLE state shown in Figure 16-9 (PHY receive state machine).

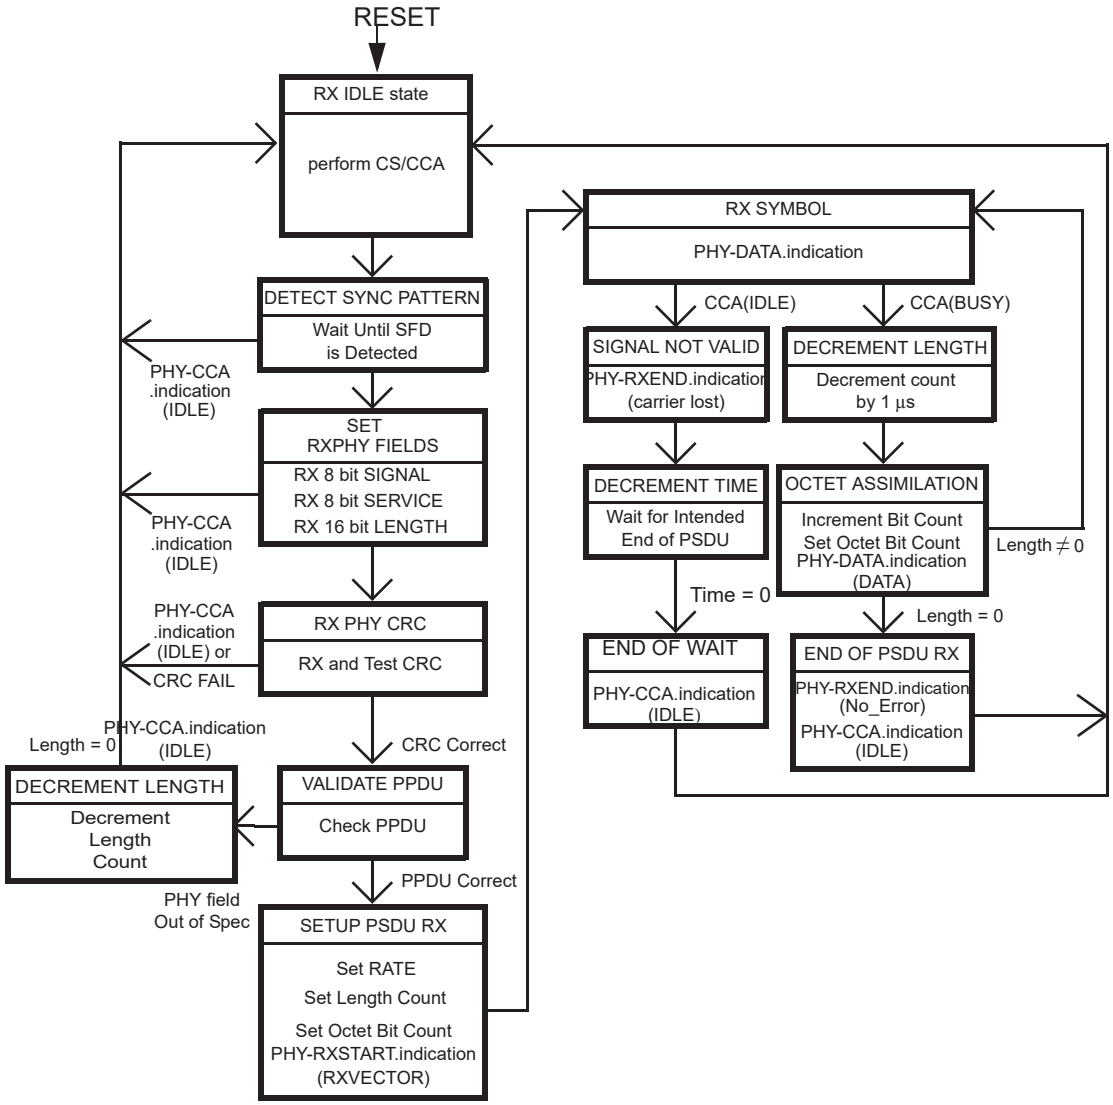

Figure 16-9—PHY receive state machine

A PHY-RXEND.indication(NoError) primitive shall be issued. A PHY-CCA.indication(IDLE) primitive shall be issued following a change in PHYCS and/or PHYED according to the selected CCA method.

In the event that a change in PHYCS or PHYED would cause the status of CCA to return to the IDLE state before the complete reception of the PSDU, as indicated by the PHY LENGTH field, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive. The CCA of the HR/DSSS PHY shall indicate a busy medium for the intended duration of the transmitted PPDU.

If the PHY header is successful, but the indicated rate or modulation in the SIGNAL and SERVICE fields is not within the capabilities of the receiver, a PHY-RXSTART.indication primitive shall not be issued. The PHY shall indicate the error condition by issuing a PHY-RXEND.indication(UnsupportedRate) primitive. If

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the PHY header is invalid, a PHY-RXSTART.indication primitive shall not be issued, and the PHY shall indicate the error condition using a PHY-RXEND.indication(FormatViolation) primitive. Also, in both cases, the CCA of the HR/DSSS PHY shall indicate a busy medium for the intended duration of the transmitted PSDU, as indicated by the LENGTH field. The intended duration is indicated by the LENGTH field (LENGTH × 1 μs).

A typical state machine implementation of the receive PHY is shown in Figure 16-9 (PHY receive state machine).

16.3 HR/DSSS PLME

16.3.1 PLME SAP sublayer management primitives

Table 16-3 (MIB attribute default values/ranges) lists the MIB attributes that may be accessed by the PHY entities and intralayer or higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, and PLME-RESET primitives defined in Clause 6 (Layer management).

16.3.2 HR/DSSS PHY MIB

All HR/DSSS PHY MIB attributes are defined in Annex C, with specific values defined in Table 16-3 (MIB attribute default values/ranges).

Table 16-3—MIB attribute default values/ranges

NOTE—The column titled "Operational semantics" contains two types: static and dynamic. Static MIB attributes are fixed and cannot be modified for a given PHY implementation. Dynamic MIB attributes can be modified by some management entities.

16.3.3 HR/DSSS PHY

The static HR/DSSS PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 16-4 (HR/DSSS PHY characteristics). The definitions of these characteristics are in 6.5.4 (PLME-CHARACTERISTICS.confirm).

Table 16-4—HR/DSSS PHY characteristics

Characteristic	Value
aSlotTime	If dot11OperatingClassesRequired is false, 20 μs If dot11OperatingClassesRequired is true, 20 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-79 (Coverage Class field parameters))
aSIFSTime	10 μs
aCCATime	Implementation dependent, see 10.3.7 (DCF timing relations).
aRxPHYStartDelay	192 μs for long preamble and 96 μs for short preamble
aRxTxTurnaroundTime	Implementation dependent, see 10.3.7 (DCF timing relations).
aTxPHYDelay	Implementation dependent, see 10.3.7 (DCF timing relations).
aRxPHYDelay	Implementation dependent, see 10.3.7 (DCF timing relations).
aRxTxSwitchTime	Implementation dependent, see 10.3.7 (DCF timing relations).
aTxRampOnTime	Implementation dependent, see 10.3.7 (DCF timing relations).
aAirPropagationTime	As indicated by the coverage class (see 10.21.5 (Operation with coverage classes)).
aMACProcessingDelay	Implementation dependent, see 10.3.7 (DCF timing relations).
aPreambleLength	72 μs

This is an unapproved IEEE Standards Draft, subject to change.

Table 16-4—HR/DSSS PHY characteristics *(continued)*

Characteristic	Value
aPHYHeaderLength	24 μs
aPSDUMaxLength	$2^{12} - 1$ octets
aCWmin	31
aCWmax	1023

16.3.4 HR/DSSS TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated according to the following equation:

$$\text{TXTIME} = \text{PreambleLength} + \text{PHYHeaderTime} + \left\lceil \frac{\text{LENGTH} \times 8}{\text{DATARATE}} \right\rceil$$

where

LENGTH and DATARATE are values from the TXVECTOR parameter of the corresponding PLME-TXTIME.request primitive

LENGTH is in units of octets

DATARATE is in units of Mb/s

The value of PreambleLength is 144 μs if the TXPREAMBLE_TYPE value from the TXVECTOR parameter indicates "LONGPREAMBLE," or 72 μs if the TXPREAMBLE_TYPE value from the TXVECTOR parameter indicates "SHORTPREAMBLE"

The value of PHYHeaderTime is 48 μs if the TXPREAMBLE_TYPE value from the TXVECTOR parameter indicates "LONGPREAMBLE," or 24 μs if the TXPREAMBLE_TYPE value from the TXVECTOR parameter indicates "SHORTPREAMBLE"

16.3.5 Vector descriptions

Several service primitives include a parameter vector. These vectors are a list of parameters as described in Table 16-5 (Parameter vectors). DATARATE and LENGTH are described in 8.3.4.4 (Vector descriptions). The remaining parameters are considered to be management parameters and are specific to this PHY.

Table 16-5—Parameter vectors

Parameter	Associated vector	Value
DATARATE	RXVECTOR, TXVECTOR	The rate used to transmit the PSDU in Mb/s.
LENGTH	RXVECTOR, TXVECTOR	The length of the PSDU in octets.
PREAMBLE_TYPE	RXVECTOR, TXVECTOR	The preamble used for the transmission of this PPDU. This is an enumerated type that takes the value SHORTPREAMBLE or LONGPREAMBLE.
ANT_STATE	RXVECTOR	1–256
TX_ANTENNA	TXVECTOR	Selects which of the available antennas should be used for transmit, in the range 1 to 256.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 16-5—Parameter vectors *(continued)*

Parameter	Associated vector	Value
RSSI	RXVECTOR	0–8 bits of RSSI
RCPI (see NOTE)	RXVECTOR	0–255
SQ	RXVECTOR	0–8 bits of SQ
TIME_OF_DEPARTURE_REQUESTED	TXVECTOR	false, true. When true, the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port; when false, the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.
TIME_OF_DEPARTURE	TXSTATUS	0 to 2^{32}– 1. The time when the first frame energy is sent by the transmitting port, measured by the local PHY entity, in units equal to 1/TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TIME_OF_DEPARTURE_ClockRate	TXSTATUS	0 to 2^{16}– 1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TX_START_OF_FRAME_OFFSET	TXSTATUS	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the frame was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC.
RX_START_OF_FRAME_OFFSET	RXVECTOR	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.
NOTE—RCPI is present only when dot11RadioMeasurementActivated is true.		

16.3.6 PHY operating specifications, general

16.3.6.1 General

General specifications for the HR/DSSS PHY sublayer are provided in 16.3.6.2 (Operating frequency range) to 16.3.6.11 (Transmit and receive impedance at the antenna connector). These specifications apply to both the receive and transmit functions and general operation of a HR/DSSS PHY.

WLANs implemented in accordance with this standard are subject to equipment certification and operation requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision, or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the following regulatory sources for further information. Operation in countries within defined regulatory domains may be subject to additional regulations.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

16.3.6.2 Operating frequency range

The HR/DSSS PHY shall operate in the 2.4–2.4835 GHz frequency range, as allocated by regulatory bodies in the China, United States, Europe, and Japan, or in the 2.471–2.497 GHz frequency range, as allocated by regulatory authority in Japan.

16.3.6.3 Channel Numbering of operating channels

When dot11OperatingClassesRequired is true, channel numbering shall be as specified in 17.3.8.4.2 (Channel numbering) and channelization shall be as specified in 17.3.8.4.3 (Channelization). When dot11OperatingClassesDefined is false or not defined, the channel center frequencies and CHNL_ID numbers shall be as shown in Table 16-6 (HR/DSSS PHY frequency channel plan).

Table 16-6—HR/DSSS PHY frequency channel plan

CHNL_ID	Frequency (MHz)
1	2412
2	2417
3	2422
4	2427
5	2432
6	2437
7	2442
8	2447
9	2452
10	2457
11	2462
12	2467
13	2472
14	2484

In a multiple cell network topology, overlapping and/or adjacent cells using different channels can operate simultaneously without interference if the distance between the center frequencies is at least 25 MHz. Channel 14 shall be designated specifically for operation in Japan.

16.3.6.4 Modulation and channel data rates

Four modulation formats and data rates are specified for the HR/DSSS PHY. The basic access rate shall be based on 1 Mb/s DBPSK modulation. The enhanced access rate shall be based on 2 Mb/s DQPSK. The extended direct sequence specification defines two additional data rates. The HR/DSSS access rates shall be based on the CCK modulation scheme for 5.5 Mb/s and 11 Mb/s.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

16.3.6.5 Spreading sequence and modulation for 1 Mb/s and 2 Mb/s

The following 11-chip Barker sequence shall be used as the PN code sequence for the 1 Mb/s and 2 Mb/s modulation:

+1, –1, +1, +1, –1, +1, +1, +1, –1, –1, –1

The leftmost chip shall be output first in time. The first chip shall be aligned at the start of a transmitted symbol. The symbol duration shall be exactly 11 chips long.

The DBPSK encoder for the basic access rate is specified in Table 16-7 (1 Mb/s DBPSK encoding table). The DQPSK encoder is specified in Table 16-8 (2 Mb/s DQPSK encoding table). (In these tables, +jω shall be defined as counterclockwise rotation.)

Table 16-7—1 Mb/s DBPSK encoding table

Bit input	Phase change (+jω)
0	0
1	π

Table 16-8—2 Mb/s DQPSK encoding table

Dibit pattern (d0,d1) (d0 is first in time)	Phase change (+jω)
00	0
01	π/2
11	π
10	3π/2 (–π/2)

16.3.6.6 Spreading sequences and modulation for CCK modulation at 5.5 Mb/s and 11 Mb/s

16.3.6.6.1 General

For the CCK modulation modes, the spreading code length is 8 and is based on complementary codes. The chipping rate is 11 Mchip/s. The symbol duration shall be exactly 8 complex chips long.

The following formula shall be used to derive the CCK codewords that shall be used for spreading both 5.5 Mb/s and 11 Mb/s

$$c = \{e^{j(\varphi_1+\varphi_2+\varphi_3+\varphi_4)}, e^{j(\varphi_1+\varphi_3+\varphi_4)}, e^{j(\varphi_1+\varphi_2+\varphi_4)}, -e^{j(\varphi_1+\varphi_4)}, e^{j(\varphi_1+\varphi_2+\varphi_3)}, e^{j(\varphi_1+\varphi_3)}, -e^{j(\varphi_1+\varphi_2)}, e^{j\varphi_1}\} \quad (16\text{-}1)$$

where C is the codeword

C = {c0 to c7}

The terms φ1, φ2, φ3, and φ4 are defined in 16.3.6.6.3 (CCK 5.5 Mb/s modulation) for 5.5 Mb/s and 16.3.6.6.4 (CCK 11 Mb/s modulation) for 11 Mb/s.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

This formula creates 8 complex chips (c0 to c7), where c0 is transmitted first in time.

This is a form of the generalized Hadamard transform encoding, where φ1 is added to all code chips, φ2 is added to all odd code chips, φ3 is added to all odd pairs of code chips, and φ4 is added to all odd groups of four code chips.

The term φ1 modifies the phase of all code chips of the sequence and shall be DQPSK encoded for 5.5 Mb/s and 11 Mb/s. This shall take the form of rotating the whole symbol by the appropriate amount relative to the phase of the preceding symbol. Note that the chip c7 of the symbol defined above is the chip that indicates the symbol's phase and is transmitted last.

16.3.6.6.2 Cover code for CCK

The fourth and seventh chips are rotated 180° by a cover sequence to optimize the sequence correlation properties and minimize dc offsets in the codes. This explains the minus sign on the fourth and seventh terms in Equation (16-1).

16.3.6.6.3 CCK 5.5 Mb/s modulation

At 5.5 Mb/s, 4 bits (d0 to d3; d0 first in time) are transmitted per symbol.

The data bits d0 and d1 encode φ1 based on DQPSK. The DQPSK encoder is specified in Table 16-8 (2 Mb/s DQPSK encoding table). (In the table, +jω shall be defined as counterclockwise rotation.) The phase change for φ1 is relative to the phase φ1 of the preceding symbol. For the header to PSDU transition, the phase change for φ1 is relative to the phase of the preceding DQPSK (2 Mb/s) symbol. That is, the phase of the last symbol of the CRC-16 is the reference phase for the first symbol generated from the PSDU octets. (See the definition in 16.3.6.5 (Spreading sequence and modulation for 1 Mb/s and 2 Mb/s) for the reference phase of this Barker coded symbol.) A "+1" chip in the Barker code shall represent the same carrier phase as a "+1" chip in the CCK code.

All odd-numbered symbols generated from the PSDU octets shall be given an extra 180° (π) rotation, in addition to the standard DQPSK modulation as shown in Table 16-9 (DQPSK encoding table). The symbols of the PSDU shall be numbered starting with 0 for the first symbol, for the purposes of determining odd and even symbols. That is, the PSDU transmission starts on an even-numbered symbol.

Table 16-9—DQPSK encoding table

Dibit pattern (d0, d1) (d0 is first in time)	Even symbols phase change (+jω)	Odd symbols phase change (+jω)
00	0	π
01	π/2	3π/2 (–π/2)
11	π	0
10	3π/2 (–π/2)	π/2

The data dibits d2 and d3 CCK encode the basic symbol, as specified in Table 16-10 (5.5 Mb/s CCK encoding table). This table is derived from the formula above by setting $\varphi 2 = (d2 \times \pi) + \pi/2$, $\varphi 3 = 0$, and $\varphi 4 = d3 \times \pi$. In this table, d2 and d3 are in the order shown, and the complex chips are shown c0 to c7 (left to right), with c0 transmitted first in time.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 16-10—5.5 Mb/s CCK encoding table

d2, d3	c1	c2	c3	c4	c5	c6	c7	c8
00	1j	1	1j	–1	1j	1	–1j	1
01	–1j	–1	–1j	1	1j	1	–1j	1
10	–1j	1	–1j	–1	–1j	1	1j	1
11	1j	–1	1j	1	–1j	1	1j	1

16.3.6.6.4 CCK 11 Mb/s modulation

At 11 Mb/s, 8 bits (d0 to d7; d0 first in time) are transmitted per symbol.

The first dibit (d0, d1) encodes φ1 based on DQPSK. The DQPSK encoder is specified in Table 16-8 (2 Mb/s DQPSK encoding table). The phase change for φ1 is relative to the phase φ1 of the preceding symbol. In the case of header to PSDU transition, the phase change for φ1 is relative to the phase of the preceding DQPSK symbol. All odd-numbered symbols of the PSDU are given an extra 180° (π) rotation, in accordance with the DQPSK modulation shown in Table 16-8 (2 Mb/s DQPSK encoding table). Symbol numbering starts with 0 for the first symbol of the PSDU.

The data dibits (d2, d3), (d4, d5), and (d6, d7) encode φ2, φ3, and φ4, respectively, based on QPSK as specified in Table 16-11 (QPSK encoding table). Note that this table is binary (not Gray) coded.

Table 16-11—QPSK encoding table

Dibit pattern [di, d(i+1)] (di is first in time)	Phase
00	0
01	π/2
10	π
11	3π/2 (–π/2)

16.3.6.7 Transmit and receive in-band and out-of-band spurious emissions

The HR/DSSS PHY shall comply with in-band and out-of-band spurious emissions as set by the appropriate regulatory bodies.

16.3.6.8 TX-to-RX turnaround time

The TX-to-RX turnaround time shall be less than 10 μs, including the power-down ramp specified in 16.3.7.7 (Transmit power-on and power-down ramp).

The TX-to-RX turnaround time shall be measured on the WM from the trailing edge of the last transmitted symbol to the valid CCA detection of the incoming signal. The CCA should occur within 25 μs (10 μs for turnaround time, plus 15 μs for energy detect), or by the next slot boundary occurring after the 25 μs has elapsed (see 16.3.8.5 (CCA)). A receiver input signal 3 dB above the ED threshold described in 16.3.8.5 (CCA) shall be present at the receiver.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

16.3.6.9 RX-to-TX turnaround time

The RX-to-TX turnaround time shall be measured at the MAC/PHY interface using the PHY-TXSTART.request primitive, and shall be 5 μs. This includes the transmit power-on ramp described in 16.3.7.7 (Transmit power-on and power-down ramp).

16.3.6.10 Slot time

The value of the slot time is found in Table 16-4 (HR/DSSS PHY characteristics).

16.3.6.11 Transmit and receive impedance at the antenna connector

The impedance at the transmit and receive antenna connector(s) shall be 50 Ω if the connector is exposed.

16.3.7 PHY transmit specifications

16.3.7.1 Introduction

The transmit functions and parameters associated with the PHY sublayer are described in 16.3.7.2 (Transmit power levels) to 16.3.7.9 (Transmit modulation accuracy).

16.3.7.2 Transmit power levels

The maximum allowable output power is measured in accordance with practices specified by the appropriate regulatory bodies.

16.3.7.3 Transmit power level control

Power control shall be provided for transmitted power greater than 100 mW. A maximum of four power levels may be provided. As a minimum, a radio capable of transmission greater than 100 mW shall be capable of switching power back to 100 mW or less.

16.3.7.4 Transmit spectrum mask

The transmitted spectral products shall be less than –30 dBr (decibel relative to the SINx/x peak) for

$f_c - 22\ \text{MHz} < f < f_c - 11\ \text{MHz}$; and

$f_c + 11\ \text{MHz} < f < f_c + 22\ \text{MHz}$;

and shall be less than –50 dBr for

$f < f_c - 22\ \text{MHz}$; and

$f > f_c + 22\ \text{MHz}$.

where

f_c is the channel center frequency

The transmit spectral mask is shown in Figure 16-10 (Transmit spectrum mask). The measurements shall be made using a 100 kHz resolution bandwidth and a 100 kHz video bandwidth.

16.3.7.5 Transmit center frequency tolerance

The transmitted center frequency tolerance shall be ±25 ppm maximum.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

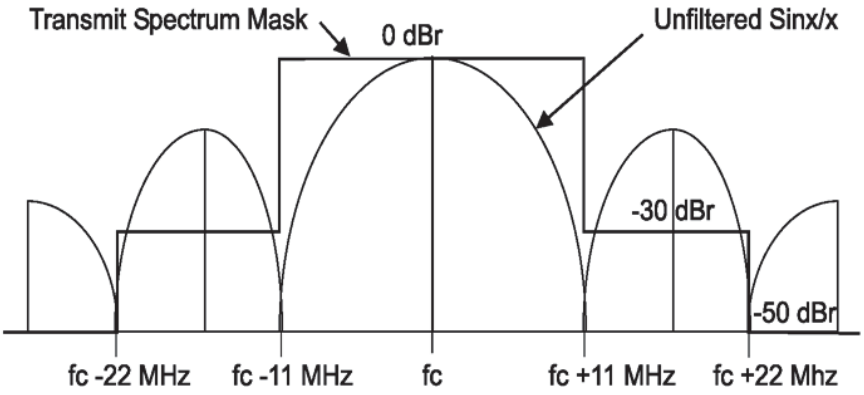

Figure 16-10—Transmit spectrum mask

16.3.7.6 Chip clock frequency tolerance

The PN code chip clock frequency tolerance shall be ±25 ppm maximum. It is highly recommended that the chip clock and the transmit frequency be locked (coupled) for optimum demodulation performance. If these clocks are locked, it is recommended that bit 2 of the SERVICE field be set to 1, as indicated in 16.2.3.5 (Long PHY SERVICE field).

16.3.7.7 Transmit power-on and power-down ramp

The transmit power-on ramp for 10% to 90% of maximum power shall be no greater than 2 μs. The transmit power-on ramp is shown in Figure 16-11 (Transmit power-on ramp).

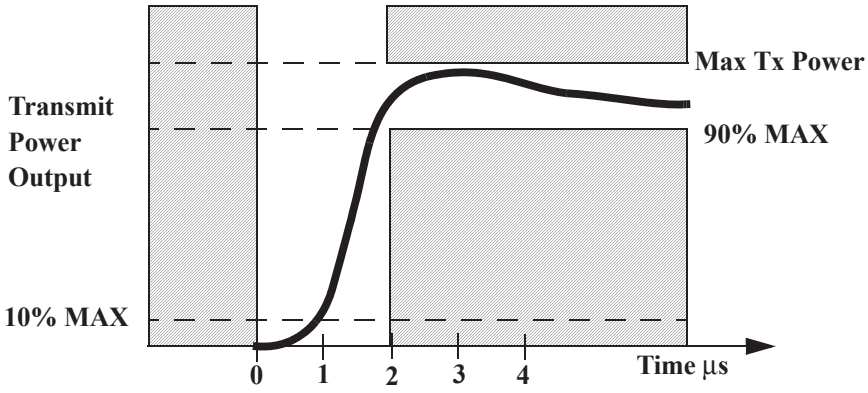

Figure 16-11—Transmit power-on ramp

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The transmit power-down ramp for 90% to 10% maximum power shall be no greater than 2 μs. The transmit power-down ramp is shown in Figure 16-12 (Transmit power-down ramp).

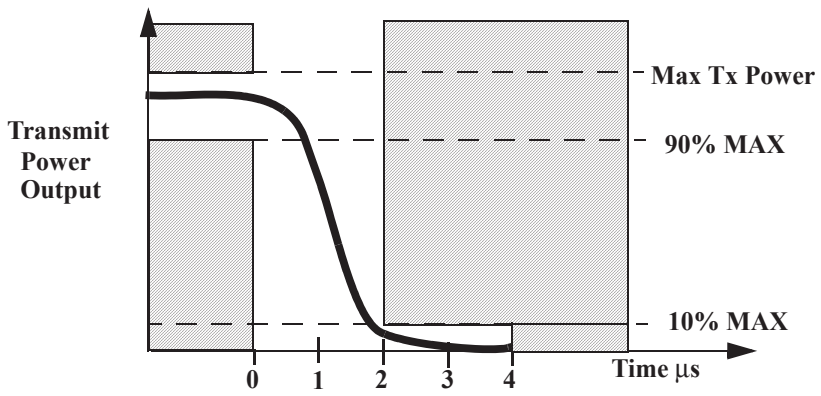

Figure 16-12—Transmit power-down ramp

The transmit power ramps shall be constructed such that the HR/DSSS PHY emissions comply with spurious frequency product specification defined in 16.3.6.7 (Transmit and receive in-band and out-of-band spurious emissions).

16.3.7.8 RF carrier suppression

The RF carrier suppression, measured at the channel center frequency, shall be at least 15 dB below the peak sin(x)/x power spectrum. The RF carrier suppression shall be measured while transmitting a repetitive 01 data sequence with the scrambler disabled using DQPSK modulation. A 100 kHz resolution bandwidth shall be used to perform this measurement.

16.3.7.9 Transmit modulation accuracy

The transmit modulation accuracy requirement for the HR/DSSS PHY shall be based on the difference between the actual transmitted waveform and the ideal signal waveform. Modulation accuracy shall be determined by measuring the peak vector error magnitude during each chip period. Worst-case vector error magnitude shall not exceeded 0.35 for the normalized sampled chip data. The ideal complex I and Q constellation points associated with DQPSK modulation, (0.707, 0.707), (0.707, –0.707), (–0.707, 0.707), (–0.707, –0.707), shall be used as the reference. These measurements shall be from baseband I and Q sampled data after recovery through a reference receiver system.

Figure 16-13 (Modulation accuracy measurement example) illustrates the ideal DQPSK constellation points and range of worst-case error specified for modulation accuracy.

Error vector measurement requires a reference receiver capable of carrier lock. All measurements shall be made under carrier lock conditions. The distortion induced in the constellation by the reference receiver shall be calibrated and measured. The test data error vectors described below shall be corrected to compensate for the reference receiver distortion.

The IEEE Std 802.11-compatible radio shall provide an exposed TX chip clock, which shall be used to sample the I and Q outputs of the reference receiver.

The measurement shall be made under the conditions of continuous DQPSK transmission using scrambled all 1s.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

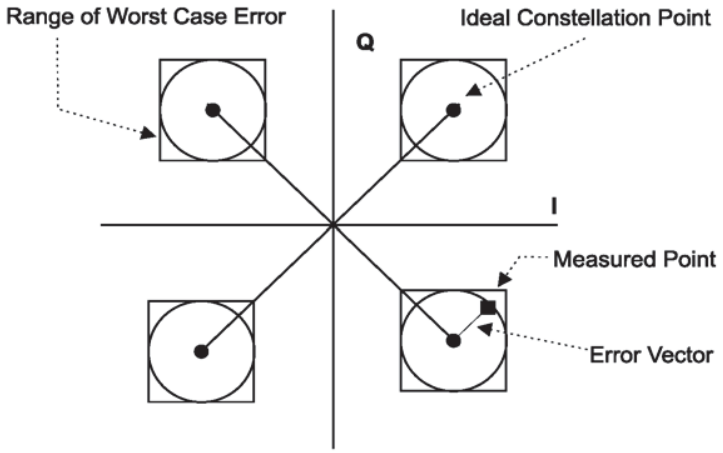

Figure 16-13—Modulation accuracy measurement example

The eye pattern of the I channel shall be used to determine the I and Q sampling point. The chip clock provided by the vendor radio shall be time delayed, such that the samples fall at a 1/2 chip period offset from the mean of the zero crossing positions of the eye (see Figure 16-14 (Chip clock alignment with baseband eye pattern)). This is the ideal center of the eye and might not be the point of maximum eye opening.

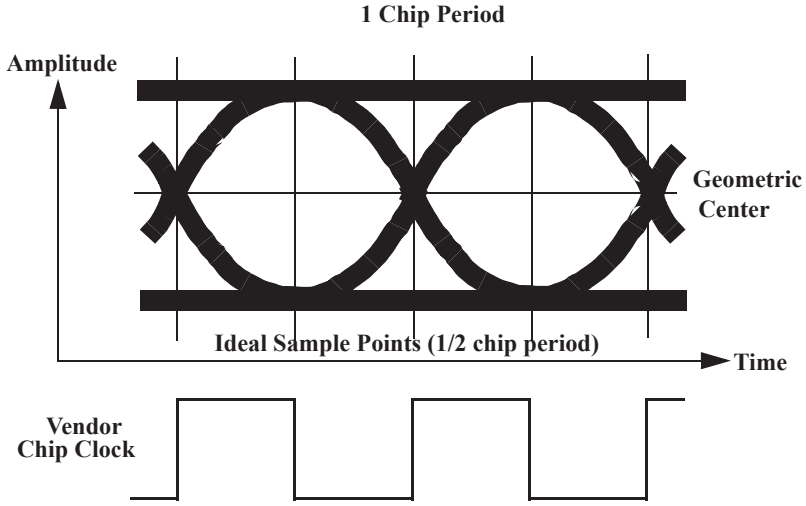

Figure 16-14—Chip clock alignment with baseband eye pattern

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Using the aligned chip clock, 1000 samples of the I and Q baseband outputs from the reference receiver are captured. The vector error magnitudes shall be calculated as follows:

Calculate the dc offsets for I and Q samples

$$I_{mean} = \sum_{n=0}^{999} I(n) / 1000$$

$$Q_{mean} = \sum_{n=0}^{999} Q(n) / 1000$$

Calculate the dc corrected *I* and *Q* samples for all $n = 1000$ sample pairs

$$I_{dc}(n) = I(n) - I_{mean}$$

$$Q_{dc}(n) = Q(n) - Q_{mean}$$

Calculate the average magnitude of *I* and *Q* samples

$$I_{mag} = \sum_{n=0}^{999} \left| I_{dc}(n) \right| / 1000$$

$$Q_{mag} = \sum_{n=0}^{999} \left| Q_{dc}(n) \right| / 1000$$

Calculate the normalized error vector magnitude for the $I_{dc}(n)/Q_{dc}(n)$ pairs

$$V_{err}(n) = [\{\left| I_{dc}(n) \right| - I_{mag}\}^2 + \{\left| Q_{dc}(n) \right| - Q_{mag}\}^2]^{\frac{1}{2}} - V_{correction}$$

where
the average power of the constellation is 1
$V_{correction}$ is the error induced by the reference receiver system

For all $n = 1000$ samples, the following condition shall be met:

$V_{err}(n) < 0.35$

16.3.7.10 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is $22 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{22\ \text{MHz}} \right\rceil\right)$ sample/s
where
f_H is the nominal center frequency in Hz of the highest channel in the channel set

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

f_L is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which frames providing measurements are transmitted, the channel set comprises channels uniformly spaced across $f_H - f_L \geq 50$ MHz

— FIRST_TRANSITION_FIELD is the SYNC field.

— SECOND_TRANSITION_FIELD is the SFD field.

— TRAINING_FIELD is the concatenation of the appropriate short or long SYNC and SFD fields, using a chip pulse which should approximate a rectangular pulse of duration 1/ 11 MHz convolved with a brick-wall low pass filter of bandwidth 11 MHz.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated chip pulse applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

16.3.8 PHY receiver specifications

16.3.8.1 Introduction

The receive functions and parameters associated with the PHY sublayer are described in 16.3.8.2 (Receiver minimum input level sensitivity) to 16.3.8.5 (CCA).

16.3.8.2 Receiver minimum input level sensitivity

The FER shall be less than 8×10^{-2} at a PSDU length of 1024 octets for an input level of –76 dBm measured at the antenna connector. This FER shall be specified for 11 Mb/s CCK modulation. The test for the minimum input level sensitivity shall be conducted with the ED threshold set less than or equal to –76 dBm.

16.3.8.3 Receiver maximum input level

The receiver shall provide a maximum FER of 8×10^{-2} at a PSDU length of 1024 octets for a maximum input level of –10 dBm measured at the antenna. This FER shall be specified for 11 Mb/s CCK modulation.

16.3.8.4 Receiver adjacent channel rejection

Adjacent channel rejection is defined between any two channels with ≥ 25 MHz separation in each channel group, as defined in 16.3.6.3 (Channel Numbering of operating channels).

The adjacent channel rejection shall be greater than or equal to than 35 dB, with an FER of 8×10^{-2} using 11 Mb/s CCK modulation described in 16.3.6.4 (Modulation and channel data rates) and a PSDU length of 1024 octets.

The adjacent channel rejection shall be measured using the following method.

Input an 11 Mb/s CCK modulated signal at a level 6 dB greater than specified in 16.3.8.2 (Receiver minimum input level sensitivity). In an adjacent channel (≥ 25 MHz separation as defined by the channel numbering), input a signal modulated in a similar fashion, which adheres to the transmit mask specified in 16.3.7.4 (Transmit spectrum mask), to a level 41 dB above the level specified in 16.3.8.2 (Receiver minimum input level sensitivity). The adjacent channel signal shall be derived from a separate signal source. It shall not be a frequency shifted version of the reference channel. Under these conditions, the FER shall be less than or equal to 8×10^{-2}.

16.3.8.5 CCA

The HR/DSSS PHY shall provide the capability to perform CCA according to both:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A — At least one of the following options:

- *CCA Mode 1*: Energy above threshold. CCA shall report a busy medium upon detecting any energy above the ED threshold.
- *CCA Mode 4*: CS with timer. CCA shall start a timer whose duration is 3.65 ms and report a busy medium only upon the detection of a HR/DSSS PHY signal. CCA shall report an IDLE medium after the timer expires and no HR/DSSS PHY signal is detected. The 3.65 ms timeout is the duration of the longest possible 5.5 Mb/s PSDU.
- *CCA Mode 5*: A combination of CS and energy above threshold. CCA shall report busy at least while a HR/DSSS PPDU is being received with energy above the ED threshold at the antenna.

and

B — *CCA Mode 6*: CCA shall report a busy medium upon detection of any energy above –62 dBm.

A busy channel shall be indicated by issuing a PHY-CCA.indication(BUSY) primitive. A clear channel shall be indicated by issuing a PHY-CCA.indication(IDLE) primitive.

dot11HRCCAModeSupported shall indicate the appropriate operation modes. The PHY shall be configured through dot11CurrentCCAMode.

The CCA shall indicate a clear channel if there is no energy detect or CS. The CCA parameters are subject to the following criteria:

a) If a valid HR/DSSS signal is detected during its preamble within the CCA window, the ED threshold shall be less than or equal to –76 dBm for TX power > 100 mW; –73 dBm for 50 mW < TX power ≤ 100 mW; and –70 dBm for TX power ≤ 50 mW.

b) With a valid signal (according to the CCA mode of operation) present at the receiver antenna within 5 μs of the start of a MAC slot boundary, the PHY-CCA.indication(BUSY) primitive shall be generated before the end of the slot time. Refer to Figure 10-19 (DCF timing relationships) (in 10.3.7 (DCF timing relations)) and Figure 10-26 (EDCA mechanism timing relationships) for a definition of slot boundary.

c) In the event that a correct PHY header is received, the HR/DSSS PHY shall not generate a PHY-CCA.indication (IDLE) primitive until the end of the PPDU as determined by TXTIME in 16.3.4 (HR/DSSS TXTIME calculation). Upon reception of a correct PHY header, the timer of CCA Mode 4 shall be overridden by this requirement.

Compliance to the HR/DSSS PHY CCA shall be demonstrated by applying an equivalent HR/DSSS signal above the appropriate ED threshold (item a) so that all conditions described in item b and item c are demonstrated.

16.3.8.6 Received Channel Power Indicator Measurement

The RCPI indicator is a measure of the received RF power in the selected channel for a received frame. This parameter shall be a measure by the PHY of the received RF power in the channel measured over the entire received frame or by other equivalent means that meet the specified accuracy.

The RCPI encoding is defined in 9.4.2.38 (RCPI element).

RCPI shall equal the received RF power within an accuracy of ±5 dB (95% confidence interval) within the specified dynamic range of the receiver. The received RF power shall be determined assuming a receiver noise equivalent bandwidth equal to the channel bandwidth multiplied by 1.1.

17. Orthogonal frequency division multiplexing (OFDM) PHY specification

17.1 Introduction

17.1.1 General

This clause specifies the PHY entity for an orthogonal frequency division multiplexing (OFDM) system. The OFDM system provides a WLAN with data payload communication capabilities of 6, 9, 12, 18, 24, 36, 48, and 54 Mb/s. The support of transmitting and receiving at data rates of 6, 12, and 24 Mb/s is mandatory. The system uses 52 subcarriers that are modulated using binary or quadrature phase shift keying (BPSK or QPSK) or using 16- or 64-quadrature amplitude modulation (16-QAM or 64-QAM). Forward error correction coding (convolutional coding) is used with a coding rate of 1/2, 2/3, or 3/4.

The OFDM system also provides a "half-clocked" operation using 10 MHz channel spacings with data communications capabilities of 3, 4.5, 6, 9, 12, 18, 24, and 27 Mb/s. The support of transmitting and receiving at data rates of 3, 6, and 12 Mb/s is mandatory when using 10 MHz channel spacing. The half-clocked operation doubles symbol times and clear channel assessment (CCA) times when using 10 MHz channel spacing. The regulatory requirements and information regarding use of this OFDM PHY are in Annex D and Annex E.

The OFDM system also provides a "quarter-clocked" operation using 5 MHz channel spacing with data communication capabilities of 1.5, 2.25, 3, 4.5, 6, 9, 12, and 13.5 Mb/s. The support of transmitting and receiving at data rates of 1.5, 3, and 6 Mb/s is mandatory when using 5 MHz channel spacing. The quarter-clocked operation quadruples symbol times and CCA times when using 5 MHz channel spacing. The regulatory requirements and information regarding use of this OFDM PHY are in Annex D and Annex E.

17.1.2 Scope

Subclause 17.1 (Introduction) describes the PHY services provided to the IEEE Std 802.11 WLAN MAC by the OFDM PHY. The OFDM PHY consists of the following protocol functions:

a) A function that defines a method of mapping the IEEE Std 802.11 PSDUs into a framing format suitable for sending and receiving user data and management information between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a WM between two or more STAs, each using the OFDM system.

17.1.3 OFDM PHY functions

17.1.3.1 General

The OFDM PHY architecture is depicted in the reference model shown in Figure 4-19 (Portion of the ISO/IEC basic reference model covered in this standard) (in 4.9 (Reference model)). The OFDM PHY contains two functional entities: the PHY function and the layer management function. Each of these functions is described in detail in 17.3 (OFDM PHY) and 17.4 (OFDM PLME).

The OFDM PHY service is provided to the MAC through the PHY service primitives described in Clause 8 (PHY service specification).

17.1.3.2 PLME

The PLME performs management of the local PHY functions in conjunction with the MLME.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

17.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation.

The service of a layer or sublayer is the set of capabilities that it offers to a user in the next higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

17.2 OFDM PHY specific service parameter list

17.2.1 Introduction

The architecture of the IEEE Std 802.11 MAC is intended to be PHY independent. Some PHY implementations require medium management state machines running in the MAC sublayer in order to meet certain PHY requirements. These PHY-dependent MAC state machines reside in a sublayer defined as the MLME. In certain PHY implementations, the MLME may need to interact with the PLME as part of the normal PHY SAP primitives. These interactions are defined by the PLME parameter list currently defined in the PHY service primitives as TXVECTOR and RXVECTOR. The list of these parameters, and the values they may represent, are defined in the specific PHY specifications for each PHY. Subclause 17.2 (OFDM PHY specific service parameter list) addresses the TXVECTOR and RXVECTOR for the OFDM PHY.

17.2.2 TXVECTOR parameters

17.2.2.1 General

The parameters in Table 17-1 (TXVECTOR parameters) are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive.

Table 17-1—TXVECTOR parameters

Parameter	Associated primitive	Value
LENGTH	PHY-TXSTART.request (TXVECTOR)	1–4095
DATATRATE	PHY-TXSTART.request (TXVECTOR)	6, 9, 12, 18, 24, 36, 48, and 54 Mb/s for 20 MHz channel spacing (Support of 6, 12, and 24 Mb/s data rates is mandatory.) 3, 4.5, 6, 9, 12, 18, 24, and 27 Mb/s for 10 MHz channel spacing (Support of 3, 6, and 12 Mb/s data rates is mandatory.) 1.5, 2.25, 3, 4.5, 6, 9, 12, and 13.5 Mb/s for 5 MHz channel spacing (Support of 1.5, 3, and 6 Mb/s data rates is mandatory.)
SERVICE	PHY-TXSTART.request (TXVECTOR)	Null
TXPWR_LEVEL_INDEX	PHY-TXSTART.request (TXVECTOR)	1–8

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 17-1—TXVECTOR parameters

Parameter	Associated primitive	Value
TIME_OF_ DEPARTURE_ REQUESTED	PHY-TXSTART.request (TXVECTOR)	false, true. When true, the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port; when false, the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.
CH_BANDWIDTH_ IN_NON_HT	PHY-TXSTART.request (TXVECTOR)	If present, CBW20, CBW40, CBW80, CBW160, or CBW80+80
DYN_BANDWIDTH _IN_NON_HT	PHY-TXSTART.request (TXVECTOR)	If present, Static or Dynamic

17.2.2.2 TXVECTOR LENGTH

The allowed values for the LENGTH parameter are in the range 1 to 4095. This parameter is used to indicate the number of octets in the MPDU which the MAC is currently requesting the PHY to transmit. This value is used by the PHY to determine the number of octet transfers that will occur between the MAC and the PHY after receiving a request to start the transmission.

17.2.2.3 TXVECTOR DATARATE

The DATARATE parameter describes the bit rate at which the PHY shall transmit the PSDU. Its value takes any of the rates defined in Table 17-1 (TXVECTOR parameters). Data rates of 6, 12, and 24 Mb/s shall be supported for 20 MHz channel spacing, data rates of 3, 6, and 12 Mb/s shall be supported for 10 MHz channel spacing, and data rates of 1.5, 3, and 6 Mb/s shall be supported for 5 MHz channel spacing; other rates may also be supported.

17.2.2.4 TXVECTOR SERVICE

The SERVICE parameter shall be null.

17.2.2.5 TXVECTOR TXPWR_LEVEL_INDEX

The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to 8. This parameter is used to indicate which of the available TxPowerLevel attributes defined in the MIB shall be used for the current transmission.

17.2.2.6 TXVECTOR TIME_OF_DEPARTURE_REQUESTED

The allowed values are false or true. A parameter value of true indicates that the MAC sublayer is requesting that the PHY entity provides measurement of when the first frame energy is sent by the transmitting port and reporting within the PHY-TXSTART.confirm(TXSTATUS) primitive. A parameter value of false indicates that the MAC sublayer is requesting that the PHY entity not provide time of departure measurement nor reporting in the PHY-TXSTART.confirm(TXSTATUS) primitive.

17.2.2.7 TXVECTOR CH_BANDWIDTH_IN_NON_HT

If present, the allowed values for CH_BANDWIDTH_IN_NON_HT are CBW20, CBW40, CBW80, CBW160, and CBW80+80. If present, this parameter is used to modify the first 7 bits of the scrambling sequence to indicate the bandwidth of the non-HT duplicate PPDU.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—The CH_BANDWIDTH_IN_NON_HT parameter is not present when the frame is transmitted by a non-VHT STA. The CH_BANDWIDTH_IN_NON_HT parameter is not present when the frame is transmitted by a VHT STA to a non-VHT STA. See 10.7.11 (Channel Width in non-HT and non-HT duplicate PPDUs).

17.2.2.8 TXVECTOR DYN_BANDWIDTH_IN_NON_HT

If present, the allowed values for DYN_BANDWIDTH_IN_NON_HT are Static and Dynamic. If present, this parameter is used to modify the first 7 bits of the scrambling sequence to indicate if the transmitter is capable of Static or Dynamic bandwidth operation. If DYN_BANDWIDTH_IN_NON_HT is present, then CH_BANDWIDTH_IN_NON_HT is also present.

NOTE—The DYN_BANDWIDTH_IN_NON_HT parameter is not present when the frame is transmitted by a non-VHT STA. The DYN_BANDWIDTH_IN_NON_HT parameter is not present when the frame is transmitted by a VHT STA to a non-VHT STA. See 10.7.11 (Channel Width in non-HT and non-HT duplicate PPDUs).

17.2.3 RXVECTOR parameters

17.2.3.1 General

The parameters listed in Table 17-2 (RXVECTOR parameters) are defined as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

Table 17-2—RXVECTOR parameters

Parameter	Associated primitive	Value
LENGTH	PHY-RXSTART.indication	1–4095
RSSI	PHY-RXSTART.indication (RXVECTOR)	0–RSSI maximum
DATARATE	PHY-RXSTART.request (RXVECTOR)	6, 9, 12, 18, 24, 36, 48, and 54 Mb/s for 20 MHz channel spacing (Support of 6, 12, and 24 Mb/s data rates is mandatory.) 3, 4.5, 6, 9, 12, 18, 24, and 27 Mb/s for 10 MHz channel spacing (Support of 3, 6, and 12 Mb/s data rates is mandatory.) 1.5, 2.25, 3, 4.5, 6, 9, 12, and 13.5 Mb/s for 5 MHz channel spacing (Support of 1.5, 3, and 6 Mb/s data rates is mandatory.)
SERVICE	PHY-RXSTART.request (RXVECTOR)	Null
RCPI (see NOTE)	PHY-RXSTART.indication (RXVECTOR) PHY-RXEND.indication (RXVECTOR)	0–255
ANT_STATE (see NOTE)	PHY-RXSTART.indication (RXVECTOR) PHY-RXEND.indication (RXVECTOR)	0–255

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 17-2—RXVECTOR parameters *(continued)*

Parameter	Associated primitive	Value
RX_START_OF_FRAME_OFFSET	PHY-RXSTART.indication (RXVECTOR)	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.
CH_BANDWIDTH_IN_NON_HT	PHY-RXSTART.request (RXVECTOR)	If present, CBW20, CBW40, CBW80, CBW160, or CBW80+80
DYN_BANDWIDTH_IN_NON_HT	PHY-RXSTART.request (RXVECTOR)	If present, Static or Dynamic
NOTE—Parameter is present only when dot11RadioMeasurementActivated is true.		

17.2.3.2 RXVECTOR LENGTH

The allowed values for the LENGTH parameter are in the range 1–4095. This parameter is used to indicate the value contained in the LENGTH field which the PHY has received in the PHY header. The MAC and PHY use this value to determine the number of octet transfers that will occur between the two sublayers during the transfer of the received PSDU.

17.2.3.3 RXVECTOR RSSI

The allowed values for the RSSI parameter are in the range 0 to RSSI maximum. This parameter is a measure by the PHY of the energy observed at the antenna used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power.

17.2.3.4 RXVECTOR DATARATE

DATARATE shall represent the data rate at which the current PPDU was received. The allowed values of the DATARATE are 6, 9, 12, 18, 24, 36, 48, or 54 Mb/s for 20 MHz channel spacing; 3, 4.5, 6, 9, 12, 18, 24, or 27 Mb/s for 10 MHz channel spacing; and 1.5, 2.25, 3, 4.5, 6, 9, 12, or 13.5 Mb/s for 5 MHz channel spacing.

17.2.3.5 RXVECTOR SERVICE

The SERVICE parameter shall be null.

17.2.3.6 RXVECTOR RCPI

The allowed values for the RCPI parameter are in the range 0 to 255, as defined in 17.3.10.7 (Received Channel Power Indicator Measurement). This parameter is a measure by the PHY of the received channel power. RCPI indications of 8 bits are supported. RCPI shall be measured over the entire received frame or by other equivalent means that meet the specified accuracy.

17.2.3.7 RXVECTOR CH_BANDWIDTH_IN_NON_HT

If present, the allowed values for CH_BANDWIDTH_IN_NON_HT are CBW20, CBW40, CBW80, CBW160, and CBW80+80. If present and valid, this parameter indicates the bandwidth of the non-HT

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

duplicate PPDU. This parameter is used by the MAC only when valid (see 10.3.2.7 (CTS and DMG CTS procedure) and 10.7.6.6 (Channel Width selection for Control frames)).

NOTE—The CH_BANDWIDTH_IN_NON_HT parameter is not present when the frame is received by a non-VHT STA (see 10.7.11 (Channel Width in non-HT and non-HT duplicate PPDUs)).

17.2.3.8 RXVECTOR DYN_BANDWIDTH_IN_NON_HT

If present, the allowed values for DYN_BANDWIDTH_IN_NON_HT are Static and Dynamic. If present and valid, this parameter indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. This parameter is used by the MAC only when valid (see 10.3.2.7 (CTS and DMG CTS procedure) and 10.7.6.6 (Channel Width selection for Control frames)). If DYN_BANDWIDTH_IN_NON_HT is present, then CH_BANDWIDTH_IN_NON_HT is also present.

NOTE—The DYN_BANDWIDTH_IN_NON_HT parameter is not present when the frame is received by a non-VHT STA (see 10.7.11 (Channel Width in non-HT and non-HT duplicate PPDUs)).

17.2.4 TXSTATUS parameters

17.2.4.1 General

The parameters listed in Table 17-3 (TXSTATUS parameters) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm primitive.

Table 17-3—TXSTATUS parameters

Parameter	Associated primitive	Value
TIME_OF_DEPARTURE	PHY-TXSTART.confirm (TXSTATUS)	0 to 2^{32}– 1. The locally measured time when the first frame energy is sent by the transmitting port, in units equal to 1/ TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TIME_OF_DEPARTURE_ClockRate	PHY-TXSTART.confirm (TXSTATUS)	0 to 2^{16}– 1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TX_START_OF_FRAME_OFFSET	PHY-TXSTART.confirm (TXSTATUS)	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the frame was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC.

17.2.4.2 TXSTATUS TIME_OF_DEPARTURE

The allowed values for the TIME_OF_DEPARTURE parameter are integers in the range 0 to 2^{32}– 1. This parameter is used to indicate when the first frame energy is sent by the transmitting port in units equal to 1/ TIME_OF_DEPARTURE_ClockRate. TIME_OF_DEPARTURE may be included in the transmitted frame in order for recipients on multiple channels to determine the time differences of air propagation times between transmitter and recipients and hence to compute the location of the transmitter.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

17.2.4.3 TXSTATUS TIME_OF_DEPARTURE_ClockRate

TIME_OF_DEPARTURE_ClockRate indicates the clock rate used for TIME_OF_DEPARTURE.

17.3 OFDM PHY

17.3.1 Introduction

Subclause 17.3 (OFDM PHY) provides a convergence procedure in which PSDUs are converted to and from PPDUs. During transmission, the PSDU shall be provided with a PHY preamble and header to create the PPDU. At the receiver, the PHY preamble and header are processed to aid in demodulation and delivery of the PSDU.

17.3.2 PPDU format

17.3.2.1 General

Figure 17-1 (PPDU format) shows the format for the PPDU including the OFDM PHY preamble, OFDM PHY header, PSDU, tail bits, and pad bits. The PHY header contains the following fields: LENGTH, RATE, a reserved bit, an even parity bit, and the SERVICE field. In terms of modulation, the LENGTH, RATE, reserved bit, and parity bit (with 6 zero tail bits appended) constitute a separate single OFDM symbol, denoted SIGNAL, which is transmitted with the most robust combination of BPSK modulation and a coding rate of R = 1/2. The SERVICE field of the PHY header and the PSDU (with 6 zero tail bits and pad bits appended), denoted as DATA, are transmitted at the data rate described in the RATE field and may constitute multiple OFDM symbols. The tail bits in the SIGNAL symbol enable decoding of the RATE and LENGTH fields immediately after the reception of the tail bits. The RATE and LENGTH fields are required for decoding the DATA part of the packet. In addition, the CCA mechanism is augmented by predicting the duration of the packet from the contents of the RATE and LENGTH fields, even if the data rate is not supported by the STA. Each of these fields is described in detail in 17.3.3 (PHY preamble (SYNC)), 17.3.4 (SIGNAL field), and 17.3.5 (DATA field).

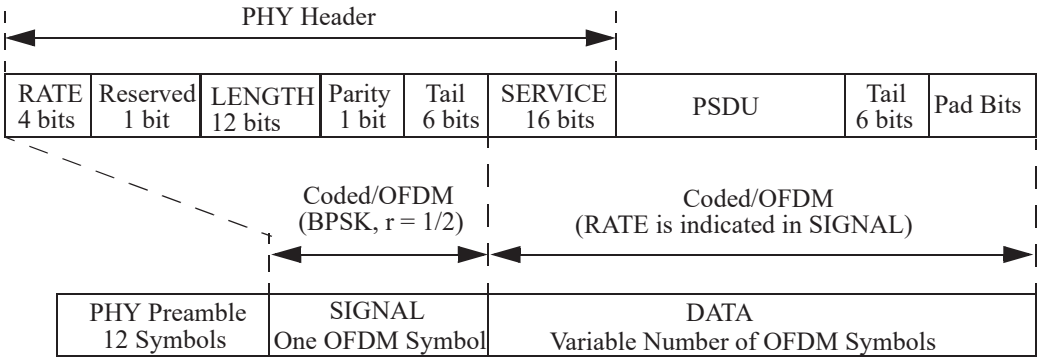

Figure 17-1—PPDU format

17.3.2.2 Overview of the PPDU encoding process

The encoding process is composed of many detailed steps, which are described fully in later subclauses, as noted below. The following overview intends to facilitate understanding the details of the convergence procedure:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

a) Produce the PHY Preamble field, composed of 10 repetitions of a "short training sequence" (used for AGC convergence, diversity selection, timing acquisition, and coarse frequency acquisition in the receiver) and two repetitions of a "long training sequence" (used for channel estimation and fine frequency acquisition in the receiver), preceded by a guard interval (GI). Refer to 17.3.3 (PHY preamble (SYNC)) for details.

b) Produce the PHY header field from the RATE, LENGTH, and SERVICE fields of the TXVECTOR by filling the appropriate bit fields. The RATE and LENGTH fields of the PHY header are encoded by a convolutional code at a rate of R = 1/2, and are subsequently mapped onto a single BPSK encoded OFDM symbol, denoted as the SIGNAL symbol. In order to facilitate a reliable and timely detection of the RATE and LENGTH fields, 6 zero tail bits are inserted into the PHY header. The encoding of the SIGNAL field into an OFDM symbol follows the same steps for convolutional encoding, interleaving, BPSK modulation, pilot insertion, Fourier transform, and prepending a GI as described subsequently for data transmission with BPSK-OFDM modulated at coding rate 1/2. The contents of the SIGNAL field are not scrambled. Refer to 17.3.4 (SIGNAL field) for details.

c) Calculate from RATE field of the TXVECTOR the number of data bits per OFDM symbol (N_{DBPS}), the coding rate (R), the number of bits in each OFDM subcarrier (N_{BPSC}), and the number of coded bits per OFDM symbol (N_{CBPS}). Refer to 17.3.2.3 (Modulation-dependent parameters) for details.

d) Append the PSDU to the SERVICE field of the TXVECTOR. Extend the resulting bit string with zero bits (at least 6 bits) so that the resulting length is a multiple of N_{DBPS}. The resulting bit string constitutes the DATA part of the packet. Refer to 17.3.5.4 (Pad bits (PAD)) for details.

e) If the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT is not present, initiate the scrambler with a pseudorandom nonzero seed and generate a scrambling sequence. If the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT is present, construct the first 7 bits of the scrambling sequence from CH_BANDWIDTH_IN_NON_HT, DYN_BANDWIDTH_IN_NON_HT (if present), and a pseudorandom integer constrained such that the first 7 bits of the scrambling sequence are not all 0s; then set the scrambler state to these 7 bits and generate the remainder of the scrambling sequence. XOR the scrambling sequence with the extended string of data bits. Refer to 17.3.5.5 (PHY DATA scrambler and descrambler) for details.

f) Replace the six scrambled zero bits following the data with six nonscrambled zero bits. (Those bits return the convolutional encoder to the zero state and are denoted as tail bits.) Refer to 17.3.5.3 (PPDU TAIL field) for details.

g) Encode the extended, scrambled data string with a convolutional encoder (R = 1/2). Omit (puncture) some of the encoder output string (chosen according to "puncturing pattern") to reach the "coding rate" corresponding to the TXVECTOR parameter RATE. Refer to 17.3.5.6 (Convolutional encoder) for details.

h) Divide the encoded bit string into groups of N_{CBPS} bits. Within each group, perform an "interleaving" (reordering) of the bits according to a rule corresponding to the TXVECTOR parameter RATE. Refer to 17.3.5.7 (Data interleaving) for details.

i) Divide the resulting coded and interleaved data string into groups of N_{BPSC} bits. For each of the bit groups, convert the bit group into a complex number according to the modulation encoding tables. Refer to 17.3.5.8 (Subcarrier modulation mapping) for details.

j) Divide the complex number string into groups of 48 complex numbers. Each such group is associated with one OFDM symbol. In each group, the complex numbers are numbered 0 to 47 and mapped hereafter into OFDM subcarriers numbered –26 to –22, –20 to –8, –6 to –1, 1 to 6, 8 to 20, and 22 to 26. The subcarriers –21, –7, 7, and 21 are skipped and, subsequently, used for inserting pilot subcarriers. The 0 subcarrier, associated with center frequency, is omitted and filled with the value 0. Refer to 17.3.5.10 (OFDM modulation) for details.

k) Four subcarriers are inserted as pilots into positions –21, –7, 7, and 21. The total number of the subcarriers is 52 (48 + 4). Refer to 17.3.5.9 (Pilot subcarriers) for details.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

l) For each group of subcarriers –26 to 26, convert the subcarriers to time domain using inverse Fourier transform. Prepend to the Fourier-transformed waveform a circular extension of itself thus forming a GI, and truncate the resulting periodic waveform to a single OFDM symbol length by applying time domain windowing. Refer to 17.3.5.10 (OFDM modulation) for details.

m) Append the OFDM symbols one after another, starting after the SIGNAL symbol describing the RATE and LENGTH fields. Refer to 17.3.5.10 (OFDM modulation) for details.

n) Upconvert the resulting "complex baseband" waveform to an RF according to the center frequency of the operating channel and transmit. Refer to 17.3.2.5 (Mathematical conventions in the signal descriptions) and 17.3.8.2 (Outline description) for details.

An illustration of the transmitted frame and its parts appears in Figure 17-4 (OFDM training structure) (in 17.3.3 (PHY preamble (SYNC))).

17.3.2.3 Modulation-dependent parameters

The modulation parameters dependent on the data rate used shall be set according to Table 17-4 (Modulation-dependent parameters).

Table 17-4—Modulation-dependent parameters

Modulation	Coding rate (R)	Coded bits per subcarrier (N_{BPSC})	Coded bits per OFDM symbol (N_{CBPS})	Data bits per OFDM symbol (N_{DBPS})	Data rate (Mb/s) (20 MHz channel spacing)	Data rate (Mb/s) (10 MHz channel spacing)	Data rate (Mb/s) (5 MHz channel spacing)
BPSK	1/2	1	48	24	6	3	1.5
BPSK	3/4	1	48	36	9	4.5	2.25
QPSK	1/2	2	96	48	12	6	3
QPSK	3/4	2	96	72	18	9	4.5
16-QAM	1/2	4	192	96	24	12	6
16-QAM	3/4	4	192	144	36	18	9
64-QAM	2/3	6	288	192	48	24	12
64-QAM	3/4	6	288	216	54	27	13.5

17.3.2.4 Timing related parameters

Table 17-5 (Timing-related parameters) is the list of timing parameters associated with the OFDM PHY.

17.3.2.5 Mathematical conventions in the signal descriptions

The transmitted signals are described in a complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the following relation:

$$r_{(RF)}\langle t\rangle = Re\{r\langle t\rangle \exp\langle j2\pi f_c t\rangle\} \quad (17\text{-}1)$$

where

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 17-5—Timing-related parameters

Parameter	Value (20 MHz channel spacing)	Value (10 MHz channel spacing)	Value (5 MHz channel spacing)
N_{SD}: Number of data subcarriers	48	48	48
N_{SP}: Number of pilot subcarriers	4	4	4
N_{ST}: Number of subcarriers, total	52 ($N_{SD} + N_{SP}$)	52 ($N_{SD} + N_{SP}$)	52 ($N_{SD} + N_{SP}$)
Δ_F: Subcarrier frequency spacing	0.3125 MHz (=20 MHz/64)	0.156 25 MHz (= 10 MHz/64)	0.078 125 MHz (= 5 MHz/64)
T_{FFT}: Inverse Fast Fourier Transform (IFFT) / Fast Fourier Transform (FFT) period	3.2 μs ($1/\Delta_F$)	6.4 μs ($1/\Delta_F$)	12.8 μs ($1/\Delta_F$)
$T_{PREAMBLE}$: PHY preamble duration	16 μs ($T_{SHORT} + T_{LONG}$)	32 μs ($T_{SHORT} + T_{LONG}$)	64 μs ($T_{SHORT} + T_{LONG}$)
T_{SIGNAL}: Duration of the SIGNAL BPSK-OFDM symbol	4.0 μs ($T_{GI} + T_{FFT}$)	8.0 μs ($T_{GI} + T_{FFT}$)	16.0 μs ($T_{GI} + T_{FFT}$)
T_{GI}: GI duration	0.8 μs ($T_{FFT}/4$)	1.6 μs ($T_{FFT}/4$)	3.2 μs ($T_{FFT}/4$)
T_{GI2}: Training symbol GI duration	1.6 μs ($T_{FFT}/2$)	3.2 μs ($T_{FFT}/2$)	6.4 μs ($T_{FFT}/2$)
T_{SYM}: Symbol interval	4 μs ($T_{GI} + T_{FFT}$)	8 μs ($T_{GI} + T_{FFT}$)	16 μs ($T_{GI} + T_{FFT}$)
T_{SHORT}: Short training sequence duration	8 μs ($10 \times T_{FFT}/4$)	16 μs ($10 \times T_{FFT}/4$)	32 μs ($10 \times T_{FFT}/4$)
T_{LONG}: Long training sequence duration	8 μs ($T_{GI2} + 2 \times T_{FFT}$)	16 μs ($T_{GI2} + 2 \times T_{FFT}$)	32 μs ($T_{GI2} + 2 \times T_{FFT}$)

f_c denotes the carrier center frequency

The transmitted baseband signal is composed of contributions from several OFDM symbols.

$$r_{PACKET}(t) = r_{PREAMBLE}(t) + r_{SIGNAL}(t - t_{SIGNAL}) + r_{DATA}(t - t_{DATA}) \quad (17\text{-}2)$$

The subframes of which Equation (17-2) are composed are described in 17.3.3 (PHY preamble (SYNC)), 17.3.4 (SIGNAL field), and 17.3.5.10 (OFDM modulation). The time offsets $t_{SUBFRAME}$ determine the starting time of the corresponding subframe; t_{SIGNAL} is equal to 16 μs for 20 MHz channel spacing, 32 μs for 10 MHz channel spacing, and 64 μs for 5 MHz channel spacing, and t_{DATA} is equal to 20 μs for 20 MHz channel spacing, 40 μs for 10 MHz channel spacing, and 80 μs for 5 MHz channel spacing.

All of the subframes of the signal are constructed as an inverse Fourier transform of a set of coefficients, C_k, with C_k defined later as data, pilots, or training symbols in 17.3.3 (PHY preamble (SYNC)) to 17.3.5 (DATA field).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$r_{SUBFRAME}(t) = w_{TSUBFRAME}(t) \sum_{k=-N_{ST}/2}^{N_{ST}/2} C_k \exp(j2\pi k\Delta_f)(t - T_{GUARD}) \quad (17\text{-}3)$$

The parameters Δ_F and N_{ST} are described in Table 17-5 (Timing-related parameters). The resulting waveform is periodic with a period of $T_{FFT} = 1/\Delta_F$. Shifting the time by T_{GUARD} creates the "circular prefix" used in OFDM to avoid ISI from the previous frame. Three kinds of T_{GUARD} are defined: for the short training sequence (= 0 μs), for the long training sequence (= T_{GI2}), and for data OFDM symbols (= T_{GI}). (Refer to Table 17-5 (Timing-related parameters).) The boundaries of the subframe are set by a multiplication by a time-windowing function, $w_{TSUBFRAME}(t)$, which is defined as a rectangular pulse, $w_T(t)$, of duration T, accepting the value $T_{SUBFRAME}$. The time-windowing function, $w_T(t)$, depending on the value of the duration parameter, T, may extend over more than one period, T_{FFT}. In particular, window functions that extend over multiple periods of the FFT are utilized in the definition of the preamble. Figure 17-2 (Illustration of OFDM frame with cyclic extension and windowing for (a) single reception or (b) two receptions of the FFT period) illustrates the possibility of extending the windowing function over more than one period, T_{FFT}, and additionally shows smoothed transitions by application of a windowing function, as exemplified in Equation (17-4). In particular, window functions that extend over multiple periods of the FFT are utilized in the definition of the preamble.

$$w_T(t) = \begin{cases} \sin^2\left(\frac{\pi}{2}(0.5 + t/T_{TR})\right) & (-T_{TR}/2 < t < T_{TR}/2) \\ 1 & (T_{TR}/2 \le t < T - T_{TR}/2) \\ \sin^2\left(\frac{\pi}{2}(0.5 - (t-T)/T_{TR})\right) & (T - T_{TR}/2 \le t < T + T_{TR}/2) \end{cases} \quad (17\text{-}4)$$

In the case of vanishing T_{TR}, the windowing function degenerates into a rectangular pulse of duration T. This standard describes transmitted waveforms using a rectangular pulse shape. In a typical implementation, a higher T_{TR} is used in order to smooth the transitions between consecutive subsections. This creates a small overlap between them, of duration T_{TR}, as shown in Figure 17-2 (Illustration of OFDM frame with cyclic extension and windowing for (a) single reception or (b) two receptions of the FFT period). The transition time, T_{TR}, is about 100 ns. Smoothing the transition is required in order to reduce the spectral sidelobes of the transmitted waveform. However, the binding requirements are the spectral mask and modulation accuracy requirements, as detailed in 17.3.9.3 (Transmit spectrum mask) and 17.3.9.7 (Modulation accuracy). Time domain windowing, as described here, is just one way to achieve those objectives. The

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

implementer may use other methods to achieve the same goal, such as frequency domain filtering. Therefore, the transition shape and duration of the transition are informative parameters.

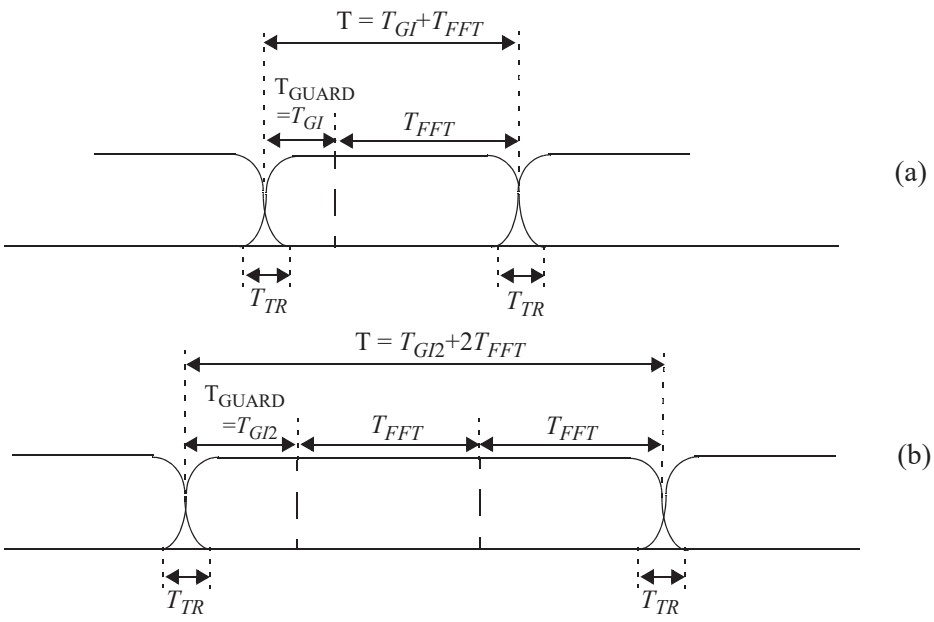

Figure 17-2—Illustration of OFDM frame with cyclic extension and windowing for (a) single reception or (b) two receptions of the FFT period

17.3.2.6 Discrete time implementation considerations

The following descriptions of the discrete time implementation are informational.

In a typical implementation, the windowing function is represented in discrete time. As an example, when a windowing function with parameters T = 4.0 μs and a T_{TR} = 100 ns is applied, and the signal is sampled at 20 Msample/s, it becomes

$$w_T[n] = w_T(nT_S) = \begin{Bmatrix} 1 & 1 \le n \le 79 \\ 0.5 & 0,\ 80 \\ 0 & otherwise \end{Bmatrix} \quad (17\text{-}5)$$

The common way to implement the inverse Fourier transform, as shown in Equation (17-3), is by an IFFT algorithm. If, for example, a 64-point IFFT is used, the coefficients 1 to 26 are mapped to the same numbered IFFT inputs, while the coefficients –26 to –1 are copied into IFFT inputs 38 to 63. The rest of the inputs, 27 to 37 and the 0 (dc) input, are set to 0. This mapping is illustrated in Figure 17-3 (Inputs and

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

outputs of inverse Fourier transform). After performing an IFFT, the output is cyclically extended and the resulting waveform is windowed to the required OFDM symbol length.

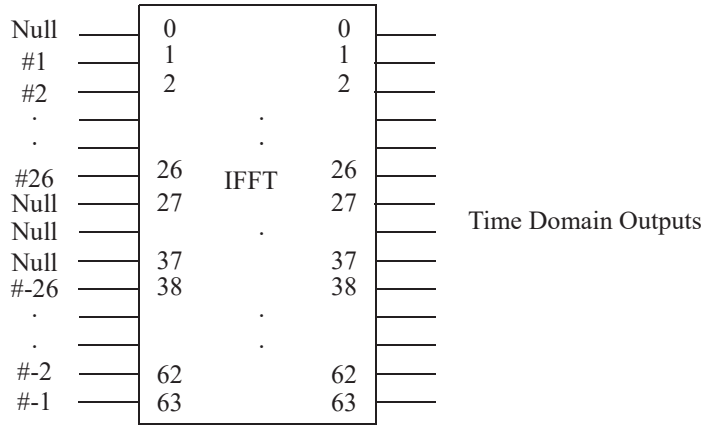

Figure 17-3—Inputs and outputs of inverse Fourier transform

17.3.3 PHY preamble (SYNC)

The PHY Preamble field is used for synchronization. It consists of 10 short symbols and two long symbols that are shown in Figure 17-4 (OFDM training structure) and described in this subclause. The timings described in this subclause and shown in Figure 17-4 (OFDM training structure) are for 20 MHz channel spacing. They are doubled for half-clocked (i.e., 10 MHz) channel spacing and are quadrupled for quarter-clocked (i.e., 5 MHz) channel spacing.

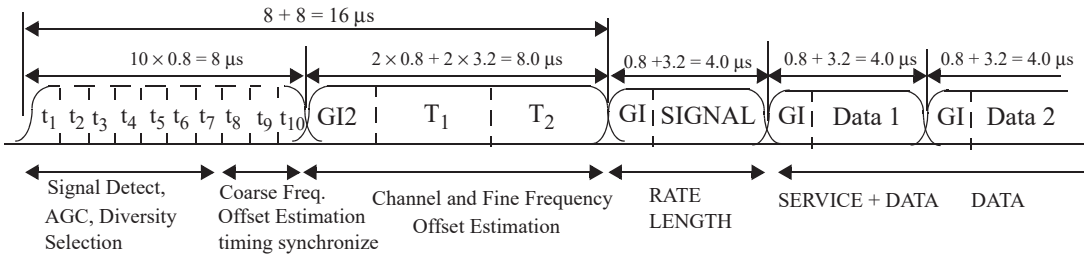

Figure 17-4—OFDM training structure

Figure 17-4 (OFDM training structure) shows the OFDM training structure (PHY preamble), where t_1 to t_{10} denote short training symbols and T_1 and T_2 denote long training symbols. The PHY preamble is followed by the SIGNAL field and DATA. The total training length is 16 µs. The dashed boundaries in the figure denote repetitions due to the periodicity of the inverse Fourier transform.

A short OFDM training symbol consists of 12 subcarriers, which are modulated by the elements of the sequence S, given by

$$S_{-26,26} = \sqrt{(13/6)} \times \{0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0,$$

$$0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0,0\} \quad (17\text{-}6)$$

The multiplication by a factor of $\sqrt{(13/6)}$ is in order to normalize the average power of the resulting OFDM symbol, which utilizes 12 out of 52 subcarriers.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The signal shall be generated according to the following equation:

$$r_{SHORT}(t) = w_{TSHORT}(t) \sum_{k=-N_{ST}/2}^{N_{ST}/2} S_k \exp(j2\pi k\Delta_F t) \quad (17\text{-}7)$$

The fact that only spectral lines of $S_{-26:26}$ with indices that are a multiple of 4 have nonzero amplitude results in a periodicity of $T_{FFT}/4 = 0.8$ μs. The interval T_{SHORT} is equal to ten 0.8 μs periods (i.e., 8 μs).

Generation of the short training sequence is illustrated in Table I-2 (Frequency domain representation of the short sequences).

A long OFDM training symbol consists of 53 subcarriers (including the value 0 at dc), which are modulated by the elements of the sequence L, given by

$$L_{-26,26} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 0,$$

$$1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (17\text{-}8)$$

A long OFDM training symbol shall be generated according to the following equation:

$$r_{LONG}(t) = w_{TLONG}(t) \sum_{k=-N_{ST}/2}^{N_{ST}/2} L_k \exp(j2\pi k\Delta_F (t - T_{G12})) \quad (17\text{-}9)$$

where

$T_{G12} = 1.6$ μs

Two periods of the long sequence are transmitted for improved channel estimation accuracy, yielding $T_{LONG} = 1.6 + 2 \times 3.2 = 8$ μs.

An illustration of the long training sequence generation is given in Table I-5 (Frequency domain representation of the long sequences).

The sections of short repetitions and long repetitions shall be concatenated to form the preamble

$$r_{PREAMBLE}(t) = r_{SHORT}(t) + r_{LONG}(t - T_{SHORT}) \quad (17\text{-}10)$$

17.3.4 SIGNAL field

17.3.4.1 General

The OFDM training symbols shall be followed by the SIGNAL field, which contains the RATE and the LENGTH fields of the TXVECTOR. The RATE field conveys information about the type of modulation and the coding rate as used in the rest of the packet. The encoding of the SIGNAL single OFDM symbol shall be performed with BPSK modulation of the subcarriers and using convolutional coding at R = 1/2. The encoding procedure, which includes convolutional encoding, interleaving, modulation mapping processes, pilot insertion, and OFDM modulation, follows the steps described in 17.3.5.6 (Convolutional encoder), 17.3.5.7 (Data interleaving), and 17.3.5.9 (Pilot subcarriers), as used for transmission of data with BPSK-OFDM modulated at coding rate 1/2. The contents of the SIGNAL field are not scrambled.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The SIGNAL field shall be composed of 24 bits, as illustrated in Figure 17-5 (SIGNAL field bit assignment). The four bits 0 to 3 shall encode the RATE. Bit 4 shall be reserved for future use. Bits 5–16 shall encode the LENGTH field of the TXVECTOR, with the LSB being transmitted first.

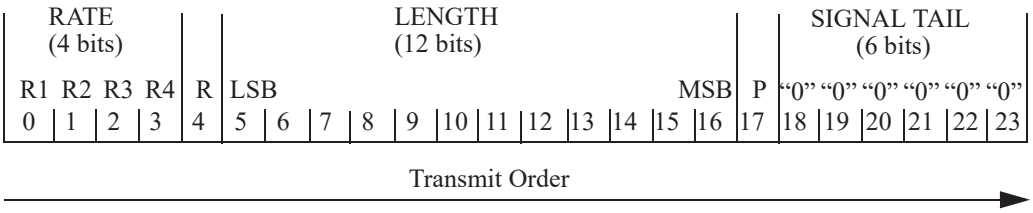

Figure 17-5—SIGNAL field bit assignment

The process of generating the SIGNAL OFDM symbol is illustrated in I.1.4 (Generation of the SIGNAL field).

17.3.4.2 RATE field

The bits R1–R4 shall be set, dependent on RATE, according to the values in Table 17-6 (Contents of the SIGNAL field).

Table 17-6—Contents of the SIGNAL field

R1–R4	Rate (Mb/s) (20 MHz channel spacing)	Rate (Mb/s) (10 MHz channel spacing)	Rate (Mb/s) (5 MHz channel spacing)
1101	6	3	1.5
1111	9	4.5	2.25
0101	12	6	3
0111	18	9	4.5
1001	24	12	6
1011	36	18	9
0001	48	24	12
0011	54	27	13.5

17.3.4.3 PHY LENGTH field

The PHY LENGTH field shall be an unsigned 12-bit integer that indicates the number of octets in the PSDU that the MAC is currently requesting the PHY to transmit. This value is used by the PHY to determine the number of octet transfers that will occur between the MAC and the PHY after receiving a request to start transmission. The transmitted value shall be determined from the LENGTH parameter in the TXVECTOR issued with the PHY-TXSTART.request primitive described in 8.3.5.5 (PHY-TXSTART.request). The LSB shall be transmitted first in time. This field shall be encoded by the convolutional encoder described in 17.3.5.6 (Convolutional encoder).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

17.3.4.4 Parity (P), Reserved (R), and SIGNAL TAIL fields

Bit 4 is reserved. It shall be set to 0 on transmit and ignored on receive. Bit 17 shall be a positive parity (even parity) bit for bits 0–16. The bits 18–23 constitute the SIGNAL TAIL field, and all 6 bits shall be set to 0.

17.3.5 DATA field

17.3.5.1 General

The DATA field contains the SERVICE field, the PSDU, the TAIL bits, and the PAD bits, if needed, as described in 17.3.5.3 (PPDU TAIL field) and 17.3.5.4 (Pad bits (PAD)). All bits in the DATA field are scrambled, as described in 17.3.5.5 (PHY DATA scrambler and descrambler).

17.3.5.2 SERVICE field

The SERVICE field has 16 bits, which shall be denoted as bits 0–15. The bit 0 shall be transmitted first in time. The bits from 0–6 of the SERVICE field, which are transmitted first, are set to 0s and are used to synchronize the descrambler in the receiver. The remaining 9 bits (7–15) of the SERVICE field shall be reserved for future use. All reserved bits shall be set to 0 on transmission and ignored on reception. Refer to Figure 17-6 (SERVICE field bit assignment).

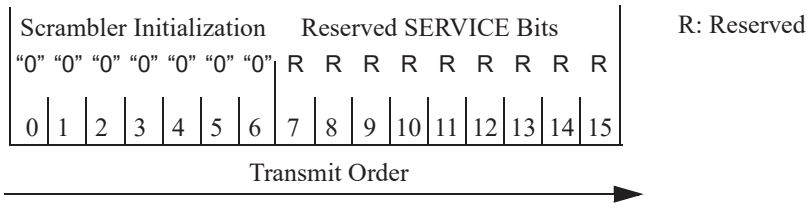

Figure 17-6—SERVICE field bit assignment

17.3.5.3 PPDU TAIL field

The PPDU TAIL field shall be six bits of 0, which are required to return the convolutional encoder to the zero state. This procedure improves the error probability of the convolutional decoder, which relies on future bits when decoding and which may be not be available past the end of the message. The PPDU TAIL field shall be produced by replacing six scrambled zero bits following the message end with six nonscrambled zero bits.

17.3.5.4 Pad bits (PAD)

The number of bits in the DATA field shall be a multiple of N_{CBPS}, the number of coded bits in an OFDM symbol (48, 96, 192, or 288 bits). To achieve that, the length of the message is extended so that it becomes a multiple of N_{DBPS}, the number of data bits per OFDM symbol. At least 6 bits are appended to the message, in order to accommodate the TAIL bits, as described in 17.3.5.3 (PPDU TAIL field). The number of OFDM symbols, N_{SYM}; the number of bits in the DATA field, N_{DATA}; and the number of pad bits, N_{PAD}, are computed from the length of the PSDU (LENGTH) as follows:

$$N_{SYM} = \left\lceil \frac{16 + 8 \times \text{LENGTH} + 6}{N_{DBPS}} \right\rceil \tag{17-11}$$

$$N_{DATA} = N_{SYM} \times N_{DBPS} \tag{17-12}$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$N_{PAD} = N_{DATA} - (16 + 8 \times \text{LENGTH} + 6) \quad (17\text{-}13)$$

The appended bits ("pad bits") are set to 0 and are subsequently scrambled with the rest of the bits in the DATA field.

An example of a DATA field that contains the SERVICE field, DATA, tail, and pad bits is given in I.1.5.1 (Delineating, SERVICE field prepending, and zero padding).

17.3.5.5 PHY DATA scrambler and descrambler

The DATA field, composed of SERVICE, PSDU, tail, and pad parts, shall be scrambled with a length-127 PPDU-synchronous scrambler. The octets of the PSDU are placed in the transmit serial bit stream, bit 0 first and bit 7 last. The PPDU synchronous scrambler uses the generator polynomial *S(x)* as follows, and is illustrated in Figure 17-7 (Data scrambler):

$$S(x) = x^7 + x^4 + 1 \quad (17\text{-}14)$$

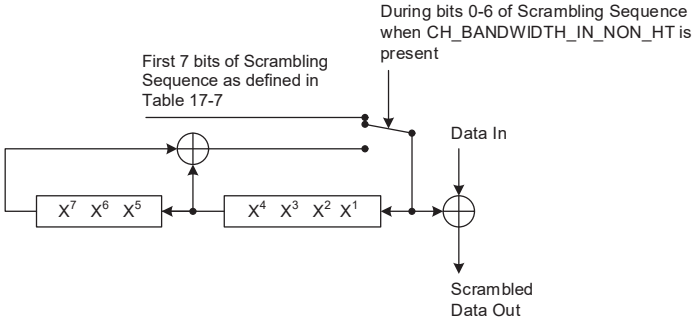

Figure 17-7—Data scrambler

The 127-bit sequence generated repeatedly by the scrambler shall be (leftmost used first), 00001110 11110010 11001001 00000010 00100110 00101110 10110110 00001100 11010100 11100111 10110100 00101010 11111010 01010001 10111000 1111111, when the all 1s initial state is used. The same scrambler is used to scramble transmit data and to descramble receive data. If the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT is not present, when transmitting, the initial state of the scrambler shall be set to a pseudorandom nonzero state. If the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT is present,

— The first 7 bits of the scrambling sequence shall be set as shown in Table 17-7 (Contents of the first 7 bits of the scrambling sequence) (with field values defined in Table 17-8 (TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT values) and Table 17-10 (DYN_BANDWIDTH_IN_NON_HT values)) and shall be also used to initialize the state of the scrambler

— The scrambler with this initialization shall generate the remainder (i.e., after the first 7 bits) of the scrambling sequence as shown in Figure 17-7 (Data scrambler)

— CH_BANDWIDTH_IN_NON_HT is transmitted LSB first. For example, if CBW80 has a value of 2, which is '10' in binary representation, then B5=0 and B6=1

During reception by a VHT STA, the CbwInNonHtTemp variable shall be set to selected bits in the scrambling sequence as shown in Table 17-7 (Contents of the first 7 bits of the scrambling sequence) and then mapped as shown in Table 17-9 (RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT values) to the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT. During reception by a VHT STA, the RXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT shall be set to selected bits in the scrambling

This is an unapproved IEEE Standards Draft, subject to change.

sequence as shown in Table 17-7 (Contents of the first 7 bits of the scrambling sequence). The fields shall be interpreted as being sent LSB-first.

NOTE 1—The receiving PHY cannot determine whether the CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT parameters were present in the TXVECTOR of the transmitting PHY; therefore, the receiving PHY in a VHT STA always includes values for the CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT parameters in the RXVECTOR if the detected PPDU is a non-HT PPDU. It is the responsibility of the MAC to determine the validity of the RXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT.

NOTE 2—The receiving PHY cannot determine whether the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT was present, but it does not matter since descrambling the DATA field is the same either way.

The seven LSBs of the SERVICE field shall be set to all 0s prior to scrambling to enable estimation of the initial state of the scrambler in the receiver.

An example of the scrambler output is illustrated in I.1.5.2 (Scrambling the BCC example) with CH_BANDWIDTH_IN_NON_HT not present.

17.3.5.6 Convolutional encoder

The DATA field, composed of SERVICE, PSDU, tail, and pad parts, shall be coded with a convolutional encoder of coding rate R = 1/2, 2/3, or 3/4, corresponding to the TXVECTOR parameter RATE. The convolutional encoder shall use the industry-standard generator polynomials, $g_0 = 133_8$ and $g_1 = 171_8$, of rate R = 1/2, as shown in Figure 17-8 (Convolutional encoder (k = 7)). The bit denoted as "A" shall be output from the encoder before the bit denoted as "B." Higher rates are derived from it by employing "puncturing." Puncturing is a procedure for omitting some of the encoded bits in the transmitter (thus reducing the number of transmitted bits and increasing the coding rate) and inserting a dummy "zero" metric into the convolutional decoder on the receive side in place of the omitted bits. The puncturing patterns are illustrated in Figure 17-9 (Example of the bit-stealing and bit-insertion procedure (r = 3/4, 2/3)). Decoding by the Viterbi algorithm is recommended.

An example of encoding operation is shown in I.1.6.1 (Coding the DATA bits).

3	1 to 200	CBW80+80

17.3.5.7 Data interleaving

All encoded data bits shall be interleaved by a block interleaver with a block size corresponding to the number of bits in a single OFDM symbol, N_{CBPS}. The interleaver is defined by a two-step permutation. The first permutation causes adjacent coded bits to be mapped onto nonadjacent subcarriers. The second causes adjacent coded bits to be mapped alternately onto less and more significant bits of the constellation and, thereby, long runs of low reliability (LSB) bits are avoided.

The index of the coded bit before the first permutation shall be denoted by k; i shall be the index after the first and before the second permutation; and j shall be the index after the second permutation, just prior to modulation mapping.

The first permutation is defined by the rule

$$i = (N_{CBPS}/16) \times (k \bmod 16) + \lfloor k/16 \rfloor \quad k = 0,1,\ldots,N_{CBPS} - 1 \tag{17-15}$$

The second permutation is defined by the rule

$$j = s \times \left\lfloor \frac{i}{s} \right\rfloor + \left(i + N_{CBPS} - \left\lfloor \frac{16 \times i}{N_{CBPS}} \right\rfloor \right) \bmod s \quad i = 0,1,\ldots N_{CBPS} - 1 \tag{17-16}$$

The value of s is determined by the number of coded bits per subcarrier, N_{BPSC}, according to

$$s = \max(N_{BPSC}/2,1) \tag{17-17}$$

The deinterleaver, which performs the inverse relation, is also defined by two permutations.

This is an unapproved IEEE Standards Draft, subject to change.

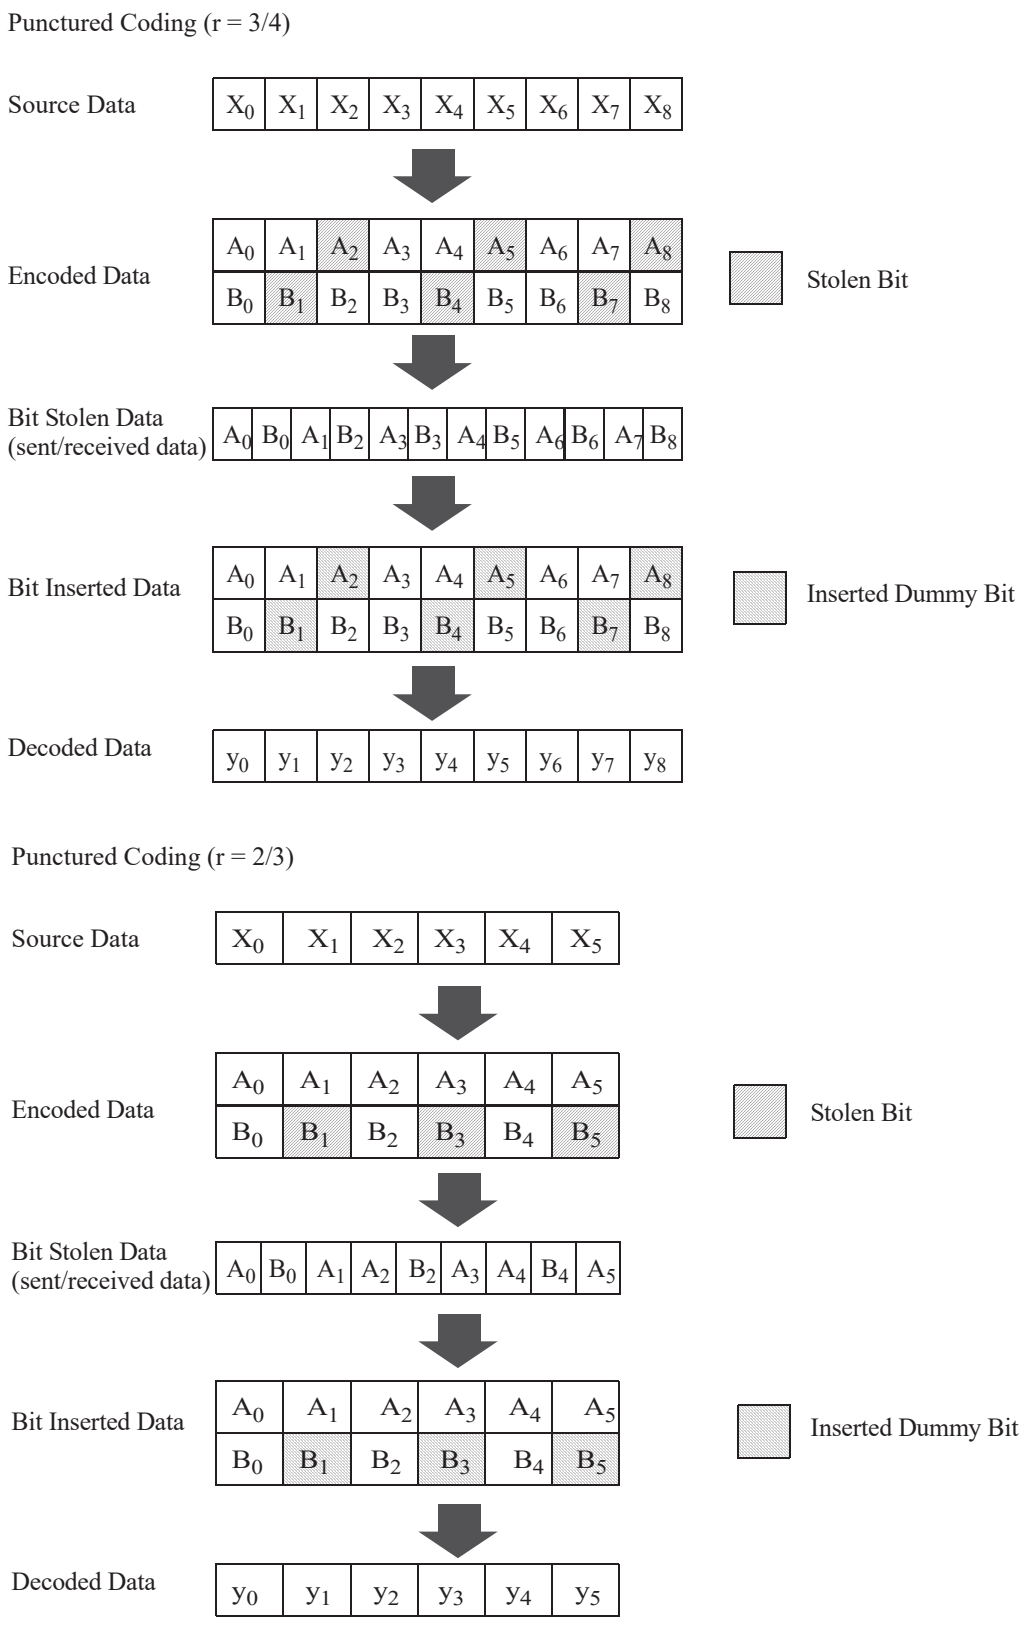

Figure 17-9—Example of the bit-stealing and bit-insertion procedure (r = 3/4, 2/3)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Here the index of the original received bit before the first permutation shall be denoted by *j*; *i* shall be the index after the first and before the second permutation; and *k* shall be the index after the second permutation, just prior to delivering the coded bits to the convolutional (Viterbi) decoder.

The first permutation is defined by the rule

$$i = s \times \lfloor j/s \rfloor + \left(j + \left\lfloor \frac{16 \times j}{N_{CBPS}} \right\rfloor \right) \bmod s \quad j = 0,1,\ldots N_{CBPS} - 1 \tag{17-18}$$

where

s is defined in Equation (17-17).

This permutation is the inverse of the permutation described in Equation (17-16).

The second permutation is defined by the rule

$$k = 16 \times i - (N_{CBPS} - 1) \times \left\lfloor \frac{16 \times i}{N_{CBPS}} \right\rfloor, \quad i = 0,1,\ldots N_{CBPS} - 1 \tag{17-19}$$

This permutation is the inverse of the permutation described in Equation (17-15).

An example of interleaving operation is illustrated in I.1.6.2 (Interleaving the DATA bits).

17.3.5.8 Subcarrier modulation mapping

The OFDM subcarriers shall be modulated by using BPSK, QPSK, 16-QAM, or 64-QAM, depending on the RATE requested. The encoded and interleaved binary serial input data shall be divided into groups of N_{BPSC} (1, 2, 4, or 6) bits and converted into complex numbers representing BPSK, QPSK, 16-QAM, or 64-QAM constellation points. The conversion shall be performed according to Gray-coded constellation mappings, illustrated in Figure 17-10 (BPSK, QPSK, 16-QAM, and 64-QAM constellation bit encoding), with the input bit, B_0, being the earliest in the stream. The output values, d, are formed by multiplying the resulting (I+jQ) value by a normalization factor K_{MOD}, as described in Equation (17-20).

$$d = (I + jQ) \times K_{MOD} \tag{17-20}$$

The normalization factor, K_{MOD}, depends on the base modulation mode, as prescribed in Table 17-11 (Modulation-dependent normalization factor K_{MOD}). Note that the modulation type can be different from the start to the end of the transmission, as the signal changes from SIGNAL to DATA, as shown in Figure 17-1 (PPDU format). The purpose of the normalization factor is to achieve the same average power for all mappings. In practical implementations, an approximate value of the normalization factor may be used, as long as the device complies with the modulation accuracy requirements described in 17.3.9.7 (Modulation accuracy).

For BPSK, B_0 determines the I value, as illustrated in Table 17-12 (BPSK encoding table). For QPSK, B_0 determines the I value and B_1 determines the Q value, as illustrated in Table 17-13 (QPSK encoding table). For 16-QAM, B_0B_1 determines the I value and B_2B_3 determines the Q value, as illustrated in Table 17-14 (16-QAM encoding table). For 64-QAM, $B_0B_1B_2$ determines the I value and $B_3B_4B_5$ determines the Q value, as illustrated in Table 17-15 (64-QAM encoding table).

17.3.5.9 Pilot subcarriers

In each OFDM symbol, four of the subcarriers are dedicated to pilot signals in order to make the coherent detection robust against frequency offsets and phase noise. These pilot signals shall be put in subcarriers –21, –7, 7, and 21. The pilots shall be BPSK modulated by a pseudo-binary sequence to prevent the generation of spectral lines. The contribution of the pilot subcarriers to each OFDM symbol is described in 17.3.5.10 (OFDM modulation).

17.3.5.10 OFDM modulation

The stream of complex numbers is divided into groups of $N_{SD} = 48$ complex numbers. This shall be denoted by writing the complex number $d_{k,n}$, which corresponds to subcarrier k of OFDM symbol n, as follows:

$$d_{k,n} \equiv d_{k+N_{SD}\times n}, \qquad \text{k} = 0, \ldots N_{SD} - 1, \text{n} = 0, \ldots \text{N}_{\text{SYM}} - 1 \tag{17-21}$$

The number of OFDM symbols, N_{SYM}, was introduced in 17.3.5.4 (Pad bits (PAD)).

An OFDM symbol, $r_{DATA,n}(t)$, is defined as

$$r_{DATA,n}(t) = w_{TSYM}(t)\left(\sum_{k=0}^{N_{SD}-1} d_{k,n}\exp((j2\pi M(k)\Delta_F(t-T_{GI})) + p_{n+1}\sum_{k=-N_{ST}/2}^{N_{ST}/2} P_k\exp(j2\pi k\Delta_F(t-T_{GI}))\right) \tag{17-22}$$

where the function, $M(k)$, defines a mapping from the logical subcarrier number 0 to 47 into frequency offset index –26 to 26, while skipping the pilot subcarrier locations and the 0th (dc) subcarrier.

$$M(k) = \begin{cases} k-26 & 0 \le k \le 4 \\ k-25 & 5 \le k \le 17 \\ k-24 & 18 \le k \le 23 \\ k-23 & 24 \le k \le 29 \\ k-22 & 30 \le k \le 42 \\ k-21 & 43 \le k \le 47 \end{cases} \tag{17-23}$$

The contribution of the pilot subcarriers for the nth OFDM symbol is produced by inverse Fourier transform of sequence P, given by

$$\text{P}_{-26,26} = \{0, 0, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0,$$

$$0, 0, 0, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, –1, 0, 0, 0, 0, 0\} \tag{17-24}$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The polarity of the pilot subcarriers is controlled by the sequence, p_n, which is a cyclic extension of the 127 elements sequence and is given by

$$p_{0..126v} = \{1,1,1,1,\ -1,-1,-1,1,\ -1,-1,-1,-1,\ 1,1,-1,1,\ -1,-1,1,1,\ -1,1,1,-1,\ 1,1,1,1,\ 1,1,-1,1,$$
$$1,1,-1,1,\ 1,-1,-1,1,\ 1,1,-1,1,\ -1,-1,-1,1,\ -1,1,-1,-1,\ 1,-1,-1,1,\ 1,1,1,1,\ -1,-1,1,1,$$
$$-1,-1,1,-1,\ 1,-1,1,1,\ -1,-1,-1,1,\ 1,-1,-1,-1,\ -1,1,-1,-1,\ 1,-1,1,1,\ 1,1,-1,1,\ -1,1,-1,1,$$
$$-1,-1,-1,-1,\ -1,1,-1,1,\ 1,-1,1,-1,\ 1,1,1,-1,\ -1,1,-1,-1,\ -1,1,1,1,\ -1,-1,-1,-1,\ -1,-1,-1\} \quad (17\text{-}25)$$

The sequence p_n is generated by the scrambler defined by Figure 17-7 (Data scrambler) when the all 1s initial state is used, and by replacing all 1s with –1 and all 0s with 1. Each sequence element is used for one OFDM symbol. The first element, p_0, multiplies the pilot subcarriers of the SIGNAL symbol, while the elements from p_1 on are used for the DATA symbols.

The subcarrier frequency allocation is shown in Figure 17-11 (Subcarrier frequency allocation). To avoid difficulties in D/A and A/D converter offsets and carrier feedthrough in the RF system, the subcarrier falling at DC (0th subcarrier) is not used.

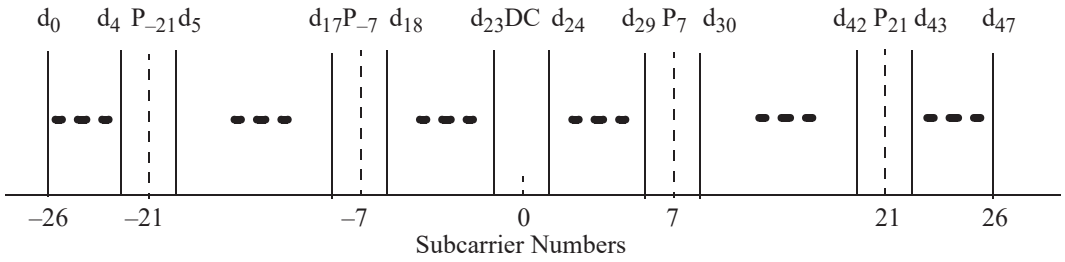

Figure 17-11—Subcarrier frequency allocation

The concatenation of N_{SYM} OFDM symbols is written as

$$r_{DATA}(t) = \sum_{n=0}^{N_{SYM}-1} r_{DATA,n}(t - nT_{SYM}) \quad (17\text{-}26)$$

An example of mapping into symbols is shown in I.1.6.3 (Mapping into symbols), as well as the scrambling of the pilot signals (see I.1.7 (Generating the additional DATA symbols)). The final output of these operations is also shown in I.1.8 (The entire packet for the BCC example).

17.3.6 CCA

The PHY shall provide the capability to perform CCA and report the result to the MAC. The CCA mechanism shall detect a "medium busy" condition with requirements specified in 17.3.10.6 (CCA requirements) and 17.3.12 (Receive PHY). The PHY issues the PHY-CCA.indication primitive to provide this medium status report to the MAC.

17.3.7 PHY data modulation and modulation rate change

The PHY preamble shall be transmitted using an OFDM modulated fixed waveform. The SIGNAL field, BPSK-OFDM modulated with coding rate 1/2, shall indicate the modulation and coding rate that shall be used to transmit the MPDU. The transmitter (receiver) shall initiate the modulation (demodulation) constellation and the coding rate according to the RATE indicated in the SIGNAL field. The MPDU transmission rate shall be set by the DATARATE parameter in the TXVECTOR, issued with the PHY-TXSTART.request primitive described in 17.2.2 (TXVECTOR parameters).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

17.3.8 PHY operating specifications (general)

17.3.8.1 General

General specifications for the BPSK OFDM, QPSK OFDM, 16-QAM OFDM, and 64-QAM OFDM PHY sublayers are provided in 17.3.8.2 (Outline description) to 17.3.8.7 (Transmit and receive impedance at the antenna connector). These specifications apply to both the receive and transmit functions and general operation of the OFDM PHY.

17.3.8.2 Outline description

The general block diagram of the transmitter and receiver for the OFDM PHY is shown in Figure 17-12 (Transmitter and receiver block diagram for the OFDM PHY). Major specifications for the OFDM PHY are listed in Table 17-16 (Major parameters of the OFDM PHY).

[a]Refer to 17.3.2.5 (Mathematical conventions in the signal descriptions).

17.3.8.3 Regulatory requirements

WLANs implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision, or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains may be subject to additional or alternative national regulations.

17.3.8.4 Operating channel frequencies

17.3.8.4.1 Operating frequency range

The OFDM PHY shall not operate in frequency bands not allocated by a regulatory body in its operational region. Regulatory requirements for a given frequency band are set by the regulatory authority responsible for spectrum management in a given geographic region or domain. The particular channelization to be used for this standard is dependent on such allocation, as well as the associated regulations for use of the allocations. These regulations are subject to revision, or may be superseded.

In some regulatory domains, several frequency bands may be available for OFDM PHY-based WLANs. These bands may be contiguous or not, and different regulatory limits may be applicable. An OFDM PHY shall support at least one frequency band in at least one regulatory domain. The support of specific regulatory domains, and bands within the domains, shall be indicated by PLME attributes dot11RegDomainsImplementedValue and dot11FrequencyBandsImplemented.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an OFDM PHY contains an OPERATING_CHANNEL parameter, which identifies the operating channel. The PHY shall set dot11CurrentFrequency to the value of this parameter.

17.3.8.4.2 Channel numbering

Channel center frequencies are defined at every integer multiple of 5 MHz above the channel starting frequency. The relationship between center frequency and channel number is given by Equation (17-27):

$$\text{Channel center frequency} = \text{Channel starting frequency} + 5 \times n_{ch} \text{ (MHz)} \quad (17\text{-}27)$$

where

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

n_{ch} = 1,…200.

Channel starting frequency is defined as dot11ChannelStartingFactor × 500 kHz or
is defined as 5 GHz for systems where dot11OperatingClassesRequired is false or not defined.

For example, dot11ChannelStartingFactor = 10000 indicates that Channel 0 center frequency is 5.000 GHz. A channel center frequency of 5.000 GHz shall be indicated by dot11ChannelStartingFactor = 8000 and n_{ch} = 200. An SME managing multiple channel sets can change the channel set being managed by changing dot11ChannelStartingFactor.

This definition provides a unique numbering system for all channels with 5 MHz between center frequencies, as well as the flexibility to define channelization sets for all current and future regulatory domains.

17.3.8.4.3 Channelization

The set of valid operating channel numbers by regulatory domain is defined in Annex E. As shown in Figure 17-11 (Subcarrier frequency allocation), no subcarrier is allocated on the channel center frequency.

17.3.8.5 Transmit and receive in-band and out-of-band spurious emissions

The OFDM PHY shall comply with in-band and out-of-band spurious emissions as set by regulatory bodies.

17.3.8.6 Slot time

The value of the slot time is found in Table 17-21 (OFDM PHY characteristics).

17.3.8.7 Transmit and receive impedance at the antenna connector

The impedance at the transmit and receive antenna connector(s) shall be 50 Ω if the connector is exposed.

17.3.9 PHY transmit specifications

17.3.9.1 General

The transmit specifications associated with the PHY sublayer are described in 17.3.9.2 (Transmit power levels) to 17.3.9.8 (Transmit modulation accuracy test).

17.3.9.2 Transmit power levels

The maximum allowable output power is measured in accordance with practices specified by the appropriate regulatory bodies.

17.3.9.3 Transmit spectrum mask

The transmit spectrum mask by regulatory domain is defined in Annex D and Annex E.

NOTE 1—In the presence of additional regulatory restrictions, the device needs to meet both the regulatory requirements and the mask defined here, i.e., its emissions need to be no higher at any frequency offset than the minimum of the values specified in the regulatory and default masks.

NOTE 2—For rules regarding TX center frequency leakage levels by VHT STAs, see 21.3.17.4.2 (Transmit center frequency leakage).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For operation using 20 MHz channel spacing, the transmitted spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and the maximum of –40 dBr and –53 dBm/MHz at 30 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 17-13 (Transmit spectrum mask for 20 MHz transmission). The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

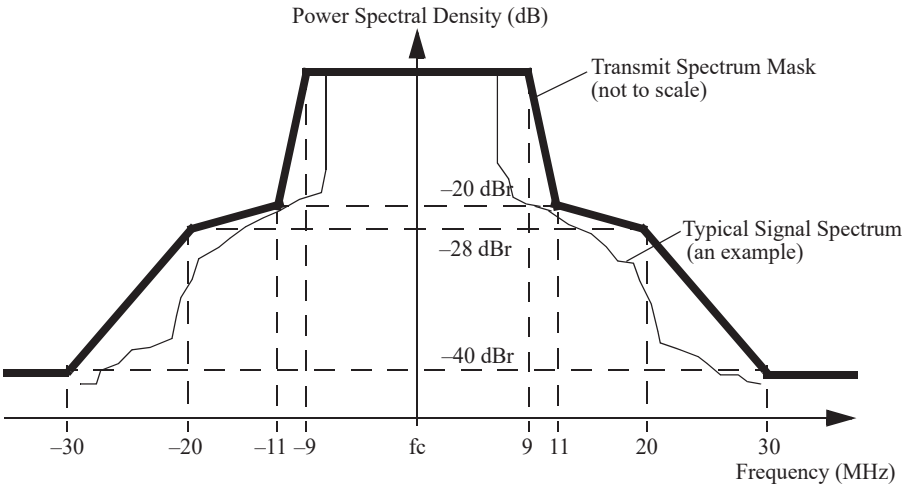

Figure 17-13—Transmit spectrum mask for 20 MHz transmission

For operation using 10 MHz channel spacing, the transmitted spectrum shall have a 0 dBr bandwidth not exceeding 9 MHz, –20 dBr at 5.5 MHz frequency offset, –28 dBr at 10 MHz frequency offset, and the maximum of –40 dBr and –50 dBm/MHz at 15 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 17-14 (Transmit spectrum mask for 10 MHz transmission). The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

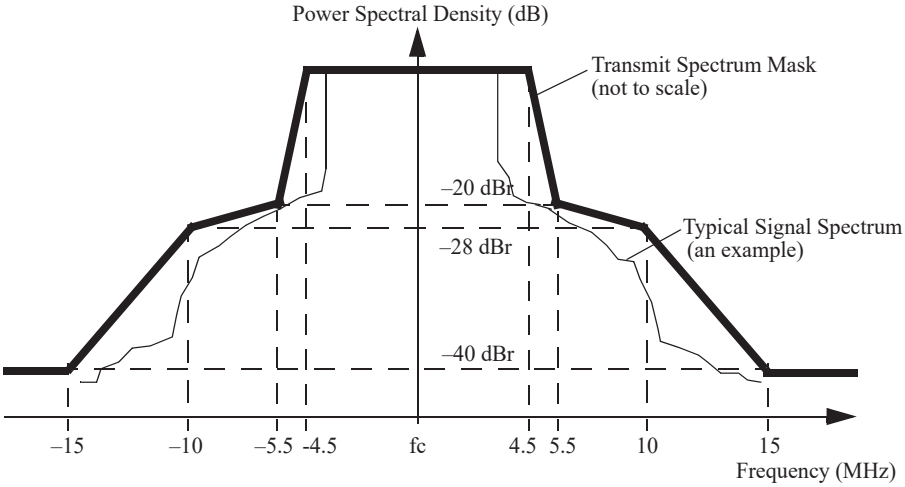

Figure 17-14—Transmit spectrum mask for 10 MHz transmission

For operation using 5 MHz channel spacing, the transmitted spectrum shall have a 0 dBr bandwidth not exceeding 4.5 MHz, –20 dBr at 2.75 MHz frequency offset, –28 dBr at 5 MHz frequency offset, and the maximum of –40 dBr and –47 dBm/MHz at 7.5 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 17-15 (Transmit

This is an unapproved IEEE Standards Draft, subject to change.

spectrum mask for 5 MHz transmission). The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

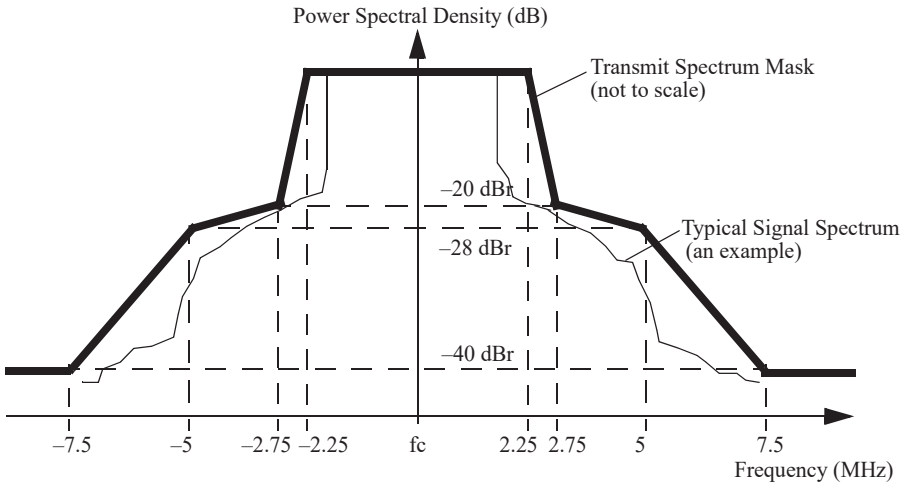

Figure 17-15—Transmit spectrum mask for 5 MHz transmission

17.3.9.4 Transmission spurious

Spurious transmissions shall comply with national regulations.

17.3.9.5 Transmit center frequency tolerance

The transmitted center frequency tolerance shall be ±20 ppm maximum for 20 MHz and 10 MHz channels and shall be ±10 ppm maximum for 5 MHz channels. The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

17.3.9.6 Symbol clock frequency tolerance

The symbol clock frequency tolerance shall be ±20 ppm maximum for 20 MHz and 10 MHz channels, and shall be ±10 ppm maximum for 5 MHz channels. The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

17.3.9.7 Modulation accuracy

17.3.9.7.1 Introduction

Transmit modulation accuracy specifications are described in 17.3.9.7 (Modulation accuracy). The test method is described in 17.3.9.8 (Transmit modulation accuracy test).

17.3.9.7.2 Transmitter center frequency leakage

For VHT STAs, the requirements on transmitter center frequency leakage are defined in 21.3.17.4.2 (Transmit center frequency leakage); otherwise, the requirements are defined in this subclause.

Certain transmitter implementations may cause leakage of the center frequency component. Such leakage (which manifests itself in a receiver as energy in the center frequency component) shall not exceed –15 dB relative to overall transmitted power or, equivalently, +2 dB relative to the average energy of the rest of the subcarriers. The data for this test shall be derived from the channel estimation phase.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

17.3.9.7.3 Transmitter spectral flatness

The average energy of the constellations in each of the spectral lines –16.. –1 and +1.. +16 shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the spectral lines –26.. –17 and +17.. +26 shall deviate no more than +4/–6 dB from the average energy of spectral lines –16.. –1 and +1.. +16. The data for this test shall be derived from the channel estimation step.

17.3.9.7.4 Transmitter constellation error

The relative constellation RMS error, averaged over subcarriers and OFDM PPDUs, shall not exceed a data-rate dependent value according to Table 17-17 (Allowed relative constellation error versus data rate).

Table 17-17—Allowed relative constellation error versus data rate

Relative constellation error (dB)	Modulation	Coding rate (R)
–5	BPSK	1/2
–8	BPSK	3/4
–10	QPSK	1/2
–13	QPSK	3/4
–16	16-QAM	1/2
–19	16-QAM	3/4
–22	64-QAM	2/3
–25	64-QAM	3/4

17.3.9.8 Transmit modulation accuracy test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples at 20 Msample/s or more, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc. A possible embodiment of such a setup is converting the signal to a low IF with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components.

The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or an equivalent procedure:

a) Start of frame shall be detected.

b) Transition from short sequences to channel estimation sequences shall be detected, and fine timing (with one sample resolution) shall be established.

c) Coarse and fine frequency offsets shall be estimated.

d) The packet shall be derotated according to estimated frequency offset.

e) The complex channel response coefficients shall be estimated for each of the subcarriers.

f) For each of the data OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to estimated phase, and divide each subcarrier value with a complex estimated channel response coefficient.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

g) For each data-carrying subcarrier, find the closest constellation point and compute the Euclidean distance from it.

h) Compute the RMS average of all errors in a packet. It is given by

$$Error_{RMS} = \frac{\sum_{i=1}^{N_f} \sqrt{\frac{\sum_{j=1}^{L_P} \left[\sum_{k=1}^{52} \{ (I(i,j,k) - I_0(i,j,k))^2 + (Q(i,j,k) - Q_0(i,j,k))^2 \} \right]}{52 L_P \times P_0}}}{N_f} \quad (17\text{-}28)$$

where

L_P is the length of the packet;

N_f is the number of frames for the measurement;

($I_0(i,j,k)$, $Q_0(i,j,k)$) denotes the ideal symbol point of the ith frame, j^{th} OFDM symbol of the frame, k^{th} sub-carrier of the OFDM symbol in the complex plane;

($I(i,j,k)$, $Q(i,j,k)$) denotes the observed point of the ith frame, j^{th} OFDM symbol of the frame, k^{th} subcarrier of the OFDM symbol in the complex plane (see Figure 17-16 (Constellation error));

P_0 is the average power of the constellation.

The vector error on a phase plane is shown in Figure 17-16 (Constellation error).

The test shall be performed over at least 20 frames (N_f), and the RMS average shall be taken. The packets under test shall be at least 16 OFDM symbols long. Random data shall be used for the symbols.

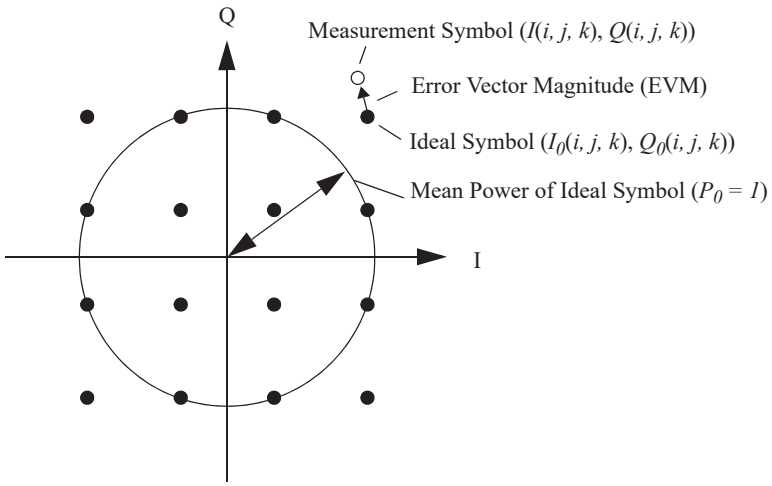

Figure 17-16—Constellation error

17.3.9.9 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is $20 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{20\ \text{MHz}} \right\rceil\right)$ sample/s

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where

f_H is the nominal center frequency in Hz of the highest channel in the channel set

f_L is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which frames providing measurements are transmitted, the channel set comprises channels uniformly spaced across $f_H - f_L \geq 50$ MHz

— FIRST_TRANSITION_FIELD is the Short symbols.

— SECOND_TRANSITION_FIELD is the Long symbols.

— TRAINING_FIELD is the Long symbols windowed in a manner which should approximate the windowing described in 17.3.2.5 (Mathematical conventions in the signal descriptions) with T_{TR} = 100 ns for 20 MHz channel spacing, T_{TR} = 200 ns for 10 MHz channel spacing and T_{TR} = 400 ns for 5 MHz channel spacing.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

17.3.10 PHY receiver specifications

17.3.10.1 Introduction

The receive specifications associated with the PHY sublayer are described in 17.3.10.2 (Receiver minimum input sensitivity) to 17.3.10.6 (CCA requirements).

17.3.10.2 Receiver minimum input sensitivity

The packet error ratio (PER) shall be 10% or less when the PSDU length is 1000 octets and the rate-dependent input level is as shown in Table 17-18 (Receiver performance requirements). The minimum input levels are measured at the antenna connector (noise factor of 10 dB and 5 dB implementation margins are assumed).

Table 17-18—Receiver performance requirements

Modulation	Coding rate (R)	Adjacent channel rejection (dB)	Alternate adjacent channel rejection (dB)	Minimum sensitivity (dBm) (20 MHz channel spacing)	Minimum sensitivity (dBm) (10 MHz channel spacing)	Minimum sensitivity (dBm) (5 MHz channel spacing)
BPSK	1/2	16	32	–82	–85	–88
BPSK	3/4	15	31	–81	–84	–87
QPSK	1/2	13	29	–79	–82	–85
QPSK	3/4	11	27	–77	–80	–83
16-QAM	1/2	8	24	–74	–77	–80
16-QAM	3/4	4	20	–70	–73	–76
64-QAM	2/3	0	16	–66	–69	–72
64-QAM	3/4	–1	15	–65	–68	–71

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

17.3.10.3 Adjacent channel rejection

The adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 17-18 (Receiver performance requirements) and raising the power of the interfering signal until 10% PER is caused for a PSDU length of 1000 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The interfering signal in the adjacent channel shall be a signal compliant with the OFDM PHY, unsynchronized with the signal in the channel under test. In an OFDM PHY the corresponding rejection shall be no less than specified in Table 17-18 (Receiver performance requirements).

An optional enhanced performance specification is provided for systems requiring improved immunity to out-of-channel interfering emissions. If a STA has dot11ACRType equal to 2, the adjacent channel rejection shall be no less than specified in Table 17-19 (Optional enhanced receiver performance requirements). The interfering signal in the adjacent channel shall be a signal compliant with the OFDM PHY, using transmit mask M (see D.2.4 (Transmit Mask M)), unsynchronized with the signal in the channel under test. The corresponding minimum receiver sensitivities for each modulation and coding rate are the same as in Table 17-18 (Receiver performance requirements).

NOTE—Transmit mask M is equivalent to class C (see D.2.2 (Transmit power levels)).

Table 17-19—Optional enhanced receiver performance requirements

Modulation	Coding rate (R)	Adjacent channel rejection (dB)	Nonadjacent channel rejection (dB)
BPSK	1/2	28	42
BPSK	3/4	27	41
QPSK	1/2	25	39
QPSK	3/4	23	37
16-QAM	1/2	20	34
16-QAM	3/4	16	30
64-QAM	2/3	12	26
64-QAM	3/4	11	25

17.3.10.4 Nonadjacent channel rejection

The nonadjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 17-18 (Receiver performance requirements), and raising the power of the interfering signal until a 10% PER occurs for a PSDU length of 1000 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The interfering signal in the nonadjacent channel shall be a signal compliant with the OFDM PHY, unsynchronized with the signal in the channel under test. In an OFDM PHY, the corresponding rejection shall be no less than specified in Table 17-18 (Receiver performance requirements).

An optional enhanced performance specification is provided for systems requiring improved immunity to out-of-channel interfering emissions. If a STA has dot11ACRType equal to 2, the nonadjacent channel rejection shall be no less than specified in Table 17-19 (Optional enhanced receiver performance requirements). The interfering signal in the nonadjacent channel shall be a signal compliant with the OFDM

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

PHY, using transmit mask M (see D.2.4 (Transmit Mask M)), unsynchronized with the signal in the channel under test. The corresponding minimum receiver sensitivities for each modulation and coding rate are the same as in Table 17-18 (Receiver performance requirements).

17.3.10.5 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 1000 octets, for a maximum input level of –30 dBm measured at the antenna for any baseband modulation.

17.3.10.6 CCA requirements

The PHY shall indicate a medium busy condition by issuing a PHY-CCA.indication primitive when the carrier sense/clear channel assessment (CS/CCA) mechanism detects a channel busy condition.

For the operating classes requiring CCA-Energy Detect (CCA-ED), the PHY shall also indicate a medium busy condition when CCA-ED detects a channel busy condition.

The start of a valid OFDM transmission at a receive level greater than or equal to the minimum modulation and coding rate sensitivity (–82 dBm for 20 MHz channel spacing, –85 dBm for 10 MHz channel spacing, and –88 dBm for 5 MHz channel spacing) shall cause CS/CCA to detect a channel busy condition with a probability > 90% within 4 μs for 20 MHz channel spacing, 8 μs for 10 MHz channel spacing, and 16 μs for 5 MHz channel spacing.

NOTE 1—CS/CCA detect time is based on finding the short sequences in the preamble, so when T_{SYM} doubles, so does CS/CCA detect time.

Additionally, the CS/CCA mechanism shall detect a medium busy condition within 4 μs of any signal with a received energy that is 20 dB above the minimum modulation and coding rate sensitivity (minimum modulation and coding rate sensitivity + 20 dB resulting in –62 dBm for 20 MHz channel spacing, –65 dBm for 10 MHz channel spacing, and –68 dBm for 5 MHz channel spacing).

For improved spectrum sharing, CCA-ED is required in some bands. The behavior class indicating CCA-ED is given in Table D-2 (Behavior limits). The operating classes requiring the corresponding CCA-ED behavior class are given in E.1 (Country information and operating classes). The PHY of a STA that is operating within an operating class that requires CCA-ED shall operate with CCA-ED.

CCA-ED shall detect a channel busy condition when the received signal strength exceeds the CCA-ED threshold as given by dot11OFDMEDThreshold. The CCA-ED thresholds for the operating classes requiring CCA-ED are subject to the criteria in D.2.5 (CCA-ED threshold).

NOTE 2—The requirement to detect a channel busy condition for any signal 20 dB above the minimum modulation and coding rate sensitivity (minimum modulation and coding rate sensitivity + 20 dB resulting in –62 dBm for 20 MHz channel spacing, –65 dBm for 10 MHz channel spacing, and –68 dBm for 5 MHz channel spacing) is a mandatory energy detect requirement on all Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) receivers. Support for CCA-ED is an additional requirement that relates specifically to the sensitivities described in D.2.5 (CCA-ED threshold).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

17.3.10.7 Received Channel Power Indicator Measurement

The RCPI indicator is a measure of the received RF power in the selected channel for a received frame. This parameter shall be a measure by the PHY of the received RF power in the channel measured over the entire received frame or by other equivalent means that meet the specified accuracy.

The RCPI encoding is defined in 15.4.6.6 (Received Channel Power Indicator Measurement).

RCPI shall equal the received RF power within an accuracy of ±5 dB (95% confidence interval) within the specified dynamic range of the receiver. The received RF power shall be determined assuming a receiver noise equivalent bandwidth equal to the channel bandwidth multiplied by 1.1.

17.3.11 Transmit PHY

The transmit PHY is shown in Figure 17-17 (Transmit PHY). In order to transmit data, the PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through STA management via the PLME. Other transmit parameters, such as DATARATE and TX power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 17.2.2 (TXVECTOR parameters).

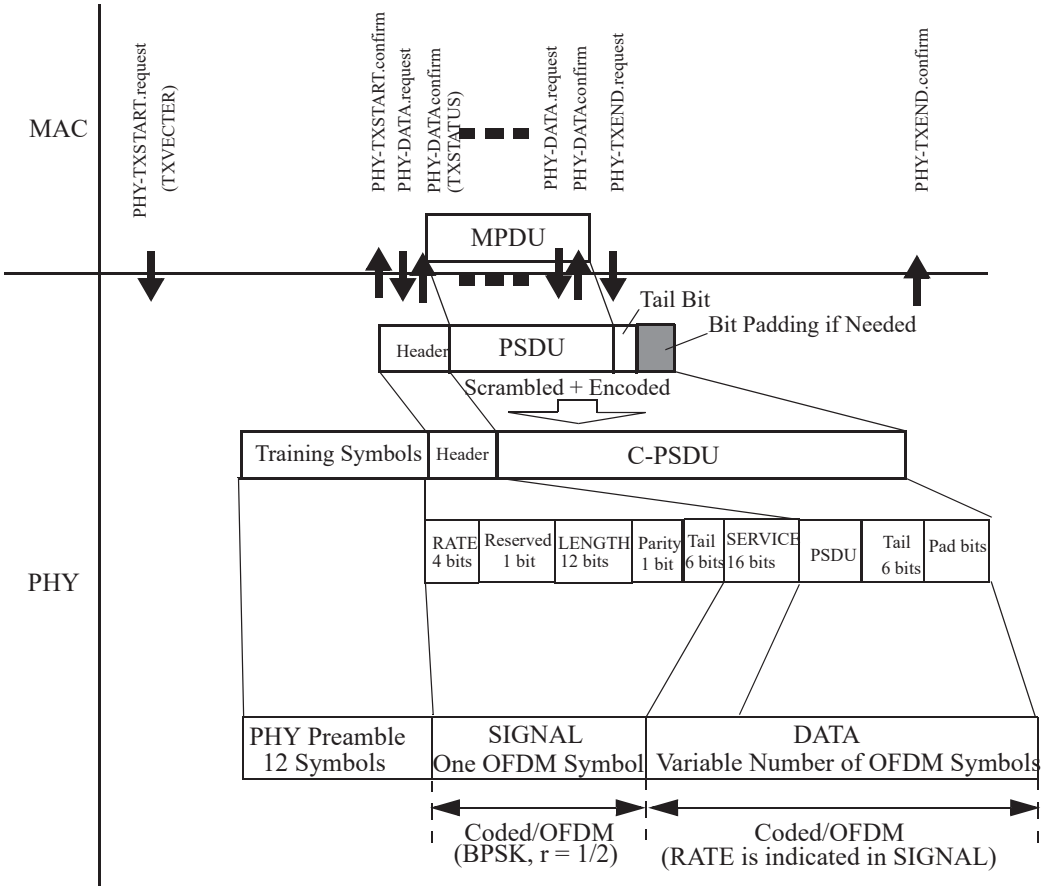

Figure 17-17—Transmit PHY

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The PHY shall indicate a clear channel by issuing a PHY-CCA.indication(IDLE) primitive. The MAC considers this indication before issuing the PHY-TXSTART.request primitive. Transmission of the PPDU shall be initiated after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are the PHY header parameters DATARATE, SERVICE, and LENGTH and the PHY parameters TXPWR_LEVEL_INDEX and TIME_OF_DEPARTURE_REQUESTED.

The PHY is configured with the TXVECTOR elements DATARATE and TXPWR_LEVEL_INDEX. Transmission of the PHY preamble and PHY header, based on the parameters passed in the PHY-TXSTART.request primitive, shall be immediately initiated.

Once PHY preamble transmission is started, the PHY entity shall immediately initiate PHY header encoding then data scrambling and data encoding, where the data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY. The modulation rate change, if any, shall be initiated from the SERVICE field data of the PHY header, as described in 17.3.2 (PPDU format).

The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The PHY header parameter, SERVICE, and PSDU are encoded by the convolutional encoder with the bit-stealing function described in 17.3.5.6 (Convolutional encoder). Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by the issuance of the PHY-TXEND.request primitive. Normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number supplied in the OFDM PHY preamble LENGTH field.

The packet transmission shall be completed and the PHY entity shall enter the receive state (i.e., PHY-TXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. If the coded PSDU (C-PSDU) length is not a multiple of the OFDM symbol length N_{CBPS}, the PSDU is padded prior to scrambling and coding (see 17.3.5.4 (Pad bits (PAD))).

In the PHY, the GI shall be inserted in every OFDM symbol as a countermeasure against severe delay spread.

A typical state machine implementation of the transmit PHY is provided in Figure 17-18 (PHY transmit state machine). Requests (.request) and confirmations (.confirm) are issued once with designated states.

This is an unapproved IEEE Standards Draft, subject to change.

17.3.12 Receive PHY

The receive PHY is shown in Figure 17-19 (Receive PHY). In order to receive data, the PHY-TXSTART.request primitive shall be disabled so that the PHY entity is in the receive state. Further, through STA management (via the PLME) the PHY is set to the appropriate frequency. Other receive parameters, such as RSSI, RCPI, and indicated DATARATE, may be accessed via the PHY SAP.

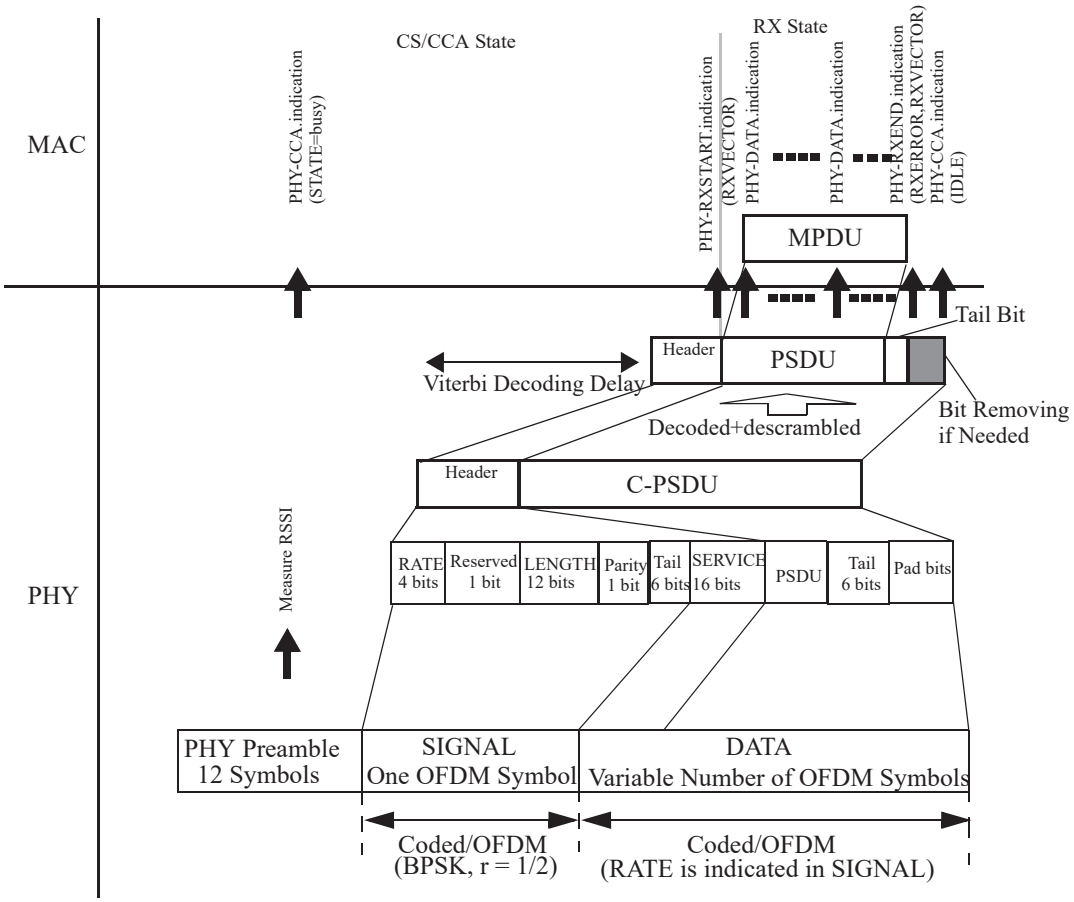

Figure 17-19—Receive PHY

Upon receiving the transmitted PHY preamble, the PHY measures the received signal strength level. This indicates activity to the MAC via PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY) primitive shall be issued for reception of a signal prior to correct reception of the PPDU. The RSSI parameter reported to the MAC in the RXVECTOR.

After a PHY-CCA.indication primitive is issued, the PHY entity shall begin receiving the training symbols and searching for the SIGNAL in order to set the length of the data stream, the demodulation type, and the decoding rate.

If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. If dot11TimingMsmtActivated is true, the PHY shall do the following:

— Complete receiving the PHY header and verify the validity of the PHY Header.

— If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 17.2.3 (RXVECTOR parameters)).

A VHT STA shall include the CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT parameters in the RXVECTOR within the PHY-RXSTART.indication(RXVECTOR) primitive.

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.57 (Timing measurement) in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the SIGNAL field, the SERVICE field, the PSDU length in octets, and the RSSI. Also, in this case, the CCA of the OFDM PHY shall indicate a busy medium for the intended duration of the transmitted frame, as indicated by the LENGTH field.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. The rate change indicated in the SIGNAL field shall be initiated from the SERVICE field data of the PHY header, as described in 17.3.2 (PPDU format). The PHY shall proceed with PSDU reception. After the reception of the final bit of the last PSDU octet indicated by the PHY preamble LENGTH field, the receiver shall be returned to the RX IDLE state, as shown in Figure 17-19 (Receive PHY). A PHY-RXEND.indication(NoError) primitive shall be issued.

In the event that a change in the RSSI causes the status of the CCA to return to the IDLE state before the complete reception of the PSDU, as indicated by the PHY LENGTH field, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive and the PHY receiver shall return to the RX IDLE state. The CCA of the OFDM PHY shall indicate a busy medium for the intended duration of the transmitted packet.

If the indicated rate in the SIGNAL field is not receivable, a PHY-RXSTART.indication primitive shall not be issued. The PHY shall indicate the error condition by issuing a PHY-RXEND.indication(UnsupportedRate) primitive and hold CCA busy for the calculated duration of the PPDU. If the PHY header is receivable, but the parity check of the PHY header is not valid, a PHY-RXSTART.indication primitive shall not be issued. The PHY shall indicate the error condition using a PHY-RXEND.indication(FormatViolation) primitive.

Any data received after the indicated data length are considered pad bits (to fill out an OFDM symbol) and should be discarded.

A typical state machine implementation of the receive PHY is given in Figure 17-20 (PHY receive state machine).

17.4 OFDM PLME

17.4.1 PLME SAP sublayer management primitives

Table 17-20 (MIB attribute default values/ranges) lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5 (PLME SAP interface).

17.4.2 OFDM PHY MIB

All OFDM PHY MIB attributes are defined in Annex C, with specific values defined in Table 17-20 (MIB attribute default values/ranges). The column titled “Operational semantics” in Table 17-20 (MIB attribute default values/ranges) contains two types: static and dynamic. Static MIB attributes are fixed and cannot be

17.4.3 OFDM TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated according to the following equation:

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIGNAL} + T_{SYM} \times N_{SYM} \quad (17\text{-}29)$$

where

$T_{PREAMBLE}$ is defined in Table 17-5 (Timing-related parameters)
T_{SIGNAL} is defined in Table 17-5 (Timing-related parameters)
T_{SYM} is defined in Table 17-5 (Timing-related parameters)
N_{SYM} is given by Equation (17-11).

17.4.4 OFDM PHY characteristics

The static OFDM PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 17-21 (OFDM PHY characteristics). The definitions for these characteristics are given in 6.5 (PLME SAP interface).

18. Extended Rate PHY (ERP) specification

18.1 Overview

18.1.1 General

This clause specifies further rate extension of the PHY for the DSSS system of Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) and the extensions of Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification). Hereinafter the PHY defined in this clause is known as the ERP. This PHY operates in the 2.4 GHz ISM band.

18.1.2 Introduction

The ERP builds on the payload data rates of 1 and 2 Mb/s, as described in Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), that use DSSS modulation and builds on the payload data rates of 1, 2, 5.5, and 11 Mb/s, as described in Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), that use DSSS and CCK. The ERP draws from Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) to provide additional payload data rates of 6, 9, 12, 18, 24, 36, 48, and 54 Mb/s. Of these rates, transmission and reception capability for 1, 2, 5.5, 6, 11, 12, and 24 Mb/s data rates is mandatory.

18.1.3 Operational modes

The radio portion of all Clause 18 (Extended Rate PHY (ERP) specification) systems implements all mandatory modes of Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), except it uses the 2.4 GHz frequency band and channelization plan specified in 16.3.6 (PHY operating specifications, general). The ERP has the capability to decode Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) and ERP PPDUs. An ERP shall be capable of sending and receiving the short preamble that is (and remains) optional for Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) PHYs.

The ERP has the capability to detect ERP and Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) preambles whenever a CCA is requested. Because protection mechanisms are not required in all cases, the ERP CCA mechanisms for all preamble types shall be active at all times.

An ERP BSS is capable of operating in any combination of available ERP modes (Clause 18 (Extended Rate PHY (ERP) specification) PHYs) and NonERP modes (Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) or Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) PHYs). For example, a BSS could operate in an ERP-OFDM-only mode, a mixed mode of ERP-OFDM and ERP-DSSS/CCK, or a mixed mode of ERP-DSSS/CCK and NonERP. When options are enabled, combinations are also allowed.

The changes to other parts of this standard required to implement the ERP are summarized as follows:

a) ERP-DSSS/CCK
   1) The PHY uses the capabilities of Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) with the following exceptions:
      i) Support of the short PPDU header format capability of 16.2.2.3 (Short PPDU format) is mandatory.
      ii) CCA (see 16.3.8.5 (CCA)) has a mechanism that detects all mandatory Clause 18 (Extended Rate PHY (ERP) specification) sync symbols.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

iii) The maximum input signal level (see 16.3.8.3 (Receiver maximum input level)) is –20 dBm.

iv) Locking the transmit center frequency and the symbol clock frequency to the same reference oscillator is mandatory.

b) ERP-OFDM

1) The PHY uses the capabilities of Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) with the following exceptions:

i) The frequency plan is in accordance with 16.3.6.2 (Operating frequency range) and 16.3.6.3 (Channel Numbering of operating channels) instead of 17.3.8.4 (Operating channel frequencies).

ii) CCA has a mechanism that detects all mandatory Clause 18 (Extended Rate PHY (ERP) specification) sync symbols.

iii) The frequency accuracy (see 17.3.9.5 (Transmit center frequency tolerance) and 17.3.9.6 (Symbol clock frequency tolerance)) is ±25 ppm.

iv) The maximum input signal level (see 17.3.10.5 (Receiver maximum input level)) is –20 dBm.

v) The value of the slot time is found in Table 18-5 (ERP characteristics).

vi) SIFS is 10 μs in accordance with 16.3.3 (HR/DSSS PHY). See 18.3.2.4 (ERP-OFDM PPDU format) for more detail.

The 2.4 GHz ISM band is a shared medium, and coexistence with other devices such as Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) and Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) STAs is an important issue for maintaining high performance in Clause 18 (Extended Rate PHY (ERP) specification) (ERP) STAs. The ERP modulation (ERP-OFDM) has been designed to coexist with existing Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications) and Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) STAs. This coexistence is achieved by several means, including virtual CS (RTS/CTS or CTS-to-self), CSMA/CA protocols, and MSDU fragmentation.

18.1.4 Scope

This clause specifies the ERP entity and the deviations from earlier clauses to accommodate it. It is organized by reference to the relevant earlier clauses to avoid excessive duplication.

The ERP consists of the following protocol functions:

a) A function that defines a method for mapping the MPDUs into a framing format suitable for sending and receiving user data and management information between two or more STAs using the associated PHY system. The PHY exchanges PPDUs that contain PSDUs. The MAC uses the PHY service, so each MPDU corresponds to a PSDU that is carried in a PPDU.

b) A function that defines the characteristics and method of transmitting and receiving data through a WM between two or more STAs; each using the ERP.

18.1.5 ERP functions

The ERP contains two functional entities: the PHY function and the layer management function.

The ERP service is provided to the MAC through the PHY service primitives described in Clause 8 (PHY service specification). Interoperability is addressed by use of the CS mechanism specified in 10.3.2.1 (CS mechanism) and the protection mechanism in 10.26 (Protection mechanisms). This mechanism allows NonERP STAs to know of ERP traffic that they cannot demodulate so that they may defer the medium to that traffic.

18.2 PHY-specific service parameter list

The architecture of the IEEE Std 802.11 MAC is intended to be PHY independent. Some PHY implementations require PHY-dependent MAC state machines running in the MAC sublayer in order to meet certain PHY requirements. The PHY-dependent MAC state machine resides in a sublayer defined as the MLME. In certain PHY implementations, the MLME may need to interact with the PLME as part of the normal PHY SAP primitives. These interactions are defined by the PLME parameter list currently defined in the PHY service primitives as TXVECTOR, TXSTATUS, and RXVECTOR. The list of these parameters and the values they may represent are defined in the specific PHY specifications for each PHY. This subclause addresses the TXVECTOR, TXSTATUS, and RXVECTOR for the ERP. The service parameters for TXVECTOR, TXSTATUS, and RXVECTOR shall follow 17.2.2 (TXVECTOR parameters), 17.2.4 (TXSTATUS parameters), and 17.2.3 (RXVECTOR parameters), respectively.

Several service primitives include a parameter vector. DATARATE and LENGTH are described in 8.3.4.4 (Vector descriptions). The remaining parameters are considered to be management parameters and are specific to this PHY.

The parameters in Table 18-1 (TXVECTOR parameters) are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request and PLME-TXTIME.request primitives.

Table 18-1—TXVECTOR parameters

Parameter	Value
DATARATE	The rate used to transmit the PSDU in Mb/s. Allowed value depends on value of MODULATION parameter: ERP-DSSS: 1 and 2 ERP-CCK: 5.5 and 11 ERP-OFDM: 6, 9, 12, 18, 24, 36, 48, and 54
LENGTH	The length of the PSDU in octets. Range: 1–4095
PREAMBLE_TYPE	The preamble used for the transmission of the PPDU. Enumerated type for which the allowed value depends on value of MODULATION parameter: ERP-OFDM: null ERP-DSSS, ERP-CCK: SHORTPREAMBLE, LONGPREAMBLE
MODULATION	The modulation used for the transmission of this PSDU. Enumerated type: ERP-DSSS, ERP-CCK, ERP-OFDM
SERVICE	The scrambler initialization vector. Null.
TXPWR_LEVEL_INDEX	The transmit power level index. The definition of these levels is up to the implementer. 1–8
TIME_OF_DEPARTURE_REQUESTED	false, true. When true, the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port; when false, the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.

The parameters in Table 18-2 (TXSTATUS parameters) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART. confirm service primitive.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 18-2—TXSTATUS parameters

Parameter	Value
TIME_OF_DEPARTURE	0 to 2^{32}– 1. The locally measured time when the first frame energy is sent by the transmitting port, in units equal to 1/ TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TIME_OF_DEPARTURE_ClockRate	0 to 2^{16}– 1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TX_START_OF_FRAME_OFFSET	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the frame was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC.

The parameters in Table 18-3 (RXVECTOR parameters) are defined as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive. When implementations require the use of these vectors, some or all of these parameters may be used in the vectors.

Table 18-3—RXVECTOR parameters

Parameter	Value
DATARATE	The rate at which the PSDU was received in Mb/s. Allowed value depends on value of MODULATION parameter: ERP-DSSS: 1 and 2 ERP-CCK: 5.5 and 11 ERP-OFDM: 6, 9, 12, 18, 24, 36, 48, and 54
LENGTH	The length of the PSDU in octets. Range: 1–4095
PREAMBLE_TYPE	The preamble type detected during reception of the PPDU. Enumerated type for which the allowed value depends on value of MODULATION parameter: ERP-OFDM: null ERP-DSSS, ERP-CCK: SHORTPREAMBLE, LONGPREAMBLE.
MODULATION	The modulation used for the reception of this PSDU. Enumerated types: ERP-DSSS, ERP-CCK, ERP-OFDM
SERVICE	Null.
RSSI	The RSSI is a measure of the RF energy received by the ERP. The 8-bit value is in the range 0 to RSSI maximum as described in 17.2.3.3 (RXVECTOR RSSI).
RCPI	The RCPI is a measure of the received channel power and is included when dot11RadioMeasurementActivated is true. The 8-bit RCPI value is described in 17.2.3.6 (RXVECTOR RCPI) and 16.3.8.6 (Received Channel Power Indicator Measurement).
RX_START_OF_FRAME _OFFSET	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.

18.3 Extended Rate PHY sublayer

18.3.1 Introduction

Subclause 18.3 (Extended Rate PHY sublayer) provides a PHY for the ERP. The convergence procedure specifies how PSDUs are converted to and from PPDUs at the transmitter and receiver. The PPDU is formed during data transmission by appending the PSDU to the Extended Rate PHY preamble and header. At the receiver, the PHY preamble and header are processed to aid in the demodulation and delivery of the PSDU.

18.3.2 PPDU format

18.3.2.1 General

An ERP STA shall support three different preamble and header formats. The first is the long preamble and header described in 18.3.2.2 (Long preamble PPDU format) (and based on 16.2.2.2 (Long PPDU format) with redefinition of reserved bits defined therein). This PPDU provides interoperability with Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) STAs when using the 1, 2, 5.5, and 11 Mb/s data rates. The second is the short preamble and header described in 18.3.2.3 (Short preamble PPDU format) (and based on 16.2.2.3 (Short PPDU format) where it is optional). The short preamble supports the rates 2, 5.5, and 11 Mb/s. The third is the ERP-OFDM preamble and header specified in 18.3.2.4 (ERP-OFDM PPDU format) (and based on 17.3.2 (PPDU format)).

18.3.2.2 Long preamble PPDU format

Figure 16-1 (Long PPDU format) of 16.2.2.2 (Long PPDU format) shows the basic format for the long preamble PPDU. This preamble is appropriate for use with the 1, 2, 5.5, and 11 Mb/s (Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification)) modes and is compatible with BSSs using these modes.

The SERVICE field is defined in 16.2.3.5 (Long PHY SERVICE field). An ERP STA shall set the Locked clocks bit to 1, when transmitting at a data rate described in Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification).

18.3.2.3 Short preamble PPDU format

Figure 16-2 (Short PPDU format) of 16.2.2.3 (Short PPDU format) shows the basic format for the short preamble PPDU. For the ERP, support for this preamble is mandatory. The short preamble is appropriate for use with 2, 5.5, and 11 Mb/s modes. The bits of the Short PHY SERVICE field and RATE field are the same as for the Long PHY SERVICE field and RATE field and are defined in 18.3.2.2 (Long preamble PPDU format).

18.3.2.4 ERP-OFDM PPDU format

The format, preamble, and headers for the ERP-OFDM PPDU are described in 17.3.2 (PPDU format) to 17.3.5 (DATA field). For the ERP-OFDM modes, the DATA field that contains the SERVICE field, the PSDU, the TAIL bits, and the PAD bits shall follow 17.3.5 (DATA field).

For ERP-OFDM modes, an ERP packet is followed by a period of no transmission with a duration of aSignalExtension called the signal extension. The purpose of this extension is to make the TXTIME calculation in 18.5.3 (TXTIME) result in a transmission duration interval that includes an additional duration of aSignalExtension. The SIFS for Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) packets is 16 μs, and the SIFS for Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) packets is 10 μs. The longer SIFS in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) is to allow extra time for the convolutional

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

decode process to finish. As Clause 18 (Extended Rate PHY (ERP) specification) packets use a SIFS of 10 μs, this extra aSignalExtension length extension causes the transmitter to compute the Duration field in the MAC header incorporating the aSignalDuration of "idle time" following each ERP-OFDM transmission, which causes the NAV value of Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) STAs to be set correctly.

The "CS mechanism" described in 10.3.2.1 (CS mechanism) combines the NAV state and the STA's transmitter status with physical CS to determine the busy/idle state of the medium. The time interval between frames is called the IFS. A STA shall determine that the medium is idle through the use of the CCA mechanism for the interval specified. The starting reference of slot boundaries is the end of the last symbol of the previous frame on the medium. For ERP-OFDM frames, this includes the length extension. For ERP-OFDM frames, a STA shall generate the PHY-RXEND.indication aSignalDuration after the end of the last symbol of the previous frame on the medium. This adjustment shall be performed by the STA based on local configuration information set using the PLME SAP.

18.3.3 PHY data modulation and rate change

18.3.3.1 Long and short preamble formats

The long and short PHY preamble and the long PHY header shall be transmitted using the 1 Mb/s DBPSK modulation. The short PHY header shall be transmitted using the 2 Mb/s modulation. The SIGNAL and SERVICE fields combined shall indicate the modulation and rate that shall be used to transmit the PSDU. The transmitter and receiver shall initiate the modulation and rate indicated by the SIGNAL and SERVICE fields, starting with the first octet of the PSDU. The PSDU transmission rate shall be set by the DATARATE parameter in the TXVECTOR, issued with the PHY-TXSTART.request primitive described in 16.3.5 (Vector descriptions).

Four modulation formats are mandatory, 1 Mb/s and 2 Mb/s ERP-DSSS and 5.5 Mb/s and 11 Mb/s ERP-CCK, and they are specified in 16.3.6.4 (Modulation and channel data rates).

18.3.3.2 ERP-OFDM format

PHY modulation and rate change for the ERP-OFDM frame format follows 17.3.7 (PHY data modulation and modulation rate change).

18.3.4 CCA

The PHY shall provide the capability to perform a CCA and report the results of the assessment to the MAC. The CCA mechanism shall detect a "medium busy" condition for all supported preamble and header types. That is, the CCA mechanism shall detect that the medium is busy for the PPDUs specified in 17.3.2 (PPDU format) and 16.2.2 (PPDU format). The CCA mechanism performance requirements are given in 18.4.6 (CCA performance).

The ERP shall provide the capability to perform CCA according to the following method:

> **CCA Mode** (ED and CS): A combination of CS and energy above threshold. CCA shall have a mechanism for CS that detects all mandatory Clause 18 (Extended Rate PHY (ERP) specification) sync symbols. This CCA's mode's CS shall include both Barker code sync detection and OFDM sync symbol detection. CCA shall report busy at least while a PPDU is being received with energy above the ED threshold at the antenna.

The PHY shall indicate a busy channel by issuing a PHY-CCA.indication(BUSY) primitive and shall indicate a clear channel by issuing a PHY-CCA.indication(IDLE) primitive.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

18.3.5 PHY receive procedure

This subclause describes the procedure used by receivers of the ERP. An ERP receiver shall be capable of receiving 1, 2, 5.5, and 11 Mb/s PPDUs using either the long or short preamble formats described in Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) and shall be capable of receiving 6, 12, and 24 Mb/s using the modulation and preamble described in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). The PHY may also implement the ERP-OFDM modulations at rates of 9, 18, 36, 48, and 54 Mb/s. The receiver shall be capable of detecting the preamble type (ERP-OFDM, short preamble, or long preamble) and the modulation type. These values shall be reported in the RXVECTOR (see 18.2 (PHY-specific service parameter list)).

Upon the receipt of a PPDU, the receiver shall first distinguish between the ERP-OFDM preamble and the single carrier modulations (long or short preamble). In the case where the preamble is an ERP-OFDM preamble, the PHY receive procedure shall follow the procedure described in 17.3.12 (Receive PHY). Otherwise, the receiver shall then distinguish between the long preamble and short preamble as specified in 16.2.2 (PPDU format). The receiver shall then demodulate the SERVICE field to determine the modulation type as specified in 18.3.2.2 (Long preamble PPDU format) or 18.3.2.3 (Short preamble PPDU format). For short preamble and long preamble using ERP-DSSS or ERP-CCK, the receiver shall then follow the receive procedure described in 16.2.6 (Receive PHY).

18.4 ERP operating specifications (general)

18.4.1 Introduction

Subclauses 18.4.2 (Regulatory requirements) to 18.4.7 (PHY transmit specifications) provide general specifications for the ERP sublayers. These specifications are based on 17.3.8 (PHY operating specifications (general)) except where noted.

18.4.2 Regulatory requirements

All systems shall comply with the appropriate regulatory requirements for operation in the 2.4 GHz band.

18.4.3 Operating channel frequencies

The ERP shall operate in the frequency ranges specified in 16.3.6.3 (Channel Numbering of operating channels), as allocated by regulatory bodies in the United States, Europe, and Japan. The channel numbering and the number of operating channels shall follow Table 16-6 (HR/DSSS PHY frequency channel plan) of 16.3.6.3 (Channel Numbering of operating channels).

18.4.4 Transmit and receive in-band and out-of-band spurious emissions

The ERP shall comply with in-band and out-of-band spurious emissions as set by the appropriate regulatory bodies for the 2.4 GHz band.

18.4.5 SIFS

The ERP shall use a SIFS of 10 μs.

18.4.6 CCA performance

The CCA shall indicate true if there is no CCA “medium busy” indication. The CCA parameters are subject to the following criteria:

a) When the start of a valid ERP-OFDM signal or valid ERP-DSSS/CCK sync symbols at a receive level greater than or equal to –82 dBm at the receiver antenna connector are present at the start of the

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

PHY slot, the receiver's CCA indicator shall report the channel busy with probability CCA_Detect_Probabilty within a aCCATime. CCA_Detect_Probabilty is the probability that the CCA does respond correctly to a valid signal and shall be at least 99% for the long slot time and at least 90% for the short slot time. The values for the other parameters are found in Table 18-5 (ERP characteristics). Note that the CCA Detect Probability and the power level are performance requirements.

b) In the event that a correct PHY header is received, the ERP shall hold the CCA signal inactive (channel busy) for the full duration, as indicated by the PHY LENGTH field. Should a loss of CS occur in the middle of reception, the CCA shall indicate a busy medium for the intended duration of the transmitted PPDU.

c) CCA shall report a busy medium upon detection of any energy above –62 dBm.

18.4.7 PHY transmit specifications

18.4.7.1 General

The PHY transmit specifications shall follow 17.3.9 (PHY transmit specifications) with the exception of the transmit power level (17.3.9.2 (Transmit power levels)), the transmit center frequency tolerance (17.3.9.5 (Transmit center frequency tolerance)), the symbol clock frequency tolerance (17.3.9.6 (Symbol clock frequency tolerance)), and the time of departure accuracy (17.3.9.9 (Time of Departure accuracy)). Regulatory requirements may have an effect on the combination of maximum transmit power and spectral mask if the resulting signals violate restricted band emission limits.

18.4.7.2 Transmit power levels

The maximum transmit power level shall meet the requirements of the local regulatory body.

18.4.7.3 Transmit spectral mask

The transmit spectral mask for the ERP-OFDM modes shall follow 17.3.9.3 (Transmit spectrum mask) and is shown in Figure 17-13 (Transmit spectrum mask for 20 MHz transmission) therein. The transmit spectral mask for the ERP-DSSS modes shall follow 16.3.7.4 (Transmit spectrum mask) and is shown in Figure 16-10 (Transmit spectrum mask) therein.

18.4.7.4 Transmit center frequency tolerance

The transmit center frequency tolerance shall be ± 25 ppm maximum. The transmit center frequency and symbol clock frequency shall be derived from the same reference oscillator (locked).

18.4.7.5 Symbol clock frequency tolerance

The symbol clock frequency tolerance shall be ± 25 ppm maximum. The transmit center frequency and symbol clock frequency shall be derived from the same reference oscillator (locked oscillators). This means that the error in ppm for the carrier and the symbol timing shall be the same.

18.4.7.6 Time of Departure accuracy

The time of departure specifications shall follow 17.3.9.9 (Time of Departure accuracy) for PPDUs transmitted using ERP-OFDM format and 16.3.7.10 (Time of Departure accuracy) for PPDUs transmitted using ERP-DSSS/CCK.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

18.4.8 PHY receive specifications

18.4.8.1 General

Subclause 18.4.8 (PHY receive specifications) describes the receive specifications for the PHY sublayer. The receive specification for the ERP-OFDM modes shall follow 17.3.10 (PHY receiver specifications) with the exception of the receiver maximum input level (17.3.10.5 (Receiver maximum input level)) and the adjacent channel rejection (17.3.10.3 (Adjacent channel rejection)). The receive specifications for the ERP-DSSS modes shall follow 16.3.8 (PHY receiver specifications) with the exception of the receiver maximum input level (16.3.8.3 (Receiver maximum input level)).

18.4.8.2 Receiver minimum input level sensitivity

The PER of the ERP-OFDM modes shall be less than 10% at a PSDU length of 1000 octets for the input levels of Table 17-18 (Receiver performance requirements) of 17.3.10 (PHY receiver specifications). Input levels are specific for each data rate and are measured at the antenna connector. A noise figure of 10 dB and an implementation loss of 5 dB are assumed. The PER of the ERP-DSSS modes shall be as specified in 16.3.8.2 (Receiver minimum input level sensitivity).

18.4.8.3 Adjacent channel rejection

Adjacent channels at 2.4 GHz are defined to be at ± 25 MHz spacing. The adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 17-18 (Receiver performance requirements) of 17.3.10 (PHY receiver specifications) and raising the power of the interfering signal until 10% PER is caused for a PSDU length of 1000 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The interfering signal in the adjacent channel shall be a signal compliant with the ERP, unsynchronized with the signal in the channel under test. In an ERP the corresponding rejection shall be no less than specified in Table 17-18 (Receiver performance requirements) of 17.3.10 (PHY receiver specifications).

The alternative adjacent channel rejection of Table 17-18 (Receiver performance requirements) shall not be required for the ERP.

The adjacent channel rejection of the ERP-DSSS modes shall follow 16.3.8.4 (Receiver adjacent channel rejection).

18.4.8.4 Receive maximum input level capability

The PER shall be less than 10% at a PSDU length of 1000 octets for an input level of –20 dBm measured at the antenna connector for any supported modulation signal or data rate (i.e., 1, 2, 5.5, 6, 9, 11, 12, 18, 22, 24, 33, 36, 48, 54 Mb/s).

18.5 ERP PLME

18.5.1 PLME SAP

Table 18-4 (MIB attribute default values/ranges) lists the additional MIB attributes that may be accessed by the PHY entities and the intralayer of higher LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5 (PLME SAP interface).

Copyright © 2016 IEEE. All rights reserved.

18.5.3 TXTIME

18.5.3.1 General

The value of TXTIME is calculated for each modulation type based on parameters in the TXVECTOR. For the 1, 2, 5.5, and 11 Mb/s modes with DSSS and CCK modulation formats, the value shall be calculated as described in 16.3.4 (HR/DSSS TXTIME calculation).

18.5.3.2 ERP-OFDM TXTIME calculations

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated using the ERP-OFDM TXTIME calculation as shown in Equation (18-1).

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIGNAL} + T_{SYM} \times \left\lceil \frac{16 + 8 \times \text{LENGTH} + 6}{N_{DBPS}} \right\rceil + T_{SE} \quad (18\text{-}1)$$

where

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$T_{PREAMBLE}$, T_{SIGNAL}, and T_{SYM}	are defined in Table 17-5 (Timing-related parameters) in 17.3.2.4 (Timing related parameters)
N_{DBPS}	is the number of data bits per symbol and is derived from the DATARATE parameter in Table 17-4 (Modulation-dependent parameters) in 17.3.2.3 (Modulation-dependent parameters)
T_{SE}	is aSignalExtension

18.5.4 ERP characteristics

The ERP characteristics in Table 18-5 (ERP characteristics) shall be used for the ERP for the purposes of MAC timing calculations.

Table 18-5—ERP characteristics

Characteristic	Value
aSlotTime	If dot11OperatingClassesRequired is false: Long = 20 μs Short = 9 μs If dot11OperatingClassesRequired is true: Long = 20 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-79 (Coverage Class field parameters)) Short = 9 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-79 (Coverage Class field parameters))
aSIFSTime	10 μs
aSignalExtension	6 μs
aCCATime	Implementation dependent, see 10.3.7 (DCF timing relations).
aRxPHYStartDelay	20 μs for ERP-OFDM, 192 μs for ERP-DSSS/CCK with long preamble, and 96 μs for ERP-DSSS/CCK with short preamble
aRxTxTurnaroundTime	Implementation dependent, see 10.3.7 (DCF timing relations).
aTxPHYDelay	Implementation dependent, see 10.3.7 (DCF timing relations).
aRxPHYDelay	Implementation dependent, see 10.3.7 (DCF timing relations).
aRxTxSwitchTime	Implementation dependent, see 10.3.7 (DCF timing relations).
aTxRampOnTime	Implementation dependent, see 10.3.7 (DCF timing relations).
aAirPropagationTime	As indicated by the coverage class (see 10.21.5 (Operation with coverage classes)).
aMACProcessingDelay	Implementation dependent, see 10.3.7 (DCF timing relations).
aPreambleLength	16 μs for ERP-OFDM, 144 μs for ERP-DSSS/CCK with long preamble, 72 μs for ERP-DSSS/CCK with short preamble
aPHYHeaderLength	4 μs for ERP-OFDM, 48 μs for ERP-DSSS/CCK with long preamble, 24 μs for ERP-DSSS/CCK with short preamble

Table 18-5—ERP characteristics *(continued)*

Characteristic	Value
aCWmin(1)	15
ACWmin	The set aCWmin()
aCWmax	1023

The long slot time indicated in Table 18-5 (ERP characteristics) shall be used unless the BSS consists only of ERP STAs that support the Short Slot Time option. STAs indicate support for a short slot time by setting the Short Slot Time subfield to 1 when transmitting Association Request and Reassociation Request frames. If the BSS consists of only ERP STAs that support the Short Slot Time option, an optional short slot time may be used. APs indicate usage of the short slot time indicated in Table 18-5 (ERP characteristics) by setting the Short Slot Time subfield to 1 in all Beacon, Probe Response, Association Response, and Reassociation Response frame transmissions as described in 9.4.1.4 (Capability Information field). A STA shall use short slot if the BSS indicates short slot.

19. High Throughput (HT) PHY specification

19.1 Introduction

19.1.1 Introduction to the HT PHY

Clause 19 (High Throughput (HT) PHY specification) specifies the PHY entity for a high throughput (HT) orthogonal frequency division multiplexing (OFDM) system.

In addition to the requirements found in Clause 19 (High Throughput (HT) PHY specification), an HT STA shall be capable of transmitting and receiving frames that are compliant with the mandatory PHY specifications defined as follows:

— In Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) when the HT STA is operating in a 20 MHz channel width in the 5 GHz band

— In Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) when the HT STA is operating in a 20 MHz channel width in the 2.4 GHz band

The HT PHY is based on the OFDM PHY defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), with extensibility up to four spatial streams, operating in 20 MHz bandwidth. Additionally, transmission using one to four spatial streams is defined for operation in 40 MHz bandwidth. These features are capable of supporting data rates up to 600 Mb/s (four spatial streams, 40 MHz bandwidth).

The HT PHY data subcarriers are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), or 64-QAM. Forward error correction (FEC) coding (convolutional coding) is used with a coding rate of 1/2, 2/3, 3/4, or 5/6. LDPC codes are added as an optional feature.

Other optional features at both transmit and receive sides are 400 ns (short) guard interval (GI), transmit beamforming, HT-greenfield format, and STBC.

The maximum HT PSDU length is 65 535 octets.

19.1.2 Scope

The services provided to the MAC by the HT PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PSDUs into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of HT PHY and Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), or Clause 18 (Extended Rate PHY (ERP) specification) PHYs.

19.1.3 HT PHY functions

19.1.3.1 General

The HT PHY contains two functional entities: the PHY and the layer management function (i.e., the PLME). Both of these functions are described in detail in 19.3 (HT PHY) and 19.4 (HT PLME).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The HT PHY service is provided to the MAC through the PHY service primitives defined in Clause 8 (PHY service specification).

19.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

19.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation. The service of a layer or sublayer is the set of capabilities that it offers to a user in the next higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

19.1.4 PPDU formats

The structure of the PPDU transmitted by an HT STA is determined by the TXVECTOR FORMAT, CH_BANDWIDTH, CH_OFFSET, and MCS parameters as defined in Table 19-1 (TXVECTOR and RXVECTOR parameters). The effect of the CH_BANDWIDTH, CH_OFFSET, and MCS parameters on PPDU format is described in 19.2.4 (Effect of CH_BANDWIDTH, CH_OFFSET, and MCS parameters on PPDU format).

The FORMAT parameter determines the overall structure of the PPDU as follows:

— *Non-HT format* **(NON_HT):** Packets of this format are structured according to the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) (OFDM) or Clause 18 (Extended Rate PHY (ERP) specification) (ERP) specification. Support for non-HT format is mandatory.

— *HT-mixed format* **(HT_MF):** Packets of this format contain a preamble compatible with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) receivers. The non-HT-STF (L-STF), the non-HT-LTF (L-LTF), and the non-HT SIGNAL field (L-SIG) are defined so they can be decoded by non-HT Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) STAs. The rest of the packet cannot be decoded by Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) or Clause 18 (Extended Rate PHY (ERP) specification) STAs. Support for HT-mixed format is mandatory.

— *HT-greenfield format* **(HT_GF):** HT packets of this format do not contain a non-HT compatible part. Support for HT-greenfield format is optional. An HT STA that does not support the reception of an HT-greenfield format packet shall be able to detect that an HT-greenfield format packet is an HT transmission (as opposed to a non-HT transmission). In this case, the receiver shall decode the HT-SIG and determine whether the HT-SIG cyclic redundancy check (CRC) passes.

19.2 HT PHY service interface

19.2.1 Introduction

The PHY interfaces to the MAC through the TXVECTOR, TXSTATUS, RXVECTOR, and PHYCONFIG_VECTOR. Using the TXVECTOR, the MAC supplies the PHY with per-PPDU transmit parameters. Status of the transmission is reported from PHY to MAC by parameters within TXSTATUS. Using the RXVECTOR, the PHY informs the MAC of the received packet parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of frame transmission or reception.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

This interface is an extension of the generic PHY service interface defined in 8.3.4 (Basic service and options).

19.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 19-1 (TXVECTOR and RXVECTOR parameters) are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

Table 19-1—TXVECTOR and RXVECTOR parameters

Parameter	Condition	Value	TXVECTOR	RXVECTOR
			See NOTE 1	
FORMAT		Determines the format of the PPDU. Enumerated type: NON_HT indicates Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), or Clause 18 (Extended Rate PHY (ERP) specification) PPDU formats or non-HT duplicate PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter. HT_MF indicates HT-mixed format. HT_GF indicates HT-greenfield format.	Y	Y
NON_HT_MODULATION	FORMAT is NON_HT	Enumerated type: ERP-DSSS ERP-CCK ERP-OFDM OFDM NON_HT_DUP_OFDM	Y	Y
	Otherwise	Not present		
L_LENGTH	FORMAT is NON_HT	Indicates the length of the PSDU in octets in the range 1 to 4095. This value is used by the PHY to determine the number of octet transfers that occur between the MAC and the PHY.	Y	Y
	FORMAT is HT_MF	Indicates the value in the Length field of the L-SIG in the range 1 to 4095. This use is defined in 10.26.4 (L_LENGTH and L_DATARATE parameter values for HT-mixed format PPDUs). This parameter may be used for the protection of more than one PPDU as described in 10.26.5 (L-SIG TXOP protection).	Y	Y
	FORMAT is HT_GF	Not present	N	N

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 19-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
			See NOTE 1	
L_DATARATE	FORMAT is NON_HT	Indicates the rate used to transmit the PSDU in megabits per second. Allowed values depend on the value of the NON_HT_MODULATION parameter as follows: ERP-DSSS: 1 and 2 ERP-CCK: 5.5 and 11 ERP-OFDM, NON_HT_DUP_OFDM: 6, 9, 12, 18, 24, 36, 48, and 54 OFDM: 6, 9, 12, 18, 24, 36, 48, and 54	Y	Y
	FORMAT is HT_MF	Indicates the data rate value that is in the L-SIG. This use is defined in 10.26.4 (L_LENGTH and L_DATARATE parameter values for HT-mixed format PPDUs).	Y	Y
	FORMAT is HT_GF	Not present	N	N
LSIGVALID	FORMAT is HT_MF	true if L-SIG Parity is valid false if L-SIG Parity is not valid	N	Y
	Otherwise	Not present	N	N
SERVICE	FORMAT is NON_HT and NON_HT_MODULATION is one of — ERP-OFDM — OFDM	Scrambler initialization, null	Y	N
	FORMAT is HT_MF or HT_GF	Scrambler initialization, null	Y	N
	Otherwise	Not present	N	N
TXPWR_LEVEL_INDEX		The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to 8. This parameter is used to indicate which of the available TxPowerLevel attributes defined in the MIB shall be used for the current transmission.	Y	N
RSSI		The allowed values for the RSSI parameter are in the range 0 to RSSI maximum. This parameter is a measure by the PHY of the power observed at the antennas used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. In HT-mixed format, the reported RSSI shall be measured during the reception of the HT-LTFs. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power.	N	Y

Table 19-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
			See NOTE 1	
PREAMBLE_TYPE	FORMAT is NON_HT and NON_HT_MODULATION is one of — ERP-DSSS — ERP-CCK	Enumerated type: SHORTPREAMBLE LONGPREAMBLE	Y	Y
	Otherwise	Not present	N	N
MCS	FORMAT is HT_MF or HT_GF	Selects the modulation and coding scheme used in the transmission of the packet. The value used in each MCS is the index defined in 19.5 (Parameters for HT MCSs). Integer: range 0 to 76. Values of 77 to 127 are reserved. The interpretation of the MCS index is defined in 19.5 (Parameters for HT MCSs).	Y	Y
	Otherwise	Not present	N	N
REC_MCS	FORMAT is HT_MF or HT_GF	Indicates the MCS that the STA's receiver recommends.	N	O
	Otherwise	Not present	N	N
CH_BANDWIDTH	FORMAT is HT_MF or HT_GF	Indicates whether the packet is transmitted using 40 MHz or 20 MHz channel width. Enumerated type: HT_CBW20 for 20 MHz and 40 MHz upper and 40 MHz lower modes HT_CBW40 for 40 MHz	Y	Y
	FORMAT is NON_HT	Enumerated type: NON_HT_CBW40 for non-HT duplicate format NON_HT_CBW20 for all other non-HT formats	Y	Y
CH_OFFSET		Indicates which portion of the channel is used for transmission. Refer to Table 19-2 (Interpretation of FORMAT, CH_BANDWIDTH and CH_OFFSET parameters) for valid combinations of CH_OFFSET and CH_BANDWIDTH. Enumerated type: CH_OFF_20 indicates the use of a 20 MHz channel (that is not part of a 40 MHz channel). CH_OFF_40 indicates the entire 40 MHz channel. CH_OFF_20U indicates the upper 20 MHz of the 40 MHz channel CH_OFF_20L indicates the lower 20 MHz of the 40 MHz channel.	Y	N
LENGTH	FORMAT is HT_MF or HT_GF	Indicates the length of an HT PSDU in the range 0 to 65 535 octets. A value of 0 indicates a NDP that contains no data symbols after the HT preamble (see 19.3.9 (HT preamble)).	Y	Y
	Otherwise	Not present	N	N

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 19-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
			See NOTE 1	
SMOOTHING	FORMAT is HT_MF or HT_GF	Indicates whether frequency domain smoothing is recommended as part of channel estimation. (See NOTE 2.) Enumerated type: SMOOTHING_REC indicates that smoothing is recommended. SMOOTHING_NOT_REC indicates that smoothing is not recommended.	Y	Y
	Otherwise	Not present	N	N
SOUNDING	FORMAT is HT_MF or HT_GF	Indicates whether this packet is a sounding packet. Enumerated type: SOUNDING indicates this is a sounding packet. NOT_SOUNDING indicates this is not a sounding packet.	Y	Y
	Otherwise	Not present	N	N
AGGREGATION	FORMAT is HT_MF or HT_GF	Indicates whether the PSDU contains an A-MPDU. Enumerated type: AGGREGATED indicates this PSDU has A-MPDU aggregation. NOT_AGGREGATED indicates this PSDU does not have A-MPDU aggregation.	Y	Y
	Otherwise	Not present	N	N
STBC	FORMAT is HT_MF or HT_GF	Indicates the difference between the number of space-time streams (N_{STS}) and the number of spatial streams (N_{SS}) indicated by the MCS as follows: 0 indicates no STBC ($N_{STS} = N_{SS}$). 1 indicates $N_{STS} - N_{SS} = 1$. 2 indicates $N_{STS} - N_{SS} = 2$. Value of 3 is reserved.	Y	Y
	Otherwise	Not present	N	N
FEC_CODING	FORMAT is HT_MF or HT_GF	Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code.	Y	Y
	Otherwise	Not present	N	N
GI_TYPE	FORMAT is HT_MF or HT_GF	Indicates whether a short guard interval is used in the transmission of the packet. Enumerated type: LONG_GI indicates short GI is not used in the packet. SHORT_GI indicates short GI is used in the packet.	Y	Y
	Otherwise	Not present	N	N

Copyright © 2016 IEEE. All rights reserved.

Table 19-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
			See NOTE 1	
NUM_EXTEN_SS	FORMAT is HT_MF or HT_GF	Indicates the number of extension spatial streams that are sounded during the extension part of the HT training in the range 0 to 3.	Y	Y
	Otherwise	Not present	N	N
ANTENNA_SET	FORMAT is HT_MF or HT_GF	Indicates which antennas of the available antennas are used in the transmission. The length of the field is 8 bits. A 1 in bit position *n,* relative to the LSB, indicates that antenna *n* is used. At most 4 bits out of 8 may be set to 1. This field is present only if ASEL is applied.	O	N
	Otherwise	Not present	N	N
N_TX	FORMAT is HT_MF or HT_GF	The N_TX parameter indicates the number of transmit chains.	Y	N
	Otherwise	Not present	N	N
EXPANSION_MAT	EXPANSION_MAT_TYPE is COMPRESSED_SV	Contains a set of compressed beamforming feedback matrices as defined in 19.3.12.3.6 (Compressed beamforming feedback matrix). The number of elements depends on the number of spatial streams and the number of transmit chains.	Y	N
	EXPANSION_MAT_TYPE is NON_COMPRESSED_SV	Contains a set of noncompressed beamforming feedback matrices as defined in 19.3.12.3.5 (Noncompressed beamforming feedback matrix). The number of complex elements is $N_{ST} \times N_r \times N_c$ where N_{ST} is the total number of subcarriers, N_c is the number of columns, and N_r is the number of rows in each matrix.	Y	N
	EXPANSION_MAT_TYPE is CSI_MATRICES	Contains a set of CSI matrices as defined in 19.3.12.3.2 (CSI matrices feedback). The number of complex elements is $N_{ST} \times N_r \times N_c$ where N_{ST} is the total number of subcarriers, N_c is the number of columns, and N_r is the number of rows in each matrix.	Y	N
	Otherwise	Not present	N	N
EXPANSION_MAT_TYPE	EXPANSION_MAT is present	Enumerated type: COMPRESSED_SV indicates that EXPANSION_MAT is a set of compressed beamforming feedback matrices. NON_COMPRESSED_SV indicates that EXPANSION_MAT is a set of noncompressed beamforming feedback matrices. CSI_MATRICES indicates that EXPANSION_MAT is a set of channel state matrices.	Y	N
	Otherwise	Not present	N	N

Table 19-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
			See NOTE 1	
CHAN_MAT	CHAN_MAT_TYPE is COMPRESSED_SV	Contains a set of compressed beamforming feedback matrices as defined in 19.3.12.3.6 (Compressed beamforming feedback matrix) based on the channel measured during the training symbols of the received PPDU. The number of elements depends on the number of spatial streams and the number of transmit chains.	N	Y
	CHAN_MAT_TYPE is NON_COMPRESSED_SV	Contains a set of noncompressed beamforming feedback matrices as defined in 19.3.12.3.5 (Noncompressed beamforming feedback matrix) based on the channel measured during the training symbols of the received PPDU. The number of complex elements is $N_{ST} \times N_r \times N_c$ where N_{ST} is the total number of subcarriers, N_c is the number of columns, and N_r is the number of rows in each matrix.	N	Y
	CHAN_MAT_TYPE is CSI_MATRICES	Contains a set of CSI matrices as defined in 19.3.12.3.2 (CSI matrices feedback) based on the channel measured during the training symbols of the received PPDU. The number of complex elements is $N_{ST} \times N_r \times N_c$ where N_{ST} is the total number of subcarriers, N_c is the number of columns, and N_r is the number of rows in each matrix.	N	Y
	Otherwise	Not present	N	N
CHAN_MAT_TYPE	FORMAT is HT_MF or HT_GF	Enumerated type: COMPRESSED_SV indicates that CHAN_MAT is a set of compressed beamforming vector matrices. NON_COMPRESSED_SV indicates that CHAN_MAT is a set of noncompressed beamforming vector matrices. CSI_MATRICES indicates that CHAN_MAT is a set of channel state matrices.	N	Y
	Otherwise	Not present	N	N
RCPI		Is a measure of the received RF power averaged over all of the receive chains in the data portion of a received frame. Refer to 19.3.19.6 (Received channel power indicator (RCPI) measurement) for the definition of RCPI.	N	Y
SNR	CHAN_MAT_TYPE is CSI_MATRICES	Is a measure of the received SNR per chain. SNR indications of 8 bits are supported. SNR shall be the decibel representation of linearly averaged values over the tones represented in each receive chain as described in 9.4.1.28 (CSI Report field)	N	Y
	CHAN_MAT_TYPE is COMPRESSED_SV or NON_COMPRESSED_SV	Is a measure of the received SNR per stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.29 (Noncompressed Beamforming Report field) and 9.4.1.30 (Compressed Beamforming Report field)	N	Y

Table 19-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
			See NOTE 1	
NO_SIG_EXTN	FORMAT is HT_MF or HT_GF Or FORMAT is NON_HT and NON_HT_MODULATION is NON_HT_DUP_OFDM	Indicates whether signal extension needs to be applied at the end of transmission. Boolean values: true indicates no signal extension is present. false indicates signal extension may be present depending on other TXVECTOR parameters (see 19.2.2 (TXVECTOR and RXVECTOR parameters)).	Y	N
	Otherwise	Not present	N	N
TIME_OF_DEPARTURE_REQUESTED		Enumerated type: true indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port. false indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.	O	N
RX_START_OF_FRAME_OFFSET		0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.	N	O

NOTE 1—In the "TXVECTOR" and "RXVECTOR" columns, the following apply:
Y = Present; N = Not present; O = Optional.
NOTE 2—Setting the smoothing bit is defined in 19.3.11.11.2 (Spatial mapping).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

19.2.3 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an HT PHY contains an OPERATING_CHANNEL parameter, which identifies the operating or primary channel. The PHY shall set dot11CurrentPrimaryChannel to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an HT PHY contains a SECONDARY_CHANNEL_OFFSET parameter, which takes one of the following values:

— SECONDARY_CHANNEL_NONE if no secondary channel is present; in this case the PHY shall set dot11CurrentSecondaryChannel to 0.

— SECONDARY_CHANNEL_ABOVE if the secondary channel is above the primary channel; in this case the PHY shall set dot11CurrentSecondaryChannel to dot11CurrentPrimaryChannel + 4.

— SECONDARY_CHANNEL_BELOW if the secondary channel is below the primary channel; in this case the PHY shall set dot11CurrentSecondaryChannel to dot11CurrentPrimaryChannel – 4.

19.2.4 Effect of CH_BANDWIDTH, CH_OFFSET, and MCS parameters on PPDU format

The structure of the PPDU transmitted by an HT STA is determined by the TXVECTOR FORMAT, CH_BANDWIDTH, CH_OFFSET, and MCS parameters as defined in Table 19-1 (TXVECTOR and RXVECTOR parameters). The effect of the FORMAT parameter is described in 19.1.4 (PPDU formats).

The operation of the PHY in the frequency domain is determined by the FORMAT, CH_BANDWIDTH and CH_OFFSET parameters. Table 19-2 (Interpretation of FORMAT, CH_BANDWIDTH and CH_OFFSET parameters) shows the valid combinations of FORMAT, CH_BANDWIDTH and CH_OFFSET and the corresponding PPDU format. Other combinations are reserved.

Table 19-2—Interpretation of FORMAT, CH_BANDWIDTH and CH_OFFSET parameters

FORMAT	CH_BANDWIDTH	CH_OFFSET
HF_MF, HF_GF	HT_CBW20	CH_OFF_20: *20 MHz HT format*—The STA has a 20 MHz operating channel width and transmits an HT-mixed or HT-greenfield format PPDU of 20 MHz bandwidth. CH_OFF_20U: *40 MHz HT upper format*—The STA transmits an HT-mixed or HT-greenfield format PPDU of 20 MHz bandwidth in the upper 20 MHz of a 40 MHz channel. CH_OFF_20L: *40 MHz HT lower format*—The STA transmits an HT-mixed or HT-greenfield format PPDU of 20 MHz bandwidth in the lower 20 MHz of a 40 MHz channel.
HT_MF, HT_GF	HT_CBW40	CH_OFF_40: *40 MHz HT format*—The STA transmits an HT-mixed or HT-greenfield format PPDU of 40 MHz bandwidth.
NON_HT	NON_HT_CBW20 and the SECONDARY_CHANNEL_OFFSET parameter of the PHYCONFIG_VECTOR is SECONDARY_CHANNEL_NONE	CH_OFF_20: *20 MHz non-HT format*—The STA has a 20 MHz operating channel width and transmits an ERP-DSSS, ERP-CCK, ERP-OFDM, or OFDM format PPDU.

This is an unapproved IEEE Standards Draft, subject to change.

Table 19-2—Interpretation of FORMAT, CH_BANDWIDTH and CH_OFFSET parameters *(continued)*

FORMAT	CH_BANDWIDTH	CH_OFFSET
NON_HT	NON_HT_CBW20 and the SECONDARY_CHANNEL_OFFSET parameter of the PHYCONFIG_VECTOR is SECONDARY_CHANNEL_BELOW	CH_OFF_20U: *40 MHz non-HT upper format*—The STA transmits an ERP-DSSS, ERP-CCK, ERP-OFDM, or OFDM format PPDU, in the upper 20 MHz of a 40 MHz channel.
NON_HT	NON_HT_CBW20 and the SECONDARY_CHANNEL_OFFSET parameter of the PHYCONFIG_VECTOR is SECONDARY_CHANNEL_ABOVE	CH_OFF_20L: *40 MHz non-HT lower format*—The STA transmits an ERP-DSSS, ERP-CCK, ERP-OFDM, or OFDM format PPDU, in the lower 20 MHz of a 40 MHz channel.
NON_HT	NON_HT_CBW40	CH_OFF_40: *Non-HT duplicate format*—The STA transmits an ERP-OFDM or OFDM format PPDU in each of the 20 MHz channels of a 40 MHz channel. The upper channel (higher frequency) is rotated by +90° relative to the lower channel. See 19.3.11.12 (Non-HT duplicate transmission).

NOTE—Support of 20 MHz non-HT format and 20 MHz HT format with one and two spatial streams is mandatory at APs. Support of 20 MHz non-HT format and 20 MHz HT format with one spatial stream is mandatory at non-AP STAs.

19.2.5 Support for NON_HT formats

When the FORMAT parameter is equal to NON_HT, the behavior of the HT PHY is defined in other clauses as shown in Table 19-3 (Mapping of the HT PHY parameters for NON_HT operation), dependent on the operational band. In this case, the PHY-TXSTART.request primitive is handled by mapping the TXVECTOR parameters as defined in Table 19-3 (Mapping of the HT PHY parameters for NON_HT operation) and following the operation as defined in the referenced clause. Likewise the PHY-RXSTART.indication primitive emitted when a non-HT PPDU is received is defined in the referenced

clauses, with mapping of RXVECTOR parameters as defined in Table 19-3 (Mapping of the HT PHY parameters for NON_HT operation).

NOTE—A dash (—) in an entry above indicates that the related parameter is not present.

Non-HT format PPDUs structured according to Clause 15 (DSSS PHY specification for the 2.4 GHz band designated for ISM applications), Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), Clause 16 (High rate direct sequence spread spectrum (HR/DSSS) PHY specification), or Clause 18 (Extended Rate PHY (ERP) specification) are transmitted

— Within the limits of the transmit spectrum mask specified in the respective clauses, or

— As non-HT duplicate PPDUs within the limits of the 40 MHz transmit spectrum mask defined in 19.3.18.1 (Transmit spectrum mask), or

— As 20 MHz format non-HT PPDUs, within the limits of the 40 MHz transmit spectrum mask defined in 19.3.18.1 (Transmit spectrum mask), in the upper (CH_BANDWIDTH of value NON_HT_CBW20 and CH_OFFSET of value CH_OFF_20U) or lower (CH_BANDWIDTH of value NON_HT_CBW20 and CH_OFFSET of value CH_OFF_20U) 20 MHz of the 40 MHz channel

Non-HT PPDUs transmitted using the 40 MHz transmit spectrum mask are referred to as 40 MHz mask non-HT PPDUs. Refer to 11.16.9 (STA CCA sensing in a 20/40 MHz BSS) for CCA sensing rules for transmission of 40 MHz mask non-HT PPDUs.

19.2.6 TXSTATUS parameters

The parameters listed in Table 19-4 (TXSTATUS parameter) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm(TXSTATUS) service primitive.

19.3 HT PHY

19.3.1 Introduction

Subclause 19.3 (HT PHY) provides a procedure in which PSDUs are converted to and from PPDUs. During transmission, the PSDU is processed (i.e., scrambled and coded) and appended to the PHY preamble to

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 19-4—TXSTATUS parameter

Parameter	Value
TIME_OF_DEPARTURE	0 to 2^{32}– 1. The locally measured time when the first frame energy is sent by the transmitting port, in units equal to 1/ TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TIME_OF_DEPARTURE_ClockRate	0 to 2^{16}– 1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TX_START_OF_FRAME_OFFSET	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the frame was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC.

create the PPDU. At the receiver, the PHY preamble is processed to aid in demodulation and delivery of the PSDU.

Two preamble formats are defined. For HT-mixed format operation, the preamble has a non-HT portion and an HT portion. The non-HT portion of the HT-mixed format preamble enables detection of the PPDU and acquisition of carrier frequency and timing by both HT STAs and STAs that are compliant with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and/or Clause 18 (Extended Rate PHY (ERP) specification). The non-HT portion of the HT-mixed format preamble also consists of the SIGNAL field defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and is thus decodable by STAs compliant with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) as well as HT STAs.

The HT portion of the HT-mixed format preamble enables estimation of the MIMO channel to support demodulation of the HT data by HT STAs. The HT portion of the HT-mixed format preamble also includes the HT-SIG field, which supports HT operation. The SERVICE field is prepended to the PSDU.

For HT-greenfield operation, compatibility with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) STAs is not required. Therefore, the non-HT portions of the preamble are not included in the HT-greenfield format preamble.

19.3.2 PPDU format

Two formats are defined for the PPDU: HT-mixed format and HT-greenfield format. These two formats are called *HT formats*. Figure 19-1 (PPDU format) shows the non-HT format[51] and the HT formats. There is also an MCS 32 format (specified in 19.3.11.11.5 (Transmission in MCS 32 format)) used for MCS 32 that provides the lowest rate in a 40 MHz channel. In addition to the HT formats, there is a non-HT duplicate format (specified in 19.3.11.12 (Non-HT duplicate transmission)) that duplicates the 20 MHz non-HT packet in two 20 MHz halves of a 40 MHz channel.

The elements of the PPDU are summarized in Table 19-5 (Elements of the HT PPDU).

[51] The non-HT format is shown related to the terminology of this subclause. The non-HT PPDU format is defined in 17.3.3 (PHY preamble (SYNC)) and 17.3.2 (PPDU format).

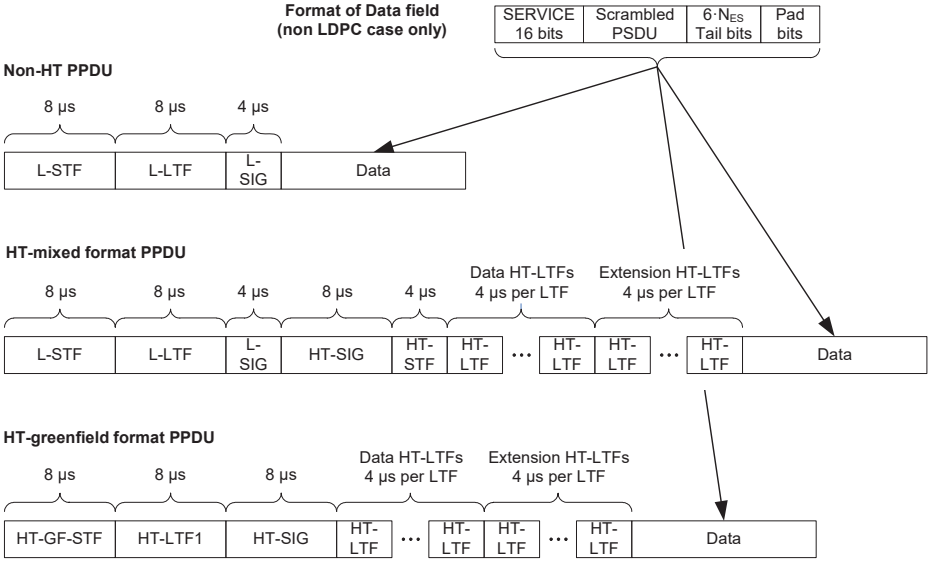

Figure 19-1—PPDU format

Table 19-5—Elements of the HT PPDU

Element	Description
L-STF	Non-HT Short Training field
L-LTF	Non-HT Long Training field
L-SIG	Non-HT SIGNAL field
HT-SIG	HT SIGNAL field
HT-STF	HT Short Training field
HT-GF-STF	HT-Greenfield Short Training field
HT-LTF1	First HT Long Training field (Data)
HT-LTFs	Additional HT Long Training fields (Data and Extension)
Data	The Data field includes the PSDU

The HT-SIG, HT-STF, HT-GF-STF, HT-LTF1, and HT-LTFs exist only in HT packets. In non-HT packets only the L-STF, L-LTF, L-SIG, and Data fields exist.

In both HT-mixed format and HT-greenfield format frames, there are two types of HT-LTFs: Data HT-LTFs (HT-DLTFs) and Extension HT-LTFs (HT-ELTFs). HT-DLTFs are always included in HT PPDUs to provide the necessary reference for the receiver to form a channel estimate that allows it to demodulate the data portion of the frame. The number of HT-DLTFs, $N_{HT\text{-}DLTF}$, may be 1, 2, or 4 and is determined by the number of space-time streams being transmitted in the frame (see Table 19-13 (Number of HT-DLTFs required for data space-time streams)). HT-ELTFs provide additional reference in sounding PPDUs so that the receiver can form an estimate of additional dimensions of the channel beyond those that are used by the data portion of the frame. The number of HT-ELTFs, $N_{HT\text{-}ELTF}$, may be 0, 1, 2, or 4 (see Table 19-14

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(Number of HT-ELTFs required for extension spatial streams)). PHY preambles in which HT-DLTFs are followed by HT-ELTFs are referred to as staggered preambles. The HT-mixed format and HT-greenfield format frames shown in Figure 19-1 (PPDU format) both contain staggered preambles for illustrative purposes.

Transmissions of frames with TXVECTOR parameter NO_SIG_EXTN equal to false are followed by a period of no transmission for a duration of aSignalExtension. See 10.3.8 (Signal Extension).

A Signal Extension shall be present in a transmitted PPDU, based on the parameters of the TXVECTOR, when the NO_SIG_EXTN parameter is equal to false and either of the following is true:

— The FORMAT parameter is equal to HT_MF or HT_GF.

— The FORMAT parameter is equal to NON_HT, and the NON_HT_MODULATION parameter is equal to ERP-OFDM, or NON_HT_DUP_OFDM.

A Signal Extension shall be assumed to be present (for the purpose of timing of PHY-RXEND.indication and PHY-CCA.indication primitives, as described below and in 19.3.21 (PHY receive procedure)) in a received PPDU when either of the following is true, based on the determined parameter values of the RXVECTOR:

— The FORMAT parameter is equal to HT_MF or HT_GF.

— The FORMAT parameter is equal to NON_HT, and the NON_HT_MODULATION parameter is equal to ERP-OFDM, or NON_HT_DUP_OFDM.

A PPDU containing a Signal Extension is called a *signal extended PPDU*. When transmitting a signal extended PPDU, the PHY-TXEND.indication primitive shall be emitted a period of aSignalExtension after the end of the last symbol of the PPDU. When receiving a signal extended PPDU, the PHY-RXEND.indication primitive shall be emitted a period of aSignalExtension after the end of the last symbol of the PPDU.

19.3.3 Transmitter block diagram

HT-mixed format and HT-greenfield format transmissions can be generated using a transmitter consisting of the following blocks:

a) *Scrambler* scrambles the data to reduce the probability of long sequences of 0s or 1s; see 19.3.11.3 (Scrambler).

b) *Encoder parser*, if BCC encoding is to be used, demultiplexes the scrambled bits among N_{ES} (number of BCC encoders for the Data field) BCC encoders, in a round robin manner.

c) *FEC encoders* encode the data to enable error correction. An FEC encoder may include a binary convolutional encoder followed by a puncturing device, or it may include an LDPC encoder.

d) *Stream parser* divides the outputs of the encoders into blocks that are sent to different interleaver and mapping devices. The sequence of the bits sent to an interleaver is called a *spatial stream*.

e) *Interleaver* interleaves the bits of each spatial stream (changes order of bits) to prevent long sequences of adjacent noisy bits from entering the BCC decoder. Interleaving is applied only when BCC encoding is used.

f) *Constellation mapper* maps the sequence of bits in each spatial stream to constellation points (complex numbers).

g) *STBC* encoder spreads constellation points from N_{SS} spatial streams into N_{STS} space-time streams using a space-time block code. STBC is used only when $N_{SS} < N_{STS}$; see 19.3.11.9.2 (Space-time block coding (STBC)).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

h) *Spatial mapper* maps space-time streams to transmit chains. This may include one of the following:
   1) *Direct mapping*: Constellation points from each space-time stream are mapped directly onto the transmit chains (one-to-one mapping).
   2) *Spatial expansion*: Vectors of constellation points from all of the space-time streams are expanded via matrix multiplication to produce the input to all of the transmit chains.
   3) *Beamforming*: Similar to spatial expansion, each vector of constellation points from all of the space-time streams is multiplied by a matrix of steering vectors to produce the input to the transmit chains.

i) *Inverse discrete Fourier transform (IDFT)* converts a block of constellation points to a time domain block.

j) *Cyclic shift (CSD) insertion* is where the insertion of the cyclic shifts prevents unintentional beamforming. CSD insertion may occur before or after the IDFT. There are three cyclic shift types as follows:
   1) A cyclic shift specified per transmitter chain with the values defined in Table 19-9 (Cyclic shift for non-HT portion of packet) (a possible implementation is shown in Figure 19-2 (Transmitter block diagram 1)).
   2) A cyclic shift specified per space-time stream with the values defined in Table 19-10 (Cyclic shift values of HT portion of packet) (a possible implementation is shown in Figure 19-3 (Transmitter block diagram 2)).
   3) A cyclic shift $M_{CSD}(k)$ that may be applied as a part of the spatial mapper; see 19.3.11.11.2 (Spatial mapping).

k) *GI insertion* prepends to the symbol a circular extension of itself.

l) *Windowing* optionally smooths the edges of each symbol to increase spectral decay.

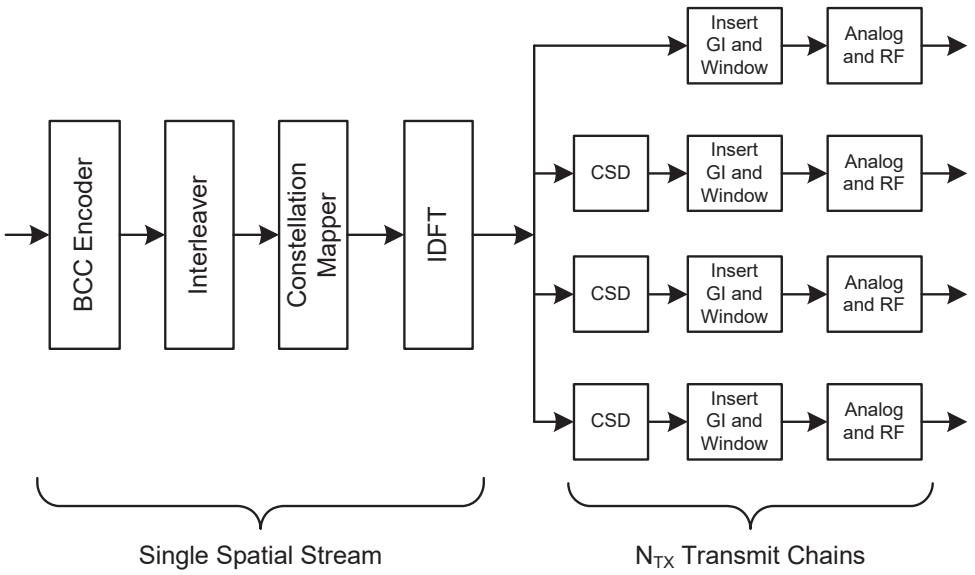
Figure 19-2 (Transmitter block diagram 1) and Figure 19-3 (Transmitter block diagram 2) show example transmitter block diagrams. In particular, Figure 19-2 (Transmitter block diagram 1) shows the transmitter blocks used to generate the HT-SIG of the HT-mixed format PPDU. These transmitter blocks are also used to generate the non-HT portion of the HT-mixed format PPDU, except that the BCC encoder and interleaver are not used when generating the L-STF and L-LTFs. Figure 19-3 (Transmitter block diagram 2) shows the transmitter blocks used to generate the Data field of the HT-mixed format and HT-greenfield format PPDUs. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right of, and including, the spatial mapping block, are also used to generate the HT-STF, HT-GF-STF, and HT-LTFs. The HT-greenfield format SIGNAL field is generated using the transmitter blocks shown in Figure 19-2 (Transmitter block diagram 1), augmented by additional CSD and spatial mapping blocks.

19.3.4 Overview of the PPDU encoding process

The encoding process is composed of the steps described below. The following overview is intended to facilitate an understanding of the details of the convergence procedure:

a) Determine the number of transmit chains, N_{TX}, from the N_TX field of the TXVECTOR. Produce the PHY preamble training fields for each of the N_{TX} transmit chains based on the FORMAT, NUM_EXTEN_SS, CH_BANDWIDTH, and MCS parameters of the TXVECTOR. The format and relative placement of the PHY preamble training fields vary depending on the frame format being used, as indicated by these parameters. Apply cyclic shifts. Determine spatial mapping to be used for HT-STF and HT-LTFs in HT-mixed format frame and HT-GF-STF and HT-LTFs in HT-greenfield format frame from the EXPANSION_MAT parameter of the TXVECTOR. Refer to 19.3.9 (HT preamble) for details.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.



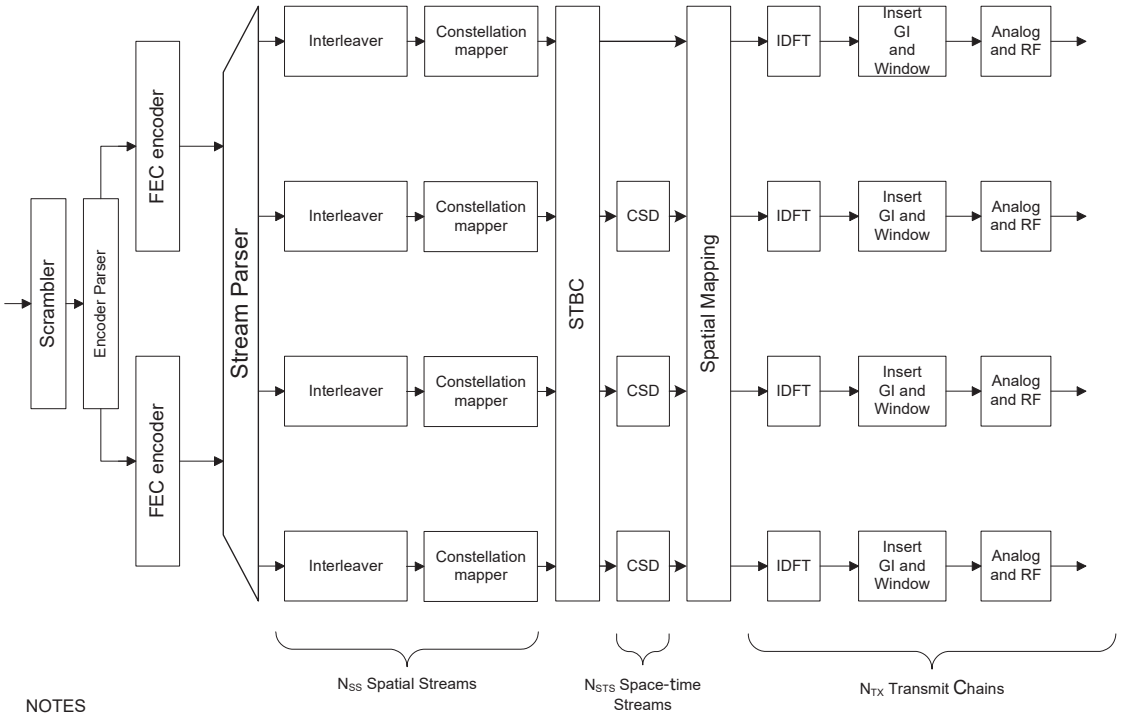


Figure 19-2—Transmitter block diagram 1

NOTES
—There might be 1 or 2 FEC encoders when BCC encoding is used.
—The stream parser might have 1, 2, 3 or 4 outputs.
—When LDPC encoding is used, the interleavers are not used
—When STBC is used, the STBC block has more outputs than inputs.
—When spatial mapping is used, there might be more transmit chains than space-time streams.
—The number of inputs to the spatial mapper might be 1, 2, 3, or 4.

Figure 19-3—Transmitter block diagram 2

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

b) Construct the PHY preamble SIGNAL fields from the appropriate fields of the TXVECTOR by adding tail bits, applying convolutional coding, formatting into one or more OFDM symbols, applying cyclic shifts, applying spatial processing, calculating an inverse Fourier transform for each OFDM symbol and transmit chain, and prepending a cyclic prefix or GI to each OFDM symbol in each transmit chain. The number and placement of the PHY preamble SIGNAL fields depend on the frame format being used. Refer to 19.3.9.3.5 (L-SIG definition), 19.3.9.4.3 (HT-SIG definition), and 19.3.9.5.4 (HT-greenfield format HT-SIG).

c) Concatenate the PHY preamble training and SIGNAL fields for each transmit chain one field after another, in the appropriate order, as described in 19.3.2 (PPDU format) and 19.3.7 (Mathematical description of signals).

d) Use the MCS and CH_BANDWIDTH parameters of the TXVECTOR to determine the number of data bits per OFDM symbol (N_{DBPS}), the coding rate (R), the number of coded bits in each OFDM subcarrier (N_{BPSC}), and the number of coded bits per OFDM symbol (N_{CBPS}). Determine the number of encoding streams (N_{ES}) from the MCS, CH_BANDWIDTH, and FEC_CODING parameters of the TXVECTOR. Refer to 19.3.11.4 (Coding) for details.

e) Append the PSDU to the SERVICE field (see 19.3.11.2 (SERVICE field)). If BCC encoding is to be used, as indicated by the FEC_CODING parameter of the TXVECTOR, tail bits are appended to the PSDU. If a single BCC encoder is used (i.e., when the value of N_{ES} is 1), the bit string is extended by 6 zero bits. If two BCC encoders are used (i.e., when the value of N_{ES} is 2), the bit string is extended by 12 zero bits. The number of symbols, N_{SYM}, is calculated according to Equation (19-32), and if necessary, the bit string is further extended with zero bits so that the resulting length is a multiple of $N_{SYM} \times N_{DBPS}$, as described in 19.3.11 (Data field). If LDPC encoding is to be used, as indicated by the FEC_CODING parameter of the TXVECTOR, the resulting bit string is padded, if needed, by repeating coded bits rather than using zero bits, as given in the encoding procedure of 19.3.11.7.5 (LDPC PPDU encoding process). The number of resulting symbols is given by Equation (19-41), and the number of repeated coded bits used for padding is given by Equation (19-42). The resulting bit string constitutes the DATA part of the packet.

f) Initiate the scrambler with a pseudorandom nonzero seed, generate a scrambling sequence, and exclusive-OR (XOR) it with the string of data bits, as described in 17.3.5.5 (PHY DATA scrambler and descrambler).

g) If BCC encoding is to be used, replace the scrambled zero bits that served as tail bits (6 bits if the value of N_{ES} is 1, or 12 bits if the value of N_{ES} is 2) following the data with the same number of nonscrambled zero bits, as described in 17.3.5.3 (PPDU TAIL field). (These bits return the convolutional encoder to the zero state.)

h) If BCC encoding is to be used and the value of N_{ES} is 2, divide the scrambled data bits between two BCC encoders by sending alternating bits to the two different encoders, as described in 19.3.11.5 (Encoder parsing operation for two BCC FEC encoders).

i) If BCC encoding is to be used, encode the extended, scrambled data string with a rate 1/2 convolutional encoder (see 17.3.5.6 (Convolutional encoder)). Omit (puncture) some of the encoder output string (chosen according to puncturing pattern) to reach the coding rate, *R*, corresponding to the TXVECTOR parameters MCS or L_DATARATE. Refer to 19.3.11.6 (Binary convolutional coding and puncturing) for details. If LDPC encoding is to be used, encode the scrambled data stream according to 19.3.11.7.5 (LDPC PPDU encoding process).

j) Parse the coded bit stream that results from the BCC encoding or LDPC encoding into N_{SS} spatial streams, where the value of N_{SS} is determined from the MCS parameter of the TXVECTOR. See 19.3.11.8.2 (Stream parser) for details.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

k) Divide each of the N_{SS} encoded and parsed spatial streams of bits into groups of $N_{CBPSS}(i)$ bits. If BCC encoding is to be used, within each spatial stream and group, perform an interleaving (reordering) of the bits according to a rule corresponding to $N_{BPSCS}(i)$, where i is the index of the spatial stream. Refer to 19.3.6 (Timing-related parameters) for details.

l) For each of the N_{SS} encoded, parsed, and interleaved spatial streams, divide the resulting coded and interleaved data string into groups of $N_{BPSCS}(i)$ bits, where i is the index of the spatial stream. For each of the bit groups, convert the bit group into a complex number according to the modulation encoding tables. Refer to 17.3.5.8 (Subcarrier modulation mapping) for details.

m) Divide the complex number string for each of the resulting N_{SS} spatial streams into groups of N_{SD} complex numbers, where the value of N_{SD} is determined from the CH_OFFSET parameter of TXVECTOR and the CH_BANDWIDTH parameter of TXVECTOR. Each such group is associated with one OFDM symbol in one spatial stream. In each group, the complex numbers are indexed 0 to $N_{SD}-1$, and these indices have an associated one-to-one correspondence with subcarrier indices via the mapping function $M^{r}(k)$ as described in 19.3.11.11 (OFDM modulation), 19.3.11.11.3 (Transmission in 20 MHz HT format), 19.3.11.11.4 (Transmission in 40 MHz HT format), 19.3.11.11.5 (Transmission in MCS 32 format), and 19.3.11.12 (Non-HT duplicate transmission).

n) If STBC is to be applied, as indicated by the STBC parameter in the TXVECTOR, operate on the complex number associated with each data subcarrier in sequential pairs of OFDM symbols as described in 19.3.11.9.2 (Space-time block coding (STBC)) to generate N_{STS} OFDM symbols for every N_{SS} OFDM symbols associated with the N_{SS} spatial streams. If STBC is not to be used, the number of space-time streams is the same as the number of spatial streams, and the sequences of OFDM symbols in each space-time stream are composed of the sequences of OFDM symbols in the corresponding spatial stream. In each group of N_{SD} resulting complex numbers in each space-time stream, the complex numbers indexed 0 to $N_{SD}-1$ are mapped onto OFDM subcarriers via the mapping function $M^{r}(k)$ as described in 19.3.11.11 (OFDM modulation), 19.3.11.11.3 (Transmission in 20 MHz HT format), 19.3.11.11.4 (Transmission in 40 MHz HT format), 19.3.11.11.5 (Transmission in MCS 32 format), and 19.3.11.12 (Non-HT duplicate transmission).

o) Determine whether 20 MHz or 40 MHz operation is to be used from the CH_BANDWIDTH parameter of the TXVECTOR. Specifically, when CH_BANDWIDTH is HT_CBW20 or NON_HT_CBW20, 20 MHz operation is to be used. When CH_BANDWIDTH is HT_CBW40 or NON_HT_CBW40, 40 MHz operation is to be used. For 20 MHz operation (with the exception of non-HT formats), insert four subcarriers as pilots into positions –21, –7, 7, and 21. The total number of the subcarriers, N_{ST}, is 56. For 40 MHz operation (with the exception of MCS 32 and non-HT duplicate format), insert six subcarriers as pilots into positions –53, –25, –11, 11, 25, and 53, resulting in a total of $N_{ST} = 114$ subcarriers. See 19.3.11.11.5 (Transmission in MCS 32 format) for pilot locations when using MCS 32 and 19.3.11.12 (Non-HT duplicate transmission) for pilot locations when using non-HT duplicate format. The pilots are modulated using a pseudorandom cover sequence. Refer to 19.3.11.10 (Pilot subcarriers) for details. For 40 MHz operation, apply a +90° phase shift to the complex value in each OFDM subcarrier with an index greater than 0, as described in 19.3.11.11.4 (Transmission in 40 MHz HT format), 19.3.11.11.5 (Transmission in MCS 32 format), and 19.3.11.12 (Non-HT duplicate transmission).

p) Map each of the complex numbers in each of the N_{ST} subcarriers in each of the OFDM symbols in each of the N_{STS} space-time streams to the N_{TX} transmit chain inputs. For direct-mapped operation, $N_{TX} = N_{STS}$, and there is a one-to-one correspondence between space-time streams and transmit chains. In this case, the OFDM symbols associated with each space-time stream are also associated

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

with the corresponding transmit chain. Otherwise, a spatial mapping matrix associated with each OFDM subcarrier, as indicated by the EXPANSION_MAT parameter of the TXVECTOR, is used to perform a linear transformation on the vector of N_{STS} complex numbers associated with each subcarrier in each OFDM symbol. This spatial mapping matrix maps the vector of N_{STS} complex numbers in each subcarrier into a vector of N_{TX} complex numbers in each subcarrier. The sequence of N_{ST} complex numbers associated with each transmit chain (where each of the N_{ST} complex numbers is taken from the same position in the N_{TX} vector of complex numbers across the N_{ST} subcarriers associated with an OFDM symbol) constitutes an OFDM symbol associated with the corresponding transmit chain. For details, see 19.3.11.11 (OFDM modulation). Spatial mapping matrices may include cyclic shifts, as described in 19.3.11.11.2 (Spatial mapping).

q) If the CH_BANDWIDTH and CH_OFFSET parameters of the TXVECTOR indicate that upper or lower 20 MHz are to be used in 40 MHz, move the complex numbers associated with subcarriers –28 to 28 in each transmit chain to carriers 4 to 60 in the upper channel or –60 to –4 in the lower channel. Note that this shifts the signal in frequency from the center of the 40 MHz channel to +10 MHz or –10 MHz offset from the center of the 40 MHz channel. The complex numbers in the other subcarriers are set to 0.

r) For each group of N_{ST} subcarriers and each of the N_{TX} transmit chains, convert the subcarriers to time domain using IDFT. Prepend to the Fourier-transformed waveform a circular extension of itself, thus forming a GI, and truncate the resulting periodic waveform to a single OFDM symbol length by applying time domain windowing. Determine the length of the GI according to the GI_TYPE parameter of the TXVECTOR. Refer to 19.3.11.11 (OFDM modulation) and 19.3.11.12 (Non-HT duplicate transmission) for details. When beamforming is not used, it is sometimes possible to implement the cyclic shifts in the time domain.

s) Append the OFDM symbols associated with each transmit chain one after another, starting after the final field of the PHY preamble. Refer to 19.3.2 (PPDU format) and 19.3.7 (Mathematical description of signals) for details.

t) Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 19.3.7 (Mathematical description of signals) for details. The transmit chains are connected to antenna elements according to ANTENNA_SET of the TXVECTOR if ASEL is applied.

19.3.5 Modulation and coding scheme (MCS)

The MCS is a value that determines the modulation, coding, and number of spatial channels. It is a compact representation that is carried in the HT-SIG. Rate-dependent parameters for the full set of MCSs are shown in Table 19-27 (MCS parameters for mandatory 20 MHz, N_{SS} = 1, N_{ES} = 1) through Table 19-41 (MCS parameters for optional 40 MHz, N_{SS} = 4, UEQM) (in 19.5 (Parameters for HT MCSs)). These tables give rate-dependent parameters for MCSs with indices 0 to 76. MCSs with indices 0 to 7 and 32 have a single spatial stream; MCSs with indices 8 to 31 have multiple spatial streams using equal modulation (EQM) on all of the streams; MCSs with indices 33 to 76 have multiple spatial streams using unequal modulation (UEQM) on the spatial streams. MCS indices 77 to 127 are reserved.

Table 19-27 (MCS parameters for mandatory 20 MHz, N_{SS} = 1, N_{ES} = 1) through Table 19-30 (MCS parameters for optional 20 MHz, N_{SS} = 4, N_{ES} = 1, EQM) show rate-dependent parameters for EQM MCSs for one, two, three, and four streams for 20 MHz operation. Table 19-31 (MCS parameters for optional 40 MHz, N_{SS} = 1, N_{ES} = 1) through Table 19-34 (MCS parameters for optional 40 MHz, N_{SS} = 4, EQM) show rate-dependent parameters for EQM MCSs in one, two, three, and four streams for 40 MHz operation. The same EQM MCSs are used for 20 MHz and 40 MHz operation. Table 19-35 (MCS parameters for optional

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

40 MHz MCS 32 format, N_{SS} = 1, N_{ES} = 1) shows rate-dependent parameters for the 40 MHz, 6 Mb/s MCS 32 format.

The remaining tables, Table 19-36 (MCS parameters for optional 20 MHz, N_{SS} = 2, N_{ES} = 1, UEQM) to Table 19-41 (MCS parameters for optional 40 MHz, N_{SS} = 4, UEQM), show rate-dependent parameters for the MCSs with UEQM of the spatial streams for use with $N_{SS} > 1$.

UEQM MCSs are detailed in the following tables:

— Table 19-36 (MCS parameters for optional 20 MHz, N_{SS} = 2, N_{ES} = 1, UEQM) through Table 19-38 (MCS parameters for optional 20 MHz, N_{SS} = 4, N_{ES} = 1, UEQM) are for 20 MHz operation.

— Table 19-39 (MCS parameters for optional 40 MHz, N_{SS} = 2, N_{ES} = 1, UEQM) through Table 19-41 (MCS parameters for optional 40 MHz, N_{SS} = 4, UEQM) are for 40 MHz operation.

An HT STA shall support all equal modulation (EQM) rates for one spatial stream (MCSs 0 to 7) using a 20 MHz channel width. An HT AP that is not a VHT AP shall support all EQM rates for two spatial streams (MCSs 8 to 15) using a 20 MHz channel width. All other MCSs and modes are optional, specifically including transmit and receive support of 400 ns GI, operation in 40 MHz, and support of MCSs with indices 16 to 76.

19.3.6 Timing-related parameters

Table 19-6 (Timing-related constants) defines the timing-related parameters.

Table 19-6—Timing-related constants

Parameter	TXVECTOR CH_BANDWIDTH			
	NON_HT_CBW20	HT_CBW_20	HT_CBW40 or NON_HT_CBW40	
			HT format	MCS 32 and non-HT duplicate
N_{SD}: Number of complex data numbers	48	52	108	48
N_{SP}: Number of pilot values	4	4	6	4
N_{ST}: Total number of subcarriers See NOTE 1	52	56	114	104
N_{SR}: Highest data subcarrier index	26	28	58	58
Δ_F : Subcarrier frequency spacing	312.5 kHz (20 MHz/64)	312.5 kHz	312.5 kHz (40 MHz/128)	
T_{DFT}: IDFT/DFT period	3.2 µs	3.2 µs	3.2 µs	
T_{GI}: Guard interval duration	0.8 µs= T_{DFT}/4	0.8 µs	0.8 µs	
T_{GI2}: Double guard interval	1.6 µs	1.6 µs	1.6 µs

Table 19-6—Timing-related constants *(continued)*

Parameter	TXVECTOR CH_BANDWIDTH			
	NON_HT_CBW20	HT_CBW_20	HT_CBW40 or NON_HT_CBW40	
			HT format	MCS 32 and non-HT duplicate
T_{GIS}: Short guard interval duration	N/A	0.4 μs = T_{DFT}/8	0.4 μs See NOTE 2	
$T_{L\text{-}STF}$: Non-HT short training sequence duration	8 μs=10× T_{DFT}/4	8 μs	8 μs	
$T_{HT\text{-}GF\text{-}STF}$: HT-greenfield short training field duration	N/A	8 μs=10× T_{DFT}/4	8 μs See NOTE 2	
$T_{L\text{-}LTF}$: Non-HT long training field duration	8 μs=2× T_{DFT}+T_{GI2}	8 μs	8 μs	
T_{SYM}: Symbol interval	4 μs= T_{DFT}+T_{GI}	4 μs	4 μs	
T_{SYMS}: Short GI symbol interval	N/A	3.6 μs = T_{DFT}+T_{GIS}	3.6 μs See NOTE 2	
$T_{L\text{-}SIG}$: Non-HT SIGNAL field duration	4 μs= T_{SYM}	4 μs	4 μs	
$T_{HT\text{-}SIG}$: HT SIGNAL field duration	N/A	8 μs= 2T_{SYM}	8 μs See NOTE 2	
$T_{HT\text{-}STF}$: HT short training field duration	N/A	4 μs	4 μs See NOTE 2	
$T_{HT\text{-}LTF1}$: First HT long training field duration	N/A	4 μs in HT-mixed format, 8 μs in HT-greenfield format	4 μs in HT-mixed format, 8 μs in HT-greenfield format See NOTE 2	
$T_{HT\text{-}LTFs}$: Second, and subsequent, HT long training fields duration	N/A	4 μs	4 μs See NOTE 2	

NOTE 1—N_{ST}=N_{SD}+N_{SP} except in the cases of MCS 32 and non-HT duplicate, where the number of data subcarriers differs from the number of complex data numbers, and the number of pilot subcarriers differs from the number of pilot values. In those cases, data numbers and pilot values are replicated in upper and lower 20 MHz portions of 40 MHz signal to make a total of 104 subcarriers.
NOTE 2—Not applicable in non-HT formats.
NOTE 3—N/A = Not applicable.

Table 19-7 (Frequently used parameters) defines parameters used frequently in Clause 19 (High Throughput (HT) PHY specification).

Table 19-7—Frequently used parameters

Symbol	Explanation
N_{CBPS}	Number of coded bits per symbol
$N_{CBPSS}(i)$	Number of coded bits per symbol per the *i*-th spatial stream
N_{DBPS}	Number of data bits per symbol
N_{BPSC}	Number of coded bits per single carrier
$N_{BPSCS}(i)$	Number of coded bits per single carrier for spatial stream *i*
N_{RX}	Number of receive chains
N_{STS}	Number of space-time streams
N_{SS}	Number of spatial streams
N_{ESS}	Number of extension spatial streams
N_{TX}	Number of transmit chains
N_{ES}	Number of BCC encoders for the Data field
$N_{HT\text{-}LTF}$	Number of HT Long Training fields (see 19.3.9.4.6 (HT-LTF definition))
$N_{HT\text{-}DLTF}$	Number of Data HT Long Training fields
$N_{HT\text{-}ELTF}$	Number of Extension HT Long Training fields
R	Coding rate

19.3.7 Mathematical description of signals

For the description of the convention on mathematical description of signals, see 17.3.2.5 (Mathematical conventions in the signal descriptions).

In the case of either a 20 MHz non-HT format (TXVECTOR parameter FORMAT equal to NON_HT, MODULATION parameter equal to one of {ERP-OFDM, OFDM}) transmission or a 20 MHz HT format (TXVECTOR parameter FORMAT equal to HT_MF or HT_GF, CH_BANDWIDTH equal to HT_CBW_20) transmission, the channel is divided into 64 subcarriers. In the 20 MHz non-HT format, the signal is transmitted on subcarriers –26 to –1 and 1 to 26, with 0 being the center (dc) carrier. In the 20 MHz HT format, the signal is transmitted on subcarriers –28 to –1 and 1 to 28.

In the case of the 40 MHz HT format, a 40 MHz channel is used. The channel is divided into 128 subcarriers. The signal is transmitted on subcarriers –58 to –2 and 2 to 58.

In the case of 40 MHz HT upper format or 40 MHz HT lower format, the upper or lower 20 MHz is divided into 64 subcarriers. The signal is transmitted on subcarriers –60 to –4 in the case of a 40 MHz HT lower format transmission and on subcarriers 4 to 60 in the case of a 40 MHz HT upper format transmission.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In the case of the MCS 32 and non-HT duplicate formats, the same data are transmitted over two adjacent 20 MHz channels. In this case, the 40 MHz channel is divided into 128 subcarriers, and the data are transmitted on subcarriers –58 to –6 and 6 to 58.

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (19-1).

$$r_{RF}(t) = \mathrm{Re}\{r(t)\exp(j2\pi f_c t)\} \tag{19-1}$$

where

f_c is the center frequency of the carrier

The transmitted RF signal is derived by modulating the complex baseband signal, which consists of several fields. The timing boundaries for the various fields are shown in Figure 19-4 (Timing boundaries for PPDU fields).

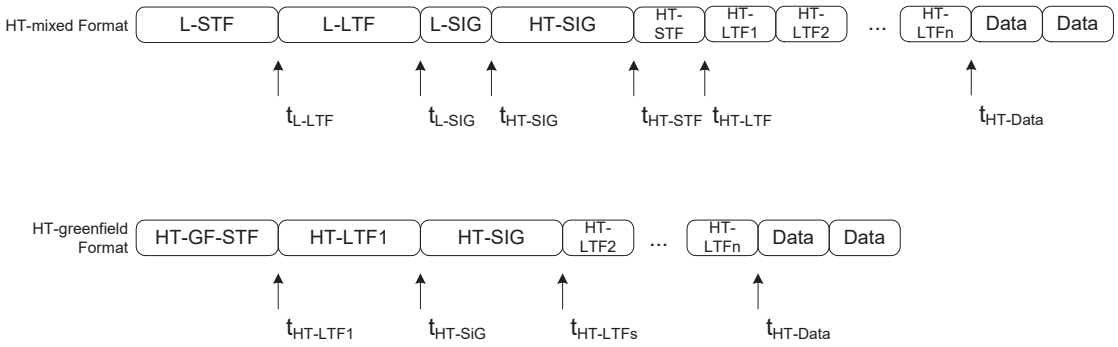

Figure 19-4—Timing boundaries for PPDU fields

The time offset, t_{Field}, determines the starting time of the corresponding field.

In HT-mixed format, the signal transmitted on transmit chain i_{TX} shall be as shown in Equation (19-2).

$$\begin{aligned} r_{PPDU}^{(i_{TX})}(t) = {} & r_{L\text{-}STF}^{(i_{TX})}(t) + r_{L\text{-}LTF}^{(i_{TX})}(t - t_{L\text{-}LTF}) \\ & + r_{L\text{-}SIG}^{(i_{TX})}(t - t_{L\text{-}SIG}) + r_{HT\text{-}SIG}^{(i_{TX})}(t - t_{HT\text{-}SIG}) + r_{HT\text{-}STF}^{(i_{TX})}(t - t_{HT\text{-}STF}) \\ & + \sum_{i_{LTF}=1}^{N_{HTLTF}} r_{HT\text{-}LTF}^{(i_{TX}, i_{LTF})}(t - t_{HT\text{-}LTF} - (i_{LTF} - 1)T_{HT\text{-}LTFs}) + r_{HT\text{-}DATA}^{(i_{TX})}(t - t_{HT\text{-}DATA}) \end{aligned} \tag{19-2}$$

where

$t_{L\text{-}LTF} = T_{L\text{-}STF}$

$t_{L\text{-}SIG} = t_{L\text{-}LTF} + T_{L\text{-}LTF}$

$t_{HT\text{-}SIG} = t_{L\text{-}SIG} + T_{L\text{-}SIG}$

$t_{HT\text{-}STF} = t_{HT\text{-}SIG} + T_{HT\text{-}SIG}$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$t_{HT\text{-}LTF} = t_{HT\text{-}STF} + T_{HT\text{-}STF}$$
$$t_{HT\text{-}Data} = t_{HT\text{-}LTF} + N_{HT\text{-}LTF} \cdot T_{HT\text{-}LTFs}$$

In the case of HT-greenfield format, the transmitted signal on transmit chain i_{TX} shall be as shown in Equation (19-3).

$$\begin{aligned} r_{PPDU}^{(i_{TX})}(t) = {} & r_{HT-GF-STF}^{(i_{TX})}(t) + r_{HT-LTF1}^{(i_{TX})}(t - t_{HT-LTF1}) \\ & + r_{HT-SIG}^{(i_{TX})}(t - t_{HT-SIG}) \\ & + \sum_{i_{LTF}=2}^{N_{HTLTF}} r_{HT-LTF}^{(i_{TX}, i_{LTF})}(t - t_{HT-LTFs} - (i_{LTF} - 2)T_{HT-LTFs}) \\ & + r_{HT-DATA}^{(i_{TX})}(t - t_{HT-DATA}) \end{aligned} \tag{19-3}$$

where

$$t_{HT-LTF1} = T_{HT-GF-STF}$$
$$t_{HT\text{-}SIG} = t_{HT\text{-}LTF1} + T_{HT\text{-}LTF1}$$
$$t_{HT\text{-}LTFs} = t_{HT\text{-}SIG} + T_{HT\text{-}SIG}$$
$$t_{HT\text{-}Data} = t_{HT\text{-}LTFs} + (N_{HT\text{-}LTF} - 1) \cdot T_{HT\text{-}LTFs}$$

Each baseband waveform, $r_{\text{Field}}^{(i_{TX})}(t)$, is defined via the discrete Fourier transform (DFT) per OFDM symbol as shown in Equation (19-4).

$$r_{\text{Field}}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{Field}}^{\text{Tone}} \cdot N_{TX}}} w_{\text{T}_{\text{Field}}}(t) \sum_k \Upsilon_k X_k^{(i_{TX})} \exp(j2\pi k \Delta_F t) \tag{19-4}$$

This general representation holds for all fields. A suggested definition of the windowing function, $w_{\text{T}_{\text{Field}}}(t)$, is given in 17.3.2.5 (Mathematical conventions in the signal descriptions). The frequency domain symbols $X_k^{(i_{TX})}$ represent the output of any spatial processing in subcarrier k for transmit chain i_{TX} required for the field.

The function Υ_k is used to represent a rotation of the upper tones in a 40 MHz channel as shown in Equation (19-5) and Equation (19-6).

$$\Upsilon_k = \begin{cases} 1, k \le 0, \text{ in a 40 MHz channel} \\ j, k > 0, \text{ in a 40 MHz channel} \end{cases} \tag{19-5}$$

$$\Upsilon_k = 1, \text{ in a 20 MHz channel} \tag{19-6}$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The $1/\sqrt{N_{\text{Field}}^{\text{Tone}} \cdot N_{TX}}$ scale factor in Equation (19-4) causes the total power of the time domain signal as summed over all transmit chains to be either 1 or lower than 1 when required. Table 19-8 (Value of tone scaling factor) summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$.

Table 19-8—Value of tone scaling factor N_{Field}^{Tone}

Field	N_{Field}^{Tone}, see NOTE 1	
	20 MHz	40 MHz
L-STF	12	24
HT-GF-STF	12	24
L-LTF	52	104
L-SIG	52	104
HT-SIG	52/56, see NOTE 2	104/114, see NOTE 2
HT-STF	12	24
HT-LTF	56	114
HT-DATA	56	114
MCS 32	—	104
Non-HT Duplicate	—	104

NOTE 1—The numbers in the table refer only to the value of N_{Field}^{Tone} as it appears in Equation (19-4) and in subsequent specification of various fields. This value might be different from the actual number of tones being transmitted.

NOTE 2—The values 56 and 114 are for HT-greenfield format; the values 52 and 104 are for HT-mixed format.

19.3.8 Transmission in the upper/lower 20 MHz of a 40 MHz channel

When transmitting in the upper/lower 20 MHz portion of a 40 MHz channel, the mathematical definition of transmission shall follow that of a 20 MHz channel with f_c in Equation (19-1) replaced by $f_c \pm 10$ MHz.

This rule applies to 20 MHz HT transmission in the upper/lower 20 MHz of a 40 MHz channel (TXVECTOR primitive CH_BANDWIDTH equal to HT_CBW20 and CH_OFFSET primitive equal to CH_OFF_20U or CH_OFF_20L) and to 20 MHz non-HT transmission in the upper/lower 20 MHz of a 40 MHz channel (TXVECTOR primitive CH_BANDWIDTH equal to NON_HT_CBW20 and CH_OFFSET primitive equal to CH_OFF_20U or CH_OFF_20L).

19.3.9 HT preamble

19.3.9.1 Introduction

The HT preambles are defined in HT-mixed format and in HT-greenfield format to carry the required information to operate in a system with multiple transmit and multiple receive antennas.

In the HT-mixed format, to provide compatibility with non-HT STAs, specific non-HT fields are defined so that they can be received by non-HT STAs compliant with Clause 17 (Orthogonal frequency division

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

multiplexing (OFDM) PHY specification) or Clause 18 (Extended Rate PHY (ERP) specification) followed by the fields specific to HT STAs.

In the HT-greenfield format, all of the non-HT fields are omitted. The specific HT fields used are as follows:

— One HT-GF-STF for automatic gain control convergence, timing acquisition, and coarse frequency acquisition,

— One or several HT-LTFs, provided as a way for the receiver to estimate the channel between each spatial mapper input and receive chain. The first HT-LTFs (HT-DLTFs) are necessary for demodulation of the HT-Data portion of the PPDU and are followed, for sounding packets only, by optional HT-LTFs (HT-ELTFs) to sound extra spatial dimensions of the MIMO channel,

— HT-SIG, which provides all the information required to interpret the HT packet format.

In the case of multiple transmit chains, the HT preambles use cyclic shift techniques to prevent unintentional beamforming.

19.3.9.2 HT-mixed format preamble

In HT-mixed format frames, the preamble has fields that support compatibility with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) STAs and fields that support HT operation. The non-HT portion of the HT-mixed format preamble enables detection of the PPDU and acquisition of carrier frequency and timing by both HT STAs and STAs that are compliant with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) or Clause 18 (Extended Rate PHY (ERP) specification). The non-HT portion of the HT-mixed format preamble contains the SIGNAL field (L-SIG) defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and is thus decodable by STAs compliant with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) as well as HT STAs.

The HT portion of the HT-mixed format preamble enables estimation of the MIMO channel to support demodulation of the data portion of the frame by HT STAs. The HT portion of the HT-mixed format preamble also contains the HT-SIG field that supports HT operation.

19.3.9.3 Non-HT portion of the HT-mixed format preamble

19.3.9.3.1 Introduction

The transmission of the non-HT training fields and the L-SIG as part of an HT-mixed format packet is described in 19.3.9.3.2 (Cyclic shift definition) through 19.3.9.3.5 (L-SIG definition).

19.3.9.3.2 Cyclic shift definition

The cyclic shift values defined in this subclause apply to the non-HT fields in the HT-mixed format preamble and the HT-SIG in the HT-mixed format preamble.

Cyclic shifts are used to prevent unintentional beamforming when the same signal or scalar multiples of one signal are transmitted through different spatial streams or transmit chains. A cyclic shift of duration T_{CS} on a signal $s(t)$ on interval $0 \le t \le T$ is defined as follows, where T is defined as T_{DFT} as referenced in Table 19-6 (Timing-related constants).

With $T_{CS} \le 0$, replace $s(t)$ with $s(t - T_{CS})$ when $0 \le t < T + T_{CS}$ and with $s(t - T_{CS} - T)$ when $T + T_{CS} \le t \le T$. The cyclic-shifted signal is defined as shown in Equation (19-7).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$s_{CS}(t;T_{CS})\big|_{T_{CS}<0} = \begin{cases} s(t-T_{CS}) & 0 \le t < T + T_{CS} \\ s(t-T_{CS}-T) & T + T_{CS} \le t \le T \end{cases} \quad (19\text{-}7)$$

The cyclic shift is applied to each OFDM symbol in the packet separately. Table 19-9 (Cyclic shift for non-HT portion of packet) specifies the values for the cyclic shifts that are applied in the L-STF (in an HT-mixed format packet), the L-LTF, and L-SIG. It also applies to the HT-SIG in an HT-mixed format packet.

Table 19-9—Cyclic shift for non-HT portion of packet

$T_{CS}^{i_{TX}}$ values for non-HT portion of packet				
Number of transmit chains	**Cyclic shift for transmit chain 1 (ns)**	**Cyclic shift for transmit chain 2 (ns)**	**Cyclic shift for transmit chain 3 (ns)**	**Cyclic shift for transmit chain 4 (ns)**
1	0	—	—	—
2	0	–200	—	—
3	0	–100	–200	—
4	0	–50	–100	–150

With more than four transmit chains, each cyclic shift on the additional transmit chains shall be between –200 ns and 0 ns inclusive.

19.3.9.3.3 L-STF definition

The L-STF is identical to the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) short training symbol. The non-HT short training OFDM symbol in the 20 MHz channel width is shown in Equation (19-8).

$$\begin{aligned} S_{-26,26} = \sqrt{1/2} \\ \{&0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, \\ &0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0\} \end{aligned} \quad (19\text{-}8)$$

The normalization factor $\sqrt{1/2}$ is the QPSK normalization.

The non-HT short training OFDM symbol in a 40 MHz channel width is given by Equation (19-9), after rotating the tones in the upper subchannel (subcarriers 6–58) by +90° (see Equation (19-10)).

$$\begin{aligned} S_{-58,58} = \sqrt{1/2} \\ \{&0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, \\ &0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, \\ &0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, \\ &0, 0, 0, 0, 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0\} \end{aligned} \quad (19\text{-}9)$$

In HT-mixed format, the L-STF on transmit chain i_{TX} shall be as shown in Equation (19-10).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$r_{L-STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-STF}^{Tone}}} w_{T_{L-STF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \Upsilon_k S_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{TX}})) \quad (19\text{-}10)$$

where

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} and takes values from Table 19-9 (Cyclic shift for non-HT portion of packet)

Υ_k is defined in Equation (19-5) and Equation (19-6)

The L-STF has a period of 0.8 µs. The entire STF includes ten such periods, with a total duration of $T_{L\text{-}STF}$ = 8 µs.

19.3.9.3.4 L-LTF definition

The non-HT long training OFDM symbol is identical to the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) long training OFDM symbol. In the 20 MHz channel width, the long training OFDM symbol is given by Equation (19-11).

$$L_{-26,26} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 0, 1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (19\text{-}11)$$

The non-HT long training OFDM symbol in a 40 MHz channel width is given by Equation (19-12), after rotating the tones in the upper subchannel (subcarriers 6–58) by +90° (see Equation (19-13)).

$$L_{-58,58} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 0, 1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 0, 1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 1\} \quad (19\text{-}12)$$

The subcarriers at ± 32 in 40 MHz, which are the dc subcarriers for the non-HT 20 MHz transmission, are both nulled in the L-LTF. Such an arrangement allows proper synchronization of a 20 MHz non-HT STA.

The L-LTF waveform shall be as shown in Equation (19-13).

$$r_{L-LTF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-LTF}^{Tone}}} w_{T_{L-LTF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \Upsilon_k L_k \exp(j2\pi k \Delta_F (t - T_{GI2} - T_{CS}^{i_{TX}})) \quad (19\text{-}13)$$

where

T_{GI2} is 1.6 µs

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} and takes values specified in Table 19-9 (Cyclic shift for non-HT portion of packet)

Υ_k is defined in Equation (19-5) and Equation (19-6)

The entire LTF includes two 3.2 µs IDFT/DFT periods and an additional 1.6 µs double GI. The entire LTF is modulated with the L-LTF waveform.

This is an unapproved IEEE Standards Draft, subject to change.

19.3.9.3.5 L-SIG definition

The L-SIG is used to communicate rate and length information.The structure of the L-SIG is shown in Figure 19-5 (L-SIG structure).

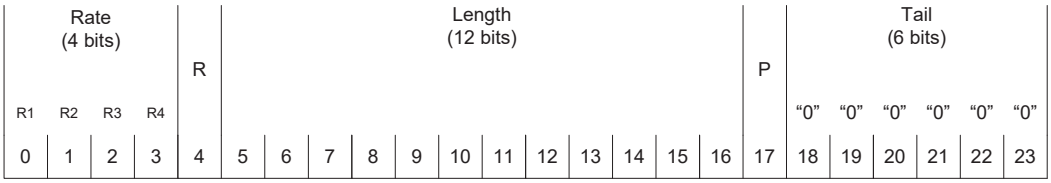

Figure 19-5—L-SIG structure

The value in the Rate field is obtained from the L_DATARATE field of the TXVECTOR. The value in the Length field is obtained from the L_LENGTH field of the TXVECTOR. The Length field is transmitted LSB first.

The reserved bit shall be set to 0.

The parity field has the even parity of bits 0–16.

The L-SIG shall be encoded, interleaved and mapped, and it shall have pilots inserted following the steps described in 17.3.5.6 (Convolutional encoder), 17.3.5.7 (Data interleaving), and 17.3.5.9 (Pilot subcarriers). The stream of 48 complex numbers generated by the steps described in 17.3.5.7 (Data interleaving) is denoted by $d_k, k = 0 \ldots 47$. The time domain waveform of the L-SIG in 20 MHz transmission shall be as given by Equation (19-14).

$$r_{L-SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-SIG}^{Tone}}} w_{T_{SYM}}(t) \sum_{k=-26}^{26} (D_k + p_0 P_k) \exp(j2\pi k \Delta_F (t - T_{GI} - T_{CS}^{i_{TX}})) \quad (19\text{-}14)$$

In a 40 MHz transmission the time domain waveform of the L-SIG shall be as given by Equation (19-15).

$$r_{L-SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-SIG}^{Tone}}} w_{T_{SYM}}(t) \sum_{k=-26}^{26} (D_k + p_0 P_k) \cdot (\exp(j2\pi(k-32)\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}})) + j\exp(j2\pi(k+32)\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}}))) \quad (19\text{-}15)$$

where

$$D_k = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M^r(k)}, \text{otherwise} \end{cases}$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$M^r(k) = \begin{cases} k+26, & -26 \le k \le -22 \\ k+25, & -20 \le k \le -8 \\ k+24, & -6 \le k \le -1 \\ k+23, & 1 \le k \le 6 \\ k+22, & 8 \le k \le 20 \\ k+21, & 22 \le k \le 26 \end{cases}$$

P_k is defined in 17.3.5.10 (OFDM modulation)

p_0 is the first pilot value in the sequence defined in 17.3.5.10 (OFDM modulation)

N_{L-SIG}^{Tone} has the value given in Table 19-8 (Value of tone scaling factor)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} and is defined by Table 19-9 (Cyclic shift for non-HT portion of packet) for HT-mixed format PPDUs

NOTE— D_k exists for $-N_{SR} \le k \le N_{SR}$ and takes the values from d_k that exists for $0 \le k \le N_{SD}-1$. $M^r(k)$ is a "reverse" function of the function $M(k)$ defined in 17.3.5.10 (OFDM modulation).

19.3.9.4 HT portion of HT-mixed format preamble

19.3.9.4.1 Introduction

When an HT-mixed format preamble is transmitted, the HT preamble consists of the HT-STF, the HT-LTFs, and the HT-SIG.

19.3.9.4.2 Cyclic shift definition

The cyclic shift values defined in this subclause apply to the HT-STF and HT-LTFs of the HT-mixed format preamble. The cyclic shift values defined in 19.3.9.3.2 (Cyclic shift definition) apply to the HT-SIG in an HT-mixed format preamble.

Throughout the HT portion of an HT-mixed format preamble, cyclic shift is applied to prevent beamforming when similar signals are transmitted in different space-time streams. The same cyclic shift is applied to these streams during the transmission of the data portion of the frame. The values of the cyclic shifts to be used during the HT portion of the HT-mixed format preamble (with the exception of the HT_SIG) and the data portion of the frame are specified in Table 19-10 (Cyclic shift values of HT portion of packet).

Table 19-10—Cyclic shift values of HT portion of packet

$T_{CS}^{i_{STS}}$ values for HT portion of packet				
Number of space-time streams	**Cyclic shift for space-time stream 1 (ns)**	**Cyclic shift for space-time stream 2 (ns)**	**Cyclic shift for space-time stream 3 (ns)**	**Cyclic shift for space-time stream 4 (ns)**
1	0	—	—	—
2	0	–400	—	—
3	0	–400	–200	—
4	0	–400	–200	–600

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

19.3.9.4.3 HT-SIG definition

The HT-SIG is used to carry information required to interpret the HT packet formats. The fields of the HT-SIG are described in Table 19-11 (HT-SIG fields).

Table 19-11—HT-SIG fields

Field	Number of bits	Explanation and coding
Modulation and Coding Scheme	7	Index into the MCS table. See NOTE 1.
CBW 20/40	1	Set to 0 for 20 MHz or 40 MHz upper/lower. Set to 1 for 40 MHz.
HT Length	16	The number of octets of data in the PSDU in the range 0 to 65 535. See NOTE 1 and NOTE 2.
Smoothing	1	Set to 1 indicates that channel estimate smoothing is recommended. Set to 0 indicates that only per-carrier independent (unsmoothed) channel estimate is recommended. See 19.3.11.11.2 (Spatial mapping).
Not Sounding	1	Set to 0 indicates that PPDU is a sounding PPDU. Set to 1 indicates that the PPDU is not a sounding PPDU.
Reserved	1	Set to 1.
Aggregation	1	Set to 1 to indicate that the PPDU in the data portion of the packet contains an A-MPDU; otherwise, set to 0.
STBC	2	Set to a nonzero number, to indicate the difference between the number of space-time streams (N_{STS}) and the number of spatial streams (N_{SS}) indicated by the MCS. Set to 00 to indicate no STBC ($N_{STS} = N_{SS}$). See NOTE 1.
FEC Coding	1	Set to 1 for LDPC. Set to 0 for BCC.
Short GI	1	Set to 1 to indicate that the short GI is used after the HT training. Set to 0 otherwise.
Number of Extension Spatial Streams	2	Indicates the number of extension spatial streams (N_{ESS}). Set to 0 for no extension spatial stream. Set to 1 for 1 extension spatial stream. Set to 2 for 2 extension spatial streams. Set to 3 for 3 extension spatial streams. See NOTE 1.
CRC	8	CRC of bits 0–23 in HT-SIG$_1$ and bits 0–9 in HT-SIG$_2$. See 19.3.9.4.4 (CRC calculation for HT-SIG). The first bit to be transmitted is bit C7 as explained in 19.3.9.4.4 (CRC calculation for HT-SIG).
Tail Bits	6	Used to terminate the trellis of the convolution coder. Set to 0.

NOTE 1—Integer fields are transmitted in unsigned binary format, LSB first.
NOTE 2—A value of 0 in the HT Length field indicates a PPDU that does not include a data field, i.e., NDP. NDP transmissions are used for sounding purposes only (see 10.34.2 (Transmission of an HT NDP)). The packet ends after the last HT-LTF or the HT-SIG.

This is an unapproved IEEE Standards Draft, subject to change.

The structure of the HT-SIG$_1$ and HT-SIG$_2$ fields is defined in Figure 19-6 (Format of HT-SIG1 and HT-SIG2).

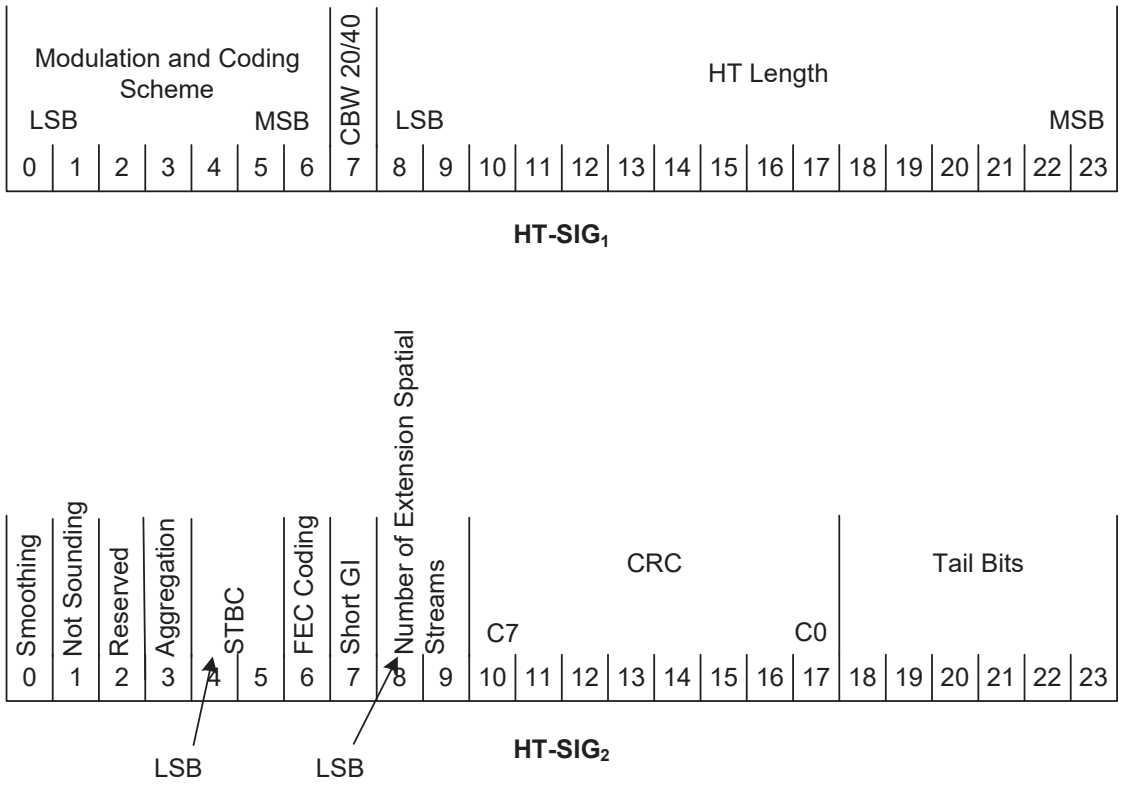

Figure 19-6—Format of HT-SIG$_1$ and HT-SIG$_2$

The HT-SIG is composed of two parts, HT-SIG$_1$ and HT-SIG$_2$, each containing 24 bits, as shown in Figure 19-6 (Format of HT-SIG1 and HT-SIG2). All of the fields in the HT-SIG are transmitted LSB first, and HT-SIG$_1$ is transmitted before HT-SIG$_2$.

The HT-SIG parts shall be encoded at R = 1/2, interleaved, and mapped to a BPSK constellation, and they have pilots inserted following the steps described in 17.3.5.6 (Convolutional encoder), 17.3.5.7 (Data interleaving), 17.3.5.8 (Subcarrier modulation mapping), and 17.3.5.9 (Pilot subcarriers), respectively. The BPSK constellation is rotated by 90° relative to the L-SIG in order to accommodate detection of the start of the HT-SIG. The stream of 96 complex numbers generated by these steps is divided into two groups of 48 complex numbers: $d_{k,n}, 0 \le k \le 47, n = 0, 1$. The time domain waveform for the HT-SIG in an HT-mixed format packet in a 20 MHz transmission shall be as shown in Equation (19-16).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$r_{HT-SIG}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^{1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} (jD_{k,n} + p_{n+1}P_k) \exp(j2\pi k\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}})) \quad (19\text{-}16)$$

In a 40 MHz transmission the time domain waveform shall be as shown in Equation (19-17).

$$r_{HT-SIG}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^{1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} (jD_{k,n} + p_{n+1}P_k)(\exp(j2\pi(k-32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}})) + j\exp(j2\pi(k+32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}}))) \quad (19\text{-}17)$$

where

$$D_{k,n} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M^r(k),n}, \text{otherwise} \end{cases}$$

$M^r(k)$ is defined in 19.3.9.3 (Non-HT portion of the HT-mixed format preamble)

P_k and p_n are defined in 17.3.5.10 (OFDM modulation)

N_{HT-SIG}^{Tone} has the value given in Table 19-8 (Value of tone scaling factor)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} and is defined by Table 19-9 (Cyclic shift for non-HT portion of packet) for HT-mixed format PPDUs.

NOTE—This definition results in a quadrature binary phase shift keying (QBPSK) modulation in which the constellation of the data tones is rotated by 90° relative to the L-SIG in HT-mixed format PPDUs and relative to the first HT-LTF in HT-greenfield format PPDUs (see Figure 19-7 (Data tone constellations in an HT-mixed format PPDU)). In HT-mixed format PPDUs, the HT-SIG is transmitted with the same number of subcarriers and the same cyclic shifts as

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the preceding non-HT portion of the preamble. This is done to accommodate the estimation of channel parameters needed to robustly demodulate and decode the information contained in the HT-SIG.

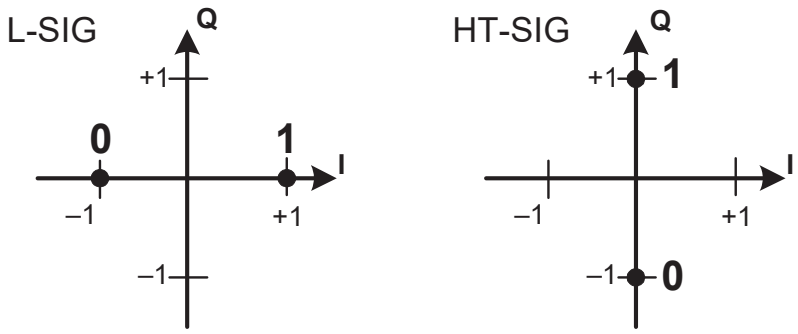

Figure 19-7—Data tone constellations in an HT-mixed format PPDU

19.3.9.4.4 CRC calculation for HT-SIG

The CRC protects bits 0–33 of the HT-SIG (bits 0–23 of HT-SIG$_1$ and bits 0–9 of HT-SIG$_2$). The value of the CRC field shall be the 1s complement of

$$crc(D) = (M(D) \oplus I(D))D^8 \bmod G(D) \tag{19-18}$$

where

$M(D) = m_0D^{33} + m_1D^{32} + \ldots + m_{32}D + m_{33}$ is the HT-SIG represented as a polynomial

where

m_0 is bit 0 of HT-SIG$_1$

m_{33} is bit 9 of HT-SIG$_2$

$I(D) = \sum_{i=26}^{33} D^i$ are initialization values that are added modulo 2 to the first 8 bits of HT-SIG$_1$

$G(D) = D^8 + D^2 + D + 1$ is the CRC generating polynomial

$crc(D) = c_0D^7 + c_1D^6 + \ldots + c_6D + c_7$

The CRC field is transmitted with c_7 first.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Figure 19-8 (HT-SIG CRC calculation) shows the operation of the CRC. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, C7 first, through an inverter.

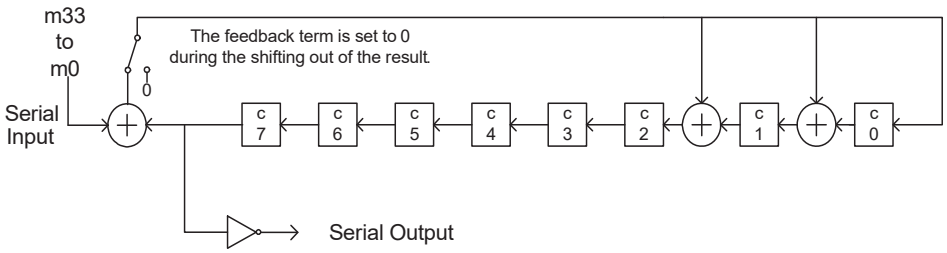

Figure 19-8—HT-SIG CRC calculation

As an example, if bits $\{m_0 \ldots m_{33}\}$ are given by $\{1\,1\,1\,1\,0\,0\,0\,1\,0\,0\,1\,0\,0\,1\,1\,0\,0\,0\,0\,0\,0\,0\,0\,0\,1\,1\,1\,0\,0\,0\,0\,0\,0\,0\}$, the output bits $\{B_7 \ldots B_0\}$, where B_7 is output first, are $\{1\,0\,1\,0\,1\,0\,0\,0\}$.

19.3.9.4.5 HT-STF definition

The purpose of the HT-STF is to improve automatic gain control estimation in a MIMO system. The duration of the HT-STF is 4 μs. In a 20 MHz transmission, the frequency sequence used to construct the HT-STF is identical to L-STF. In a 40 MHz transmission, the HT-STF is constructed from the 20 MHz version by duplicating and frequency shifting and by rotating the upper subcarriers by 90°. The frequency sequences are shown in Equation (19-19) and Equation (19-20).

For 20 MHz:

$$HTS_{-28,28} = \sqrt{1/2} \{0, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 0\} \quad (19\text{-}19)$$

For 40 MHz:

$$HTS_{-58,58} = \sqrt{1/2} \{0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0\} \quad (19\text{-}20)$$

The time domain representation of the transmission in transmit chain i_{TX} shall be as shown in Equation (19-21).

$$r_{HT-STF}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-STF}^{Tone}}} w_{T_{HT-STF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} \Upsilon_k HTS_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{STS}})) \quad (19\text{-}21)$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where

$T_{CS}^{i_{STS}}$ represents the cyclic shift for the space-time stream i_{STS} and takes the values given in Table 19-10 (Cyclic shift values of HT portion of packet)

Q_k is defined in 19.3.11.11.2 (Spatial mapping)

Υ_k is defined in Equation (19-5) and Equation (19-6)

19.3.9.4.6 HT-LTF definition

The HT-LTF provides a means for the receiver to estimate the MIMO channel between the set of QAM mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. If the transmitter is providing training for exactly the space-time streams (spatial mapper inputs) used for the transmission of the PSDU, the number of training symbols, N_{LTF}, is equal to the number of space-time streams, N_{STS}, except that for three space-time streams, four training symbols are required. If the transmitter is providing training for more space-time streams (spatial mapper inputs) than the number used for the transmission of the PSDU, the number of training symbols is greater than the number of space-time streams. This latter case happens in a sounding PPDU.

The HT-LTF portion has one or two parts. The first part consists of one, two, or four HT-LTFs that are necessary for demodulation of the HT-Data portion of the PPDU. These HT-LTFs are referred to as HT-DLTFs. The optional second part consists of zero, one, two, or four HT-LTFs that may be used to sound extra spatial dimensions of the MIMO channel that are not utilized by the HT-Data portion of the PPDU. These HT-LTFs are referred to as HT-ELTFs. If a receiver has not advertised its ability to receive HT-ELTFs, it shall either issue a PHY-RXEND.indication(UnsupportedRate) primitive upon reception of a frame that includes HT-ELTFs or decode that frame. (When an HT packet includes one or more HT-ELTFs, it is optional for a receiver that has not advertised its capability to receive HT-ELTFs to decode the data portion of the PPDU.)

The number of HT-DLTFs is denoted $N_{HT\text{-}DLTF}$. The number of HT-ELTFs is denoted $N_{HT\text{-}ELTF}$. The total number of HT-LTFs is shown in Equation (19-22).

$$N_{HT\text{-}LTF} = N_{HT\text{-}DLTF} + N_{HT\text{-}ELTF} \tag{19-22}$$

$N_{HT\text{-}LTF}$ shall not exceed 5. Table 19-12 (Determining the number of space-time streams) shows the determination of the number of space-time streams from the MCS and STBC fields in the HT-SIG. Table 19-13 (Number of HT-DLTFs required for data space-time streams) shows the number of HT-DLTFs as a function of the number of space-time streams (N_{STS}). Table 19-14 (Number of HT-ELTFs required for extension spatial streams) shows the number of HT-ELTFs as a function of the number of extension spatial streams (N_{ESS}). N_{STS} plus N_{ESS} is less than or equal to 4. In the case where N_{STS} equals 3, N_{ESS} cannot exceed one; if N_{ESS} equals one in this case then N_{LTF} equals 5.

The HT-LTF sequence shown in Equation (19-23) is transmitted in the case of 20 MHz operation.

$$HT\text{-}LTF_{-28,28} = \{1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 0,$$
$$1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, -1, -1\} \quad (19\text{-}23)$$

NOTE 1—This sequence is an extension of the L-LTF where the four extra subcarriers are filled with +1 for negative frequencies and –1 for positive frequencies.

In 40 MHz transmissions, including MCS 32 format frames, the sequence to be transmitted is shown in Equation (19-24).

$$HT\text{-}LTF_{-58,58} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1,$$
$$1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, -1, 1, 1, 1, 1, -1, -1, -1, 1, 0,$$
$$0, 0, -1, 1, 1, -1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1,$$
$$1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 1\} \quad (19\text{-}24)$$

NOTE 2—This sequence is also constructed by extending the L-LTF in the following way: first, the L-LTF is duplicated and shifted as explained in 19.3.9.3.4 (L-LTF definition) for the non-HT duplicate format; then the missing subcarriers [–32, –5, –4, –3, –2, 2, 3, 4, 5, 32] are filled with the values [1, –1, –1, –1, 1, –1, 1, 1, –1, 1], respectively.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

This sequence, occupying 114 tones, is used even if the data portion is transmitted with MCS 32 format, which uses 104 tones.

NOTE 3—This sequence uses 114 tones when MCS 32 format is used to retain consistency with other 40 MHz formats and to facilitate channel estimation for beamforming and link adaptation.

In an HT-mixed format preamble, each HT-LTF consists of a single occurrence of the sequence plus a GI insertion and has a duration of 4 μs. In case of multiple space-time streams, cyclic shift is invoked as specified in Table 19-10 (Cyclic shift values of HT portion of packet).

The generation of HT-DLTFs is shown in Figure 19-9 (Generation of HT-DLTFs). The generation of HT-ELTFs is shown in Figure 19-10 (Generation of HT-ELTFs). In these figures, and in the following text, the following notational conventions are used:

— $[X]_{m,\,n}$ indicates the element in row m and column n of matrix X

— $[X]_{N}$ indicates a matrix consisting of the first N columns of matrix X

— $[X]_{M:N}$ indicates a matrix consisting of columns M to N of matrix X

where

$M \le N$

X is either Q_k or $P_{HT\text{-}LTF}$

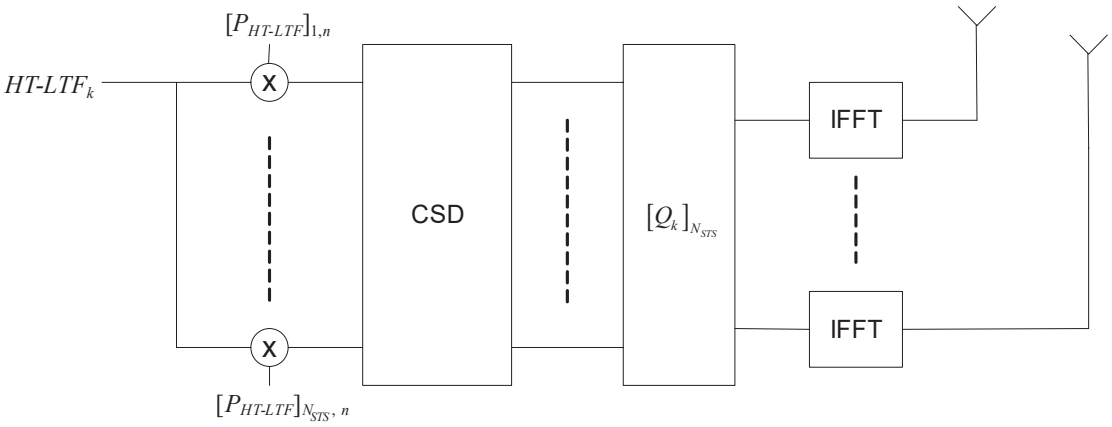

Figure 19-9—Generation of HT-DLTFs

The mapping between space-time streams and transmit chains is defined by the columns of an antenna map matrix Q_k for subcarrier k. The first N_{STS} columns define the space-time streams used for data transmission, and the next N_{ESS} columns (up to $N_{TX} - N_{STS}$ columns) define the extension spatial streams. Thus, for the purpose of defining HT-LTFs, Q_k is an $N_{TX} \times (N_{STS} + N_{ESS})$ dimension matrix. Columns $1 \ldots N_{STS}$ of Q_k are excited by the HT-DLTFs, and columns $N_{STS} + 1 \ldots N_{STS} + N_{ESS}$ are excited by the HT-ELTFs, where $N_{STS} + N_{ESS} \le N_{TX}$ is the total number of spatial streams being probed by the HT-LTFs.

Possible forms of Q_k and other limitations on Q_k are specified in 19.3.11.11.2 (Spatial mapping). $P_{HT\text{-}LTF}$ is defined in Equation (19-27).

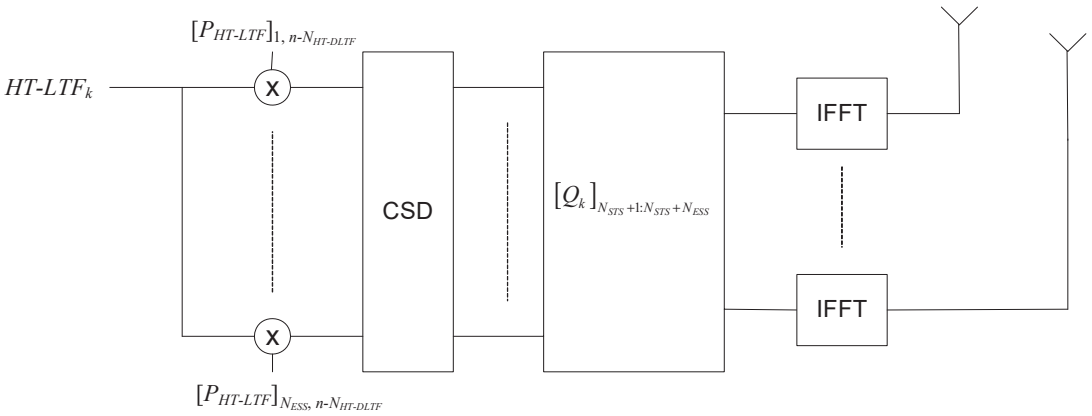

Figure 19-10—Generation of HT-ELTFs

The time domain representation of the waveform transmitted on transmit chain i_{TX} during HT-DLTF n, where $1 \le n \le N_{HT\text{-}DLTF}$, shall be as shown in Equation (19-25).

$$r_{HT-LTF}^{n,\, i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-LTF}^{Tone}}} w_{\mathrm{T}_{HT-LTFs}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX},\, i_{STS}} [P_{HT\text{-}LTF}]_{i_{STS},\, n} \Upsilon_k HT\text{-}LTF_k \exp(j2\pi k \Delta_F (t - T_{GI} - T_{CS}^{i_{STS}})) \quad (19\text{-}25)$$

For the HT-ELTFs ($N_{HT\text{-}DLTF} < n \le N_{HT\text{-}LTF}$), it shall be as shown in Equation (19-26).

$$r_{HT-LTF}^{n,\, i_{TX}}(t) = \frac{1}{\sqrt{N_{HT-LTF}^{Tone} \cdot N_{ESS}}} w_{\mathrm{T}_{HT-LTFs}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{ESS}=1}^{N_{ESS}} \Big([Q_k]_{i_{TX},\, N_{STS}+i_{ESS}} [P_{HT\text{-}LTF}]_{i_{ESS},\, n-N_{HTDLTF}} \Upsilon_k HT\text{-}LTF_k \cdot \exp(j2\pi k \Delta_F (t - T_{GI} - T_{CS}^{i_{ESS}})) \Big) \quad (19\text{-}26)$$

where

$T_{CS}^{i_{STS}}$ cyclic shift values are given in Table 19-10 (Cyclic shift values of HT portion of packet)

$T_{CS}^{i_{ESS}}$ cyclic shift values are given in Table 19-10 (Cyclic shift values of HT portion of packet) with $i_{ESS} = i_{STS}$

Q_k is defined in 19.3.11.11.2 (Spatial mapping)

Υ_k is defined in Equation (19-5) and Equation (19-6)

$P_{HT\text{-}LTF}$ the HT-LTF mapping matrix, is given by Equation (19-27)

$$P_{HT\text{-}LTF} = \begin{bmatrix} 1 & -1 & 1 & 1 \\ 1 & 1 & -1 & 1 \\ 1 & 1 & 1 & -1 \\ -1 & 1 & 1 & 1 \end{bmatrix} \quad (19\text{-}27)$$

19.3.9.5 HT-greenfield format preamble

19.3.9.5.1 General

For HT-greenfield operation, compatibility with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) STAs is not required. Therefore, the portions of the preamble that are compatible with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) STAs are not included. The result is a shorter and more efficient PHY frame format that includes a STF, LTF(s), and an HT-SIG.

19.3.9.5.2 Cyclic shift definition for HT-greenfield format preamble

Throughout the HT-greenfield format preamble, cyclic shift is applied to prevent beamforming when similar signals are transmitted on different spatial streams. The same cyclic shift is applied to these streams during the transmission of the data portion of the frame. The values of the cyclic shift to be used during the HT-greenfield format preamble, as well as the data portion of the HT-greenfield format frame, are specified in Table 19-10 (Cyclic shift values of HT portion of packet).

19.3.9.5.3 HT-GF-STF definition

The HT-GF-STF is placed at the beginning of an HT-greenfield format frame. The time domain waveform for the HT-GF-STF on transmit chain i_{TX} shall be as shown in Equation (19-28).

$$r^{(i_{TX})}_{HT-GF-STF}(t) = \frac{1}{\sqrt{N_{STS} \cdot N^{Tone}_{HT-GF-STF}}} w_{T_{HT-GF-STF}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT\text{-}LTF}]_{i_{STS}, 1} \Upsilon_k S_k \exp(j2\pi k \Delta_F (t - T^{i_{STS}}_{CS})) \quad (19\text{-}28)$$

where

$T^{i_{STS}}_{CS}$ represents the cyclic shift for the space-time stream i_{STS} and takes values from Table 19-10 (Cyclic shift values of HT portion of packet)

Q_k is defined in 19.3.11.11.2 (Spatial mapping)

$P_{HT\text{-}LTF}$ is defined in Equation (19-27)

S_k is defined in non-HT-STF (L-STF), Equation (19-8) for 20 MHz operation and Equation (19-9) for 40 MHz operation

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Υ_k is defined in Equation (19-5) and Equation (19-6)

The waveform defined by Equation (19-28) has a period of 0.8 μs, and the HT-GF-STF includes ten such periods, with a total duration of $T_{HT-GF-STF} = 8$ μs.

19.3.9.5.4 HT-greenfield format HT-SIG

The content and format of the HT-SIG of an HT-greenfield format frame is identical to the HT-SIG in an HT-mixed format frame, as described in 19.3.9.4.3 (HT-SIG definition). The placement of the HT-SIG in an HT-greenfield format frame is shown in Figure 19-1 (PPDU format). In HT-greenfield format frames, the HT-SIG is transmitted with the same cyclic shifts and the same spatial mapping as the preceding portions of the preamble. This use of the same cyclic shifts and spatial mapping is done to accommodate the estimation of channel parameters needed to robustly demodulate and decode the information contained in the HT-SIG.

The time domain waveform for the HT-SIG on transmit chain i_{TX} with 20 MHz operation shall be as shown in Equation (19-29).

$$r_{HT-SIG}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^{1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT\text{-}LTF}]_{i_{STS}, 1} (jD_{k,n} + p_n P_k) \cdot \exp(j2\pi k\Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})) \quad (19\text{-}29)$$

where

P_k and p_n are defined in 17.3.5.10 (OFDM modulation)

$D_{k,n}$ is defined in 19.3.9.4.3 (HT-SIG definition)

$T_{CS}^{i_{STS}}$ represents the cyclic shift for space-time stream i_{STS} and takes values from Table 19-10 (Cyclic shift values of HT portion of packet)

Q_k is defined in 19.3.11.11.2 (Spatial mapping)

$P_{HT\text{-}LTF}$ is defined in Equation (19-27)

The time domain waveform for the HT-SIG on transmit chain i_{TX} with 40 MHz operation shall be as shown in Equation (19-30).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$r_{HT-SIG}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^{1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} \sum_{i_{STS}=1}^{N_{STS}} [P_{HT\text{-}LTF}]_{i_{STS},1}(jD_{k,n} + p_n P_k) \cdot ([Q_{k-32}]_{i_{TX},i_{STS}} \exp(j2\pi(k-32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})) + j[Q_{k+32}]_{i_{TX},i_{STS}} \exp(j2\pi(k+32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})))$$ (19-30)

where

p_n and P_k are defined in 17.3.5.10 (OFDM modulation)

$D_{k,n}$ is defined in 19.3.9.4.3 (HT-SIG definition)

$T_{CS}^{i_{STS}}$ represents the cyclic shift for space-time stream i_{STS} and takes values from Table 19-10 (Cyclic shift values of HT portion of packet)

Q_k is defined in 19.3.11.11.2 (Spatial mapping)

$P_{HT\text{-}LTF}$ is defined in Equation (19-27)

19.3.9.5.5 HT-greenfield format LTF

The format of the LTF portion of the preamble in an HT-greenfield format frame is similar to that of the HT-LTF in an HT-mixed format frame, as described in 19.3.9.4.6 (HT-LTF definition), with the difference that the first HT-LTF (HT-LTF1) is twice as long (8 μs) as the other HT-LTFs. The time domain waveform for the long training symbol on transmit chain i_{TX} for the first HT-LTF in an HT-greenfield format frame shall be as shown in Equation (19-31).

$$r_{HT-LTF}^{1,i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-LTF}^{Tone}}} w_{T_{HT-LTF1}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX},i_{STS}} [P_{HT\text{-}LTF}]_{i_{STS},1} \Upsilon_k HT\text{-}LTF(k) \exp(j2\pi k\Delta_F(t - T_{GI2} - T_{CS}^{i_{STS}}))$$ (19-31)

where

$T_{CS}^{i_{STS}}$ represents the cyclic shift for space-time stream i_{STS} and takes values from Table 19-10 (Cyclic shift values of HT portion of packet)

Q_k is defined in 19.3.11.11.2 (Spatial mapping)

$P_{HT\text{-}LTF}$ is defined in Equation (19-27)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The first HT-LTF (HT-LTF1) consists of two periods of the long training symbol, preceded by a double-length (1.6 μs) cyclic prefix. The placement of the first and subsequent HT-LTFs in an HT-greenfield format frame is shown in Figure 19-1 (PPDU format).

19.3.10 Transmission of NON_HT format PPDUs with more than one transmit chain

When an HT device transmits a NON_HT format PPDU with the MODULATION parameter equal to OFDM or ERP-OFDM using more than one transmit chain, it shall apply the cyclic shifts defined in Table 19-9 (Cyclic shift for non-HT portion of packet) to the transmission in each chain.

19.3.11 Data field

19.3.11.1 General

When BCC encoding is used, the Data field consists of the 16-bit SERVICE field, the PSDU, either six or twelve tail bits, depending on whether one or two encoding streams are represented, and pad bits. When LDPC encoding is used, the Data field consists of the 16-bit SERVICE field and the PSDU, processed by the procedure in 19.3.11.7.5 (LDPC PPDU encoding process).

The number of OFDM symbols in the data field when BCC encoding is used is computed as shown in Equation (19-32).

$$N_{SYM} = m_{STBC}\left\lceil \frac{8 \cdot length + 16 + 6 \cdot N_{ES}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \quad (19\text{-}32)$$

where

m_{STBC} is 2 if STBC is used and 1 otherwise (making sure that the number of symbols is even when STBC is used)

length is the value of the HT Length field in the HT-SIG field defined in Table 19-11 (HT-SIG fields)

N_{DBPS} takes the values defined in Table 19-27 (MCS parameters for mandatory 20 MHz, $N_{SS} = 1$, $N_{ES} = 1$) through Table 19-41 (MCS parameters for optional 40 MHz, $N_{SS} = 4$, UEQM)

The number of "zero" pad bits is thus $N_{SYM} \times N_{DBPS} - 8 \times length - 16 - 6 \times N_{ES}$. The number of symbols in the data field when LDPC encoding is used is described in 19.3.11.7 (LDPC codes).

For LDPC encoding, the number of encoded data bits, N_{avbits}, is given by Equation (19-39); the number of OFDM symbols, N_{SYM}, is given by Equation (19-41); and the number of repeated encoded bits for padding, N_{rep}, is given by Equation (19-42), in 19.3.11.7.5 (LDPC PPDU encoding process).

19.3.11.2 SERVICE field

The SERVICE field is used for scrambler initialization. The SERVICE field is composed of 16 bits, all set to 0 before scrambling. In non-HT PPDUs, the SERVICE field is the same as in 17.3.5.2 (SERVICE field). In HT PPDUs, the SERVICE field is composed of 16 zero bits, scrambled by the scrambler, as defined in 19.3.11.3 (Scrambler).

19.3.11.3 Scrambler

The data field shall be scrambled by the scrambler defined in 17.3.5.5 (PHY DATA scrambler and descrambler). The Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT shall not be present; therefore, the initial state of the scrambler shall be set to a pseudorandom nonzero seed.

19.3.11.4 Coding

The Data field shall be encoded using either the BCC defined in 17.3.5.6 (Convolutional encoder) or the LDPC code defined in 19.3.11.7 (LDPC codes). The encoder is selected by the FEC coding field in the HT-SIG, as described in 19.3.9.4.3 (HT-SIG definition). A single FEC encoder is always used when LDPC coding is used. When the BCC FEC encoder is used, a single encoder is used, except that two encoders are used when the selected MCS has a PHY rate greater than 300 Mb/s (see 19.5 (Parameters for HT MCSs)). To determine whether to use one or two BCC FEC encoders, the rate is calculated based on the use of an 800 ns GI. The operation of the BCC FEC is described in 19.3.11.6 (Binary convolutional coding and puncturing). The operation of the LDPC coder is described in 19.3.11.7 (LDPC codes).

Support for the reception of BCC-encoded Data field frames is mandatory.

19.3.11.5 Encoder parsing operation for two BCC FEC encoders

If two BCC encoders are used, the scrambled data bits are divided between the encoders by sending alternating bits to different encoders. Bit with index i sent to the encoder j, denoted $x_i^{(j)}$, is shown in Equation (19-33).

$$x_i^{(j)} = b_{N_{ES} \cdot i + j} \quad ; \quad 0 \le j \le N_{ES} - 1 \tag{19-33}$$

Following the parsing operation, 6 scrambled "zero" bits following the end of the message bits in each BCC input sequence are replaced by unscrambled "zero" bits, as described in 17.3.5.3 (PPDU TAIL field).

The replaced bits are shown in Equation (19-34).

$$x_i^{(j)} \quad : \quad 0 \le j \le N_{ES} - 1 \quad ; \quad \frac{length \cdot 8 + 16}{N_{ES}} \le i \le \frac{length \cdot 8 + 16}{N_{ES}} + 5 \tag{19-34}$$

19.3.11.6 Binary convolutional coding and puncturing

When BCC encoding is used, the encoder parser output sequences $\{x_i^0\}$, and $\{x_i^1\}$ where applicable, are each encoded by the rate 1/2 convolutional encoder defined in 17.3.5.6 (Convolutional encoder). After encoding, the encoded data shall be punctured by the method defined in 17.3.5.7 (Data interleaving) to achieve the rate selected by the MCS.

If rate 5/6 coding is selected, the puncturing scheme is defined in Figure 19-11 (Puncturing at rate 5/6).

19.3.11.7 LDPC codes

19.3.11.7.1 Introduction

HT LDPC codes are described in 19.3.11.7.2 (LDPC coding rates and codeword block lengths) through 19.3.11.7.6 (LDPC parser). These codes are optionally used in the HT system as a high-performance error correcting code instead of the convolutional code (19.3.11.6 (Binary convolutional coding and puncturing)). The LDPC encoder shall use the rate-dependent parameters in Table 19-27 (MCS parameters for mandatory 20 MHz, $N_{SS} = 1$, $N_{ES} = 1$) through Table 19-41 (MCS parameters for optional 40 MHz, $N_{SS} = 4$, UEQM), with the exception of the N_{ES} parameter.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Figure 19-11—Puncturing at rate 5/6

Support for LDPC codes is optional.

19.3.11.7.2 LDPC coding rates and codeword block lengths

The supported coding rates, information block lengths, and codeword block lengths are described in Table 19-15 (LDPC parameters).

Table 19-15—LDPC parameters

Coding rate (R)	LDPC information block length (bits)	LDPC codeword block length (bits)
1/2	972	1944
1/2	648	1296
1/2	324	648
2/3	1296	1944
2/3	864	1296
2/3	432	648
3/4	1458	1944
3/4	972	1296

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 19-15—LDPC parameters *(continued)*

Coding rate (R)	LDPC information block length (bits)	LDPC codeword block length (bits)
3/4	486	648
5/6	1620	1944
5/6	1080	1296
5/6	540	648

19.3.11.7.3 LDPC encoder

For each of the three available codeword block lengths, the LDPC encoder supports rate 1/2, rate 2/3, rate 3/4, and rate 5/6 encoding. The LDPC encoder is systematic, i.e., it encodes an information block, c=(i_0,i_1,..., $i_{(k-1)}$), of size k, into a codeword, **c,** of size n, **c**=(i_0,i_1,... $i_{(k-1)}$, p_0, p_1, ..., $p_{(n-k-1)}$), by adding $n-k$ parity bits obtained so that $\mathbf{H}\times\mathbf{c}^T = \mathbf{0}$, where **H** is an $(n-k)\times n$ parity-check matrix. The selection of the codeword block length (n) is achieved via the LDPC PPDU encoding process described in 19.3.11.7.5 (LDPC PPDU encoding process).

19.3.11.7.4 Parity-check matrices

Each of the parity-check matrices is partitioned into square subblocks (submatrices) of size $Z \times Z$. These submatrices are either cyclic-permutations of the identity matrix or null submatrices.

The cyclic-permutation matrix P_i is obtained from the $Z \times Z$ identity matrix by cyclically shifting the columns to the right by i elements. The matrix P_0 is the $Z \times Z$ identity matrix. Figure 19-12 (Examples of cyclic-permutation matrices with Z=8) illustrates examples (for a subblock size of 8 × 8) of cyclic-permutation matrices P_i.

$$P_0 = \begin{bmatrix} 1&0&0&0&0&0&0&0\\ 0&1&0&0&0&0&0&0\\ 0&0&1&0&0&0&0&0\\ 0&0&0&1&0&0&0&0\\ 0&0&0&0&1&0&0&0\\ 0&0&0&0&0&1&0&0\\ 0&0&0&0&0&0&1&0\\ 0&0&0&0&0&0&0&1 \end{bmatrix}, P_1 = \begin{bmatrix} 0&1&0&0&0&0&0&0\\ 0&0&1&0&0&0&0&0\\ 0&0&0&1&0&0&0&0\\ 0&0&0&0&1&0&0&0\\ 0&0&0&0&0&1&0&0\\ 0&0&0&0&0&0&1&0\\ 0&0&0&0&0&0&0&1\\ 1&0&0&0&0&0&0&0 \end{bmatrix}, P_5 = \begin{bmatrix} 0&0&0&0&0&1&0&0\\ 0&0&0&0&0&0&1&0\\ 0&0&0&0&0&0&0&1\\ 1&0&0&0&0&0&0&0\\ 0&1&0&0&0&0&0&0\\ 0&0&1&0&0&0&0&0\\ 0&0&0&1&0&0&0&0\\ 0&0&0&0&1&0&0&0 \end{bmatrix}$$

Figure 19-12—Examples of cyclic-permutation matrices with *Z*=8

Table F-1 (Matrix prototypes for codeword block length n=648 bits, subblock size is Z = 27 bits) displays the "matrix prototypes" of parity-check matrices for all four coding rates at block length n=648 bits. The integer i denotes the cyclic-permutation matrix P_i, as illustrated in Figure 19-12 (Examples of cyclic-permutation matrices with Z=8). Vacant entries of the table denote null (zero) submatrices.

Table F-2 (Matrix prototypes for codeword block length n=1296 bits, subblock size is Z= 54 bits) displays the matrix prototypes of parity-check matrices for block length n=1296 bits, in the same fashion.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table F-3 (Matrix prototypes for codeword block length n=1944 bits, subblock size is Z = 81 bits) displays the matrix prototypes of parity-check matrices for block length *n*=1944 bits, in the same fashion.

19.3.11.7.5 LDPC PPDU encoding process

To encode an LDPC PPDU, step a) through step g) shall be performed in sequence:

a) Compute the number of available bits, N_{avbits}, in the minimum number of OFDM symbols in which the Data field of the packet may fit.

$$N_{pld} = length \times 8 + 16 \tag{19-35}$$

$$N_{avbits} = N_{CBPS} \times m_{STBC} \times \left\lceil \frac{N_{pld}}{N_{CBPS} \times R \times m_{STBC}} \right\rceil \tag{19-36}$$

where

m_{STBC} is 2 if STBC is used and 1 otherwise

length is the value of the HT Length field in the HT-SIG field defined in Table 19-11 (HT-SIG fields)

N_{pld} is the number of bits in the PSDU and SERVICE field

b) Compute the integer number of LDPC codewords to be transmitted, N_{CW}, and the length of the codewords to be used, L_{LDPC} from Table 19-16 (PPDU encoding parameters).

Table 19-16—PPDU encoding parameters

Range of N_{avbits} (bits)	Number of LDPC codewords (N_{CW})	LDPC codeword length L_{LDPC} (bits)
$N_{avbits} \le 648$	1	1296, if $N_{avbits} \ge N_{pld} + 912 \times (1\text{-}R)$ 648, otherwise
$648 < N_{avbits} \le 1296$	1	1944, if $N_{avbits} \ge N_{pld} + 1464 \times (1\text{-}R)$ 1296, otherwise
$1296 < N_{avbits} \le 1944$	1	1944
$1944 < N_{avbits} \le 2592$	2	1944, if $N_{avbits} \ge N_{pld} + 2916 \times (1\text{-}R)$ 1296, otherwise
$2592 < N_{avbits}$	$\left\lceil \frac{N_{pld}}{1944 \cdot R} \right\rceil$	1944

c) Compute the number of shortening bits, N_{shrt}, to be padded to the N_{pld} data bits before encoding, as shown in Equation (19-37).

$$N_{shrt} = \max(0, (N_{CW} \times L_{LDPC} \times R) - N_{pld}) \tag{19-37}$$

When $N_{shrt} = 0$, shortening is not performed. (Note that N_{shrt} is inherently restricted to be non-negative due to the codeword length and count selection of 19-16 (PPDU encoding parameters)).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When $N_{shrt} > 0$, shortening bits shall be equally distributed over all N_{CW} codewords with the first N_{shrt} mod N_{CW} codewords shortened 1 bit more than the remaining codewords. Define $N_{spcw} = \lfloor N_{shrt} / N_{CW} \rfloor$. Then, when $N_{shrt} > 0$, the shortening is performed by setting information bits $i_{k-N_{spcw}-1}, \ldots, i_{k-1}$ to 0 in the first N_{shrt} mod N_{CW} codewords and setting information bits $i_{k-N_{spcw}}, \ldots, i_{k-1}$ to 0 in the remaining codewords. For all values of N_{shrt}, encode each of the N_{CW} codewords using the LDPC encoding technique described in 19.3.11.7.2 (LDPC coding rates and codeword block lengths) through 19.3.11.7.4 (Parity-check matrices). When $N_{shrt} > 0$, the shortened bits shall be discarded after encoding.

d) Compute the number of bits to be punctured, N_{punc}, from the codewords after encoding, as shown in Equation (19-38).

$$N_{punc} = \max(0, (N_{CW} \times L_{LDPC}) - N_{avbits} - N_{shrt}) \quad (19\text{-}38)$$

If $\left((N_{punc} > 0.1 \times N_{CW} \times L_{LDPC} \times (1-R)) \text{ AND } \left(N_{shrt} < 1.2 \times N_{punc} \times \frac{R}{1-R}\right)\right)$ is true OR if $(N_{punc} > 0.3 \times N_{CW} \times L_{LDPC} \times (1-R))$ is true, increment N_{avbits} and recompute N_{punc} by the following two equations once:

$$N_{avbits} = N_{avbits} + N_{CBPS} \times m_{STBC} \quad (19\text{-}39)$$

$$N_{punc} = \max(0, (N_{CW} \times L_{LDPC}) - N_{avbits} - N_{shrt}) \quad (19\text{-}40)$$

The punctured bits shall be equally distributed over all N_{CW} codewords with the first N_{punc} mod N_{CW} codewords punctured 1 bit more than the remaining codewords. Define $N_{\text{ppcw}} = \lfloor N_{\text{punc}} / N_{\text{CW}} \rfloor$. When $N_{\text{ppcw}} > 0$, the puncturing is performed by discarding parity bits $p_{n-k-N_{ppcw}-1}, \ldots, p_{n-k-1}$ of the first N_{punc} mod N_{CW} codewords and discarding parity bits $(p_{n-k-N_{ppcw}}, \ldots, p_{n-k-1})$ of the remaining codewords after encoding. The number of OFDM symbols to be transmitted in the PPDU is computed as shown in Equation (19-41).

$$N_{SYM} = N_{avbits} / N_{CBPS} \quad (19\text{-}41)$$

e) Compute the number of coded bits to be repeated, N_{rep}, as shown in Equation (19-42).

$$N_{rep} = \max(0, N_{avbits} - N_{CW} \times L_{LDPC} \times (1-R) - N_{pld}) \quad (19\text{-}42)$$

The number of coded bits to be repeated shall be equally distributed over all N_{CW} codewords with one more bit repeated for the first N_{rep} mod N_{CW} codewords than for the remaining codewords.

NOTE—When puncturing occurs, the coded bits are not repeated, and vice versa.

The coded bits to be repeated for any codeword shall be copied only from that codeword itself, starting from information bit i_0 and continuing sequentially through the information bits and, when necessary, into the parity bits, until the required number of repeated bits is obtained for that codeword. Note that these repeated bits are copied from the codeword after the shortening bits have been removed. If for a codeword the required number of repeated bits are not obtained in this manner (i.e., repeating the codeword once), the procedure is repeated until the required number is achieved. These repeated bits are then concatenated to the codeword after the parity bits in their

same order. This process is illustrated in Figure 19-13 (LDPC PPDU encoding padding and puncturing of a single codeword). In this figure, the outlined arrows indicate the encoding procedure steps, while the solid arrows indicate the direction of puncturing and padding with repeated bits.

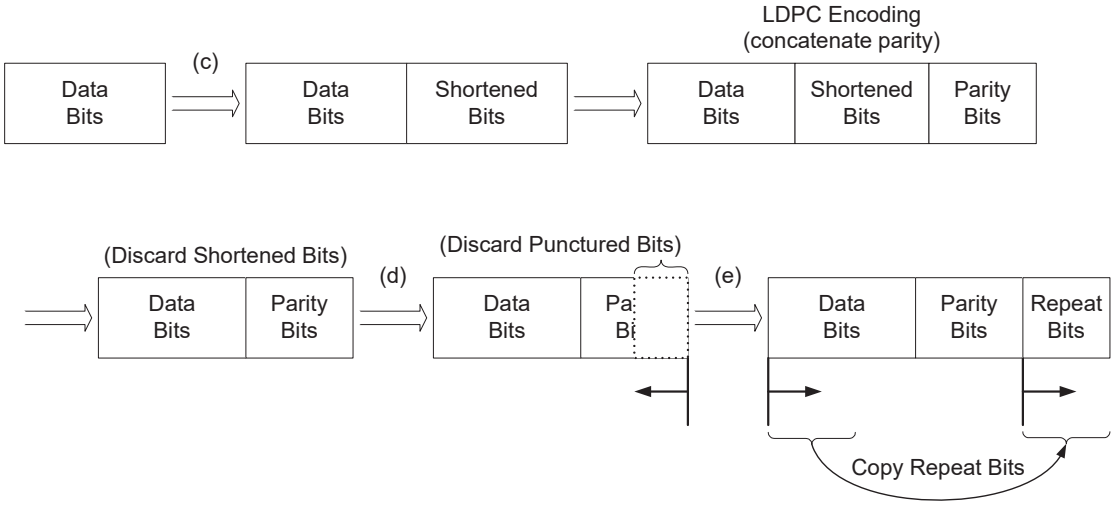

Figure 19-13—LDPC PPDU encoding padding and puncturing of a single codeword

f) For each of the N_{CW} codewords, process the data using the number of shortening bits per codeword as computed in step c) for encoding, and puncture or repeat bits per codeword as computed per step d) and step e), as illustrated in Figure 19-13 (LDPC PPDU encoding padding and puncturing of a single codeword).

g) Aggregate all codewords and parse as defined in 19.3.11.7.6 (LDPC parser).

19.3.11.7.6 LDPC parser

The succession of LDPC codewords that result from the encoding process of 19.3.11.7.5 (LDPC PPDU encoding process) shall be converted into a bitstream in sequential fashion. Within each codeword, bit i_0 is ordered first. The parsing of this encoded data stream into spatial streams shall follow exactly the parsing rules defined for the BCC encoder, as defined in 19.3.11.8.1 (Overview). However, the frequency interleaver of 19.3.11.8.3 (Frequency interleaver) is bypassed.

19.3.11.8 Data interleaver

19.3.11.8.1 Overview

After coding and puncturing, the data bit streams at the output of the FEC encoders are rearranged into blocks of $N_{CBPSS}(i_{SS})$ bits, where $i_{SS} = 1, 2, \ldots N_{SS}$ is the spatial stream index. This operation is referred to as *stream parsing* and is described in 19.3.11.8.2 (Stream parser). If BCC encoding was used, each of these blocks is then interleaved by an interleaver that is a modification of the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) interleaver.

19.3.11.8.2 Stream parser

The number of bits assigned to a single axis (real or imaginary) in a constellation point in spatial stream i_{SS} is denoted by Equation (19-43).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$s(i_{SS}) = \max\left\{1, \frac{N_{BPSCS}(i_{SS})}{2}\right\} \quad (19\text{-}43)$$

The sum of these over all streams is $S = \sum_{i_{SS}=1}^{N_{SS}} s(i_{SS})$.

NOTE—If equal MCS is used for all spatial streams, this sum becomes $N_{SS} \cdot s$, where s is the number of bits for an axis common to all streams.

Consecutive blocks of $s(i_{SS})$ bits are assigned to different spatial streams in a round robin fashion.

If two encoders are present, the output of each encoder is used alternately for each round robin cycle, i.e., at the beginning S bits from the output of first encoder are fed into all spatial streams, and then S bits from the output of second encoder are used, and so on.

Input k to spatial stream i_{SS} shall be $y_i^{(j)}$, which is output bit i of the encoder j,

where

$$j = \left\lfloor \frac{k}{s(i_{SS})} \right\rfloor \bmod N_{ES} \quad (19\text{-}44)$$

$$i = \sum_{i'=1}^{i_{SS}-1} s(i') + S \cdot \left\lfloor \frac{k}{N_{ES} \cdot s(i_{SS})} \right\rfloor + k \bmod s(i_{SS}) \quad (19\text{-}45)$$

$$1 \le i_{SS} \le N_{SS}$$

For $i_{SS} = 1$, the first term in Equation (19-45) has a value of 0.

19.3.11.8.3 Frequency interleaver

MCS 32 interleaving shall be as defined in 17.3.5.7 (Data interleaving). Interleaving for all other MCSs is defined in this subclause.

The bits at the output of the stream parser are divided into blocks of $N_{CBPSS}(i_{SS})$, $i_{SS} = 1, 2, \ldots N_{SS}$ bits; and if BCC encoding was used, each block shall be interleaved by an interleaver based on the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) interleaver. This interleaver, which is based on entering the data in rows and reading them out in columns, has a different number of columns and rows depending on whether a 20 MHz channel or a 40 MHz channel is used. Table 19-17 (Number of rows and columns in the interleaver) defines the interleaver parameters. If LDPC encoding was used, no frequency interleaving is performed; hence the parsed streams are immediately mapped to symbols as defined in 19.3.11.9 (Constellation mapping).

Table 19-17—Number of rows and columns in the interleaver

Parameter	20 MHz	40 MHz
N_{COL}	13	18

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 19-17—Number of rows and columns in the interleaver

N_{ROW}	$4 \times N_{BPSCS}(i_{SS})$	$6 \times N_{BPSCS}(i_{SS})$
N_{ROT}	11	29

If more than one spatial stream exists after the operations based on the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) interleaver have been applied, a third operation called *frequency rotation* shall be applied to the additional spatial streams. The parameter for the frequency rotation is N_{ROT}.

The interleaving is defined using three permutations. The first permutation is defined by the rule shown in Equation (19-46).

$$i = N_{ROW} \times (k \bmod N_{COL}) + \lfloor k / N_{COL} \rfloor, \qquad k = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \tag{19-46}$$

The second permutation is defined by the rule shown in Equation (19-47).

$$j = s(i_{SS}) \times \lfloor i / s(i_{SS}) \rfloor + (i + N_{CBPSS}(i_{SS}) - \lfloor N_{COL} \times i / N_{CBPSS}(i_{SS}) \rfloor) \bmod s(i_{SS}); \quad i = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \tag{19-47}$$

The value of $s(i_{SS})$ is determined by the number of coded bits per subcarrier as shown in Equation (19-48).

$$s(i_{SS}) = \max(N_{BPSCS}(i_{SS})/2, 1) \tag{19-48}$$

If more than one spatial stream exists, a frequency rotation is applied to the output of the second permutation as shown in Equation (19-49).

$$r = \left(j - \left(((i_{SS} - 1) \times 2) \bmod 3 + 3 \times \left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor\right) \times N_{ROT} \times N_{BPSCS}(i_{SS})\right) \bmod N_{CBPSS}(i_{SS}); \quad j = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \tag{19-49}$$

where

$i_{SS} = 1, 2, \ldots, N_{SS}$ is the index of the spatial stream on which this interleaver is operating

The deinterleaver uses the following operations to perform the inverse rotation. The index of the bit in the received block (per spatial stream) is denoted by *r*. The first permutation reverses the third (frequency rotation) permutation of the interleaver as shown in Equation (19-50).

$$j = \left(r + \left(((i_{SS} - 1) \times 2) \bmod 3 + 3 \times \left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor\right) \times N_{ROT} \times N_{BPSCS}(i_{SS})\right) \bmod N_{CBPSS}(i_{SS}); \quad r = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \tag{19-50}$$

The second permutation reverses the second permutation in the interleaver as shown in Equation (19-51).

$$i = s(i_{SS}) \times \lfloor j / s(i_{SS}) \rfloor + (j + \lfloor N_{COL} \times j / N_{CBPSS}(i_{SS}) \rfloor) \bmod s(i_{SS}); \quad j = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \tag{19-51}$$

where $s(i_{SS})$ is defined in Equation (19-48).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The third permutation reverses the first permutation of the interleaver as shown in Equation (19-52).

$$k = N_{COL} \times i - (N_{CBPSS}(i_{SS}) - 1) \times \lfloor i / N_{ROW} \rfloor \qquad i = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \tag{19-52}$$

19.3.11.9 Constellation mapping

19.3.11.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points for BPSK, QPSK, 16-QAM, and 64-QAM follows the rules defined in 17.3.5.8 (Subcarrier modulation mapping).

The streams of complex numbers are denoted as shown in Equation (19-53).

$$d_{k,\,l,\,n},\ 0 \le k \le N_{SD} - 1; 1 \le l \le N_{SS}; 0 \le n \le N_{SYM} - 1 \tag{19-53}$$

19.3.11.9.2 Space-time block coding (STBC)

This subclause defines a set of optional robust transmission formats that are applicable only when N_{STS} is greater than N_{SS}. In this case, N_{SS} spatial streams are mapped to N_{STS} space-time streams, which are mapped to N_{TX} transmit chains. These formats are based on STBC. When the use of STBC is indicated in the STBC field of the HT-SIG, a symbol operation shall occur between the constellation mapper and the spatial mapper (see Figure 19-3 (Transmitter block diagram 2)) as defined in this subclause.

If STBC is applied, the stream of complex numbers, $d_{k,\,i,\,n}; k = 0 \ldots N_{SD} - 1; i = 1 \ldots N_{SS}; n = 0 \ldots N_{SYM} - 1$, generated by the constellation mapper, is the input of the STBC encoder, which produces as output the stream of complex numbers $\tilde{d}_{k,\,i,\,n}; k = 0 \ldots N_{SD} - 1; i = 1 \ldots N_{STS}; n = 0 \ldots N_{SYM} - 1$. For given values of k and i, STBC processing operates on the complex modulation symbols in sequential pairs of OFDM symbols so that the value of $\tilde{d}_{k,\,i,\,2m}$ depends on $d_{k,\,i,\,2m}$ and $d_{k,\,i,\,2m+1}$, and $\tilde{d}_{k,\,i,\,2m+1}$ also depends on $d_{k,\,i,\,2m}$ and $d_{k,\,i,\,2m+1}$, as defined in Table 19-18 (Constellation mapper output to spatial mapper input for STBC).

Table 19-18—Constellation mapper output to spatial mapper input for STBC

N_{STS}	HT-SIG MCS field (bits 0–6 in HT-SIG$_1$)	N_{SS}	HT-SIG STBC field (bits 4–5 in HT-SIG$_2$)	i_{STS}	$\tilde{d}_{k,\,i,\,2m}$	$\tilde{d}_{k,\,i,\,2m+1}$
2	0–7	1	1	1	$d_{k,\,1,\,2m}$	$d_{k,\,1,\,2m+1}$
				2	$-d^*_{k,\,1,\,2m+1}$	$d^*_{k,\,1,\,2m}$
3	8–15, 33–38	2	1	1	$d_{k,\,1,\,2m}$	$d_{k,\,1,\,2m+1}$
				2	$-d^*_{k,\,1,\,2m+1}$	$d^*_{k,\,1,\,2m}$
				3	$d_{k,\,2,\,2m}$	$d_{k,\,2,\,2m+1}$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 19-18—Constellation mapper output to spatial mapper input for STBC *(continued)*

N_{STS}	HT-SIG MCS field (bits 0–6 in HT-SIG$_1$)	N_{SS}	HT-SIG STBC field (bits 4–5 in HT-SIG$_2$)	i_{STS}	$\tilde{d}_{k, i, 2m}$	$\tilde{d}_{k, i, 2m+1}$
4	8–15	2	2	1	$d_{k, 1, 2m}$	$d_{k, 1, 2m+1}$
				2	$-d^{*}_{k, 1, 2m+1}$	$d^{*}_{k, 1, 2m}$
				3	$d_{k, 2, 2m}$	$d_{k, 2, 2m+1}$
				4	$-d^{*}_{k, 2, 2m+1}$	$d^{*}_{k, 2, 2m}$
4	16–23, 39, 41, 43, 46, 48, 50	3	1	1	$d_{k, 1, 2m}$	$d_{k, 1, 2m+1}$
				2	$-d^{*}_{k, 1, 2m+1}$	$d^{*}_{k, 1, 2m}$
				3	$d_{k, 2, 2m}$	$d_{k, 2, 2m+1}$
				4	$d_{k, 3, 2m}$	$d_{k, 3, 2m+1}$

NOTE—The '*' operator represents the complex conjugate.

If STBC is not applied, $\tilde{d}_{k, i, n} = d_{k, i, n}$ and $N_{SS} = N_{STS}$.

NOTE 1—The specific STBC schemes for single spatial streams ($N_{SS} = 1$) with $N_{TX} \geq 3$ are not detailed in this subclause since they are covered through the use of spatial expansion as detailed in 19.3.11.11.2 (Spatial mapping).

NOTE 2—STBC is applied only for the HT-SIG MCS field values specified in Table 19-18 (Constellation mapper output to spatial mapper input for STBC) and is not used with MCS 32.

19.3.11.10 Pilot subcarriers

In a 20 MHz transmission four pilot tones shall be inserted in the same subcarriers used in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), i.e., in subcarriers –21, –7, 7, and 21. The pilot sequence for the nth symbols and $i_{STS}{}^{\text{th}}$ space-time stream shall be as shown in Equation (19-54).

$$\begin{aligned} {}^{-28,28}_{(i_{STS}, n)} = \Big\{ & 0, 0, 0, 0, 0, 0, 0, \Psi^{(N_{STS})}_{i_{STS}, n \bmod 4}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, \Psi^{(N_{STS})}_{i_{STS}, (n+1) \bmod 4}, 0, 0, 0, 0, 0, 0, 0, \\ & 0, 0, 0, 0, 0, 0, \Psi^{(N_{STS})}_{i_{STS}, (n+2) \bmod 4}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, \Psi^{(N_{STS})}_{i_{STS}, (n+3) \bmod 4}, 0, 0, 0, 0, 0, 0, 0 \Big\} \end{aligned} \tag{19-54}$$

In a 40 MHz transmission (excluding MCS 32; see 19.3.11.11.5 (Transmission in MCS 32 format)), pilot signals shall be inserted in subcarriers –53, –25, –11, 11, 25, and 53. The pilot sequence for symbol n and space-time stream i_{STS} shall be as shown in Equation (19-55).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$P^{-58,58}_{(i_{STS},\,n)} = \Big\{ 0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,n \bmod 6},0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,$$
$$0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+1) \bmod 6},0,0,0,0,0,0,0,0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+2) \bmod 6},0,0,0,0,0,0,0,0,0,0,$$
$$0,0,0,0,0,0,0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+3) \bmod 6},0,0,0,0,0,0,0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+4) \bmod 6},$$
$$0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},\,(n+5) \bmod 6},0,0,0,0,0 \Big\} \quad (19\text{-}55)$$

where the patterns $\Psi^{(N_{STS})}_{i_{STS},\,n}$ are defined in Table 19-19 (Pilot values for 20 MHz transmission) and Table 19-20 (Pilots values for 40 MHz transmission (excluding MCS 32)).

NOTE—For each space-time stream, there is a different pilot pattern, and the pilot patterns are cyclically rotated over symbols.

The basic patterns are also different according to the total number of space-time streams for the packet.

Table 19-19—Pilot values for 20 MHz transmission

19.3.11.11 OFDM modulation

19.3.11.11.1 General

The time domain signal is composed from the stream of complex numbers as shown in Equation (19-56)

$$\tilde{d}_{k,l,n},\ 0 \le k \le N_{SD}-1;1 \le l \le N_{STS};0 \le n \le N_{SYM}-1 \tag{19-56}$$

and from the pilot signals. In a 40 MHz transmission, the upper subcarriers are rotated 90° relative to the lower subcarriers.

19.3.11.11.2 Spatial mapping

The transmitter may choose to rotate and/or scale the constellation mapper output vector (or the space-time block coder output, if applicable). This rotation and/or scaling is useful in the following cases:

— When there are more transmit chains than space-time streams, $N_{STS} < N_{TX}$

— As part of (an optional) sounding packet

— As part of (an optional) calibration procedure

— When the packet is transmitted using one of the (optional) beamforming techniques

If the data to be transmitted on subcarrier k on space-time stream i_{STS} are $X_k^{(i_{STS})}$, the transmitted data on the transmit chain i_{TX} shall be as shown in Equation (19-57).

$$r_{Field}^{(i_{TX})} = \frac{1}{\sqrt{N_{STS} \cdot N_{Field}^{Tone}}} w_{\mathrm{T}_{Field}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} X_k^{(i_{STS})} \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{STS}})) \tag{19-57}$$

where

$[Q_k]_{i_{TX}, i_{STS}}$ is the element in row i_{TX} and column i_{STS} in a matrix Q_k with N_{TX} rows and N_{STS} columns; Q_k may be frequency dependent

Field is any field, as defined in 19.3.7 (Mathematical description of signals), excluding L-STF, L-LTF, L-SIG, and HT-SIG in HT_MF format PPDU

Below are examples of spatial mapping matrices that might be used. There exist many other alternatives; implementation is not restricted to the spatial mapping matrices shown. The examples are:

a) *Direct mapping*: Q_k is a diagonal matrix of unit magnitude complex values that takes one of two forms:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

1) $Q_k = \mathbf{I}$, the identity matrix

2) A CSD matrix in which the diagonal elements represent cyclic shifts in the time domain: $[Q_k]_{i,i} = \exp(-j2\pi k\Delta_F \tau_{CS}^i)$, where τ_{CS}^i, $i = 1, \ldots, N_{TX}$ represents the CSD applied.

b) *Indirect mapping:* Q_k may be the product of a CSD matrix and a unitary matrix such as the Hadamard matrix or the Fourier matrix.

c) *Spatial expansion:* Q_k is the product of a CSD matrix and a square matrix formed of orthogonal columns. As an illustration:

1) The spatial expansion may be performed by duplicating some of the N_{STS} streams to form the N_{TX} streams, with each stream being scaled by the normalization factor $\sqrt{N_{STS}/N_{TX}}$. The spatial expansion may be performed by using, for instance, one of the following matrices, denoted D, left-multiplied by a CSD matrix, denoted $M_{CSD}(k)$, and/or possibly multiplied by any unitary matrix. The resulting spatial mapping matrix is then $Q_k = M_{CSD}(k) \cdot D$, where D may take on one of the following values:

i) N_{TX}=2, N_{STS}=1, $D = \frac{1}{\sqrt{2}}\begin{bmatrix}1 & 1\end{bmatrix}^T$

ii) N_{TX}=3, N_{STS}=1, $D = \frac{1}{\sqrt{3}}\begin{bmatrix}1 & 1 & 1\end{bmatrix}^T$

iii) N_{TX}=4, N_{STS}=1, $D = \frac{1}{2}\begin{bmatrix}1 & 1 & 1 & 1\end{bmatrix}^T$

iv) N_{TX}=3, N_{STS}=2, $D = \sqrt{\frac{2}{3}}\begin{bmatrix}1 & 0\\ 0 & 1\\ 1 & 0\end{bmatrix}$

v) N_{TX}=4, N_{STS}=2, $D = \frac{1}{\sqrt{2}}\begin{bmatrix}1 & 0\\ 0 & 1\\ 1 & 0\\ 0 & 1\end{bmatrix}$

vi) N_{TX}=4, N_{STS}=3, $D = \frac{\sqrt{3}}{2}\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\\ 1 & 0 & 0\end{bmatrix}$

2) Different spatial expansion over subcarriers should be used in HT-mixed format only and with the smoothing bit equal to 0:

i) N_{TX}=2, N_{STS}=1, $[Q_k]_{N_{STS}} = \begin{bmatrix}1 & 0\end{bmatrix}^T$ or $[Q_k]_{N_{STS}} = \begin{bmatrix}0 & 1\end{bmatrix}^T$

ii) N_{TX}=3, N_{STS}=2, $[Q_k]_{N_{STS}} = \begin{bmatrix}1 & 0\\ 0 & 0\\ 0 & 1\end{bmatrix}, \begin{bmatrix}1 & 0\\ 0 & 1\\ 0 & 0\end{bmatrix}$ or $\begin{bmatrix}0 & 0\\ 1 & 0\\ 0 & 1\end{bmatrix}$

iii) N_{TX}=4, N_{STS}=2, $[Q_k]_{N_{STS}} = \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 1 \end{bmatrix}, \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 0 \\ 0 & 1 \end{bmatrix}$ or $\begin{bmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$

iv) N_{TX}=4, N_{STS}=3, $[Q_k]_{N_{STS}} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ or $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

d) *Beamforming steering matrix:* Q_k is any matrix that improves the reception in the receiver based on some knowledge of the channel between the transmitter and the receiver. With transmit beamforming with explicit feedback, the steering matrix Q_k is determined using either H_{eff} for CSI feedback or V_k for noncompressed and compressed matrices feedback from the STA to which the beamformed packet is addressed.

When there are fewer space-time streams than transmit chains, the first N_{STS} columns of the matrices above that are square might be used.

The same matrix Q_k shall be applied to subcarrier *k* during all parts of the packet in HT-greenfield format and all parts of the packet following and including the HT-STF field in an HT-mixed format packet. This operation is transparent to the receiver.

If at least 95% of the sum of the energy from all impulse responses of the time domain channels between all space-time streams and all transmit chain inputs, induced by the CSD added according to Table 19-10 (Cyclic shift values of HT portion of packet) and the frequency-dependence in the matrix Q_k, is contained within 800 ns, the smoothing bit should be set to 1. Otherwise, it shall be set to 0.

The CSD of Table 19-10 (Cyclic shift values of HT portion of packet) shall be applied at the input of the spatial mapper.

For the identity matrix direct mapping, the smoothing bit should be set to 1.

If no spatial mapping is applied, the matrix Q_k is equal to the identity matrix and $N_{STS} = N_{TX}$.

Sounding PPDUs using spatial expansion shall use an orthonormal column matrix Q_k. When the number of rows and columns is equal, the orthonormal column matrix becomes a unitary matrix.

19.3.11.11.3 Transmission in 20 MHz HT format

For 20 MHz HT transmissions, the signal from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$ shall be as shown in Equation (19-58).

$$\tilde{D}_{k,\,i_{STS},\,n} = \begin{cases} 0,\ k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ \tilde{d}_{M^r(k),\,i_{STS},\,n},\ \text{otherwise} \end{cases}$$

$$M^r(k) = \begin{cases} k + 58,\ -58 \le k \le -54 \\ k + 57,\ -52 \le k \le -26 \\ k + 56,\ -24 \le k \le -12 \\ k + 55,\ -10 \le k \le -2 \\ k + 52,\ 2 \le k \le 10 \\ k + 51,\ 12 \le k \le 24 \\ k + 50,\ 26 \le k \le 52 \\ k + 49,\ 54 \le k \le 58 \end{cases}$$

$P^k_{(i_{STS},\,n)}$ is defined in Equation (19-55)

NOTE—The 90° rotation that is applied to the upper part of the 40 MHz channel is applied in the same way to the HT-STF, HT-LTF, and HT-SIG. The rotation applies to both pilots and the data in the upper part of the 40 MHz channel.

19.3.11.11.5 Transmission in MCS 32 format

MCS 32 format provides the lowest transmission rate in 40 MHz. It is used only for one spatial stream and only with BPSK modulation and rate 1/2 coding.

In the MCS 32 format, the signal shall be as shown in Equation (19-60).

$$r^{i_{TX}}_{HT-DATA}(t) = \frac{1}{\sqrt{N^{Tone}_{HT-Duplicate}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-N_{SR}}^{N_{SR}} (D_{k,\,n} + p_{n+z}P_k)([Q_{k-32}]_{i_{TX},\,1} \exp(j2\pi(k-32)\Delta_F(t - nT_{SYM} - T_{GI})) + j[Q_{k+32}]_{i_{TX},\,1} \exp(j2\pi(k+32)\Delta_F(t - nT_{SYM} - T_{GI})))$$ (19-60)

where

z is defined in 19.3.11.11.3 (Transmission in 20 MHz HT format)

P_k and p_n are defined in 17.3.5.10 (OFDM modulation)

$D_{k,\,n}$ is defined in 19.3.9.4.3 (HT-SIG definition)

N_{SR} has the value defined for non-HT 20 MHz transmission

$[Q_k]_{i_{TX},\,1}$ is an element from a vector of length N_{TX}, which may be frequency dependent

$N^{Tone}_{HT-Duplicate}$ is defined in Table 19-8 (Value of tone scaling factor)

The rules of spatial expansion CSD limitation, as specified in 19.3.11.11.2 (Spatial mapping), shall apply to $[Q_k]_{i_{TX},\,1}$.

19.3.11.11.6 Transmission with a short GI

Short GI is used in the data field of the packet when the Short GI field in the HT-SIG is equal to 1. When it is used, the same formula for the formation of the signal shall be used as in 19.3.11.11.3 (Transmission in 20 MHz HT format), 19.3.11.11.4 (Transmission in 40 MHz HT format), and 19.3.11.11.5 (Transmission in MCS 32 format), with T_{GI} replaced by T_{GIS} and T_{SYM} replaced by T_{SYMS}.

NOTE—Short GI is not used in HT-greenfield format with one spatial stream, in which case the HT-SIG is immediately followed by data. It is very difficult to parse the HT-SIG in time to demodulate these data with the correct GI length if the GI length is not known in advance.

19.3.11.12 Non-HT duplicate transmission

Non-HT duplicate transmission is used to transmit to Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) STAs, Clause 18 (Extended Rate PHY (ERP) specification) STAs, and Clause 19 (High Throughput (HT) PHY specification) STAs that may be present in either the upper or lower halves of the 40 MHz channel. The L-STF, L-LTF, and L-SIG shall be transmitted in the same way as in the HT 40 MHz transmission. The HT-SIG, HT-STF, and HT-LTF are not transmitted. Data transmission shall be as defined in Equation (19-61).

$$r^{i_{TX}}_{LEG-DUP}(t) = \frac{1}{\sqrt{N^{Tone}_{Non\text{-}HT\ Duplicate}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} (D_{k,n} + p_{n+1}P_k)(\exp(j2\pi(k-32)\Delta_F(t - nT_{SYM} - T_{GI} - T^{i_{TX}}_{CS})) + j\exp(j2\pi(k+32)\Delta_F(t - nT_{SYM} - T_{GI} - T^{i_{TX}}_{CS}))) \quad (19\text{-}61)$$

where

P_k and p_n	are defined in 17.3.5.10 (OFDM modulation)
$D_{k,n}$	is defined in 19.3.9.4.3 (HT-SIG definition)
$T^{i_{TX}}_{CS}$	represents the cyclic shift of the transmit chain i_{TX} and is defined in Table 19-9 (Cyclic shift for non-HT portion of packet)
$N^{Tone}_{Non\text{-}HT\ Duplicate}$	is defined in Table 19-8 (Value of tone scaling factor)

19.3.12 Beamforming

19.3.12.1 General

Beamforming is a technique in which the beamformer utilizes the knowledge of the MIMO channel to generate a steering matrix Q_k that improves reception in the beamformee.

The equivalent complex baseband MIMO channel model is one in which, when a vector $\mathbf{x}_k = [x_1, x_2, \ldots x_{N_{TX}}]^T$ is transmitted in subcarrier k, the received vector $\mathbf{y}_k = [y_1, y_2, \ldots y_{N_{RX}}]^T$ is modeled as shown in Equation (19-62).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$\mathbf{y}_k = H_k\mathbf{x}_k + \mathbf{n} \quad (19\text{-}62)$$

where

H_k is channel matrix of dimensions $N_{RX} \times N_{TX}$

n is white (spatially and temporally) Gaussian noise as illustrated in Figure 19-14 (Beamforming MIMO channel model (3x2 example))

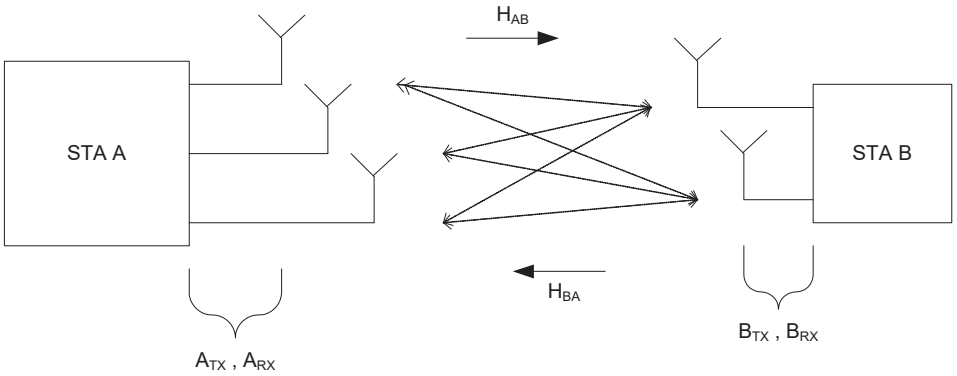

Figure 19-14—Beamforming MIMO channel model (3x2 example)

When beamforming is used, the beamformer replaces $\mathbf{x}_k$, which in this case has $N_{STS} \le N_{TX}$ elements, with $Q_k\mathbf{x}_k$, where Q_k has N_{TX} rows and N_{STS} columns, so that the received vector is as shown in Equation (19-63).

$$\mathbf{y}_k = H_kQ_k\mathbf{x}_k + \mathbf{n} \quad (19\text{-}63)$$

The beamforming steering matrix that is computed (or updated) from a new channel measurement replaces the existing Q_k for the next beamformed data transmission. There are several methods of beamforming, differing in the way the beamformer acquires the knowledge of the channel matrices H_k and on whether the beamformer generates Q_k or the beamformee provides feedback information for the beamformer to generate Q_k.

19.3.12.2 Implicit feedback beamforming

Implicit feedback beamforming is a technique that relies on reciprocity in the time division duplex channel to estimate the channel over which a device is transmitting based on the MIMO reference that is received from the device to which it plans to transmit. This technique allows the transmitting device to calculate a set of transmit steering matrices, Q_k, one for each subcarrier, which are intended to optimize the performance of the link.

Referring to Figure 19-14 (Beamforming MIMO channel model (3x2 example)), beamforming transmissions from STA A to STA B using implicit techniques are enabled when STA B sends STA A a sounding PPDU, the reception of which allows STA A to form an estimate of the MIMO channel from STA B to STA A, for all subcarriers. In a TDD channel in which the forward and reverse channels are reciprocal, the channel from STA A to STA B in subcarrier k is the matrix transpose of the channel from STA B to STA

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

A in subcarrier k to within a complex scaling factor, i.e., $H_{\mathrm{AB},k} = \rho[H_{\mathrm{BA},k}]^T$. Here $H_{\mathrm{AB},k}$ is the MIMO channel matrix from STA A to STA B at subcarrier k, and $H_{\mathrm{BA},k}$ is the channel matrix from STA B to STA A at subcarrier k. STA A uses this relationship to compute transmit steering matrices that are suitable for transmitting to STA B over $H_{\mathrm{AB},k}$.

NOTE 1—In order for the recipient of the sounding to compute steering matrices when steered or unsteered sounding is used, the steering matrices need to have the property $(H_kQ_k)(H_kQ_k)^H = H_kH_k^H$, where X^H indicates the conjugate transpose of the matrix X.

While the over-the-air channel between the antenna(s) at one STA and the antenna(s) at a second STA is reciprocal, the observed baseband-to-baseband channel used for communication might not be, as it includes the transmit and receive chains of the STAs. Differences in the amplitude and phase characteristics of the transmit and receive chains associated with individual antennas degrade the reciprocity of the over-the-air channel and cause degradation of performance of implicit beamforming techniques. The over-the-air calibration procedure described in 10.32.2.4 (Calibration) may be used to restore reciprocity. The procedure provides the means for calculating a set of correction matrices that can be applied at the transmit side of a STA to correct the amplitude and phase differences between the transmit and receive chains in the STA. If this correction is done at least at the STA that serves as the beamformer, there is sufficient reciprocity for implicit feedback in the baseband-to-baseband response of the forward link and reverse channel.

Figure 19-15 (Baseband-to-baseband channel) illustrates the observed baseband-to-baseband channel, including reciprocity correction. Spatial mapping matrices $Q_{\mathrm{A},k}$ and $Q_{\mathrm{B},k}$ are assumed to be identity matrices here for simplicity of illustration.

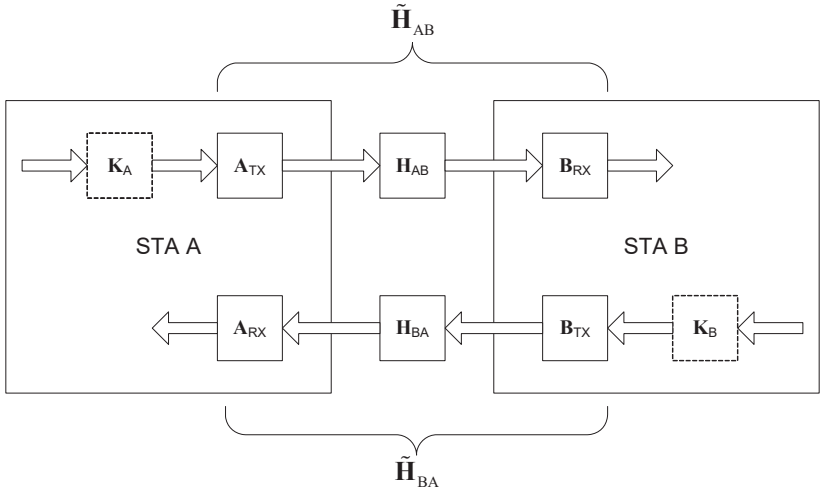

Figure 19-15—Baseband-to-baseband channel

NOTE 2—Spatial mapping matrix for sounding PPDUs are specified in 19.3.13.3 (Sounding PPDU for calibration).

The amplitude and phase responses of the transmit and receive chains can be expressed as diagonal matrices with complex valued diagonal entries, of the form $A_{TX,k}$ and $A_{RX,k}$ at STA A. The relationship between the baseband-to-baseband channel, $\tilde{H}_{\mathrm{AB},k}$, and the over-the-air channel, $H_{\mathrm{AB},k}$, is shown in Equation (19-64).

$$\tilde{H}_{\mathrm{AB},k} = B_{\mathrm{RX},k}H_{\mathrm{AB},k}A_{\mathrm{TX},k} \quad (19\text{-}64)$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Similarly, the relationship between $\tilde{H}_{\mathrm{BA},k}$ and $H_{\mathrm{BA},k}$ is shown in Equation (19-65).

$$\tilde{H}_{\mathrm{BA},k} = A_{\mathrm{RX},k} H_{\mathrm{BA},k} B_{\mathrm{TX},k} \tag{19-65}$$

As an example, consider the case where calibration is performed at both STA A and STA B. The objective is to compute correction matrices, $K_{\mathrm{A},k}$ and $K_{\mathrm{B},k}$, that restore reciprocity so that Equation (19-66) is true.

$$\tilde{H}_{\mathrm{AB},k} K_{\mathrm{A},k} = \rho[\tilde{H}_{\mathrm{BA},k} K_{\mathrm{B},k}]^{\mathrm{T}} \tag{19-66}$$

The correction matrices are diagonal matrices with complex valued diagonal entries. The reciprocity condition in Equation (19-66) is enforced when Equation (19-67) and Equation (19-68) are true.

$$K_{\mathrm{A},k} = \alpha_{\mathrm{A},k}[A_{\mathrm{TX},k}]^{-1} A_{\mathrm{RX},k} \tag{19-67}$$

and

$$K_{\mathrm{B},k} = \alpha_{\mathrm{B},k}[B_{\mathrm{TX},k}]^{-1} B_{\mathrm{RX},k} \tag{19-68}$$

where $\alpha_{\mathrm{A},k}$ and $\alpha_{\mathrm{B},k}$ are complex valued scaling factors.

Using these expressions for the correction matrices, the calibrated baseband-to-baseband channel between STA A and STA B is expressed as shown in Equation (19-69).

$$\hat{H}_{\mathrm{AB},k} = \tilde{H}_{\mathrm{AB},k} K_{\mathrm{A},k} = \alpha_{\mathrm{A},k} B_{\mathrm{RX},k} H_{\mathrm{AB},k} A_{\mathrm{RX},k} \tag{19-69}$$

If both sides apply the correction matrices, the calibrated baseband-to-baseband channel between STA A and STA B is expressed as shown in Equation (19-70).

$$\hat{H}_{\mathrm{BA},k} = \alpha_{\mathrm{B},k} A_{\mathrm{RX},k} H_{\mathrm{BA},k} B_{\mathrm{RX},k} = \frac{\alpha_{\mathrm{B},k}}{\alpha_{\mathrm{A},k}}[\hat{H}_{\mathrm{AB},k}]^{\mathrm{T}} \tag{19-70}$$

Focusing on STA A, the procedure for estimating $K_{\mathrm{A},k}$ is as follows:

a) STA A sends STA B a sounding PPDU, the reception of which allows STA B to estimate the channel matrices $\tilde{H}_{\mathrm{AB},k}$.

b) STA B sends STA A a sounding PPDU, the reception of which allows STA A to estimate the channel matrices $\tilde{H}_{\mathrm{BA},k}$.

c) STA B sends the quantized estimates of $\tilde{H}_{\mathrm{AB},k}$ to STA A.

d) STA A uses its local estimates of $\tilde{H}_{\mathrm{BA},k}$ and the quantized estimates of $\tilde{H}_{\mathrm{AB},k}$ received from STA B to compute the correction matrices $K_{\mathrm{A},k}$.

NOTE 3—When a nonidentity matrix is used for $Q_{A,k}$, STA A is responsible for accounting for the spatial mapping in its local channel estimate as well as in the quantized CSI fed back since the channel feedback received in step c) is actually $\tilde{H}_{\mathrm{AB},k} Q_{\mathrm{A},k}$ and not $\tilde{H}_{\mathrm{AB},k}$. Furthermore, since $Q_{\mathrm{B},k}$ is defined in 19.3.13.3 (Sounding PPDU for calibration), additional steps might be taken in STA A to remove the effect of $Q_{\mathrm{B},k}$ when computing the correction matrix $K_{A,k}$.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Steps a) and b) occur over a short time interval to so the channel changes as little as possible between measurements. A similar procedure is used to estimate $K_{\mathrm{B},k}$ at STA B. The details of the computation of the correction matrices is implementation specific and beyond the scope of this standard.

19.3.12.3 Explicit feedback beamforming

19.3.12.3.1 General

In explicit beamforming, in order for STA A to transmit a beamformed packet to STA B, STA B measures the channel matrices and sends STA A either the effective channel, $H_{eff,k}$, or the beamforming feedback matrix, V_k, for STA A to determine a steering matrix, $Q_{\mathrm{steer},k} = Q_k V_k$, with V_k found from $H_k Q_k$, where Q_k is the orthonormal spatial mapping matrix that was used to transmit the sounding packet that elicited the V_k feedback. The effective channel, $H_{eff,k} = H_k Q_k$, is the product of the spatial mapping matrix used on transmit with the channel matrix. When new steering matrix $Q_{\mathrm{steer},k}$ is found, $Q_{\mathrm{steer},k}$ may replace Q_k for the next beamformed data transmission.

NOTE—$Q_{\mathrm{steer},k}$ is a mathematical term to update a new steering matrix for Q_k in the next beamformed data transmission.

19.3.12.3.2 CSI matrices feedback

In CSI matrices feedback, the beamformer receives the quantized MIMO channel matrix, H_{eff}, from the beamformee. The beamformer then may use this matrix to compute a set of transmit steering matrices, Q_k. The CSI matrix, H_{eff}, shall be determined from the transmitter spatial mapper input to the receiver FFT outputs. The beamformee shall remove the CSD in Table 19-10 (Cyclic shift values of HT portion of packet) from the measured channel matrix.

The matrices $H_{eff}(k)$, where k is the subcarrier index, are encoded so that applying the procedure in 19.3.12.3.3 (CSI matrices feedback decoding procedure) optimally reconstructs the matrix.

19.3.12.3.3 CSI matrices feedback decoding procedure

The received, quantized matrix $H^{q}_{eff}(k)$ (of a specific subcarrier, k) shall be decoded as follows:

a) The real and imaginary parts of each element of the matrix, $H^{q(R)}_{eff(m,l)}(k)$ and $H^{q(I)}_{eff(m,l)}(k)$, are decoded as a pair of 2s complement numbers to create the complex element, where $1 \le m \le N_r$ and $1 \le l \le N_c$.

b) Each element in the matrix of subcarrier k is then scaled using the value in the carrier matrix amplitude field (3 bits), $M_H(k)$, interpreted as a positive integer, in decibels, as follows:

   1) Calculate the linear value as defined in Equation (19-71).
   2) Calculate decoded values of the real and imaginary parts of the matrix element as defined in Equation (19-72) and Equation (19-73).

$$r(k) = 10^{M_H(k)/20} \tag{19-71}$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$\mathrm{Re}\{\tilde{H}_{eff(m,l)}(k)\} = \frac{H^{q(R)}_{eff(m,l)}(k)}{r(k)} \quad (19\text{-}72)$$

$$\mathrm{Im}\{\tilde{H}_{eff(m,l)}(k)\} = \frac{H^{q(I)}_{eff(m,l)}(k)}{r(k)} \quad (19\text{-}73)$$

19.3.12.3.4 Example of CSI matrices feedback encoding

The following is an example of an encoding process:

a) The maximums of the real and imaginary parts of each element of the matrix in each subcarrier are found, as defined by Equation (19-74).

$$m_H(k) = \max\left\{\max\left\{\left|\mathrm{Re}(H_{eff(m,l)}(k))\right|^{m=N_r,\,l=N_c}_{m=1,\,l=1}\right\}, \max\left\{\left|\mathrm{Im}(H_{eff(m,l)}(k))\right|^{m=N_r,\,l=N_c}_{m=1,\,l=1}\right\}\right\} \quad (19\text{-}74)$$

b) The scaling ratio is calculated and quantized to 3 bits as defined by Equation (19-75). A linear scaler is given by Equation (19-76).

$$M_H(k) = \min\left\{7, \left\lfloor 20\log_{10}\left(\frac{\max\{m_H(z)\}^{z=N_{SR}}_{z=-N_{SR}}}{m_H(k)}\right)\right\rfloor\right\} \quad (19\text{-}75)$$

where

$$M^{\mathrm{lin}}_H(k) = \frac{\max\{m_H(z)\}^{z=N_{SR}}_{z=-N_{SR}}}{10^{M_H(k)/20}} \quad (19\text{-}76)$$

c) The real and imaginary parts of each element in the matrix $H_{eff(m,l)}(k)$ are quantized to N_b bits in 2s complement encoding as defined by Equation (19-77) and Equation (19-78).

$$H^{q(R)}_{eff(m,l)}(k) = \left\lfloor \frac{\mathrm{Re}\{H_{eff(m,l)}(k)\}}{M^{\mathrm{lin}}_H(k)}(2^{N_b-1}-1)+0.5 \right\rfloor \quad (19\text{-}77)$$

$$H^{q(I)}_{eff(m,l)}(k) = \left\lfloor \frac{\mathrm{Im}\{H_{eff(m,l)}(k)\}}{M^{\mathrm{lin}}_H(k)}(2^{N_b-1}-1)+0.5 \right\rfloor \quad (19\text{-}78)$$

Each matrix is encoded using $3 + 2 \times N_b \times N_r \times N_c$ bits, where N_r and N_c are the number of rows and columns, respectively, in the channel matrix estimate computed by the receiving station and where N_b may have the value of 4, 5, 6, or 8 bits.

19.3.12.3.5 Noncompressed beamforming feedback matrix

In noncompressed beamforming feedback matrix, the beamformee shall remove the space-time stream CSD in Table 19-10 (Cyclic shift values of HT portion of packet) from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrices, $V(k)$, found by the beamformee are sent to the beamformer in the order of real and imaginary components per tone as specified

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

in 9.4.1.29 (Noncompressed Beamforming Report field). The beamformer might use these matrices to determine the steering matrices, Q_k.

The beamformee shall encode the matrices $V(k)$ so a beamformer applying the procedure below optimally reconstructs the matrix.

The received matrix $V^q(k)$ (of a specific subcarrier k) shall be decoded as follows:

a) The real and imaginary parts of each element of the matrix, $V_{m,l}^{q,R}$ and $V_{m,l}^{q,I}$, shall be decoded as a pair of 2s complement numbers to create the complex element, where $1 \le m \le N_r$ and $1 \le l \le N_c$.

b) The dimensions of the beamforming feedback matrices are $N_r \times N_c$, where N_r and N_c are the number of rows and columns, respectively, in the beamforming feedback matrix computed by the receiving station. Each matrix is encoded using $2 \times N_b \times N_r \times N_c$ bits. N_b may have the value of 2, 4, 6, or 8 bits.

c) Columns $1 \ldots N_c$ of the beamforming feedback matrix correspond to spatial streams $1 \ldots N_c$, respectively. The mapping of spatial stream to modulation is defined in the MCS tables in 19.5 (Parameters for HT MCSs). A transmitter shall not reorder the columns of the beamforming feedback matrices.

19.3.12.3.6 Compressed beamforming feedback matrix

In compressed beamforming feedback matrix, the beamformee shall remove the space-time stream CSD in Table 19-10 (Cyclic shift values of HT portion of packet) from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrices, $V(k)$, found by the beamformee are compressed in the form of angles, which are sent to the beamformer. The beamformer might use these angles to decompress the matrices and determine the steering matrices Q_k.

The matrix V per tone shall be compressed as follows: The $N_r \times N_c$ beamforming feedback orthonormal column matrix V found by the beamformee shall be represented as shown in Equation (19-79). When the number of rows and columns is equal, the orthonormal column matrix becomes a unitary matrix.

$$V = \left[\prod_{i=1}^{\min(N_c, N_r - 1)} \left[D_i\left(1_{i-1} \; e^{j\phi_{i,i}} \; \ldots \; e^{j\phi_{N_r-1,i}} \; 1 \right) \prod_{l=i+1}^{N_r} G_{li}^{T}(\psi_{li}) \right] \right] \tilde{I}_{N_r \times N_c} \tag{19-79}$$

The matrix $D_i\left(1_{i-1} \; e^{j\phi_{i,i}} \; \ldots \; e^{j\phi_{N_r-1,i}} \; 1 \right)$ is an $N_r \times N_r$ diagonal matrix, where 1_{i-1} represents a sequence of 1s with length of *i*–1, as shown in Equation (19-80).

$$D\left(1_{i-1} \; e^{j\phi_{i,i}} \ldots \; e^{j\phi_{N_r-1,i}} \; 1 \right) = \begin{bmatrix} I_{i-1} & 0 & \ldots & \ldots & 0 \\ 0 & e^{j\phi_{i,i}} & 0 & \ldots & 0 \\ \vdots & 0 & \ddots & 0 & 0 \\ \vdots & \vdots & 0 & e^{j\phi_{N_r-1,i}} & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \tag{19-80}$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The matrix $G_{li}(\psi)$ is an $N_r \times N_r$ Givens rotation matrix as shown in Equation (19-81).

$$G_{li}(\psi) = \begin{bmatrix} I_{i-1} & 0 & 0 & 0 & 0 \\ 0 & \cos(\psi) & 0 & \sin(\psi) & 0 \\ 0 & 0 & I_{l-i-1} & 0 & 0 \\ 0 & -\sin(\psi) & 0 & \cos(\psi) & 0 \\ 0 & 0 & 0 & 0 & I_{N_r-l} \end{bmatrix} \tag{19-81}$$

where each I_m is an $m \times m$ identity matrix, and $\cos(\psi)$ and $\sin(\psi)$ are located at row l and column i. $\tilde{I}_{N_r \times N_c}$ is an identity matrix padded with 0s to fill the additional rows or columns when $N_r \neq N_c$.

For example, a 4×2 V matrix has the representation shown in Equation (19-82).

$$\begin{aligned} V = & \begin{bmatrix} e^{j\phi_{11}} & 0 & 0 & 0 \\ 0 & e^{j\phi_{21}} & 0 & 0 \\ 0 & 0 & e^{j\phi_{31}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \times \begin{bmatrix} \cos\psi_{21} & \sin\psi_{21} & 0 & 0 \\ -\sin\psi_{21} & \cos\psi_{21} & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^T \times \begin{bmatrix} \cos\psi_{31} & 0 & \sin\psi_{31} & 0 \\ 0 & 1 & 0 & 0 \\ -\sin\psi_{31} & 0 & \cos\psi_{31} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^T \times \begin{bmatrix} \cos\psi_{41} & 0 & 0 & \sin\psi_{41} \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\sin\psi_{41} & 0 & 0 & \cos\psi_{41} \end{bmatrix}^T \\ & \times \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & e^{j\phi_{22}} & 0 & 0 \\ 0 & 0 & e^{j\phi_{32}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \times \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{32} & \sin\psi_{32} & 0 \\ 0 & -\sin\psi_{32} & \cos\psi_{32} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^T \times \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{42} & 0 & \sin\psi_{42} \\ 0 & 0 & 1 & 0 \\ 0 & -\sin\psi_{42} & 0 & \cos\psi_{42} \end{bmatrix}^T \times \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \end{aligned} \tag{19-82}$$

The procedure for finding a compressed V matrix is described as follows:

A $N_r \times N_c$ beamforming feedback orthonormal column matrix V is column-wise phase invariant because the steering matrix needs a reference in phase per each column. When the number of rows and columns is equal, the orthonormal column matrix becomes a unitary matrix. In other words, V is equivalent to $\tilde{V}\tilde{D}$, where $\tilde{D}$ is a column-wise phase shift matrix such as $\tilde{D} = \text{diag}\left(e^{j\theta_1}, e^{j\theta_2}, \ldots, e^{j\theta_{N_c}}\right)$. When the beamformee estimates the channel, it may find $\tilde{V}$ for the beamforming feedback matrix for the beamformer, but it should send $\tilde{V}\tilde{D}$ back to the beamformer, where $V = \tilde{V}\tilde{D}$. The angle, θ_i, in $\tilde{D}$ is found to make the last row of $\tilde{V}\tilde{D}$ to be non-negative real numbers.

The angles $\phi_{1,1} \ldots \phi_{N_r-1,1}$ in the diagonal matrix $D_1\left(e^{j\phi_{11}} \ldots e^{j\phi_{N_r-1,1}} \; 1\right)^*$ shall satisfy the constraint that all elements in the first column of $D_1^* V$ are non-negative real numbers. Now, the first column of $(G_{N_r1} \ldots G_{31} G_{21} D_1^*) \times V$ can be $\begin{bmatrix} 1 & 0 & \ldots & 0 \end{bmatrix}^T$ by the Givens rotations G_{l1} such as shown in Equation (19-83).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$\begin{bmatrix} \cos\psi_{N_r1} & 0 & 0 & \sin\psi_{N_r1} \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\sin\psi_{N_r1} & 0 & 0 & \cos\psi_{N_r1} \end{bmatrix} \cdots \begin{bmatrix} \cos\psi_{31} & 0 & \sin\psi_{31} & 0 \\ 0 & 1 & 0 & 0 \\ -\sin\psi_{31} & 0 & \cos\psi_{31} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \cos\psi_{21} & \sin\psi_{21} & 0 & 0 \\ -\sin\psi_{21} & \cos\psi_{21} & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} e^{j\phi_{11}} & 0 & 0 & 0 \\ 0 & \ddots & 0 & 0 \\ 0 & 0 & e^{j\phi_{N_r-1,1}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^* \times V = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & & & \\ 0 & & V_2 & \\ 0 & & & \end{bmatrix} \quad (19\text{-}83)$$

For a new $(N_r-1)\times(N_c-1)$ submatrix V_2, this process is applied in the same way. Then, the angles $\phi_{2,2}\ldots\phi_{N_r-1,2}$ in the diagonal matrix $D_2\begin{pmatrix} 1 & e^{j\phi_{22}} & \ldots & e^{j\phi_{N_r-1,2}} & 1 \end{pmatrix}^*$ shall satisfy the constraint that all elements in the second column of $D_2^* \times \mathrm{diag}(1, V_2)$ are non-negative real numbers. Now, the first two columns of $(G_{N_r2}\ldots G_{32}D_2^*)(G_{N_r1}\ldots G_{31}G_{21}D_1^*)\times V$ can be $\tilde{I}_{N_r\times 2}$ by the Givens rotations G_{l2} such as shown in Equation (19-84).

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{N_r2} & 0 & \sin\psi_{N_r2} \\ 0 & 0 & 1 & 0 \\ 0 & -\sin\psi_{N_r2} & 0 & \cos\psi_{N_r2} \end{bmatrix} \cdots \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{32} & \sin\psi_{32} & 0 \\ 0 & -\sin\psi_{32} & \cos\psi_{32} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & e^{j\phi_{22}} & 0 & 0 \\ 0 & 0 & e^{j\phi_{N_r-1,2}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^* \times G_{N,1}\ldots G_{31}G_{21}D_1^* \times V = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & & \\ 0 & 0 & V_3 & \end{bmatrix} \quad (19\text{-}84)$$

This process continues until the first N_c columns of the right side matrix become $\tilde{I}_{N_r\times N_c}$. When $N_c < N_r$, this process does not need to continue because V_{N_c+1} is nulled out by $\tilde{I}_{N_r\times N_c}$. Then, by multiplying the complex conjugate transpose of the products of the D_i and G_{li} matrices on the left, V can be expressed as shown in Equation (19-85).

$$V = D_1 G_{21}^T G_{31}^T \ldots G_{N_r1}^T \times D_2 G_{32}^T G_{42}^T \ldots G_{N_r2}^T \times \ldots \times D_p G_{p+1,p}^T G_{p+2,p}^T \ldots G_{N_r p}^T \times \tilde{I}_{N_r\times N_C} \quad (19\text{-}85)$$

where $p = \min(N_c, N_r-1)$, which can be written in short form as in Equation (19-79).

The angles found from the decomposition process above, e.g., the values of $\psi_{i,j}$ and $\phi_{k,l}$, are quantized as described in 9.6.12.8 (Compressed Beamforming frame format).

Columns $1\ldots N_c$ of the beamforming feedback matrix correspond to spatial streams $1\ldots N_c$, respectively. The mapping of spatial stream to modulation is defined in the MCS tables in 19.5 (Parameters for HT MCSs). A transmitter shall not reorder the columns of the beamforming feedback matrices in determining steering matrices.

19.3.13 HT Preamble format for sounding PPDUs

19.3.13.1 General

The MIMO channel measurement takes place in every PPDU as a result of transmitting the HT-LTFs as part of the PHY preamble. The number of HT-LTFs transmitted shall be determined by the number of space-time streams transmitted unless additional dimensions are optionally sounded using HT-ELTFs and these are transmitted using the same spatial transformation that is used for the Data field of the HT PPDU. The use of the same spatial transformation enables the computation of the spatial equalization at the receiver.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When the number of space-time streams, N_{STS}, is less than the number of transmit antennas, or less than $\min(N_{TX}, N_{RX})$, sending only N_{STS} HT-LTFs does not allow the receiver to recover a full characterization of the MIMO channel, even though the resulting MIMO channel measurement is sufficient for receiving the Data field of the HT PPDU.

However, it is often desirable to obtain as full a characterization of the channel as possible. This involves the transmission of a sufficient number of HT-LTFs to sound the full dimensionality of the channel, which is in some cases N_{TX} and in other cases $\min(N_{TX}, N_{RX})$. These cases of MIMO channel measurement are referred to as *MIMO channel sounding*. A sounding packet may be used to sound available channel dimensions. A sounding PPDU is identified by setting the Not Sounding field in the HT-SIG to 0. A sounding PPDU may have any allowed number of HT-LTFs satisfying $N_{HT\text{-}LTF} \geq N_{STS}$. In general, if the Not Sounding field in the HT-SIG is equal to 0 and $N_{HT\text{-}LTF} > N_{STS}$, HT-ELTFs are used, except where $N_{SS} = 3$ and $N_{HT\text{-}LTF} = 4$ or in an NDP.

19.3.13.2 Sounding with a NDP

A STA may sound the channel using a NDP (indicated by the HT Length field in the HT-SIG equal to 0) with the Not Sounding field equal to 0. The number of LTFs is the number implied by the MCS, which shall indicate two or more spatial streams. The last HT-LTF of an NDP shall not be followed by a Data field (see Figure 19-16 (Example of an NDP used for sounding)).

It is optional for a STA to process an NDP.

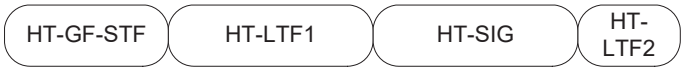

Figure 19-16—Example of an NDP used for sounding

19.3.13.3 Sounding PPDU for calibration

In the case of a bidirectional calibration exchange, two STAs exchange sounding PPDUs, the exchange of which enables the receiving STA to compute an estimate of the MIMO channel matrix H_k for each subcarrier *k*. In general, in an exchange of calibration messages, the number of spatial streams is less than the number of transmit antennas. In such cases, HT-ELTFs are used. In the case of sounding PPDUs for calibration, the antenna mapping matrix shall be as shown in Equation (19-86).

$$Q_k = C_{CSD}(k) P_{CAL} \tag{19-86}$$

where

$C_{CSD}(k)$ is a diagonal cyclic shift matrix in which the diagonal elements carry frequency domain representation of the cyclic shifts given in Table 19-9 (Cyclic shift for non-HT portion of packet)

P_{CAL} is one of the following unitary matrices:

For $N_{TX} = 1, P_{CAL} = 1$

For $N_{TX} = 2, P_{CAL} = \frac{\sqrt{2}}{2}\begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix}$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$\text{For } N_{TX} = 3, P_{CAL} = \frac{\sqrt{3}}{3}\begin{bmatrix} 1 & 1 & 1 \\ 1 & e^{-j2\pi/3} & e^{-j4\pi/3} \\ 1 & e^{-j4\pi/3} & e^{-j2\pi/3} \end{bmatrix}$$

$$\text{For } N_{TX} = 4, P_{CAL} = \frac{1}{2}\begin{bmatrix} 1 & -1 & 1 & 1 \\ 1 & 1 & -1 & 1 \\ 1 & 1 & 1 & -1 \\ -1 & 1 & 1 & 1 \end{bmatrix}$$

19.3.13.4 Sounding PPDU for channel quality assessment

In response to the reception of an MRQ, sent by STA A to STA B, the responding STA B returns to the requesting STA A an MCS selection that STA B determines to be a suitable MCS for STA A to use in subsequent transmissions to STA B. In determining the MCS, STA B performs a channel quality assessment, which entails using whatever information STA B has about the channel, such as an estimate of the MIMO channel derived from the sounding PPDU that carries the MRQ. To enable this calculation, the MRQ is sent in conjunction with a sounding PPDU.

The STA sending the MRQ (STA A) determines how many HT-LTFs to send, and whether to use HT-ELTFs or an NDP, based on the Transmit Beamforming Capabilities field, number of space-time streams used in the PPDU carrying the MRQ, the number of transmit chains it is using (N_{TX}), whether the transmit and receive STAs support STBC, and in some cases, the number of receive chains at the responding STA (N_{RX}).

The maximum number of available space-time streams is set by the number of transmit and receive chains and the STBC capabilities of the transmitter and receiver, as is shown in Table 19-21 (Maximum available space-time streams). While the number of receive chains is not communicated in a capabilities indicator, the maximum number of space-time streams supported may be inferred from the MCS capabilities and the STBC capabilities of the receiving STA. When the number of receive chains is known at the transmitter, the number of HT-LTFs sent to obtain a full channel quality assessment is determined according to the maximum number of space-time streams indicated in Table 19-21 (Maximum available space-time streams). The number of HT-LTFs to use in conjunction with the indicated number of space-time streams is determined according to 19.3.9.4.6 (HT-LTF definition).

Table 19-21—Maximum available space-time streams

N_{TX}	N_{RX}	$N_{STS,\max}$ without STBC	$N_{STS,\max}$ with STBC
1	1	1	N/A
2	1	1	2
3	1	1	2
3	2	2	3
4	1	1	2
4	2	2	4

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If the requesting STA A sends an MRQ in a PPDU that uses fewer space-time streams in the data portion than the maximum number of space-time streams possible given the number of antennas at STA A and the responding STA B, the channel quality assessment made by STA B may be based on the HT-DLTFs alone. In this case, the MFB is limited to MCSs using the number of streams used in the Data field of the HT PPDU, or fewer. To determine whether an MCS should be chosen that uses more spatial streams than the PPDU containing the MRQ, it is necessary for the requesting STA A to either use HT-ELTFs (i.e., send the MRQ in a staggered sounding PPDU) or use an NDP (i.e., send the MRQ in conjunction with an NDP).

The sounding PPDU may have nonidentity spatial mapping matrix Q_k. For different receiving STAs, Q_k may vary.

19.3.14 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains may be subject to additional or alternative national regulations.

19.3.15 Channel numbering and channelization

19.3.15.1 General

The STA may operate in the 5 GHz band and/or 2.4 GHz band. When using 20 MHz channels, it uses channels defined in 17.3.8.4 (Operating channel frequencies) (5 GHz band) or 16.3.6 (PHY operating specifications, general) (2.4 GHz band). When using 40 MHz channels, it can operate in the channels defined in 19.3.15.2 (Channel allocation in the 2.4 GHz Band) and 19.3.15.3 (Channel allocation in the 5 GHz band).

The set of valid operating channel numbers by regulatory domain is defined in Annex E.

19.3.15.2 Channel allocation in the 2.4 GHz Band

Channel center frequencies are defined at every integer multiple of 5 MHz in the 2.4 GHz band. The relationship between center frequency and channel number is given by Equation (19-87).

$$\text{Channel center frequency} = 2407 + 5 \times n_{ch}(\text{MHz}) \tag{19-87}$$

where

n_{ch} = 1, 2, …, 13

19.3.15.3 Channel allocation in the 5 GHz band

Channel center frequencies are defined at every integer multiple of 5 MHz above 5 GHz. The relationship between center frequency and channel number is given in Equation (19-88).

$$\text{Channel center frequency} = \text{Channel starting frequency} + 5 \times n_{ch}(\text{MHz}) \tag{19-88}$$

where

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

n_{ch} = 1, …, 200

Channel starting frequency is defined as dot11ChannelStartingFactor × 500 kHz or is defined as 5.000 GHz for systems where dot11OperatingClassesRequired is false or not defined. A channel center frequency of 5.000 GHz shall be indicated by dot11ChannelStartingFactor = 8000 and n_{ch} = 200.

19.3.15.4 40 MHz channelization

The set of valid operating channel numbers by regulatory domain is defined in Annex E.

The 40 MHz channels are specified by two fields: (*Nprimary_ch*, *Secondary*). The first field represents the channel number of the primary channel, and the second field indicates whether the secondary channel is above or below the primary channel (1 indicates above, –1 indicates below). The secondary channel number shall be $Nprimary_ch + Secondary \times 4$.

For example, a 40 MHz channel consisting of 40 MHz channel number 36 and Secondary 1 specifies the primary channel is 36 and the secondary channel is 40.

19.3.16 Slot time

The slot time shall follow 17.3.8.6 (Slot time) for 5 GHz bands and 18.5.4 (ERP characteristics) for 2.4 GHz bands.

The slot time for 40 MHz channel spacing shall be the same as that for 20 MHz channel spacing.

19.3.17 Transmit and receive impedance at the antenna connector

The impedance at the transmit and receive antenna connector(s) for each transmit and receive antenna shall follow 17.3.8.7 (Transmit and receive impedance at the antenna connector).

19.3.18 PHY transmit specification

19.3.18.1 Transmit spectrum mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause, i.e., its emissions can be no higher at any frequency offset than the minimum of the values specified in the regulatory and default masks.

NOTE 2—The transmit spectral mask figures in this subclause are not drawn to scale.

NOTE 3—For rules regarding TX center frequency leakage levels by VHT STAs, see 21.3.17.4.2 (Transmit center frequency leakage).

For the 2.4 GHz band, when transmitting in a 20 MHz channel, the transmitted spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and the maximum of –45 dBr and –53 dBm/MHz at 30 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-17 (Transmit spectral mask for 20 MHz transmission in

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the 2.4 GHz band). The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

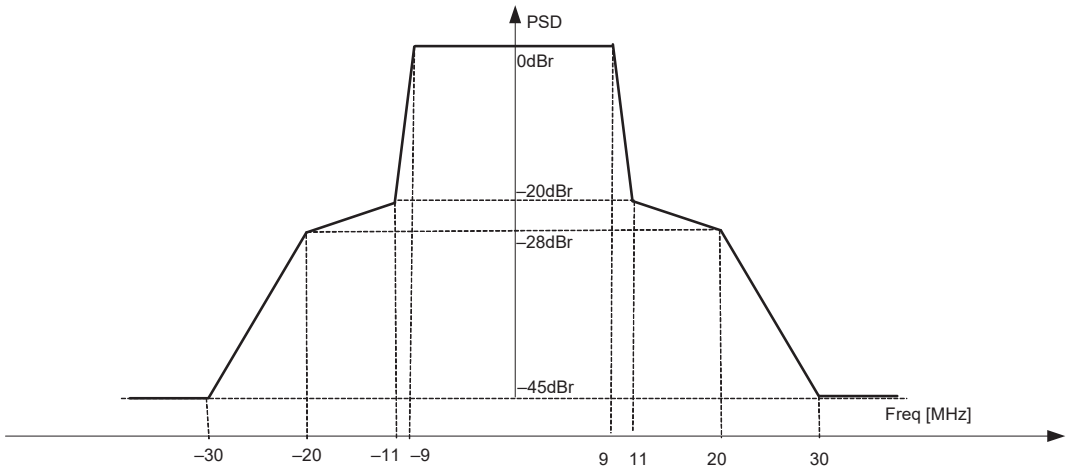

Figure 19-17—Transmit spectral mask for 20 MHz transmission in the 2.4 GHz band

For the 2.4 GHz band, when transmitting in a 40 MHz channel, the transmitted spectrum shall have a 0 dBr bandwidth not exceeding 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz offset, and the maximum of –45 dBr and –56 dBm/MHz at 60 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-18 (Transmit spectral mask for a 40 MHz channel in the 2.4 GHz band).

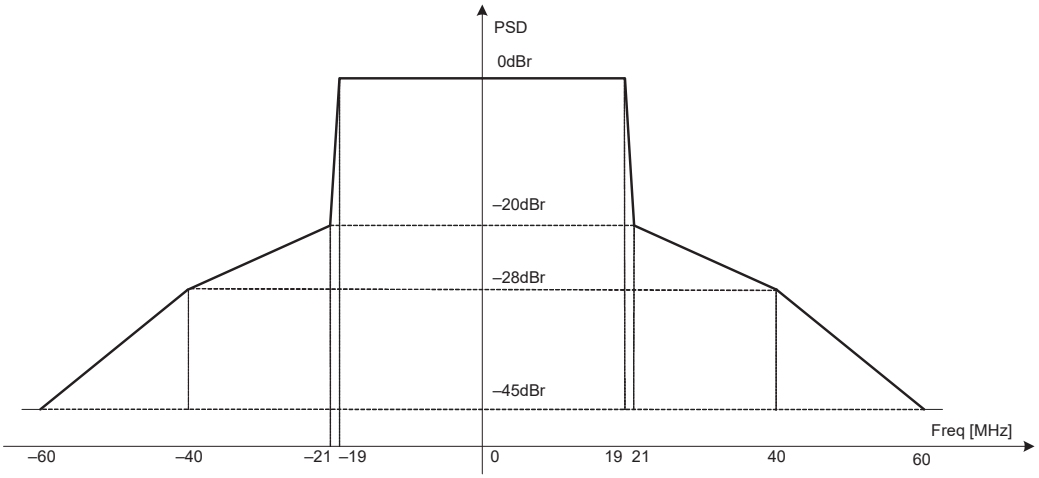

Figure 19-18—Transmit spectral mask for a 40 MHz channel in the 2.4 GHz band

For the 5 GHz band, when transmitting in a 20 MHz channel, the transmitted spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and the maximum of –40 dBr and –53 dBm/MHz at 30 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-19 (Transmit spectral mask for 20 MHz transmission in the 5 GHz band). The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

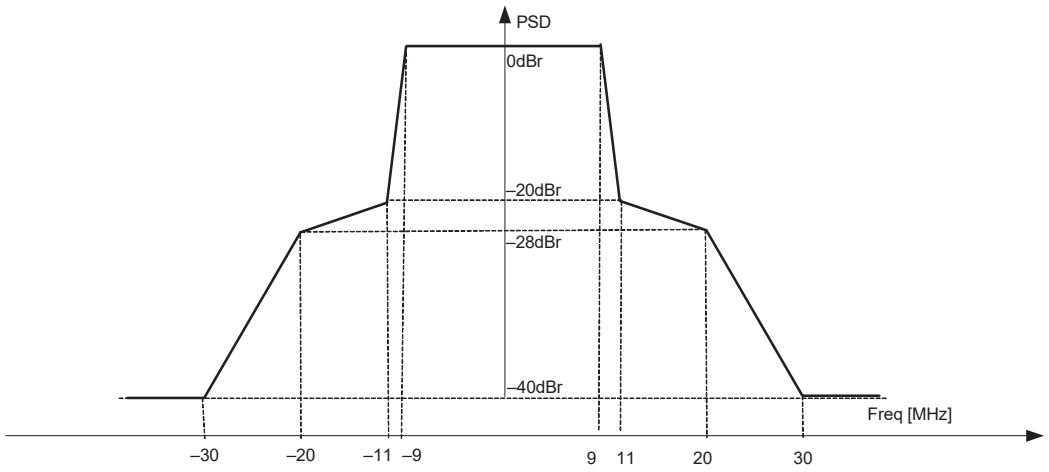

Figure 19-19—Transmit spectral mask for 20 MHz transmission in the 5 GHz band

For the 5 GHz band, when transmitting in a 40 MHz channel, the transmitted spectrum shall have a 0 dBr bandwidth not exceeding 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz offset, and the maximum of –40 dBr and –56 dBm/MHz at 60 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-20 (Transmit spectral mask for a 40 MHz channel in the 5 GHz band).

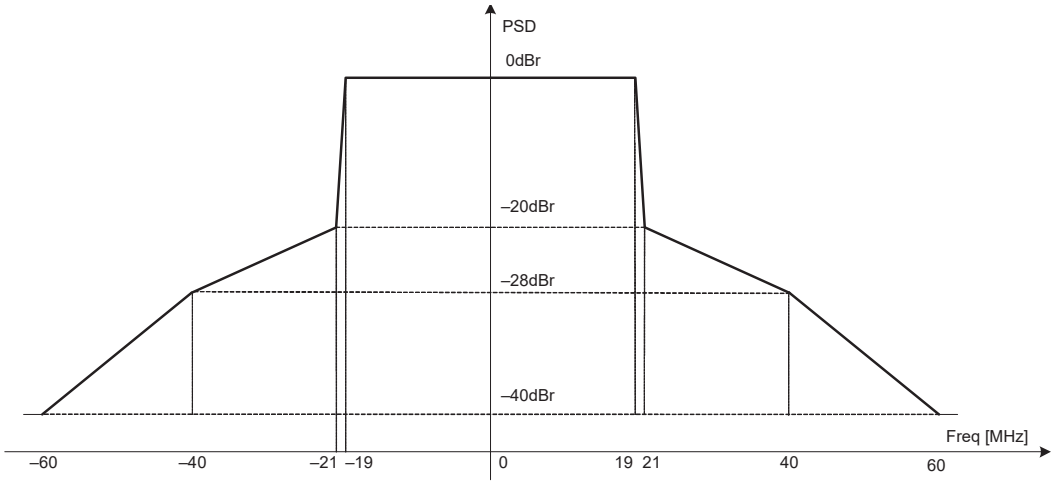

Figure 19-20—Transmit spectral mask for a 40 MHz channel in the 5 GHz band

Transmission with CH_OFF_20U, CH_OFF_20L, or CH_OFF_40 shall comply with the same mask that is used for the 40 MHz channel.

19.3.18.2 Spectral flatness

In a 20 MHz channel and in corresponding 20 MHz transmission in a 40 MHz channel, the average energy of the constellations in each of the subcarriers with indices –16 to –1 and +1 to +16 shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices –28 to –17 and +17 to +28 shall deviate no more than +4/–6 dB from the average energy of subcarriers with indices –16 to –1 and +1 to +16.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In a 40 MHz transmission (excluding PPDUs in MCS 32 format and non-HT duplicate format), the average energy of the constellations in each of the subcarriers with indices –42 to –2 and +2 to +42 shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices –43 to –58 and +43 to +58 shall deviate no more than +4/–6 dB from the average energy of subcarriers with indices –42 to –2 and +2 to +42.

In MCS 32 format and non-HT duplicate format, the average energy of the constellations in each of the subcarriers with indices –42 to –33, –31 to –6, +6 to +31, and +33 to +42 shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices –43 to –58 and +43 to +58 shall deviate no more than +4/–6 dB from the average energy of subcarriers with indices –42 to –33, –31 to –6, +6 to +31, and +33 to +42.

The tests for the spectral flatness requirements may be performed with spatial mapping $Q_k = \mathbf{I}$ (see 19.3.11.11.2 (Spatial mapping)).

19.3.18.3 Transmit power

The maximum allowable output power is measured in accordance with practices specified by the appropriate regulatory bodies.

19.3.18.4 Transmit center frequency tolerance

The transmitter center frequency tolerance shall be ± 20 ppm maximum for the 5 GHz band and ± 25 ppm maximum for the 2.4 GHz band. The different transmit chain center frequencies (LO) and each transmit chain symbol clock frequency shall all be derived from the same reference oscillator.

19.3.18.5 Packet alignment

If no signal extension is required (see 19.3.2 (PPDU format)), the receiver shall emit a PHY-CCA.indication(IDLE) primitive (see 8.3.5.12 (PHY-CCA.indication)) at the 4 μs boundary following the reception of the last symbol of the packet. If a signal extension is required, the receiver shall emit a PHY-CCA.indication(IDLE) primitive a duration of aSignalExtension after the 4 μs boundary following the reception of the last symbol of the packet. This situation is illustrated for an HT-greenfield format packet using short GI in Figure 19-21 (Packet alignment example (HT-greenfield format packet with short GI)).

If no signal extension is required, the transmitter shall emit a PHY-TXEND.confirm primitive (see 8.3.5.8 (PHY-TXEND.confirm)) at the 4 μs boundary following the trailing boundary of the last symbol of the packet on the WM. If a signal extension is required, the transmitter shall emit a PHY-TXEND.confirm primitive (see 8.3.5.8 (PHY-TXEND.confirm)) a duration of aSignalExtension after the 4 μs boundary following the trailing boundary of the last symbol of the packet on the WM. This situation is illustrated in Figure 19-21 (Packet alignment example (HT-greenfield format packet with short GI)).

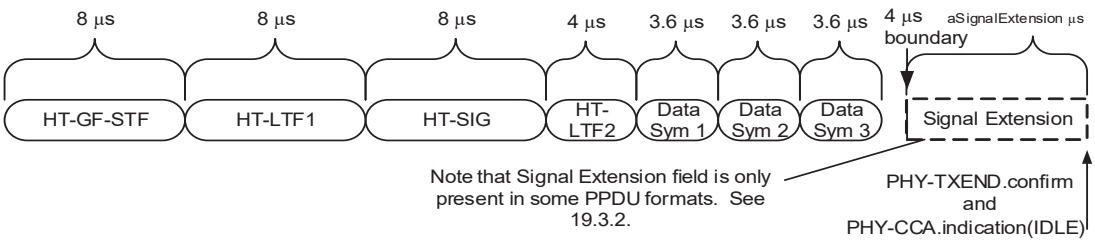

Figure 19-21—Packet alignment example (HT-greenfield format packet with short GI)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

19.3.18.6 Symbol clock frequency tolerance

The symbol clock frequency tolerance shall be ± 20 ppm maximum for 5 GHz bands and ± 25 ppm for 2.4 GHz bands. The transmit center frequency and the symbol clock frequency for all transmit antennas shall be derived from the same reference oscillator.

19.3.18.7 Modulation accuracy

19.3.18.7.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 19.3.18.7.2 (Transmit center frequency leakage) and 19.3.18.7.3 (Transmitter constellation error). The test method is described in 19.3.18.7.4 (Transmitter modulation accuracy (EVM) test).

19.3.18.7.2 Transmit center frequency leakage

For VHT STAs the requirements on transmitter center frequency leakage are defined in 21.3.17.4.2 (Transmit center frequency leakage); otherwise, the requirements are defined in this subclause.

The transmitter center frequency leakage shall follow 17.3.9.7.2 (Transmitter center frequency leakage) for all transmissions in a 20 MHz channel width. For transmissions in a 40 MHz channel width, the center frequency leakage shall not exceed –20 dB relative to overall transmitted power, or, equivalently, 0 dB relative to the average energy of the rest of the subcarriers. For upper or lower 20 MHz transmissions in a 40 MHz channel, the center frequency leakage (center of a 40 MHz channel) shall not exceed –17 dB relative to overall transmitted power, or, equivalently, 0 dB relative to the average energy of the rest of the subcarriers. The transmit center frequency leakage is specified per antenna.

19.3.18.7.3 Transmitter constellation error

The relative constellation frame-averaged RMS error, calculated first by averaging over subcarriers, OFDM frames, and spatial streams, shall not exceed a data-rate-dependent value according to Table 19-22 (Allowed relative constellation error versus constellation size and coding rate). The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, $N_{SS} = N_{STS}$ with EQM MCSs shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The same requirement applies both to 20 MHz channels and 40 MHz channels.

Table 19-22—Allowed relative constellation error versus constellation size and coding rate

Modulation	Coding rate	Relative constellation error (dB)
BPSK	1/2	–5
QPSK	1/2	–10
QPSK	3/4	–13
16-QAM	1/2	–16
16-QAM	3/4	–19
64-QAM	2/3	–22

This is an unapproved IEEE Standards Draft, subject to change.

Table 19-22—Allowed relative constellation error versus constellation size and coding rate *(continued)*

Modulation	Coding rate	Relative constellation error (dB)
64-QAM	3/4	–25
64-QAM	5/6	–27

19.3.18.7.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a streams of complex samples at 40 Msample/s or more, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, and analog-to-digital quantization noise. Each transmit chain is connected directly through a cable to the setup input port. A possible embodiment of such a setup is converting the signals to a low intermediate frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope, and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or an equivalent procedure:

a) Detect the start of frame.

b) Detect the transition from short sequences to channel estimation sequences, and establish fine timing (with one sample resolution).

c) Estimate the coarse and fine frequency offsets.

d) Derotate the frame according to estimated frequency offset.

e) Estimate the complex channel response coefficients for each of the subcarriers and each of the transmit chains.

f) For each of the data OFDM symbols, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers in all spatial streams, derotate the subcarrier values according to estimated phase, group the results from all of the receiver chains in each subcarrier to a vector, multiply the vector by a zero-forcing equalization matrix generated from the channel estimated during the channel estimation phase.

g) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it.

h) Compute the average of the RMS of all errors in a frame. It is given by Equation (19-89).

$$Error_{RMS} = \frac{\sum_{i_f=1}^{N_f} \sqrt{\frac{\sum_{i_s=1}^{N_{SYM}} \left[\sum_{i_{ss}=1}^{N_{SS}} \left(\sum_{i_{sc}=1}^{N_{ST}} \left((I(i_f, i_s, i_{ss}, i_{sc}) - I_0(i_f, i_s, i_{ss}, i_{sc}))^2 + (Q(i_f, i_s, i_{ss}, i_{sc}) - Q_0(i_f, i_s, i_{ss}, i_{sc}))^2 \right) \right) \right]}{N_{SYM} \times N_{SS} \times N_{ST} \times P_0}}}{N_f} \quad (19\text{-}89)$$

where

N_f is the number of frames for the measurement

$I_0(i_f, i_s, i_{ss}, i_{sc}), Q_0(i_f, i_s, i_{ss}, i_{sc})$ denotes the ideal symbol point in the complex plane in subcarrier i_{sc}, spatial stream i_{ss}, and OFDM symbol i_s of frame i_f

$I(i_f, i_s, i_{ss}, i_{sc}), Q(i_f, i_s, i_{ss}, i_{sc})$ denotes the observed symbol point in the complex plane in subcarrier i_{sc}, spatial stream i_{ss}, and OFDM symbol i_s of frame i_f

P_0 is the average power of the constellation

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The vector error on a phase plane is shown in Figure 17-16 (Constellation error).

The test shall be performed over at least 20 frames (N_f), and the average of the RMS shall be taken. The frames under test shall be at least 16 OFDM symbols long. Random data shall be used for the symbols.

19.3.18.8 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is:

$20 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{20\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to HT_CBW20

$40 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{40\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to HT_CBW40

where

f_H is the nominal center frequency in Hz of the highest channel in the channel set

f_L is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which frames providing measurements are transmitted, the channel set comprises channels uniformly spaced across $f_H - f_L \geq 50$ MHz

— FIRST_TRANSITION_FIELD is L-STF (for HT-mixed format) or HT-GF-STF (for HT-greenfield format)

— SECOND_TRANSITION_FIELD is L-LTF (for HT-mixed format) or HT-GF-LTF1 (for HT-greenfield format)

— TRAINING_FIELD is L-LTF (for HT-mixed format) or HT-LTF1 (for HT-greenfield format) windowed in a manner which should approximate the windowing described in 17.3.2.5 (Mathematical conventions in the signal descriptions) with T_{TR} = 100 ns.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns (for a CH_BANDWIDTH parameter equal to HT_CBW20) or 80 ns (for a CH_BANDWIDTH parameter equal to HT_CBW40).

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

19.3.19 HT PHY receiver specification

19.3.19.1 Receiver minimum input sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 19-23 (Receiver minimum input level sensitivity) or less. The minimum input levels are measured at the antenna connectors and are referenced as the average power per receive antenna. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized device under test input ports. Each output port of the transmitting STA shall be connected through a cable to one input port of the device under test. The test in this subclause and the minimum sensitivity levels specified in Table 19-23 (Receiver minimum input level sensitivity) apply only to non-STBC modes, MCSs 0–31, 800 ns GI, and BCC.

19.3.19.2 Adjacent channel rejection

For all transmissions in a 20 MHz channel width, the adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 (Receiver

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 19-23—Receiver minimum input level sensitivity

Modulation	Rate (R)	Adjacent channel rejection (dB)	Nonadjacent channel rejection (dB)	Minimum sensitivity (20 MHz channel spacing) (dBm)	Minimum sensitivity (40 MHz channel spacing) (dBm)
BPSK	1/2	16	32	–82	–79
QPSK	1/2	13	29	–79	–76
QPSK	3/4	11	27	–77	–74
16-QAM	1/2	8	24	–74	–71
16-QAM	3/4	4	20	–70	–67
64-QAM	2/3	0	16	–66	–63
64-QAM	3/4	–1	15	–65	–62
64-QAM	5/6	–2	14	–64	–61

minimum input level sensitivity) and raising the power of an interfering signal of 20 MHz bandwidth until 10% PER is caused for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The adjacent channel center frequencies shall be separated by 20 MHz when operating in the 5 GHz band, and the adjacent channel center frequencies shall be separated by 25 MHz when operating in the 2.4 GHz band.

For all transmissions in a 40 MHz channel width, the adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 (Receiver minimum input level sensitivity) and raising the power of an interfering signal of 40 MHz bandwidth until 10% PER is caused for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The adjacent channel center frequencies shall be separated by 40 MHz.

The interfering signal in the adjacent channel shall be a signal compliant with the HT PHY, unsynchronized with the signal in the channel under test. The corresponding rejection shall be no less than specified in Table 19-23 (Receiver minimum input level sensitivity). The interference signal shall have a minimum duty cycle of 50%.

The test in this subclause and the adjacent channel rejection levels specified in Table 19-23 (Receiver minimum input level sensitivity) apply only to non-STBC modes, MCSs 0–31, 800 ns GI, and BCC.

19.3.19.3 Nonadjacent channel rejection

For all transmissions in a 20 MHz channel width in the 5 GHz band, the nonadjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 (Receiver minimum input level sensitivity) and raising the power of an interfering signal of 20 MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel center frequencies shall be separated by 40 MHz or more.

For all transmissions in a 40 MHz channel width in the 5 GHz band, the nonadjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 (Receiver minimum input level sensitivity) and raising the power of an interfering signal of 40 MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel center frequencies shall be separated by 80 MHz or more.

The interfering signal in the nonadjacent channel shall be a signal compliant with the HT PHY, unsynchronized with the signal in the channel under test. The corresponding rejection shall be no less than specified in Table 19-23 (Receiver minimum input level sensitivity). The interference signal shall have a minimum duty cycle of 50%. The nonadjacent channel rejection for transmissions in a 20 MHz or 40 MHz channel width is applicable only to 5 GHz band.

The test in this subclause and the nonadjacent channel rejection level specified in Table 19-23 (Receiver minimum input level sensitivity) apply only to non-STBC modes, MCSs 0–31, 800 ns GI, and BCC.

19.3.19.4 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –30 dBm in the 5 GHz band and –20 dBm in the 2.4 GHz band, measured at each antenna for any baseband modulation.

19.3.19.5 CCA sensitivity

19.3.19.5.1 CCA-Energy Detect (CCA-ED)

For the operating classes requiring CCA-Energy Detect (CCA-ED), the PHY shall also indicate a medium busy condition when CCA-ED detects a channel busy condition.

For improved spectrum sharing, CCA-ED is required in some bands. The behavior class indicating CCA-ED is given in Table D-2 (Behavior limits). The operating classes requiring the corresponding CCA-ED behavior class are given in E.1 (Country information and operating classes). The PHY of a STA that is operating within an operating class that requires CCA-ED shall operate with CCA-ED.

CCA-ED shall detect a channel busy condition when the received signal strength exceeds the CCA-ED threshold as given by dot11OFDMEDThreshold for the primary 20 MHz channel and dot11OFDMEDThreshold for the secondary 20 MHz channel (if present). The CCA-ED thresholds for the operating classes requiring CCA-ED are subject to the criteria in D.2.5 (CCA-ED threshold).

NOTE—The requirement to detect a channel busy condition as stated in 19.3.19.5.2 (CCA sensitivity for non-HT PPDUs), 19.3.19.5.3 (CCA sensitivity in 20 MHz) and 19.3.19.5.4 (CCA sensitivity in 40 MHz) is a mandatory energy detection requirement on all Clause 19 receivers. Support for CCA-ED is an additional requirement that relates specifically to the sensitivities described in D.2.5 (CCA-ED threshold).

19.3.19.5.2 CCA sensitivity for non-HT PPDUs

CCA sensitivity requirements for non-HT PPDUs in the primary channel are described in 17.3.10.6 (CCA requirements) and 18.4.6 (CCA performance).

19.3.19.5.3 CCA sensitivity in 20 MHz

For an HT STA with the operating channel width equal to 20 MHz, the start of a valid 20 MHz HT signal at a receive level greater than or equal to the minimum modulation and coding rate sensitivity of –82 dBm shall cause the PHY to set PHY-CCA.indication(BUSY) with a probability > 90% within 4 μs. The receiver shall indicate a channel busy condition for any signal 20 dB or more above the minimum modulation and coding rate sensitivity (–82 + 20 = –62 dBm) in the 20 MHz channel.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

An HT STA that does not support the reception of HT_GF format PPDUs shall indicate a channel busy condition (PHY-CCA.indication(BUSY)) for any valid HT_GF signal in the 20 MHz channel at a receive level greater than or equal to –72 dBm.

19.3.19.5.4 CCA sensitivity in 40 MHz

This subclause describes the CCA sensitivity requirements for an HT STA with the operating channel width equal to 40 MHz.

The receiver of a 20/40 MHz STA with the operating channel width equal to 40 MHz shall provide CCA on both the primary and secondary channels.

When the secondary channel is idle, the start of a valid 20 MHz HT signal in the primary channel at a receive level greater than or equal to the minimum modulation and coding rate sensitivity of –82 dBm shall cause the PHY to generate a PHY-CCA.indication(BUSY, {primary}) primitive with a probability > 90% within 4 μs. The start of a valid 40 MHz HT signal that occupies both the primary and secondary channels at a receive level greater than or equal to the minimum modulation and coding rate sensitivity of –79 dBm shall cause the PHY to generate a PHY-CCA.indication(BUSY, {primary, secondary}) primitive for both the primary and secondary channels with a probability per channel > 90% within 4 μs.

An HT STA that does not support the reception of HT_GF format PPDUs shall indicate a {primary} channel busy condition (PHY-CCA.indication(BUSY, {primary}) primitive) for any valid HT_GF signal in the primary channel at a receive level greater than or equal to –72 dBm when the secondary channel is idle. An HT STA that does not support the reception of HT_GF format PPDUs shall indicate a {primary, secondary} channel busy condition (PHY-CCA.indication(BUSY, {primary, secondary}) primitive) for any valid 40 MHz HT_GF signal in both the primary and secondary channels at a receive level greater than or equal to –69 dBm.

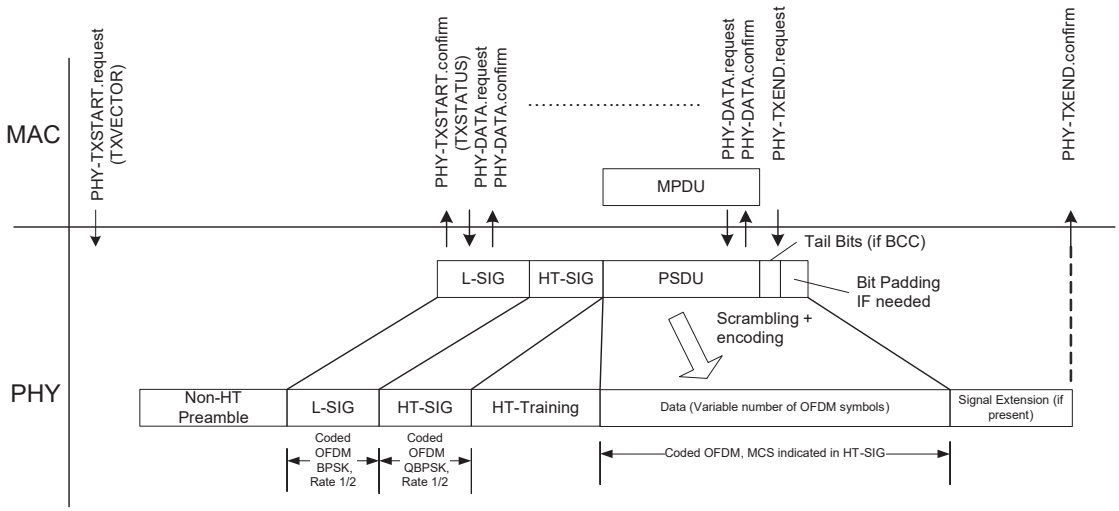
The receiver shall indicate a {primary} channel busy condition for any signal at or above –62 dBm in the 20 MHz primary channel. This level is 20 dB above the minimum modulation and coding rate sensitivity for a 20 MHz PPDU. When the primary channel is idle, the receiver indicate a {secondary} channel busy condition for any signal at or above –62 dBm in the 20 MHz secondary channel. The receiver shall indicate a {primary, secondary} channel busy condition for any signal present in both the primary and secondary channels that is at or above –62 dBm in the primary channel and at or above –62 dBm in the secondary channel.

19.3.19.6 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel. This parameter shall be a measure by the PHY of the received RF power in the channel measured over the data portion of the received frame. The received power shall be the average of the power in all active receive chains.

The RCPI encoding is defined in 15.4.6.6 (Received Channel Power Indicator Measurement).

RCPI shall equal the received RF power within an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver. The received RF power shall be determined assuming a receiver noise equivalent bandwidth equal to the channel width multiplied by 1.1.



19.3.19.7 Reduced interframe space (RIFS)

The receiver shall be able to decode a packet that was transmitted with a RIFS separation from the previous packet.

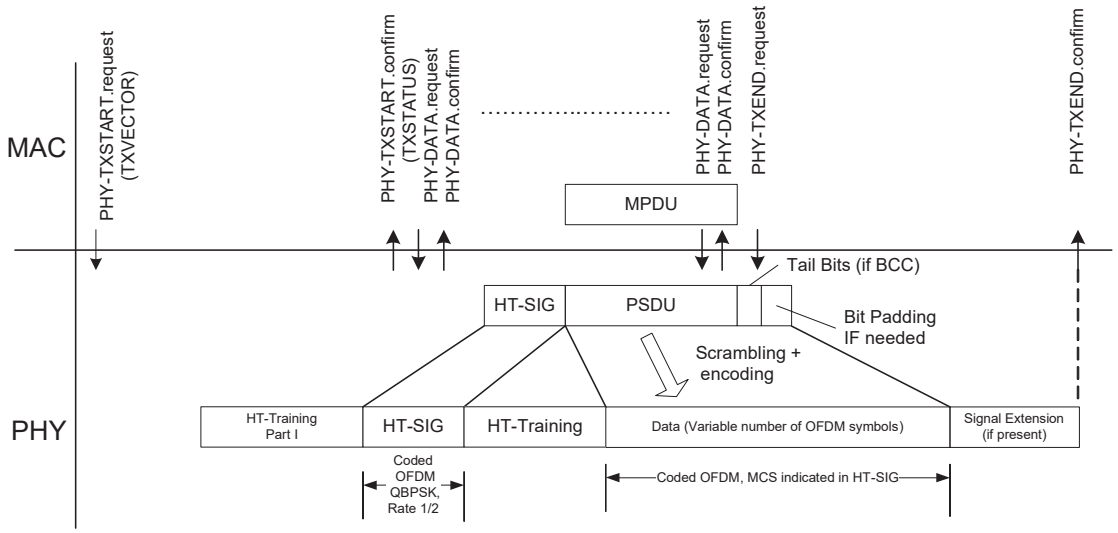
This is an unapproved IEEE Standards Draft, subject to change.

19.3.20 PHY transmit procedure



There are three options for the transmit PHY procedure. The first two options, for which typical transmit procedures are shown in Figure 19-22 (PHY transmit procedure (HT-mixed format PPDU)) and Figure 19-23 (PHY transmit procedure (HT-greenfield format PPDU)), are selected if the FORMAT field of the PHY-TXSTART.request(TXVECTOR) primitive is equal to HT_MF or HT_GF, respectively. These transmit procedures do not describe the operation of optional features, such as LDPC or STBC. The third option is to follow the transmit procedure in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) or Clause 18 (Extended Rate PHY (ERP) specification) if the FORMAT field is equal to NON_HT. Additionally, if the FORMAT field is equal to NON_HT, CH_BANDWIDTH indicates NON_HT_CBW20, and NON_HT_MODULATION indicates OFDM, follow the transmit procedure in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). If the FORMAT field is equal to NON_HT, CH_BANDWIDTH indicates NON_HT_CBW20, and NON_HT_MODULATION indicates other than OFDM, follow the transmit procedure in Clause 18 (Extended Rate PHY (ERP) specification). And furthermore, if the FORMAT field is equal to NON_HT and CH_BANDWIDTH indicates NON_HT_CBW40, follow the transmit procedure in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), except that the signal in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) is generated simultaneously on each of the upper and lower 20 MHz channels that constitute the 40 MHz channel as defined in 19.3.8 (Transmission in the upper/lower 20 MHz of a 40 MHz channel) and 19.3.11.12 (Non-HT duplicate transmission). In all these options, in order to transmit data, the PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 19.4 (HT PLME). Other transmit parameters, such as MCS coding types and transmit power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 19.2.2 (TXVECTOR and RXVECTOR parameters).

NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC

Figure 19-22—PHY transmit procedure (HT-mixed format PPDU)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC.

Figure 19-23—PHY transmit procedure (HT-greenfield format PPDU)

A clear channel shall be indicated by issuing a PHY-CCA.indication(IDLE) primitive. Note that under some circumstances, the MAC uses the latest value of the PHY-CCA.indication primitive before issuing the PHY-TXSTART.request primitive. Transmission of the PPDU shall be initiated after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 19-1 (TXVECTOR and RXVECTOR parameters).

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

The data shall then be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC and PHY-DATA.confirm primitives issued by the PHY. Once PHY preamble transmission is started, the PHY entity shall immediately initiate data scrambling and data encoding. The encoding method shall be based on the FEC_CODING, CH_BANDWIDTH, and MCS parameter of the TXVECTOR. A modulation rate change, if any, shall be initiated starting with the SERVICE field data, as described in 19.3.2 (PPDU format).

The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The SERVICE field and PSDU are encoded by the encoder selected by the FEC_CODING, CH_BANDWIDTH, and MCS parameters of the TXVECTOR as described in 19.3.3 (Transmitter block diagram). Transmission can be prematurely terminated by the MAC through the primitive PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by receiving a PHY-TXEND.request primitive. Normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number supplied in the LENGTH field.

The packet transmission shall be completed, and the PHY entity shall enter the receive state (i.e., PHY-TXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. If the length of the coded PSDU is not an integer multiple of the

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

OFDM symbol length, bits shall be stuffed to make the coded PSDU length an integer multiple of the OFDM symbol length.

The GI shall be inserted in every OFDM symbol as a countermeasure against delay spread.

In some PPDU formats (as defined in 19.3.2 (PPDU format)), a signal extension is present. When no signal extension is present, the PHY-TXEND.confirm primitive is generated at the end of last symbol of the PPDU. When a signal extension is present, the PHY-TXEND.confirm primitive is generated at the end of the signal extension.

A typical state machine implementation of the transmit PHY is provided in Figure 19-24 (PHY transmit state machine). Requests (.request) and confirmations (.confirm) are issued once per state as shown. This state machine does not describe the operation of optional features, such as LDPC or STBC.

19.3.21 PHY receive procedure

Typical PHY receive procedures are shown in Figure 19-25 (PHY receive procedure for HT-mixed format PPDU format) and Figure 19-26 (PHY receive procedure for HT-greenfield format PPDU). The receive procedures correspond to HT-mixed format and HT-greenfield format, respectively. A typical state machine implementation of the receive PHY is given in Figure 19-27 (PHY receive state machine). These receive procedures and state machine do not describe the operation of optional features, such as LDPC or STBC. If the detected format indicates a non-HT PPDU format, refer to the receive procedure and state machine in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) or Clause 18 (Extended Rate PHY (ERP) specification). Further, through station management (via the PLME), the PHY is set to the appropriate frequency, as specified in 19.4 (HT PLME). Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.

Upon receiving the transmitted PHY preamble, the PHY measures a receive signal strength. This indicates activity to the MAC via the PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive shall also be issued as an initial indication of reception of a signal. The channel-list parameter of the PHY-CCA.indication primitive is determined as follows:

- It is absent when the operating channel width is 20 MHz.
- It is set to {primary} when the operating channel width is 40 MHz and the signal is present only in the primary channel.
- It is set to {secondary} when the operating channel width is 40 MHz and the signal is present only in the secondary channel.
- It is set to {primary, secondary} when the operating channel width is 40 MHz and the signal is present in both the primary and secondary channels.

The RSSI parameter is reported to the MAC in the RXVECTOR.

After the PHY-CCA.indication(BUSY, channel-list) primitive is issued, the PHY entity shall begin receiving the training symbols and searching for SIGNAL and HT-SIG in order to set the length of the data stream, the demodulation type, code type, and the decoding rate. If signal loss occurs before validating L-SIG and/or HT-SIG, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below the CCA sensitivity level (for a missed preamble) specified in 19.3.19.5 (CCA sensitivity). If the check of the HT-SIG CRC is not valid, a PHY-RXSTART.indication primitive is not issued. The PHY shall indicate the error condition by issuing a PHY-RXEND.indication(FormatViolation) primitive. The HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below the CCA sensitivity level (for a missed preamble) specified in 19.3.19.5 (CCA sensitivity).

If the PHY preamble reception is successful and a valid HT-SIG CRC is indicated:

— Upon reception of an HT-mixed format preamble, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive for the predicted duration of the transmitted frame, as defined by TXTIME in 19.4.3 (TXTIME calculation), for all supported and unsupported modes except Reserved HT-SIG Indication. Reserved HT-SIG Indication is defined in the fourth list item below.

— Upon reception of a GF preamble by an HT STA that does not support GF, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until either the predicted duration of the packet from the contents of the HT-SIG field, as defined by TXTIME in 19.4.3 (TXTIME calculation), except Reserved HT-SIG Indication, elapses or until the received level drops below the receiver minimum sensitivity level of BPSK, R=1/2 in Table 19-23 (Receiver minimum input level sensitivity) + 10 dB (–72 dBm for 20 MHz, –69 dBm for 40 MHz). Reserved HT-SIG Indication is defined in the fourth list item below.

— Upon reception of a GF preamble by an HT STA that supports GF, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive for the predicted duration of the transmitted frame, as defined by TXTIME in 19.4.3 (TXTIME calculation), for all supported and unsupported modes except Reserved HT-SIG Indication. Reserved HT-SIG Indication is defined in the fourth list item below.

— If the HT-SIG indicates a Reserved HT-SIG Indication, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below the CCA sensitivity level (minimum modulation and coding rate sensitivity + 20 dB) specified in 19.3.19.5 (CCA sensitivity). Reserved HT-SIG Indication is defined as an HT-SIG with MCS field in the range 77–127 or Reserved field = 0 or STBC field = 3 and any other HT-SIG field bit combinations that do not correspond to modes of PHY operation defined in Clause 19 (High Throughput (HT) PHY specification).

Subsequent to an indication of a valid HT-SIG CRC, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. If dot11TimingMsmtActivated is true, the PHY shall do the following:

— Complete receiving the PHY header and verify the validity of the PHY Header.

— If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 19.2.2 (TXVECTOR and RXVECTOR parameters)).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.57 (Timing measurement) in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the parameters specified in Table 19-1 (TXVECTOR and RXVECTOR parameters). Upon reception of a GF preamble by an HT STA that does not support GF, the FORMAT field of RXVECTOR is equal to HT_GF, the remaining fields may be empty, and the PHY shall indicate the error condition by issuing a PHY-RXEND.indication(FormatViolation) primitive. If the HT-SIG indicates an unsupported mode or Reserved HT-SIG Indication, the PHY shall indicate the error condition by issuing a PHY-RXEND.indication(UnsupportedRate) primitive.

Following training and SIGNAL fields, the coded PSDU (which comprises the coded PHY SERVICE field and scrambled and coded PSDU) shall be received. If signal loss occurs during reception prior to completion of the PSDU reception, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive. After waiting for the intended end of the PSDU, if no signal extension is present (as defined in 19.3.2 (PPDU format)), the PHY shall generate a PHY-CCA.indication(IDLE) primitive and return to RX IDLE state. Otherwise, the receiver waits for the duration of the signal extension before returning to the RX IDLE state.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. The number of PSDU octets is indicated in the HT Length field of the HT-SIG. The PHY shall proceed with PSDU reception. After the reception of the final bit of the last PSDU octet and possible tail and padding bits, the receiver shall be returned to the RX IDLE state if no signal extension is present (as defined in 19.3.2 (PPDU format)), as shown in Figure 19-27 (PHY receive state machine). Otherwise, the receiver waits for the duration of the signal extension before returning to the RX IDLE state. A PHY-RXEND.indication(NoError) primitive shall be issued on entry to the RX IDLE state.

While in the Signal Extension state, if the receiver detects a CS/CCA event, it issues an RXEND.indication primitive (with the RXERROR parameter set to NoError or CarrierLost, depending on whether a carrier lost event occurred during the reception of the PPDU), leaves the Signal Extension state, and enters the Detect SIG state. This sequence occurs when signal-extended PPDUs are transmitted while separated by a RIFS.

If the binary convolutional code is used, any data received after the indicated data length are considered pad bits (to fill out an OFDM symbol) and should be discarded.

19.4 HT PLME

19.4.1 PLME SAP sublayer management primitives

Table 19-24 (HT PHY MIB attributes) lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.2 (Generic management primitives) and 6.5.4 (PLME-CHARACTERISTICS.confirm).

19.4.2 PHY MIB

HT PHY MIB attributes are defined in Annex C with specific values defined in Table 19-24 (HT PHY MIB attributes). The “Operational semantics” column in Table 19-24 (HT PHY MIB attributes) contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute. When MAX-ACCESS is equal to read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is equal to read-write, the MIB attribute may be read and written by management entities.

19.4.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive or calculated for the PHY receive procedure shall be calculated for HT-mixed format according to the Equation (19-90) and Equation (19-91) for short and long GI, respectively, and for HT-greenfield format according to Equation (19-92) and Equation (19-93) for short and long, respectively:

$$\text{TXTIME} = T_{LEG_PREAMBLE} + T_{L_SIG} + T_{HT_PREAMBLE} + T_{HT_SIG} + T_{SYM} \times \left\lceil \frac{T_{SYMS} \times N_{SYM}}{T_{SYM}} \right\rceil + SignalExtension \quad (19\text{-}90)$$

$$\text{TXTIME} = T_{LEG_PREAMBLE} + T_{L_SIG} + T_{HT_PREAMBLE} + T_{HT_SIG} + T_{\text{SYM}} \times N_{SYM} + SignalExtension \quad (19\text{-}91)$$

$$\text{TXTIME} = T_{GF_HT_PREAMBLE} + T_{HT_SIG} + T_{SYMS} \times N_{SYM} + SignalExtension \quad (19\text{-}92)$$

$$\text{TXTIME} = T_{GF_HT_PREAMBLE} + T_{HT_SIG} + T_{SYM} \times N_{SYM} + SignalExtension \quad (19\text{-}93)$$

where

$T_{LEG_PREAMBLE} = T_{L\text{-}STF} + T_{L\text{-}LTF}$ is the duration of the non-HT preamble

$T_{HT_PREAMBLE}$ is the duration of the HT preamble in HT-mixed format, given by $T_{HT-STF} + T_{HT-LTF1} + (N_{HT\text{-}LTF} - 1) T_{HT-LTFs}$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$T_{GF_HT_PREAMBLE}$ is the duration of the preamble in HT-greenfield format, given by $T_{HT-GF-STF} + T_{HT-LTF1} + (N_{HT\text{-}LTF} - 1)T_{HT-LTFs}$

T_{SYM}, T_{SYMS}, $T_{HT\text{-}SIG}$, $T_{L\text{-}STF}$, $T_{HT\text{-}STF}$, $T_{HT\text{-}GF\text{-}STF}$, $T_{L\text{-}LTF}$, $T_{HT\text{-}LTF1}$ and $T_{HT\text{-}LTFs}$ are defined in Table 19-6 (Timing-related constants)

SignalExtension is 0 μs when TXVECTOR parameter NO_SIG_EXTN is true and is aSignalExtension as defined in Table 19-25 (HT PHY characteristics) when TXVECTOR parameter NO_SIG_EXTN is false

$N_{HT\text{-}LTF}$ is defined in Equation (19-22)

N_{SYM} is defined in Equation (19-32) for BCC and Equation (19-41) for LDPC

For non-HT modes of operation, refer to Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 18 (Extended Rate PHY (ERP) specification) for TXTIME calculations, except that frames transmitted with a value of NON_HT_DUP_OFDM for the TXVECTOR parameter NON_HT_MODULATION shall use Equation (18-1) for TXTIME calculation.

19.4.4 HT PHY

The static HT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 19-25 (HT PHY characteristics). The definitions for these characteristics are given in 6.5.4 (PLME-CHARACTERISTICS.confirm)

Table 19-25—HT PHY characteristics

Characteristics	Value
aRIFSTime	2 μs
aSlotTime	When operating in the 2.4 GHz band: If dot11OperatingClassesRequired is false, long = 20 μs If dot11OperatingClassesRequired is true, long = 20 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-79 (Coverage Class field parameters)) If dot11OperatingClassesRequired is false, short = 9 μs If dot11OperatingClassesRequired is true, short = 9 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-79 (Coverage Class field parameters)) When operating in the 5 GHz band: If dot11OperatingClassesRequired is false, 9 μs If dot11OperatingClassesRequired is true, 9 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-79 (Coverage Class field parameters))
aSIFSTime	10 μs when operating in the 2.4 GHz band 16 μs when operating in the 5 GHz bands
aSignalExtension	0 μs when operating in the 5 GHz band 6 μs when operating in the 2.4 GHz band
aCCATime	Implementation dependent, see 10.3.7 (DCF timing relations).
aRxPHYStartDelay	28 μs for HT-mixed format, 24 μs for HT-greenfield format
aRxTxTurnaroundTime	Implementation dependent, see 10.3.7 (DCF timing relations).
aTxPHYDelay	Implementation dependent, see 10.3.7 (DCF timing relations).

19.5 Parameters for HT MCSs

Table 19-26 (Symbols used in MCS parameter tables) defines the symbols used in the rate-dependent parameter tables.

Table 19-26—Symbols used in MCS parameter tables

Symbol	Explanation
N_{SS}	Number of spatial streams
R	Coding rate
N_{BPSC}	Number of coded bits per single carrier (total across spatial streams)
$N_{BPSCS}(i_{SS})$	Number of coded bits per single carrier for each spatial stream, $i_{SS} = 1,...,N_{SS}$
N_{SD}	Number of complex data numbers per spatial stream per OFDM symbol
N_{SP}	Number of pilot values per OFDM symbol
N_{CBPS}	Number of coded bits per OFDM symbol
N_{DBPS}	Number of data bits per OFDM symbol
N_{ES}	Number of BCC encoders for the DATA field
N_{TBPS}	Total bits per subcarrier

In the MCS parameter tables that follow, data rates for a 400 ns GI are rounded to 1 decimal place.

The rate-dependent parameters for mandatory 20 MHz, N_{SS} = 1 MCSs with N_{ES} = 1 shall be as shown in Table 19-27 (MCS parameters for mandatory 20 MHz, N_{SS} = 1, N_{ES} = 1).

Table 19-27—MCS parameters for mandatory 20 MHz, N_{SS} = 1, N_{ES} = 1

MCS Index	Modulation	R	$N_{BPSCS}(i_{SS})$	N_{SD}	N_{SP}	N_{CBPS}	N_{DBPS}	Data rate (Mb/s)	
								800 ns GI	400 ns GI (see NOTE)
0	BPSK	1/2	1	52	4	52	26	6.5	7.2
1	QPSK	1/2	2	52	4	104	52	13.0	14.4
2	QPSK	3/4	2	52	4	104	78	19.5	21.7
3	16-QAM	1/2	4	52	4	208	104	26.0	28.9
4	16-QAM	3/4	4	52	4	208	156	39.0	43.3
5	64-QAM	2/3	6	52	4	312	208	52.0	57.8
6	64-QAM	3/4	6	52	4	312	234	58.5	65.0
7	64-QAM	5/6	6	52	4	312	260	65.0	72.2

NOTE—Support of 400 ns GI is optional on transmit and receive.

20. Directional multi-gigabit (DMG) PHY specification

20.1 DMG PHY introduction

20.1.1 Scope

The DMG PHY supports three modulation methods:

— A control modulation using MCS 0 (the DMG control mode; see 20.4 (DMG control mode))

— A single carrier (SC) modulation using MCS 1 to MCS 12, MCS 9.1, 12.1, 12.2, 12.3, 12.4, 12.5 and 12.6 (the DMG SC mode; see 20.6 (DMG SC mode)) and MCS 25 to MCS 31 (the DMG low-power SC mode; see 20.7 (DMG low-power SC mode))

— An OFDM modulation using MCS 13 to MCS 24 (the DMG OFDM mode; see 20.5 (DMG OFDM mode))

All DMG modulation methods share a similar preamble (see 20.3.6 (Common preamble)).

The services provided to the MAC by the DMG PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PHY service data units (PSDU) into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the DMG MCSs, these STAs support a mixture of DMG SC mode, DMG OFDM mode, DMG low-power SC mode, and DMG control mode.

20.1.2 DMG PHY functions

The DMG PHY contains two functional entities: the PHY and the layer management function (PLME). Each of these functions is described in detail in 20.3 (Common parameters) to 20.11 (Golay sequences). The DMG PHY service is provided to the MAC through the PHY service primitives defined in Clause 8 (PHY service specification).

20.1.2.1 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

20.1.2.2 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation. The service of a layer or sublayer is the set of capabilities that it offers to a user in the next higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

20.2 DMG PHY service interface

20.2.1 Introduction

The PHY interfaces to the MAC through the TXVECTOR, RXVECTOR, and the PHYCONFIG_VECTOR. Using the TXVECTOR, the MAC supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received packet parameters. Using the

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of frame transmission or reception.

This interface is an extension of the generic PHY service interface defined in 8.3.4 (Basic service and options).

20.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 20-1 (TXVECTOR and RXVECTOR parameters) are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

20.2.3 TXSTATUS parameters

The parameters listed in Table 20-2 (TXSTATUS parameters) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm(TXSTATUS) primitive.

20.3 Common parameters

20.3.1 Channelization

The DMG PHY operates in the channels defined in Annex E and shall support at least channel number 2.

The channel center frequency is defined as:

$$\textit{Channel center frequency} = \textit{Channel starting frequency} + \textit{Channel spacing} \times \textit{Channel number}$$

where channel starting frequency, channel spacing and channel number are as defined in Annex E.

20.3.2 Transmit mask

The transmitted spectrum shall adhere to the transmit spectrum mask shown in the Figure 20-1 (Transmit mask). The transmit spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 1.88 GHz, –17 dBr at a 1.2 GHz offset, –22 dBr at a 2.7 GHz offset and –30 dBr at a 3.06 GHz offset and above, inside the channels allowed for the regulatory domain in which the device is transmitting. The measurement shall be made using a 1 MHz resolution bandwidth and a 300 KHz video bandwidth.

The transmit mask shall be measured on data packets longer than 10 μs without training fields.

Table 20-1—TXVECTOR and RXVECTOR parameters

Parameter	Value	TXVECTOR	RXVECTOR
MCS	The MCS parameter is an enumerated type that indicates the modulation and coding scheme used in the transmission of the packet. Values are integers in the range 0 to 31 and the values 9.1, 12.1, 12.2, 12.3, 12.4, 12.5 and 12.6. — An MCS value of 0 indicates the use of DMG control mode. — MCS values of 1 to 12 and 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, 12.6 indicate use of single carrier modulations. The value is an index to Table 20-19 (DMG SC mode modulation and coding schemes). — MCS values of 13 to 24 indicates use of OFDM modulations. The value is an index to Table 20-14 (DMG OFDM mode modulation and coding schemes). — MCS values of 25 to 31 indicate use of DMG low-power SC mode. The value is an index to Table 20-23 (DMG low-power SC mode modulation and coding schemes).	Y	Y
LENGTH	Indicates the number of octets in the PSDU in the range 1 to 262 143.	Y	Y
ADD-PPDU	Enumerated Type: — ADD-PPDU indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. — NO-ADD-PPDU indicates no additional PPDU follows this PPDU.	Y	Y
PACKET-TYPE	Enumerated Type: — TRN-R-PACKET indicates either a packet whose data part is followed by one or more TRN subfields, or a packet that is requesting TRN subfields to be appended to a future response packet. — TRN-T-PACKET indicates a packet whose data part is followed by one or more TRN subfields. The transmitter may change AWV configuration at the beginning of each TRN subfield. This parameter is reserved if TRN-LEN is 0.	Y	Y
TRN-LEN	TRN-LEN indicates the length of the training field. Values are in the range 0–16 (see 20.10.2.2.3 (BRP packet header fields)).	Y	Y
AGGREGATION	Indicates whether the PSDU contains an A-MPDU. Enumerated Type: — AGGREGATED indicates this is a PSDU with A-MPDU aggregation. — NOT_AGGREGATED indicates this is a PSDU without A-MPDU aggregation.	Y	Y
RSSI	The allowed values for the RSSI parameter are in the range 0 through RSSI maximum. This parameter is a measure by the PHY of the power observed at the input of the antennas plus the antenna gain, or equivalent antenna gain for a phased-array antenna, used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power.	N	Y

This is an unapproved IEEE Standards Draft, subject to change.

Table 20-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Value	TXVECTOR	RXVECTOR
SNR	This parameter indicates the SNR measured during the reception of a DMG control mode packet. Values are –13 dB to 50.75 dB in 0.25 dB steps.	N	Y
RCPI	Is a measure of the received RF power measured over the preamble of a received frame. Refer to 20.3.10 (Received channel power indicator (RCPI) measurement) for the definition of RCPI.	N	Y
ANT_CONFIG	Indicates which antenna configuration(s) is to be used throughout the transmission of the packet, and when to switch between configurations. Values are implementation dependent.	Y	N
CHAN_MEASUREMENT	Channel as measured during the reception of TRN subfields. Each measurement includes 63 complex numbers.	N	Y
TIME_OF_DEPARTURE_REQUESTED	Enumerated type: — true indicates that the MAC entity requests that the PHY PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port. — false indicates that the MAC entity requests that the PHY PHY entity neither measures nor reports time of departure parameters.	O	N
RX_START_OF_FRAME_OFFSET	0 to 2^{32}–1. An estimate of the offset (in 10 nanosecond units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.	N	See NOTE
DTP_TYPE	Enumerated: — STATIC indicating static tone paring (see 20.5.3.2.4.6.2 (Static tone pairing (STP))). — DYNAMIC indicating dynamic tone pairing (see 20.5.3.2.4.6.3 (Dynamic tone pairing (DTP))).	Y	Y
DTP_INDICATOR	An update to the DTP tone map is indicated by changing the value of this parameter from 0 to 1 or from 1 to 0 (see 10.40 (DMG dynamic tone pairing (DTP)))	Y	Y
BEAM_TRACKING_REQUEST	This parameter indicates whether beam tracking is requested. Enumerated type: Beam tracking requested or Beam tracking not requested	Y	Y
LAST_RSSI	In the TXVECTOR, LAST_RSSI indicates the received power level of the last packet with a valid PHY header that was received a SIFS before transmission of the current packet; otherwise, it is 0 (10.3.2.3.3 (SIFS)). In the RXVECTOR, LAST_RSSI indicates the value of the LAST_RSSI field from the PCLP header of the received packet. Valid values are integers in the range 0 to 15: — Values of 2 to 14 represent power levels (–71+value×2) dBm. — A value of 15 represents power greater than or equal to –42 dBm. — A value of 1 represents power less than or equal to –68 dBm. — A value of 0 indicates that the previous packet was not received a SIFS before the current transmission.	Y	Y
Turnaround	Set to 1 or 0 as specified in 10.3.2.3.3 (SIFS).	Y	Y
NOTE— “Y” if dot11TimingMsmtActivated is true, otherwise “N”.

This is an unapproved IEEE Standards Draft, subject to change.

Table 20-2—TXSTATUS parameters

Parameter	Value
TIME_OF_DEPARTURE	When the first frame energy is sent by the transmitting port, in units equal to 1/TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TIME_OF_DEPARTURE_ClockRate	0 to 2^{16}–1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TX_START_OF_FRAME_OFFSET	0 to 2^{32}–1. An estimate of the offset (in 10 nanosecond units) from the point in time at which the start of the preamble corresponding to the frame was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC.

20.3.3 Common requirements

20.3.3.1 Introduction

This subclause describes the common requirement from all 4 DMG modes: control, SC, OFDM, and low-power SC.

In all of the modes all defined fields are transmitted bit 0 first in time.

20.3.3.2 Center frequency tolerance

20.3.3.2.1 General

The transmitter center frequency tolerance shall be ± 20 ppm maximum.

20.3.3.2.2 Center frequency convergence

The transmitter center frequency shall converge to within 1 ppm of its final value within 0.9 μs from the start of the packet.

20.3.3.3 Symbol clock tolerance

The symbol clock frequency tolerance shall be ± 20 ppm maximum.

The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

20.3.3.4 Transmit center frequency leakage

The transmitter center frequency leakage shall not exceed –23 dB relative to the overall transmitted power or, equivalently, in OFDM (MCS 13-24), +2.5 dB relative to the average power of a subcarrier, measured over a subcarrier spacing bandwidth.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

20.3.3.5 Transmit rampup and rampdown

The transmit power-on ramp is defined as the time it takes for a transmitter to rise from less than 10% to greater than 90% of the average power to be transmitted in the frame.

The transmit power-on ramp shall be less than 10 ns.

The transmit power-down ramp is defined as the time it takes the transmitter to fall from greater than 90% to less than 10% of the maximum power to be transmitted in the frame.

The transmit power-down ramp shall be less than 10 ns.

20.3.3.6 Antenna setting

Antenna setting shall remain constant for the transmission of the entire packet except for the case of transmission of BRP-TX packets (see 20.10.2.2 (Beam refinement)). During the transmission of BRP-TX packets, it shall remain constant for the transmission of the STF, CE field, and Data field.

20.3.3.7 Maximum input requirement

The receiver maximum input level is the maximum power level at the receive antenna(s) of the incoming signal, in dBm, present at the input of the receiver antenna for which the error rate criterion (defined in 20.3.3.8 (Receive sensitivity)) is met. A receiver shall have a receiver maximum input level at the receive antenna(s) of at least 10 microwatts/cm^2 for each of the modulation formats that the receiver supports.

20.3.3.8 Receive sensitivity

For MCS 0, the PER shall be less than 5% for a PSDU length of 256 octets with the MCS dependent input levels listed in Table 20-3 (Receiver sensitivity) defined at the antenna connector(s). For the other MCSs, the PER shall be less than 1% for a PSDU length of 4096 octets with the MCS dependent input levels listed in Table 20-3 (Receiver sensitivity) defined at the antenna connector(s).

NOTE—For RF power measurements performed over the air, the input level shall be corrected to compensate for the antenna gain in the implementation. The gain of the antenna is the maximum estimated gain by the manufacturer. In the case of the phased-array antenna, the gain of the phased-array antenna is the maximum sum of estimated element gain minus 3 dB implementation loss.

Table 20-3 (Receiver sensitivity) assumes 5 dB implementation loss and 10 dB noise factor (Noise Figure).

20.3.4 Timing-related parameters

20.3.5 Mathematical conventions in the signal description

20.3.5.1 General

The transmitted signal is described in complex base-band signal notation. The actual transmitted signal is related to the complex baseband signal $r(t)$ by the following relation:

$$r_{RF}(t) = \mathrm{Re}\{r(t)\exp(j2\pi f_c t)\}$$

where

f_C is the center frequency of the carrier

Table 20-5—Frequently used parameters

Symbol	Explanation
N_{CBPS}	Number of coded bits per symbol
N_{DBPS}	Number of data bits per symbol
N_{BPSC}	Number of coded bits per single carrier
R	Code rate

The transmitted RF signal is generated by modulating the complex baseband signal, which consists of several fields. The fields and the timing boundaries for the various fields are shown in Figure 20-2 (Packet structure).

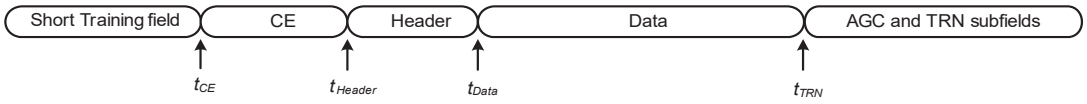

Figure 20-2—Packet structure

The time offset, t_{Field}, determines the starting time of the corresponding field.

$$r_{PPDU}(t) = r_{STF}(t) + r_{CE}(t - t_{CE}) + r_{Header}(t - t_{Header}) + r_{Data}(t - t_{Data}) + r_{TRN}(t - t_{TRN})$$

where

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$t_{CE} = T_{STF}$$
$$t_{Header} = t_{CE} + T_{CE}$$
$$t_{Data} = t_{Header} + T_{Header}$$
$$t_{TRN} = t_{Data} + T_{Data}$$

Each OFDM base band waveform $r_{Field}(nT_S)$, for the fields above, is defined via the discrete inverse Fourier transform as:

$$r_{Field}(nT_S) = w_{T_{Field}}(nT_S)\sum_k X_k \exp(j2\pi k\Delta_F(nT_S - T_{GI}))$$

where

X_k is the complex constellation point to be transmitted on subcarrier k

n is the discrete time index

The window $w_{T_{Field}}(nT_S)$ is user defined and is used to smooth the transition between fields.

The base band waveform for fields defined by time domain sequences or for single carrier transmission is

$$r_{Field}(nT_C) = x(n)$$

where

$x(n)$ is the constellation point n

Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

20.3.5.2 Windowing function

The windowing function $w_{T_{Field}}(nT_S)$ is used to smooth the transition between adjacent fields in the PPDU where OFDM modulation is employed. No windowing is applied to preamble fields or to SC modulated fields.

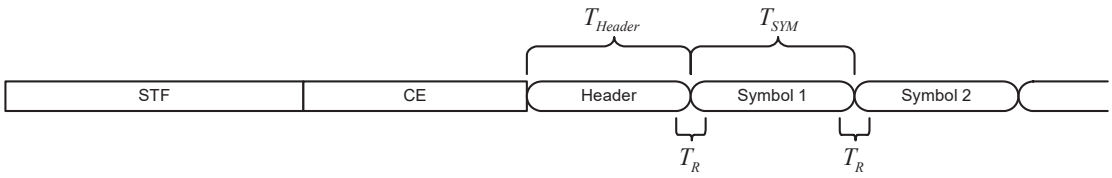

Figure 20-3—Illustration of windowing function

An example of a windowing function is given by

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$w_T(t) = \begin{cases} \sin^2\left(\frac{\pi}{2}\left(\frac{1}{2}+\frac{t}{T_R}\right)\right) & \frac{-T_R}{2} < t \le \frac{T_R}{2} \\ 1 & \frac{T_R}{2} < t \le T - \frac{T_R}{2} \\ \sin^2\left(\frac{\pi}{2}\left(\frac{1}{2}-\frac{t-T}{T_R}\right)\right) & T - \frac{T_R}{2} < t \le T + \frac{T_R}{2} \end{cases}$$

The transition region creates an overlap (with length T_R) between adjacent fields. The field wave form $r_{Field}(nT_S)$ is extended cyclically to fill the part of the transition region in which it is undefined. If the transition region vanishes (i.e., T_R=0), the windowing function degenerates to a rectangular window. The choice of windowing function is implementation dependent, as long as transmit EVM and transmit mask requirements are met.

20.3.6 Common preamble

20.3.6.1 General

The preamble is the part of the PPDU that is used for packet detection, AGC, frequency offset estimation, synchronization, indication of modulation (SC or OFDM) and channel estimation. The format of the preamble is common to both OFDM packets and SC packets and consists of a Short Training field followed by a Channel Estimation field. The content of the Short Training field is the same between SC and OFDM packets (see 20.3.6.2 (Short Training field)), but the content of the Channel Estimation field is not the same between such packets (see 20.3.6.3 (Channel Estimation field)). Figure 20-4 (SC preamble) illustrates the SC packet preamble and Figure 20-5 (OFDM preamble) illustrates the OFDM packet preamble.

Figure 20-4—SC preamble

20.3.6.2 Short Training field

The Short Training field is composed of 16 repetitions of sequences $Ga_{128}(n)$ of length 128 defined in 20.11 (Golay sequences), followed by a single repetition of $-Ga_{128}(n)$.

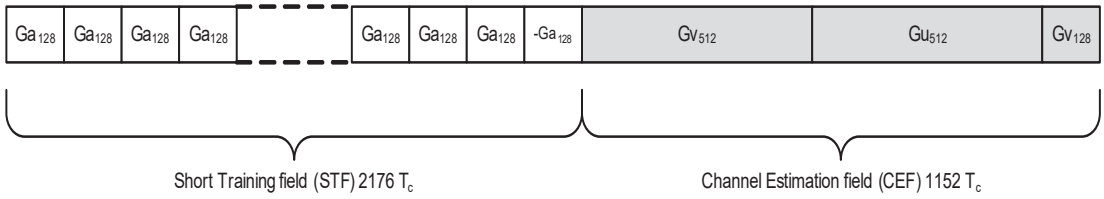

Figure 20-5—OFDM preamble

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} (Ga_{128}(n \bmod 128))\exp\left(j\pi\frac{n}{2}\right) & n = 0, 1, \ldots, 16\times 128 - 1 \\ (-Ga_{128}(n \bmod 128))\exp\left(j\pi\frac{n}{2}\right) & n = 16\times 128, \ldots, 17\times 128 - 1 \end{cases}$$

where

mod is the modulus operation

20.3.6.3 Channel Estimation field

The Channel Estimation field is used for channel estimation, as well as indication of which modulation is going to be used for the packet. The Channel Estimation field is composed of a concatenation of two sequences $Gu_{512}(n)$ and $Gv_{512}(n)$, where the last 128 samples of $Gu_{512}(n)$ and $Gv_{512}(n)$ are equal to the last 128 samples used in the Short Training field. They are followed by a 128 samples sequence $Gv_{128}(n)$ equal to the first 128 samples of both $Gv_{512}(n)$ and $Gu_{512}(n)$.

The Gu_{512} and Gv_{512} sequences are defined as

$$G_{u_{512}} = \left[-Gb_{128} \;\; -Ga_{128} \;\; Gb_{128} \;\; -Ga_{128}\right]$$

$$G_{v_{512}} = \left[-Gb_{128} \;\; Ga_{128} \;\; -Gb_{128} \;\; -Ga_{128}\right]$$

where

Ga_{128} and Gb_{128} are as defined in 20.11 (Golay sequences)

When the data field of the packet is modulated using single carrier, the Gu_{512} and Gv_{512} fields are concatenated in the order illustrated in Figure 20-6 (Channel Estimation field for SC packets). When the data field of the packet is modulated using OFDM, the Gu_{512} and Gv_{512} fields are concatenated in the order illustrated in Figure 20-7 (Channel Estimation field for OFDM packets).

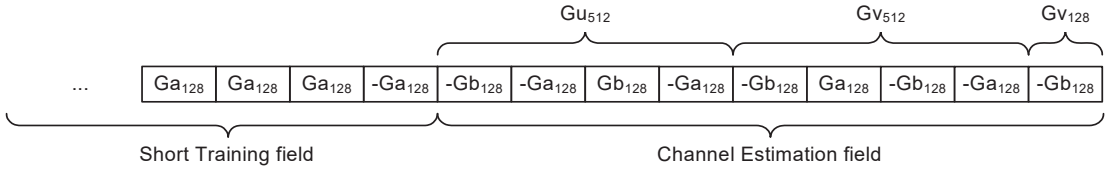

Figure 20-6—Channel Estimation field for SC packets

The waveform for the channel estimation sequence is

$$r_{CE_{SC}}(nT_c) = (Gu_{512}(n) + Gv_{512}(n-512) + Gv_{128}(n-1024))\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 1151$$

$$r_{CE_{OFDM}}(nT_c) = (Gv_{512}(n) + Gu_{512}(n-512) + Gv_{128}(n-1024))\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 1151$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

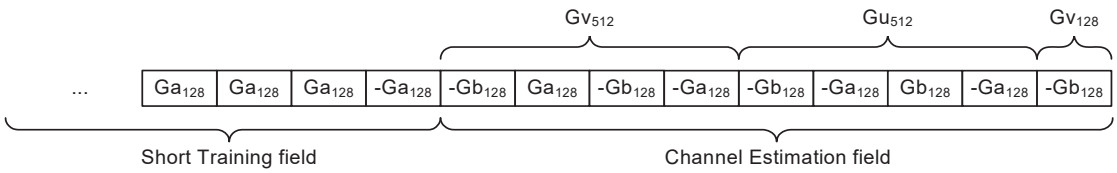

Figure 20-7—Channel Estimation field for OFDM packets

Note that sequences $Gu_{512}(n)$ and $Gv_{512}(n)$ are defined for $0 \le n \le 511$. For other values of n, $Gu_{512}(n)$ and $Gv_{512}(n)$ are set to 0.

20.3.6.4 Transmission of the preamble and BRP fields in an OFDM packet

20.3.6.4.1 General

The preamble sequence defined in the above subclauses and the BRP fields defined in 20.10.2.2.5 (AGC field), 20.10.2.2.6 (TRN field), and 20.10.2.2.7 (Channel measurement) are specified at the SC chip rate (T_c). For transmission in the OFDM (nominal) sample rate, the signal is resampled with a 3/2 rate change. The resampling is done by upsampling by a factor of 3, filtering by the filter h_{Filt} defined in 20.3.6.4.2 (hFilt definition), and downsampling by a factor of 2 (see equation below). The resampling is performed using a specific filter h_{Filt} since the OFDM receiver needs to know this filter to correct for its response during channel estimation. To define the transmission of the preamble when the packet is an OFDM packet, the preamble waveform is defined below.

Let $r_{preamble}(nT_c) = r_{STF}(nT_c) + r_{CE}(nT_c - t_{ce})$, where r_{CE} is $r_{CE_{SC}}$ or $r_{CE_{OFDM}}$ as appropriate.

Then:

$$r_{preamble}^{OFDM(2)}\left(n\frac{T_s}{2}\right) = \begin{cases} r_{preamble}\left(n\frac{T_c}{3}\right) & n = 0, 3, 6, \ldots \\ 0 & otherwise \end{cases}$$

$$\tilde{r}_{preamble}^{OFDM(2)}\left(n\frac{T_s}{2}\right) = \sum_{K=0}^{K-1} r_{preamble}^{OFDM(2)}\left((n-k)\frac{T_s}{2}\right) h_{Filt}(k),\ n = 0, 1, \ldots$$

$$\tilde{r}_{preamble}^{OFDM}(nT_s) = r_{preamble}^{OFDM(2)}\left(2n\frac{T_s}{2} - \frac{K-1}{2}\frac{T_s}{2}\right),\ n = 0, 1, \ldots$$

where

K is the length of the filter defined in 20.3.6.4.2 (hFilt definition)

$\tilde{r}_{preamble}^{OFDM(2)}(n) = 0$, for $n < 0$

20.3.6.4.2 h_{Filt} definition

The filter h_{Filt} is defined by the following coefficients (from h_0 to h_{70}):

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

[-1,0,1,1,-2,-3,0,5,5,-3,-9,-4,10,14,-1,-20,-16,14,33,9,-35,-42,11,64,40,-50,-96,-15,120,126,-62,-256,-148,360,985,1267,985,360,-148,-256,-62,126,120,-15,-96,-50,40,64,11,-42,-35,9,33,14,-16,-20,-1,14,10,-4,-9,-3,5,5,0,-3,-2,1,1,0,-1]. Normalized to have a norm of $\sqrt{3}$ so that $h_{Filt}(k) = \frac{\sqrt{3} \times h_k}{\sqrt{\sum_{l=0}^{70} h_l^2}}$.

20.3.7 HCS calculation for headers of DMG control mode, DMG OFDM mode, and DMG SC mode

The header check sequence (HCS) is a CRC of the header bits. The header is considered to be a stream of bits $B_0,...,B_{M-1}$. The CRC is based on CRC 16-CCITT. The value of the CRC field is the 1s complement of

$$CRC(D) = (M(D) \oplus I(D))D^{16} \bmod G(D)$$

where

$M(D) = B_0 D^{M-1} + B_1 D^{M-2} + \ldots + B_{M-1}$ is the header bits represented as polynomial (over the binary field) where B_0 is bit 0 of the header and B_{M-1} is bit $M-1$ of the header

$I(D) = \sum_{k=M-16}^{M-1} D^k$ is an initialization polynomial added to the first 16 bits of the header (setting the shift register bits to 1)

$G(D) = D^{16} + D^{12} + D^5 + 1$ is the CRC generating polynomial

$CRC(D) = x_0 D^{15} + x_1 D^{14} + \ldots x_{14} D + x_{15}$

The CRC field is transmitted with x_{15} first.

For a block diagram and an example of how to calculate the CRC, see 15.3.3.7 (PHY CRC field).

20.3.8 Common LDPC parity matrices

20.3.8.1 General

Four Low-Density Parity-Check (LDPC) codes are specified, each of a different rate but with a common codeword size of 672 bits.

Each of the parity-check matrices ***H*** is partitioned into square submatrices of size $Z \times Z$. The submatrices are either cyclic-permutations of the identity matrix, or null submatrices with all zero entries.

A location with integer i denotes the cyclic-permutation submatrix P_i obtained from the $Z \times Z$ identity matrix by cyclically shifting the columns to the right by i elements. The matrix P_0 is the $Z \times Z$ identity matrix. An empty location denotes a null submatrix of size $Z \times Z$.

Examples with $Z = 4$:

20.3.9 Scrambler

The header and data fields following the scrambler initialization field (including data padding bits) shall be scrambled by XORing each bit in turn with a length 127 periodic sequence generated by the polynomial $S(x) = x^7 + x^4 + 1$. The PHY header bits, with the exception of the first seven bits for SC and OFDM and the first five bits for control mode, are placed one after the other, bit 7 first (bit 5 first for DMG control mode). The octets of the PSDU and the pad bits shall be placed into a bit stream with bit 0 (LSB) of each octet first and bit 7 of each octet (MSB) last. The generation of the sequence and the XOR operation are defined in Figure 20-8 (Data scrambler).

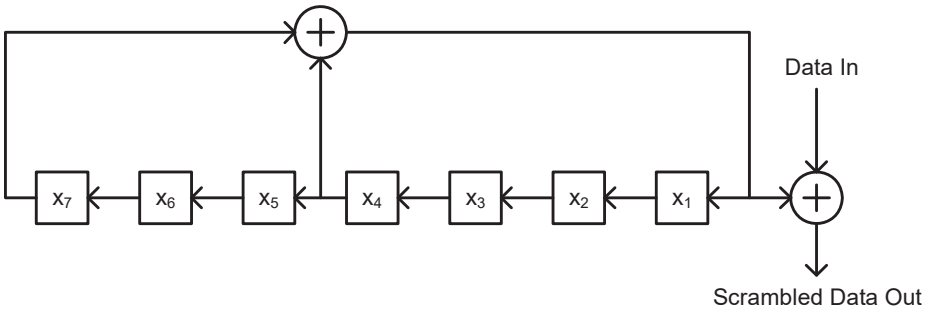

Figure 20-8—Data scrambler

For each PPDU, the transmitter shall select a nonzero seed value for the scrambler (bits x_1 through x_7). The seed value should be selected in a pseudo random fashion. The seed value is sent in the Scrambler

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Initialization field of the PHY header. Each data bit in the data field of the PPDU is then XORed with the scrambler output ($x_4 \oplus x_7$) and then the scrambler content is shifted once.

20.3.10 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel as measured at the DMG Antenna output. This parameter shall be measured by the PHY of the received RF power in the channel measured over the preamble of the received frame.

The RCPI encoding is defined in 15.4.6.6 (Received Channel Power Indicator Measurement).

RCPI shall equal the received RF power with an accuracy of ± 5 dB with 95% confidence interval within the specified dynamic range of the receiver. The received RF power shall be determined assuming a receiver noise equivalent bandwidth equal to the channel width multiplied by 1.1. The relative error between RF power measurements made within a 1 second interval should be less than ± 1 dB.

20.4 DMG control mode

20.4.1 Introduction

Transmission and reception of control mode PPDUs is mandatory. DMG control mode uses the same chip rate as the DMG SC mode. DMG control mode is transmitted when the TXVECTOR indicates MCS 0.

The modulation and coding scheme for the DMG control mode is shown in Table 20-10 (DMG control mode modulation and coding scheme).

Table 20-10—DMG control mode modulation and coding scheme

MCS index	Modulation	Code rate	Data rate
0	DBPSK	1/2[a]	27.5 Mb/s[a]

[a]Code rate and data rate might be lower due to codeword shortening.

20.4.2 PPDU format

The DMG control mode PPDU is composed of the Preamble, Header, Data field, and possibly AGC and TRN subfields. This is shown in Figure 20-9 (DMG control mode PPDU format).

Figure 20-9—DMG control mode PPDU format

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

20.4.3 Transmission

20.4.3.1 Preamble

20.4.3.1.1 General

The preamble is the part of the DMG control mode PPDU that is used for packet detection, AGC, frequency offset estimation, synchronization, indication of frame type and channel estimation.

The preamble is composed of two parts as shown in Figure 20-10 (DMG control mode preamble): the Short Training field and the Channel Estimation field.

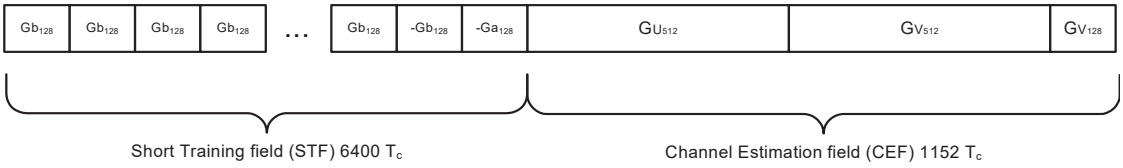

Figure 20-10—DMG control mode preamble

20.4.3.1.2 Short Training field

The Short Training field is composed of 48 repetitions of the sequence $Gb_{128}(n)$ of length 128, followed by a single –Gb128(n) sequence (for synchronization) and then a single –Ga128(n) sequence. The sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined in 20.11 (Golay sequences).

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right) & n = 0, 1, \ldots, 48\times 128 - 1 \\ -Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right) & n = 48\times 128, \ldots, 49\times 128 - 1 \\ -Ga_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right) & n = 49\times 128, \ldots, 50\times 128 - 1 \end{cases}$$

where mod is the modulus operation. Note that sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined for $0 \le n \le 127$. For other n they are set to 0.

20.4.3.1.3 Channel Estimation field

The Channel Estimation field is the same as the Channel Estimation field of the DMG SC mode, as defined in Figure 20-6 (Channel Estimation field for SC packets) of 20.3.6.3 (Channel Estimation field).

20.4.3.2 Header

20.4.3.2.1 General

In the DMG control mode, the preamble is followed by the header block. The header consists of several fields that define the details of the PPDU to be transmitted.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The header fields are described in Table 20-11 (DMG control mode header fields).

Table 20-11—DMG control mode header fields

Field name	Number of bits	Starting bit	Description
Differential encoder initialization	1	0	Used to initialize the differential encoding.
Scrambler Initialization	4	1	Bits X1–X4 of the initial scrambler state.
Length	10	5	Number of data octets in the PSDU. Range 14–1023.
Packet Type	1	15	As defined in Table 20-17 (DMG SC mode header fields).
Training Length	5	16	Length of the training field. The use of this field is defined in 20.10.2.2.3 (BRP packet header fields).
Turnaround	1	21	As defined in Table 20-1 (TXVECTOR and RXVECTOR parameters).
Reserved bits	2	22	
HCS	16	24	Header Check sequence. Calculation of the header check sequence is defined in 20.3.7 (HCS calculation for headers of DMG control mode, DMG OFDM mode, and DMG SC mode).

All of the numeric fields are encoded in unsigned binary, least significant bit first.

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

20.4.3.2.2 Generation of HCS bits

The header check sequence (HCS) is calculated over bits 0-23 and uses CRC 16-CCITT as described in 20.3.7 (HCS calculation for headers of DMG control mode, DMG OFDM mode, and DMG SC mode).

20.4.3.2.3 Header encoding and modulation

The header bits followed by the HCS bits are prepended to the data field bits and passed into the data field encoder per 20.4.3.3 (Data field). The minimal payload length is 14 octets.

20.4.3.3 Data field

20.4.3.3.1 General

The Data field consists of the payload data of the PSDU. The PSDU is scrambled, encoded, modulated and spread as described in the following subclauses.

20.4.3.3.2 Scrambler

The operation of the scrambler is defined in 20.3.9 (Scrambler). Bits x1, x2, x3, x4 of the scrambler shift register are initialized using the bits in the scrambler initialization bits from the header, bits x5, x6, x7 are set

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

to 1. The header is scrambled starting from bit 5. The scrambling of the data field continues the scrambling of the header with no reset.

20.4.3.3.3 Encoder

The DMG control mode header and data is encoded using an effective LDPC code rate less than or equal to 1/2, generated from the data PHY rate 3/4 LDPC parity check matrix, with shortening. The following steps are used for the encoding:

1) $L_{CWD} = 168$ is the maximal number of data bits in each LDPC codeword. L_{HDR}=5 is the length of the header (including HCS) in octets. L_{FDCW}=6 is the length of the additional data in the first LDPC codeword in octets.

2) The total (header and additional data) number of bits in the first LDPC codeword is $L_{DPFCW} = (L_{HDR} + L_{FDCW}) \times 8 = 88$.

3) The number of LDPC codewords is $N_{CW} = 1 + \left\lceil \frac{(Length - 6) \times 8}{L_{CWD}} \right\rceil$.

4) The number of bits in the second and any subsequent LDPC codeword (if present), except the last, is $L_{DPCW} = \left\lceil \frac{(Length - 6) \times 8}{N_{CW} - 1} \right\rceil$.

5) The number of bits in the last LDPC codeword is $L_{DPLCW} = (Length - 6) \times 8 - (N_{CW} - 2) \times L_{DPCW}$.

NOTE—For example: If $Length = 128$, then $N_{CW} = 1 + \left\lceil \frac{(128 - 6) \times 8}{L_{CWD}} \right\rceil = 7$, $L_{DPCW} = 163$ and $L_{DPLCW} = 161$. In the first LDPC block the 88 bits of L_{DPFCW} consist of 40 header+HCS bits along with 48 bits of the data.

20.4.3.3.4 Modulation

The scrambled and coded bit stream is converted into a stream of complex constellation points using differential binary phase shift keying (DBPSK) as follows.

The encoded bit stream $[c_0, c_1, c_2, c_3, c_4, \ldots]$ is converted to the nondifferential stream $s(k) = 2c_k - 1$. The differential sequence is created by setting $d(k) = s(k) \times d(k-1)$. For the differential encoding purposes $d(-1)$ is defined to be 1. $s(0)$ is the first bit of the encoded header bits.

20.4.3.3.5 Spreading

The constellation points are spread using the sequence $Ga_{32}(n)$, which is defined in 20.11 (Golay sequences).

The waveform for the modulated and spread data field is

$$r_{DATA}(nT_c) = \left(Ga_{32}(n \bmod 32) \cdot d\left(\left\lfloor \frac{n}{32} \right\rfloor \right) \right) \exp\left(j\pi \frac{n}{2} \right), n = 0, 1, 2, \ldots$$

where $d(k)$ is the modulated constellation point k.

This is an unapproved IEEE Standards Draft, subject to change.

20.4.4 Performance requirements

20.4.4.1 Transmit requirements

20.4.4.1.1 Introduction

Transmitter performance requirements of the DMG control mode are defined in 20.4.4.1.2 (Transmit EVM).

20.4.4.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc. The instrumentation shall perform carrier lock, symbol timing recovery, and amplitude adjustment while making the measurements. The instrumentation shall incorporate a rake receiver or equalizer to minimize error resulting from multipath. If used, the equalizer shall be trained using information in the preamble (STF and/or CEF). For the DMG control mode EVM, the signal is first de-spread using Ga_{32}. The EVM is then calculated on the resulting symbols according to the formula below:

$$EVM = 20\log_{10}\left(\sqrt{\left(\frac{1}{N_s P_{avg}}\sum_{i=1}^{N_s}[(I_i - I_i^*)^2 + (Q_i - Q_i^*)^2]\right)}\right)$$

where N_S is the number of symbols to be measured and N_S should be greater than 511, P_{avg} is the average power of the constellation, (I_i,Q_i) is the complex coordinates of the measured symbol i, and (I_i^*,Q_i^*) is the complex coordinates of the ideal constellation point for the measured symbol i.

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The EVM shall not exceed a data-rate dependent value according to Table 20-12 (DMG control mode EVM requirements).

Table 20-12—DMG control mode EVM requirements

MCS index	Description	EVM value [dB]
0	DMG control mode modulation	–6

20.4.4.2 Receive requirements

20.4.4.2.1 Introduction

Subclause 20.4.4.2 (Receive requirements) describes the performance requirement from the DMG control mode receiver.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

20.4.4.2.2 CCA

The start of a valid DMG control mode transmission at a receive level greater than -68dBm shall cause CCA to indicate busy with a probability > 90% within 3 μs.

20.5 DMG OFDM mode

20.5.1 Introduction

Transmission and reception of DMG OFDM mode PPDUs is optional. The use of the DMG OFDM mode is obsolete. Consequently, this option may be removed in a later revision of the standard.

20.5.2 PPDU format

An OFDM frame is composed of the Short Training field (STF), the channel estimation field (CE), the Header, OFDM symbols and optional training fields (see 20.10.2.2.2 (BRP packet structure)), as shown in Figure 20-11 (OFDM frame format).

Figure 20-11—OFDM frame format

20.5.3 Transmission

20.5.3.1 Header

20.5.3.1.1 General

In the DMG OFDM mode, the preamble is followed by the PHY header. The PHY header consists of several fields that define the details of the PPDU being transmitted. The encoding and modulation of the header is described in 20.5.3.1.4 (Header encoding and modulation).

The header fields are described in Table 20-13 (DMG OFDM mode header fields).

Table 20-13—DMG OFDM mode header fields

Field name	Number of bits	Start bit	Description
Scrambler Initial-ization	7	0	Bits X1–X7 of the initial scrambler state.
MCS	5	7	Index into the Modulation and Coding Scheme table.
Length	18	12	Number of data octets in the PSDU. Range 1–262 143.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 20-13—DMG OFDM mode header fields *(continued)*

Field name	Number of bits	Start bit	Description
Additional PPDU	1	30	Contains a copy of the parameter ADD-PPDU from the TXVECTOR. A value of 1 indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. A value of 0 indicates that no additional PPDU follows this PPDU.
Packet Type	1	31	See the definition in Table 20-17 (DMG SC mode header fields).
Training Length	5	32	Corresponds to the TXVECTOR parameter TRN-LEN. If the Beam Tracking Request field is 0, the Training Length field indicates the length of the training field. The use of this field is defined in 20.10.2.2.3 (BRP packet header fields). A value of 0 indicates that no training field is present in this PPDU. If the Beam Tracking Request field is 1 and the Packet Type field is 1, the Training Length field indicates the length of the training field appended to this PPDU. If the Packet Type field is 0, the Training Length field indicates the length of the training field requested for receive training.
Aggregation	1	37	Set to 1 to indicate that the PPDU in the data portion of the packet contains an A-MPDU; otherwise, set to 0.
Beam Tracking Request	1	38	Corresponds to the TXVECTOR parameter BEAM_TRACKING_REQUEST. Set to 1 to indicate the need for beam tracking (10.38.7 (Beam tracking)); otherwise, set to 0. The Beam Tracking Request field is reserved when the Training Length field is 0.
Tone Pairing Type	1	39	Set to 0 to indicate Static Tone Pairing (20.5.3.2.4.6.2 (Static tone pairing (STP))); Set to 1 to indicate Dynamic Tone Pairing (20.5.3.2.4.6.3 (Dynamic tone pairing (DTP))). Only valid if MCS field value is in the range 13 to 17; otherwise reserved.
DTP Indicator	1	40	Bit flip used to indicate DTP update. Only valid when the Tone Pairing Type field is 1 and the MCS field value is in the range 13 to 17; otherwise reserved.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 20-13—DMG OFDM mode header fields *(continued)*

Field name	Number of bits	Start bit	Description
Last RSSI	4	41	Contains a copy of the parameter LAST_RSSI from the TXVECTOR. The value is an unsigned integer: — Values of 2 to 14 represent power levels (–71 + value × 2) dBm. — A value of 15 represents a power greater than or equal to –42 dBm. — A value of 1 represents a power less than or equal to –68 dBm. Value of 0 indicates that the previous packet was not received a SIFS before the current transmission.
Turnaround	1	45	As defined in Table 20-1 (TXVECTOR and RXVECTOR parameters).
Reserved	2	46	
HCS	16	48	Header check sequence. Definition of this field calculation is in 20.5.3.1.3 (Generation of the HCS bits).

All of the numeric fields are encoded in unsigned binary, least significant bit first.

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

If the Additional PPDU field is equal to 1, the Training Length field shall be set to 0.

20.5.3.1.2 Modulation and coding scheme

The modulation and coding scheme (MCS) field specifies the modulation and code rate used in the PPDU. The modulation and coding schemes for OFDM modulations are defined in Table 20-14 (DMG OFDM mode modulation and coding schemes).

Table 20-14—DMG OFDM mode modulation and coding schemes

MCS index	Modulation	Code rate	N_{BPSC}	N_{CBPS}	N_{DBPS}	Data rate (Mb/s)
13	SQPSK	1/2	1	336	168	693.00
14	SQPSK	5/8	1	336	210	866.25
15	QPSK	1/2	2	672	336	1386.00
16	QPSK	5/8	2	672	420	1732.50
17	QPSK	3/4	2	672	504	2079.00
18	16-QAM	1/2	4	1344	672	2772.00
19	16-QAM	5/8	4	1344	840	3465.00
20	16-QAM	3/4	4	1344	1008	4158.00
21	16-QAM	13/16	4	1344	1092	4504.50

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 20-14—DMG OFDM mode modulation and coding schemes *(continued)*

MCS index	Modulation	Code rate	N_{BPSC}	N_{CBPS}	N_{DBPS}	Data rate (Mb/s)
22	64-QAM	5/8	6	2016	1260	5197.50
23	64-QAM	3/4	6	2016	1512	6237.00
24	64-QAM	13/16	6	2016	1638	6756.75

A device that supports OFDM shall support MCSs 13-17 for both transmit and receive.

20.5.3.1.3 Generation of the HCS bits

Calculation of the HCS for bits 0–47 of the header is defined in 20.3.7 (HCS calculation for headers of DMG control mode, DMG OFDM mode, and DMG SC mode).

20.5.3.1.4 Header encoding and modulation

The header is encoded using a single OFDM symbol. The bits are scrambled and encoded as follows:

1) The 64 header bits (B_1, B_2, …, B_{LH}), where LH = 64, are scrambled as described in 20.3.9 (Scrambler), starting from the eighth bit, to create $\mathbf{q}=(q_1,q_2,\ldots,q_{LH})$.
2) The sequence **q** is padded with 440 zeros to obtain a total of 504 bits, $(q_1,q_2,\ldots,q_{LH},0_{LH+1},0_{LH+2},\ldots 0_{504})$, which are then encoded using the rate-3/4 LDPC code as described in 20.5.3.2.3.3 (LDPC encoding process). 168 parity bits, $p_1,p_2,\ldots,p_{168}$, are generated.
3) A sequence $\mathbf{c_1}$ is generated as $(q_1,q_2,\ldots,q_{LH},p_9,p_{10},\ldots p_{168})$.
4) A sequence $\mathbf{c_2}$ is generated as $(q_1,q_2,\ldots,q_{LH},p_1,p_2,\ldots p_{84}, p_{93},p_{94},\ldots p_{168})$ XORed with a one-time pad sequence generated using the scrambler defined in 20.3.9 (Scrambler), with the shift register is initialized to all 1s.
5) A sequence $\mathbf{c_3}$ is generated as $(q_1,q_2,\ldots,q_{LH},p_1,p_2,\ldots p_{160})$ XORed with the continuation of the one-time pad sequence generated in step 4).
6) The sequences $\mathbf{c_1}$,$\mathbf{c_2}$ and $\mathbf{c_3}$ are concatenated to form the 672-bit sequence $\mathbf{c}=(c_1,c_2,c_3,\ldots,c_{672})=(\mathbf{c_1},\mathbf{c_2},\mathbf{c_3})$.
7) The 672-bit sequence, **c**, is then mapped as QPSK as described in 20.5.3.2.4.3 (QPSK modulation), pilots are inserted as described in 20.5.3.2.5 (Pilot sequence) and the resulting sequence $d_0,d_1,\ldots,d_{SD-1}$ is modulated as an OFDM symbol as follows:

$$r_{Header}(qT_s) = \frac{1}{\sqrt{N_{Tones}}} w_{T_{SYM}}(qT_s) \sum_{k=-N_{SR}}^{N_{SR}} (D_k + p_1 P_k) \exp(j2\pi k \Delta_F (qT_s - T_{GI}))$$

where p_1 and P_k are defined in 20.5.3.2.5 (Pilot sequence) and D_k is defined in 20.5.3.2.6 (OFDM modulation).

20.5.3.2 Data field

20.5.3.2.1 General

The data field consists of the payload data of the PSDU and possible padding. The data are padded with zeros, scrambled, encoded and modulated as described in the following subclauses. The amount of padding is defined in 20.5.3.2.3 (Encoding).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

20.5.3.2.2 Scrambler

The operation of the scrambler is defined in 20.3.9 (Scrambler). The scrambling of the data field continues the scrambling of the header with no reset.

20.5.3.2.3 Encoding

20.5.3.2.3.1 General

The data are encoded by a systematic LDPC encoder. LDPC is a block code. Each block of bits $(B_1, B_2,...,B_k)$ is concatenated with a block of parity bits $(p_1,p_2,....,p_{n-k})$ to create a codeword $\boldsymbol{c}=(B_1, B_2,...,B_k,p_1,p_2,....,p_{n-k})$ such that $\mathbf{Hc}^{\mathbf{T}}=\mathbf{0}$. **H** is an $(n-k)\times n$ parity check matrix. The block size n is 672 bits. The code rate, R, is equal to k/n. The set of code rates is defined in Table 20-15 (LDPC code rates). The parity check matrices are defined in 20.5.3.2.3.2 (Parity check matrices). The encoding process is defined in 20.5.3.2.3.3 (LDPC encoding process).

Table 20-15—LDPC code rates

Code rate	Codeword size	Number of data bits
1/2	672	336
5/8	672	420
3/4	672	504
13/16	672	546

20.5.3.2.3.2 Parity check matrices

See 20.3.8 (Common LDPC parity matrices).

20.5.3.2.3.3 LDPC encoding process

The LDPC encoding process is composed of several steps including determining the number of padding bits, padding with zeros and the coding of every word.

1) First the total number of padding bits N_{PAD} is calculated, using the number of LDPC codeword N_{CW} and the number of OFDM symbols N_{SYM}:

$$N_{CW} = \left\lceil \frac{Length \times 8}{L_{CW} \times R} \right\rceil$$

$$N_{SYM} = \left\lceil \frac{N_{CW} \times L_{CW}}{N_{CBPS}} \right\rceil$$

If BRP packet and N_{SYM} < aBRPminOFDMblocks ; N_{SYM} = aBRPminOFDMblocks

$$N_{PAD} = R \times N_{SYM} \times N_{CBPS} - Length \times 8$$

Recalculate $N_{CW} = N_{SYM} \cdot \frac{N_{CBPS}}{L_{CW}}$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where L_{CW}=672 is the LDPC codeword length, *Length* is the length of the PSDU defined in the header field, R is the code rate and N_{CBPS} is the number of code bits per symbol as defined in the MCS table.

2) The PSDU is concatenated with N_{PAD} zeros. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU.

3) The output stream of the scrambler is broken into blocks of $L_{CWD}= R \times L_{CW}$ bits such as the *m'th* data word is $(b_1^{(m)}, b_2^{(m)}, \ldots, b_{L_{CWD}}^{(m)})$.

4) To each data word, $n\text{-}k=L_{CW}\text{-}R \times L_{CW}$ parity bits $(p_1^{(m)}, p_2^{(m)}, \ldots, p_{n-k}^{(m)})$ are added to create the codeword $\boldsymbol{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{L_{CWD}}^{(m)}, p_1^{(m)}, \ldots p_{n-k}^{(m)})$ such that $\mathbf{H}\mathbf{c}^{(m)^{\mathrm{T}}} = 0$.

5) The codewords are the concatenated one after the other to create the coded bits stream $(c_1, c_2, \ldots c_{N_{SYM} \times N_{CBPS}})$.

20.5.3.2.4 Modulation mapping

20.5.3.2.4.1 General

The coded bits are mapped to complex constellation points for the modulation specified in the MCS as described in the following subclauses.

20.5.3.2.4.2 SQPSK modulation

In SQPSK (Spread QPSK) modulation, the input stream is broken into groups of N_{CBPS} bits – $(c_0^{(q)}, c_1^{(q)}, \ldots, c_{N_{CBPS-1}}^{(q)})$. Each pair of bits $(c_{2k}^{(q)}, c_{2k+1}^{(q)}), k = 0, 1, \ldots, \frac{N_{CBPS}}{2} - 1$ is converted into a complex constellation point $d_k^{(q)} = \frac{1}{\sqrt{2}}((2c_{2k}^{(q)} - 1) + j(2c_{2k}^{(q)} - 1))$. This generates the constellation points for half the OFDM subcarriers. For the other subcarriers, $d_{P(k)}^{(q)} = \mathrm{conj}(d_k^{(q)})$ for $k = 0, 1, \ldots, \frac{N_{CBPS}}{2} - 1$ where the indices *P(k),* in the range $N_{CBPS}/2$ *to* $N_{CBPS} - 1$, are as defined in 20.5.3.2.4.6 (Tone pairing for SQPSK and QPSK).

20.5.3.2.4.3 QPSK modulation

a) The input stream is broken into groups of N_{CBPS} bits – $(c_0^{(q)}, c_1^{(q)}, \ldots, c_{N_{CBPS-1}}^{(q)})$. Each group of four bits $(c_{4k}^{(q)}, c_{4k+1}^{(q)}, c_{4k+2}^{(q)}, c_{4k+3}^{(q)})$ is converted into two complex constellation points $x_{2k}^{(q)} = \frac{1}{\sqrt{2}}((2c_{4k}^{(q)} - 1) + j(2c_{4k+2}^{(q)} - 1)), x_{2k+1}^{(q)} = \frac{1}{\sqrt{2}}((2c_{4k+1}^{(q)} - 1) + j(2c_{4k+3}^{(q)} - 1))$. The block $\left(x_0^{(q)}, x_1^{(q)}, \ldots, x_{N_{\frac{CBPS}{2}-1}}^{(q)}\right)$ is created.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

b) Each pair of constellation points $(x_{2k}^{(q)}, x_{2k+1}^{(q)}), k = 0, 1\ldots, \frac{N_{SD}}{2} - 1$ is converted into $[d_k^{(q)}, d_{P(k)}^{(q)}] = Q[x_{2k}^{(q)}, x_{2k+1}^{(q)}]$ where the matrix $Q = \frac{1}{\sqrt{5}}\begin{bmatrix} 1 & 2 \\ -2 & 1 \end{bmatrix}$ and the indices *P(k),* in the range N_{SD} */ 2 to* $N_{SD} - 1$*,* are as defined in 20.5.3.2.4.6 (Tone pairing for SQPSK and QPSK).

c) The output is the stream of blocks $(d_0^{(q)}, d_1^{(q)}, \ldots, d_{N_{SD}-1}^{(q)}), q = 1, \ldots, N_{SYM}$.

20.5.3.2.4.4 16-QAM modulation

The input stream is broken into groups of N_{CBPS} bits $(c_0^{(q)}, c_1^{(q)}, \ldots, c_{N_{CBPS-1}}^{(q)})$. Each group of eight bits $(c_{4k}^{(q)}, c_{4k+1}^{(q)}, c_{4k+2}^{(q)}, c_{4k+3}^{(q)}, c_{4k+2N_{SD}}^{(q)}, c_{4k+1+2N_{SD}}^{(q)}, c_{4k+2+2N_{SD}}^{(q)}, c_{4k+3+2N_{SD}}^{(q)}), k = 0, 1, 2, \ldots, \frac{N_{SD}}{2} - 1$ is converted into two complex constellation points $(x_{2k}^{(q)}, x_{2k+1}^{(q)})$ such that

$$x_{2k}^{(q)} = \frac{1}{\sqrt{10}}\{[(4c_{4k}^{(q)} - 2) - (2c_{4k}^{(q)} - 1)(2c_{4k+1}^{(q)} - 1)] + j[(4c_{4k+2}^{(q)} - 2) - (2c_{4k+2}^{(q)} - 1)(2c_{4k+3}^{(q)} - 1)]\}$$

and

$$x_{2k+1}^{q} = \frac{1}{\sqrt{10}}\{[(4c_{4k+2N_{SD}}^{(q)} - 2) - (2c_{4k+2N_{SD}}^{(q)} - 1)(2c_{4k+1+2N_{SD}}^{(q)} - 1)] + j[(4c_{4k+2+2N_{SD}}^{(q)} - 2) - (2c_{4k+2+2N_{SD}}^{(q)} - 1)(2c_{4k+3+2N_{SD}}^{(q)} - 1)]\}$$

The output is the stream of blocks $(x_0^{(q)}, x_1^{(q)}, \ldots, x_{N_{SD}-1}^{(q)}), q = 0, 1, \ldots, N_{SYM} - 1$.

20.5.3.2.4.5 64-QAM modulation

The input stream is broken into groups of N_{CBPS} bits $(c_0^{(q)}, c_1^{(q)}, \ldots, c_{N_{CBPS-1}}^{(q)})$. The constellation point for the *k*'th subcarrier in the *q*'th symbol is

$$d_k^{(q)} = \frac{1}{\sqrt{42}}((8c_{6m}^{(q)} - 4) - (2c_{6m}^{(q)} - 1)(4c_{6m+1}^{(q)} - 2) + (2c_{6m}^{(q)} - 1)(2c_{6m+1}^{(q)} - 1)(2c_{6m+2}^{(q)} - 1)) + j\left(\frac{1}{\sqrt{42}}((8c_{6m+3}^{(q)} - 4) - (2c_{6m+3}^{(q)} - 1)(4c_{6m+4}^{(q)} - 2) + (2c_{6m+3}^{(q)} - 1)(2c_{6m+4}^{(q)} - 1)(2c_{6m+5}^{(q)} - 1))\right)$$

$$m = 112(k \bmod 3) + \left\lfloor \frac{k}{3} \right\rfloor, k = 0, 1, \ldots, N_{SD} - 1$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—This mapping provides interleaving between three LDPC codewords on a subcarrier basis.

The mapping is shown in Figure 20-12 (64-QAM modulation mapping).

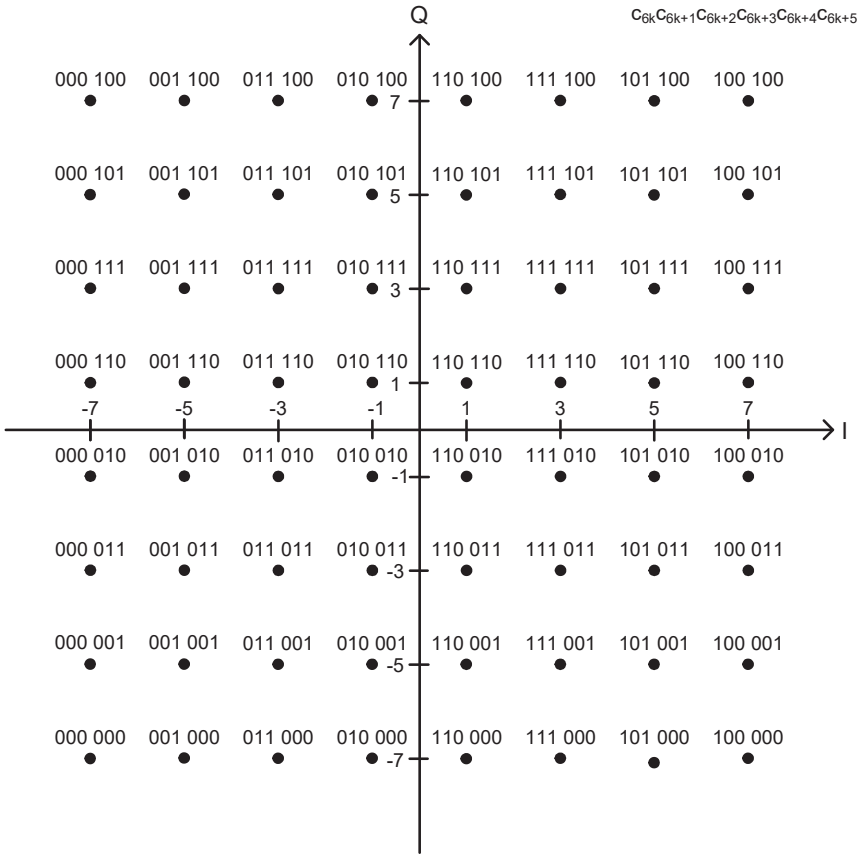

Figure 20-12—64-QAM modulation mapping

20.5.3.2.4.6 Tone pairing for SQPSK and QPSK

20.5.3.2.4.6.1 General

When SQPSK or QPSK modulations are employed in OFDM, bit sequences are mapped to pairs of symbols $(d_k^{(q)}, d_{P(k)}^{(q)})$ where k is in the range $0 \le k \le \frac{N_{SD}}{2} - 1$ and $P(k)$ is in the range $\frac{N_{SD}}{2} \le P(k) \le N_{SD} - 1$ in order to exploit frequency diversity. The indices k and $P(k)$ determine which pair of OFDM subcarriers each pair of symbols are carried on.

All DMG modes shall support Static Tone Pairing (STP) where a constant mapping between k and $P(k)$ is employed. The PHY header is always encoded using STP.

A STA may employ Dynamic Tone Pairing (DTP) where the mapping between k and $P(k)$ are determined by the receiving STA and fed back to the transmitting STA. A STA may use DTP when transmitting to a DTP-capable STA, from which it has received DTP feedback.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

20.5.3.2.4.6.2 Static tone pairing (STP)

When applied to the payload, STP is indicated by the value 0 in the Tone Pairing Type field in the PHY header. STP is always applied to the PHY header.

When STP is applied, the QPSK or SQPSK symbol-pair indices k and $P(k)$ are such that

$$P(k) = k + \frac{N_{SD}}{2} \text{ for } k = 0, 1, 2, \ldots, \frac{N_{SD}}{2} - 1$$

20.5.3.2.4.6.3 Dynamic tone pairing (DTP)

When applied, DTP is indicated by the value 1 in the Tone Pairing Type field in the PHY header. DTP can be applied only to the payload of a PPDU employing MCS 13-17.

When DTP is applied, the SQPSK symbol-pair indices, k and $P(k)$, are such that

$$P(k) = \text{ToneIndexOffset}\left(\left\lfloor \frac{k}{N_{TPG}} \right\rfloor\right) + \text{mod}(k, N_{TPG}) \text{ for } k = 0, 1, 2, \ldots, \frac{N_{SD}}{2} - 1$$

where

N_{TPG} denotes the number of tones per group

ToneIndexOffset(l) denotes the starting index of the l-th group of tone pairs, for $l = 0, 1, 2, \ldots, \frac{N_{SD}}{N_{TPG}} - 1$

The values of N_{TPG} and ToneIndexOffset(l) for $l = 0, 1, 2, \ldots, \frac{N_{SD}}{N_{TPG}} - 1$ are derived from the DTP Report element (9.4.2.146 (Dynamic Tone Pairing (DTP) Report element)) included in the last received DTP Report frame (9.6.20.9 (DTP Report frame format)).

The number of tone-pairs per group, $N_{TPG,}$ is derived as

$$N_{TPG} = \frac{N_{SD}}{2N_G}$$

where

N_G is the number of DTP groups, which is equal to 42

The tone index offsets, ToneIndexOffset(l), are derived as

$$\text{ToneIndexOffset}(l) = N_{TPG} \times \text{GroupPairIndex}(l) + \frac{N_{SD}}{2}$$

where

GroupPairIndex(l) is the value of the GroupPairIndex(l) subfield of the DTP Report element

20.5.3.2.5 Pilot sequence

Pilot tones are inserted at tones –150, –130, –110, –90, –70, –50, –30, –10, 10, 30, 50, 70, 90, 110, 130,150. The values of the pilots at these tones is [–1, 1, –1, 1, 1, –1, –1, –1, –1, –1, 1, 1, 1, –1, 1, 1], respectively. The pilot sequence P is created by creating a sequence of zeros corresponding to tones $-N_{SR}$ to N_{SR}. The pilots are then inserted at the corresponding tones with the values specified above.

At OFDM symbol n the pilot sequence is multiplied by the value $2\times p_n - 1$, where p_n is the value generated by the shift register defined in 20.5.3.2.2 (Scrambler) if $x_1, x_2, \ldots x_7$ are all set to 1 at the first OFDM symbol.

20.5.3.2.6 OFDM modulation

The stream of complex constellation points d_k is broken into groups of N_{SD} points $d_{m,n}$ where $m=1,2,\ldots,N_{SD}$ and $n=1,2,\ldots,N_{SYM}$. The baseband signal for the data phase is

$$r_{DATA}(qT_s) = \frac{1}{\sqrt{N_{Tones}}} \sum_{n=1}^{N_{SYM}} w_{T_{SYM}}(qT_s - (n-1)T_{SYM}) \sum_{k=-N_{SR}}^{N_{SR}} (D_{k,n} + p_{n+1}P_k)\exp(j2\pi k\Delta_F(qT_s - (n-1)T_{SYM} - T_{GI}))$$

where

p_n, P are defined in 20.5.3.2.5 (Pilot sequence)

$N_{Tones} = N_{ST} - N_{DC}$ is the number of active subcarriers

$$D_{k,n} = \begin{cases} 0 & k = 0, \pm1, \pm10, \pm30, \pm50, \pm70, \pm90, \pm110, \pm130, \pm150 \\ d_{M(k),n} & Otherwise \end{cases}$$

$$M(k) = \begin{cases} k+178 & -177 \le k \le -151 \\ k+177 & -149 \le k \le -131 \\ k+176 & -129 \le k \le -111 \\ k+175 & -109 \le k \le -91 \\ k+174 & -89 \le k \le -71 \\ k+173 & -69 \le k \le -51 \\ k+172 & -49 \le k \le -31 \\ k+171 & -29 \le k \le -11 \\ k+170 & -9 \le k \le -2 \\ k+167 & 2 \le k \le 9 \\ k+166 & 11 \le k \le 29 \\ k+165 & 31 \le k \le 49 \\ k+164 & 51 \le k \le 69 \\ k+163 & 71 \le k \le 89 \\ k+162 & 91 \le k \le 109 \\ k+161 & 111 \le k \le 129 \\ k+160 & 131 \le k \le 149 \\ k+159 & 151 \le k \le 177 \end{cases}$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The header symbol uses p_n with $n = 1$.

20.5.4 Performance requirements

20.5.4.1 Transmit requirements

20.5.4.1.1 Introduction

This subclause describes the performance requirement from the DMG OFDM mode transmitter.

20.5.4.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc.

The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or an equivalent procedure:

a) Start of frame shall be detected.

b) Transition from short sequences to channel estimation sequences shall be detected, and fine timing (with one sample resolution) shall be established.

c) Frequency offsets shall be estimated and corrected.

d) The frame shall be de-rotated according to estimated frequency offset.

e) The complex channel response coefficients shall be estimated for each of the subcarriers using information contained in the preamble (STF and/or CEF).

f) For each of the OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to estimated phase, and divide each subcarrier value with a complex estimated channel response coefficient.

g) For subcarrier, compute the Euclidean distance to the ideal location for the symbol, or pilot.

h) Compute the RMS average of all errors in a packet. It is given by

$$EVM = 20\log_{10}\left(\frac{1}{N_f}\sum_{i=1}^{N_f}\sqrt{\left(\frac{\sum_{j=1}^{N_{SYM}}\sum_{k\in K}[(I(i,j,k)-I^*(i,j,k))^2+(Q(i,j,k)-Q^*(i,j,k))^2]}{(N_{ST}-N_{DC})N_{SYM}P_0}\right)}\right)$$

where

N_f is the number of frames

i is the frame index

k is the carrier index

K is the set of pilot and data subcarriers {1,2, …, (N_{SR} − 1), (N_{SR} + N_{DC}), (N_{SR}+N_{DC}+1),…, N_{ST}}

j is the symbol index

N_{SYM} is the number of symbols

N_{ST} is the total number of subcarriers

I^*,Q^* is the ideal constellation point for I and Q, respectively

P_0 is the average power of the constellation (I^*,Q^*) computed over the ith frame

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The measurements shall occur only on the OFDM symbols, the measurement shall be performed on at least 10 frames with 16 symbols at least in each of them. Random data shall be used.

The EVM RMS error shall not exceed an MCS dependent value as found in Table 20-16 (DMG OFDM mode EVM requirements).

Table 20-16—DMG OFDM mode EVM requirements

MCS index	Modulation	Coding rate	EVM value [dB]
13	SQPSK	1/2	–7
14	SQPSK	5/8	–9
15	QPSK	1/2	–10
16	QPSK	5/8	–11
17	QPSK	3/4	–13
18	16-QAM	1/2	–15
19	16-QAM	5/8	–17
20	16-QAM	3/4	–19
21	16-QAM	13/16	–20
22	64-QAM	5/8	–22
23	64-QAM	3/4	–24
24	64-QAM	13/16	–26

20.5.4.1.3 Tx flatness

When using the DMG OFDM mode and only while transmitting OFDM symbols, the average energy of the OFDM Symbols constellations in each of the subcarriers with indices –146 to –2 and +2 to +145 shall deviate no more than ± 2 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices –147 to –177 and +147 to +177 shall deviate no more than +2/–4 dB from the average energy of subcarriers with indices –177 to –2 and +2 to +177.

20.5.4.1.4 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is 2640×10^6 sample/s
— FIRST_TRANSITION_FIELD is Short Training field
— SECOND_TRANSITION_FIELD is Channel Estimation field
— TRAINING_FIELD is Channel Estimation field
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

20.5.4.2 Receive requirements

20.5.4.2.1 Introduction

Subclause 20.5.4.2 (Receive requirements) describes the performance requirement for an OFDM receiver.

20.5.4.2.2 CCA

The start of a valid DMG OFDM mode or DMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 1 (–68 dBm) shall cause CCA to indicate busy with a probability >90% within 1 μs.

20.6 DMG SC mode

20.6.1 Introduction

Transmission and reception of DMG SC mode PPDUs is mandatory for selected MCSs.

20.6.2 PPDU format

A SC frame is composed of the Short Training field (STF), the channel estimation field (CE), the Header, SC blocks and optional training fields, as shown in Figure 20-13 (SC frame format).

Figure 20-13—SC frame format

20.6.3 Transmission

20.6.3.1 Header

20.6.3.1.1 General

In the DMG SC mode, the preamble is followed by the header. The header consists of several fields that define the details of the PPDU to be transmitted. The encoding and modulation of the header is described in 20.6.3.1.4 (Header encoding and modulation).

The header fields are described in Table 20-17 (DMG SC mode header fields).

Table 20-17—DMG SC mode header fields

Field name	Number of bits	Start bit	Description
Scrambler Initial-ization	7	0	Bits X1–X7 of the initial scrambler state.
Base MCS	5	7	Modulation and Coding Scheme (see Table 20-19 (DMG SC mode modulation and coding schemes))

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 20-17—DMG SC mode header fields *(continued)*

Field name	Number of bits	Start bit	Description
Length	18	12	If the Extended SC MCS Indication field is 0, indicates the number of data octets in the PSDU; range 1–262 143. If the Extended SC MCS Indication field is 1, the Length field value is set to $Base_Length1 - \lfloor (Base_Length2 - N)/4 \rfloor$, where N is the number of data octets in the PSDU, and *Base_Length1* and *Base_Length2* are computed according to Table 20-18 (Parameters for computing the Length field value in SC header when the Extended SC MCS Indication field is set to 1). The number of data octets in the PSDU shall not exceed 262 143.
Additional PPDU	1	30	Contains a copy of the parameter ADD-PPDU from the TXVECTOR. A value of 1 indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. A value of 0 indicates that no additional PPDU follows this PPDU.
Packet Type	1	31	Corresponds to the TXVECTOR parameter PACKET-TYPE. — Packet Type = 0 (BRP-RX packet, see 20.10.2.2.3 (BRP packet header fields)), indicates either a PPDU whose data part is followed by one or more TRN subfields (when the Beam Tracking Request field is 0 or in DMG control mode), or a PPDU that contains a request for TRN subfields to be appended to a future response PPDU (when the Beam Tracking Request field is 1). — Packet Type = 1 (BRP-TX packet, see 20.10.2.2.3 (BRP packet header fields)), indicates a PPDU whose data part is followed by one or more TRN subfields. The transmitter may change AWV at the beginning of each TRN subfield. The field is reserved when the Training Length field is 0.
Training Length	5	32	Corresponds to the TXVECTOR parameter TRN-LEN. If the Beam Tracking Request field is 0, the Training Length field indicates the length of the training field. The use of this field is defined in 20.10.2.2.3 (BRP packet header fields). A value of 0 indicates that no training field is present in this PPDU. If the Beam Tracking Request field is 1 and the Packet Type field is 1, the Training Length field indicates the length of the training field appended to this PPDU. If the Packet Type field is 0, the Training Length field indicates the length of the training field requested for receive training.
Aggregation	1	37	Set to 1 to indicate that the PPDU in the data portion of the packet contains an A-MPDU; otherwise, set to 0.
Beam Tracking Request	1	38	Corresponds to the TXVECTOR parameter BEAM_TRACKING_REQUEST. Set to 1 to indicate the need for beam tracking (10.38.7 (Beam tracking)); otherwise, set to 0. The Beam Tracking Request field is reserved when the Training Length field is 0.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 20-17—DMG SC mode header fields *(continued)*

Field name	Number of bits	Start bit	Description
Last RSSI	4	39	Contains a copy of the parameter LAST_RSSI from the TXVECTOR. The value is an unsigned integer: Values 2 to 14 represent power levels (–71+value×2) dBm. A value of 15 represents a power greater than or equal to –42 dBm. A value of 1 represents a power less than or equal to –68 dBm. A value of 0 indicates that the previous packet was not received a SIFS before the current transmission.
Turnaround	1	43	As defined in Table 20-1 (TXVECTOR and RXVECTOR parameters).
Extended SC MCS Indication	1	44	The Extended SC MCS Indication field combined with the Base MCS field indicates the MCS. The Extended SC MCS Indication field indicates whether the length field shall be calculated according to Table 20-18 (Parameters for computing the Length field value in SC header when the Extended SC MCS Indication field is set to 1).
Reserved	3	45	
HCS	16	48	Header check sequence

All of the numeric fields are encoded in unsigned binary, least significant bit first.

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

If the Additional PPDU field is equal to 1, the Training Length field shall be set to 0.

When the MCS belongs to the set {9.1, 12.1, 12.2, 12.3, 12.4, 12.5, 12.6}, bits (X7, X6) of the initial scrambler state are set to (*Base_Length2* – *N*) mod 4, where *N* is the number of data octets in the PSDU, and *Base_Length2* is computed according to Table 20-18 (Parameters for computing the Length field value in SC header when the Extended SC MCS Indication field is set to 1). Bits (X1–X5) are selected in a pseudorandom fashion making sure that at least one bit in X1–X7 is nonzero.

X1–X7 are sent in the Scrambler Initialization field, as defined in 20.6.3.1.4 (Header encoding and modulation), and 20.6.3.2.2 (Scrambler).

20.6.3.1.2 Modulation and coding scheme

The modulation and coding scheme defines the modulation and code rate that is used in the PPDU. The modulation and coding schemes for SC are defined in Table 20-19 (DMG SC mode modulation and coding schemes).

Transmit and receive support for MCS 4 and below is mandatory. Other MCSs are optional.

20.6.3.1.3 Generation of the HCS bits

Calculation of the HCS for bits 0–47 of the header is defined in 20.3.7 (HCS calculation for headers of DMG control mode, DMG OFDM mode, and DMG SC mode).

Table 20-18—Parameters for computing the Length field value in SC header when the Extended SC MCS Indication field is set to 1

MCS	*Base_Length1* (See NOTE 1 and 2)	*Base_Length2* (See NOTE 1 and 3)
9.1	$\left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 42$	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 56}{39} \right\rfloor \times 68.25 \right\rfloor$
12.1	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 52.5 \right\rfloor$	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 68.25 \right\rfloor$
12.2	$\left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 63$	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 112}{39} \right\rfloor \times 68.25 \right\rfloor$
12.3	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 68.25 \right\rfloor$	$N_{BLKS} \times 210$
12.4	$\left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 42$	$N_{BLKS} \times 252$
12.5	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 52.5 \right\rfloor$	$N_{BLKS} \times 273$
12.6	$\left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 63$	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 56}{13} \right\rfloor \times 68.25 \right\rfloor$

NOTE 1—N_{BLKS} is the number of symbol blocks defined in 20.6.3.2.3.3 (LDPC encoding process).

NOTE 2—*Base_Length1* is the maximum Length value such that the packet with the base MCS specified in SC header has the given N_{BLKS}.

NOTE 3—*Base_Length2* is the maximum number of data octets in PSDU such that the packet with the extended MCS has the given N_{BLKS}.

20.6.3.1.4 Header encoding and modulation

The header is encoded using a two SC block of N_{SPB} symbols with N_{GI} guard symbols. The bits are scrambled and encoded as follows:

1) The input header bits (B_1, B_2, …, B_{LH}), where LH = 64, are scrambled as described in 20.3.9 (Scrambler), starting from the eighth bit. to create $\mathbf{d_{1s}}=(q_1,q_2,\ldots,q_{LH})$
2) The LDPC codeword $\mathbf{c} = (q_1,q_2,\ldots,q_{LH},0_1,0_2,\ldots,0_{504\text{-}LH},p_1,p_2,\ldots,p_{168})$ is created by concatenating 504-LH zeros to the LH bits of $\mathbf{d_{1s}}$ and then generating the parity bits $p_1,p_2,\ldots,p_{168}$ such that $\mathbf{Hc^T} = \mathbf{0}$, where **H** is the parity check matrix for the rate 3/4 LDPC code specified in 20.6.3.2.3.2 (Parity check matrices).
3) Remove bits LH+1 to 504 and bits 665 to 672 of the codeword **c** to create the sequence $\mathbf{cs1}=(q_1,q_2,\ldots,q_{LH},p_1,p_2,\ldots,p_{160})$.
4) Remove bits LH+1 to 504 and bits 657 to 664 of the codeword **c** to create the sequence $\mathbf{cs2} = (q_1,q_2,\ldots,q_{LH},p_1,p_2,\ldots,p_{152},p_{161},p_{162},\ldots,p_{168})$ and then XOR with a PN sequence that is generated from the LFSR used for data scramblings defined in 20.3.9 (Scrambler). The LFSR is initialized to the all 1s vector.

This is an unapproved IEEE Standards Draft, subject to change.

Table 20-19—DMG SC mode modulation and coding schemes

MCS	Base MCS field	Extended SC MCS Indication field	Modulation	N_{CBPS}	Repetition	Code rate	Data rate (Mb/s)
1	1	0	π/2-BPSK	1	2	1/2	385
2	2	0	π/2-BPSK	1	1	1/2	770
3	3	0	π/2-BPSK	1	1	5/8	962.5
4	4	0	π/2-BPSK	1	1	3/4	1155
5	5	0	π/2-BPSK	1	1	13/16	1251.25
6	6	0	π/2-QPSK	2	1	1/2	1540
7	7	0	π/2-QPSK	2	1	5/8	1925
8	8	0	π/2-QPSK	2	1	3/4	2310
9	9	0	π/2-QPSK	2	1	13/16	2502.5
9.1	6	1	π/2-QPSK	2	1	7/8	2695
10	10	0	π/2-16-QAM	4	1	1/2	3080
11	11	0	π/2-16-QAM	4	1	5/8	3850
12	12	0	π/2-16-QAM	4	1	3/4	4620
12.1	7	1	π/2-16-QAM	4	1	13/16	5005
12.2	8	1	π/2-16-QAM	4	1	7/8	5390
12.3	9	1	π/2-64-QAM	6	1	5/8	5775
12.4	10	1	π/2-64-QAM	6	1	3/4	6390
12.5	11	1	π/2-64-QAM	6	1	13/16	7507.5
12.6	12	1	π/2-64-QAM	6	1	7/8	8085

5) **cs1** and **cs2** are concatenated to form the sequence (**cs1**, **cs2**). The resulting 448 bits are then mapped as π/2-BPSK as described in 20.6.3.2.4.2 (π/2-BPSK modulation). The N_{GI} guard symbols are then prepended to the resulting N_{CBPB} symbols as described in 20.6.3.2.5 (Symbol blocking and guard insertion).

The same resulting N_{CBPB} symbols are multiplied by -1 and repeated, and then prepended with N_{GI} guard symbols as described in 20.6.3.2.5 (Symbol blocking and guard insertion). The resulting sequence is then appended after the sequence created in step 5).

20.6.3.2 Data field

20.6.3.2.1 General

The data field consists of the payload data of the PSDU and possible padding. The data are padded with zeros, scrambled, encoded and modulated as described in the following subclauses. The amount of padding is defined in 20.6.3.2.3 (Encoding).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

20.6.3.2.2 Scrambler

The operation of the scrambler is defined in 20.3.9 (Scrambler). The scrambling of the PSDU continues the scrambling of the header with no reset of the scrambler.

20.6.3.2.3 Encoding

20.6.3.2.3.1 General

The data are encoded by a systematic LDPC encoder. The LDPC is a block code. Each block of information bits $(B_1, B_2,...,B_k)$ is concatenated with a block of parity bits $(p_1,p_2,....,p_{n-k})$ to create a codeword $\boldsymbol{c}=(B_1, B_2,...,B_k,p_1,p_2,....,p_{n-k})$ such that $\mathbf{Hc}^{\mathbf{T}}=\mathbf{0}$, where $\mathbf{H}$ is the $(n-k)\times n$ parity check matrix. The block size n is 672 bits. The code rate, R, is equal to k/n. The set of code rates is defined in Table 20-20 (LDPC code rates). The parity check matrices are defined in 20.6.3.2.3.2 (Parity check matrices). The encoding process is defined in 20.6.3.2.3.3 (LDPC encoding process).

Table 20-20—LDPC code rates

Code rate	Codeword size	Number of data bits
1/2	672	336
5/8	672	420
3/4	672	504
13/16	672	546
7/8	624	546

20.6.3.2.3.2 Parity check matrices

See 20.3.8 (Common LDPC parity matrices).

20.6.3.2.3.3 LDPC encoding process

The LDPC encoding process is composed of several steps that includes deciding the number of shortening/ repetition bits in every codeword, the shortening itself, the coding of each word and then any repetition of bits.

a) First the total number of data pad bits N_{DATA_PAD} is calculated, using the number of LDPC codewords N_{CW}:

$$N_{CW} = \left\lceil \frac{Length \cdot 8}{\frac{L_{CW}}{\rho} \cdot R} \right\rceil$$

if BRP packet and $N_{CW} < N_{CWmin}$; $N_{CW} = N_{CWmin}$

$$N_{DATA_PAD} = N_{CW} \cdot \frac{L_{CW}}{\rho} \cdot R - Length \cdot 8$$

where

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

L_{CW}	is the LDPC codeword length, which is 624 for code rate R=7/8, 672 for all other code rates
Length	is the length of the PSDU defined in the header field (in octets)
ρ	is the repetition factor (1 or 2)
R	is the code rate
N_{CWmin}	is defined for BRP packets in Table 20-24 (Zero filling for DMG SC mode BRP packets).

The scrambled PSDU is concatenated with N_{DATA_PAD} zeros. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU input bits.

b) The procedure for converting the scrambled PSDU data to LDPC codewords depends on the repetition factor.

1) If ρ = 1 and the code rate is not 7/8,

i) The output stream of the scrambler is broken into blocks of $L_{CWD} = L_{CW} \times R$ bits such that the mth data word is $(b_1^{(m)}, b_2^{(m)}, \ldots b_{L_{CWD}}^{(m)})$, $m \le N_{CW}$.

ii) To each data word, $n\text{-}k = L_{CW} - R \times L_{CW}$ parity bits $(p_1^{(m)}, p_2^{(m)}, \ldots, p_{n-k}^{(m)})$ are added to create the codeword $\mathrm{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{L_{CWD}}^{(m)}, p_1^{(m)}, \ldots p_{n-k}^{(m)})$ such that $\mathbf{H}\boldsymbol{c}^{(m)^{\mathrm{T}}} = 0$

2) If ρ = 1 and the code rate is 7/8, 48 bits are punctured from the parity bits of the rate 13/16 parity bits:

i) The output stream of the scrambler is broken into blocks of 546 bits such that the mth data word is $(b_1^{(m)}, b_2^{(m)}, \ldots, b_{546}^{(m)})$, $m \le N_{CW}$.

ii) To each data word, 126 parity bits $(p_1^{(m)}, p_2^{(m)}, \ldots, p_{126}^{(m)})$ are added to create the code word $\tilde{\boldsymbol{c}}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{546}^{(m)}, p_1^{(m)}, \ldots p_{126}^{(m)})$ such that $\boldsymbol{H}\tilde{\boldsymbol{c}}^{(m)^{\mathrm{T}}} = \mathbf{0}$. The code word $\boldsymbol{c}^{(m)}$ is generated from $\tilde{\boldsymbol{c}}^{(m)}$ by removing the first 48 parity bits so that $\boldsymbol{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{546}^{(m)}, p_{49}^{(m)}, p_{50}^{(m)}, \ldots p_{126}^{(m)})$

3) If ρ = 2,

i) The data bits in each codeword $(b_1, b_2, \ldots, b_{L_Z})$ where $L_Z = L_{CW}/2\rho$ are concatenated with $L_{CW}/2\rho$ zeros to produce a sequence of length of $2L_Z$ $(b_1, b_2, \ldots, b_{L_Z}, 0_1, 0_2, \ldots, 0_{L_Z})$.

ii) The LDPC codeword $\mathbf{c} = (b_1, b_2, \ldots, b_{L_Z}, 0_1, 0_2, \ldots, 0_{L_Z}, p_1, p_2, \ldots, p_{336})$ is created by generating the parity bits $p_1, p_2, \ldots, p_{336}$ such that $\mathbf{H}\mathbf{c}^{\boldsymbol{T}} = \mathbf{0}$, where **H** is the parity matrix for rate 1/2 LDPC coding specified in 20.3.8 (Common LDPC parity matrices).

iii) Replace bits $L_Z + 1$ to 336 of the codeword **c** with bits from the sequence $b_1, b_2, \ldots, b_{L_Z}$ XORed by a PN sequence that is generated from the LFSR used for data scrambling as defined in 20.3.9 (Scrambler). The LFSR is initialized to the all 1s vector and reinitialized to the same vector after every codeword.

c) The codewords are then concatenated one after the other to create the coded bits stream $(c_1, c_2, \ldots, c_{L_{CW} \cdot N_{CW}})$.

d) The number of symbol blocks, N_{BLKS}, and the number of symbol block padding bits, N_{BLK_PAD}, are calculated:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$N_{BLKS} = \left\lceil \frac{N_{CW} \cdot L_{CW}}{N_{CBPB}} \right\rceil$$

$$N_{BLK_PAD} = N_{BLKS} \cdot N_{CBPB} - N_{CW} \cdot L_{CW}$$

where N_{CBPB} is the number of coded bits per symbol block, per Table 20-21 (Values of NCBPB) in 20.6.3.2.5 (Symbol blocking and guard insertion).

e) The coded bit stream is concatenated with N_{BLK_PAD} zeros. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU input bits.

20.6.3.2.4 Modulation mapping

20.6.3.2.4.1 General

The coded and padded bit stream is converted into a stream of complex constellation points according to the modulation specified in the MCS table.

20.6.3.2.4.2 π/2-BPSK modulation

In π/2-BPSK modulation, the input bit stream is mapped according to the following equation: $\tilde{s}_k = 2 \cdot c_k - 1$, where c_k is the kth input coded (or scrambled pad) bit. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j\pi k/2}$.

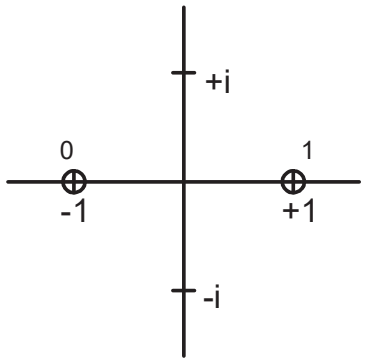

Figure 20-14—BPSK constellation bit encoding

NOTE—With appropriate choice of transmit filtering, π/2-BPSK is equivalent to a precoded pulse-shaped MSK (e.g., GMSK). The precoder is simply $b_{out,k} = b_{in,k} \oplus b_{in,k-1}$, $k = 0, 1, \ldots$, where $b_{in,k}$ is the scrambled input stream, $b_{in,-1}$ is 0, $b_{out,k}$ is the input to the (G)MSK modulator.

20.6.3.2.4.3 π/2-QPSK modulation

In π/2-QPSK modulation, the input bit stream is grouped into sets of 2 bits and mapped according to the following equation: $\tilde{s}_k = \frac{1}{\sqrt{2}}((2c_{2k} - 1) + j(2c_{2k+1} - 1)) \exp\left(-j\frac{\pi}{4}\right)$, where k is the output symbol index, k = 0, 1, …. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j\pi k/2}$.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

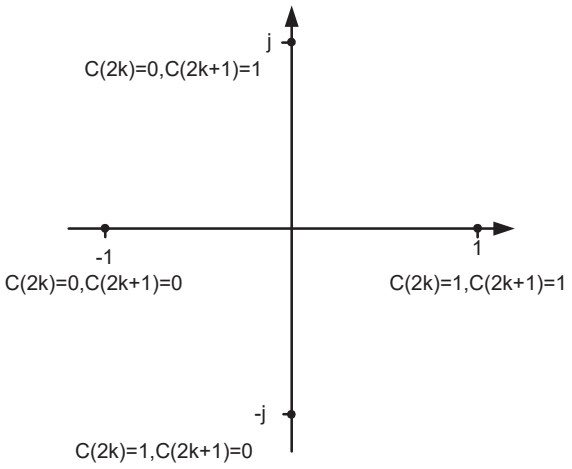

Figure 20-15—QPSK constellation bit encoding

20.6.3.2.4.4 π/2-16-QAM modulation

In π/2-16-QAM modulation, the input bit stream is grouped into sets of 4 bits and mapped according to the following equation:

$$\tilde{s}_k = \frac{1}{\sqrt{10}}\{(4c_{4k}-2)-(2c_{4k}-1)(2c_{4k+1}-1)+j(4c_{4k+2}-2)-j(2c_{4k+2}-1)(2c_{4k+3}-1)\}$$

where k is the output symbol index, k =0, 1, …. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j \cdot \pi \cdot k/2}$. The constellation bit encoding is depicted in Figure 20-16 (16-QAM constellation bit encoding).

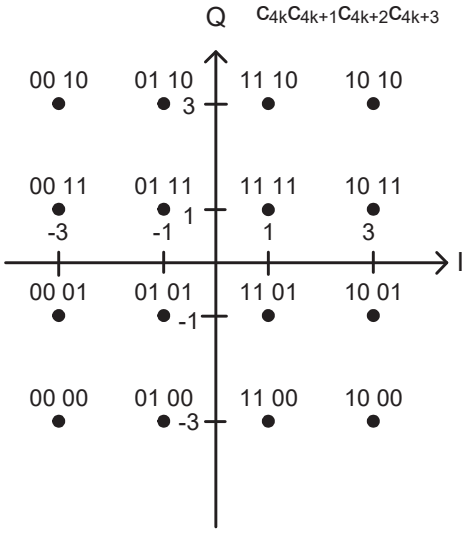

Figure 20-16—16-QAM constellation bit encoding

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

20.6.3.2.4.5 π/2-64-QAM modulation

In π/2-64-QAM modulation, the input bit stream is grouped in sets of 6 bits and mapped according to the following equation:

$$\tilde{s}_k =$$

$$\frac{1}{\sqrt{42}}((8c_{6k}-4)-(2c_{6k}-1)(4c_{6k+1}-2)+(2c_{6k}-1)(2c_{6k+1}-1)(2c_{6k+2}-1))+$$

$$\frac{j}{\sqrt{42}}((8c_{6k+3}-4)-(2c_{6k+3}-1)(4c_{6k+4}-2)+(2c_{6k+3}-1)(2c_{6k+4}-1)(2c_{6k+5}-1))$$

where k is the output symbol index, k=0,1, …. Each output symbol is then rotated according to the following equation $s_k = \tilde{s}_k \cdot e^{\frac{j\pi k}{2}}$. The constellation bit encoding is depicted in Figure 20-17 (64-QAM constellation bit encoding).

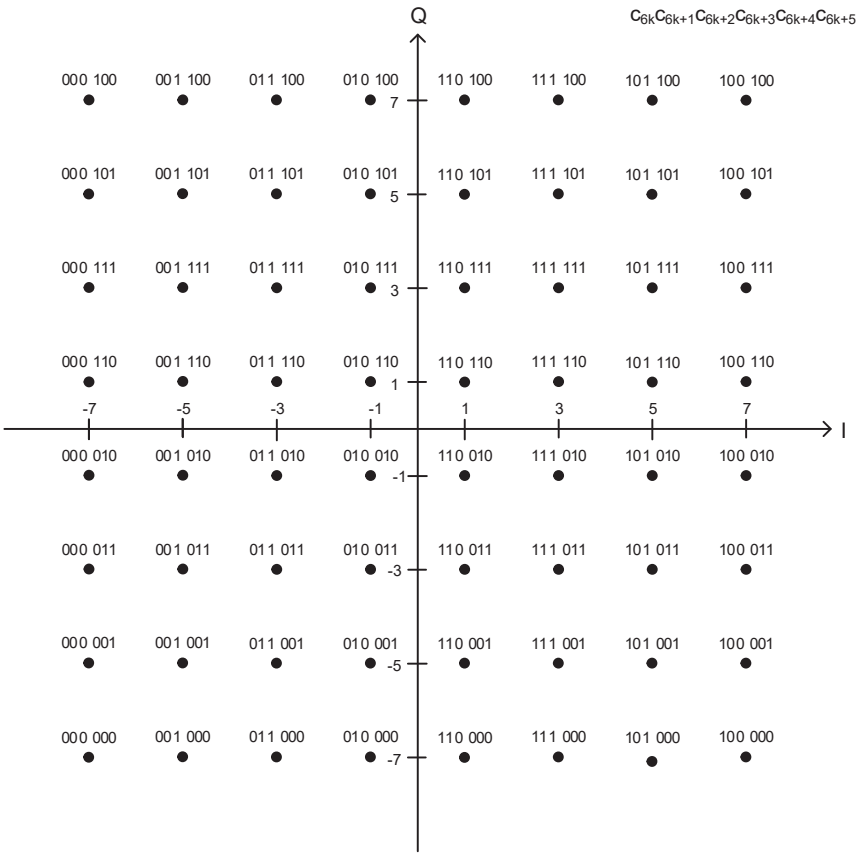

Figure 20-17—64-QAM constellation bit encoding

20.6.3.2.5 Symbol blocking and guard insertion

Each group of N_{CBPB} bits is pre-pended by π/2-BPSK symbols generated by the 64 point Golay sequence Ga_{64} defined in 20.11 (Golay sequences). N_{CBPB} values are shown in Table 20-21 (Values of NCBPB). The starting index for the first symbol for π/2 rotation is 0.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 20-21—Values of N_{CBPB}

Symbol mapping	N_{CBPB}
π/2-BPSK	448
π/2-QPSK	896
π/2-16-QAM	1792
π/2-64-QAM	2688

If the Additional PPDU field within the PHY header is equal to 0, the final block transmitted is followed by the same Golay sequence guard interval. If the Additional PPDU field within the PHY header is equal to 1, the final block transmitted of the last PPDU in an A-PPDU is followed by the same Golay sequence guard interval.

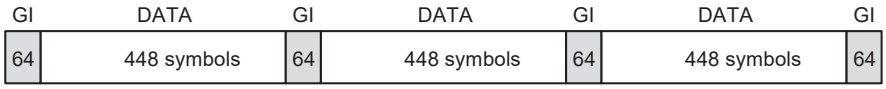

Figure 20-18—Block transmission

20.6.4 Performance requirements

20.6.4.1 Transmit requirements

20.6.4.1.1 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc.

The instrumentation shall perform carrier lock, symbol timing recovery and amplitude adjustment and equalization while making the measurements. The equalizer shall be trained using information in the SC preamble (STF and/or CEF). For the DMG SC mode EVM, measuring Ns samples at the sample rate, the measured symbols should not contain the first and the last hundred symbols of a given packet (ramp up/down). The EVM is calculated according to the formula below:

$$EVM = 20\log_{10}\left(\sqrt{\left(\frac{1}{N_s P_{avg}}\sum_{i=1}^{N_s}\left[(I_i - I_i^* - I_0)^2 + (Q_i - Q_i^* - Q_0)^2\right]\right)}\right)$$

where N_s is the number of samples to be measured and N_s shall be 1000, P_{avg} is the average power of the constellation, (I_i, Q_i) is the complex coordinates of the measured symbol i, (I_i^*, Q_i^*) is the complex coordinates of the ideal constellation point for the measured symbol i, and (I_o, Q_o) is the complex DC term chosen to minimize EVM.

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The relative constellation error (EVM) shall not exceed an MCS dependent value according to Table 20-22 (DMG SC mode EVM requirements).

Table 20-22—DMG SC mode EVM requirements

MCS	Modulation	Coding rate	EVM value [dB]
1	π/2-BPSK	1/2 with repetition	–6
2	π/2-BPSK	1/2	–7
3	π/2-BPSK	5/8	–9
4	π/2-BPSK	3/4	–10
5	π/2-BPSK	13/16	–12
6	π/2-QPSK	1/2	–11
7	π/2-QPSK	5/8	–12
8	π/2-QPSK	3/4	–13
9	π/2-QPSK	13/16	–15
9.1	π/2-QPSK	7/8	–16
10	π/2-16-QAM	1/2	–19
11	π/2-16-QAM	5/8	–20
12	π/2-16-QAM	3/4	–21
12.1	π/2-16-QAM	13/16	–22
12.2	π/2-16-QAM	7/8	–23
12.3	π/2-64-QAM	5/8	–26
12.4	π/2-64-QAM	3/4	–27
12.5	π/2-64-QAM	13/16	–29
12.6	π/2-64-QAM	7/8	–31

20.6.4.1.2 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

- MULTICHANNEL_SAMPLING_RATE is 1760×10^6 sample/s
- FIRST_TRANSITION_FIELD is Short Training field
- SECOND_TRANSITION_FIELD is Channel Estimation field
- TRAINING_FIELD is Channel Estimation field
- TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

20.6.4.2 Receive requirements

20.6.4.2.1 Introduction

This subclause describes the receiver requirements of the DMG SC mode.

20.6.4.2.2 CCA

The start of a valid DMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 1 (–68 dBm) shall cause CCA to indicate busy with a probability > 90% within 1 μs. The receiver shall hold the carrier sense signal busy for any signal 20 dB above the minimum sensitivity for MCS 1.

20.7 DMG low-power SC mode

20.7.1 Introduction

The DMG low-power SC mode is an optional SC mode that can provide lower processing power requirements for DMG transceivers.

20.7.2 Transmission

20.7.2.1 Preamble

The DMG low-power SC mode uses the same preamble as the DMG SC mode.

20.7.2.2 Header

20.7.2.2.1 General

The DMG low-power SC mode header fields are the same fields as in the DMG SC mode (see Table 20-17 (DMG SC mode header fields) in 20.6.3.1 (Header)).

The DMG low-power SC mode modulation and coding schemes are listed in Table 20-23 (DMG low-power SC mode modulation and coding schemes).

Table 20-23—DMG low-power SC mode modulation and coding schemes

MCS	Modulation	Effective code rate	Coding scheme	N_{CPB}	Rate (Mb/s)
25	π/2-BPSK	13/28	RS(224,208)+Block-Code(16,8)	392	626
26	π/2-BPSK	13/21	RS(224,208)+Block-Code(12,8)	392	834
27	π/2-BPSK	52/63	RS(224,208)+SPC(9,8)	392	1112
28	π/2-QPSK	13/28	RS(224,208)+Block-Code(16,8)	392	1251
29	π/2-QPSK	13/21	RS(224,208)+Block-Code(12,8)	392	1668
30	π/2-QPSK	52/63	RS(224,208)+SPC(9,8)	392	2224

20.7.2.2.2 Header encoding and modulation

The DMG low-power SC mode header is encoded and modulated as defined in 20.6.3.1.4 (Header encoding and modulation).

20.7.2.3 Data field

20.7.2.3.1 General

The data field consists of the payload data of the PSDU and possible padding. The data are padded with zeros, scrambled, encoded and modulated as described in the following subclauses.

20.7.2.3.2 Scrambler

The operation of the scrambler is defined in 20.3.9 (Scrambler). The scrambling of the PSDU continues the scrambling of the header with no reset of the scrambler. The padding bits are also scrambled.

20.7.2.3.3 Encoding

20.7.2.3.3.1 General

Data is encoded using an outer RS(224,208) block code and a short inner code. The inner code is a (16,8) block code for MCSs 25 and 28, a (12,8) block code for MCSs 26 and 29, and a (9,8) single parity check (SPC) block code for MCSs 27 and 30 and the identity block-code for MCS 31. The encoding is further detailed in the following steps:

1) First, the number of block padding bits is calculated:

   a)The total number of Reed Solomon codewords is $N_{RS} = \lceil (Length)/208 \rceil$ and the total number of RS encoded symbols is given by $Length + N_{RS} \times 16$;

   b)After Reed Solomon encoding, the data is encoded with a short block code (N,8) where N can take one of the following values 8, 9, 12, or 16 depending on the MCS as shown in Table 20-23 (DMG low-power SC mode modulation and coding schemes). Therefore:

      i) The total number of encoded bits is $N_{EB} = N \times (Length + N_{RS} \times 16)$;

      ii) The total number of 512 (in length) blocks (each containing 392 data symbols) is $N_{BLKS} = \lceil N_{EB}/(N_{CBPS} \times 392) \rceil$. If BRP packet and $N_{BLKS} < N_{BLKS_MIN}$; $N_{BLKS} = N_{BLKS_MIN}$, where $N_{BLKS_MIN} = 18$. The total number of zero block padding bits is $N_{BLK_PAD} = N_{BLKS} \times N_{CBPS} \times 392 - N_{EB}$.

2) The data is broken into blocks of length 208×8 bits (except for possibly the last block).

3) Each block is encoded using the RS(224,208) block code as described in 20.7.2.3.3.2 (RS encoding), except perhaps the last block, which is encoded by a shortened version of the code (i.e., if the last block length is K, the shortened block code is RS(16+K,K).

4) The Reed Solomon encoded data stream is further encoded using the block code(N,8) as described in 20.7.2.3.3.3 ((N,8) Block-coding).

5) The coded bit stream is concatenated with N_{BLK_PAD} zeros. They are scrambled with the continuation of the scrambler sequence that scrambled the PSDU input bits.

6) Each set of 7 octets is interleaved using a uniform interleaver of 7 rows and 8 columns. The 7 octets are written row wise and read column wise, i.e., the index i of a bit after interleaving is related to the

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

index k of a bit before interleaving by the following rule:

$i = 8 \times (k \bmod 7) + \lfloor k/7 \rfloor$, $k = 0, 1, \ldots, 55$.

7) The resulting bit stream is modulated and then blocked as described in 20.7.2.3.4 (Modulation) and 20.7.2.3.5 (Blocking).

20.7.2.3.3.2 RS encoding

The RS block code is based on the polynomial

$$g(x) = \prod_{k=1}^{16} (x + a^k)$$

where $a = 0x02$ is a root of the primitive polynomial $p(x) = 1 + x^2 + x^3 + x^4 + x^8$. We assume that an octet $b_0 b_1 b_2 b_3 b_4 b_5 b_6 b_7$ (b_0 is the LSB) represented by the polynomial

$M = b_7 x^7 + b_6 x^6 + b_5 x^5 + b_4 x^4 + b_3 x^3 + b_2 x^2 + b_1 x + b_0$.

The RS is a systematic block code. Given a block of octets $\mathbf{m} = (m_{M-1}, m_{M-2}, \ldots m_0)$, the additional parity octets $\mathbf{r} = (r_{15}, r_{14}, \ldots r_0)$ are calculated by setting $r = x^{16}\mathbf{m}(x) \bmod g(x)$, where $\mathbf{r}(x) = \sum_{k=0}^{15} r_k x^k$ and $\mathbf{m}(x) = \sum_{k=0}^{M-1} m_k x^k$ and where the calculation is performed over $GF(2^8)$. The parity octets $\mathbf{r}$ are appended to the uncoded block $\mathbf{m}$ to generate the encoded RS block $m_{M-1}, m_{M-2}, \ldots m_0, r_{15}, r_{14}, \ldots, r_0$.

20.7.2.3.3.3 (N,8) Block-coding

Every octet $\mathbf{b}_{1\times 8} = [b_0 b_1 b_2 b_3 b_4 b_5 b_6 b_7]$ is encoded into an N-bit codeword $\mathbf{c}_{1\times N} = \left[\mathbf{b}_{1\times 8} \; \mathbf{p}_{1\times(N-8)} \right]$ such that $\mathbf{c}_{1\times N} = \mathbf{b}_{1\times 8}\mathbf{G}_{8\times N}$, where the generator matrix $\mathbf{G}_{8\times N}$ is given by the following expressions for $N = 8, 9, 12,$ *and* 16, respectively:

G_{8x8} is the identity matrix.

$$\mathbf{G}_{8\times 9} = \begin{bmatrix} 1&0&0&0&0&0&0&0&1 \\ 0&1&0&0&0&0&0&0&1 \\ 0&0&1&0&0&0&0&0&1 \\ 0&0&0&1&0&0&0&0&1 \\ 0&0&0&0&1&0&0&0&1 \\ 0&0&0&0&0&1&0&0&1 \\ 0&0&0&0&0&0&1&0&1 \\ 0&0&0&0&0&0&0&1&1 \end{bmatrix}$$

$$\mathbf{G}_{8\times 12} = \begin{bmatrix} 1&0&0&0&0&0&0&0&1&1&0&0 \\ 0&1&0&0&0&0&0&0&1&0&1&0 \\ 0&0&1&0&0&0&0&0&0&1&0&1 \\ 0&0&0&1&0&0&0&0&0&0&1&1 \\ 0&0&0&0&1&0&0&0&1&0&1&1 \\ 0&0&0&0&0&1&0&0&1&1&0&1 \\ 0&0&0&0&0&0&1&0&1&1&1&0 \\ 0&0&0&0&0&0&0&1&0&1&1&1 \end{bmatrix}$$

$$\mathbf{G}_{8\times 16} = \begin{bmatrix} 1&0&0&0&0&0&0&0&0&1&1&0&1&0&1&0 \\ 0&1&0&0&0&0&0&0&0&0&1&1&0&1&0&1 \\ 0&0&1&0&0&0&0&0&1&0&0&1&1&0&1&0 \\ 0&0&0&1&0&0&0&0&0&1&0&0&1&1&0&1 \\ 0&0&0&0&1&0&0&0&1&0&1&0&0&1&1&0 \\ 0&0&0&0&0&1&0&0&0&1&0&1&0&0&1&1 \\ 0&0&0&0&0&0&1&0&1&0&1&0&1&0&0&1 \\ 0&0&0&0&0&0&0&1&1&1&0&1&0&1&0&0 \end{bmatrix}$$

20.7.2.3.4 Modulation

The same π/2-BPSK described in 20.6.3.2.4.2 (π/2-BPSK modulation) and π/2-QPSK described in 20.6.3.2.4.2 (π/2-BPSK modulation) are used in the DMG low-power SC mode.

20.7.2.3.5 Blocking

The blocking for the low-power SC is illustrated in Figure 20-19 (Blocking for DMG low-power SC mode). The data is partitioned into blocks of length 512 wherein each 512-block is constructed from 8 subblocks. Each subblock is of length 64. The first subblock is a G_{64}, which is the π/2-BPSK symbols sequence generated by the 64 point Golay sequence Ga_{64} defined in 20.11 (Golay sequences). The starting index for the first symbol π/2 rotation is 0, and subblocks 2 to 8 are constructed in the same way, i.e., a data portion of 56 symbols followed by a guard interval of 8 symbols. Note that each 512-block carries 392 symbols of data and 120 symbols of guard.

If the Additional PPDU field within the PHY header is equal to 0, the final block transmitted is followed by Ga_{64}. If the Additional PPDU field within the PHY header is equal to 1, the final block transmitted of the last PPDU in an A-PPDU is followed by Ga_{64}.

The G_8 guard interval is a copy of the last 8 samples of Ga_{64}.

This is an unapproved IEEE Standards Draft, subject to change.

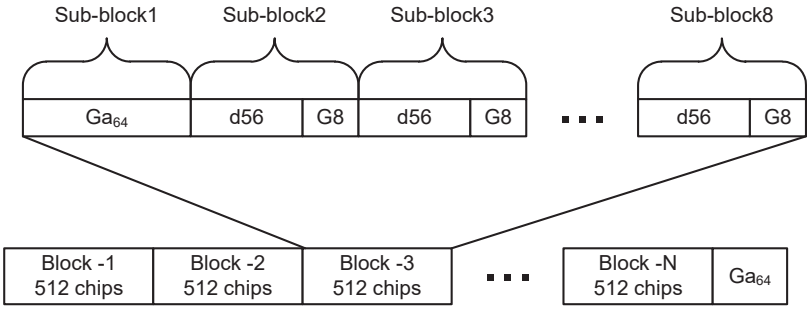

Figure 20-19—Blocking for DMG low-power SC mode

NOTE—A STA might estimate the channel impulse response from the CEF, and decides whether to equalize using the 512-block or the short 64-subblock. For example, if the channel impulse response energy is almost concentrated in 8 taps, a 64-equalizer can be used; otherwise, a 512-equalizer is used.

20.8 PHY transmit procedure

The PHY transmit procedure is shown in Figure 20-20 (PHY transmit procedure). In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 20.12 (DMG PLME). Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 20.2.2 (TXVECTOR and RXVECTOR parameters).

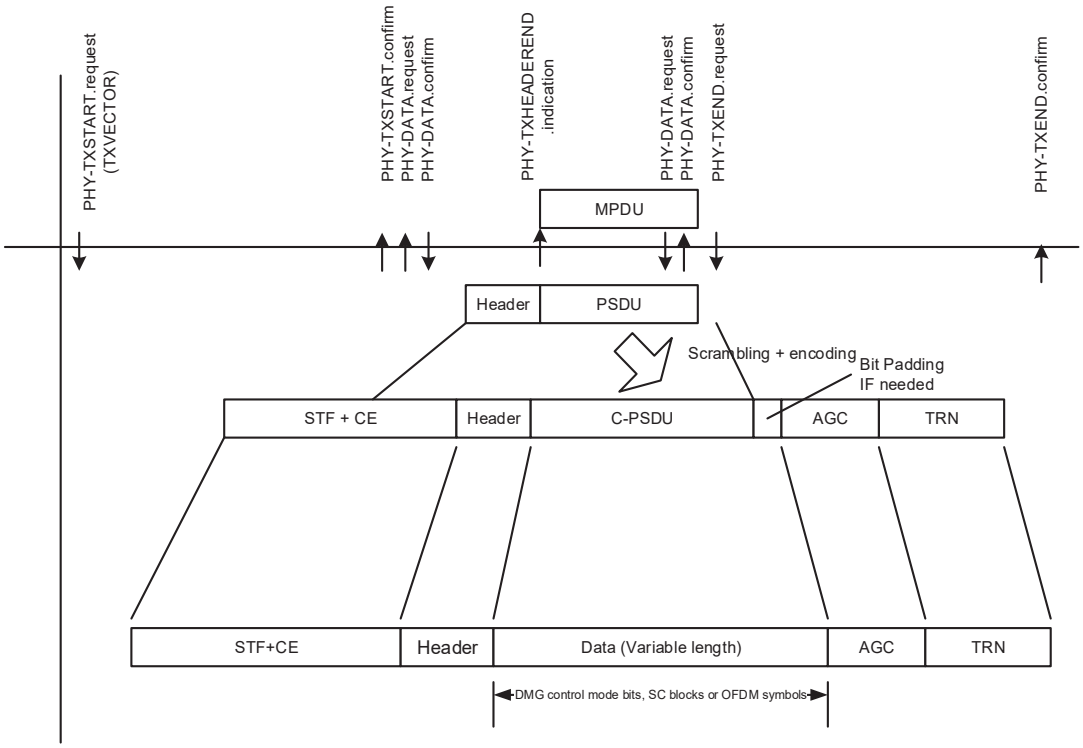

Figure 20-20—PHY transmit procedure

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

The preamble format (control, SC or OFDM mode) depend on the MCS in the PHY-TXSTART.request. The PHY shall calculate the length of the packet according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the encoding and transmission of the header according to the parameters of the PHY-TXSTART.request(TXVECTOR) primitive. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are encoded as described in 20.4.3.2.3 (Header encoding and modulation), 20.5.3.2.3 (Encoding), and 20.6.3.2.3 (Encoding). The encoded data are then modulated as described in 20.4 (DMG control mode), 20.5 (DMG OFDM mode), 20.6 (DMG SC mode), and 20.7 (DMG low-power SC mode), depending on the MCS requested in the PHY-TXSTART.request primitive. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by receiving a PHY-TXEND.request primitive.

Transmission of the PSDU is completed with the transmission of the last bits of the (encoded) PSDU. If no TRN-T/R fields are specified in the PHY-TXSTART.request primitive, the PHY shall issue a PHY-TXEND.confirm primitive after the transmission of the last bits. If TRN units are requested in the PHY-TXSTART.request primitive, the transmission continues with the transmission of AGC subfields and TRN units. The PHY issues the PHY-TXEND.confirm primitive to the MAC after the transmission of the last TRN unit. The packet transmission shall be completed, and the PHY entity shall enter the receive state (i.e., PHY-TXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.

A typical transmit state machine is shown in Figure 20-21 (Typical Tx state machine (Training Length = 0 is assumed; some optional features such as DMG SC low-power mode are not shown)).

20.9 PHY receive procedure

A typical PHY receive procedure is shown in Figure 20-22 (PHY receive procedure).

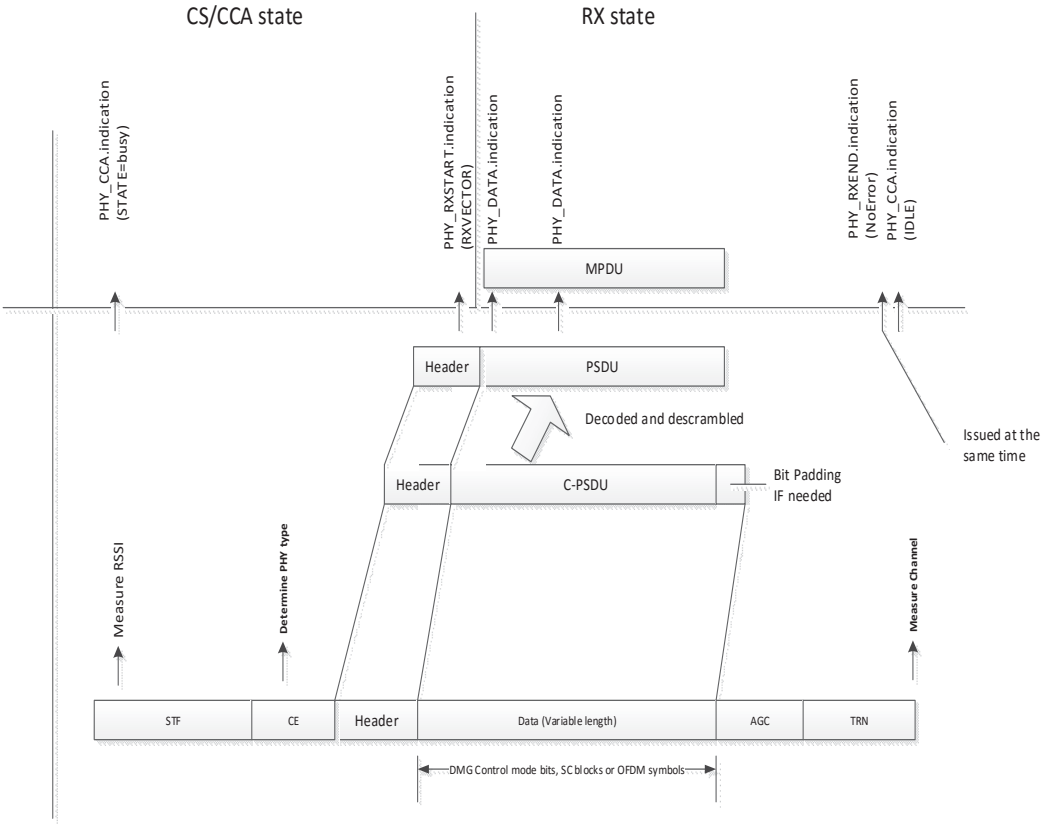

Figure 20-22—PHY receive procedure

Upon receiving the STF, the PHY measures signal strength. This activity is indicated by the PHY to the MAC by issuing a PHY-CCA.indication(BUSY) primitive.

After the PHY-CCA.indication(BUSY) primitive is issued, the PHY entity shall search for the CE field and begin receiving the CE field. The PHY demodulates the header according to the PHY type determined the reception of the CE field. If the CE field indicated a SC mode, the receiver is capable of receiving low-power SC mode, and dot11LowPowerSCPHYActivated is true, then the PHY shall attempt to demodulate both a SC header and an SC low-power header. The PHY shall decode the header and determine the MCS, length and other parameters needed for the demodulation of the packet.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 20.2.2 (TXVECTOR and RXVECTOR parameters)).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.57 (Timing measurement) in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

At the end of the data portion of a packet that has the Training Length field in the PHY header equal to 0, the PHY shall issue a PHY-RXEND.indication(No_Error) primitive to the MAC. If the Training Length field in the PHY header is greater than 0, the PHY shall continue to receive these training fields after the data

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

portion of the packet and measure the channel. After the end of the training fields, the PHY shall generate a PHY-CCA.indication(IDLE) primitive and the PHY-RXEND.indication(NoError) primitive.

In the case of signal loss before the decoding of the header or in the case of an invalid header, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below a value that is 20 dB higher than the receive sensitivity of MCS 1. In the case of signal loss after decoding of a valid header, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the expected end of the packet, including AGC and TRN fields.

A typical receive state machine is shown in Figure 20-23 (Typical Rx state machine (some optional features such as DMG low-power SC mode are not shown)).

20.10 Beamforming

20.10.1 Beamforming concept

Beamforming enables a pair of STAs to train their transmit and receive antennas for subsequent communication. A beamformed link is established following the successful completion of BF training, which is described in 10.38 (DMG beamforming).

DMG STAs use a quasi-omni antenna pattern. The antenna gain of the main beam of a quasi-omni antenna pattern shall be at most 15 dB lower than the antenna gain in the main beam for a directional pattern.

20.10.2 Beamforming frame format

20.10.2.1 Sector-level sweep

PPDUs transmitted during transmit sector sweep are DMG control mode PPDUs. PPDUs transmitted during receive sector sweep are DMG control mode or DMG SC mode PPDUs.

20.10.2.2 Beam refinement

20.10.2.2.1 General

Beam refinement is a process where a STA can improve its antenna configuration (or antenna weight vectors) both for transmission and reception. If the SLS beamforming training did not include an RSS, as in the case where both devices have more than one transmit sector per antenna, beam refinement can serve as the first receive antenna configuration training. The procedure of beam refinement is described in 10.38.6.4 (BRP phase execution).

In the beam refinement procedure, BRP packets are used to train the receiver and transmitter antenna. There are two types of BRP packets: BRP-RX packets and BRP-TX packets:

— BRP-RX packets are packets that have TRN training subfields appended to them. These packets enable receiver antenna weight vector training.

— BRP-TX packets are packets that have TRN training subfields appended to them. The transmitting STA may change antenna configuration at the beginning of each subfield. The receiving STA performs measurements on these subfields and sends feedback to the STA that transmits the BRP-TX packet.

20.10.2.2.2 BRP packet structure

The TRN-LEN parameter in the TVXVECTOR or RXVECTOR of a BRP packet shall be greater than zero. If the PACKET-TYPE parameter in the RXVECTOR or TXVECTOR is equal to TRN-R-PACKET, then

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

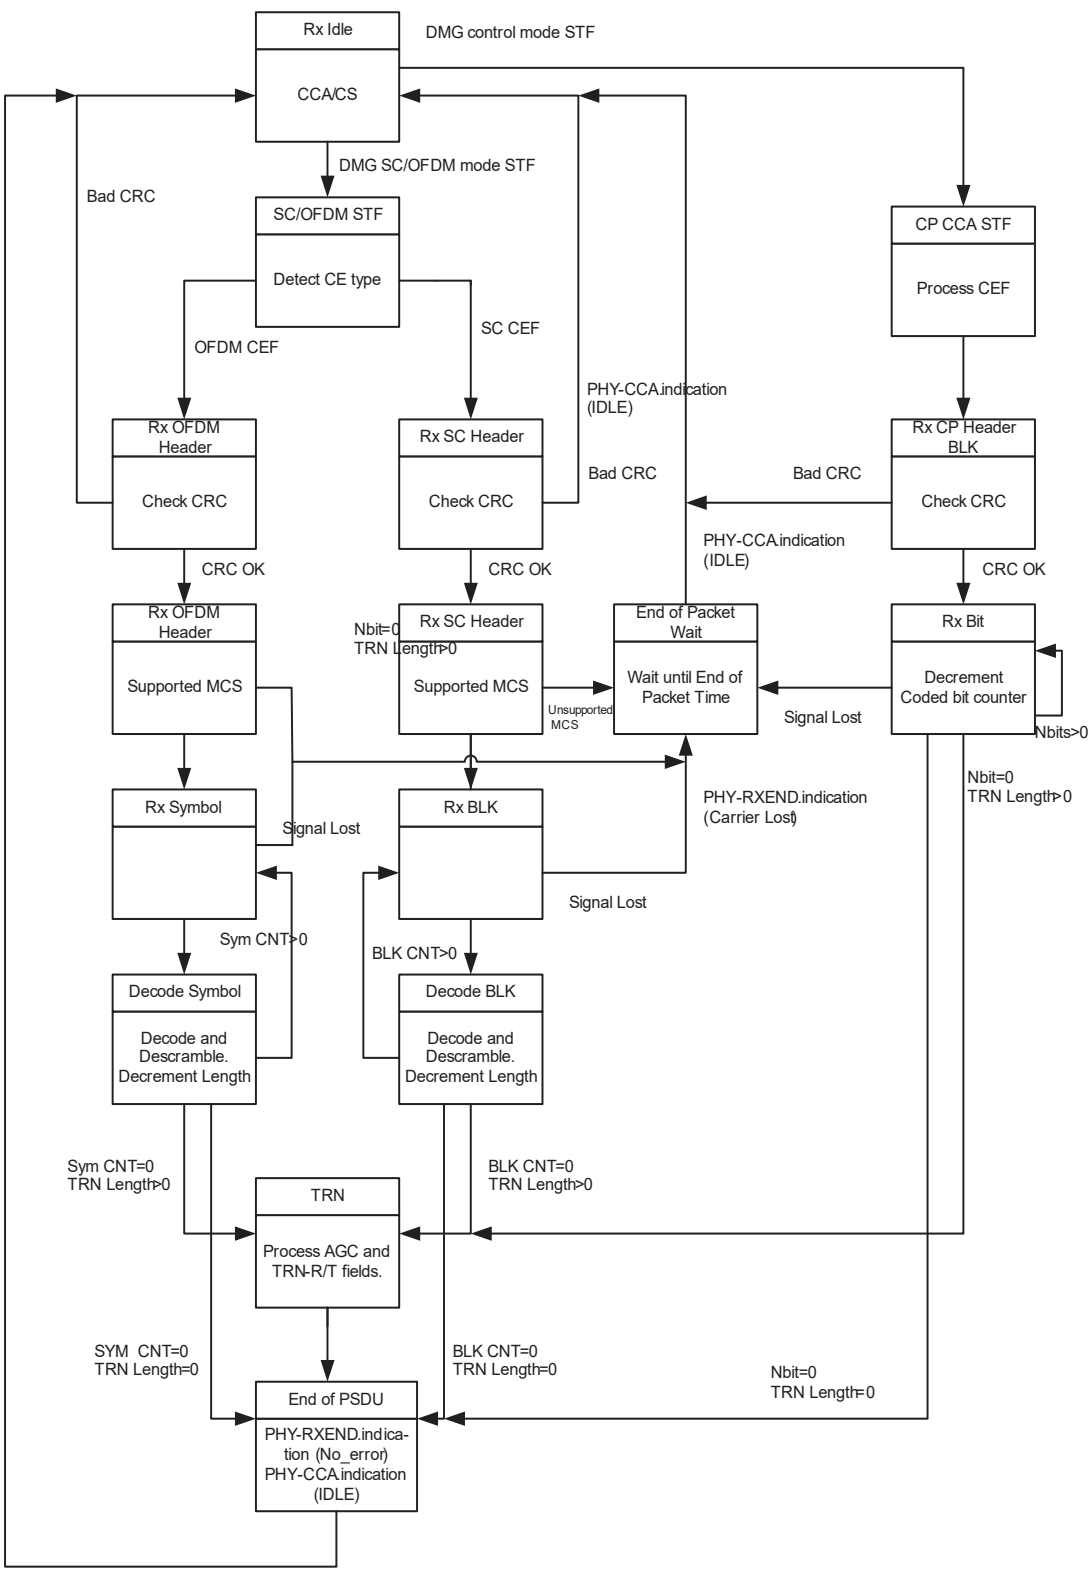

Figure 20-23—Typical Rx state machine
(some optional features such as DMG low-power SC mode are not shown)

This is an unapproved IEEE Standards Draft, subject to change.

the BEAM_TRACKING_REQUEST parameter in the corresponding RXVECTOR or TXVECTOR shall be set to Beam Tracking Not Requested.

Each BRP packet is composed of an STF, a CE field, and a data field followed by a training field containing an AGC training field and a TRN field. This is shown in Figure 20-24 (BRP packet structure).

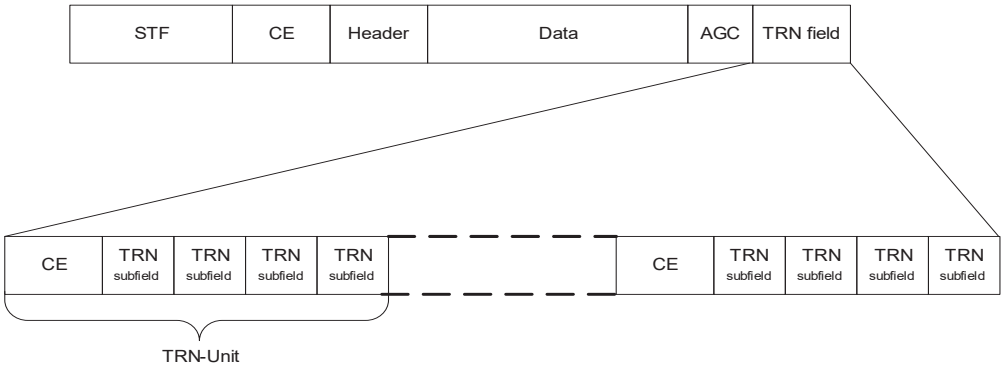

Figure 20-24—BRP packet structure

20.10.2.2.3 BRP packet header fields

The Packet Type and Training Length fields present within the SC mode header, control mode header, LP SC mode header, and OFDM mode header are used to indicate that a packet is BRP packet and the length of the training fields, respectively.

A value of 0 in the Packet Type field and a value of 0 in the Beam Tracking Request field indicate a BRP-RX packet.

A value of 1 in the Packet Type field indicates a BRP-TX packet.

A value of *N* in the Training Length field indicates 4×*N* AGC subfields and that the TRN-R/T field has *N* TRN-Units.

The value *N* in the Training Length field of a BRP-RX packet is equal to the value of the L-RX field requested by the intended receiver of the BRP-RX packet at a previously received BRP Request field (see 9.5.4 (BRP Request field)).

20.10.2.2.4 BRP packet duration

The minimum duration of the data field of a BRP packet when sent in an SC mode is aBRPminSCblocks SC blocks (see 20.6.3.2.5 (Symbol blocking and guard insertion)) and, if needed, the data field of the packet shall be extended by extra zero padding to generate the required number of SC blocks. Table 20-24 (Zero filling for DMG SC mode BRP packets) contains the values of N_{CWmin} for each MCS necessary to compute the padding described in 20.6.3.2.3.3 (LDPC encoding process).

The minimum duration of the data field of a BRP packet when sent in an DMG OFDM mode is aBRPminOFDMblocks OFDM blocks and, if needed, the data field of the packet shall be extended by extra zero padding to generate the required number of OFDM symbols.

The minimum duration of the data field of a BRP packet when sent with the low-power SC mode is N_{BLKS_MIN} low-power SC blocks (see 20.7.2.3.3 (Encoding)).

12.5	π/2-64-QAM	6	1	13/16	7507.5	69
12.6	π/2-64-QAM	6	1	7/8	8085	74

20.10.2.2.5 AGC field

The beam refinement AGC fields are composed of $4N$ repetitions of the sequence [Ga_{64} Ga_{64} Ga_{64} Ga_{64} Ga_{64}] when the packet is transmitted using the OFDM or SC mode and [Gb_{64} Gb_{64} Gb_{64} Gb_{64} Gb_{64}] when the packet is transmitted using the control mode. The sequences Ga_{64} and Gb_{64} are defined in 20.11 (Golay sequences). The sequences are transmitted using rotated π/2-BPSK modulation. Any transmit signal transients that occur due to this TX AWV configuration change shall completely settle by the end of the first Ga64 or Gb64 subsequence.

In a BRP-TX packet, the transmitter may change the TX AWV configuration at the beginning of each AGC subfield. The set of AWVs used for the AGC subfields should be the same as that used for the TRN-T subfields. In a BRP-RX packet, the transmitter shall use the same TX AWV as in the preamble and data fields of the packet.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

20.10.2.2.6 TRN field

The TRN field enable transmitter and receiver AWV training. The TRN field has the form shown in Figure 20-25 (TRN field definition).

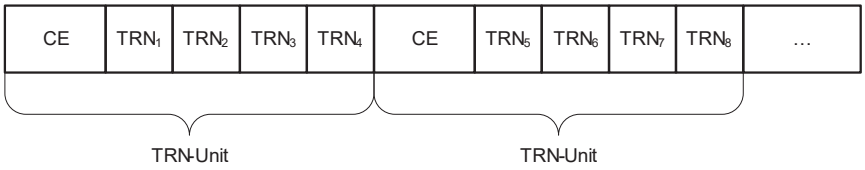

Figure 20-25—TRN field definition

The TRN field is composed of *N* TRN-Units. Each TRN-Unit is composed of a CE subfield and 4 TRN subfields. Each subfield CE matches the Channel Estimation field defined in 20.3.6.3 (Channel Estimation field). The 4N subfields TRN_1 through TRN_{4N} each consist of the sequence [Ga_{128} $-Gb_{128}$ Ga_{128} Gb_{128} Ga_{128}]. The sequences Ga_{128} and Gb_{128} are defined in Table 20-25 (The sequence Ga128(n)) and Table 20-26 (The sequence Gb128(n)), respectively, in 20.11 (Golay sequences). The sequences are transmitted using rotated π/2-BPSK modulation.

In a BRP-RX packet, all of the TRN and CE subfields are transmitted using the same AWV as the preamble and data field of the packet. In a BRP-TX packet, the CE subfield shall be transmitted using the same AWV as the preamble and data field of the packet. In a BRP-TX packet, the transmitter may change AWV at the beginning of each TRN subfield. Any transmit signal transients that occur due to TX AWV configuration changes at the beginning of TRN subfields shall settle by the end of the first 64 samples of the subfield.

20.10.2.2.7 Channel measurement

The good autocorrelation properties of the Golay sequence enable reconstructing part of the impulse response of the channel between the transmitter and the receiver. The receiver should find the tap with largest amplitude in the channel during the CE field of the BRP-RX. It selects thereafter the set of taps that is measured around the tap with the largest amplitude, according to dot11ChanMeasFBCKNtaps. It can select a contiguous set of taps or select a noncontiguous set of taps, and include the tap delays subfield as part of the subfield measurement. It then measures the phase and amplitude of the corresponding channel taps in each of the TRN-T field repetition (except for those using the CE AWV configuration). The beam refinement feedback subfield k-1 is the relative amplitude and phase of this tap in the k'th repetition compared to this tap in the first TRN-T subfield.

20.10.2.2.8 BRP resampling in an OFDM packet

The BRP AGC, CE, and Tn/Rn fields are specified at the SC chip rate (T_c). When appended to an OFDM packet, the signal is resampled as defined in 20.3.3.2 (Center frequency tolerance).

20.11 Golay sequences

The following Golay sequences are used in the preamble, in the single carrier guard interval and in beam refinement TRN-R/T and AGC fields: $Ga_{128}(n)$, $Gb_{128}(n)$, $Ga_{64}(n)$, $Gb_{64}(n)$, $Ga_{32}(n)$, $Gb_{32}(n)$. These are 3 pairs of complementary sequences. The subscript denotes the length of the sequences. These sequences are generated using the following recursive procedure:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$A_0(n) = \delta(n)$$
$$B_0(n) = \delta(n)$$
$$A_k(n) = W_k A_{k-1}(n) + B_{k-1}(n - D_k)$$
$$B_k(n) = W_k A_{k-1}(n) - B_{k-1}(n - D_k)$$

Note that $A_k(n), B_k(n)$ are zero for n < 0 and for $n \geq 2^k$.

$Ga_{128}(n)=A_7(128-n)$, $Gb_{128}(n)=B_7(128-n)$ when the procedure uses D_k = [1 8 2 4 16 32 64] (k=1,2,…,7) and W_k = [–1 –1 –1 –1 +1 –1 –1].

$Ga_{64}(n)=A_6(64-n)$, $Gb_{64}(n)=B_6(64-n)$ when the procedure uses D_k= [2 1 4 8 16 32] and W_k =[1 1 -1 -1 1 -1].

$Ga_{32}(n)=A_5(32-n)$, $Gb_{32}(n)=B_5(32-n)$ when the procedure uses D_k=[1 4 8 2 16] and W_k =[-1 1 -1 1 -1].

The sequences are defined in Table 20-25 (The sequence Ga128(n)), Table 20-26 (The sequence Gb128(n)), Table 20-27 (The sequence Ga64(n)), Table 20-28 (The sequence Gb64(n)), Table 20-29 (The sequence Ga32(n)), and Table 20-30 (The sequence Gb32(n)). The sequences in the tables are normative, the description above is informative.

20.12 DMG PLME

20.12.1 PLME SAP sublayer management primitives

Table 20-31 (DMG PHY MIB attribute default values) lists the MIB attributes that may be accessed by the PHY entities and the intra-layer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5 (PLME SAP interface).

20.12.2 DMG PHY MIB

All DMG PHY MIB attributes are defined in Annex C, with specific values defined in Table 20-31 (DMG PHY MIB attribute default values). The column titled “Operational semantics” in Table 20-31 (DMG PHY MIB attribute default values) contains two types: static and dynamic. Static MIB attributes are fixed and cannot be modified for a given PHY implementation. Dynamic MIB attributes can be modified by some management entity.

Table 20-31—DMG PHY MIB attribute default values

Managed object	Default value/range	Operational semantics
dot11PHYOperationTable		
dot11PHYtype	DMG	Static
dot11PHYDMGTable		
dot11LowPowerSCPHYImplemented	Boolean	Static
dot11LowPowerSCPHYActivated	Boolean	Dynamic

This is an unapproved IEEE Standards Draft, subject to change.

20.12.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated according to the following equations.

For the DMG OFDM mode and for the DMG SC mode (N_{TRN} is Training Length field defined in the header – see, for example, Table 20-13 (DMG OFDM mode header fields)):

$$TXTIME = \begin{cases} T_{STF} + T_{CE} + T_{header} + T_{Data} & N_{TRN} = 0 \\ T_{STF} + T_{CE} + T_{header} + \max\{T_{Data}, (\alpha \times \beta + \gamma) \times T_C\} + N_{TRN} \times T_{TRN-Unit} & N_{TRN} > 0 \text{ and SC} \\ T_{STF} + T_{CE} + T_{header} + \max\{T_{Data}, \delta \times T_{SYM}\} + N_{TRN} \times T_{TRN-Unit} & N_{TRN} > 0 \text{ and OFDM} \end{cases}$$

where α =aBRPminSCblocks, β=aSCBlockSize, γ=aSCGILength, δ=aBRPminOFDMblocks, and $T_{TRN-Unit}$ = aBRPTRNBlock $\times T_C$.

For the DMG control mode:

$$TXTIME = T_{STF-CP} + T_{CE-CP} + (11 \times 8 + (Length - 6) \times 8 + N_{CW} \times 168) \times T_C \times 32 + N_{TRN} \times T_{TRN-Unit}$$

where N_{CW} calculation is defined in 20.4.3.3.3 (Encoder).

20.12.4 DMG PHY

The static DMG PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 20-32 (DMG PHY characteristics). The definitions for these characteristics are given in 6.5.4 (PLME-CHARACTERISTICS.confirm).

21. Very High Throughput (VHT) PHY specification

21.1 Introduction

21.1.1 Introduction to the VHT PHY

Clause 21 (Very High Throughput (VHT) PHY specification) specifies the PHY entity for a very high throughput (VHT) orthogonal frequency division multiplexing (OFDM) system.

In addition to the requirements in Clause 21 (Very High Throughput (VHT) PHY specification), a VHT STA shall be capable of transmitting and receiving PPDUs that are compliant with the mandatory PHY specifications defined in Clause 19 (High Throughput (HT) PHY specification).

The VHT PHY is based on the HT PHY defined in Clause 19 (High Throughput (HT) PHY specification), which in turn is based on the OFDM PHY defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). The VHT PHY extends the maximum number of space-time streams supported to eight and provides support for downlink multi-user (MU) transmissions. A downlink MU transmission supports up to four users with up to four space-time streams per user with the total number of space-time streams not exceeding eight.

NOTE—MU transmission is different from VHT SU group addressed transmission.

The VHT PHY provides support for 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous channel widths and support for 80+80 MHz noncontiguous channel width.

The VHT PHY data subcarriers are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), 64-QAM, and 256-QAM. Forward error correction (FEC) coding (convolutional or LDPC coding) is used with coding rates of 1/2, 2/3, 3/4, and 5/6.

A VHT STA shall support the following features:

- Non-HT and non-HT duplicate formats (transmit and receive) for all channel widths supported by the VHT STA
- HT-mixed format (transmit and receive)
- VHT format (transmit and receive)
- 20 MHz, 40 MHz, and 80 MHz channel widths
- Single spatial stream VHT-MCSs 0 to 7 (transmit and receive) in all supported channel widths
- Binary convolutional coding

A VHT STA may support the following features:

- HT-greenfield format (transmit and receive)
- 2 or more spatial streams (transmit and receive)
- 400 ns short guard interval (transmit and receive)
- Beamforming sounding (by sending a VHT NDP)
- Responding to transmit beamforming sounding (by providing compressed beamforming feedback)
- STBC (transmit and receive)
- LDPC (transmit and receive)
- VHT MU PPDUs (transmit and receive)
- Support for 160 MHz channel width
- Support for 80+80 MHz channel width

This is an unapproved IEEE Standards Draft, subject to change.

— VHT-MCSs 8 and 9 (transmit and receive)

21.1.2 Scope

The services provided to the MAC by the VHT PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PSDUs into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of VHT, Clause 19 (High Throughput (HT) PHY specification) and Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) PHYs.

21.1.3 VHT PHY functions

21.1.3.1 General

The VHT PHY contains two functional entities: the PHY function and the physical layer management function (i.e., the PLME). Both of these functions are described in detail in 21.3 (VHT PHY) and 21.4 (VHT PLME).

The VHT PHY service is provided to the MAC through the PHY service primitives defined in Clause 8 (PHY service specification). The VHT PHY service interface is described in 21.2 (VHT PHY service interface).

21.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

21.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation.

The service of a layer is the set of capabilities that it offers to a user in the next higher layer. Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

21.1.4 PPDU formats

The structure of the PPDU transmitted by a VHT STA is determined by the TXVECTOR parameters as defined in Table 21-1 (TXVECTOR and RXVECTOR parameters).

In a VHT STA the FORMAT parameter determines the overall structure of the PPDU and can take one of the following values:

— Non-HT format (NON_HT), based on Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and including non-HT duplicate format.

— HT-mixed format (HT_MF) as specified in Clause 19 (High Throughput (HT) PHY specification).

— HT-greenfield format (HT_GF) as specified in Clause 19 (High Throughput (HT) PHY specification).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— VHT format (VHT). PPDUs of this format contain a preamble compatible with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 19 (High Throughput (HT) PHY specification) STAs. The non-VHT portion of the VHT format preamble (the parts of VHT preamble preceding the VHT-SIG-A field) is defined so that it can be decoded by these STAs.

NOTE—Required support for these formats is defined in 11.40 (VHT BSS operation), 19.1.1 (Introduction to the HT PHY), and 21.1.1 (Introduction to the VHT PHY).

A VHT PPDU can be further categorized as a VHT SU PPDU or a VHT MU PPDU. A VHT PPDU using a group ID value of 0 or 63 is a VHT SU PPDU and either carries only one PSDU or no PSDU. A VHT PPDU using a group ID value in the range 1 to 62 is a VHT MU PPDU and carries one or more PSDUs to one or more users.

21.2 VHT PHY service interface

21.2.1 Introduction

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4 (Basic service and options). The interface includes TXVECTOR, RXVECTOR, and PHYCONFIG_VECTOR.

Using the TXVECTOR, the MAC supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received PPDU parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of frame transmission or reception.

21.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 21-1 (TXVECTOR and RXVECTOR parameters) are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

Table 21-1—TXVECTOR and RXVECTOR parameters

Parameter	Condition	Value	TXVECTOR	RXVECTOR
FORMAT		Determines the format of the PPDU. Enumerated type: NON_HT indicates Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) (Orthogonal frequency division multiplexing (OFDM) PHY specification) or non-HT duplicate PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter. HT_MF indicates HT-mixed format. HT_GF indicates HT-greenfield format. VHT indicates VHT format.	Y	Y

This is an unapproved IEEE Standards Draft, subject to change.

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NON_HT_MODULATION	FORMAT is NON_HT	In TXVECTOR, indicates the format type of the transmitted non-HT PPDU. In RXVECTOR, indicates the estimated format type of the received non-HT PPDU. Enumerated type: OFDM indicates Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) (Orthogonal frequency division multiplexing (OFDM) PHY specification) format NON_HT_DUP_OFDM indicates non-HT duplicate format	Y	Y
	Otherwise	Not present	N	N
L_LENGTH	FORMAT is VHT	Not present NOTE—The Length field of the L-SIG in VHT PPDUs is defined in Equation (21-24) using the TXTIME value defined by Equation (21-110) and Equation (21-111), which in turn depend on other parameters including the TXVECTOR parameter APEP_LENGTH.	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
L_DATARATE	FORMAT is VHT	Not present NOTE 2—The RATE field in the L-SIG field in a VHT PPDU is set to the value representing 6 Mb/s in the 20 MHz channel spacing column of Table 17-6 (Contents of the SIGNAL field).	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
LSIGVALID	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
SERVICE	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
SMOOTHING	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
AGGREGATION	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
NUM_EXTEN_SS	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
ANTENNA_SET	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
N_TX	FORMAT is VHT	Indicates the number of transmit chains.	Y	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
EXPANSION_MAT_TYPE	FORMAT is VHT and EXPANSION_MAT is present.	Set to COMPRESSED_SV	Y	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
EXPANSION_MAT	FORMAT is VHT	Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 21.3.11.2 (Beamforming Feedback Matrix V) based on the channel measured during the training symbols of a previous VHT NDP PPDU.	M U	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CHAN_MAT_TYPE	FORMAT is VHT and PSDU_LENGTH equals 0	Set to COMPRESSED_SV	N	Y
	FORMAT is VHT and PSDU_LENGTH is greater than 0	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
CHAN_MAT	FORMAT is VHT and PSDU_LENGTH equals 0	Contains a set of compressed beamforming feedback matrices as defined in 21.3.11.2 (Beamforming Feedback Matrix V) based on the channel measured during the training symbols of the received VHT NDP PPDU.	N	Y
	FORMAT is VHT and PSDU_LENGTH is greater than 0	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
DELTA_SNR	FORMAT is VHT	Contains an array of delta SNR values as defined in 9.4.1.51 (MU Exclusive Beamforming Report field) based on the channel measured during the training symbols of the received VHT NDP PPDU. NOTE 3—In the RXVECTOR this parameter is present only for VHT NDP PPDUs for MU sounding.	M U	Y
	Otherwise	Not present	N	N
RCPI		See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
SNR	FORMAT is VHT	Contains an array of received SNR measurements for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.49 (VHT Compressed Beamforming Report field)	N	Y
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
NO_SIG_EXTN	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
FEC_CODING	FORMAT is VHT	Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code.	M U	Y
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
STBC	FORMAT is VHT	Indicates whether STBC is used. 0 indicates no STBC ($N_{STS}=N_{SS}$ in the Data field). 1 indicates STBC is used ($N_{STS}=2N_{SS}$ in the Data field). This parameter is 0 for a VHT MU PPDU.	Y	Y
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
GI_TYPE	FORMAT is VHT	Indicates whether a short guard interval is used in the transmission of the Data field of the PPDU. Enumerated type: LONG_GI indicates short GI is not used in the Data field of the PPDU. SHORT_GI indicates short GI is used in the Data field of the PPDU.	Y	Y
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
TXPWR_LEVEL_INDEX	FORMAT is VHT	The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to numberOfOctets(dot11TxPowerLevelExtended)/2. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission.	Y	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
RSSI	FORMAT is VHT	The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a measure by the PHY of the power observed at the antennas used to receive the current PPDU measured during the reception of the VHT-LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power.	N	Y
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
MCS	FORMAT is VHT	Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9	M U	Y
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
REC_MCS	FORMAT is HT_MF, HT_GF or VHT	Indicates the MCS that the STA's receiver recommends.	N	O
	Otherwise	Not present	N	N
CH_BANDWIDTH	FORMAT is HT_MF or HT_GF	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
	FORMAT is VHT	Indicates the channel width of the transmitted PPDU: Enumerated type: CBW20 for 20 MHz CBW40 for 40 MHz CBW80 for 80 MHz CBW160 for 160 MHz CBW80+80 for 80+80 MHz	Y	Y
	FORMAT is NON_HT	In TXVECTOR, indicates the channel width of the transmitted PPDU. In RXVECTOR, indicates the estimated channel width of the received PPDU. Enumerated type: CBW40, CBW80, CBW160, or CBW80+80 if NON_HT_MODULATION equals NON_HT_DUP_OFDM CBW20 if NON_HT_MODULATION equals OFDM NOTE 4—On reception, where valid, the CH_BANDWIDTH_IN_NON_HT parameter is likely to be a more reliable indication of subformat and channel width than the NON_HT_MODULATION and CH_BANDWIDTH parameters, since for non-HT or non-HT duplicate frames, CH_BANDWIDTH is a receiver estimate of the bandwidth, whereas CH_BANDWIDTH_IN_NON_HT is the signaled bandwidth.	Y	Y
DYN_BANDWIDTH_IN_NON_HT	FORMAT is NON_HT	In TXVECTOR, if present, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. In RXVECTOR, if valid, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. Enumerated type: Static if the transmitter is capable of Static bandwidth operation Dynamic if the transmitter is capable of Dynamic bandwidth operation NOTE 5—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU.	O	Y
	Otherwise	Not present	N	N

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CH_BANDWIDTH_IN_NON_HT	FORMAT is NON_HT	In TXVECTOR, if present, indicates the channel width of the transmitted PPDU, which is signaled via the scrambling sequence. In RXVECTOR, if valid, indicates the channel width of the received PPDU, which is signaled via the scrambling sequence. Enumerated type: CBW20, CBW40, CBW80, CBW160, CBW80+80 NOTE 6—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the currently received MPDU (e.g., RTS) or the previous MPDU in an exchange (e.g., the RTS preceding a CTS).	O	Y
	Otherwise	Not present	N	N
LENGTH	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
APEP_LENGTH	FORMAT is VHT	If equal to 0, indicates a VHT NDP PPDU for both RXVECTOR and TXVECTOR. If greater than 0 in the TXVECTOR, indicates the number of octets in the range 1 to 1 048 575 in the A-MPDU pre-EOF padding (see 10.13.2 (A-MPDU length limit rules)) carried in the PSDU. If greater than 0 in the RXVECTOR, this parameter is the value obtained from the VHT-SIG-B Length field multiplied by 4.	M U	O
	Otherwise	Not present	N	N
PSDU_LENGTH	FORMAT is VHT	Indicates the number of octets in the VHT PSDU in the range 0 to aPSDUMaxLength octets (see Table 21-29 (VHT PHY characteristics)). A value of 0 indicates a VHT NDP PPDU.	N	Y
	Otherwise	Not present	N	N
USER_POSITION	FORMAT is VHT and $1 \leq$ GROUP_ID ≤ 62	Index for user in MU transmission. Integer: range 0-3. NOTE 7—The entries in the USER_POSITION array are in ascending order.	M U	O
	Otherwise	Not present	N	N
NUM_STS	FORMAT is VHT	Indicates the number of space-time streams. Integer: range 1-8 for SU, 1-4 per user in the TXVECTOR and 0-4 in the RXVECTOR for MU. NUM_STS summed over all users is in the range 1 to 8.	M U	Y
	Otherwise	Not present	N	N

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
GROUP_ID	FORMAT is VHT	Indicates the group ID. Integer: range 0-63 (see Table 21-12 (Fields in the VHT-SIG-A field)) A value of 0 or 63 indicates a VHT SU PPDU. A value in the range 1 to 62 indicates a VHT MU PPDU.	Y	Y
	Otherwise	Not present	N	N
PARTIAL_AID	FORMAT is VHT and GROUP_ID is 0 or 63	Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.20 (Group ID and partial AID in VHT PPDUs)). Integer: range 0-511.	Y	Y
	Otherwise	Not present	N	N
NUM_USERS	FORMAT is VHT	Indicates the number of users with nonzero space-time streams. Integer: range 1 to 4.	Y	N
	Otherwise	Not present	N	N
BEAMFORMED	FORMAT is VHT and GROUP_ID is 0 or 63	Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission. Set to 0 otherwise. NOTE 8—When BEAMFORMED is set to 1, frequency domain smoothing as part of channel estimation is not recommended.	Y	O
	Otherwise	Not present	N	N
TXOP_PS_NOT_ALLOWED	FORMAT is VHT	Indicates whether a VHT AP allows non-AP VHT STAs in TXOP power save mode to enter doze state during the TXOP. 0 indicates that the VHT AP allows non-AP VHT STAs to enter doze state during a TXOP. 1 indicates that the VHT AP does not allow non-AP VHT STAs to enter doze state during a TXOP.	Y	Y
	Otherwise	Not present	N	N

This is an unapproved IEEE Standards Draft, subject to change.

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
TIME_OF_DEPARTURE_REQUESTED		See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
RX_START_OF_FRAME_OFFSET	dot11TimingMsmtActivated is true	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.	N	Y
	Otherwise	Not present	N	N

NOTE 9—In the "TXVECTOR" and "RXVECTOR" columns, the following apply:
Y = Present;
N = Not present;
O = Optional;
MU indicates that the parameter is present once for a VHT SU PPDU and present per user for a VHT MU PPDU. Parameters specified to be present per user are conceptually supplied as an array of values indexed by *u*, where *u* takes values 0 to NUM_USERS-1.

21.2.3 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains an OPERATING_CHANNEL parameter, which identifies the operating or primary channel. The PHY shall set dot11CurrentPrimaryChannel to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a CHANNEL_WIDTH parameter, which identifies the operating channel width and takes one of the values 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz. The PHY shall set dot11CurrentChannelWidth to the value of this parameter.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a CENTER_FREQUENCY_SEGMENT_0 parameter, which identifies the center frequency of the channel (or of segment 0 if the CHANNEL_WIDTH parameter indicates 80+80 MHz) and takes a value between 1 and 200. The PHY shall set dot11CurrentChannelCenterFrequencyIndex0 to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a CENTER_FREQUENCY_SEGMENT_1 parameter, which takes the value 0 if the CHANNEL_WIDTH parameter does not indicate 80+80 MHz, and otherwise identifies the center frequency of segment 1 and takes a value between 1 and 200. The PHY shall set dot11CurrentChannelCenterFrequencyIndex1 to the value of this parameter.

21.2.4 Effects of CH_BANDWIDTH parameter on PPDU format

Table 21-2 (Interpretation of FORMAT, NON_HT Modulation and CH_BANDWIDTH parameters) shows the valid combinations of the FORMAT, NON_HT MODULATION and CH_BANDWIDTH parameters and the corresponding PPDU format and value of CH_OFFSET (if applicable). Other combinations are reserved..

Table 21-2— Interpretation of FORMAT, NON_HT Modulation and CH_BANDWIDTH parameters

FORMAT	NON_HT_ MODULATION	CH_BANDWIDTH	CH_OFFSET	PPDU format
VHT	N/A	CBW20	N/A	The STA transmits a VHT PPDU (when FORMAT is VHT) of 20 MHz bandwidth. If the BSS bandwidth is wider than 20 MHz, then the transmission shall use the primary 20 MHz channel.
VHT	N/A	CBW40	N/A	The STA transmits a VHT PPDU (when FORMAT is VHT) of 40 MHz bandwidth. If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel.
HT_MF or HT_GF	N/A	HT_CBW20 and CHANNEL_WIDTH in PHYCONFIG_VECTOR > 20 MHz and $f_{S20, idx} < f_{P20, idx}$	CH_OFF_20U	The STA transmits an HT-mixed PPDU (when FORMAT is HT_MF) or HT-greenfield PPDU (when FORMAT is HT_GF) of 20 MHz bandwidth. The transmission shall use the primary 20 MHz channel.
HT_MF or HT_GF	N/A	HT_CBW20 and CHANNEL_WIDTH in PHYCONFIG_VECTOR > 20 MHz and $f_{S20, idx} > f_{P20, idx}$	CH_OFF_20L	The STA transmits an HT-mixed PPDU (when FORMAT is HT_MF) or HT-greenfield PPDU (when FORMAT is HT_GF) of 20 MHz bandwidth. The transmission shall use the primary 20 MHz channel.
HT_MF or HT_GF	N/A	HT_CBW20 and CHANNEL_WIDTH in PHYCONFIG_VECTOR = 20 MHz	CH_OFF_20	The STA transmits an HT-mixed PPDU (when FORMAT is HT_MF) or HT-greenfield PPDU (when FORMAT is HT_GF) of 20 MHz bandwidth.

This is an unapproved IEEE Standards Draft, subject to change.

Table 21-2— Interpretation of FORMAT, NON_HT Modulation and CH_BANDWIDTH parameters *(continued)*

FORMAT	NON_HT_ MODULATION	CH_BANDWIDTH	CH_OFFSET	PPDU format
HT_MF or HT_GF	N/A	HT_CBW40	CH_OFF_40	The STA transmits an HT-mixed PPDU (when FORMAT is HT_MF) or HT-greenfield PPDU (when FORMAT is HT_GF) of 40 MHz bandwidth. If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel.
VHT	N/A	CBW80		The STA transmits a VHT PPDU of 80 MHz bandwidth. If the BSS bandwidth is 160 MHz or 80+80 MHz, then the transmission shall use the primary 80 MHz channel.
VHT	N/A	CBW160		The STA transmits a VHT PPDU of 160 MHz bandwidth.
VHT	N/A	CBW80+80		The STA transmits a VHT PPDU of 80+80 MHz bandwidth.
NON_HT	OFDM	CBW20		The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to OFDM using the primary 20 MHz channel as defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification).
NON_HT	NON_HT_DUP_ OFDM	CBW40		The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two adjacent 20 MHz channels as defined in 21.3.10.12 (Non-HT duplicate transmission). If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel. The one 20 MHz channel higher in frequency is rotated +90º relative to the 20 MHz channel lowest in frequency as defined in Equation (21-15).

Table 21-2— Interpretation of FORMAT, NON_HT Modulation and CH_BANDWIDTH parameters *(continued)*

FORMAT	NON_HT_ MODULATION	CH_BANDWIDTH	CH_OFFSET	PPDU format
NON_HT	NON_HT_DUP_ OFDM	CBW80		The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using four adjacent 20 MHz channels as defined in 21.3.10.12 (Non-HT duplicate transmission). If the BSS BSS bandwidth is 160 MHz or 80+80 MHz, then the transmission shall use the primary 80 MHz channel. The three 20 MHz channels higher in frequency are rotated +180º relative to the 20 MHz channel lowest in frequency as defined in Equation (21-16).
NON_HT	NON_HT_DUP_ OFDM	CBW160		The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using eight adjacent 20 MHz channels as defined in 21.3.10.12 (Non-HT duplicate transmission). The second, third, fourth, sixth, seventh, and eighth 20 MHz channels in the order of increasing frequency are rotated +180º relative to the 20 MHz channel lowest in frequency as defined in Equation (21-17).
NON_HT	NON_HT_DUP_ OFDM	CBW80+80		The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of four adjacent 20 MHz channels as defined in 21.3.10.12 (Non-HT duplicate transmission). In each frequency segment, the three 20 MHz channels higher in frequency are rotated +180º relative to the 20 MHz channel lowest in frequency as defined in Equation (21-16).

21.2.5 Support for NON_HT and HT formats

21.2.5.1 General

A VHT STA logically contains Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), Clause 19 (High Throughput (HT) PHY specification), and Clause 21 (Very High Throughput (VHT) PHY specification) PHYs. The MAC interfaces to the PHYs via the Clause 21 (Very High Throughput (VHT) PHY specification) PHY service interface, which in turn interacts with the

This is an unapproved IEEE Standards Draft, subject to change.

Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and Clause 19 (High Throughput (HT) PHY specification) PHY service interfaces as shown in Figure 21-1 (PHY interaction on transmit for various PPDU formats), Figure 21-2 (PHY interaction on receive for various PPDU formats), and Figure 21-3 (PHY-CONFIG and CCA interaction with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), Clause 19 (High Throughput (HT) PHY specification), and Clause 21 (Very High Throughput (VHT) PHY specification) PHYs).

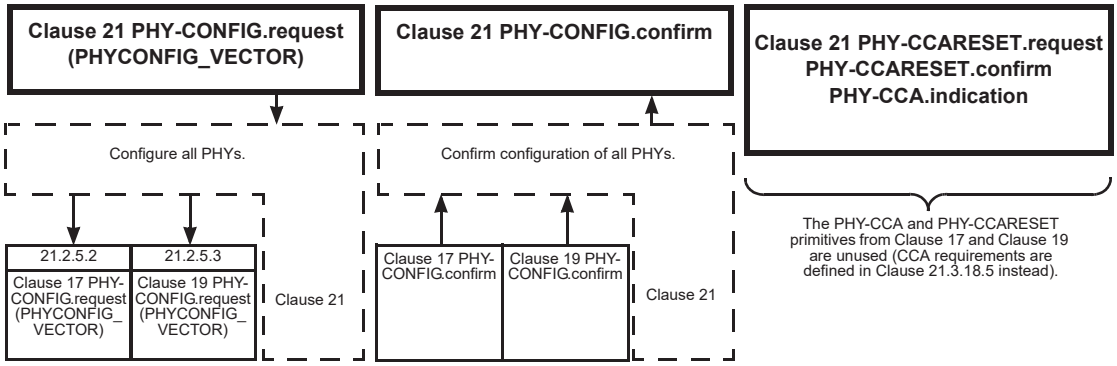

Figure 21-3—PHY-CONFIG and CCA interaction with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), Clause 19 (High Throughput (HT) PHY specification), and Clause 21 (Very High Throughput (VHT) PHY specification) PHYs

21.2.5.2 Support for NON_HT format when NON_HT_MODULATION is OFDM

When a PHY-TXSTART.request(TXVECTOR) primitive with the FORMAT parameter equal to NON_HT and the NON_HT_MODULATION parameter equal to OFDM is issued, the behavior of the VHT PHY is defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) with additional requirements described in the following subclauses:

— 21.3.9.1 (Transmission of 20 MHz NON_HT PPDUs with more than one transmit chain)

— 21.3.17.1 (Transmit spectrum mask) instead of 17.3.9.3 (Transmit spectrum mask)

— 21.3.17.4.2 (Transmit center frequency leakage) instead of 17.3.9.7.2 (Transmitter center frequency leakage)

where the Clause 21 (Very High Throughput (VHT) PHY specification) TXVECTOR parameters in Table 21-1 (TXVECTOR and RXVECTOR parameters) are mapped to Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) TXVECTOR parameters in Table 17-1 (TXVECTOR parameters) according to Table 21-3 (Mapping of the VHT PHY parameters for NON_HT operation).

NOTE—When the FORMAT parameter is set to NON_HT and the NON_HT_MODULATION parameter is set to NON_HT_DUP_OFDM in a PHY-TXSTART.request(TXVECTOR) primitive, the behavior of the VHT PHY is defined in Clause 21 (Very High Throughput (VHT) PHY specification).

When the VHT PHY receives a Clause 21 (Very High Throughput (VHT) PHY specification) PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive, the VHT PHY shall, for the purposes of OFDM PPDU transmission and reception, behave as if it were a Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) PHY that had received a PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive but with the CHANNEL_WIDTH, CENTER_FREQUENCY_SEGMENT_0, and CENTER_FREQUENCY_SEGMENT_1 parameters discarded from PHYCONFIG_VECTOR.

As defined in 21.3.20 (PHY receive procedure), once a PPDU is received and detected as a NON_HT PPDU, the behavior of the VHT PHY is defined in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). The RXVECTOR parameters from the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) PHY-RXSTART.indication primitive are mapped to the Clause 21 (Very High Throughput (VHT) PHY specification) RXVECTOR parameters as defined in

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 21-3 (Mapping of the VHT PHY parameters for NON_HT operation). VHT PHY parameters not listed in the table are not present.

Table 21-3—Mapping of the VHT PHY parameters for NON_HT operation

VHT PHY Parameter	5 GHz operation defined by Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification)	Parameter List
L_LENGTH	LENGTH	TXVECTOR/RXVECTOR
L_DATARATE	DATARATE	TXVECTOR/RXVECTOR
TXPWR_LEVEL_INDEX	TXPWR_LEVEL_INDEX	TXVECTOR
RSSI	RSSI	RXVECTOR
SERVICE	SERVICE	TXVECTOR/RXVECTOR
RCPI	RCPI	RXVECTOR
CH_BANDWIDTH_IN_NON_HT	CH_BANDWIDTH_IN_NON_HT	TXVECTOR/RXVECTOR
DYN_BANDWIDTH_IN_NON_HT	DYN_BANDWIDTH_IN_NON_HT	TXVECTOR/RXVECTOR
OPERATING_CHANNEL	OPERATING_CHANNEL	PHYCONFIG_VECTOR
CHANNEL_WIDTH	discarded	PHYCONFIG_VECTOR
CENTER_FREQUENCY_SEGMENT_0	discarded	PHYCONFIG_VECTOR
CENTER_FREQUENCY_SEGMENT_1	discarded	PHYCONFIG_VECTOR

21.2.5.3 Support for HT formats

When a PHY-TXSTART.request(TXVECTOR) primitive is received with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF, the behavior of the PHY is defined by Clause 19 (High Throughput (HT) PHY specification) with additional requirements defined in the following subclauses:

— 21.3.9.2 (Transmission of HT PPDUs with more than four transmit chains)

— 21.3.17.1 (Transmit spectrum mask) instead of 19.3.18.1 (Transmit spectrum mask)

— 21.3.17.4.2 (Transmit center frequency leakage) instead of 19.3.18.4 (Transmit center frequency tolerance)

The Clause 21 (Very High Throughput (VHT) PHY specification) TXVECTOR parameters in Table 21-1 (TXVECTOR and RXVECTOR parameters) are mapped directly to Clause 19 (High Throughput (HT) PHY specification) TXVECTOR parameters in Table 19-1 (TXVECTOR and RXVECTOR parameters) and the Clause 19 (High Throughput (HT) PHY specification) PHY-TXSTART.request(TXVECTOR) primitive is issued. The PHY shall use a value of CH_OFFSET in the Clause 19 (High Throughput (HT) PHY specification) TXVECTOR that is consistent with Table 21-2 (Interpretation of FORMAT, NON_HT Modulation and CH_BANDWIDTH parameters).

When the VHT PHY receives a Clause 21 (Very High Throughput (VHT) PHY specification) PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive, the VHT PHY shall, for the purposes of HT PPDU transmission and reception, behave as if it were a Clause 19 (High Throughput (HT) PHY specification) PHY that had received PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive but with the

Copyright © 2016 IEEE. All rights reserved.

CHANNEL_WIDTH, CENTER_FREQUENCY_SEGMENT_0, and CENTER_FREQUENCY_SEGMENT_1 parameters discarded from the PHYCONFIG_VECTOR and the SECONDARY_CHANNEL_OFFSET parameter set to SECONDARY_CHANNEL_NONE if dot11CurrentChannelWidth indicates 20 MHz, to SECONDARY_CHANNEL_ABOVE if $f_{P20,\,idx} < f_{S20,\,idx}$, or to SECONDARY_CHANNEL_BELOW otherwise.

As defined in 21.3.20 (PHY receive procedure), once a PPDU is received and detected as an HT PPDU, the behavior of the VHT PHY is defined in Clause 19 (High Throughput (HT) PHY specification). The RXVECTOR parameters in Table 19-1 (TXVECTOR and RXVECTOR parameters) from the Clause 19 (High Throughput (HT) PHY specification) PHY-RXSTART.indication primitive are mapped directly to the RXVECTOR parameters in Table 21-1 (TXVECTOR and RXVECTOR parameters) and a Clause 21 (Very High Throughput (VHT) PHY specification) PHY-RXSTART.indication primitive is issued.

21.2.6 TXSTATUS parameters

The parameters listed in Table 20-2 (TXSTATUS parameters) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm(TXSTATUS) primitive.

21.3 VHT PHY

21.3.1 Introduction

This subclause provides the procedure by which PSDUs are converted to and from transmissions on the wireless medium.

During transmission, a PSDU (in the SU case) or one or more PSDUs (in the MU case) are processed (i.e., scrambled and coded) and appended to the PHY preamble to create the PPDU. At the receiver, the PHY preamble is processed to aid in the detection, demodulation, and delivery of the PSDU.

Pre-VHT modulated fields refer to the L-STF, L-LTF, L-SIG, and VHT-SIG-A fields, while VHT modulated fields refer to the VHT-STF, VHT-LTF, VHT-SIG-B, and Data fields (see Figure 21-17 (Timing boundaries for VHT PPDU fields)).

21.3.2 VHT PPDU format

A single PPDU format is defined for this PHY: the VHT PPDU format. Figure 21-4 (VHT PPDU format) shows the VHT PPDU format.

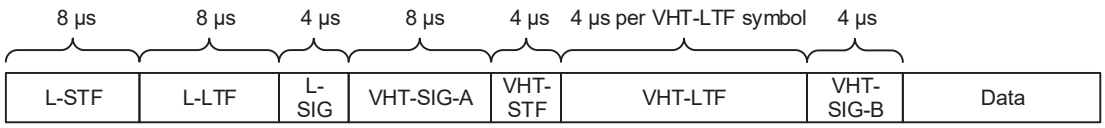

Figure 21-4—VHT PPDU format

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The fields of the VHT PPDU format are summarized in Table 21-4 (Fields of the VHT PPDU).

Table 21-4—Fields of the VHT PPDU

Field	Description
L-STF	Non-HT Short Training field
L-LTF	Non-HT Long Training field
L-SIG	Non-HT SIGNAL field
VHT-SIG-A	VHT Signal A field
VHT-STF	VHT Short Training field
VHT-LTF	VHT Long Training field
VHT-SIG-B	VHT Signal B field
Data	The Data field carrying the PSDU(s)

The VHT-SIG-A, VHT-STF, VHT-LTF, and VHT-SIG-B fields exist only in VHT PPDUs. In a VHT NDP the Data field is not present. The number of symbols in the VHT-LTF field, N_{VHTLTF}, can be either 1, 2, 4, 6, or 8 and is determined by the total number of space-time streams across all users being transmitted in the VHT PPDU (see Table 21-13 (Number of VHT-LTFs required for different numbers of space-time streams)).

21.3.3 Transmitter block diagram

The generation of each field in a VHT PPDU uses many of the following blocks:

a) PHY padding
b) Scrambler
c) BCC encoder parser
d) FEC (BCC or LDPC) encoders
e) Stream parser
f) Segment parser (for 160 MHz and 80+80 MHz transmissions)
g) BCC interleaver
h) Constellation mapper
i) Pilot insertion
j) Replicate over multiple 20 MHz (if BW > 20 MHz)
k) Multiply by 1st column of P_{VHTLTF}
l) LDPC tone mapper
m) Segment deparser
n) Space time block code (STBC) encoder
o) Cyclic shift diversity (CSD) per STS insertion
p) Spatial mapper
q) Inverse discrete Fourier transform (IDFT)
r) Cyclic shift diversity (CSD) per chain insertion
s) Guard interval (GI) insertion

t) Windowing

Figure 21-5 (Transmitter block diagram for the L-SIG and VHT-SIG-A fields) to Figure 21-16 (Transmitter block diagram for the Data field of an 80+80 MHz VHT SU PPDU with LDPC encoding) show example transmitter block diagrams. The actual structure of the transmitter is implementation dependent. In particular, Figure 21-5 (Transmitter block diagram for the L-SIG and VHT-SIG-A fields) shows the transmit process for the L-SIG and VHT-SIG-A fields of a VHT PPDU using one frequency segment. These transmit blocks are also used to generate L-STF and L-LTF fields, except that the BCC encoder and interleaver are not used for these fields.

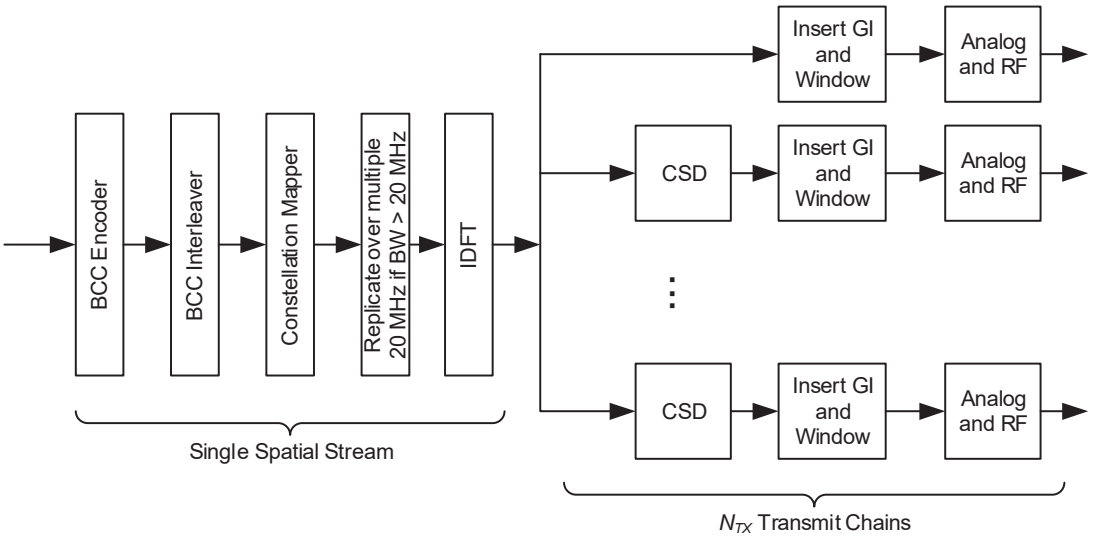

Figure 21-5—Transmitter block diagram for the L-SIG and VHT-SIG-A fields

Figure 21-6 (Transmitter block diagram for the VHT-SIG-B field of a 20 MHz, 40 MHz, and 80 MHz VHT SU PPDU) and Figure 21-7 (Transmitter block diagram for the VHT-SIG-B field of a 20 MHz, 40 MHz, and 80 MHz VHT MU PPDU) show the transmit process for generating the VHT-SIG-B field of a VHT SU PPDU and VHT MU PPDU, respectively, in 20 MHz, 40 MHz, and 80 MHz channel widths. Figure 21-8 (Transmitter block diagram for the VHT-SIG-B field of a 160 MHz VHT SU PPDU) and Figure 21-9 (Transmitter block diagram for the VHT-SIG-B field of an 80+80 MHz VHT SU PPDU) show the transmit process for generating the VHT_SIG-B field of a 160 MHz and 80+80 MHz VHT SU PPDU, respectively.

Figure 21-10 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT SU PPDU with BCC encoding) shows the transmitter blocks used to generate the Data field of a 20 MHz, 40 MHz, and 80 MHz VHT SU PPDU with BCC encoding. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right of, and including, the spatial mapping block, are also used to generate the VHT-LTF fields. This is illustrated in Figure 21-21 (Generation of VHT-LTF symbols per frequency segment). A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right of, and including, the spatial mapping block, are also used to generate the VHT-STF field but without the multiplication by $A^k_{VHT\text{-}LTF}$ (defined in Equation (21-40)).

Figure 21-11 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT SU PPDU with LDPC encoding) shows the transmitter blocks used to generate the Data field of a 20 MHz, 40 MHz, and 80 MHz VHT SU PPDU with LDPC encoding for a single frequency segment.

Figure 21-13 (Transmitter block diagram for the Data field of a 160 MHz VHT SU PPDU with BCC encoding) and Figure 21-14 (Transmitter block diagram for the Data field of a 160 MHz VHT SU PPDU with LDPC encoding) show the transmit process for generating the Data field of a 160 MHz VHT SU PPDU with BCC and LDPC encoding, respectively.

Figure 21-15 (Transmitter block diagram for the Data field of an 80+80 MHz VHT SU PPDU with BCC encoding) and Figure 21-16 (Transmitter block diagram for the Data field of an 80+80 MHz VHT SU PPDU with LDPC encoding) show the transmit process for generating the Data field of an 80+80 MHz VHT SU PPDU with BCC and LDPC encoding, respectively.

21.3.4 Overview of the PPDU encoding process

21.3.4.1 General

This subclause provides an overview of the VHT PPDU encoding process.

21.3.4.2 Construction of L-STF

Construct the L-STF field as defined in 21.3.8.2.2 (L-STF definition) with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the L-STF sequence over the CH_BANDWIDTH as described in 21.3.8.2.2 (L-STF definition).

c) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

d) IDFT: Compute the inverse discrete Fourier transform.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

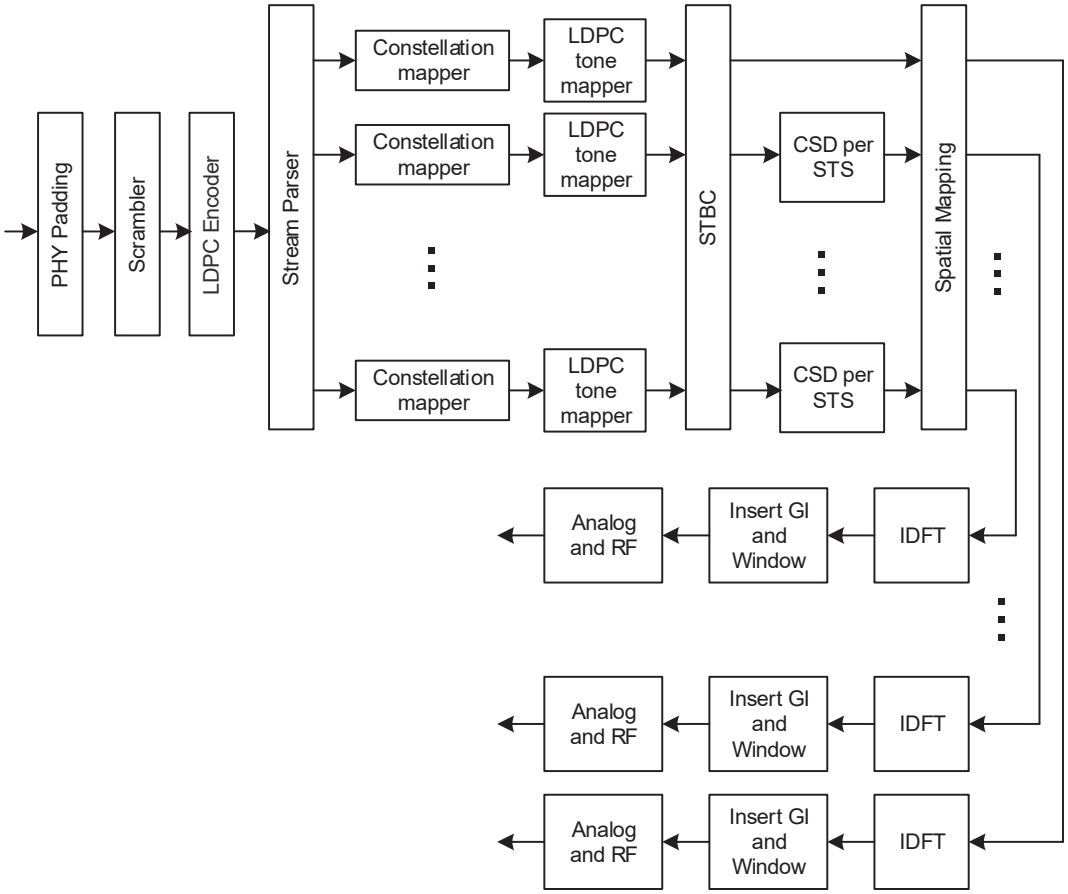

Figure 21-11—Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT SU PPDU with LDPC encoding

e) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1 (Cyclic shift for pre-VHT modulated fields).

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

21.3.4.3 Construction of the L-LTF

Construct the L-LTF field as defined in 21.3.8.2.3 (L-LTF definition) with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the L-LTF sequence over the CH_BANDWIDTH as described in 21.3.8.2.3 (L-LTF definition).

c) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

d) IDFT: Compute the inverse discrete Fourier transform.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

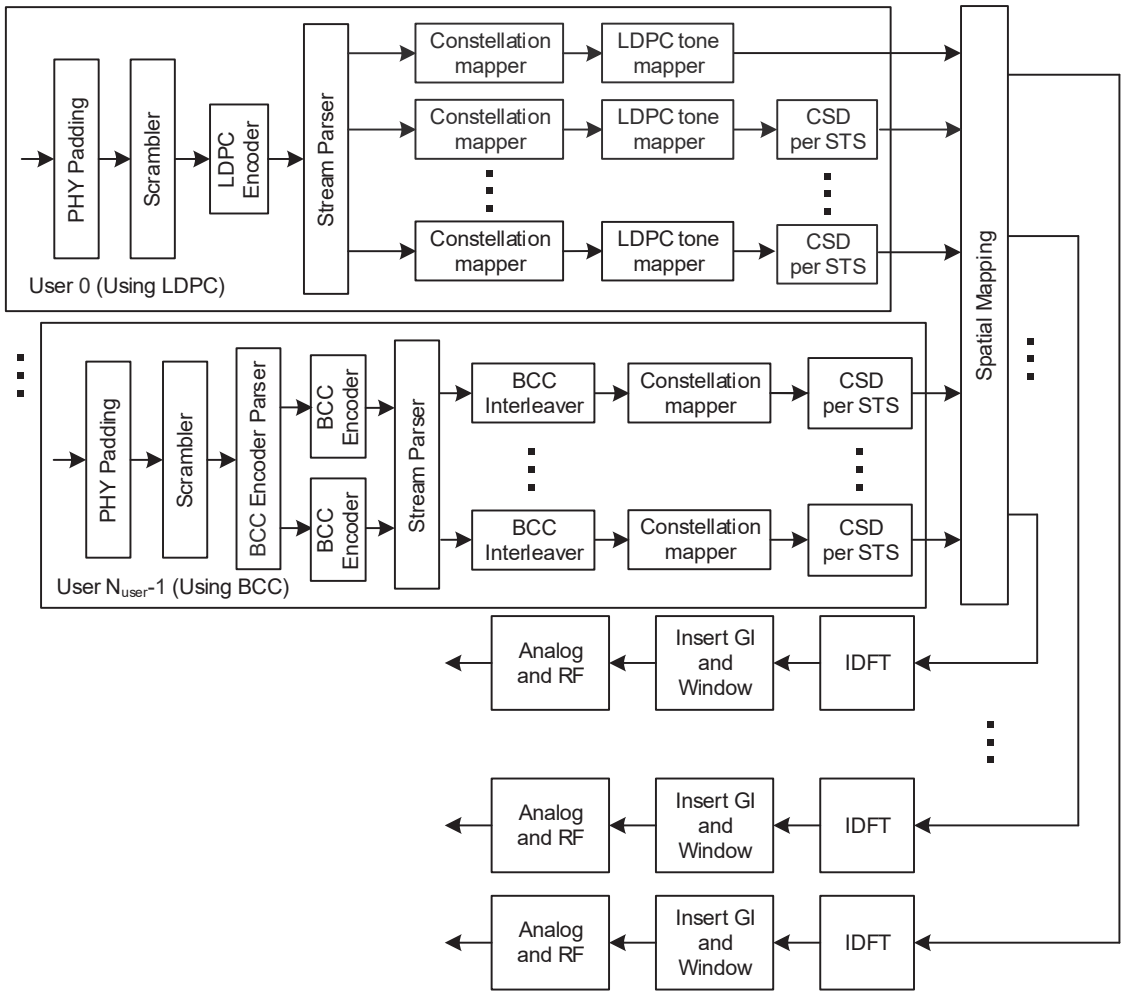

Figure 21-12—Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT MU PPDU

e) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1 (Cyclic shift for pre-VHT modulated fields).

f) Insert GI and apply windowing: Prepend a GI ($2 \times \text{LONG_GI}$) and apply windowing as described in 21.3.7.4 (Transmitted signal).

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

21.3.4.4 Construction of L-SIG

Construct the L-SIG field as the SIGNAL field defined by 21.3.8.2.4 (L-SIG definition) with the following highlights:

a) In a VHT PPDU set the RATE subfield in the SIGNAL field to 6 Mb/s. Set the Length, Parity, and Tail bits in the SIGNAL field as described in 21.3.8.2.4 (L-SIG definition).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

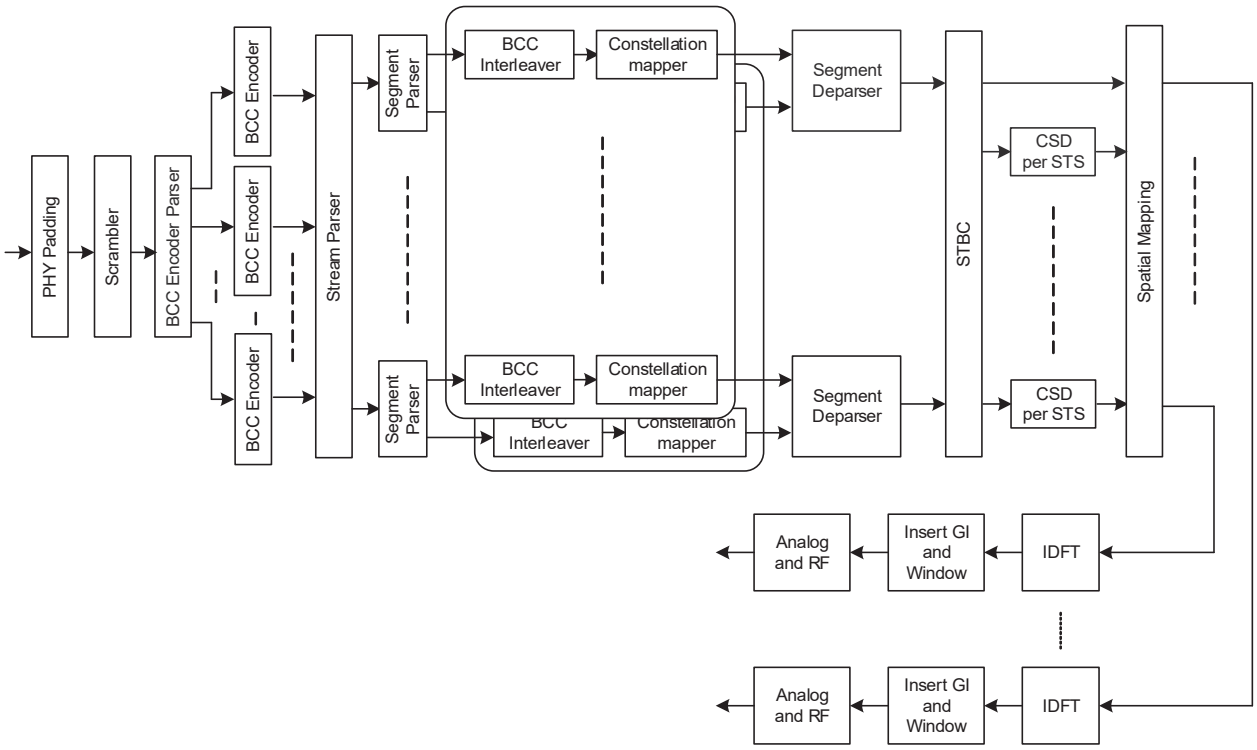

Figure 21-13—Transmitter block diagram for the Data field of a 160 MHz VHT SU PPDU with BCC encoding

b) BCC encoder: Encode the SIGNAL field by a convolutional encoder at the rate of R=1/2 as described in 21.3.10.5.3 (Binary convolutional coding and puncturing).

c) BCC interleaver: Interleave as described in 21.3.10.8 (BCC interleaver).

d) Constellation Mapper: BPSK modulate as described in 21.3.10.9 (Constellation mapping).

e) Pilot insertion: Insert pilots as described in 21.3.10.11 (OFDM modulation).

f) Duplication and phase rotation: Duplicate the L-SIG field over each 20 MHz of the CH_BANDWIDTH. Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

g) IDFT: Compute the inverse discrete Fourier transform.

h) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1 (Cyclic shift for pre-VHT modulated fields).

i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

21.3.4.5 Construction of VHT-SIG-A

The VHT-SIG-A field consists of two symbols, VHT-SIG-A1 and VHT-SIG-A2, as defined in 21.3.8.3.3 (VHT-SIG-A definition) and is constructed as follows:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

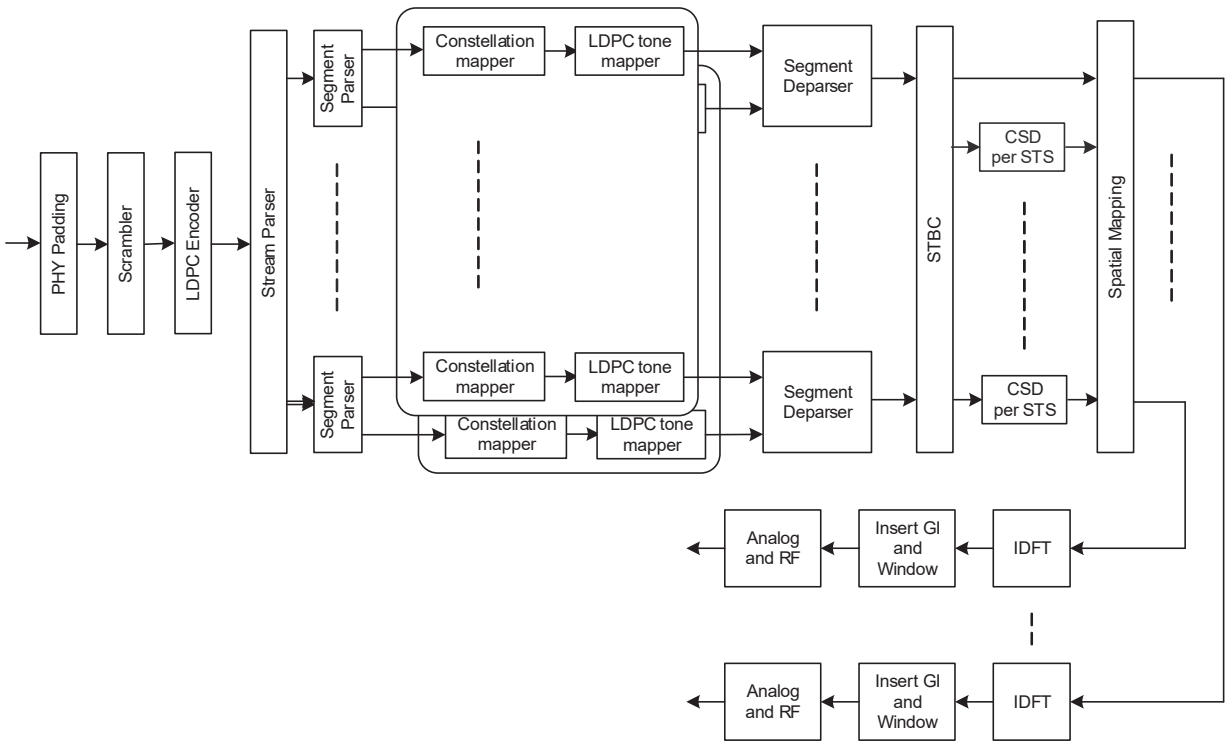

Figure 21-14—Transmitter block diagram for the Data field of a 160 MHz VHT SU PPDU with LDPC encoding

a) Obtain the CH_BANDWIDTH, STBC, GROUP_ID, PARTIAL_AID (SU only), NUM_STS, GI_TYPE, FEC_CODING, MCS (SU only), BEAMFORMED (SU only), NUM_USERS, and TXOP_PS_NOT_ALLOWED from the TXVECTOR. Add the reserved bits, append the calculated CRC, then append the N_{tail} tail bits as shown in 21.3.8.3.3 (VHT-SIG-A definition). This results in 48 uncoded bits.

b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6 (Convolutional encoder)

c) BCC interleaver: Interleave as described in 17.3.5.7 (Data interleaving).

d) Constellation mapper: BPSK modulate the first 48 interleaved bits as described in 17.3.5.8 (Subcarrier modulation mapping) to form the first symbol of VHT-SIG-A. BPSK modulate the second 48 interleaved bits and rotate by 90° counter-clockwise relative to the first symbol to form the second symbol of VHT-SIG-A.

e) Pilot insertion: Insert pilots as described in 117.3.5.9 (Pilot subcarriers).

f) Duplication and phase rotation: Duplicate VHT-SIG-A1 and VHT-SIG-A2 over each 20 MHz of the CH_BANDWIDTH. Apply the appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

g) IDFT: Compute the inverse discrete Fourier transform.

h) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1 (Cyclic shift for pre-VHT modulated fields).

i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

This is an unapproved IEEE Standards Draft, subject to change.

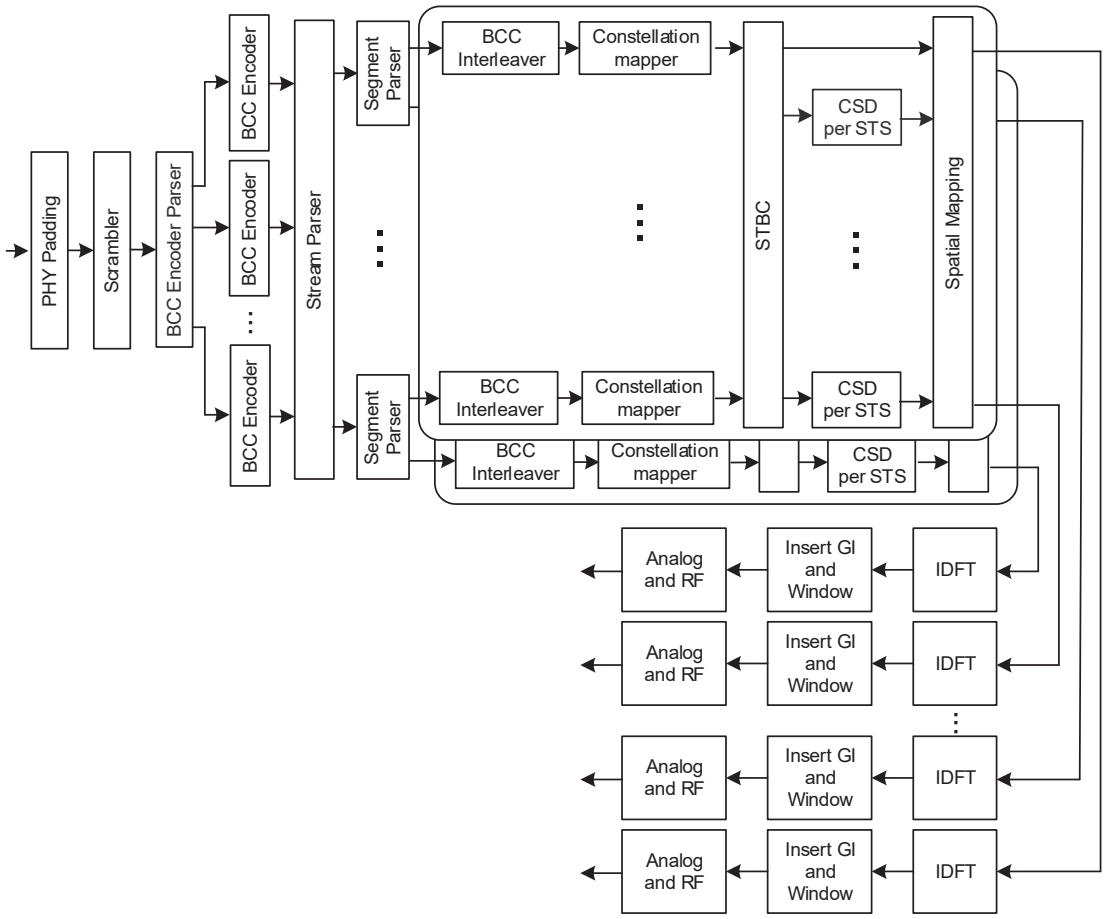

Figure 21-15—Transmitter block diagram for the Data field of an 80+80 MHz VHT SU PPDU with BCC encoding

j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

21.3.4.6 Construction of VHT-STF

The VHT-STF field is defined in 21.3.8.3.4 (VHT-STF definition) and is constructed as follows:

a) Sequence generation: Generate the VHT-STF in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 21.3.8.3.4 (VHT-STF definition).

b) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

c) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields).

d) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1 (Transmission in VHT format).

e) IDFT: Compute the inverse discrete Fourier transform.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

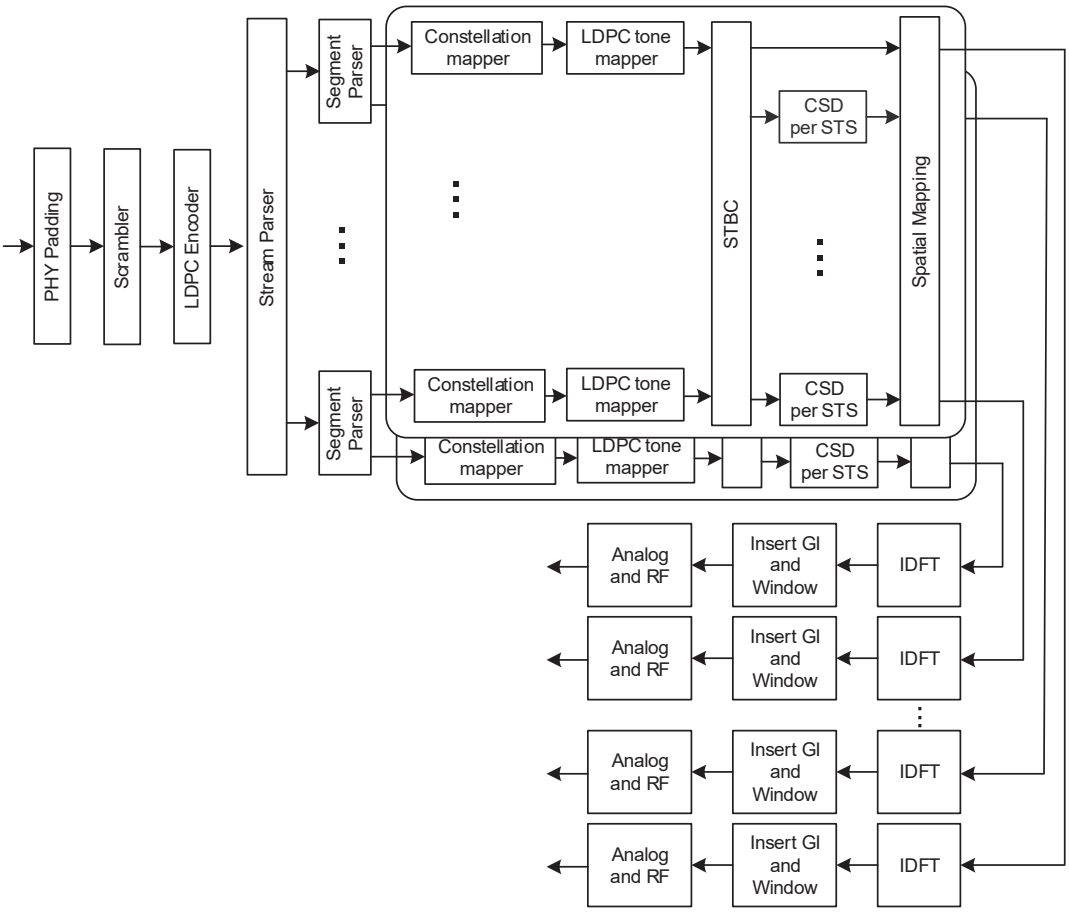

Figure 21-16—Transmitter block diagram for the Data field of an 80+80 MHz VHT SU PPDU with LDPC encoding

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

21.3.4.7 Construction of VHT-LTF

The VHT-LTF field is defined in 21.3.8.3.5 (VHT-LTF definition) and constructed as follows:

a) Sequence generation: Generate the VHT-LTF sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 21.3.8.3.5 (VHT-LTF definition).

b) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

c) $A_{VHT\text{-}LTF}$ matrix mapping: Apply the $P_{VHT\text{-}LTF}$ matrix to the data tones of the VHT-LTF sequence and apply the $R_{VHT\text{-}LTF}$ matrix to the pilot tones as described in 21.3.8.3.5 (VHT-LTF definition).

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

e) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1 (Transmission in VHT format).

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

21.3.4.8 Construction of VHT-SIG-B

The VHT-SIG-B field is constructed per-user as follows:

a) Obtain the VHT-MCS (for MU only) and APEP_LENGTH from the TXVECTOR.

b) VHT-SIG-B bits: Set the VHT-MCS (for MU only) and VHT-SIG-B Length field as described in 21.3.8.3.6 (VHT-SIG-B definition). Add the reserved bits (for SU only) and N_{tail} bits of tail. In an NDP set VHT-SIG-B to the fixed bit pattern for the bandwidth used as described in 21.3.8.3.6 (VHT-SIG-B definition).

c) VHT-SIG-B Bit Repetition: Repeat the VHT-SIG-B bits as a function of CH_BANDWIDTH as defined in 21.3.8.3.6 (VHT-SIG-B definition).

d) BCC encoder: Encode the VHT-SIG-B field using BCC at rate R=1/2 as described in 17.3.5.6 (Convolutional encoder).

e) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission, divide the output bits of the BCC encoder into two frequency subblocks as described in 21.3.10.7 (Segment parser). This block is bypassed for 20 MHz, 40 MHz, and 80 MHz VHT PPDU transmissions.

f) BCC interleaver: Interleave as described in 21.3.10.8 (BCC interleaver).

g) Constellation mapper: Map to a BPSK constellation as defined in 17.3.5.8 (Subcarrier modulation mapping).

h) Segment deparser (if needed): In a 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 21.3.10.9.3 (Segment deparser). This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz VHT PPDU transmissions.

i) Pilot insertion: Insert pilots following the steps described in 21.3.10.10 (Pilot subcarriers).

j) $P_{VHT\text{-}LTF}$ matrix mapping: Apply the mapping of the 1st column of the $P_{VHT\text{-}LTF}$ matrix to the data subcarriers as described in 21.3.8.3.6 (VHT-SIG-B definition). The total number of data and pilot subcarriers is the same as in the Data field.

k) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields).

l) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1 (Transmission in VHT format).

m) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

n) IDFT: Compute the inverse discrete Fourier transform.

o) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

p) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

21.3.4.9 Construction of the Data field in a VHT SU PPDU

21.3.4.9.1 Using BCC

The construction of the Data field in a VHT SU PPDU with BCC encoding proceeds as follows:

a) Insert the CRC calculated for VHT-SIG-B in the SERVICE field as described in 21.3.10.2 (SERVICE field) and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits and tail bits to the PSDU.

c) Scrambler: Scramble the PHY padded data.

d) BCC encoder: Divide the scrambled bits between the encoders by sending bits to different encoders in a round robin manner. The number of encoders is determined by rate-dependent parameters described in 21.5 (Parameters for VHT-MCSs). BCC encode as described in 21.3.10.5.2 (BCC encoder parsing operation) and 21.3.10.5.3 (Binary convolutional coding and puncturing).

e) Stream parser: Rearrange the output of the BCC encoders into blocks as described in 21.3.10.6 (Stream parser).

f) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 21.3.10.7 (Segment parser). This block is bypassed for 20 MHz, 40 MHz, and 80 MHz VHT PPDU transmissions.

g) BCC interleaver: Interleave as described in 21.3.10.8 (BCC interleaver).

h) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM, or 256-QAM constellation points as described in 21.3.10.9 (Constellation mapping).

i) Segment deparser (if needed): In a 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 21.3.10.9.3 (Segment deparser). This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz VHT PPDU transmissions.

j) STBC: Apply STBC as described in 21.3.10.9.4 (Space-time block coding).

k) Pilot insertion: Insert pilots following the steps described in 21.3.10.10 (Pilot subcarriers).

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields).

m) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1 (Transmission in VHT format).

n) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

o) IDFT: In an 80+80 MHz transmission, map each frequency subblock to a separate IDFT. Compute the inverse discrete Fourier transform.

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

21.3.4.9.2 Using LDPC

The construction of the Data field in a VHT SU PPDU with LDPC encoding proceeds as follows:

a) Insert the CRC calculated for VHT-SIG-B in the SERVICE field as described in 21.3.10.2 (SERVICE field) and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU. There are no tail bits.

c) Scrambler: Scramble the PHY padded data.

d) LDPC encoder: The scrambled bits are encoded using the LDPC code with the APEP_LENGTH in the TXVECTOR as described in 21.3.10.5.4 (LDPC coding).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

e) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 21.3.10.6 (Stream parser).

f) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 21.3.10.7 (Segment parser). This block is bypassed for 20 MHz, 40 MHz, and 80 MHz VHT PPDU transmissions.

g) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM or 256-QAM constellation points as described in 21.3.10.9 (Constellation mapping).

h) LDPC tone mapper: The LDPC tone mapping shall be performed on all LDPC encoded streams as described in 21.3.10.9.2 (LDPC tone mapping).

i) Segment deparser (if needed): In a 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 21.3.10.9.3 (Segment deparser). This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz VHT PPDU transmissions.

j) STBC: Apply STBC as described in 21.3.10.9.4 (Space-time block coding).

k) Pilot insertion: Insert pilots following the steps described in 21.3.10.10 (Pilot subcarriers).

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields).

m) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1 (Transmission in VHT format).

n) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

o) IDFT: In an 80+80 MHz transmission, map each frequency subblock to a separate IDFT. Compute the inverse discrete Fourier transform.

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

21.3.4.10 Construction of the Data field in a VHT MU PPDU

21.3.4.10.1 General

In an MU transmission, the PPDU encoding process is performed independently on a per-user basis up to the input of the Spatial Mapping block, except that CSD is performed with a knowledge of the space time stream starting index for that user. All user data is combined and mapped to the transmit chains in the Spatial Mapping block.

21.3.4.10.2 Using BCC

A Data field with BCC encoding is constructed using steps a) to k) in 21.3.4.9.1 (Using BCC), then applying CSD for a VHT MU PPDU (as described in 21.3.8.3.2 (Cyclic shift for VHT modulated fields)).

21.3.4.10.3 Using LDPC

A Data field with LDPC encoding is constructed using steps a) to k) in 21.3.4.9.2 (Using LDPC), then applying CSD as for a VHT MU PPDU (as described in 22.3.8.3.2).

21.3.4.10.4 Combining to form a VHT MU PPDU

The per-user data is combined as follows:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

a) Spatial Mapping: The *Q* matrix is applied as described in 21.3.10.11.1 (Transmission in VHT format). The combining of all user data is done in this block.

b) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 (Transmitted signal) and 21.3.7.5 (Definition of tone rotation).

c) IDFT: Compute the inverse discrete Fourier transform.

d) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as described in 21.3.7.4 (Transmitted signal).

e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 (Transmitted signal) and 21.3.8 (VHT preamble) for details.

21.3.5 VHT modulation and coding scheme (VHT-MCS)

The VHT-MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the VHT-SIG-A field for VHT SU PPDUs and in the VHT-SIG-B field for VHT MU PPDUs. Rate-dependent parameters for the full set of VHT-MCSs are shown in Table 21-30 (VHT-MCSs for mandatory 20 MHz, NSS = 1) to Table 21-61 (VHT-MCSs for optional 160 MHz and 80+80 MHz, NSS = 8) (in 21.5 (Parameters for VHT-MCSs)). These tables give rate-dependent parameters for VHT-MCSs with indices 0 to 9, with number of spatial streams from 1 to 8 and bandwidth options of 20 MHz, 40 MHz, 80 MHz, and either 160 MHz or 80+80 MHz. Equal modulation (EQM) is applied to all streams for a particular user.

21.3.6 Timing-related parameters

Refer to Table 19-6 (Timing-related constants) for timing-related parameters for non-VHT formats.

Table 21-5 (Timing-related constants) defines the timing-related parameters for VHT format.

Table 21-5—Timing-related constants

Parameter	CBW20	CBW40	CBW80	CBW80+80	CBW160	Description
N_{SD}	52	108	234	234	468	Number of complex data numbers per frequency segment
N_{SP}	4	6	8	8	16	Number of pilot values per frequency segment
N_{ST}	56	114	242	242	484	Total number of subcarriers per frequency segment. See NOTE.
N_{SR}	28	58	122	122	250	Highest data subcarrier index per frequency segment
N_{Seg}	1	1	1	2	1	Number of frequency segments
Δ_F	312.5 kHz					Subcarrier frequency spacing
T_{DFT}	3.2 μs					IDFT/DFT period

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 21-5—Timing-related constants *(continued)*

Parameter	CBW20	CBW40	CBW80	CBW80+80	CBW160	Description
T_{GI}	0.8 μs = T_{DFT}/4					Guard interval duration
T_{GI2}	1.6 μs					Double guard interval
T_{GIS}	0.4 μs = T_{DFT}/8					Short guard interval duration
T_{SYML}	4 μs = T_{DFT} + T_{GI} = 1.25 × T_{DFT}					Long GI symbol interval
T_{SYMS}	3.6 μs = T_{DFT} + T_{GIS} = 1.125 × T_{DFT}					Short GI symbol interval
T_{SYM}	T_{SYML} or T_{SYMS} depending on the GI used (see Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields))					Symbol interval
$T_{L\text{-}STF}$	8 μs = 10 x T_{DFT}/4					Non-HT Short Training field duration
$T_{L\text{-}LTF}$	8 μs = 2 x T_{DFT} + T_{GI2}					Non-HT Long Training field duration
$T_{L\text{-}SIG}$	4 μs = T_{SYML}					Non-HT SIGNAL field duration
$T_{VHT\text{-}SIG\text{-}A}$	8 μs = 2T_{SYML}					VHT Signal A field duration
$T_{VHT\text{-}STF}$	4 μs = T_{SYML}					VHT Short Training field duration
$T_{VHT\text{-}LTF}$	4 μs = T_{SYML}					Duration of each VHT-LTF symbol
$T_{VHT\text{-}SIG\text{-}B}$	4 μs = T_{SYML}					VHT Signal B field duration
$N_{service}$	16					Number of bits in the SERVICE field
N_{tail}	6					Number of tail bits per BCC encoder

NOTE—$N_{ST} = N_{SD} + N_{SP}$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 21-6 (Frequently used parameters) defines parameters used frequently in Clause 21 (Very High Throughput (VHT) PHY specification).

Table 21-6—Frequently used parameters

Symbol	Explanation
N_{CBPS}, $N_{CBPS,u}$	Number of coded bits per symbol for user u, $u = 0, ..., N_{user}–1$. For a VHT SU PPDU, $N_{CBPS} = N_{CBPS,0}$ For a VHT MU PPDU, N_{CBPS} is undefined
N_{CBPSS}, $N_{CBPSS,u}$	Number of coded bits per symbol per spatial stream. For the VHT-SIG-B field, N_{CBPSS} is common for all users. $N_{CBPSS} = \begin{cases} N_{SD}, \text{ for a 20 MHz, 40 MHz, 80 MHz, and 160 MHz PPDU} \\ 2N_{SD}, \text{ for an 80+80 MHz PPDU} \end{cases}$ for all users. For the Data field, $N_{CBPSS,u}$ equals the number of coded bits per symbol per spatial stream for user u, $u = 0, ..., N_{user}–1$. For the Data field of a VHT SU PPDU, $N_{CBPSS} = N_{CBPSS,0}$ For the Data field of a VHT MU PPDU, N_{CBPSS} is undefined
N_{CBPSSI}, $N_{CBPSSI,u}$	Number of coded bits per symbol per spatial stream per BCC interleaver block. For a VHT SU PPDU, $N_{CBPSSI} = \begin{cases} N_{CBPSS}, \text{ for a 20 MHz, 40 MHz, or 80 MHz PPDU} \\ \frac{N_{CBPSS}}{2}, \text{ for a 160 MHz or 80+80 MHz PPDU} \end{cases}$ For a VHT MU PPDU for user u, $u = 0, ..., N_{user}–1$ $N_{CBPSSI,u} = \begin{cases} N_{CBPSS,u}, \text{ for a 20 MHz, 40 MHz, or 80 MHz PPDU} \\ \frac{N_{CBPSS,u}}{2}, \text{ for a 160 MHz or 80+80 MHz PPDU} \end{cases}$ For a VHT MU PPDU, N_{CBPSSI} is undefined.
N_{DBPS}, $N_{DBPS,u}$	Number of data bits per symbol for user u, $u = 0, ..., N_{user}–1$. For a VHT SU PPDU, $N_{DBPS} = N_{DBPS,0}$ For a VHT MU PPDU, N_{DBPS} is undefined
N_{BPSCS}, $N_{BPSCS,u}$	Number of coded bits per subcarrier per spatial stream for user u, $u = 0, ..., N_{user}–1$. For a VHT SU PPDU, $N_{BPSCS} = N_{BPSCS,0}$ For a VHT MU PPDU, N_{BPSCS} is undefined
N_{RX}	Number of receive chains
N_{user}	For pre-VHT modulated fields, $N_{user} = 1$. For VHT modulated fields, N_{user} represents the number of users in the transmission (equal to the TXVECTOR parameter NUM_USERS).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 21-6—Frequently used parameters *(continued)*

Symbol	Explanation
N_{STS}, $N_{STS,u}$	For pre-VHT modulated fields, $N_{STS,u} = 1$ (see NOTE). For VHT modulated fields, $N_{STS,u}$ is the number of space-time streams for user u, $u = 0, \ldots, N_{user}-1$. For a VHT SU PPDU, $N_{STS} = N_{STS,0}$. For a VHT MU PPDU, N_{STS} is undefined.
$N_{STS,total}$	For VHT modulated fields, $N_{STS,total}$ is the total number of space-time streams in a PPDU. $N_{STS,total} = \sum_{u=0}^{N_{user}-1} N_{STS,u}$ For pre-VHT modulated fields, $N_{STS,total}$ is undefined. Note that $N_{STS,total} = N_{STS}$ for a VHT SU PPDU.
N_{SS}, $N_{SS,u}$	Number of spatial streams. For the VHT-SIG-B field, $N_{SS} = 1$ for each user. For the Data field, $N_{SS,u}$ is the number of spatial streams for user u, $u = 0, \ldots, N_{user}-1$. For the Data field of a VHT SU PPDU, $N_{SS} = N_{SS,0}$. For the Data field of a VHT MU PPDU, N_{SS} is undefined.
N_{TX}	Number of transmit chains
N_{ES}, $N_{ES,u}$	The number of BCC encoders. For the VHT-SIG-B field, $N_{ES} = 1$ for each user. For a Data field encoded using BCC, $N_{ES,u}$ is the number of BCC encoders for user u, $u = 0, \ldots, N_{user}-1$. For the Data field encoded using LDPC, $N_{ES} = 1$ for a VHT SU PPDU and $N_{ES,u} = 1$ for a VHT MU PPDU for user u, $u = 0, \ldots N_{user}-1$. For the Data field of a VHT SU PPDU, $N_{ES} = N_{ES,0}$. For the Data field of a VHT MU PPDU, N_{ES} is undefined.
$N_{VHT\text{-}LTF}$	Number of VHT-LTF symbols (see 21.3.8.3.5 (VHT-LTF definition))
R, R_u	R_u is the coding rate for user u, $u = 0, \ldots, N_{user}-1$. For a VHT SU PPDU, $R = R_0$ For a VHT MU PPDU, R is undefined
M_u	For pre-VHT modulated fields, $M_u = 0$. For VHT modulated fields, $M_0 = 0$ for $u = 0$ and $M_u = \sum_{u'=0}^{u-1} N_{STS,u'}$ for $u = 1, \ldots N_{user}-1$.
NOTE—For pre-VHT modulated fields, u is 0 only since $N_{user} = 1$.

21.3.7 Mathematical description of signals

21.3.7.1 Notation

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5 (Mathematical conventions in the signal descriptions). In addition, the following notational conventions are used in Clause 21 (Very High Throughput (VHT) PHY specification):

$[Q]_{m,n}$ indicates the element in row m and column n of matrix Q, where $1 \le m \le N_{row}$ and $1 \le n \le N_{col}$

N_{row} and N_{col} are the number of rows and columns, respectively, of the matrix Q

$[Q]_{M:N}$ indicates a matrix consisting of columns M to N of matrix Q

21.3.7.2 Subcarrier indices in use

For description on subcarrier indices over which the signal is transmitted for non-HT and HT PPDUs, see 19.3.7 (Mathematical description of signals).

For a 20 MHz VHT PPDU transmission, the 20 MHz is divided into 64 subcarriers. The signal is transmitted on subcarriers –28 to –1 and 1 to 28, with 0 being the center (DC) subcarrier.

For a 40 MHz VHT PPDU transmission, the 40 MHz is divided into 128 subcarriers. The signal is transmitted on subcarriers –58 to –2 and 2 to 58.

For an 80 MHz VHT PPDU transmission, the 80 MHz is divided into 256 subcarriers. The signal is transmitted on subcarriers –122 to –2 and 2 to 122.

For a 160 MHz VHT PPDU transmission, the 160 MHz is divided into 512 subcarriers. The signal is transmitted on subcarriers –250 to –130, –126 to –6, 6 to 126, and 130 to 250.

For an 80+80 MHz VHT PPDU transmission, each 80 MHz frequency segment is divided into 256 subcarriers. In each frequency segment, the signal is transmitted on subcarriers –122 to –2 and 2 to 122.

21.3.7.3 Channel frequencies

Let

$$f_{c,\,\mathrm{idx0}} = \mathrm{dot11CurrentChannelCenterFrequencyIndex0} \quad (21\text{-}1)$$

$$f_{c,\,\mathrm{idx1}} = \mathrm{dot11CurrentChannelCenterFrequencyIndex1} \quad (21\text{-}2)$$

$$f_{\mathrm{P20,\,idx}} = \mathrm{dot11CurrentPrimaryChannel} \quad (21\text{-}3)$$

$$f_{\mathrm{CH,\,start}} = \mathrm{dot11ChannelStartingFactor} \times 500\ \mathrm{kHz} \quad (21\text{-}4)$$

where

dot11CurrentChannelCenterFrequencyIndex0, dot11CurrentChannelCenterFrequencyIndex1, and dot11CurrentPrimaryChannel are defined in Table 21-22 (Fields to specify VHT channels).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When dot11CurrentChannelWidth (see Table 21-22 (Fields to specify VHT channels)) is 20 MHz, $f_{\mathrm{P20,\,idx}} = f_{c,\,\mathrm{idx0}}$. For dot11CurrentChannelWidth greater than 20 MHz, $f_{\mathrm{P20,\,idx}}$ and $f_{c,\,\mathrm{idx0}}$ shall have the relationship specified in Equation (21-5).

$$f_{\mathrm{P20,\,idx}} = f_{c,\,\mathrm{idx0}} - 4 \cdot \left(\frac{N_{\mathrm{20MHz}}}{2} - n_{\mathrm{P20}} \right) + 2 \tag{21-5}$$

where

$$N_{\mathrm{20MHz}} = \begin{cases} 2, \text{ if dot11CurrentChannelWidth indicates 40 MHz} \\ 4, \text{ if dot11CurrentChannelWidth indicates 80 MHz and 80+80 MHz} \\ 8, \text{ if dot11CurrentChannelWidth indicates 160 MHz} \end{cases}$$

n_{P20} is an integer with possible range $0 \le n_{\mathrm{P20}} \le N_{\mathrm{20MHz}} - 1$

When dot11CurrentChannelWidth is 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz,

— The primary 20 MHz channel is the channel with 20 MHz bandwidth centered at $f_{\mathrm{CH,\,start}} + 5 \times f_{\mathrm{P20,\,idx}}$ MHz.

— The secondary 20 MHz channel is the channel with 20 MHz bandwidth centered at $f_{\mathrm{CH,\,start}} + 5 \times f_{S20,\,\mathrm{idx}}$, where $f_{S20,\,\mathrm{idx}}$ is given in Equation (21-6).

$$f_{\mathrm{S20,\,idx}} = \begin{cases} f_{\mathrm{P20,\,idx}} + 4, & \text{if } n_{\mathrm{P20}} \text{ is even} \\ f_{\mathrm{P20,\,idx}} - 4, & \text{if } n_{\mathrm{P20}} \text{ is odd} \end{cases} \tag{21-6}$$

When dot11CurrentChannelWidth is 80 MHz, 160 MHz, or 80+80 MHz,

— The primary 40 MHz channel is the channel with 40 MHz bandwidth centered at $f_{\mathrm{CH,\,start}} + 5 \times f_{\mathrm{P40,\,idx}}$ MHz, where $f_{\mathrm{P40,\,idx}}$ is given in Equation (21-7).

— The secondary 40 MHz channel is the channel with 40 MHz bandwidth centered at $f_{\mathrm{CH,\,start}} + 5 \times f_{S40,\,\mathrm{idx}}$ MHz, where $f_{S40,\,\mathrm{idx}}$ is given in Equation (21-8).

$$f_{\mathrm{P40,\,idx}} = f_{c,\,\mathrm{idx0}} - 8 \cdot \left(\frac{N_{\mathrm{20MHz}}}{4} - n_{\mathrm{P40}} \right) + 4 \tag{21-7}$$

$$f_{\mathrm{S40,\,idx}} = \begin{cases} f_{\mathrm{P40,\,idx}} + 8, & \text{if } n_{\mathrm{P40}} \text{ is even} \\ f_{\mathrm{P40,\,idx}} - 8, & \text{if } n_{\mathrm{P40}} \text{ is odd} \end{cases} \tag{21-8}$$

where $n_{\mathrm{P40}} = \lfloor n_{\mathrm{P20}} / 2 \rfloor$

When dot11CurrentChannelWidth is 160 MHz,

— The primary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\mathrm{CH,\,start}} + 5 \times f_{\mathrm{P80,\,idx}}$ MHz, where $f_{\mathrm{P80,\,idx}}$ is given in Equation (21-9).

— The secondary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\mathrm{CH,\,start}} + 5 \times f_{\mathrm{S80,\,idx}}$ MHz where $f_{\mathrm{S80,\,idx}}$ is given in Equation (21-10).

$$f_{\mathrm{P80,\,idx}} = f_{c,\,\mathrm{idx0}} - 16 \cdot \left(\frac{N_{\mathrm{20MHz}}}{8} - n_{\mathrm{P80}} \right) + 8 \tag{21-9}$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$f_{\text{S80, idx}} = \begin{cases} f_{\text{P80, idx}} + 16, & \text{if } n_{\text{P80}} \text{ is even} \\ f_{\text{P80, idx}} - 16, & \text{if } n_{\text{P80}} \text{ is odd} \end{cases} \quad (21\text{-}10)$$

where $n_{\text{P80}} = \lfloor n_{\text{P20}} / 4 \rfloor$.

When dot11CurrentChannelWidth is 80+80 MHz,

— The primary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{\text{P80, idx}}$ MHz, where $f_{\text{P80, idx}} = f_{c,\text{ idx0}}$.

— The secondary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{\text{S80, idx}}$ MHz where $f_{\text{S80, idx}} = f_{c,\text{ idx1}}$.

21.3.7.4 Transmitted signal

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (21-11).

$$r_{RF}^{(i_{Seg}, i_{TX})}(t) = \text{Re}\left\{ \frac{1}{\sqrt{N_{Seg}}} r_{\text{PPDU}}^{(i_{Seg}, i_{TX})}(t) \exp(j2\pi f_c^{(i_{Seg})} t) \right\}, \quad (21\text{-}11)$$

$$i_{Seg} = 0, \ldots, N_{Seg} - 1; \quad i_{TX} = 1, \ldots, N_{TX}$$

where

N_{Seg} represents the number of frequency segments in the transmit signal, as defined in Table 21-5 (Timing-related constants);

$r_{\text{PPDU}}^{(i_{Seg}, i_{TX})}(t)$ represents the complex baseband signal of frequency segment i_{Seg} and transmit chain i_{TX};

$f_c^{(i_{Seg})}$ represents the center frequency of the portion of the PPDU transmitted in frequency segment i_{Seg}. Table 21-7 (Center frequency of the portion of the PPDU transmitted in frequency segment iSeg) shows $f_c^{(i_{Seg})}$ as a function of the channel starting frequency and dot11CurrentChannelWidth (see Table 21-22 (Fields to specify VHT channels)) where $f_{\text{P20, idx}}$, $f_{\text{P40, idx}}$, and $f_{\text{P80, idx}}$ are given in Equation (21-4), Equation (21-5), Equation (21-7), and Equation (21-9), respectively.

Table 21-7—Center frequency of the portion of the PPDU transmitted in frequency segment i_{Seg}

dot11CurrentChannelWidth	CH_BANDWIDTH	$f_c^{(i_{Seg})} = f_{\text{CH, start}} + 5 \times f_{(i_{Seg})}$

160 MHz	CBW20	$f_{\text{P20, idx}}$	–
	CBW40	$f_{\text{P40, idx}}$	–
	CBW80	$f_{\text{P80, idx}}$	–
	CBW160	$f_{c,\text{ idx0}}$	–
80+80 MHz	CBW20	$f_{\text{P20, idx}}$	–
	CBW40	$f_{\text{P40, idx}}$	–
	CBW80	$f_{\text{P80, idx}}$	–
	CBW80+80	$\min(f_{c,\text{ idx0}}, f_{c,\text{ idx1}})$	$\max(f_{c,\text{ idx0}}, f_{c,\text{ idx1}})$

NOTE—Transmitted signals might have different impairments such as phase offset or phase noise between the two frequency segments, which is not shown in Equation (21-11) for simplicity. See 21.3.17.3 (Transmit center frequency and symbol clock frequency tolerance).

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The timing boundaries for the various fields are shown in Figure 21-17 (Timing boundaries for VHT PPDU fields) where N_{VHTLTF} is the number of VHT-LTF symbols and is defined in Table 21-13 (Number of VHT-LTFs required for different numbers of space-time streams).

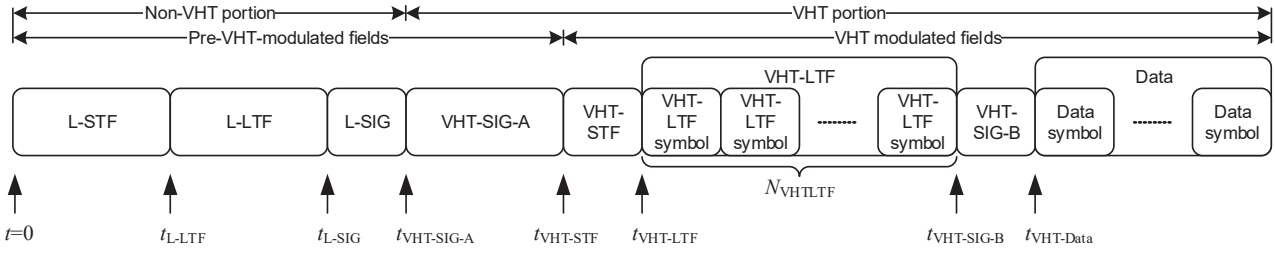

Figure 21-17—Timing boundaries for VHT PPDU fields

The time offset, t_{Field}, determines the starting time of the corresponding field relative to the start of L-STF ($t = 0$).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The signal transmitted on frequency segment i_{Seg} and transmit chain i_{TX} shall be as shown in Equation (21-12).

$$\begin{aligned} r_{\text{PPDU}}^{(i_{Seg}, i_{TX})}(t) = {} & r_{\text{L-STF}}^{(i_{Seg}, i_{TX})}(t) + r_{\text{L-LTF}}^{(i_{Seg}, i_{TX})}(t - t_{\text{L-LTF}}) \\ & + r_{\text{L-SIG}}^{(i_{Seg}, i_{TX})}(t - t_{\text{L-SIG}}) + r_{\text{VHT-SIG-A}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-SIG-A}}) \\ & + r_{\text{VHT-STF}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-STF}}) + r_{\text{VHT-LTF}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-LTF}}) \\ & + r_{\text{VHT-SIG-B}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-SIG-B}}) + r_{\text{VHT-Data}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-Data}}) \end{aligned} \quad (21\text{-}12)$$

where

$0 \le i_{Seg} \le N_{Seg} - 1$

$1 \le i_{TX} \le N_{TX}$

$t_{\text{L-LTF}} = T_{\text{L-STF}}$

$t_{\text{L-SIG}} = t_{\text{L-LTF}} + T_{\text{L-LTF}}$

$t_{\text{VHT-SIG-A}} = t_{\text{L-SIG}} + T_{\text{L-SIG}}$

$t_{\text{VHT-STF}} = t_{\text{VHT-SIG-A}} + T_{\text{VHT-SIG-A}}$

$t_{\text{VHT-LTF}} = t_{\text{VHT-STF}} + T_{\text{VHT-STF}}$

$t_{\text{VHT-SIG-B}} = t_{\text{VHT-LTF}} + N_{VHT\text{-}LTF} T_{\text{VHT-LTF}}$

$t_{\text{VHT-Data}} = t_{\text{VHT-SIG-B}} + T_{\text{VHT-SIG-B}}$

Each field, $r_{Field}^{(i_{Seg}, i_{TX})}(t)$, is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (21-13).

$$\begin{aligned} r_{\text{Subfield}}^{(i_{Seg}, i_{TX})}(t) = {} & \frac{1}{\sqrt{N_{\text{Field}}^{\text{Tone}} N_{\text{Norm}}}} w_{T_{\text{Subfield}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,u}} \left[Q_k^{(i_{Seg})} \right]_{i_{TX}, (M_u + m)} \Upsilon_{k, BW} X_{k,u}^{(i_{Seg}, m)} \\ & \exp(j 2\pi k \Delta_F (t - T_{\text{GI, Field}} - T_{\text{CS, VHT}} (M_u + m))) \end{aligned} \quad (21\text{-}13)$$

This general representation holds for all subfields. The total power of the time domain VHT modulated field signals summed over all transmit chains should not exceed the total power of the time domain pre-VHT modulated field signals summed over all transmit chains. For notational simplicity, the parameter BW is omitted from some bandwidth dependent terms.

In Equation (21-13) the following notions are used:

$N_{\text{Field}}^{\text{Tone}}$ Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields) summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment.

N_{Norm} For pre-VHT modulated fields, $N_{\text{Norm}} = N_{TX}$. For VHT modulated fields, $N_{\text{Norm}} = N_{STS,total}$ where $N_{STS,total}$ is given in Table 21-6 (Frequently used parameters).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 21-8—Tone scaling factor and guard interval duration values for PHY fields

Field	$N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment				Guard interval duration
	20 MHz	40 MHz	80 MHz	160 MHz	
L-STF	12	24	48	96	-
L-LTF	52	104	208	416	T_{GI2}
L-SIG	52	104	208	416	T_{GI}
VHT-SIG-A	52	104	208	416	T_{GI}
VHT-STF	12	24	48	96	-
VHT-LTF	56	114	242	484	T_{GI}
VHT-SIG-B	56	114	242	484	T_{GI}
VHT-Data	56	114	242	484	T_{GI} or T_{GIS} (see NOTE 2)
NON_HT_DUP_OFDM-Data (see NOTE 1)	-	104	208	416	T_{GI}

NOTE 1—For notational convenience, NON_HT_DUP_OFDM-Data is used as a label for the Data field of a NON_HT PPDU with format type NON_HT_DUP_OFDM.

NOTE 2—T_{GI} denotes guard interval duration when TXVECTOR parameter GI_TYPE equals LONG_GI, T_{GIS} denotes short guard interval duration when TXVECTOR parameter GI_TYPE equals SHORT_GI.

$w_{T_{\text{Subfield}}}(t)$ is a windowing function. An example function, $w_{T_{\text{Subfield}}}(t)$, is given in 17.3.2.5 (Mathematical conventions in the signal descriptions). T_{Subfield} is $T_{L\text{-}STF}$ for L-STF, $T_{L\text{-}LTF}$ for L-LTF, $T_{L\text{-}SIG}$ for L-SIG, T_{SYML} for VHT-SIG-A, $T_{VHT\text{-}STF}$ for VHT-STF, $T_{VHT\text{-}LTF}$ for VHT-LTF and $T_{VHT\text{-}SIG\text{-}B}$ for VHT-SIG-B. T_{Subfield} is T_{SYM} for VHT-Data, that is T_{SYML} when not using the short guard interval (Short GI field of VHT-SIG-A is 0) and T_{SYMS} when using the short guard interval (Short GI field of VHT-SIG-A is 1).

$Q_k^{(i_{Seg})}$ is the spatial mapping matrix for the subcarrier k in frequency segment i_{Seg}. For pre-VHT modulated fields, $Q_k^{(i_{Seg})}$ is a column vector with N_{TX} elements with element i_{TX} being $\exp(-j2\pi k\Delta_F T_{\text{CS}}^{i_{TX}})$, where $T_{\text{CS}}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} whose values are given in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU). For VHT modulated fields, $Q_k^{(i_{Seg})}$ is a matrix with N_{TX} rows and $N_{STS,\,total}$ columns.

$\Upsilon_{k,\,\text{BW}}$ is defined in 21.3.7.5 (Definition of tone rotation)

Δ_F is the subcarrier frequency spacing given in Table 21-5 (Timing-related constants).

$X_{k,\,u}^{(i_{Seg},\,m)}$ is the frequency domain symbol in subcarrier k of user u for frequency segment i_{Seg} of space-time stream m. Some of the $X_{k,\,u}^{(i_{Seg},\,m)}$ within $-N_{SR} \le k \le N_{SR}$ have a value of 0. Examples of such cases include the DC tones, guard tones on each side of the transmit spectrum, as well as

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

the unmodulated tones of L-STF and VHT-STF fields. Note that the multiplication matrices $A^k_{VHT\text{-}LTF}$ and $P_{VHT\text{-}LTF}$ are included in the calculation of $X^{(i_{Seg},\,m)}_{k,\,u}$ for the VHT-LTF and VHT-SIG-B fields, respectively.

$T_{\text{GI, Field}}$ is the guard interval duration used for each OFDM symbol in the field. For L-STF and VHT-STF, $T_{\text{GI, Field}} = T_{\text{GI}}$ but it can be omitted from Equation (21-13) due to the periodic property of L-STF and VHT-STF over every 0.8 μs. For the L-SIG, VHT-SIG-A, VHT-LTF, and VHT-SIG-B fields, $T_{\text{GI, Field}}$ is defined in the "Guard interval duration" column of Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields).

$T_{\text{CS, VHT}}(l)$ For pre-VHT modulated fields, $T_{\text{CS, VHT}}(l) = 0$. For VHT modulated fields, $T_{\text{CS, VHT}}(l)$ represents the cyclic shift per space-time stream, whose value is defined in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU).

M_u is defined in Table 21-6 (Frequently used parameters).

21.3.7.5 Definition of tone rotation

The function $\Upsilon_{k,\,\text{BW}}$ is used to represent a rotation of the tones. BW in $\Upsilon_{k,\,\text{BW}}$ is determined by the TXVECTOR parameter CH_BANDWIDTH as defined in Table 21-9 (CH_BANDWIDTH and).

Table 21-9—CH_BANDWIDTH and $\Upsilon_{k,\,\text{BW}}$

CH_BANDWIDTH	$\Upsilon_{k,\,\text{BW}}$
CBW20	$\Upsilon_{k,\,20}$
CBW40	$\Upsilon_{k,\,40}$
CBW80	$\Upsilon_{k,\,80}$
CBW160	$\Upsilon_{k,\,160}$
CBW80+80	$\Upsilon_{k,\,80}$ per frequency segment

For a 20 MHz PPDU transmission,

$$\Upsilon_{k,\,20} = 1 \tag{21-14}$$

For a 40 MHz PPDU transmission,

$$\Upsilon_{k,\,40} = \begin{cases} 1, & k < 0 \\ j, & k \geq 0 \end{cases} \tag{21-15}$$

For an 80 MHz PPDU transmission,

$$\Upsilon_{k,\,80} = \begin{cases} 1, & k < -64 \\ -1, & k \geq -64 \end{cases} \tag{21-16}$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For an 80+80 MHz PPDU transmission, each 80 MHz frequency segment shall use the phase rotation for 80 MHz PPDU transmissions as defined in Equation (21-16).

For a 160 MHz PPDU transmission,

$$\Upsilon_{k,160} = \begin{cases} 1, & k < -192 \\ -1, & -192 \le k < 0 \\ 1, & 0 \le k < 64 \\ -1, & 64 \le k \end{cases} \quad (21\text{-}17)$$

21.3.8 VHT preamble

21.3.8.1 Introduction

A VHT preamble is defined to carry the required information to operate in either single user or multi-user mode. To maintain compatibility with non-VHT STAs, specific non-VHT fields are defined that can be received by non-VHT STAs compliant with Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) or Clause 19 (High Throughput (HT) PHY specification). The non-VHT fields are followed by VHT fields specific to VHT STAs.

21.3.8.2 Non-VHT portion of VHT format preamble

21.3.8.2.1 Cyclic shift for pre-VHT modulated fields

The cyclic shift value $T_{CS}^{i_{TX}}$ for the L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU for transmit chain i_{TX} out of a total of N_{TX} are defined in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU).

21.3.8.2.2 L-STF definition

The L-STF field for a 20 MHz or 40 MHz transmission is defined by Equation (19-8) and Equation (19-9), respectively, in 19.3.9.3.3 (L-STF definition). For 80 MHz, the L-STF field is defined by Equation (21-18). Note that these equations do not include the phase rotation per 20 MHz subchannel.

$$S_{-122,122} = \{S_{-58,58}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, S_{-58,58}\} \quad (21\text{-}18)$$

where

$S_{-58,58}$ is defined in Equation (19-9)

For 160 MHz, the L-STF is defined by Equation (21-19).

$$S_{-250,250} = \{S_{-122,122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, S_{-122,122}\} \quad (21\text{-}19)$$

where

$S_{-122,122}$ is defined in Equation (21-18)

For an 80+80 MHz transmission, each 80 MHz frequency segment shall use the L-STF pattern for the 80 MHz ($S_{-122,122}$) defined in Equation (21-18).

This is an unapproved IEEE Standards Draft, subject to change.

Table 21-10—Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU

$T_{CS}^{i_{TX}}$ values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU									
Total number of transmit chains (N_{TX}) per frequency segment	Cyclic shift for transmit chain i_{TX} (in units of ns)								
	1	2	3	4	5	6	7	8	>8
1	0	–	–	–	–	–	–	–	–
2	0	–200	–	–	–	–	–	–	–
3	0	–100	–200	–	–	–	–	–	–
4	0	–50	–100	–150	–	–	–	–	–
5	0	–175	–25	–50	–75	–	–	–	–
6	0	–200	–25	–150	–175	–125	–	–	–
7	0	–200	–150	–25	–175	–75	–50	–	–
8	0	–175	–150	–125	–25	–100	–50	–200	–
>8	0	–175	–150	–125	–25	–100	–50	–200	Between –200 and 0 inclusive

The time domain representation of the signal on frequency segment i_{Seg} and transmit chain i_{TX} shall be as specified in Equation (21-20).

$$r_{\text{L-STF}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{L-STF}}^{\text{Tone}} N_{\text{TX}}}} w_{T_{\text{L-STF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \Upsilon_{k,\text{BW}} S_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{TX}})) \quad (21\text{-}20)$$

where

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} with a value given in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU)

$\Upsilon_{k,\text{BW}}$ is defined by Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$N_{\text{L-STF}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

21.3.8.2.3 L-LTF definition

For a 20 MHz or 40 MHz transmission, the L-LTF pattern in the VHT preamble is defined by Equation (20-11) and Equation (20-12) in 19.3.9.3.4 (L-LTF definition), respectively. For an 80 MHz transmission, the L-LTF pattern is defined by Equation (21-21). Note that these equations do not include the phase rotation per 20 MHz subchannel.

$$L_{-122,122} = \{L_{-58,58}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, L_{-58,58}\} \quad (21\text{-}21)$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where

$L_{-58,\,58}$ is defined in Equation (19-12)

For a 160 MHz transmission, the L-LTF is defined by Equation (21-22). Note that this equation does not include the phase rotations per 20 MHz subchannel.

$$L_{-250,\,250} = \{L_{-122,\,122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, L_{-122,\,122}\} \quad (21\text{-}22)$$

where

$L_{-122,\,122}$ is given by Equation (21-21)

For an 80+80 MHz transmission, each 80 MHz frequency segment shall use the L-LTF pattern for the 80 MHz L-LTF pattern ($L_{-122,\,122}$) defined in Equation (21-21).

The time domain representation of the signal on frequency segment i_{Seg} and transmit chain i_{TX} shall be as defined in Equation (21-23).

$$r_{\text{L-LTF}}^{(i_{Seg},\,i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{L-LTF}}^{\text{Tone}} N_{\text{TX}}}} w_{T_{\text{L-LTF}}}(t) \sum_{k\,=\,-N_{SR}}^{N_{SR}} \Upsilon_{k,\,\text{BW}} L_k \exp(j2\pi k\Delta_F(t - T_{\text{GI2}} - T_{CS}^{i_{TX}})) \quad (21\text{-}23)$$

where

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU)

$\Upsilon_{k,\,\text{BW}}$ is defined by Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

$N_{\text{L-LTF}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

21.3.8.2.4 L-SIG definition

The L-SIG field is used to communicate rate and length information. The structure of the L-SIG field is defined in Figure 17-5 (SIGNAL field bit assignment).

In a VHT PPDU, the RATE field shall be set to the value representing 6 Mb/s in the 20 MHz channel spacing column of Table 17-6 (Contents of the SIGNAL field). In a non-HT duplicate PPDU, the RATE field is defined in 17.3.4.2 (RATE field) using the L_DATARATE parameter in the TXVECTOR.

The LENGTH field shall be set to the value given by Equation (21-24).

$$\text{Length} = \frac{\text{TXTIME} - 20}{4} \times 3 - 3 \quad (21\text{-}24)$$

where

TXTIME (in μs) is defined in 21.4.3 (TXTIME and PSDU_LENGTH calculation)

The LSB of the binary expression of the Length value shall be mapped to B5. In a non-HT duplicate PPDU, the LENGTH field is defined in 17.3.4.3 (PHY LENGTH field) using the L_LENGTH parameter in the TXVECTOR.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The Reserved (R) field shall be set to 0.

The Parity (P) field has the even parity of bits 0-16.

The SIGNAL TAIL field shall be set to 0.

The L-SIG field shall be encoded, interleaved, and mapped following the steps described in 17.3.5.6 (Convolutional encoder), 17.3.5.7 (Data interleaving), and 17.3.5.8 (Subcarrier modulation mapping). The stream of 48 complex numbers generated by these steps is denoted by d_k, $k = 0, \ldots, 47$. Pilots shall be inserted as described in 17.3.5.9 (Pilot subcarriers). The time domain waveform of the L-SIG field shall be as given by Equation (21-25).

$$r_{\text{L-SIG}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{L-SIG}}^{\text{Tone}} N_{TX}}} w_{T_{\text{L-SIG}}}(t) \cdot \sum_{i_{\text{BW}}=0}^{N_{20\text{MHz}}-1} \sum_{k=-26}^{26} \left(\Upsilon_{(k-K_{\text{Shift}}(i_{\text{BW}})),\,\text{BW}}(D_{k,20} + p_0 P_k) \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}})) \right) \quad (21\text{-}25)$$

where

$N_{20\text{MHz}}$ is defined in 21.3.7.3 (Channel frequencies)

$K_{\text{Shift}}(i) = (N_{20\text{MHz}} - 1 - 2i) \cdot 32$

$$D_{k,20} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k)}, \text{otherwise} \end{cases} \quad (21\text{-}26)$$

$$M_{20}^r(k) = \begin{cases} k + 26, -26 \le k \le -22 \\ k + 25, -20 \le k \le -8 \\ k + 24, -6 \le k \le -1 \\ k + 23, 1 \le k \le 6 \\ k + 22, 8 \le k \le 20 \\ k + 21, 22 \le k \le 26 \end{cases} \quad (21\text{-}27)$$

P_k is defined in 17.3.5.10 (OFDM modulation)

p_0 is the first pilot value in the sequence defined in 17.3.5.10 (OFDM modulation)

$N_{\text{L-SIG}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

$\Upsilon_{k,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU)

NOTE—$M_{20}^r(k)$ is a "reverse" function of the function $M(k)$ defined in 17.3.5.10 (OFDM modulation).

21.3.8.3 VHT portion of VHT format preamble

21.3.8.3.1 Introduction

The VHT portion of the VHT format preamble consists of the VHT-SIG-A, VHT-STF, VHT-LTF, and VHT-SIG-B fields.

21.3.8.3.2 Cyclic shift for VHT modulated fields

The cyclic shift values defined in this subclause apply to the VHT-STF, VHT-LTF, VHT-SIG-B, and Data fields of the VHT PPDU. The cyclic shift values defined in 21.3.8.2.1 (Cyclic shift for pre-VHT modulated fields) apply to VHT-SIG-A field in the VHT format preamble.

Throughout the VHT modulated fields of the preamble, cyclic shifts are applied to prevent unintended beamforming when correlated signals are transmitted in multiple space-time streams. The same cyclic shift is also applied to these streams during the transmission of the Data field of the VHT PPDU. The cyclic shift value $T_{CS,VHT}(n)$ for the VHT modulated fields for space-time stream n out of $N_{STS,total}$ total space-time streams is shown in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU).

Table 21-11—Cyclic shift values for the VHT modulated fields of a PPDU

$T_{CS,VHT}(n)$ values for the VHT modulated fields of a PPDU								
Total number of space-time streams ($N_{STS,total}$)	Cyclic shift for space-time stream n (ns)							
	1	2	3	4	5	6	7	8
1	0	–	–	–	–	–	–	–
2	0	–400	–	–	–	–	–	–
3	0	–400	–200	–	–	–	–	–
4	0	–400	–200	–600	–	–	–	–
5	0	–400	–200	–600	–350	–	–	–
6	0	–400	–200	–600	–350	–650	–	–
7	0	–400	–200	–600	–350	–650	–100	–
8	0	–400	–200	–600	–350	–650	–100	–750

In a VHT MU PPDU, the cyclic shifts are applied sequentially across the space-time streams as follows: the cyclic shift of the space-time stream number m of user u is given by $T_{CS,VHT}(M_u + m)$ of the row corresponding to $N_{STS,total}$ in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU).

21.3.8.3.3 VHT-SIG-A definition

The VHT-SIG-A field carries information required to interpret VHT PPDUs. The structure of the VHT-SIG-A field for the first part (VHT-SIG-A1) is shown in Figure 21-18 (VHT-SIG-A1 structure) and for the second part (VHT-SIG-A2) is shown in Figure 21-19 (VHT-SIG-A2 structure).

NOTE—Integer fields are represented in unsigned binary format with the least significant bit in the lowest numbered bit position.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

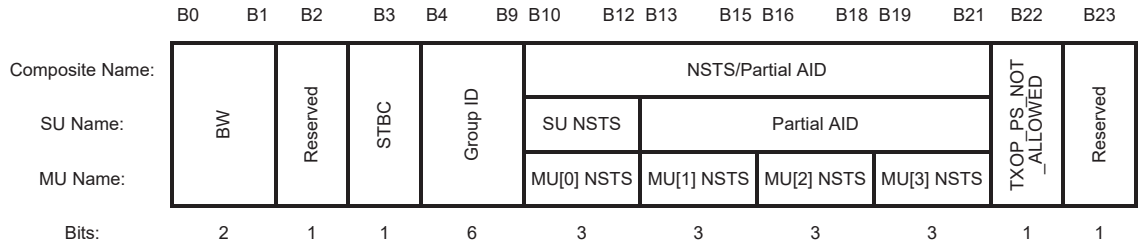

Figure 21-18—VHT-SIG-A1 structure

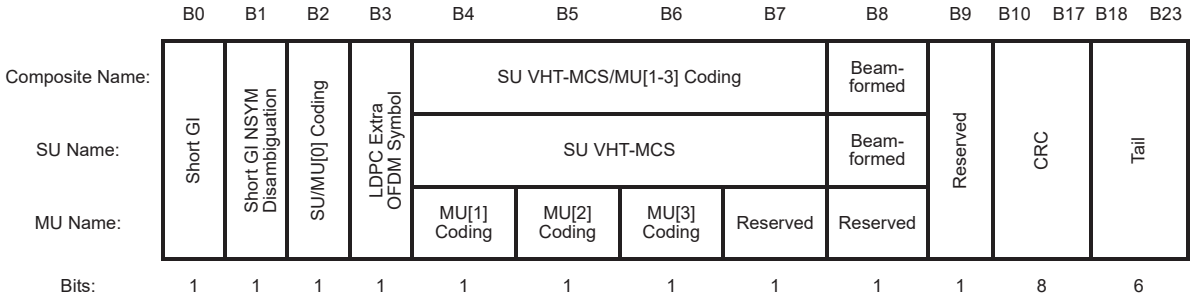

Figure 21-19—VHT-SIG-A2 structure

The VHT-SIG-A field contains the fields listed in Table 21-12 (Fields in the VHT-SIG-A field). The mapping of the fields is also described in Table 21-12 (Fields in the VHT-SIG-A field). Note that the mapping of the STBC field, the NSTS/Partial AID field, the SU/MU[0] Coding field, the SU VHT-MCS/MU[1-3] Coding field, and the Beamformed field is different for VHT SU and MU PPDUs.

The VHT-SIG-A field is composed of two parts, VHT-SIG-A1 and VHT-SIG-A2, each containing 24 data bits, as shown in Table 21-12 (Fields in the VHT-SIG-A field). VHT-SIG-A1 is transmitted before VHT-SIG-A2. The VHT-SIG-A symbols shall be BCC encoded at rate, R = 1/2, be interleaved, be mapped to a BPSK constellation, and have pilots inserted following the steps described in 17.3.5.6 (Convolutional encoder), 17.3.5.7 (Data interleaving), 17.3.5.8 (Subcarrier modulation mapping), and 17.3.5.9 (Pilot subcarriers), respectively. The first and second half of the stream of 96 complex numbers generated by these steps (before pilot insertion) is divided into two groups of 48 complex numbers $d_{k,n}, k = 0 \ldots 47$, where $n = 0, 1$, respectively. The first 48 complex numbers form the first symbol of VHT-SIG-A and the second 48 complex numbers form the second symbol of VHT-SIG-A after rotating by 90° counter-clockwise relative to the first symbol. The first symbol of VHT-SIG-A, which does not have the 90° rotation, is used to differentiate VHT PPDUs from HT PPDUs, while the second symbol of VHT-SIG-A, which has the 90° rotation, is used to differentiate VHT PPDUs from non-HT PPDUs.

The time domain waveform for the VHT-SIG-A field in a VHT PPDU shall be as specified in Equation (21-28).

Table 21-12—Fields in the VHT-SIG-A field

Two parts of VHT-SIG-A	Bit	Field	Number of bits	Description
VHT-SIG-A1	B0-B1	BW	2	Set to 0 for 20 MHz, 1 for 40 MHz, 2 for 80 MHz, and 3 for 160 MHz and 80+80 MHz
	B2	Reserved	1	Reserved. Set to 1.
	B3	STBC	1	For a VHT SU PPDU: Set to 1 if space time block coding (see 21.3.10.9.4 (Space-time block coding)) is used and set to 0 otherwise. For a VHT MU PPDU: Set to 0.
	B4-B9	Group ID	6	Set to the value of the TXVECTOR parameter GROUP_ID. A value of 0 or 63 indicates a VHT SU PPDU; otherwise, indicates a VHT MU PPDU.
	B10-B21	NSTS/Partial AID	12	For a VHT MU PPDU: NSTS is divided into 4 user positions of 3 bits each. User position p, where $0 \le p \le 3$, uses bits B($10 + 3p$) to B($12 + 3p$). The number of space-time streams for user u are indicated at user position p = USER_POSITION[u] where u = 0, 1, …, NUM_USERS – 1 and the notation A[b] denotes the value of array A at index b. Zero space-time streams are indicated at positions not listed in the USER_POSITION array. Each user position is set as follows: Set to 0 for 0 space-time streams Set to 1 for 1 space-time stream Set to 2 for 2 space-time streams Set to 3 for 3 space-time streams Set to 4 for 4 space-time streams Values 5-7 are reserved For a VHT SU PPDU: B10-B12 Set to 0 for 1 space-time stream Set to 1 for 2 space-time streams Set to 2 for 3 space-time streams Set to 3 for 4 space-time streams Set to 4 for 5 space-time streams Set to 5 for 6 space-time streams Set to 6 for 7 space-time streams Set to 7 for 8 space-time streams B13-B21 Partial AID: Set to the value of the TXVECTOR parameter PARTIAL_AID. Partial AID provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.20 (Group ID and partial AID in VHT PPDUs)).
	B22	TXOP_PS_NOT_ALLOWED	1	Set to 0 by VHT AP if it allows non-AP VHT STAs in TXOP power save mode to enter doze state during a TXOP. Set to 1 otherwise. The bit is reserved and set to 1 in VHT PPDUs transmitted by a non-AP VHT STA.
	B23	Reserved	1	Set to 1

Table 21-12—Fields in the VHT-SIG-A field *(continued)*

Two parts of VHT-SIG-A	Bit	Field	Number of bits	Description
VHT-SIG-A2	B0	Short GI	1	Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field.
	B1	Short GI N_{SYM} Disambiguation	1	Set to 1 if short guard interval is used and N_{SYM} mod 10 = 9; otherwise, set to 0. N_{SYM} is defined in 21.4.3 (TXTIME and PSDU_LENGTH calculation).
	B2	SU/MU[0] Coding	1	For a VHT SU PPDU, B2 is set to 0 for BCC, 1 for LDPC For a VHT MU PPDU, if the MU[0] NSTS field is nonzero, then B2 indicates the coding used for user *u* with USER_POSITION[*u*] = 0; set to 0 for BCC and 1 for LDPC. If the MU[0] NSTS field is 0, then this field is reserved and set to 1.
	B3	LDPC Extra OFDM Symbol	1	Set to 1 if the LDPC PPDU encoding process (if an SU PPDU), or at least one LDPC user's PPDU encoding process (if a VHT MU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4 (LDPC coding) and 21.3.10.5.5 (Encoding process for VHT MU PPDUs). Set to 0 otherwise.
	B4-B7	SU VHT-MCS/MU[1-3] Coding	4	For a VHT SU PPDU: VHT-MCS index For a VHT MU PPDU: If the MU[1] NSTS field is nonzero, then B4 indicates coding for user *u* with USER_POSITION[*u*] = 1: set to 0 for BCC, 1 for LDPC. If the MU[1] NSTS field is 0, then B4 is reserved and set to 1. If the MU[2] NSTS field is nonzero, then B5 indicates coding for user *u* with USER_POSITION[*u*] = 2: set to 0 for BCC, 1 for LDPC. If the MU[2] NSTS field is 0, then B5 is reserved and set to 1. If the MU[3] NSTS field is nonzero, then B6 indicates coding for user *u* with USER_POSITION[*u*] = 3: set to 0 for BCC, 1 for LDPC. If the MU[3] NSTS field is 0, then B6 is reserved and set to 1. B7 is reserved and set to 1
	B8	Beamformed	1	For a VHT SU PPDU: Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission, set to 0 otherwise. For a VHT MU PPDU: Reserved and set to 1 NOTE—If equal to 1 smoothing is not recommended.
	B9	Reserved	1	Reserved and set to 1
	B10-B17	CRC	8	CRC calculated as in 19.3.9.4.4 (CRC calculation for HT-SIG) with c7 in B10. Bits 0-23 of HT-SIG1 and bits 0-9 of HT-SIG2 are replaced by bits 0-23 of VHT-SIG-A1 and bits 0-9 of VHT-SIG-A2, respectively.
	B18-B23	Tail	6	Used to terminate the trellis of the convolutional decoder. Set to 0.

$$r_{\text{VHT-SIG-A}}^{(i_{Seg},\, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{VHT-SIG-A}}^{\text{Tone}} N_{\text{TX}}}} \sum_{n=0}^{1} w_{T_{SYML}}(t - nT_{SYML}) \cdot \tag{21-28}$$

$$\sum_{i_{\text{BW}}=0}^{N_{20\text{MHz}}-1} \left(\sum_{k=-26}^{26} \Upsilon_{(k - K_{\text{Shift}}(i_{\text{BW}})),\, \text{BW}} (j^n D_{k,\, n,\, BW} + p_{n+1} P_k) \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_F(t - nT_{SYML} - T_{\text{GI}} - T_{CS}^{i_{TX}})) \right)$$

where

$N_{20\text{MHz}}$ and $K_{\text{Shift}}(i)$ are defined in 21.3.8.2.4 (L-SIG definition)

$$D_{k,\, n,\, 20} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k),\, n}, \text{otherwise} \end{cases}$$

$M_{20}^r(k)$ is defined in Equation (21-27)

P_k and p_n are defined in 17.3.5.10 (OFDM modulation)

$N_{\text{VHT-SIG-A}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

$\Upsilon_{k,\, \text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU)

NOTE—This definition results in a QBPSK modulation on the second symbol of VHT-SIG-A where the constellation of the data tones is rotated by 90º counter-clockwise relative to the first symbol of VHT-SIG-A and relative to the non-HT signal field in VHT PPDUs (Figure 21-20 (Data tone constellation in the VHT PPDU pre-VHT modulated fields)). In VHT PPDUs, the VHT-SIG-A is transmitted with the same number of subcarriers and the same cyclic shifts as the preceding non-HT portion of the preamble.

For an 80+80 MHz transmission, each frequency segment shall use the time domain waveform for 80 MHz transmissions.

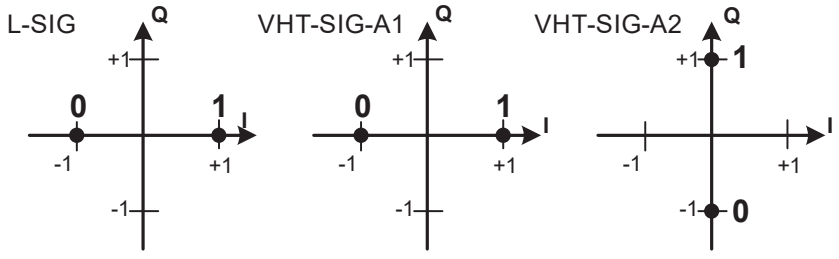

Figure 21-20—Data tone constellation in the VHT PPDU pre-VHT modulated fields

21.3.8.3.4 VHT-STF definition

The main purpose of the VHT-STF field is to improve automatic gain control estimation in a MIMO transmission. The duration of the VHT-STF field is $T_{VHT\text{-}STF}$ regardless of the Short GI field setting in VHT-SIG-A. The frequency domain sequence used to construct the VHT-STF field in a 20 MHz transmission is identical to the HT-STF field. In a 40 MHz and an 80 MHz transmission, the VHT-STF field is constructed from the 20 MHz version by frequency shifting a duplicate of it to each 20 MHz subchannel and applying appropriate phase rotations per 20 MHz subchannel.

For a 20 MHz transmission, the frequency domain sequence is given by Equation (21-29).

$$VHTS_{-28,28} = HTS_{-28,28} \tag{21-29}$$

where

$HTS_{-28,28}$ is defined in Equation (19-19)

For a 40 MHz transmission, the frequency domain sequence is given by Equation (21-30).

$$VHTS_{-58,58} = HTS_{-58,58} \tag{21-30}$$

where

$HTS_{-58,58}$ is defined in Equation (19-20)

For an 80 MHz transmission, the frequency domain sequence is given by Equation (21-31).

$$VHTS_{-122,122} = \{VHTS_{-58,58}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, VHTS_{-58,58}\} \tag{21-31}$$

where

$VHTS_{-58,58}$ is given by Equation (21-30)

For a 160 MHz transmission, the frequency domain sequence is given by Equation (21-32).

$$VHTS_{-250,250} = \{VHTS_{-122,122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, VHTS_{-122,122}\} \tag{21-32}$$

where

$VHTS_{-122,122}$ is given by Equation (21-31)

NOTE—Equation (21-29), Equation (21-30), Equation (21-31), and Equation (21-32) do not show the phase rotation per 20 MHz subchannel.

For an 80+80 MHz transmission, each 80 MHz frequency segment shall use the VHT-STF pattern for the 80 MHz ($VHTS_{-122,122}$) defined in Equation (21-31).

The time domain representation of the signal on frequency segment i_{Seg} and transmit chain i_{TX} shall be as specified in Equation (21-33).

$$r_{\text{VHT-STF}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{VHT-STF}}^{\text{Tone}} N_{STS,\,total}}} w_{T_{\text{VHT-STF}}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,\,u}} \left(\left[Q_k^{(i_{Seg})} \right]_{i_{TX},\,(M_u+m)} \Upsilon_{k,\,\text{BW}} VHTS_k \cdot \exp(j2\pi k \Delta_F (t - T_{\text{CS,VHT}}(M_u + m))) \right) \quad (21\text{-}33)$$

where

$N_{\text{VHT-STF}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

$T_{\text{CS,VHT}}(n)$ is given in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU)

$Q_k^{(i_{Seg})}$ is defined in 21.3.10.11.1 (Transmission in VHT format)

$\Upsilon_{k,\,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

21.3.8.3.5 VHT-LTF definition

The VHT Long Training field (VHT-LTF) field provides a means for the receiver to estimate the MIMO channel between the set of constellation mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. The transmitter provides training for $N_{STS,total}$ space-time streams (spatial mapper inputs) used for the transmission of the PSDU(s). For each tone, the MIMO channel that can be estimated is an $N_{RX} \times N_{STS,total}$ matrix. A VHT transmission has a preamble that contains VHT-LTF symbols, where the data tones of each VHT-LTF symbol are multiplied by entries belonging to a matrix $P_{VHT\text{-}LTF}$, to enable channel estimation at the receiver. The pilot tones of each VHT-LTF symbol are multiplied by the entries of a matrix $R_{VHT\text{-}LTF}$ defined in the following text. The multiplication of the pilot tones in the VHT-LTF symbol by the $R_{VHT\text{-}LTF}$ matrix instead of the $P_{VHT\text{-}LTF}$ matrix allows receivers to track phase and frequency offset during MIMO channel estimation using the VHT-LTF. The number of VHT-LTF symbols, $N_{VHT\text{-}LTF}$, is a function of the total number of space-time streams $N_{STS,total}$ as shown in Table 21-13 (Number of VHT-LTFs required for different numbers of space-time streams). As a result the VHT-LTF field consists of one, two, four, six or eight symbols.

Table 21-13—Number of VHT-LTFs required for different numbers of space-time streams

$N_{STS,total}$	N_{VHTLTF}
1	1
2	2

Let LTF_{left} and LTF_{right} be the sequences defined in Equation (21-34) and Equation (21-35), respectively.

$$LTF_{\text{left}} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (21\text{-}34)$$

$$LTF_{\text{right}} = \{1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (21\text{-}35)$$

NOTE—LTF_{left} is identical to the leftmost 26 elements of Equation (17-8), and LTF_{right} is identical to the rightmost 26 elements of Equation (17-8).

In a 20 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-36).

$$\begin{aligned} VHT\text{-}LTF_{-28,28} &= \{1, 1, LTF_{\text{left}}, 0, LTF_{\text{right}}, -1, -1\} \\ &= HT\text{-}LTF_{-28,28} \end{aligned} \quad (21\text{-}36)$$

where

$HT\text{-}LTF_{-28,28}$ is defined in Equation (19-23)

In a 40 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-37).

$$\begin{aligned} VHT\text{-}LTF_{-58,58} &= \{LTF_{\text{left}}, 1, LTF_{\text{right}}, -1, -1, -1, 1, 0, 0, 0, -1, 1, 1, -1, LTF_{\text{left}}, 1, LTF_{\text{right}}\} \\ &= HT\text{-}LTF_{-58,58} \end{aligned} \quad (21\text{-}37)$$

where

$HT\text{-}LTF_{-58,58}$ is defined in Equation (19-24)

In an 80 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-38).

$$\begin{aligned} VHT\text{-}LTF_{-122,122} = \{&LTF_{\text{left}}, 1, LTF_{\text{right}}, -1, -1, -1, 1, 1, -1, 1, -1, 1, 1, -1, LTF_{\text{left}}, 1, LTF_{\text{right}}, \\ &1, -1, 1, -1, 0, 0, 0, 1, -1, -1, 1, \\ &LTF_{\text{left}}, 1, LTF_{\text{right}}, -1, -1, -1, 1, 1, -1, 1, -1, 1, 1, -1, LTF_{\text{left}}, 1, LTF_{\text{right}}\} \end{aligned} \quad (21\text{-}38)$$

In a 160 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-39).

$$VHT\text{-}LTF_{-250,250} = \{VHT\text{-}LTF_{-122,122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, VHT\text{-}LTF_{-122,122}\} \quad (21\text{-}39)$$

where

$VHT\text{-}LTF_{-122,122}$ is given in Equation (21-38)

NOTE—Equation (21-36), Equation (21-37), Equation (21-38), and Equation (21-39) do not show the phase rotation per 20 MHz subchannel.

For a 80+80 MHz transmission, each 80 MHz frequency segment shall use the 80 MHz VHT-LTF sequence, $VHT\text{-}LTF_{-122,122}$, defined in Equation (21-38).

This is an unapproved IEEE Standards Draft, subject to change.

The generation of the time domain VHT-LTF symbols per frequency segment is shown in Figure 21-21 (Generation of VHT-LTF symbols per frequency segment) where $A^{k}_{VHT\text{-}LTF}$ is given in Equation (21-40).

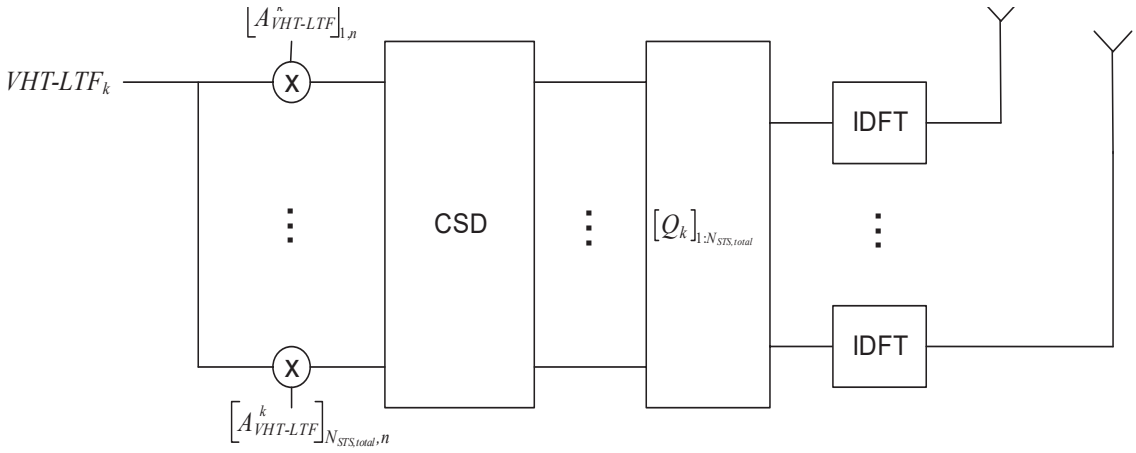

Figure 21-21—Generation of VHT-LTF symbols per frequency segment

$$A^{k}_{VHT\text{-}LTF} = \begin{cases} R_{VHT\text{-}LTF}, \text{ if } k \in K_{\text{Pilot}} \\ P_{VHT\text{-}LTF}, \text{ otherwise} \end{cases} \tag{21-40}$$

where

K_{Pilot} is the set of subcarrier indices for the pilot tones.

For a 20 MHz transmission, $K_{\text{Pilot}} = \{\pm 7, \pm 21\}$.

For a 40 MHz transmission, $K_{\text{Pilot}} = \{\pm 11, \pm 25, \pm 53\}$.

For an 80 MHz transmission, $K_{\text{Pilot}} = \{\pm 11, \pm 39, \pm 75, \pm 103\}$.

For a 160 MHz transmission, $K_{\text{Pilot}} = \{\pm 25, \pm 53, \pm 89, \pm 117, \pm 139, \pm 167, \pm 203, \pm 231\}$.

For an 80+80 MHz transmission, K_{Pilot} for each 80 MHz frequency segment is identical to K_{Pilot} for an 80 MHz transmission.

$R_{VHT\text{-}LTF}$ is a $N_{VHT\text{-}LTF} \times N_{VHT\text{-}LTF}$ matrix whose elements are defined in Equation (21-41).

$$\left[R_{VHT\text{-}LTF}\right]_{m,n} = \left[P_{VHT\text{-}LTF}\right]_{1,n}, 1 \le m, n \le N_{VHT\text{-}LTF} \tag{21-41}$$

$P_{VHT\text{-}LTF}$ is defined in (22-43). (21-42)

The time domain representation of the waveform transmitted on frequency segment i_{Seg} of transmit chain i_{TX} shall be as described by Equation (21-43).

This is an unapproved IEEE Standards Draft, subject to change.

$$r_{\text{VHT-LTF}}^{(i_{Seg},\, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{VHT-LTF}}^{\text{Tone}} N_{STS,\,total}}} \sum_{n=0}^{N_{VHT\text{-}LTF}-1} w_{T_{\text{VHT-LTF}}}(t - nT_{\text{VHT-LTF}}) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,\,u}} \left(\left[Q_k^{(i_{Seg})} \right]_{i_{TX},\,(M_u+m)} \Upsilon_{k,\,\text{BW}} \left[A_{VHT\text{-}LTF}^{k} \right]_{(M_u+m),\,(n+1)} VHT\text{-}LTF_k \cdot \exp\left(j2\pi k \Delta_F (t - nT_{\text{VHT-LTF}} - T_{\text{GI}} - T_{\text{CS,VHT}}(M_u+m))\right) \right) \quad (21\text{-}43)$$

where

$N_{\text{VHT-LTF}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

$T_{\text{CS,VHT}}(n)$ is given in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU)

$Q_k^{(i_{Seg})}$ is defined in 21.3.10.11.1 (Transmission in VHT format)

$\Upsilon_{k,\,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

$A_{VHT\text{-}LTF}^{k}$ is defined in Equation (21-40)

$$P_{VHT\text{-}LTF} = \begin{cases} P_{4\times4}, N_{STS,\,total} \le 4 \\ P_{6\times6}, N_{STS,\,total} = 5, 6 \\ P_{8\times8}, N_{STS,\,total} = 7, 8 \end{cases} \quad (21\text{-}44)$$

where

$P_{4\times4}$ is defined in Equation (19-27)

The VHT-LTF mapping matrix for six VHT-LTF symbols, $P_{6\times6}$, is defined in Equation (21-45).

$$P_{6\times6} = \begin{bmatrix} 1 & -1 & 1 & 1 & 1 & -1 \\ 1 & -w^1 & w^2 & w^3 & w^4 & -w^5 \\ 1 & -w^2 & w^4 & w^6 & w^8 & -w^{10} \\ 1 & -w^3 & w^6 & w^9 & w^{12} & -w^{15} \\ 1 & -w^4 & w^8 & w^{12} & w^{16} & -w^{20} \\ 1 & -w^5 & w^{10} & w^{15} & w^{20} & -w^{25} \end{bmatrix} \quad (21\text{-}45)$$

where

$w = \exp(-j2\pi/6)$

The VHT-LTF mapping matrix for eight VHT-LTF symbols, $P_{8\times8}$, is defined in Equation (21-46).

$$P_{8\times8} = \begin{bmatrix} P_{4\times4} & P_{4\times4} \\ P_{4\times4} & -P_{4\times4} \end{bmatrix} \quad (21\text{-}46)$$

where

$P_{4\times4}$ is defined in Equation (19-27)

As defined in Table 21-5 (Timing-related constants), the duration of each VHT-LTF symbol is $T_{\text{VHT-LTF}}$ regardless of the Short GI field setting in VHT-SIG-A.

21.3.8.3.6 VHT-SIG-B definition

The VHT-SIG-B field is one symbol and contains 26 bits in a 20 MHz PPDU, 27 bits in a 40 MHz PPDU, and 29 bits in 80 MHz, 160 MHz, and 80+80 MHz PPDUs for each user. The fields in the VHT-SIG-B field are listed in Table 21-14 (Fields in the VHT-SIG-B field). For fields consisting of multiple bits, the LSB of the value occupies the lowest numbered bit of the field. For example, for an MU transmission using VHT-MCS 5 (0101 in binary) in 20 MHz bandwidth, the VHT-SIG-B field bits are set as follows: B16=1, B17=0, B18=1, and B19=0.

Table 21-14—Fields in the VHT-SIG-B field

Field	VHT MU PPDU Allocation (bits)			VHT SU PPDU Allocation (bits)			Description
	20 MHz	40 MHz	80 MHz, 160 MHz, 80+80 MHz	20 MHz	40 MHz	80 MHz, 160 MHz, 80+80 MHz	
VHT-SIG-B Length	B0-B15 (16)	B0-B16 (17)	B0-B18 (19)	B0-B16 (17)	B0-B18 (19)	B0-B20 (21)	Length of A-MPDU pre-EOF padding in units of four octets
VHT-MCS	B16-B19 (4)	B17-B20 (4)	B19-B22 (4)	N/A	N/A	N/A	
Reserved	N/A	N/A	N/A	B17-B19 (3)	B19-B20 (2)	B21-B22 (2)	All 1s
Tail	B20-B25 (6)	B21-B26 (6)	B23-B28 (6)	B20-B25 (6)	B21-B26 (6)	B23-B28 (6)	All 0s
Total # bits	26	27	29	26	27	29	

NOTE—Due to the limitations in the maximum A-MPDU length, B19-20 are always 0 for an 80 MHz, 160 MHz, and 80+80 MHz VHT SU PPDU.

The VHT-SIG-B Length field for user u shall be set using Equation (21-47).

$$\text{VHT-SIG-B Length (for user } u \text{ in units of 4 octets)} = \left\lceil \frac{\text{APEP_LENGTH}_u}{4} \right\rceil \quad (21\text{-}47)$$

where

APEP_LENGTH_u is the TXVECTOR parameter APEP_LENGTH for user u (in octets)

The VHT-SIG-B bits for an NDP transmission in various channel widths shall be set as defined in Table 21-15 (VHT-SIG-B bits (before Tail field) in NDP for various channel widths).

For a 40 MHz transmission, the VHT-SIG-B bits are repeated twice. For an 80 MHz transmission, the VHT-SIG-B bits are repeated four times and a pad bit appended that is set to 0. For a 160 MHz and 80+80 MHz transmission, the VHT-SIG-B bits are first repeated four times and a pad bit appended that is set to 0 as in the 80 MHz transmission. Then, the resulting 117 bits are repeated again to fill the 234 available bits. The

Table 21-15—VHT-SIG-B bits (before Tail field) in NDP for various channel widths

Channel Width	B0	B1	B2	B3	B4	B5	B6	B7	B8	B9	B10	B11	B12	B13	B14	B15	B16	B17	B18	B19	B20	B21	B22
20 MHz	0	0	0	0	0	1	1	1	0	1	0	0	0	1	0	0	0	0	1	0	–	–	–
40 MHz	1	0	1	0	0	1	0	1	1	0	1	0	0	0	1	0	0	0	0	1	1	-	–
80 MHz, 160 MHz, or 80+80 MHz	0	1	0	1	0	0	1	1	0	0	1	0	1	1	1	1	1	1	1	0	0	1	0

repetition of the VHT-SIG-B bits for various channel width PPDUs is shown in Figure 21-22 (VHT-SIG-B bits in 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz transmissions).

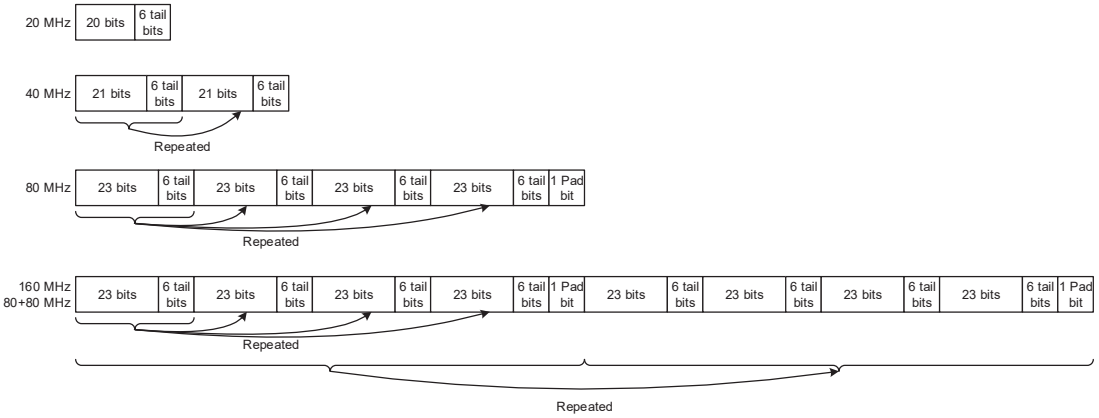

Figure 21-22—VHT-SIG-B bits in 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz transmissions

For each user *u*, the VHT-SIG-B field shall be BCC encoded at rate R = 1/2 as defined in 17.3.5.6 (Convolutional encoder), be segment parsed as defined in 21.3.10.7 (Segment parser), be interleaved as defined in 21.3.10.8 (BCC interleaver), be mapped to a BPSK constellation as defined in 17.3.5.8 (Subcarrier modulation mapping), be segment deparsed as defined in 21.3.10.9.3 (Segment deparser), and have pilots inserted following the steps described in 21.3.10.10 (Pilot subcarriers). The VHT-SIG-B field constellation points are mapped to $N_{STS,u}$ space-time streams by the user-specific elements of the first column of the $P_{VHT\text{-}LTF}$ matrix, which is defined in clause 21.3.8.3.5 (VHT-LTF definition). The total number of data subcarriers and pilot subcarriers are the same as in the Data field. The space-time streams per each frequency segment are input into the CSD block, which is defined in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU) and follow the same transmission flow as the Data field from there on. The duration of the VHT-SIG-B field is $T_{VHT\text{-}SIG\text{-}B}$, regardless of the value of the TXVECTOR parameter GI_TYPE. The time domain waveform for the VHT-SIG-B field in a VHT PPDU is specified by Equation (21-48).

$$r_{\text{VHT-SIG-B}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{VHT-SIG-B}}^{\text{Tone}} N_{STS,total}}} w_{T_{\text{VHT-SIG-B}}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,u}} \left(\left[Q_k^{(i_{Seg})} \right]_{i_{TX}, (M_u+m)} \Upsilon_{k,\text{BW}} \left(\left[P_{VHT\text{-}LTF} \right]_{(M_u+m),1} D_{k,BW}^{(i_{Seg},u)} + p_3 P_0^k \right) \cdot \exp(j2\pi k \Delta_F (t - T_{\text{GI}} - T_{\text{CS,VHT}}(M_u+m))) \right) \quad (21\text{-}48)$$

where

$N_{\text{VHT-SIG-B}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

$T_{\text{CS,VHT}}(n)$ is given in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU)

$Q_k^{(i_{Seg})}$ is defined in 21.3.10.11.1 (Transmission in VHT format)

p_n is defined in 17.3.5.10 (OFDM modulation)

P_n^k is defined in 21.3.10.10 (Pilot subcarriers)

$\Upsilon_{k,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

$P_{VHT\text{-}LTF}$ is given in Equation (21-44)

Let $d_k^{(i_{Seg},u)}$ be the stream of complex numbers generated for VHT-SIG-B for user u at subcarrier k (logical index, starting with 0) on frequency segment i_{Seg} (prior to multiplication by $P_{VHT\text{-}LTF}$). For a 20 MHz VHT transmission,

$$D_{k,20}^{(i_{Seg},u)} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k)}^{(i_{Seg},u)}, \text{otherwise} \end{cases} \quad (21\text{-}49)$$

$$M_{20}^r(k) = \begin{cases} k+28, -28 \le k \le -22 \\ k+27, -20 \le k \le -8 \\ k+26, -6 \le k \le -1 \\ k+25, 1 \le k \le 6 \\ k+24, 8 \le k \le 20 \\ k+23, 22 \le k \le 28 \end{cases} \quad (21\text{-}50)$$

For a 40 MHz VHT transmission,

$$D_{k,40}^{(i_{Seg},u)} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ d_{M_{40}^r(k)}^{(i_{Seg},u)}, \text{otherwise} \end{cases} \quad (21\text{-}51)$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$M_{40}^{r}(k) = \begin{cases} k+58, -58 \le k \le -54 \\ k+57, -52 \le k \le -26 \\ k+56, -24 \le k \le -12 \\ k+55, -10 \le k \le -2 \\ k+52, 2 \le k \le 10 \\ k+51, 12 \le k \le 24 \\ k+50, 26 \le k \le 52 \\ k+49, 54 \le k \le 58 \end{cases} \quad (21\text{-}52)$$

For an 80 MHz VHT transmission,

$$D_{k,80}^{(i_{Seg},u)} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 39, \pm 75, \pm 103 \\ d_{M_{80}^{r}(k)}^{(i_{Seg},u)}, \text{otherwise} \end{cases} \quad (21\text{-}53)$$

$$M_{80}^{r}(k) = \begin{cases} k+122, -122 \le k \le -104 \\ k+121, -102 \le k \le -76 \\ k+120, -74 \le k \le -40 \\ k+119, -38 \le k \le -12 \\ k+118, -10 \le k \le -2 \\ k+115, 2 \le k \le 10 \\ k+114, 12 \le k \le 38 \\ k+113, 40 \le k \le 74 \\ k+112, 76 \le k \le 102 \\ k+111, 104 \le k \le 122 \end{cases} \quad (21\text{-}54)$$

For a 160 MHz VHT transmission,

$$D_{k,160}^{(i_{Seg},u)} = \begin{cases} 0, k = 0, \pm 1, \pm 2, \pm 3, \pm 4, \pm 5, \pm 25, \pm 53, \pm 89, \pm 117, \pm 127, \pm 128, \pm 129, \pm 139, \pm 167, \pm 203, \pm 231 \\ d_{M_{160}^{r}(k)}^{(i_{Seg},u)}, \text{otherwise} \end{cases} \quad (21\text{-}55)$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$M^{r}_{160}(k) = \begin{cases} k+250, & -250 \le k \le -232 \\ k+249, & -230 \le k \le -204 \\ k+248, & -202 \le k \le -168 \\ k+247, & -166 \le k \le -140 \\ k+246, & -138 \le k \le -130 \\ k+243, & -126 \le k \le -118 \\ k+242, & -116 \le k \le -90 \\ k+241, & -88 \le k \le -54 \\ k+240, & -52 \le k \le -26 \\ k+239, & -24 \le k \le -6 \\ k+228, & 6 \le k \le 24 \\ k+227, & 26 \le k \le 52 \\ k+226, & 54 \le k \le 88 \\ k+225, & 90 \le k \le 116 \\ k+224, & 118 \le k \le 126 \\ k+221, & 130 \le k \le 138 \\ k+220, & 140 \le k \le 166 \\ k+219, & 168 \le k \le 202 \\ k+218, & 204 \le k \le 230 \\ k+217, & 232 \le k \le 250 \end{cases} \quad (21\text{-}56)$$

For an 80+80 MHz VHT transmission, each frequency segment shall follow the 80 MHz VHT transmission format as specified in Equation (21-53) and Equation (21-54).

21.3.9 Transmission of NON_HT and HT PPDUs with multiple transmit chains

21.3.9.1 Transmission of 20 MHz NON_HT PPDUs with more than one transmit chain

A VHT STA that transmits a NON_HT PPDU shall apply the cyclic shifts defined in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU) to the preamble and Data field.

21.3.9.2 Transmission of HT PPDUs with more than four transmit chains

A VHT STA that transmits an HT PPDU with FORMAT equal to HT_MF shall apply the cyclic shifts defined in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU) for the non-HT portion of the PPDU, including the HT-SIG field.

21.3.10 Data field

21.3.10.1 General

The number of OFDM symbols in the Data field is determined by the Length field in L-SIG (see Equation (21-24)), the preamble duration and the setting of the Short GI field in VHT-SIG-A (see 21.3.8.3.3 (VHT-SIG-A definition)).

When BCC encoding is used, the Data field shall consist of the SERVICE field, the PSDU, the PHY pad bits, and the tail bits ($N_{tail}N_{ES}$ bits for SU and $N_{tail}N_{ES,u}$ bits for each user u in MU). When LDPC

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

encoding is used, the Data field shall consist of the SERVICE field, the PSDU, and the PHY pad bits. No tail bits are present when LDPC encoding is used.

The padding flow is as follows. The MAC delivers a PSDU that fills the available octets in the Data field of the PPDU for each user *u*. The PHY determines the number of pad bits to add and appends them to the PSDU. The number of pad bits added will always be 0 to 7 per user. When user *u* of a VHT MU PPDU uses BCC encoding, the number of pad bits is calculated using Equation (21-57). In the case of SU ignore *u* in Equation (21-57).

$$N_{PAD,u} = N_{SYM}N_{DBPS,u} - 8 \cdot \text{PSDU_LENGTH}_u - N_{service} - N_{tail}N_{ES,u} \quad (21\text{-}57)$$

where

PSDU_LENGTH_u is defined in 21.4.3 (TXTIME and PSDU_LENGTH calculation)

N_{SYM} is the number of symbols in the Data field and is given by Equation (21-112) for a VHT SU PPDU and by Equation (21-68) for a VHT MU PPDU

For an SU PPDU, if LDPC encoding is used then the PHY padding bits are calculated using Equation (21-58).

$$N_{PAD} = N_{SYM,init}N_{DBPS} - 8 \cdot \text{PSDU_LENGTH} - N_{service} \quad (21\text{-}58)$$

where

PSDU_LENGTH is defined in 21.4.3 (TXTIME and PSDU_LENGTH calculation)

$N_{SYM,init}$ is given by Equation (21-63)

For a VHT MU PPDU, if LDPC encoding is used for user *u* then the PHY padding bits are calculated using Equation (21-59).

$$N_{PAD,u} = N_{\text{SYM_max_init}}N_{DBPS,u} - 8 \cdot \text{PSDU_LENGTH}_u - N_{service} \quad (21\text{-}59)$$

where

PSDU_LENGTH_u is defined in 21.4.3 (TXTIME and PSDU_LENGTH calculation)

$N_{\text{SYM_max_init}}$ is given by Equation (21-66)

The Data field of the VHT PPDU contains data for one or more users. For a VHT MU PPDU, the data processing, from scrambling to constellation mapping shall happen on a per-user basis. In the following subclauses, this process is described from a single user's point of view.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

21.3.10.2 SERVICE field

The SERVICE field is as shown in Table 21-16 (SERVICE field).

Table 21-16—SERVICE field

Bits	Field	Description
B0-B6	Scrambler Initialization	Set to 0
B7	Reserved	Set to 0
B8-B15	CRC	CRC calculated over VHT-SIG-B (excluding tail bits)

21.3.10.3 CRC calculation for VHT-SIG-B

The CRC calculation and insertion is illustrated in Figure 21-23 (VHT-SIG-B and SERVICE field relationship).

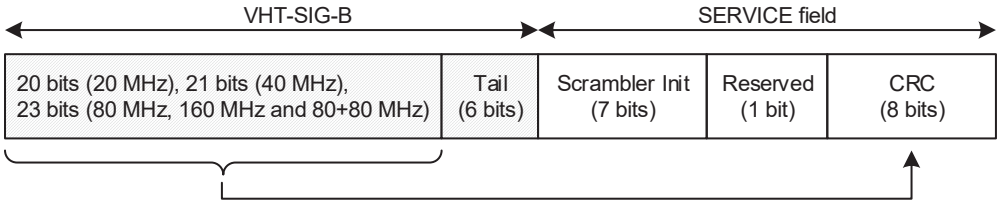

Figure 21-23—VHT-SIG-B and SERVICE field relationship

The value of the CRC field shall be the 1s complement of Equation (21-60).

$$crc(D) = (M(D) \oplus I(D))D^8 \bmod G(D) \quad (21\text{-}60)$$

where

$M(D) = m_0 D^{N-1} + m_1 D^{N-2} + \ldots + m_{N-2} D + m_{N-1}$

N is the number of bits over which the CRC is generated; 20 for 20 MHz, 21 for 40 MHz, and 23 for 80 MHz/160 MHz/80+80 MHz

m_i is bit i of VHT-SIG-B

$I(D) = \sum_{i=N-8}^{N-1} D^i$ are initialized values that are added modulo 2 to the first 8 bits of VHT-SIG-B

$G(D) = D^8 + D^2 + D + 1$ is the CRC generating polynomial

$crc(D) = c_0 D^7 + c_1 D^6 + \ldots + c_6 D + c_7$

Figure 19-8 (HT-SIG CRC calculation) shows the operation of the CRC. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, c_7 first, through an inverter.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

As an example, if bits $\{m_0, \ldots m_{22}\}$ are given by {1 0 0 1 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1 1}, the CRC bits $\{c_7, \ldots c_0\}$ are {0 0 0 1 1 1 0 0}.

The CRC field is transmitted with c_7 first. Hence, c_7 is mapped to B8 of the SERVICE field, c_6 is mapped to B9, …, and c_0 is mapped to B15 of the SERVICE field.

21.3.10.4 Scrambler

The SERVICE, PSDU, and PHY pad parts of the Data field shall be scrambled by the scrambler defined in 17.3.5.5 (PHY DATA scrambler and descrambler). The Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT are not present; therefore, the initial state of the scrambler is set to a pseudorandom nonzero seed. Different users in a VHT MU PPDU may use different pseudorandom nonzero seeds.

21.3.10.5 Coding

21.3.10.5.1 General

The Data field shall be encoded using either the binary convolutional code (BCC) defined in 21.3.10.5.2 (BCC encoder parsing operation) and 21.3.10.5.3 (Binary convolutional coding and puncturing) or the low density parity check (LDPC) code defined in 21.3.10.5.4 (LDPC coding). The encoder is selected by the SU/MU[0] Coding, MU[1] Coding, MU[2] Coding, or MU[3] Coding fields in VHT-SIG-A, as defined in 21.3.8.3.3 (VHT-SIG-A definition). When BCC FEC encoding is used, the number of encoders is determined by rate-dependent parameters as defined in 21.5 (Parameters for VHT-MCSs). The operation of the BCC FEC is described in 21.3.10.5.2 (BCC encoder parsing operation) and 21.3.10.5.3 (Binary convolutional coding and puncturing). The operation of the LDPC coder is described in 21.3.10.5.4 (LDPC coding). Support for the reception of a BCC encoded Data field is mandatory.

21.3.10.5.2 BCC encoder parsing operation

If multiple encoders are used, the scrambled SERVICE, PSDU, and PHY pad bits are divided between the encoders by sending bits to different encoders in a round robin manner. Bit i to encoder j of user u, denoted $x_{i,u}^{(j)}$, is as specified in Equation (21-61).

$$x_{i,u}^{(j)} = \begin{cases} b_{N_{ES,u}+j,u}; \quad 0 \le i < N_{SYM}\dfrac{N_{DBPS,u}}{N_{ES,u}} - N_{tail}, \quad 0 \le j \le N_{ES,u} - 1 \\ 0; \quad N_{SYM}\dfrac{N_{DBPS,u}}{N_{ES,u}} - N_{tail} \le i < N_{SYM}\dfrac{N_{DBPS,u}}{N_{ES,u}}, \quad 0 \le j \le N_{ES,u} - 1 \end{cases} \tag{21-61}$$

where

$b_{k,u}$ is bit k of the scrambled SERVICE, PSDU, and pad bits of user u

N_{SYM} is the number of symbols in the Data field and is given by Equation (21-112) for a VHT SU PPDU and by Equation (21-68) for a VHT MU PPDU

NOTE—Tail bits with value 0 are being appended to each BCC encoder parser output sequence in Equation (21-61).

21.3.10.5.3 Binary convolutional coding and puncturing

The BCC encoder parser output sequences of user u $\{x_{i,u}^{(j)}\}$, $0 \le i < N_{SYM}N_{DBPS,u}/N_{ES,u}$, $0 \le j \le N_{ES,u} - 1$ each of which is separately encoded by a rate R = ½ convolutional encoder defined in 17.3.5.6 (Convolutional encoder). After encoding, the encoded data is punctured by the method defined in 17.3.5.6 (Convolutional encoder) (except for rate 5/6), to achieve the rate selected by the modulation and coding scheme. In the case that rate 5/6 coding is selected, the puncturing scheme will be the same as described in 19.3.11.6 (Binary convolutional coding and puncturing).

21.3.10.5.4 LDPC coding

For a VHT SU PPDU using LDPC coding to encode the Data field, the LDPC code and encoding process described in 19.3.11.7 (LDPC codes) shall be used with the following modifications. First, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits are encoded. Thus, N_{pld} for VHT PPDUs shall be computed using Equation (21-62) instead of Equation (19-35).

$$N_{pld} = N_{SYM,init}N_{DBPS} \tag{21-62}$$

where

$N_{SYM,init}$ is given by Equation (21-63)

$$N_{SYM,init} = m_{STBC} \times \left\lceil \frac{8 \cdot \text{APEP_LENGTH} + N_{service}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \tag{21-63}$$

where

m_{STBC} is equal to 2 when STBC is used, and 1 otherwise

APEP_LENGTH is the TXVECTOR parameter APEP_LENGTH

Following the calculation of N_{pld}, N_{avbits} shall be computed using Equation (21-64) instead of Equation (19-36).

$$N_{avbits} = N_{SYM,init}N_{CBPS} \tag{21-64}$$

In addition, if N_{SYM} computed in Equation (19-41) in step d) of 19.3.11.7.5 (LDPC PPDU encoding process) is greater than $N_{SYM,init}$, then the LDPC Extra OFDM Symbol field of VHT-SIG-A shall be set to 1. Otherwise, the LDPC Extra OFDM Symbol field of VHT-SIG-A shall be set to 0.

LDPC codes used in VHT MU PPDUs shall also follow the definitions in 19.3.11.7 (LDPC codes). Refer to 21.3.10.5.5 (Encoding process for VHT MU PPDUs) for a description of the LDPC encoding process for VHT MU PPDUs.

21.3.10.5.5 Encoding process for VHT MU PPDUs

For a VHT MU PPDU, first compute the initial number of OFDM symbols for each user using Equation (21-65).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$N_{\mathrm{SYM_init},\,u} = \begin{cases} \left\lceil \dfrac{8 \cdot \mathrm{APEP_LENGTH}_u + N_{service} + N_{tail} \cdot N_{ES,\,u}}{N_{DBPS,\,u}} \right\rceil & \text{when user } u \text{ uses BCC} \\ \left\lceil \dfrac{8 \cdot \mathrm{APEP_LENGTH}_u + N_{service}}{N_{DBPS,\,u}} \right\rceil & \text{when user } u \text{ uses LDPC} \end{cases} \quad (21\text{-}65)$$

where

$\mathrm{APEP_LENGTH}_u$ is the TXVECTOR parameter APEP_LENGTH for user u

Based on the above equation, compute the largest initial number of symbols over all users using Equation (21-66).

$$N_{\mathrm{SYM_max_init}} = \max\{N_{\mathrm{SYM_init},\,u}\}_{u=0}^{N_{user}-1} \quad (21\text{-}66)$$

Then, for each user u that uses LDPC in the VHT MU PPDU, the final number of symbols in the Data field ($N_{SYM,u}$) shall be computed as follows. First, perform step a) in 19.3.11.7.5 (LDPC PPDU encoding process) with the exception that N_{pld} is computed using Equation (21-67) instead of Equation (19-35).

$$N_{pld} = N_{\mathrm{SYM_max_init}} N_{DBPS,\,u} \quad (21\text{-}67)$$

Then, perform steps b) through d) in 19.3.11.7.5 (LDPC PPDU encoding process) with N_{CBPS} and R replaced with $N_{CBPS,u}$ and R_u, respectively. $N_{SYM,u}$ for user u shall then be equal to the value of N_{SYM} obtained at the end of step d) using Equation (19-41).

The purpose of going through steps a) to d) in 19.3.11.7.5 (LDPC PPDU encoding process) in the above paragraph is to compute $N_{SYM,u}$. Thus, at this stage $N_{SYM,u}$ for each user may be calculated without actually encoding the data using LDPC.

For BCC users, $N_{SYM,\,u} = N_{\mathrm{SYM_init},\,u}$.

Then, compute the number of symbols in the Data field using Equation (21-68).

$$N_{SYM} = \max\{N_{SYM,\,u}\}_{u=0}^{N_{user}-1} \quad (21\text{-}68)$$

When constructing the Data field for user u encoded using LDPC code, the MAC follows the padding procedure described in 10.13.6 (A-MPDU padding for VHT PPDU) and delivers a PSDU that contains $\mathrm{PSDU_LENGTH}_u$ octets (see 21.4.3 (TXTIME and PSDU_LENGTH calculation)). The PHY follows the padding procedure described in 21.3.10.1 (General) to fill $N_{\mathrm{SYM_max_init}}$ symbols, where $N_{\mathrm{SYM_max_init}}$ is defined in Equation (21-66). Then, for each user, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits shall be encoded using the LDPC encoding process specified in 19.3.11.7.5 (LDPC PPDU encoding process) with the following modifications. First, N_{pld} shall be computed using Equation (21-67) instead of Equation (19-35). Also, replace N_{CBPS} and R with $N_{CBPS,u}$ and R_u, respectively. Next, step d) in 19.3.11.7.5 (LDPC PPDU encoding process) is replaced with step d) below:

d) If N_{SYM} computed in Equation (21-68) is equal to $N_{\mathrm{SYM_max_init}}$, then the number of bits to be punctured, N_{punc}, from the codewords after encoding is computed as shown in Equation (19-38).

If N_{SYM} computed in Equation (21-68) is greater than $N_{\mathrm{SYM_max_init}}$, then the number of bits to be punctured, N_{punc}, from the codewords after encoding is computed using Equation (19-39) and Equation (20-40). Note also that N_{avbits} has now been updated in Equation (19-39) in this case.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The punctured bits shall be equally distributed over all N_{CW} codewords with the first rem(N_{punc}, N_{CW}) codewords punctured 1 bit more than the remaining codewords. Define $N_{ppcw} = \lfloor N_{punc} / N_{CW} \rfloor$. When $N_{ppcw} > 0$, the puncturing is performed by discarding parity bits $p_{n-k-N_{ppcw}-1}, \ldots, p_{n-k-1}$ of the first rem(N_{punc}, N_{CW}) codewords and discarding parity bits $p_{n-k-N_{ppcw}}, \ldots, p_{n-k-1}$ of the remaining codewords after encoding.

When constructing the Data field for users encoded using BCC, the MAC follows the padding procedure described in 10.13.6 (A-MPDU padding for VHT PPDU) and delivers a PSDU that contains PSDU_LENGTH$_u$ octets. The PHY follows the padding procedure described in 21.3.10.1 (General) to fill up N_{SYM} symbols computed in Equation (21-68). Then, for each user, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits shall be encoded using the BCC encoding process specified in 21.3.10.5.2 (BCC encoder parsing operation) and 21.3.10.5.3 (Binary convolutional coding and puncturing). Note that this process results in the BCC tail bits being placed at the very end of the PPDU.

In addition, if N_{SYM} computed in Equation (21-68) is greater than $N_{\text{SYM_max_init}}$ computed in Equation (21-66), then the LDPC Extra OFDM Symbol field of VHT-SIG-A2 shall be set to 1. Otherwise, the LDPC Extra OFDM Symbol field of VHT-SIG-A2 shall be set to 0.

21.3.10.6 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoders are processed in groups of N_{CBPS} bits. Each of these groups is rearranged into N_{SS} blocks of N_{CBPSS} bits ($N_{SS,u}$ blocks of $N_{CBPSS,u}$ bits in the case of an MU transmission). This operation is referred to as "stream parsing" and is described in this subclause.

The description is given in terms of an SU transmission. For MU transmissions, the rearrangements are carried out in the same way per user.

The number of bits assigned to a single axis (real or imaginary) of a constellation point in a spatial stream is denoted by Equation (21-69).

$$s = \max\left\{1, \frac{N_{BPSCS}}{2}\right\} \tag{21-69}$$

The sum of these over all streams is $S = N_{SS} \cdot s$

Consecutive blocks of s bits are assigned to different spatial streams in a round robin fashion.

Let

$$N_{\text{Block}} = \left\lfloor \frac{N_{CBPS}}{N_{ES} \cdot S} \right\rfloor \tag{21-70}$$

and

$$M = \frac{N_{CBPS} - N_{\text{Block}} \cdot N_{ES} \cdot S}{s \cdot N_{ES}} \tag{21-71}$$

For the first $N_{\text{Block}} \cdot N_{ES} \cdot S$ bits of each OFDM symbol, S bits from the output of first encoder are divided among all spatial streams, s bits per stream. Then, S bits from the output of next encoder are used, and so on.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If N_{CBPS} is greater than $N_{\text{Block}} \cdot N_{ES} \cdot S$, then for the last $N_{CBPS} - N_{\text{Block}} \cdot N_{ES} \cdot S$ bits of each OFDM symbol, $M \cdot s$ bits from the output of the first encoder are fed into spatial streams 1 through M (s bits per spatial stream), and then $M \cdot s$ bits from the output of the next encoder are used for spatial stream $M + 1$ through $[(2M - 1) \bmod N_{SS}] + 1$, and so on, where $z \bmod t$ is the remainder resulting from the division of integer z by integer t.

The following equations are an equivalent description to the above procedure. Bit i at the output of encoder j is assigned to input bit k of spatial stream i_{SS} where

$$j = \begin{cases} \left\lfloor \frac{k}{s} \right\rfloor \bmod N_{ES}, & k = 0, 1, \ldots, N_{\text{Block}} \cdot N_{ES} \cdot s - 1 \\ \left\lfloor \frac{L}{M} \right\rfloor, & k = N_{\text{Block}} \cdot N_{ES} \cdot s, \ldots, N_{CBPSS} - 1 \end{cases} \tag{21-72}$$

and

$$i = \begin{cases} (i_{SS} - 1)s + S \cdot \left\lfloor \frac{k}{N_{ES} \cdot s} \right\rfloor + k \bmod s, & k = 0, 1, \ldots, N_{\text{Block}} \cdot N_{ES} \cdot s - 1 \\ (L \bmod M) \cdot s + N_{\text{Block}} \cdot S + k \bmod s, & k = N_{\text{Block}} \cdot N_{ES} \cdot s, \ldots, N_{CBPSS} - 1 \end{cases} \tag{21-73}$$

where

$i_{SS} = 1, 2, \ldots, N_{SS}$

$i = 0, 1, \ldots, N_{CBPS}/N_{ES} - 1$

$j = 0, 1, \ldots, N_{ES} - 1$

$k = 0, 1, \ldots, N_{CBPSS} - 1$

$L = \left\lfloor \frac{k'}{s} \right\rfloor N_{SS} + (i_{SS} - 1)$

$k' = k - N_{\text{Block}} \cdot N_{ES} \cdot s$

NOTE—N_{CBPS} is greater than $N_{\text{Block}} \cdot N_{ES} \cdot S$ in only the following cases:

- 160 MHz and 80+80 MHz, $N_{SS} = 5$, VHT-MCS = 5
- 160 MHz and 80+80 MHz, $N_{SS} = 5$, VHT-MCS = 6
- 160 MHz and 80+80 MHz, $N_{SS} = 7$, VHT-MCS = 5
- 160 MHz and 80+80 MHz, $N_{SS} = 7$, VHT-MCS = 6

21.3.10.7 Segment parser

The description in this subclause is given in terms of an SU transmission. For MU transmissions, the rearrangements are carried out in the same way per user.

For a 160 MHz or an 80+80 MHz transmission, the output bits of each stream parser are first divided into blocks of N_{CBPSS} bits ($N_{CBPSS,u}$ bits in the case of an MU transmission). Then, each block is further divided into two frequency subblocks of $N_{CBPSS}/2$ bits as shown in Equation (21-74).

$$y_{k,l} = x_{2s \cdot N_{ES} \left\lfloor \frac{k}{s \cdot N_{ES}} \right\rfloor + l \cdot s \cdot N_{ES} + k \bmod (s \cdot N_{ES})}, \qquad k = 0, 1, \ldots, \frac{N_{CBPSS}}{2} - 1 \tag{21-74}$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where

x_m is the m th bit of a block of N_{CBPSS} bits, m= 0 to $N_{CBPSS} - 1$

l is the frequency subblock index, $l = 0, 1$

$y_{k,l}$ is bit k of the frequency subblock l

s is defined in Equation (21-69)

If N_{CBPSS} is not divisible by $2s \cdot N_{ES}$, then apply the segment parsing method described in Equation (21-74) for $\lfloor N_{CBPSS}/(2s \cdot N_{ES}) \rfloor$ sets of $2s \cdot N_{ES}$ segment parser input bits. At this point, each stream parser output has $2s \cdot N_{res}$ ($N_{res} = \frac{N_{CBPSS} \bmod (2s \cdot N_{ES})}{2s} < N_{ES}$, integer) residue bits. Then, the residue bits are divided into subsets of s bits, with each subset being assigned to different subblock ($l = 0, 1$) in a round robin fashion. The first s bits are assigned to the subblock with index $l = 0$. Repeat N_{res} times (until all bits are distributed to the two subblocks). That is, if N_{CBPSS} is not divisible by $2s \cdot N_{ES}$, each block is further divided into two subblocks of $N_{CBPSS}/2$ bits as shown in Equation (21-75).

$$y_{k,l} = \begin{cases} x_{2s \cdot N_{ES}\left\lfloor \frac{k}{s \cdot N_{ES}} \right\rfloor + l \cdot s \cdot N_{ES} + k \bmod (s \cdot N_{ES})}, & k = 0, 1, \ldots, \lfloor N_{CBPSS}/(2s \cdot N_{ES}) \rfloor \cdot s \cdot N_{ES} - 1 \\ x_{2s \cdot N_{ES}\left\lfloor \frac{k}{s \cdot N_{ES}} \right\rfloor + 2s \cdot \left\lfloor \frac{k \bmod (s \cdot N_{ES})}{s} \right\rfloor + l \cdot s + k \bmod s}, & k = \lfloor N_{CBPSS}/(2s \cdot N_{ES}) \rfloor \cdot s \cdot N_{ES}, \ldots, \frac{N_{CBPSS}}{2} - 1 \end{cases} \quad (21\text{-}75)$$

Segment parser is bypassed for a 20 MHz, 40 MHz, or 80 MHz VHT PPDU transmission, i.e., as specified in Equation (21-76).

$$y_{k,l} = x_k, \quad k = 0, 1, \ldots, N_{CBPSS} - 1 \quad (21\text{-}76)$$

where

l is the frequency subblock index. $l = 0$ for a 20, 40 or 80 MHz VHT PPDU transmission.

$y_{k,l}$ is bit k of the frequency subblock l

x_m is bit m of a block of N_{CBPSS} bits, $m = 0$ to $N_{CBPSS} - 1$

21.3.10.8 BCC interleaver

For ease of explanation, the operation of the interleaver is described for the SU case. For user u of an MU transmission, the interleaver operates in the same way on the output bits for the user from the stream parser by replacing N_{SS}, N_{CBPSS}, N_{CBPSSI}, and N_{BPSCS} with $N_{SS,u}$, $N_{CBPSS,u}$, $N_{CBPSSI,u}$, and $N_{BPSCS,u}$, respectively. That is, the operation of the interleaver is the same as if the transmission were an SU one, consisting of bits from only that user.

This subclause describes the interleaver used in the case of BCC encoding. The interleaver described in this subclause shall be bypassed in the case of LDPC encoding.

In a 20 MHz, 40 MHz, or 80 MHz VHT PPDU transmission, the bits at the output of the stream parser are processed in groups of N_{CBPS} bits. Each of these groups is divided into N_{SS} blocks of N_{CBPSS} bits, and each

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

block shall be interleaved by an interleaver based on the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) interleaver. In a 160 MHz or an 80+80 MHz VHT PPDU transmission, each frequency subblock of $N_{CBPSS}/2$ output bits from the segment parser is interleaved by the interleaver for 80 MHz defined in this subclause. This interleaver, which is based on entering the data in rows, and reading it out in columns, has a different number of columns N_{COL} and rows N_{ROW} for different bandwidths. The values of N_{COL} and N_{ROW} are given in Table 21-17 (Number of rows and columns in the interleaver).

Table 21-17—Number of rows and columns in the interleaver

Parameter	20 MHz	40 MHz	80 MHz
N_{COL}	13	18	26
N_{ROW}	$4 \times N_{BPSCS}$	$6 \times N_{BPSCS}$	$9 \times N_{BPSCS}$
N_{ROT} ($N_{SS} \leq 4$)	11	29	58
N_{ROT} ($N_{SS} > 4$)	6	13	28

After the operations based on the Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) interleaver have been applied and if more than one spatial stream exists, a third operation called frequency rotation is applied to the additional spatial streams. The parameter for the frequency rotation is N_{ROT}. The values of N_{ROT} are given in Table 21-17 (Number of rows and columns in the interleaver).

An additional parameter is the spatial stream index $i_{SS} = 1, 2, \ldots, N_{SS}$. The output of the third operation is a function of the spatial stream index.

The interleaving is defined using three permutations. The first permutation is given by the rule shown in Equation (21-77).

$$i = N_{ROW}(k \bmod N_{COL}) + \left\lfloor \frac{k}{N_{COL}} \right\rfloor, k = 0, 1, \ldots, N_{CBPSSI} - 1 \quad (21\text{-}77)$$

The second permutation is defined by the rule shown in Equation (21-78).

$$j = s\left\lfloor \frac{i}{s} \right\rfloor + \left(i + N_{CBPSSI} - \left\lfloor \frac{N_{COL} \cdot i}{N_{CBPSSI}} \right\rfloor \right) \bmod s, \quad i = 0, 1, \ldots, N_{CBPSSI} - 1 \quad (21\text{-}78)$$

where

s is defined in Equation (21-69)

If $2 \leq N_{SS} \leq 4$, a frequency rotation is applied to the output of the second permutation as shown in Equation (21-79).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$r = \left\{ j - \left[(2(i_{SS} - 1)) \bmod 3 + 3 \left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor \right] \cdot N_{ROT} \cdot N_{BPSCS} \right\} \bmod N_{CBPSSI}, \quad (21\text{-}79)$$

$$j = 0, 1, \ldots, N_{CBPSSI} - 1$$

where

$i_{SS} = 1, 2, \ldots, N_{SS}$ is the spatial steam index on which this interleaver is operating

If $N_{SS} > 4$, a frequency rotation is applied to the output of the second permutation as shown in Equation (21-80).

$$r = \{ j - J(i_{SS}) \cdot N_{ROT} \cdot N_{BPSCS} \} \bmod N_{CBPSSI}, j = 0, 1, \ldots, N_{CBPSSI} - 1 \quad (21\text{-}80)$$

where

$i_{SS} = 1, 2, \ldots, N_{SS}$ is the spatial steam index on which this interleaver is operating, and $J(i_{SS})$ is an integer as defined in Table 21-18 (J(iSS) values).

Table 21-18— $J(i_{SS})$ values

i_{SS}	$J(i_{SS})$
1	0
2	5
3	2
4	7
5	3
6	6
7	1
8	4

The deinterleaver uses the following three operations to perform the inverse permutations. Let r denote the index of the bit in the received block (per spatial stream). The first operation reverses the third (frequency rotation) permutation of the interleaver. When $N_{SS} = 1$, this reversal is performed by $j = r$ ($r = 0, 1, \ldots, N_{CBPSSI} - 1$). When $2 \le N_{SS} \le 4$, this reversal is performed by as shown in Equation (21-81).

$$j = \left\{ r + \left[(2(i_{SS} - 1)) \bmod 3 + 3 \left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor \right] \cdot N_{ROT} \cdot N_{BPSCS} \right\} \bmod N_{CBPSSI}, \quad (21\text{-}81)$$

$$r = 0, 1, \ldots, N_{CBPSSI} - 1$$

When $N_{SS} > 4$, this reversal is performed by Equation (21-82).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$j = \{r + J(i_{SS}) \cdot N_{ROT} \cdot N_{BPSCS}\} \bmod N_{CBPSSI}, \quad r = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-82}$$

where

$J(i_{SS})$ is defined in Table 21-18 (J(iSS) values)

The second operation defined by Equation (21-83) reverses the second permutation in the interleaver.

$$i = s\left\lfloor \frac{j}{s} \right\rfloor + \left(j + \left\lfloor \frac{N_{COL} \cdot j}{N_{CBPSSI}} \right\rfloor\right) \bmod s, \quad j = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-83}$$

where

s is defined in Equation (21-69)

The third operation defined in Equation (21-84) reverses the first permutation of the interleaver.

$$k = N_{COL} \cdot i - (N_{CBPSSI} - 1)\left\lfloor \frac{i}{N_{ROW}} \right\rfloor, \quad i = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-84}$$

21.3.10.9 Constellation mapping

21.3.10.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points for BPSK, QPSK, 16-QAM, and 64-QAM follows the rules defined in 17.3.5.8 (Subcarrier modulation mapping). For 256-QAM, the mapping is shown in Figure 21-24 (Constellation bit encoding for 256-QAM (1st quadrant)), Figure 21-25 (Constellation bit encoding for 256-QAM (2nd quadrant)), Figure 21-26 (Constellation bit encoding for 256-QAM (3rd quadrant)), and Figure 21-27 (Constellation bit encoding for 256-QAM (4th quadrant)).

The bit-string convention in Figure 21-24 (Constellation bit encoding for 256-QAM (1st quadrant)), Figure 21-25 (Constellation bit encoding for 256-QAM (2nd quadrant)), Figure 21-26 (Constellation bit encoding for 256-QAM (3rd quadrant)), and Figure 21-27 (Constellation bit encoding for 256-QAM (4th quadrant)) follows the bit-string convention outlined in 17.3.5.8 (Subcarrier modulation mapping).

The streams of complex numbers in frequency subblock l for user u are denoted

21.3.10.9.2 LDPC tone mapping

The LDPC tone mapping shall be performed on all LDPC encoded streams as described in this subclause and using an LDPC tone-mapping distance parameter D_{TM}. D_{TM} is constant for each bandwidth and its value for different bandwidths is given in Table 21-19 (LDPC tone mapping distance for each bandwidth). LDPC tone mapping shall not be performed on streams that are encoded using BCC.

Table 21-19—LDPC tone mapping distance for each bandwidth

Parameter	20 MHz	40 MHz	80 MHz	160 MHz, 80+80 MHz
D_{TM}	4	6	9	9

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For a VHT PPDU transmission, the LDPC tone mapping for LDPC-coded streams corresponding to user u is done by permuting the stream of complex numbers generated by the constellation mappers (see Equation (21-85)) to obtain

$$d''_{t(k),\,i,\,n,\,l,\,u} = d'_{k,\,i,\,n,\,l,\,u};\quad k = 0, 1, \ldots, N_{SD} - 1 \text{ for 20 MHz, 40 MHz, 80 MHz and 80+80 MHz;} \tag{21-86}$$

$$k = 0, 1, \ldots, \frac{N_{SD}}{2} - 1 \text{ for 160 MHz;}$$

$$i = 1, \ldots, N_{SS,\,u};$$

$$n = 0, 1, \ldots, N_{SYM} - 1;$$

$$l = 0 \text{ for 20 MHz, 40 MHz, and 80 MHz;}$$

$$l = 0, 1 \text{ for 160 MHz and 80+80 MHz;}$$

$$u = 0, \ldots, N_{user} - 1$$

where

$$t(k) = \begin{cases} D_{TM}\left(k \bmod \dfrac{N_{SD}}{D_{TM}}\right) + \left\lfloor \dfrac{k \cdot D_{TM}}{N_{SD}} \right\rfloor, & \text{for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz} \\ D_{TM}\left(k \bmod \dfrac{N_{SD}/2}{D_{TM}}\right) + \left\lfloor \dfrac{k \cdot D_{TM}}{N_{SD}/2} \right\rfloor, & \text{for 160 MHz} \end{cases} \tag{21-87}$$

As a result of the LDPC tone mapping operation above, each two consecutively generated complex constellation numbers $d'_{k,\,i,\,n,\,l,\,u}$ and $d'_{k+1,\,i,\,n,\,l,\,u}$ will be transmitted on two data tones that are separated by at least $D_{TM} - 1$ other data tones. Note that the operation above is equivalent to block-interleaving the complex numbers $d'_{0,\,i,\,n,\,l,\,u}, \ldots, d'_{N_{SD}-1,\,i,\,n,\,l,\,u}$ for each i, n, and u using a matrix with D_{TM} rows and N_{SD}/D_{TM} (for 20 MHz, 40 MHz, 80 MHz, or 80+80 MHz) or $\dfrac{N_{SD}}{2 \cdot D_{TM}}$ (for 160 MHz) columns, where $d'_{0,\,i,\,n,\,l,\,u}, \ldots, d'_{N_{SD}-1,\,i,\,n,\,l,\,u}$ are written row-wise into the matrix, and $d''_{0,\,i,\,n,\,l,\,u}, \ldots, d''_{N_{SD}-1,\,i,\,n,\,l,\,u}$ are read column-wise from the matrix.

NOTE—LDPC tone mapping is performed separately for the upper and lower 80 MHz segments of a 160 MHz of 80+80 MHz transmission as indicated by the frequency subblock index l in Equation (21-86) and Equation (21-87).

Since LDPC tone mapping is not performed on BCC-coded streams, for BCC-coded streams, the following applies:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$d''_{k,i,n,l,u} = d'_{k,i,n,l,u};\quad k = 0, 1, \ldots, N_{SD} - 1 \text{ for 20 MHz, 40 MHz, 80 MHz and 80+80 MHz;} \quad (21\text{-}88)$$

$$k = 0, 1, \ldots, \frac{N_{SD}}{2} - 1 \text{ for 160 MHz;}$$

$$i = 1, \ldots, N_{SS,u};$$

$$n = 0, 1, \ldots, N_{SYM} - 1;$$

$$l = 0 \text{ for 20 MHz, 40 MHz, and 80 MHz;}$$

$$l = 0, 1 \text{ for 160 MHz and 80+80 MHz;}$$

$$u = 0, \ldots, N_{user} - 1$$

21.3.10.9.3 Segment deparser

In a 160 MHz VHT PPDU transmission, the two frequency subblocks at the output of the LDPC tone mapper for LDPC or constellation mapper for BCC are combined into one frequency segment as shown in Equation (21-89).

$$d^{(i_{Seg})}_{k,i,n,u} = \begin{cases} d''_{k,i,n,0,u}, & \text{if } 0 \le k \le \frac{N_{SD}}{2} - 1 \\ d''_{k - N_{SD}/2,i,n,1,u}, & \text{if } \frac{N_{SD}}{2} \le k \le N_{SD} - 1 \end{cases}, \quad i_{Seg} = 0 \quad (21\text{-}89)$$

In a 20 MHz, 40 MHz, or 80 MHz VHT PPDU transmission, the segment deparsing is not performed. Hence,

$$d^{(i_{Seg})}_{k,i,n,u} = d''_{k,i,n,0,u}, \quad 0 \le k \le N_{SD} - 1, \quad i_{Seg} = 0 \quad (21\text{-}90)$$

In an 80+80 MHz VHT PPDU transmission, the segment deparsing is not performed. Hence,

$$d^{(i_{Seg})}_{k,i,n,u} = d''_{k,i,n,i_{Seg},u}, \quad 0 \le k \le N_{SD} - 1, \quad i_{Seg} = 0, 1 \quad (21\text{-}91)$$

NOTE—As per Table 21-7 (Center frequency of the portion of the PPDU transmitted in frequency segment iSeg), $f_c^{(0)}$ (center frequency for frequency segment i_{Seg}=0) is always less than $f_c^{(1)}$ in case of 80+80 MHz VHT PPDU transmissions. Hence, $d''_{k,i,n,0,u}$ (frequency subblock 0) is always transmitted in the frequency segment lower in frequency, while $d''_{k,i,n,1,u}$ (frequency subblock 1) is always transmitted in the frequency segment higher in frequency.

21.3.10.9.4 Space-time block coding

This subclause defines a set of optional robust transmission techniques that are applicable only when using STBC coding for VHT SU PPDUs. In this case, $N_{SS,0}$ spatial streams are mapped to $N_{STS,0}$ space-time streams. These techniques are based on STBC. When the VHT-SIG-A STBC field is 1, a symbol operation shall occur between the constellation mapper and the spatial mapper as defined in this subclause. STBC shall not be applied in a VHT MU PPDU. Hence, the user subscript *u* is 0 in this subclause.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

If STBC is applied, the stream of complex numbers, $d^{(i_{Seg})}_{k,\,i,\,n,\,0}$; $k = 0, \ldots, N_{SD}-1$; $i = 1, \ldots, N_{SS,\,0}$; $n = 0, \ldots, N_{SYM}-1$, generated by the segment deparser, is the input to the STBC encoder, which produces as output the stream of complex numbers $\tilde{d}^{(i_{Seg})}_{k,\,i_{STS},\,n,\,0}$; $k = 0, \ldots, N_{SD}-1$; $i_{STS} = 1, \ldots, N_{STS,\,0}$; $n = 0, \ldots, N_{SYM}-1$. For given values of *k* and *i*, STBC processing operates on the complex modulation symbols in sequential pairs of OFDM symbols so that the value of $\tilde{d}^{(i_{Seg})}_{k,\,2i-1,\,2m,\,0}$ and $\tilde{d}^{(i_{Seg})}_{k,\,2i,\,2m,\,0}$ depend on $d^{(i_{Seg})}_{k,\,i,\,2m,\,0}$ and $d^{(i_{Seg})}_{k,\,i,\,2m+1,\,0}$. Also, $\tilde{d}^{(i_{Seg})}_{k,\,2i-1,\,2m+1,\,0}$ and $\tilde{d}^{(i_{Seg})}_{k,\,2i,\,2m+1,\,0}$ depend on $d^{(i_{Seg})}_{k,\,i,\,2m,\,0}$ and $d^{(i_{Seg})}_{k,\,i,\,2m+1,\,0}$. This is defined in Table 21-20 (Constellation mapper output to spatial mapper input for STBC). Note that the segment index i_{Seg} is omitted in Table 21-20 (Constellation mapper output to spatial mapper input for STBC) for simplicity.

Table 21-20—Constellation mapper output to spatial mapper input for STBC

N_{STS}	N_{SS}	i_{STS}	$\tilde{d}_{k,\,i_{STS},\,2m,\,0}$	$\tilde{d}_{k,\,i_{STS},\,2m+1,\,0}$
2	1	1	$d_{k,\,1,\,2m,\,0}$	$d_{k,\,1,\,2m+1,\,0}$
		2	$-d^{*}_{k,\,1,\,2m+1,\,0}$	$d^{*}_{k,\,1,\,2m,\,0}$
4	2	1	$d_{k,\,1,\,2m,\,0}$	$d_{k,\,1,\,2m+1,\,0}$
		2	$-d^{*}_{k,\,1,\,2m+1,\,0}$	$d^{*}_{k,\,1,\,2m,\,0}$
		3	$d_{k,\,2,\,2m,\,0}$	$d_{k,\,2,\,2m+1,\,0}$
		4	$-d^{*}_{k,\,2,\,2m+1,\,0}$	$d^{*}_{k,\,2,\,2m,\,0}$
6	3	1	$d_{k,\,1,\,2m,\,0}$	$d_{k,\,1,\,2m+1,\,0}$
		2	$-d^{*}_{k,\,1,\,2m+1,\,0}$	$d^{*}_{k,\,1,\,2m,\,0}$
		3	$d_{k,\,2,\,2m,\,0}$	$d_{k,\,2,\,2m+1,\,0}$
		4	$-d^{*}_{k,\,2,\,2m+1,\,0}$	$d^{*}_{k,\,2,\,2m,\,0}$
		5	$d_{k,\,3,\,2m,\,0}$	$d_{k,\,3,\,2m+1,\,0}$
		6	$-d^{*}_{k,\,3,\,2m+1,\,0}$	$d^{*}_{k,\,3,\,2m,\,0}$

Table 21-20—Constellation mapper output to spatial mapper input for STBC *(continued)*

N_{STS}	N_{SS}	i_{STS}	$\tilde{d}_{k, i_{STS}, 2m, 0}$	$\tilde{d}_{k, i_{STS}, 2m+1, 0}$
8	4	1	$d_{k, 1, 2m, 0}$	$d_{k, 1, 2m+1, 0}$
		2	$-d^*_{k, 1, 2m+1, 0}$	$d^*_{k, 1, 2m, 0}$
		3	$d_{k, 2, 2m, 0}$	$d_{k, 2, 2m+1, 0}$
		4	$-d^*_{k, 2, 2m+1, 0}$	$d^*_{k, 2, 2m, 0}$
		5	$d_{k, 3, 2m, 0}$	$d_{k, 3, 2m+1, 0}$
		6	$-d^*_{k, 3, 2m+1, 0}$	$d^*_{k, 3, 2m, 0}$
		7	$d_{k, 4, 2m, 0}$	$d_{k, 4, 2m+1, 0}$
		8	$-d^*_{k, 4, 2m+1, 0}$	$d^*_{k, 4, 2m, 0}$

If STBC is not applied, $\tilde{d}^{(i_{Seg})}_{k, i, n, 0} = d^{(i_{Seg})}_{k, i, n, 0}$ and $N_{STS, 0} = N_{SS, 0}$.

NOTE—When STBC is applied, an odd number of space-time streams is not allowed, and $N_{STS, 0} = 2N_{SS, 0}$.

21.3.10.10 Pilot subcarriers

In a 20 MHz transmission, four pilot tones shall be inserted in subcarriers $k \in \{-21, -7, 7, 21\}$. The pilot mapping P^k_n for subcarrier *k* for symbol *n* shall be as specified in Equation (21-92).

$$P^{\{-21,-7,7,21\}}_n = \{\Psi^{(1)}_{1, n \bmod 4}, \Psi^{(1)}_{1, (n+1) \bmod 4}, \Psi^{(1)}_{1, (n+2) \bmod 4}, \Psi^{(1)}_{1, (n+3) \bmod 4}\}$$
$$P^{k \notin \{-21,-7,7,21\}}_n = 0 \quad (21\text{-}92)$$

where

$\Psi^{(1)}_{1, m}$ is given by the $N_{STS} = 1$ row of Table 19-19 (Pilot values for 20 MHz transmission)

In a 40 MHz transmission, six pilot tones shall be inserted in subcarriers –53, –25, –11, 11, 25, and 53. The pilot mapping P^k_n for subcarrier *k* for symbol *n* shall be as specified in Equation (21-93).

$$P^{\{-53,-25,-11,11,25,53\}}_n = \{\Psi^{(1)}_{1, n \bmod 6}, \Psi^{(1)}_{1, (n+1) \bmod 6}, \ldots, \Psi^{(1)}_{1, (n+5) \bmod 6}\}$$
$$P^{k \notin \{-53,-25,-11,11,25,53\}}_n = 0 \quad (21\text{-}93)$$

where

$\Psi^{(1)}_{1, m}$ is given by the $N_{STS} = 1$ row of Table 19-20 (Pilots values for 40 MHz transmission (excluding MCS 32))

In an 80 MHz transmission, eight pilot tones shall be inserted in subcarriers –103, –75, –39, –11, 11, 39, 75, and 103. The pilot mapping P^k_n for subcarrier *k* for symbol *n* shall be as specified in Equation (21-94).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$P_n^{\{-103,-75,-39,-11,11,39,75,103\}} = \{\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \ldots, \Psi_{(n+7) \bmod 8}\}$$
$$P_n^{k \notin \{-103,-75,-39,-11,11,39,75,103\}} = 0 \quad (21\text{-}94)$$

where

Ψ_m is defined in Table 21-21 (Pilot values for 80 MHz transmission)

Table 21-21—Pilot values for 80 MHz transmission

Ψ_0	Ψ_1	Ψ_2	Ψ_3	Ψ_4	Ψ_5	Ψ_6	Ψ_7
1	1	1	–1	–1	1	1	1

In a 160 MHz transmission, the 80 MHz pilot mapping is replicated in the two 80 MHz subchannels of the 160 MHz transmission. Specifically, 16 pilot tones shall be inserted in subcarriers –231, –203, –167, –139, –117, –89, –53, –25, 25, 53, 89, 117, 139, 167, 203, and 231. The pilot mapping P_n^k for subcarrier k for symbol n shall be as specified in Equation (21-95).

$$P_n^{\{-231,-203,-167,-139,-117,-89,-53,-25,25,53,89,117,139,167,203,231\}} \quad (21\text{-}95)$$
$$= \{\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \Psi_{(n+2) \bmod 8}, \Psi_{(n+3) \bmod 8}, \Psi_{(n+4) \bmod 8}, \Psi_{(n+5) \bmod 8}, \Psi_{(n+6) \bmod 8}, \Psi_{(n+7) \bmod 8},$$
$$\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \Psi_{(n+2) \bmod 8}, \Psi_{(n+3) \bmod 8}, \Psi_{(n+4) \bmod 8}, \Psi_{(n+5) \bmod 8}, \Psi_{(n+6) \bmod 8}, \Psi_{(n+7) \bmod 8}\}$$
$$P_n^{k \notin \{-231,-203,-167,-139,-117,-89,-53,-25,25,53,89,117,139,167,203,231\}} = 0$$

where

Ψ_m is given in Table 21-21 (Pilot values for 80 MHz transmission)

In an 80+80 MHz transmission, each frequency segment shall follow the 80 MHz pilot tone allocation and values defined for 80 MHz transmission as specified in Equation (21-94) and Table 21-21 (Pilot values for 80 MHz transmission).

The above pilot mapping shall be copied to all space-time streams before the space-time stream cyclic shifts are applied.

21.3.10.11 OFDM modulation

21.3.10.11.1 Transmission in VHT format

The time domain waveform of the Data field of a VHT PPDU from frequency segment i_{Seg} and transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$ shall be as defined in Equation (21-96).

$$r_{\text{VHT-Data}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{VHT-Data}}^{\text{Tone}} N_{STS,total}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{\text{SYM}}}(t - nT_{SYM}) \quad (21\text{-}96)$$
$$\cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,u}} \left(\left[Q_k^{(i_{Seg})} \right]_{i_{TX}, (M_u+m)} \Upsilon_{k,\text{BW}} (\tilde{D}_{k,m,n,BW}^{(i_{Seg},u)} + p_{n+4} P_n^k) \cdot \exp(j2\pi k \Delta_F (t - nT_{SYM} - T_{\text{GI, Data}} - T_{\text{CS,VHT}}(M_u+m))) \right)$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where

p_n is defined in 17.3.5.10 (OFDM modulation)

P_n^k is defined in 21.3.10.10 (Pilot subcarriers)

$\Upsilon_{k,\,\mathrm{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

$\tilde{D}_{k,\,m,\,n,\,BW}^{(i_{Seg},\,u)}$ is the transmitted constellation for user u at subcarrier k, space-time stream m, and Data field OFDM symbol n and is defined in Equation (21-97) through Equation (21-100)

$N_{\mathrm{VHT\text{-}Data}}^{\mathrm{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

$T_{\mathrm{CS,VHT}}(n)$ is given in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU)

$T_{\mathrm{GI,\,Data}}$ is the guard interval duration. $T_{\mathrm{GI,\,Data}} = T_{\mathrm{GI}}$ when not using the short guard interval (Short GI field of VHT-SIG-A2 is 0) and $T_{\mathrm{GI,\,Data}} = T_{\mathrm{GIS}}$ when using the short guard interval (Short GI field of VHT-SIG-A2 is 1). T_{GI} and T_{GIS} are given in Table 21-5 (Timing-related constants).

In a 20 MHz VHT transmission,

$$\tilde{D}_{k,\,m,\,n,\,20}^{(i_{Seg},\,u)} = \begin{cases} 0,\ k = 0, \pm 7, \pm 21 \\ \tilde{d}_{M_{20}^r(k),\,m,\,n,\,u}^{(i_{Seg})},\ \text{otherwise} \end{cases} \tag{21-97}$$

where

$M_{20}^r(k)$ is defined in Equation (21-50)

In a 40 MHz VHT transmission,

$$\tilde{D}_{k,\,m,\,n,\,40}^{(i_{Seg},\,u)} = \begin{cases} 0,\ k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ \tilde{d}_{M_{40}^r(k),\,m,\,n,\,u}^{(i_{Seg})},\ \text{otherwise} \end{cases} \tag{21-98}$$

where

$M_{40}^r(k)$ is defined in Equation (21-52)

In an 80 MHz transmission,

$$\tilde{D}_{k,\,m,\,n,\,80}^{(i_{Seg},\,u)} = \begin{cases} 0,\ k = 0, \pm 1, \pm 11, \pm 39, \pm 75, \pm 103 \\ \tilde{d}_{M_{80}^r(k),\,m,\,n,\,u}^{(i_{Seg})},\ \text{otherwise} \end{cases} \tag{21-99}$$

where

$M_{80}^r(k)$ is defined in Equation (21-54)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

In a 160 MHz transmission,

$$\tilde{D}^{(i_{Seg},\,u)}_{k,\,m,\,n,\,160} = \begin{cases} 0, k = 0, \pm1, \pm2, \pm3, \pm4, \pm5, \pm25, \pm53, \pm89, \pm117, \pm127, \pm128, \pm129, \pm139, \pm167, \pm203, \pm231 \\ \tilde{d}^{(i_{Seg})}_{M^r_{160}(k),\,m,\,n,\,u}, \text{otherwise} \end{cases} \quad (21\text{-}100)$$

where

$M^r_{160}(k)$ is defined in Equation (21-56)

In an 80+80 MHz transmission, each frequency segment shall follow the 80 MHz VHT subcarrier mapping as specified in Equation (21-99) and Equation (21-54).

$Q^{(i_{Seg})}_k$ is a spatial mapping/steering matrix with N_{TX} rows and $N_{STS,total}$ columns for subcarrier k in frequency segment i_{Seg}. $Q^{(i_{Seg})}_k$ may be frequency dependent. Refer to the examples of Q_k listed in 19.3.11.11.2 (Spatial mapping) for examples of $Q^{(i_{Seg})}_k$ that could be used for VHT SU PPDUs. Note that implementations are not restricted to the spatial mapping matrix examples listed in 19.3.11.11.2 (Spatial mapping) and the number of transmit chains N_{TX} could be greater than 4. For VHT SU PPDUs to which beamforming is applied, $Q^{(i_{Seg})}_k$ is a beamforming steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. For VHT MU PPDUs, $Q^{(i_{Seg})}_k$ is the DL-MU-MIMO steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. The beamforming steering matrices and DL-MU-MIMO steering matrices are implementation specific.

21.3.10.12 Non-HT duplicate transmission

When the TXVECTOR parameter FORMAT is NON_HT and the TXVECTOR parameter NON_HT_MODULATION is NON_HT_DUP_OFDM, the transmitted PPDU is a non-HT duplicate. Non-HT duplicate transmission is used to transmit to non-HT OFDM STAs, HT STAs, or VHT STAs that may be present in a part of a 40 MHz, 80 MHz, or 160 MHz channel (see Table 21-2 (Interpretation of FORMAT, NON_HT Modulation and CH_BANDWIDTH parameters)). The VHT-SIG-A, VHT-STF, VHT-LTF, and VHT-SIG-B fields are not transmitted. The L-STF, L-LTF, and L-SIG fields shall be transmitted in the same way as in the VHT transmission, with the exceptions for the Rate and Length fields which shall follow 17.3.4 (SIGNAL field).

In a 40 MHz non-HT duplicate transmission, the Data field shall be as defined by Equation (19-61).

For 80 MHz and 160 MHz non-HT duplicate transmissions, the Data field shall be as defined by Equation (21-101).

$$r^{i_{TX}}_{\text{non-HT},\,BW}(t) = \frac{1}{\sqrt{N^{\text{Tone}}_{\text{NON_HT_DUP_OFDM-Data}}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \quad (21\text{-}101)$$

$$\cdot \sum_{i_{BW}=0}^{N_{20\text{MHz}}-1} \left(\sum_{k=-26}^{26} \Upsilon_{(k-K_{\text{Shift}}(i_{BW})),\,BW}(D_{k,\,n} + p_{n+1}P_k) \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{BW}))\Delta_F(t - nT_{SYM} - T_{GI} - T^{i_{TX}}_{\text{CS}})) \right)$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where

$N_{20\text{MHz}}$ and $K_{\text{Shift}}(i)$ are defined in 21.3.8.2.4 (L-SIG definition)

P_k and p_n are defined in 17.3.5.10 (OFDM modulation)

$D_{k,n}$ is defined in Equation (21-26)

$\Upsilon_{k,\,BW}$ is defined in Equation (21-16) and Equation (21-17)

$T_{\text{CS}}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU)

$N_{\text{NON_HT_DUP_OFDM-Data}}^{\text{Tone}}$ has the value given in Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields)

In an 80+80 MHz non-HT duplicate transmission, data transmission in each frequency segment shall be as defined for an 80 MHz non-HT duplicate transmission in Equation (21-101).

21.3.11 SU-MIMO and DL-MU-MIMO Beamforming

21.3.11.1 General

SU-MIMO and DL-MU-MIMO beamforming are techniques used by a STA with multiple antennas (the beamformer) to steer signals using knowledge of the channel to improve throughput. With SU-MIMO beamforming all space-time streams in the transmitted signal are intended for reception at a single STA. With DL-MU-MIMO beamforming, disjoint subsets of the space-time streams are intended for reception at different STAs.

For SU-MIMO beamforming, the steering matrix Q_k can be determined from the beamforming feedback matrix V_k that is sent back to the beamformer by the beamformee using the compressed beamforming feedback matrix format as defined in 19.3.12.3.6 (Compressed beamforming feedback matrix). The feedback report format is described in 9.4.1.49 (VHT Compressed Beamforming Report field).

For DL-MU-MIMO beamforming, the receive signal vector in subcarrier k at beamformee u, $\boldsymbol{y}_{k,\,u} = [y_{k,\,0}, y_{k,\,1}, \ldots, y_{k,\,N_{RX_u}-1}]^T$, is shown in Equation (21-102), where $\boldsymbol{x}_k = [\boldsymbol{x}_{k,\,0}^T, \boldsymbol{x}_{k,\,1}^T, \ldots, \boldsymbol{x}_{k,\,N_{user}-1}^T]^T$ denotes the transmit signal vector in subcarrier k for all N_{user} beamformees, with $\boldsymbol{x}_{k,\,u} = [x_{k,\,0}, x_{k,\,1}, \ldots, x_{k,\,N_{STS,\,u}-1}]^T$ being the transmit signal for beamformee u.

$$\boldsymbol{y}_{k,\,u} = \boldsymbol{H}_{k,\,u} \times [Q_{k,\,0}, Q_{k,\,1}, \ldots, Q_{k,\,N_{user}-1}] \times \boldsymbol{x}_k + \boldsymbol{n} \tag{21-102}$$

where

$\boldsymbol{H}_{k,u}$ is the channel matrix from the beamformer to beamformee u in subcarrier k with dimensions $N_{RX_u} \times N_{TX}$

N_{RX_u} is the number of receive antennas at beamformee u

$Q_{k,\,u}$ is a steering matrix for beamformee u in subcarrier k with dimensions $N_{TX} \times N_{STS_u}$

N_{user} is the number of VHT MU PPDU recipients (see Table 21-6 (Frequently used parameters))

$\boldsymbol{n}$ is a vector of additive noise and may include interference

This is an unapproved IEEE Standards Draft, subject to change.

The DL-MU-MIMO steering matrix $Q_k = [Q_{k,0}, Q_{k,1}, \ldots, Q_{k,N_{user}-1}]$ can be determined by the beamformer using the beamforming feedback matrices for subcarrier k from beamformee u, $V_{k,u,}$ and SNR information for subcarrier k from beamformee u, $SNR_{k,u}$, where $u = 0, 1, \ldots, N_{user} - 1$. The steering matrix that is computed (or updated) using new beamforming feedback matrices and new SNR information from some or all of participating beamformees might replace the existing steering matrix Q_k for the next DL-MU-MIMO data transmission. The beamformee group for the MU transmission is signaled using the Group ID field in VHT-SIG-A (see 21.3.8.3.3 (VHT-SIG-A definition) and 21.3.11.4 (Group ID)).

21.3.11.2 Beamforming Feedback Matrix *V*

Upon receipt of a VHT NDP sounding PPDU, the beamformee shall remove the space-time stream CSD in Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU) from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrix, $V_{k,u}$, found by the beamformee u for subcarrier k shall be compressed in the form of angles using the method described in 19.3.12.3.6 (Compressed beamforming feedback matrix). The angles, $\phi(k,u)$ and $\psi(k,u)$, are quantized according to Table 9-68 (Quantization of angles). The number of bits for quantization is chosen by the beamformee, based on the indication from the beamformer as to whether the feedback is requested for SU-MIMO beamforming or DL-MU-MIMO beamforming. The compressed beamforming feedback using 19.3.12.3.6 (Compressed beamforming feedback matrix) is the only Clause 21 (Very High Throughput (VHT) PHY specification) beamforming feedback format defined.

The beamformee shall generate the beamforming feedback matrices with the number of rows (*Nr*) equal to the N_{STS} of the NDP.

After receiving the angle information, $\phi(k,u)$ and $\psi(k,u)$, the beamformer reconstructs $V_{k,u}$ using Equation (19-79). For SU-MIMO beamforming, the beamformer can use this $V_{k,0}$ matrix to determine the steering matrix Q_k. For DL-MU-MIMO beamforming, the beamformer may calculate a steering matrix $Q_k = [Q_{k,0}, Q_{k,1}, \ldots, Q_{k,N_{user}-1}]$ using $V_{k,u}$ and $SNR_{k,u}$ ($0 \le u \le N_{user} - 1$) in order to suppress crosstalk between participating beamformees. The method used by the beamformer to calculate the steering matrix Q_k is implementation specific.

The beamformee decides the tone grouping value to be used in the beamforming feedback matrix *V*. A beamformer shall support all tone grouping values and Codebook Information values.

21.3.11.3 Maximum Number of Total Spatial Streams in VHT MU PPDUs

An MU beamformee capable STA shall support reception of VHT MU PPDUs with the total number of space-time streams across the N_user users being less than or equal to the value indicated in the Maximum $N_{STS,total}$ subfield of the Supported VHT-MCS and NSS Set field of the VHT Capabilities element.

21.3.11.4 Group ID

A value in the Group ID field in VHT-SIG-A (see 21.3.8.3.3 (VHT-SIG-A definition)) in the range 1 to 62 indicates a VHT MU PPDU. Prior to transmitting a VHT MU PPDU, group assignments have been established by the AP for DL-MU-MIMO capable STAs using the Group ID Management frame as defined in 9.6.23.3 (Group ID Management frame format).

After the PHY is configured using the PHYCONFIG_VECTOR parameter GROUP_ID_MANAGEMENT, the following lookup tables are populated:

a) group ID to Membership Status, denoted by MembershipStatusInGroupID[*g*] for $1 \le g \le 62$
b) group ID to User Position, denoted by UserPositionInGroupID[*g*] for $1 \le g \le 62$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When a STA receives a VHT MU PPDU where the Group ID field in VHT-SIG-A has the value *k* and where MembershipStatusInGroupID[*k*] is equal to 1, then the number of space-time streams for that STA is indicated in the MU[UserPositionInGroupID[*k*]] NSTS field in VHT-SIG-A. The space-time streams of different users are ordered in accordance to user position values, i.e., the space-time streams for the user in user position 0 come first, followed by the space-time streams for the user in position 1, followed by the space-time streams for the user in position 2, and followed by the space-time streams for the user in position 3.

A STA is also able to identify the space-time streams intended for other STAs that act as interference. VHT-LTF symbols in the VHT MU PPDU are used to measure the channel for the space-time streams intended for the STA and can also be used to measure the channel for the interfering space-time streams. To successfully demodulate the space-time streams intended for the STA, the STA may use the channel state information for all space-time streams to reduce the effect of interfering space-time streams.

If a STA finds that it is not a member of the group, or the STA is a member of the group but the corresponding MU NSTS field in VHT-SIG-A indicates that there are zero space-time streams for the STA in the PPDU, then the STA may elect to not process the remainder of the PPDU.

21.3.12 VHT preamble format for sounding PPDUs

NDP is the only VHT sounding format.

The format of a VHT NDP PPDU is shown in Figure 21-28 (VHT NDP format).

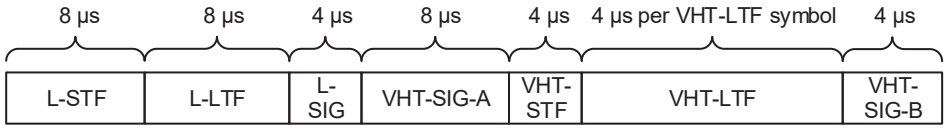

Figure 21-28—VHT NDP format

NOTE—The number of VHT-LTF symbols in the NDP is determined by the SU NSTS field in VHT-SIG-A.

The VHT NDP PPDU has the following properties:

— uses the VHT PPDU format but without the Data field
— is a VHT SU PPDU as indicated by the VHT-SIG-A field
— has the data bits of the VHT-SIG-B field set to a fixed bit pattern (see 21.3.8.3.6 (VHT-SIG-B definition))

21.3.13 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains might be subject to additional or alternative national regulations.

This is an unapproved IEEE Standards Draft, subject to change.

21.3.14 Channelization

A VHT channel is specified by the four PLME MIB fields specified in Table 21-22 (Fields to specify VHT channels).

Table 21-22—Fields to specify VHT channels

Field	Meaning
dot11CurrentChannelWidth	Channel width. Possible values represent 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channels.
dot11CurrentChannelCenterFrequencyIndex0	For a 20 MHz, 40 MHz, 80 MHz, or 160 MHz channel, denotes the channel center frequency. For an 80+80 MHz channel, denotes the center frequency of the frequency segment 0, which is the frequency segment containing the primary channel. Valid range is 1 to 200. See Equation (21-103).
dot11CurrentChannelCenterFrequencyIndex1	For an 80+80 MHz channel, denotes the center frequency of the frequency segment 1, which is the frequency segment that does not contain the primary channel. Valid range is 1 to 200. See Equation (21-103). For a 20 MHz, 40 MHz, 80 MHz, or 160 MHz channel, set to 0.
dot11CurrentPrimaryChannel	Denotes the location of the primary 20 MHz channel. Valid range is 1 to 200. See Equation (21-104).

Given dot11CurrentChannelCenterFrequencyIndex0 and dot11CurrentChannelCenterFrequencyIndex1, the respective center frequency is given by Equation (21-103).

$$\text{Channel center frequency [MHz]} = \text{Channel starting frequency} + 5 \times \text{dot11CurrentChannelCenterFrequencyIndex} \quad (21\text{-}103)$$

where

Channel starting frequency is given by the operating class (Annex E)

dot11CurrentChannelCenterFrequencyIndex is either dot11CurrentChannelCenterFrequencyIndex0 or dot11CurrentChannelCenterFrequencyIndex1

The center frequency of the primary 20 MHz channel is given by Equation (21-104).

$$\text{Primary 20 MHz channel center frequency [MHz]} = \text{Channel starting frequency} + 5 \times \text{dot11CurrentPrimaryChannel} \quad (21\text{-}104)$$

The channel starting frequency is defined as dot11ChannelStartingFactor × 500 kHz. If a channel center frequency is 5.000 GHz, it shall be indicated by dot11ChannelStartingFactor = 8000 and dot11CurrentPrimaryChannel = 200.

For an 80+80 MHz channel, any two channels that would each be allowed as 80 MHz channels and whose center frequencies are separated by greater than 80 MHz (difference between dot11CurrentChannelCenterFrequencyIndex0 and dot11CurrentChannelCenterFrequencyIndex1 corresponds to a frequency difference greater than 80 MHz) may be used.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For example, a channel specified by

channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 80 MHz
dot11CurrentChannelCenterFrequencyIndex0 = 42
dot11CurrentPrimaryChannel = 36

is an 80 MHz channel with a center frequency of 5210 MHz and the primary 20 MHz channel centered at 5180 MHz.

A channel specified by

channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 160 MHz
dot11CurrentChannelCenterFrequencyIndex0 = 50
dot11CurrentPrimaryChannel = 56

is a 160 MHz channel with a center frequency of 5250 MHz and the primary 20 MHz channel centered at 5280 MHz.

A channel specified by

channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 80+80 MHz
dot11CurrentChannelCenterFrequencyIndex0 =155
dot11CurrentChannelCenterFrequencyIndex1 = 106
dot11CurrentPrimaryChannel = 161

is an 80+80 MHz channel in which frequency segment 0 has 80 MHz bandwidth and center frequency of 5775 MHz. Frequency segment 1 also has 80 MHz bandwidth and center frequency of 5530 MHz. The primary 20 MHz channel is centered at 5805 MHz.

21.3.15 Slot time

The slot time for the VHT PHY shall be 9 μs for 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channel spacing.

21.3.16 Transmit and receive port impedance

Transmit and receive antenna connector impedance for each transmit and receive antenna is defined in 17.3.8.7 (Transmit and receive impedance at the antenna connector).

21.3.17 VHT transmit specification

21.3.17.1 Transmit spectrum mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause.

NOTE 2—Transmit spectral mask figures in this subclause are not drawn to scale.

NOTE 3—For rules regarding TX center frequency leakage levels, see 21.3.17.4.2 (Transmit center frequency leakage). The spectral mask requirements in this subclause do not apply to the RF LO.

For a 20 MHz mask PPDU of non-HT, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and –40 dBr at 30 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 9 and 11 MHz, 11 and 20 MHz, and 20 and 30 MHz shall be linearly interpolated in dB domain from the requirements for 9 MHz, 11 MHz,

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

20 MHz, and 30 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –53 dBm/MHz at any frequency offset. Figure 21-29 (Example transmit spectral mask for a 20 MHz mask PPDU) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –53 dBm/MHz.

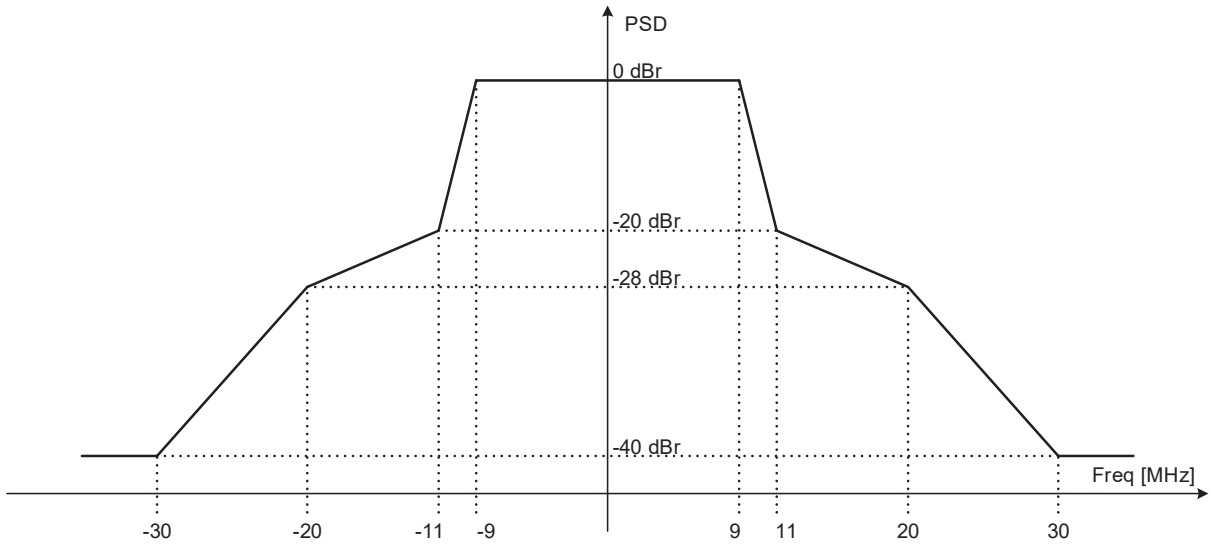

Figure 21-29—Example transmit spectral mask for a 20 MHz mask PPDU

For a 40 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz frequency offset, and –40 dBr at 60 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 19 and 21 MHz, 21 and 40 MHz, and 40 and 60 MHz shall be linearly interpolated in dB domain from the requirements for 19 MHz, 21 MHz, 40 MHz, and 60 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –56 dBm/MHz at any frequency offset greater than 19 MHz. Figure 21-30 (Example transmit spectral mask for a 40 MHz mask PPDU) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –56 dBm/MHz.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

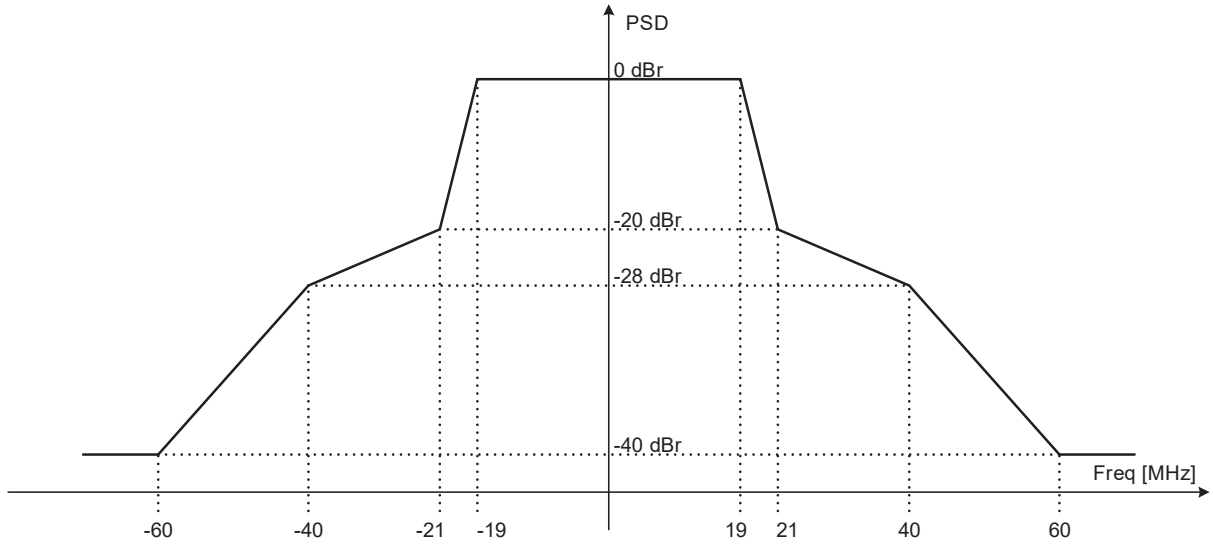

Figure 21-30—Example transmit spectral mask for a 40 MHz mask PPDU

For an 80 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 78 MHz, –20 dBr at 41 MHz frequency offset, –28 dBr at 80 MHz frequency offset, and –40 dBr at 120 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 39 and 41 MHz, 41 and 80 MHz, and 80 and 120 MHz shall be linearly interpolated in dB domain from the requirements for 39 MHz, 41 MHz, 80 MHz, and 120 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –59 dBm/MHz at any frequency offset. Figure 21-31 (Example transmit spectral mask for an 80 MHz mask PPDU) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –59 dBm/MHz.

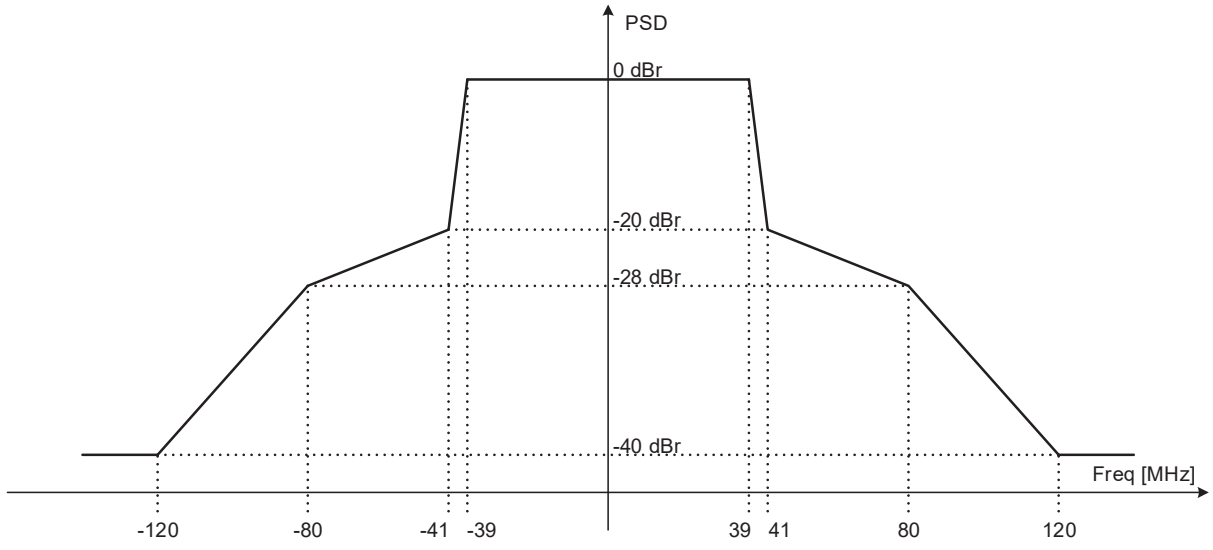

Figure 21-31—Example transmit spectral mask for an 80 MHz mask PPDU

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For a 160 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 158 MHz, –20 dBr at 81 MHz frequency offset, –28 dBr at 160 MHz frequency offset, and –40 dBr at 240 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 79 and 81 MHz, 81 and 160 MHz, and 160 and 240 MHz shall be linearly interpolated in dB domain from the requirements for 79 MHz, 81 MHz, 160 MHz, and 240 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –59 dBm/MHz at any frequency offset. Figure 21-32 (Example transmit spectral mask for a 160 MHz mask PPDU) shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –59 dBm/MHz.

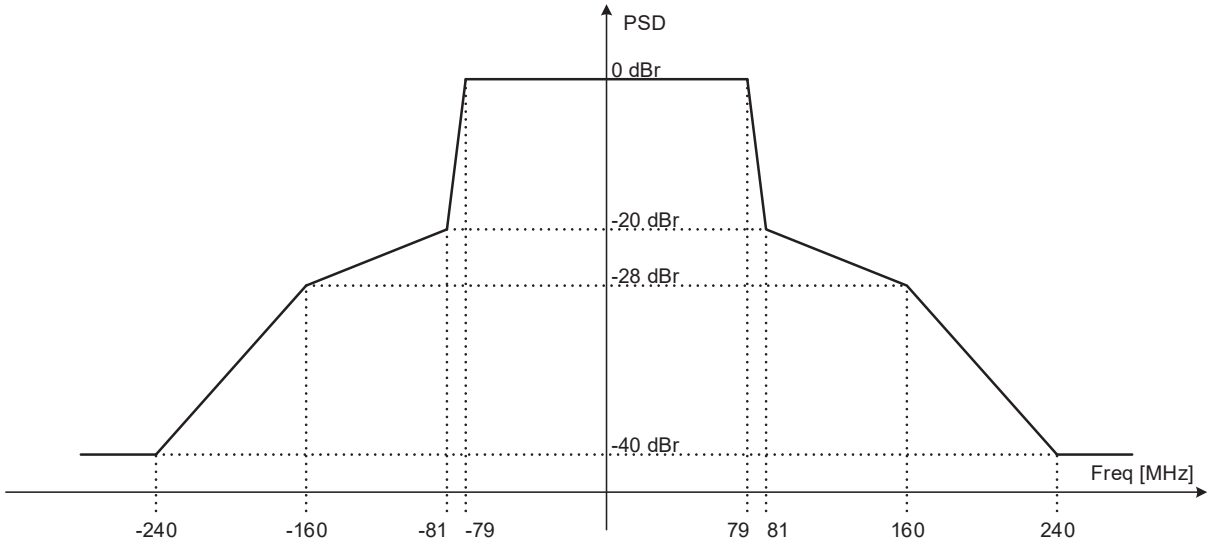

Figure 21-32—Example transmit spectral mask for a 160 MHz mask PPDU

For an 80+80 MHz mask PPDU of non-HT duplicate or VHT format, the overall transmit spectral mask is constructed in the following manner. First, the 80 MHz interim spectral mask is placed on each of the two 80 MHz segments. Then, for each frequency at which both of the 80 MHz interim spectral masks have values greater than –40 dBr and less than –20 dBr, the sum of the two interim mask values (summed in linear domain) shall be taken as the overall spectral mask value. Next, for each frequency at which neither of the two 80 MHz interim masks have values greater than or equal to –20 dBr and less than or equal to 0 dBr, the higher value of the two interim masks shall be taken as the overall interim spectral value. Finally, for any frequency region where the mask value has not been defined yet, linear interpolation (in dB domain) between the nearest two frequency points with the interim spectral mask value defined shall be used to define the interim spectral mask value. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –59 dBm/MHz at any frequency offset. Figure 21-33 (Example transmit spectral mask for an 80+80 MHz mask PPDU) shows an example of a transmit spectral mask for a noncontiguous transmission using two 80 MHz channels where the center frequency of the two 80 MHz channels are separated by 160 MHz and the –40 dBr spectrum level is above –59 dBm/MHz.

Different center frequency separation between the two 80 MHz frequency segments of the spectral mask as well as different peak levels of each 80 MHz frequency segment of the spectral mask are possible, in which case a similar procedure in determining the spectral mask as in Figure 21-33 (Example transmit spectral mask for an 80+80 MHz mask PPDU) is followed.

The transmit spectral mask for noncontiguous transmissions using two nonadjacent 80 MHz channels is applicable only in regulatory domains that allow for such transmissions.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

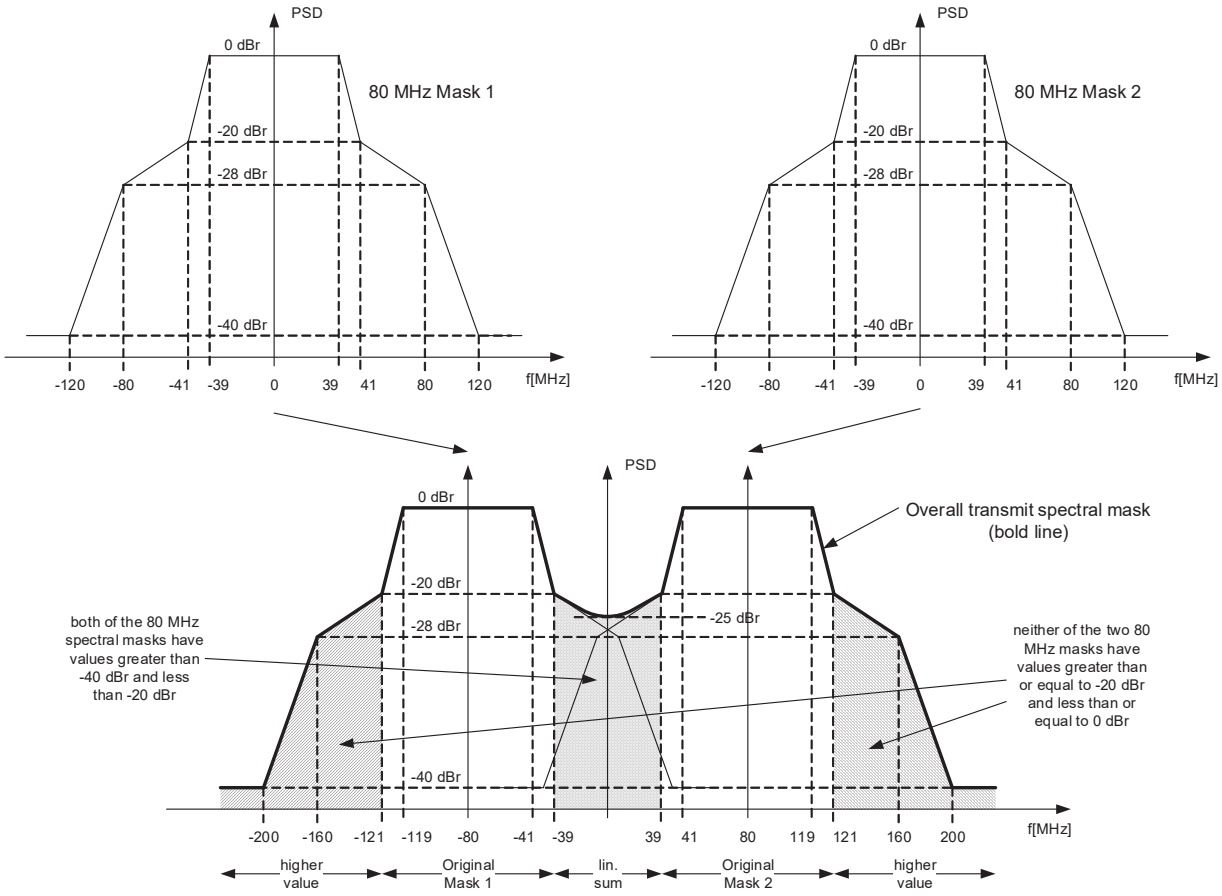

Figure 21-33—Example transmit spectral mask for an 80+80 MHz mask PPDU

Measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

21.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs. Demodulate the PPDUs according to the following (or equivalent) procedure:

a) Start of PPDU shall be detected.
b) Transition from L-STF to L-LTF shall be detected and fine timing shall be established.
c) Coarse and fine frequency offsets shall be estimated.
d) Symbols in a PPDU shall be derotated according to estimated frequency offset.
e) For each VHT-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.
f) For each of the data OFDM symbols: transform the symbol into subcarrier received values.

The spectral flatness test shall be performed over at least 20 PPDUs. The PPDUs under test shall be at least 16 data OFDM symbols long.

Evaluate spectral flatness using the subcarrier received values or the magnitude of the channel estimation.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Let $E_{i,\,avg}$ denote the magnitude of the channel estimation on subcarrier *i* or the average constellation energy of a BPSK modulated subcarrier *i* in a VHT data symbol.

In a contiguous non-HT duplicate or VHT transmission having a bandwidth listed in Table 21-23 (Maximum transmit spectral flatness deviations), $E_{i,\,avg}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 21-23 (Maximum transmit spectral flatness deviations) from the average of $E_{i,\,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,\,avg}$ is done in the linear domain.

Table 21-23—Maximum transmit spectral flatness deviations

Format	Bandwidth of transmission (MHz)	Averaging subcarrier indices (inclusive)	Tested subcarrier indices (inclusive)	Maximum deviation (dB)
VHT	20	–16 to –1 and +1 to +16	–16 to –1 and +1 to +16	±4
			–28 to –17 and +17 to +28	+4/–6
	40	–42 to –2 and +2 to +42	–42 to –2 and +2 to +42	±4
			–58 to –43 and +43 to +58	+4/–6
	80	–84 to –2 and +2 to +84	–84 to –2 and +2 to +84	±4
			–122 to –85 and +85 to +122	+4/–6
	160	–172 to –130, –126 to –44, +44 to +126, and +130 to +172	–172 to –130, –126 to –44, +44 to +126, and +130 to +172	±4
			–250 to –173, –43 to –6, +6 to +43, and +173 to +250	+4/–6
non-HT duplicate	40	–42 to –33, –31 to –6, +6 to +31, and +33 to +42	–42 to –33, –31 to –6, +6 to +31, and +33 to +42	±4
			–43 to –58 and +43 to +58	+4/–6

			–122 to –97, –95 to –85 and +85 to +95, +97 to +122	+4/–6
	160	–172 to –161, –159 to –134, –122 to –97, –95 to –70, –58 to –44, +44 to +58, +70 to +95, +97 to +122, +134 to +159, +161 to +172	–172 to –161, –159 to –134, –122 to –97, –95 to –70, –58 to –44, +44 to +58, +70 to +95, +97 to +122, +134 to +159, +161 to +172	±4
			–250 to –225, –223 to –198, –186 to –173, –43 to –33, –31 to –6, +6 to +31, +33 to +43, +173 to +186, +198 to +223, +225 to +250	+4/–6

In an 80+80 MHz transmission, each segment shall meet the spectral flatness requirement for an 80 MHz transmission.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k (see 21.3.10.11 (OFDM modulation)) with flat frequency response. Each output port under test of the

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous transmissions as well as 80+80 MHz transmissions.

21.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The symbol clock frequency and transmit center frequency tolerance shall be ±20 ppm maximum. The transmit center frequency and the symbol clock frequency for all transmit antennas and frequency segments shall be derived from the same reference oscillator. Transmit signals with TXVECTOR parameter CH_BANDWIDTH set to CBW160 or CBW80+80 may be generated using two separate RF LOs, one for each of the lower and upper 80 MHz frequency portions.

NOTE—The signal phase of the two 80 MHz frequency portions might not be correlated.

21.3.17.4 Modulation accuracy

21.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 21.3.17.4.2 (Transmit center frequency leakage) and 21.3.17.4.3 (Transmitter constellation error). The test method is described in 21.3.17.4.4 (Transmitter modulation accuracy (EVM) test).

21.3.17.4.2 Transmit center frequency leakage

TX LO leakage shall meet the following requirements for all formats and bandwidths except 80+80 MHz where the RF LO falls outside both frequency segments:

— When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW 312.5 kHz shall not exceed the average power per-subcarrier of the transmitted PPDU, or equivalently, $(P - 10\log 10(N_{ST}))$, where P is the transmit power per antenna in dBm, and N_{ST} is defined in Table 21-5 (Timing-related constants).

— When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW 312.5 kHz shall not exceed the maximum of –32 dB relative to the total transmit power and –20 dBm, or equivalently $max(P - 32, -20)$, where P is the transmit power per antenna in dBm, and N_{ST} is defined in Table 21-5 (Timing-related constants).

For an 80+80 MHz transmission where the RF LO falls outside both frequency segments, the RF LO shall follow the spectral mask requirements as defined in 21.3.17.1 (Transmit spectrum mask).

The transmit center frequency leakage is specified per antenna.

21.3.17.4.3 Transmitter constellation error

The relative constellation RMS error, calculated by first averaging over subcarriers, frequency segments, VHT PPDUs, and spatial streams (see Equation (19-89)) shall not exceed a data-rate dependent value according to Table 21-24 (Allowed relative constellation error versus constellation size and coding rate). The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, $N_{SS} = N_{STS}$ (no STBC) shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous transmissions as well as 80+80 MHz noncontiguous transmissions.

For non-HT duplicate transmissions, requirements defined in 17.3.9.7.4 (Transmitter constellation error) apply to each 20 MHz subchannel.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 21-24—Allowed relative constellation error versus constellation size and coding rate

Modulation	Coding rate	Relative constellation error (dB)
BPSK	1/2	–5
QPSK	1/2	–10
QPSK	3/4	–13
16-QAM	1/2	–16
16-QAM	3/4	–19
64-QAM	2/3	–22
64-QAM	3/4	–25
64-QAM	5/6	–27
256-QAM	3/4	–30
256-QAM	5/6	–32

21.3.17.4.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at sampling rate greater than or equal to the bandwidth of the signal being transmitted; except that

— For non-HT duplicate transmissions, each 20 MHz subchannel may be tested independently while all subchannels are being transmitted and

— For noncontiguous transmissions, each frequency segment may be tested independently while both segments are being transmitted.

In this case, transmit modulation accuracy of each segment shall meet the required value in Table 21-24 (Allowed relative constellation error versus constellation size and coding rate) using only the subcarriers within the corresponding segment.

The instrument shall have sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, and analog to digital quantization noise. A possible embodiment of such a setup is converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or equivalent procedure:

a) Start of PPDU shall be detected.

b) Transition from L-STF to L-LTF shall be detected and fine timing shall be established.

c) Coarse and fine frequency offsets shall be estimated.

d) Symbols in a PPDU shall be derotated according to estimated frequency offset.

e) For each VHT-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.

f) Estimate the complex channel response coefficient for each of the subcarriers and each of the transmit streams.

g) For each of the data OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to the estimated phase,

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

group the results from all of the receiver chains in each subcarrier to a vector, and multiply the vector by a zero-forcing equalization matrix generated from the estimated channel.

h) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it.

i) Compute the average across PPDUs of the RMS of all errors per PPDU as given by Equation (19-89).

NOTE—In the case the transmit modulation accuracy test is performed simultaneously for the two frequency segments of the 80+80 MHz transmissions, N_{ST} in Equation (19-89) represents the total number of subcarriers of both 80 MHz frequency segments.

The test shall be performed over at least 20 PPDUs (N_f as defined in Equation (19-89)). The PPDUs under test shall be at least 16 data OFDM symbols long. Random data shall be used for the symbols.

21.3.17.5 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is:

$$20 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{20\ \text{MHz}} \right\rceil\right)$$ sample/s, for a CH_BANDWIDTH parameter equal to CBW20

$$40 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{40\ \text{MHz}} \right\rceil\right)$$ sample/s, for a CH_BANDWIDTH parameter equal to CBW40

$$80 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{80\ \text{MHz}} \right\rceil\right)$$ sample/s, for a CH_BANDWIDTH parameter equal to CBW80

$$160 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{160\ \text{MHz}} \right\rceil\right)$$ sample/s, for a CH_BANDWIDTH parameter equal to CBW160 or CBW80+80

where

f_H is the nominal center frequency in Hz of the highest channel in the channel set

f_L is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which frames providing measurements are transmitted, the channel set comprises channels uniformly spaced across $f_H - f_L \leq 50$ MHz

— FIRST_TRANSITION_FIELD is L-STF.

— SECOND_TRANSITION_FIELD is L-LTF.

— TRAINING_FIELD is L-LTF windowed in a manner which should approximate the windowing described in 17.3.2.5 (Mathematical conventions in the signal descriptions) with TTR = 100 ns.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

21.3.18 VHT receiver specification

For tests in this subclause, the input levels are measured at the antenna connectors and are referenced as the average power per receive antenna. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized Device Under Test input ports. Each output port of the transmitting STA shall be connected through a cable to one input port of the Device Under Test.

21.3.18.1 Receiver minimum input sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 21-25 (Receiver minimum input level sensitivity). The test in this subclause and the minimum sensitivity levels specified in Table 21-25 (Receiver minimum input level sensitivity) apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

Table 21-25—Receiver minimum input level sensitivity

Modulation	Rate (R)	Minimum sensitivity (20 MHz PPDU) (dBm)	Minimum sensitivity (40 MHz PPDU) (dBm)	Minimum sensitivity (80 MHz PPDU) (dBm)	Minimum sensitivity (160 MHz or 80+80 MHz PPDU) (dBm)
BPSK	1/2	–82	–79	–76	–73
QPSK	1/2	–79	–76	–73	–70
QPSK	3/4	–77	–74	–71	–68
16-QAM	1/2	–74	–71	–68	–65
16-QAM	3/4	–70	–67	–64	–61
64-QAM	2/3	–66	–63	–60	–57
64-QAM	3/4	–65	–62	–59	–56
64-QAM	5/6	–64	–61	–58	–55
256-QAM	3/4	–59	–56	–53	–50
256-QAM	5/6	–57	–54	–51	–48

21.3.18.2 Adjacent channel rejection

Adjacent channel rejection for *W* MHz channels (where *W* is 20, 40, 80 or 160) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25 (Receiver minimum input level sensitivity) and raising the power of the interfering signal of *W* MHz bandwidth until 10% PER is caused for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The center frequency of the adjacent channel shall be placed *W* MHz away from the center frequency of the desired signal.

Adjacent channel rejection for 80+80 MHz channels shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25 (Receiver minimum input level sensitivity). Then, an interfering signal of 80 MHz bandwidth is introduced, where the center frequency of the interfering signal is placed 80 MHz away from the center frequency of the frequency segment lower in

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_1 be the power difference between the interfering and desired signal. Next, the interfering signal of 80 MHz bandwidth is moved to a frequency where the center frequency of the interfering signal is 80 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_2 be the power difference between the interfering and desired signal. The smaller value between ΔP_1 and ΔP_2 is the corresponding adjacent channel rejection.

The interfering signal in the adjacent channel shall be a signal compliant with the VHT PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 21-26 (Minimum required adjacent and nonadjacent channel rejection levels).

The test in this subclause and the adjacent sensitivity levels specified in Table 21-26 (Minimum required adjacent and nonadjacent channel rejection levels) apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

Table 21-26—Minimum required adjacent and nonadjacent channel rejection levels

Modulation	Rate (R)	Adjacent channel rejection (dB)		Nonadjacent channel rejection (dB)	
		20/40/80/ 160 MHz Channel	80+80 MHz Channel	20/40/80/ 160 MHz Channel	80+80 MHz Channel
BPSK	1/2	16	13	32	29
QPSK	1/2	13	10	29	26
QPSK	3/4	11	8	27	24
16-QAM	1/2	8	5	24	21
16-QAM	3/4	4	1	20	17
64-QAM	2/3	0	–3	16	13
64-QAM	3/4	–1	–4	15	12
64-QAM	5/6	–2	–5	14	11
256-QAM	3/4	–7	–10	9	6
256-QAM	5/6	–9	–12	7	4

The measurement of adjacent channel rejection for 160 MHz operation in a regulatory domain is required only if such a frequency band plan is permitted in that regulatory domain.

21.3.18.3 Nonadjacent channel rejection

Nonadjacent channel rejection for *W* MHz channels (where *W* is 20, 40, 80, or 160) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25 (Receiver minimum input level sensitivity), and raising the power of the interfering signal of *W* MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel rejection shall be met with any nonadjacent channels located at least 2×*W* MHz away from the center frequency of the desired signal.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Nonadjacent channel rejection for 80+80 MHz channels shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25 (Receiver minimum input level sensitivity). Then, an interfering signal of 80 MHz bandwidth is introduced, where the center frequency of the interfering signal is placed at least 160 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The center frequency of the interfering signal shall also be at least 160 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_1 be the power difference between the interfering and desired signal. Next, the interfering signal of 80 MHz bandwidth is moved to a frequency where the center frequency of the interfering signal is at least 160 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The center frequency of the interfering signal shall also be at least 160 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_2 be the difference in power between the signals in the interfering channel and the desired channel. The smaller value between ΔP_1 and ΔP_2 is the corresponding nonadjacent channel rejection.

The interfering signal in the nonadjacent channel shall be a signal compliant with the VHT PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 21-26 (Minimum required adjacent and nonadjacent channel rejection levels).

The test in this subclause and the nonadjacent sensitivity levels specified in Table 21-26 (Minimum required adjacent and nonadjacent channel rejection levels) apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

The measurement of nonadjacent channel rejection for 160 MHz operation in a regulatory domain is required only if such a frequency band plan is permitted in that regulatory domain.

21.3.18.4 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –30 dBm, measured at each antenna for any baseband VHT modulation.

21.3.18.5 CCA sensitivity

21.3.18.5.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

21.3.18.5.2 CCA sensitivity for operating classes requiring CCA-ED

For the operating classes requiring CCA-Energy Detect (CCA-ED), the PHY shall also indicate a medium busy condition when CCA-ED detects a channel busy condition.

For improved spectrum sharing, CCA-ED is required in some bands. The behavior class indicating CCA-ED is given in Table D-2 (Behavior limits). The operating classes requiring the corresponding CCA-ED behavior class are given in E.1 (Country information and operating classes). The PHY of a STA that is operating within an operating class that requires CCA-ED shall operate with CCA-ED.

CCA-ED shall detect a channel busy condition when the received signal strength exceeds the CCA-ED threshold as given by dot11OFDMEDThreshold for the primary 20 MHz channel, dot11OFDMEDThreshold for the secondary 20 MHz channel (if present), dot11OFDMEDThreshold + 3 dB for the secondary 40 MHz channel (if present), and dot11OFDMEDThreshold + 6 dB for the secondary

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

80 MHz channel (if present). The CCA-ED thresholds for the operating classes requiring CCA-ED are subject to the criteria in D.2.5 (CCA-ED threshold).

NOTE—The requirement to detect a channel busy condition as stated in 21.3.18.5.3 (CCA sensitivity for signals occupying the primary 20 MHz channel) and 21.3.18.5.4 (CCA sensitivity for signals not occupying the primary 20 MHz channel) is a mandatory energy detect requirement on all Clause 21 (Very High Throughput (VHT) PHY specification) receivers. Support for CCA-ED is an additional requirement that relates specifically to the sensitivities described in D.2.5 (CCA-ED threshold).

21.3.18.5.3 CCA sensitivity for signals occupying the primary 20 MHz channel

The PHY shall issue a PHY-CCA.indication(BUSY, {primary}) primitive if one of the conditions listed in Table 21-27 (Conditions for CCA BUSY on the primary 20 MHz) is met in an otherwise idle 20 MHz, 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz operating channel width. With >90% probability, the PHY shall detect the start of a PPDU that occupies at least the primary 20 MHz channel under the conditions listed in Table 21-27 (Conditions for CCA BUSY on the primary 20 MHz) within a period of aCCATime (see 21.4.4 (VHT PHY)) and hold the CCA signal busy (PHY-CCA.indication(BUSY, channel-list) primitive) for the duration of the PPDU.

Table 21-27—Conditions for CCA BUSY on the primary 20 MHz

Operating Channel Width	Conditions
20 MHz, 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz	The start of a 20 MHz NON_HT PPDU in the primary 20 MHz channel as defined in 17.3.10.6 (CCA requirements). The start of an HT PPDU under the conditions defined in 19.3.19.5 (CCA sensitivity). The start of a 20 MHz VHT PPDU in the primary 20 MHz channel at or above –82 dBm.
40 MHz, 80 MHz, 160 MHz, or 80+80 MHz	The start of a 40 MHz non-HT duplicate or VHT PPDU in the primary 40 MHz channel at or above –79 dBm. The start of an HT PPDU under the conditions defined in 19.3.19.5 (CCA sensitivity).
80 MHz, 160 MHz, or 80+80 MHz	The start of an 80 MHz non-HT duplicate or VHT PPDU in the primary 80 MHz channel at or above –76 dBm.
160 MHz or 80+80 MHz	The start of a 160 MHz or 80+80 MHz non-HT duplicate or VHT PPDU at or above –73 dBm.

The receiver shall issue a PHY-CCA.indication(BUSY, {primary}) primitive for any signal that exceeds a threshold equal to 20 dB above the minimum modulation and coding rate sensitivity (–82 + 20 = –62 dBm) in the primary 20 MHz channel within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the receiver shall not issue a PHY-CCA.indication(BUSY,{secondary}), PHY-CCA.indication(BUSY,{secondary40}), PHY-CCA.indication(BUSY,{secondary80}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

21.3.18.5.4 CCA sensitivity for signals not occupying the primary 20 MHz channel

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary}) primitive if the conditions for issuing PHY-CCA.indication(BUSY, {primary}) primitive are not present and one of the following conditions are present in an otherwise idle 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz operating channel width:

— Any signal within the secondary 20 MHz channel at or above a threshold of –62 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondary40}), PHY-CCA.indication(BUSY,{secondary80}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— A 20 MHz NON_HT, HT_MF, HT_GF or VHT PPDU detected in the secondary 20 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime (see 21.4.4 (VHT PHY)).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary40}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) and PHY-CCA.indication(BUSY, {secondary}) primitive are not present and one of the following conditions are present in an otherwise idle 80 MHz, 160 MHz, or 80+80 MHz operating channel width:

— Any signal within the secondary 40 MHz channel at or above a threshold of –59 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY, {secondary80}) primitive or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A 40 MHz non-HT duplicate, HT_MF, HT_GF or VHT PPDU detected in the secondary 40 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime (see 21.4.4 (VHT PHY)).

— A 20 MHz non-HT, HT_MF, HT_GF or VHT PPDU detected in any 20 MHz sub-channel of the secondary 40 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime.

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary80}) primitive if the conditions for PHY-CCA.indication(BUSY, {primary}), PHY-CCA.indication(BUSY, {secondary}), and PHY-CCA.indication(BUSY, {secondary40}) primitive are not present and one of the following conditions are present in an otherwise idle 160 MHz or 80+80 MHz operating channel width:

— Any signal within the secondary 80 MHz channel at or above –56 dBm.

— An 80 MHz non-HT duplicate or VHT PPDU detected in the secondary 80 MHz channel at or above –69 dBm with >90% probability within a period aCCAMidTime (see 21.4.4 (VHT PHY)).

— A 40 MHz non-HT duplicate, HT_MF, HT_GF or VHT PPDU detected in any 40 MHz sub-channel of the secondary 80 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime.

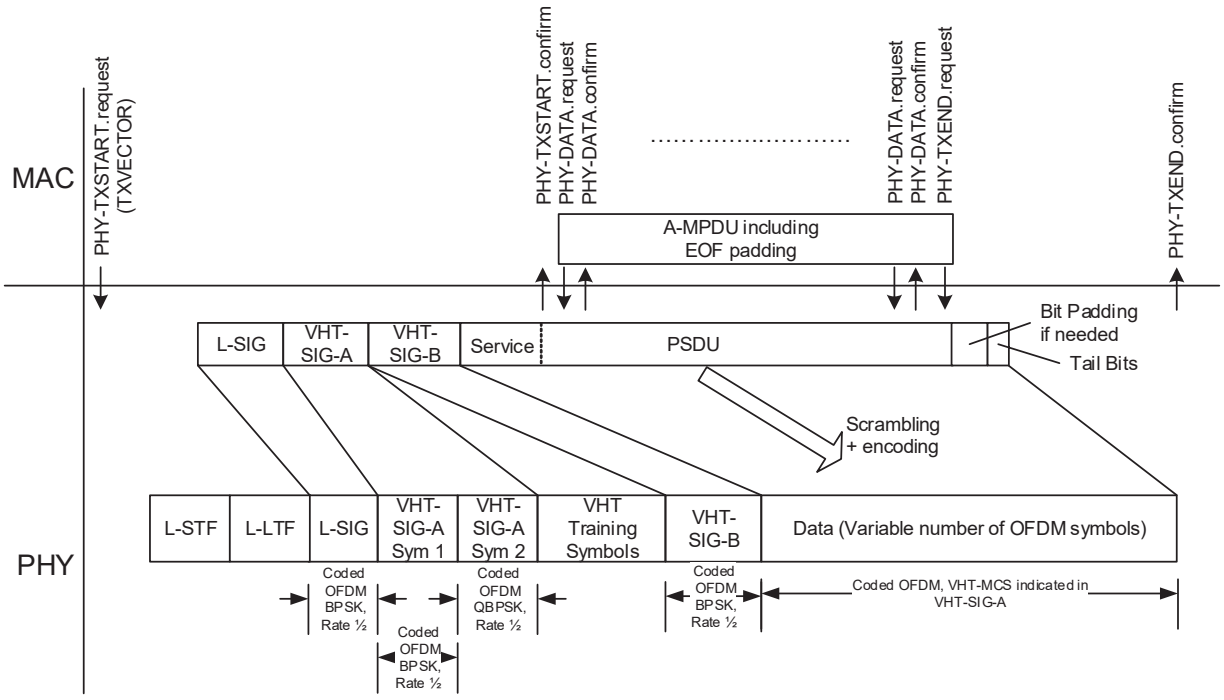
— A 20 MHz NON_HT, HT_MF, HT_GF or VHT PPDU detected in any 20 MHz sub-channel of the secondary 80 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime.

21.3.18.6 RSSI

The RSSI parameter returned in the RXVECTOR shall be calculated during the reception of the VHT-LTFs and shall be a monotonically increasing function of the received power.

21.3.19 PHY transmit procedure

There are two paths for the transmit PHY procedure:



— The first path, for which typical transmit procedures are shown in Figure 21-34 (PHY transmit procedure for an SU transmission), is selected if the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is VHT. These transmit procedures do not describe the operation of optional features, such as LDPC, STBC or MU.

— The second path is to follow the transmit procedure in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) if the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is NON_HT and the NON_HT_MODULATION parameter is set to NON_HT_DUP_OFDM except that the signal referred to in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) is instead generated simultaneously on each of the 20 MHz channels that are indicated by the CH_BANDWIDTH parameter as defined in 21.3.8 (VHT preamble) and 21.3.10.12 (Non-HT duplicate transmission).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 1—For a VHT MU PPDU the A-MPDU is per user in the MAC sublayer and the VHT Training Symbols, VHT-SIG-B, and Data are per user in the PHY in Figure 21-34 (PHY transmit procedure for an SU transmission), with the number VHT Training Symbols depending on the total number of space-time streams across all users.

NOTE 2—The transmit procedure for NON_HT format where NON_HT_MODULATION is OFDM is specified in 21.2.5.2 (Support for NON_HT format when NON_HT_MODULATION is OFDM). The transmit procedure for HT_MF and HT_GF formats is specified in 21.2.5.3 (Support for HT formats).

NOTE—This procedure does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 21-34—PHY transmit procedure for an SU transmission

In both paths, in order to transmit data, the MAC generates a PHY-TXSTART.request primitive, which causes the PHY entity to enter the transmit state. Further, the PHY is set to operate at the appropriate frequency through station management via the PLME, as specified in 21.4 (VHT PLME). Other transmit parameters, such as VHT-MCS Coding types and transmit power, are set via the PHY SAP using the PHY-TXSTART.request(TXVECTOR) primitive, as described in 21.2.2 (TXVECTOR and RXVECTOR parameters). The remainder of the clause applies to the first path.

The PHY indicates the state of the primary channel and other channels (if any) via the PHY-CCA.indication primitive (see 21.3.18.5 (CCA sensitivity) and 8.3.5.12 (PHY-CCA.indication)). Transmission of the PPDU shall be initiated by the PHY after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 21-1 (TXVECTOR and RXVECTOR parameters).

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

If all of the following conditions are met:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

— if dot11TODImplemented and dot11TODActivated are true or if dot11TimingMsmtActivated is true,
— the TXVECTOR parameter TIME_OF_DEPARTURE_REQUESTED is true,

then the PHY shall issue a PHY-TXSTART.confirm(TXSTATUS) primitive to the MAC, forwarding the TIME_OF_DEPARTURE corresponding to the time when the first frame energy is sent by the transmitting port and TIME_OF_DEPARTURE_ClockRate parameter within the TXSTATUS vector. If dot11TimingMsmtActivated is true, then the PHY shall forward the value of TX_START_OF_FRAME_OFFSET in TXSTATUS vector.

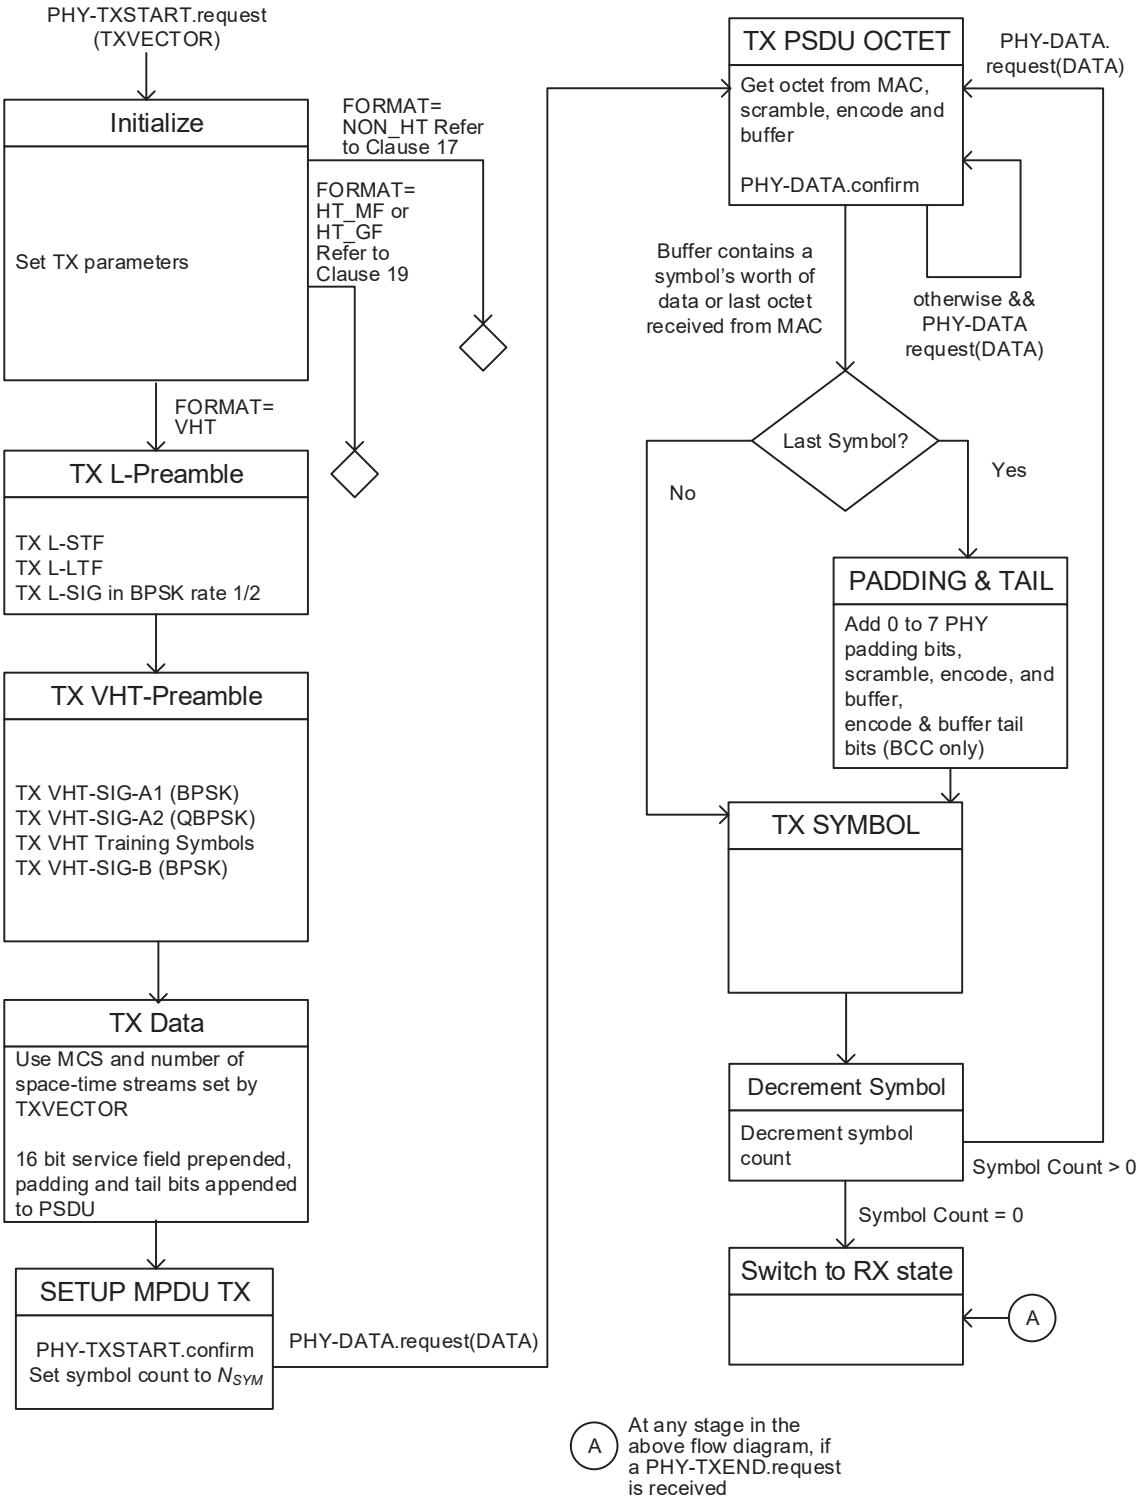
After the PHY preamble transmission is started, the PHY entity immediately initiates data scrambling and data encoding. The encoding method for the Data field is based on the FEC_CODING, CH_BANDWIDTH, NUM_STS, STBC, MCS, and NUM_USERS parameter of the TXVECTOR, as described in 21.3.2 (VHT PPDU format).

The SERVICE field and PSDU are encoded as described in 21.3.3 (Transmitter block diagram). The data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY. Zero to seven PHY padding bits are appended to the PSDU to make the number of bits in the coded PSDU an integer multiple of the number of coded bits per OFDM symbol.

Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PSDU transmission is terminated by receiving a PHY-TXEND.request primitive. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. In an SU transmission, normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number of OFDM symbols indicated by N_{SYM} (see 21.4.3 (TXTIME and PSDU_LENGTH calculation)).

In the PHY, the GI or short GI is inserted in every data OFDM symbol as a countermeasure against delay spread.

When the PPDU transmission is completed the PHY entity enters the receive state.



A typical state machine implementation of the transmit PHY for an SU transmission is provided in Figure 21-35 (PHY transmit state machine for an SU transmission). Request (.request) and confirmation (.confirm) primitives are issued once per state as shown. This state machine does not describe the operation of optional features, such as multi-user, LDPC or STBC.

21.3.20 PHY receive procedure

A typical PHY receive procedure is shown in Figure 21-36 (PHY receive procedure for an SU transmission) for VHT format. A typical state machine implementation of the receive PHY is given in Figure 21-37 (PHY receive state machine). This receive procedure and state machine do not describe the operation of optional features, such as LDPC or STBC. If the detected format indicates a NON_HT PPDU, refer to the receive procedure and state machine in Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). If the detected format indicates an HT PPDU format, refer to the receive procedure and state machine in Clause 19 (High Throughput (HT) PHY specification). Further, through station management (via the PLME) the PHY is set to the appropriate frequency, as specified in 21.4 (VHT PLME). The PHY has also been configured with group information (i.e., group membership and position in group) so that it can receive data intended for the STA. Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.

Upon receiving the transmitted PHY preamble overlapping the primary 20 MHz channel, the PHY measures a receive signal strength. The PHY indicates this activity to the MAC by issuing a PHY-CCA.indication

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—This state machine does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 21-35—PHY transmit state machine for an SU transmission

This is an unapproved IEEE Standards Draft, subject to change.

primitive. A PHY-CCA.indication(BUSY, channel-list) primitive is also issued as an initial indication of reception of a signal as specified in 21.3.18.5 (CCA sensitivity). The channel-list parameter of the PHY-CCA.indication primitive is absent when the operating channel width is 20 MHz. The channel-list parameter is present and includes the element primary when the operating channel width is 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz.

The PHY shall not issue a PHY-RXSTART.indication primitive in response to a PPDU that does not overlap the primary 20 MHz channel.

The PHY includes the most recently measured RSSI value in the PHY-RXSTART.indication(RXVECTOR) primitive issued to the MAC.

After the PHY-CCA.indication(BUSY, channel-list) primitive is issued, the PHY entity shall begin receiving the training symbols and searching for L-SIG in order to set the maximum duration of the data stream. If the check of the L-SIG parity bit is not valid, a PHY-RXSTART.indication primitive is not issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. If a valid L-SIG parity bit is indicated, the VHT PHY shall maintain PHY-CCA.indication(BUSY, channel-list) primitive for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (21-106), for all supported modes, unsupported modes, Reserved VHT-SIG-A Indication, invalid VHT-SIG-A CRC and invalid L-SIG Length field value. The L-SIG Length field value of a VHT PPDU is invalid if it is not divisible by 3. Reserved VHT-SIG-A Indication is defined as a VHT-SIG-A with Reserved bits equal to 0 or MU[u] NSTS fields (u = 0, 1, 2, 3) set to 5-7 or Short GI field set to 0 and Short GI NSYM Disambiguation field set to 1, or a combination of VHT-MCS and N_{STS} not included in 21.5 (Parameters for VHT-MCSs) or any other VHT-SIG-A field bit combinations that do not correspond to modes of PHY operation defined in Clause 21 (Very High Throughput (VHT) PHY specification). If the VHT-SIG-A indicates an unsupported mode, the PHY shall issue a PHY-RXEND.indication(UnsupportedRate) primitive. If the VHT-SIG-A indicates an invalid CRC or Reserved VHT-SIG-A Indication or if the L-SIG Length field is invalid, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive.

After receiving a valid L-SIG and VHT-SIG-A indicating a supported mode, the PHY entity shall begin receiving the VHT training symbols and VHT-SIG-B. If the received group ID in VHT-SIG-A has a value indicating a VHT SU PPDU (see 10.20 (Group ID and partial AID in VHT PPDUs)), the PHY entity may choose not to decode VHT-SIG-B. If VHT-SIG-B is not decoded, subsequent to an indication of a valid VHT-SIG-A CRC, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 20.2.2 (TXVECTOR and RXVECTOR parameters)).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.57 (Timing measurement) in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1 (TXVECTOR and RXVECTOR parameters).

If the Group ID field in VHT-SIG-A has a value indicating a VHT MU PPDU (see 10.20 (Group ID and partial AID in VHT PPDUs)), the PHY, in a STA that is MU beamformee capable, shall decode VHT-SIG-B. If the VHT-SIG-B indicates an unsupported mode, the PHY shall issue the error condition PHY-RXEND.indication(UnsupportedRate) primitive.

If VHT-SIG-B was decoded the PHY may check the VHT-SIG-B CRC in the SERVICE field. If the VHT-SIG-B CRC in the SERVICE field is not checked a PHY-RXSTART.indication(RXVECTOR) primitive

shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1 (TXVECTOR and RXVECTOR parameters).

The PHY optionally filters out the PPDU based on the GroupID, MU[0-3] NSTS and Partial AID fields of VHT-SIG-A and the contents of the PHYCONFIG_VECTOR as follows:

- The PHY shall not filter out the PPDU if one of the following is true:
  - ($g = 0$) and (l_{00} is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID00)
  - ($g = 63$) and (l_{63} is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID63)
  - ($1 \le g \le 62$) and (MembershipStatusInGroupID[g] = 1) and (n_{STS}[UserPositionInGroupID[g]] > 0)
- where
  - l_{NN} is the one of the LISTEN_TO_GID*NN* parameters of the PHYCONFIG_VECTOR
  - MembershipStatusInGroupID[g] is the Membership Status Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group g
  - g is the value of the GroupID field of VHT-SIG-A
  - $n_{STS}[u]$ is the value of the MU[u] NSTS field of VHT-SIG-A
  - UserPositionInGroupID[g] is the User Position Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group g
  - *partialaid* is the value of the Partial AID field of VHT-SIG-A
- Otherwise, the PHY may filter out the PPDU.

If the PPDU is filtered out, the PHY shall issue a PHY-RXEND.indication(Filtered) primitive.

Following training and signal fields, the Data field shall be received. The number of symbols in the Data field is determined by Equation (21-105).

$$N_{SYM} = \begin{cases} N'_{SYM} - 1, \text{ if Short GI = 1 and Short GI NSYM Disambiguation = 1} \\ N'_{SYM}, \text{ otherwise} \end{cases} \quad (21\text{-}105)$$

where

$$N'_{SYM} = \left\lfloor \frac{\text{RXTIME} - \left(\begin{array}{l} T_{\text{L-STF}} + T_{\text{L-LTF}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + \\ T_{\text{VHT-STF}} + N_{VHT\text{-}LTF} T_{\text{VHT-LTF}} + T_{\text{VHT-SIG-B}} \end{array} \right)}{T_{SYM}} \right\rfloor$$

$$\text{RXTIME}(\mu s) = \left\lceil \frac{\text{LENGTH} + 3}{3} \right\rceil \cdot 4 + 20 \quad (21\text{-}106)$$

where LENGTH is the LENGTH field in L-SIG.

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using BCC encoding is calculated using Equation (21-107).

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{SYM} N_{DBPS} - N_{service} - N_{tail} \cdot N_{ES}}{8} \right\rfloor \quad (21\text{-}107)$$

where

N_{SYM} is given by Equation (21-105)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For a VHT SU PPDU, the SU/MU[0] Coding field of VHT-SIG-A2 indicates the type of coding. The PHY entity shall use an LDPC decoder to decode the C-PSDU if this bit is 1; otherwise, BCC decoding shall be used. For an MU transmission, the SU/MU[0] Coding, MU[1] Coding, MU[2] Coding and MU[3] Coding fields of VHT-SIG-A2 indicate the type of coding for user u with USER_POSITION[u] = 0, 1, 2, and 3, respectively. The PHY entity shall use an LDPC decoder to decode the C-PSDU for the respective user if its bit for its C-PSDU is 1. BCC decoding shall be used otherwise. When an LDPC decoder is to be used, $N_{SYM,init}$ is obtained from Equation (21-108).

$$N_{SYM,init} = \begin{cases} N_{SYM,init}, \text{ if LDPC Extra OFDM Symbol} = 0 \\ N_{SYM,init} - 1, \text{ if LDPC Extra OFDM Symbol} = 1 \text{ and STBC} = 0 \\ N_{SYM,init} - 2, \text{ if LDPC Extra OFDM Symbol} = 1 \text{ and STBC} = 1 \end{cases} \quad (21\text{-}108)$$

where

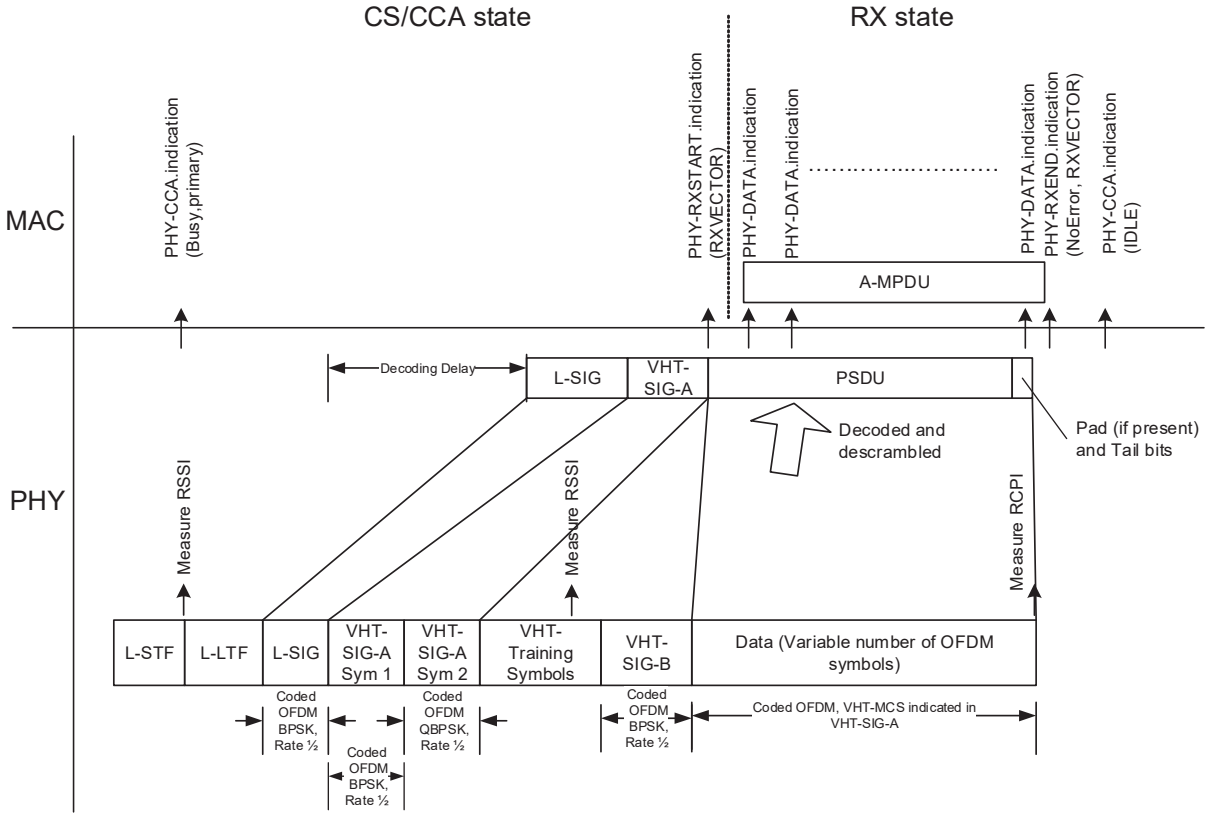
LDPC Extra OFDM Symbol and STBC are fields in VHT-SIG-A (see Table 21-12 (Fields in the VHT-SIG-A field))

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using LDPC encoding is calculated using Equation (21-109).

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{SYM,init} N_{DBPS} - N_{service}}{8} \right\rfloor \quad (21\text{-}109)$$

where

$N_{SYM,init}$ is given by Equation (21-108)



The value of the PSDU_LENGTH parameter returned in the RXVECTOR for an NDP is 0.

If VHT-SIG-B is decoded and the VHT-SIG-B CRC in the SERVICE field is checked and not valid, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. If the VHT-SIG-B field is decoded and the VHT-SIG-B CRC field is checked and valid, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1 (TXVECTOR and RXVECTOR parameters).

If signal loss occurs during reception prior to completion of the PSDU reception, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive. After waiting for the intended end of the PSDU as determined by Equation (21-106), the PHY shall generate a PHY-CCA.indication(IDLE) primitive and return to RX IDLE state.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. Any final bits that cannot be assembled into a complete octet are considered pad bits and discarded. After the reception of the final bit of the last PSDU octet, and possible padding and tail bits, the receiver shall be returned to the RX IDLE state, as shown in Figure 21-37 (PHY receive state machine). A PHY-RXEND.indication(NoError) primitive shall be issued on entry to the RX IDLE state.

This is an unapproved IEEE Standards Draft, subject to change.

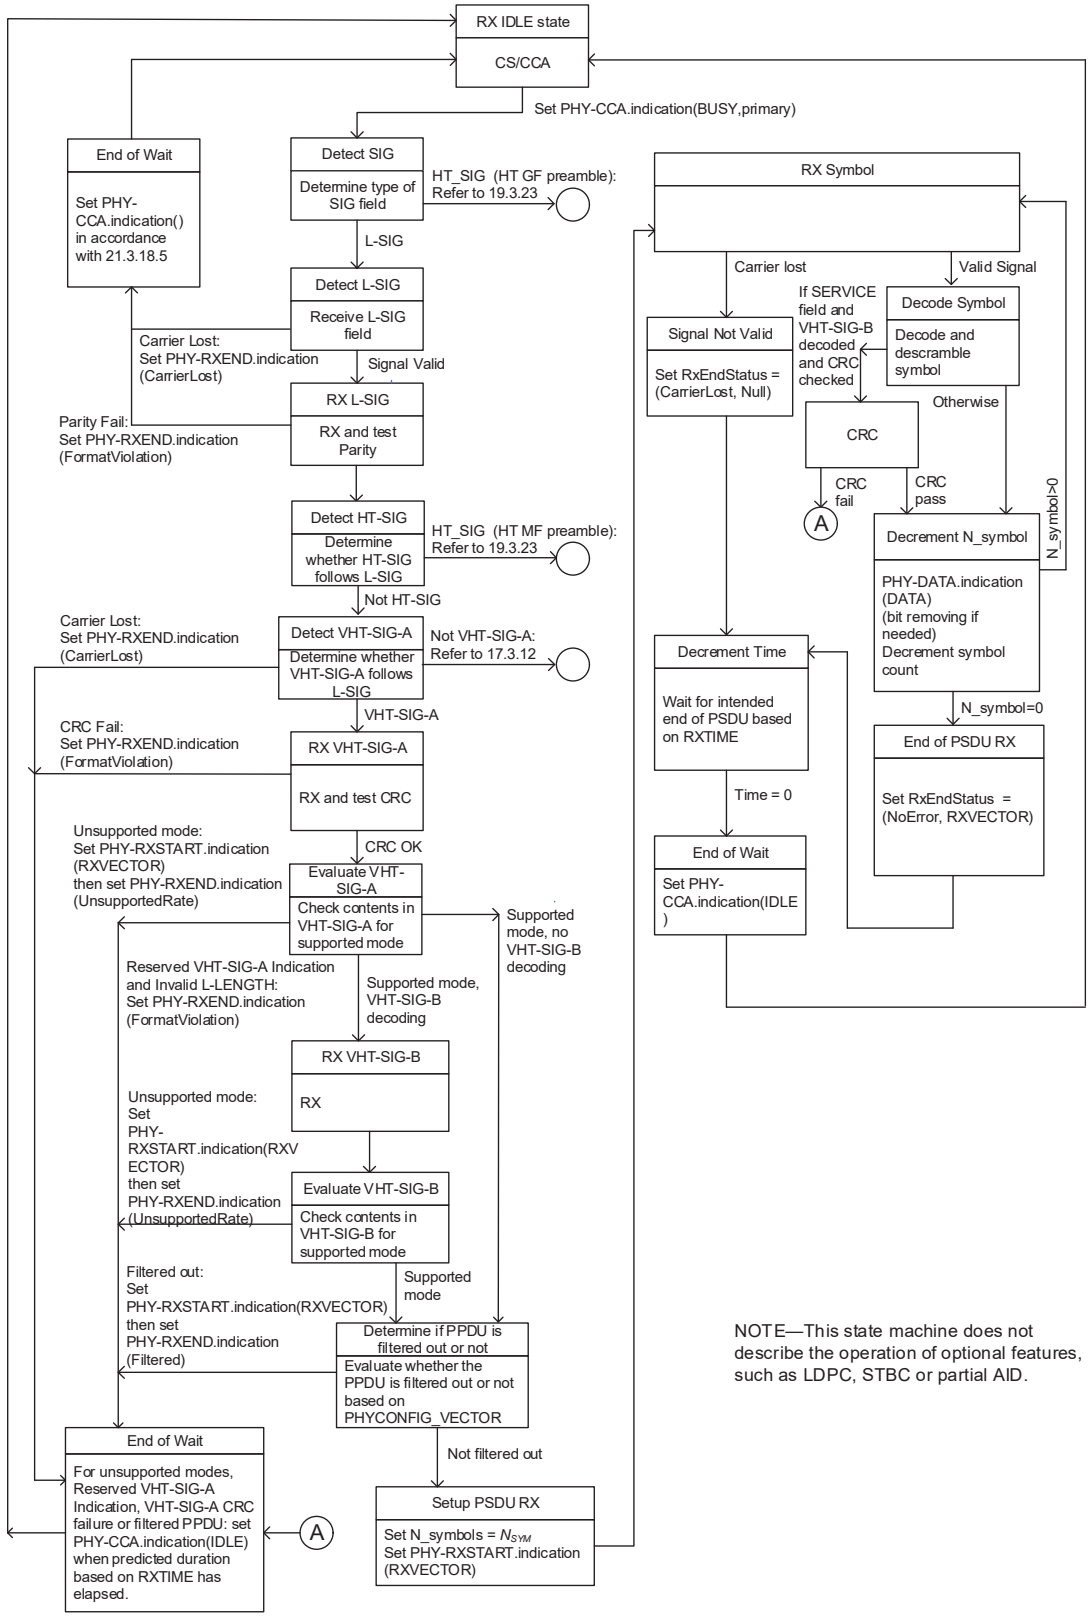
NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC. This procedure describes the case where VHT-SIG-A indicates a mode not requiring decoding of VHT-SIG-B.

Figure 21-36—PHY receive procedure for an SU transmission

21.4 VHT PLME

21.4.1 PLME SAP sublayer management primitives

Table 21-28 (VHT PHY MIB attributes) lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5 (PLME SAP interface).



21.4.2 PHY MIB

VHT PHY MIB attributes are defined in Annex C with specific values defined in Table 21-28 (VHT PHY MIB attributes). The “Operational semantics” column in Table 21-28 (VHT PHY MIB attributes) contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—This state machine does not describe the operation of optional features, such as LDPC, STBC or partial AID.

Figure 21-37—PHY receive state machine

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

21.4.3 TXTIME and PSDU_LENGTH calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for a VHT PPDU using Equation (21-110) for short GI and Equation (21-111) for long GI.

$$\text{TXTIME} = T_{\text{LEG_PREAMBLE}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + T_{\text{VHT_PREAMBLE}} + T_{\text{VHT-SIG-B}} + T_{SYML} \times \left\lceil \frac{T_{SYMS} \times N_{SYM}}{T_{SYML}} \right\rceil \quad (21\text{-}110)$$

$$\text{TXTIME} = T_{\text{LEG_PREAMBLE}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + T_{\text{VHT_PREAMBLE}} + T_{\text{VHT-SIG-B}} + T_{SYML} \times N_{SYM} \quad (21\text{-}111)$$

where

$T_{\text{LEG_PREAMBLE}} = T_{\text{L-STF}} + T_{\text{L-LTF}}$

$T_{\text{VHT_PREAMBLE}} = T_{\text{VHT-STF}} + N_{VHT\text{-}LTF} T_{\text{VHT-LTF}}$

T_{SYML}, T_{SYMS}, $T_{\text{VHT-SIG-A}}$, $T_{\text{VHT-SIG-B}}$, $T_{\text{L-STF}}$, $T_{\text{VHT-STF}}$, $T_{\text{L-LTF}}$, and $T_{\text{VHT-LTF}}$ are defined in Table 21-5 (Timing-related constants)

$N_{VHT\text{-}LTF}$ is defined in Table 21-13 (Number of VHT-LTFs required for different numbers of space-time streams)

For an NDP, there is no Data field and $N_{SYM} = 0$.

For a VHT SU PPDU using BCC encoding, the total number of data symbols in the Data field is given by Equation (21-112).

$$N_{SYM} = m_{\text{STBC}} \times \left\lceil \frac{8 \cdot \text{APEP_LENGTH} + N_{service} + N_{tail} \cdot N_{ES}}{m_{\text{STBC}} \cdot N_{DBPS}} \right\rceil \quad (21\text{-}112)$$

where

m_{STBC} is equal to 2 when STBC is used, and 1 otherwise

For a VHT SU PPDU using LDPC encoding, the total number of data symbols in the Data field, N_{SYM}, is given in 21.3.10.5.4 (LDPC coding) (computed using Equation (19-41) in step d) of 19.3.11.7.5 (LDPC PPDU encoding process)).

For a VHT MU PPDU, the total number of data symbols in the Data field, N_{SYM}, is given by Equation (21-68).

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for a VHT SU PPDU using BCC encoding is calculated using Equation (21-113).

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{SYM} N_{DBPS} - N_{service} - N_{tail} \cdot N_{ES}}{8} \right\rfloor \quad (21\text{-}113)$$

where

N_{SYM} is given by Equation (21-112)

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for a VHT SU PPDU using LDPC encoding is calculated using Equation (21-114).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{SYM,init} N_{DBPS} - N_{service}}{8} \right\rfloor \quad (21\text{-}114)$$

where

$N_{SYM,init}$ is given by Equation (21-63)

The value of the PSDU_LENGTH parameter for user u returned in the PLME-TXTIME.confirm primitive and in the RXVECTOR for a VHT MU PPDU is calculated using Equation (21-115).

$$\text{PSDU_LENGTH}_u = \begin{cases} \left\lfloor \frac{N_{SYM} N_{DBPS,u} - N_{service} - N_{tail} \cdot N_{ES,u}}{8} \right\rfloor & \text{when BCC is used for user } u \\ \left\lfloor \frac{N_{\text{SYM_max_init}} N_{DBPS,u} - N_{service}}{8} \right\rfloor & \text{when LDPC is used for user } u \end{cases} \quad (21\text{-}115)$$

where

N_{SYM} is given by Equation (21-68),

$N_{\text{SYM_max_init}}$ is given by Equation (21-66),

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an NDP is 0.

21.4.4 VHT PHY

The static VHT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 19-25 (HT PHY characteristics) unless otherwise listed in Table 21-29 (VHT PHY characteristics). The definitions for these characteristics are given in 6.5 (PLME SAP interface).

Table 21-29—VHT PHY characteristics

Characteristics	Value
aCCAMidTime	25 μs
aPPDUMaxTime	5.484 ms
aPSDUMaxLength	4 692 480 octets (see NOTE 1)
aRxPHYStartDelay	36 + 4 × the maximum possible value for $N_{\text{VHT-LTF}}$ supported + 4 (see NOTE 2)

NOTE 1—This is the maximum length in octets for a VHT SU PPDU with a bandwidth of 160 MHz or 80+80 MHz, VHT-MCS 9, and 8 spatial streams, and limited by 1504 possible Short GI data symbols in aPPDUMaxTime. This is the maximum PSDU length a VHT PHY could support assuming no restrictions in MAC. See 10.3.2 (Procedures common to the DCF and EDCAF) and 9.2.4.7.1 (General) for additional restrictions on the maximum number of octets the MAC could support.

NOTE 2—This value arises from the time to the end of VHT-SIG-B (see Figure 21-4 (VHT PPDU format)) plus the need to decode the first symbol of the Data field in order to extract the SERVICE field and check the CRC it contains.

21.5 Parameters for VHT-MCSs

The rate-dependent parameters for 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz N_{SS} = 1, …, 8 are given in Table 21-30 (VHT-MCSs for mandatory 20 MHz, NSS = 1) through Table 21-61 (VHT-MCSs for optional 160 MHz and 80+80 MHz, NSS = 8). Support for 400 ns GI is optional in all cases. Support for VHT-MCS 8 and 9 (when valid) is optional in all cases. A VHT STA shall support single spatial stream VHT-MCSs within the range VHT-MCS 0 to VHT-MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported VHT-MCS and NSS Set field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported VHT-MCS and NSS Set field may result in a reduced VHT-MCS range (cut-off) for N_{SS} = 2, …, 8 . Support for 20 MHz, 40 MHz, and 80 MHz with N_{SS} = 1 is mandatory. Support for 20 MHz, 40 MHz, and 80 MHz with N_{SS} = 2, …, 8 is optional. Support for 160 MHz and 80+80 MHz with N_{SS} = 1, …, 8 is optional. N_{ES} values were chosen to yield an integer number of punctured blocks for each BCC encoder per OFDM symbol.

Table 21-30 (VHT-MCSs for mandatory 20 MHz, NSS = 1) to Table 21-33 (VHT-MCSs for optional 20 MHz, NSS = 4), Table 21-38 (VHT-MCSs for mandatory 40 MHz, NSS = 1) to Table 21-41 (VHT-MCSs for optional 40 MHz, NSS = 4), Table 21-46 (VHT-MCSs for mandatory 80 MHz, NSS = 1) to Table 21-49 (VHT-MCSs for optional 80 MHz, NSS = 4), and Table 21-54 (VHT-MCSs for optional 160 MHz and 80+80 MHz, NSS = 1) to Table 21-57 (VHT-MCSs for optional 160 MHz and 80+80 MHz, NSS = 4) define VHT-MCSs not only for SU transmission but also for user *u* of MU transmission. In the case of VHT-MCSs for MU transmission, the parameters, N_{SS}, R, N_{BPSCS}, N_{CBPS}, N_{DBPS}, and N_{ES} are replaced with $N_{SS,u}$, R_u, $N_{BPSCS,u}$, $N_{CBPS,u}$, $N_{DBPS,u}$, and $N_{ES,u}$, respectively. Note that the 400 ns GI rate values are rounded to 1 decimal place.

Table 21-30—VHT-MCSs for mandatory 20 MHz, N_{SS} = 1

22. Television Very High Throughput (TVHT) PHY specification

22.1 Introduction

22.1.1 Introduction to the TVHT PHY

Clause 22 (Television Very High Throughput (TVHT) PHY specification) specifies the PHY entity for a television very high throughput (TVHT) orthogonal frequency division multiplexing (OFDM) system.

Three basic channel units (BCUs) are defined as 6 MHz, 7 MHz, or 8 MHz, depending on the regulatory domain, and denoted in the rest of this clause as a BCU or TVHT_W. Many of the terms used in this clause refer to different bands, depending on the regulatory domain. These terms include

— TVHT_2W, which represents two contiguous BCUs (12 MHz, 14 MHz, or 16 MHz)
— TVHT_W+W, which represents two noncontiguous BCU (6+6 MHz, 7+7 MHz, or 8+8 MHz)
— TVHT_4W, which represents four contiguous BCUs (24 MHz, 28 MHz, or 32 MHz)
— TVHT_2W+2W, which represents two noncontiguous frequency segments, each of which is composed of two BCUs (12+12 MHz, 14+14 MHz, or 16+16 MHz)

The TVHT PHY is based on the VHT PHY as defined in 21.3 (VHT PHY), 21.4 (VHT PLME), 21.5 (Parameters for VHT-MCSs), and on Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification).

All TVHT transmissions in one BCU shall use the VHT PHY parameters for 40 MHz channel defined in 21.3 (VHT PHY), 21.4 (VHT PLME), and 21.5 (Parameters for VHT-MCSs) with a sampling clock change to fit into each of the BCU bandwidths and with the number of encoders (N_{ES}) always being 1 (for SU-MIMO and per user in MU-MIMO).

Table 22-8 (Timing-related parameters) describes the sampling clock for each of the BCUs and the basic PHY parameters for transmission over one BCU.

For all VHT PPDUs and non-HT PPDUs in TVWS band, timing-related parameters shall be used as defined in Table 22-5 (Timing-related constants in Non-HT PPDU) and Table 22-8 (Timing-related parameters); frequently used parameters shall be used as defined in Table 22-6 (Tone location in Non-HT PPDU) and Table 22-9 (Tone location); phase rotation parameter $\Upsilon_{k,\mathrm{BW}}$ shall be replaced by $\Upsilon_{k,\mathrm{M}}$, which is defined in Table 22-12 (Transmission mode and Gamma subk,m); and cyclic shift parameters shall be used as defined in 22.3.8.3.2 (Cyclic shift for TVHT modulated fields).

As shown in Table 22-8 (Timing-related parameters), the design is based on defining 144 OFDM tones in the 6 MHz and 8 MHz channel units and using up to tone 58 on each side of the DC tone for data and pilots, exactly matching the VHT 40 MHz PHY parameters. The 7 MHz channel unit is split into 168 tones to maintain the same tone spacing and PHY design as used for 6 MHz channels (note the ratio of 168 to 144 is identical to the ratio of 7 to 6). The choice of 144 and not 128 was made to reduce the PHY channel BW from 6 MHz to 5 1/3 MHz in order to allow sharper filtering to achieve 55 dB ACLR.

The TVHT PHY defines the following transmission modes that incorporate transmission on one, two, or four BCUs:

a) Mandatory transmission mode - one BCU (TVHT_MODE_1)
b) Optional transmission modes - multi-BCUs
    1) Two contiguous BCUs (TVHT_MODE_2C)
    2) Two noncontiguous BCUs (TVHT_MODE_2N)
    3) Four contiguous BCUs (TVHT_MODE_4C)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

4) Two noncontiguous frequency segments, each of which comprises two contiguous BCUs (TVHT_MODE_4N)

The tone spacing, DFT duration, and other timing parameters remain unchanged for all optional modes compared with the definition in Table 22-8 (Timing-related parameters).

The number of occupied tones in each BCU of any optional mode is the same as the number defined in Table 22-8 (Timing-related parameters).

The location of the occupied tones in each BCU of any optional mode is shown in Table 22-9 (Tone location).

The DATA encoding process for multi-BCUs transmission is similar to one BCU transmission and is defined in 22.3.10 (Data field).

A TVHT STA shall support the following features:

— TVHT_MODE_1 (one BCU)
— Single spatial stream MCSs 0 to 7 (transmit and receive)
— Binary convolutional coding
— Normal and short guard interval (transmit and receive)

A TVHT STA may support the following features:

— TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, or TVHT_MODE_4N (two or four BCUs)
— Two or more spatial streams (transmit and receive)
— Beamforming sounding (by sending a VHT NDP frame)
— Respond to transmit beamforming sounding (provide compressed beamforming feedback)
— STBC (transmit and receive)
— LDPC (transmit and receive)
— VHT MU PPDUs (transmit and receive)
— MCSs 8 and 9 (transmit and receive)

22.1.2 Scope

The services provided to the MAC by the TVHT PHY consist of a protocol function defined as follows:

a) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. These STAs support a TVHT PHY.

22.1.3 TVHT PHY functions

22.1.3.1 General

See 21.1.3.1 (General) with “TVHT” replacing “VHT”.

22.1.3.2 PHY management entity (PLME)

See 21.1.3.2 (PHY management entity (PLME)).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

22.1.3.3 Service specification method

See 21.1.3.3 (Service specification method) with “TVHT” replacing “VHT”.

22.1.4 PPDU formats

The structure of the PPDU transmitted by a TVHT STA is determined by the TXVECTOR parameters as defined in 22.2.2 (TXVECTOR and RXVECTOR parameters).

The FORMAT parameter determines the overall structure of the PPDU and includes the following:

— Non-HT format (NON_HT), based on Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification). Support for non-HT format is mandatory.

— VHT format (VHT). Support for TVHT_W VHT format is mandatory.

22.2 TVHT PHY service interface

22.2.1 Introduction

See 21.2.1 (Introduction).

22.2.2 TXVECTOR and RXVECTOR parameters

The TXVECTOR and RXVECTOR parameters are defined in Table 22-1 (TXVECTOR and RXVECTOR parameters).

The TXVECTOR parameter FORMAT shall be set to NON_HT or VHT. When the TXVECTOR parameter FORMAT equals NON_HT, then NON_HT_MODULATION shall be set to NON_HT_DUP_OFDM.

When the TXVECTOR parameter FORMAT equals NON_HT, the TXVECTOR parameter L_DATARATE indicates the data rate used to transmit the PSDU in Mb/s. The allowed values are 6 Mb/s, 9 Mb/s, 12 Mb/s, 18 Mb/s, 24 Mb/s, 36 Mb/s, 48 Mb/s, and 54 Mb/s divided by 7.5 for 6 MHz and 7 MHz unit channels and by 5.625 for 8 MHz channels.

When the TXVECTOR parameter FORMAT equals VHT, the TXVECTOR parameter CH_BANDWIDTH indicates the channel width of the transmitted PPDU:

Enumerated type:

— TVHT_W for one BCU

— TVHT_2W for two contiguous BCUs

— TVHT_W+W for two noncontiguous BCUs

— TVHT_4W for four contiguous BCUs

— TVHT_2W+2W for two noncontiguous frequency segments, each of which comprises two contiguous BCUs

Note that TVHT_W represents the broadcast channel bandwidth for the regulatory domain, e.g., TVHT_W is 6 MHz, 7 MHz, or 8 MHz. TVHT_2W represents two contiguous BCUs with the same regulatory domain, e.g., TVHT_2W is 12 MHz, 14 MHz, or 16 MHz.

When the TXVECTOR parameter FORMAT equals NON_HT, the TXVECTOR parameter CH_BANDWIDTH indicates the channel width of the transmitted PPDU on transmission and the estimated channel width of the received PPDU on reception:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Enumerated type:

— TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W

When the TXVECTOR parameter FORMAT equals VHT, the TXVECTOR parameter NUM_STS indicates the number of space-time streams: range 1 to 4 for SU, 1 to 3 per user for MU. NUM_STS summed over all users shall be less than or equal to 4. The TXVECTOR parameter NUM_STS is not present when the TXVECTOR parameter FORMAT equals to NON_HT.

Table 22-1—TXVECTOR and RXVECTOR parameters

Parameter	Condition	Value	TXVECTOR	RXVECTOR
FORMAT		Determines the format of the PPDU. Enumerated type: NON_HT indicates non-HT duplicated PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter. VHT indicates VHT format.	Y	Y
NON_HT_MODULATION	FORMAT is NON_HT	In TXVECTOR, indicates the format type of the transmitted non-HT PPDU. In RXVECTOR, indicates the estimated format type of the received non-HT PPDU. Enumerated type: NON_HT_DUP_OFDM indicates non-HT duplicate format.	Y	Y
	Otherwise	Not present	N	N
L_LENGTH	FORMAT is NON_HT	Indicates the length of the PSDU in octets in the range 1 to 4095. This value is used by the PHY to determine the number of octet transfers that occur between the MAC and the PHY.	Y	Y
	FORMAT is VHT	Not present NOTE—The Length field of the L-SIG in VHT PPDUs is defined in Equation (22-9) using the scaling factor defined in 22.3.8.2.1 (Cyclic shift definition for pre-TVHT modulated fields).	N	N
L_DATARATE	FORMAT is NON_HT	Indicates the data rate used to transmit the PSDU in Mb/s. The allowed values are 6, 9, 12, 18, 24, 36, 48, and 54 divided by 7.5 for 6 MHz and 7 MHz unit channels and by 5.625 for 8 MHz channels.	Y	Y
	FORMAT is VHT	Not present NOTE—The RATE field in the L-SIG field in a VHT PPDU is set to the value representing 6/*X* Mb/s in TVWS band "Modulation BPSK and Coding rate 1/2" row of Table 22-4 (RATE field in L-SIG).	N	N
N_TX	FORMAT is VHT	Indicates the number of transmit chains.	Y	N
	Otherwise	Not present	N	N

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
EXPANSION_MAT_TYPE	FORMAT is VHT and EXPANSION_MAT is present.	Set to COMPRESSED_SV	Y	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
EXPANSION_MAT	FORMAT is VHT	Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 22.3.11.2 (Beamforming Feedback Matrix V) based on the channel measured during the training symbols of a previous VHT NDP PPDU.	M U	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
CHAN_MAT_TYPE	FORMAT is VHT and PSDU_LENGTH equals zero	Set to COMPRESSED_SV NOTE—This parameter is present only for TVHT NDP PPDUs.	N	Y
	FORMAT is VHT and PSDU_LENGTH is greater than zero	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
CHAN_MAT	FORMAT is VHT and PSDU_LENGTH equals zero	Contains a set of compressed beamforming feedback matrices as defined in 21.3.11.2 (Beamforming Feedback Matrix V) based on the channel measured during the training symbols of the received VHT NDP PPDU.	N	Y
	FORMAT is VHT and PSDU_LENGTH is greater than zero	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
DELTA_SNR	FORMAT is VHT	Contains an array of delta SNR values as defined in 9.4.1.52 (TVHT MU Exclusive Beamforming Report field) based on the channel measured during the training symbols of the received VHT NDP PPDU. NOTE—In the RXVECTOR this parameter is present only for VHT NDP PPDUs for MU sounding.	M U	Y
	Otherwise	Not present	N	N
RCPI		Is a measure of the received RF power averaged over all of the receive chains in the Data field of a received PPDU. Refer to 19.3.19.6 (Received channel power indicator (RCPI) measurement) for the definition of RCPI.	N	Y

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
SNR	FORMAT is VHT	Contains an array of measures of the received SNR for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.50 (TVHT Compressed Beamforming Report field).	N	Y
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
NO_SIG_EXTN	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
FEC_CODING	FORMAT is HT	Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code.	M U	Y
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
STBC	FORMAT is VHT	Indicates whether STBC is used. 0 indicates no STBC ($N_{STS}=N_{SS}$ in the Data field). 1 indicates STBC is used ($N_{STS}=2N_{SS}$ in the Data field).	Y	Y
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
GI_TYPE	FORMAT is VHT	Indicates whether a short guard interval is used in the transmission of the Data field of the PPDU. Enumerated type: LONG_GI indicates short GI is not used in the Data field of the PPDU. SHORT_GI indicates short GI is used in the Data field of the PPDU.	Y	Y
	Otherwise	Not present	N	N
TXPWR_LEVEL_INDEX	FORMAT is VHT	The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to numberOfOctets(dot11TxPowerLevelExtended)/2. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission.	Y	N
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
RSSI	FORMAT is VHT	The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a measure by the PHY of the power observed at the antennas used to receive the current PPDU measured during the reception of the TVHT-LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power.	N	Y
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
MCS	FORMAT is VHT	Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9	M U	Y
	Otherwise	See corresponding entry in Table 19-1 (TXVECTOR and RXVECTOR parameters)		
REC_MCS	FORMAT is VHT	Indicates the MCS that the STA's receiver recommends.	N	O
	Otherwise	Not present	N	N
CH_BANDWIDTH	FORMAT is VHT	Indicates the channel width of the transmitted PPDU: Enumerated type: TVHT_W for one BCU TVHT_2W for two contiguous BCUs TVHT_W+W for two noncontiguous BCUs TVHT_4W for four contiguous BCUs TVHT_2W+2W for two noncontiguous frequency segments, each of which comprises two contiguous BCUs	Y	Y
	FORMAT is NON_HT	In TXVECTOR, indicates the channel width of the transmitted PPDU. In RXVECTOR, indicates the estimated channel width of the received PPDU. Enumerated type: TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W if NON_HT_MODULATION equals NON_HT_DUP_OFDM	Y	Y
DYN_BANDWIDTH_IN_NON_HT	FORMAT is NON_HT	In TXVECTOR, if present, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. In RXVECTOR, if valid, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. Enumerated type: Static if the transmitter is capable of Static bandwidth operation Dynamic if the transmitter is capable of Dynamic bandwidth operation NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU.	O	Y
	Otherwise	Not present	N	N

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CH_BANDWIDTH_IN_NON_HT	FORMAT is NON_HT	In TXVECTOR, if present, indicates the channel width of the transmitted PPDU, which is signaled via the scrambling sequence. In RXVECTOR, if valid, indicates the channel width of the received PPDU, which is signaled via the scrambling sequence. Enumerated type: TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W. NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU.	O	Y
	Otherwise	Not present	N	N
APEP_LENGTH	FORMAT is VHT	If equal to 0, indicates a TVHT NDP PPDU for both RXVECTOR and TXVECTOR. If greater than zero, in the TXVECTOR, indicates the number of octets in the range 1 to 1 048 575 in the A-MPDU pre-EOF padding (see 10.13.2 (A-MPDU length limit rules)) carried in the PSDU. If greater than zero, in the RXVECTOR, is the value obtained from the VHT-SIG-B Length field multiplied by 4.	M U	O
	Otherwise	Not present	N	N
PSDU_LENGTH	FORMAT is VHT	Indicates the number of octets in the VHT PSDU in the range 0 to 1 065 600 octets. A value of 0 indicates a VHT NDP PPDU.	N	Y
	Otherwise	Not present	N	N
USER_POSITION	FORMAT is VHT and $1 \leq$ GROUP_ID ≤ 62	Index for user in MU transmission. Integer: range 0 to 3. NOTE—The entries in the USER_POSITION array are in ascending order.	M U	O
	Otherwise	Not present	N	N
NUM_STS	FORMAT is VHT	Indicates the number of space-time streams. Integer: range 1 to 4 for SU, 1 to 3 per user in the TXVECTOR, and 0 to 4 in the RXVECTOR for MU. NUM_STS summed over all users is between 1 and 4.	M U	Y
	Otherwise	Not present	N	N
GROUP_ID	FORMAT is VHT	Indicates the group ID. Integer: range 0 to 63 (see Table 22-12) A value of 0 or 63 indicates a VHT SU PPDU. A value in the range 1 to 62 indicates a VHT MU PPDU.	Y	Y
	Otherwise	Not present	N	N

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
PARTIAL_AID	FORMAT is VHT and GROUP_ID is 0 or 63	Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 9.1710.20 (Group ID and partial AID in VHT PPDUs)). Integer: range 0 to 511.	Y	Y
	Otherwise	Not present	N	N
NUM_USERS	FORMAT is VHT	Indicates the number of users with nonzero space-time streams. Integer: range 1 to 4.	Y	N
	Otherwise	Not present	N	N
BEAMFORMED	FORMAT is VHT and GROUP_ID is 0 or 63	Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission. Set to 0 otherwise. NOTE—When BEAMFORMED is set to 1, smoothing is not recommended.	Y	O
	Otherwise	Not present	N	N
TXOP_PS_NOT_ALLOWED	FORMAT is VHT	Indicates whether a TVHT AP allows non-AP TVHT STAs in TXOP power save mode to enter doze state during the TXOP. 0 indicates that the TVHT AP allows non-AP TVHT STAs to enter doze state during a TXOP. 1 indicates that the TVHT AP does not allow non-AP TVHT STAs to enter doze state during a TXOP.	Y	Y
	Otherwise	Not present	N	N
TIME_OF_DEPARTURE_REQUESTED		Boolean value: true indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first PPDU energy is sent by the transmitting port. false indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.	O	N

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
RX_START_OF_FRAME_OFFSET	dot11TimingMsmtActivated is true	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.	N	Y
	Otherwise	Not present	N	N

NOTE 1—In the "TXVECTOR" and "RXVECTOR" columns, the following apply:
Y = Present;
N = Not present;
O = Optional;
MU indicates that the parameter is present once for a VHT SU PPDU and present per user for a VHT MU PPDU. Parameters specified to be present per user are conceptually supplied as an array of values indexed by *u*, where *u* takes values 0 to NUM_USERS – 1.
NOTE 2—On reception, where valid, the CH_BANDWIDTH_IN_NON_HT parameter is likely to be a more reliable indication of subformat and channel width than the NON_HT_MODULATION and CH_BANDWIDTH parameters, since for non-HT or non-HT duplicate frames, CH_BANDWIDTH is a receiver estimate of the bandwidth, whereas CH_BANDWIDTH_IN_NON_HT is the signaled bandwidth.

22.2.3 Effects of CH_BANDWIDTH parameter on PPDU format

Table 22-2 (PPDU format as a function of CH_BANDWIDTH parameter) shows the PPDU format as a function of the CH_BANDWIDTH and FORMAT parameters.

Table 22-2—PPDU format as a function of CH_BANDWIDTH parameter

FORMAT	CH_BANDWIDTH	PPDU format
VHT	TVHT_W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_1.
VHT	TVHT_2W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_2C.
VHT	TVHT_4W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_4C.
VHT	TVHT_W+W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_2N.
VHT	TVHT_2W+2W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_4N.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Table 22-2—PPDU format as a function of CH_BANDWIDTH parameter *(continued)*

FORMAT	CH_BANDWIDTH	PPDU format
NON_HT	TVHT_W	The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using one TVHT_W channel as defined in 22.3.10.12 (Non-HT duplicate transmission). If the BSS bandwidth is wider than TVHT_W, then the transmission shall use the primary TVHT_W channel.
NON_HT	TVHT_2W	The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two adjacent TVHT_W channels as defined in 22.3.10.12 (Non-HT duplicate transmission). If the BSS bandwidth is wider than TVHT_2W, then the transmission shall use the primary TVHT_2W channel.
NON_HT	TVHT_4W	The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using four adjacent TVHT_W channels as defined in 22.3.10.12 (Non-HT duplicate transmission).
NON_HT	TVHT_W+W	The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of single TVHT_W channels as defined in 22.3.10.12 (Non-HT duplicate transmission).
NON_HT	TVHT_2W+2W	The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of two adjacent TVHT_W channels as defined in 22.3.10.12 (Non-HT duplicate transmission).

22.2.4 Support for NON_HT and HT formats

Transmission of HT PPDUs is not supported in Clause 22 (Television Very High Throughput (TVHT) PHY specification). Except for Non-HT duplicate transmission defined in 22.3.10.12 (Non-HT duplicate transmission), transmission of NON_HT is not supported in Clause 22 (Television Very High Throughput (TVHT) PHY specification).

Non-HT duplicate transmission is based on Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification), unless otherwise stated in Clause 22 (Television Very High Throughput (TVHT) PHY specification).

Non-HT PPDU format is same as in Figure 17-1 (PPDU format). Overview of the PPDU encoding process is defined in 17.3.2.2 (Overview of the PPDU encoding process) except for following modifications:

Modulation-dependent parameters for Non-HT duplicate mode in TVWS band is defined in Table 22-3 (Modulation-dependent parameters for Non-HT duplicate mode in TVWS band). Timing related parameters are defined in Table 22-5 (Timing-related constants in Non-HT PPDU). t_{SIGNAL} in Equation (17-2) is equal to 16 multiplied by X µs, and t_{DATA} in Equation (17-2) is equal to 20 multiplied by X µs where X is 7.5 for 6 MHz and 7 MHz unit channels and X is 5.625 for 8 MHz channels.

The timings for preamble are multiplied by X where X is 7.5 for 6 MHz and 7 MHz unit channels and X is 5.625 for 8 MHz channels.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Constructions of L-STF, L-LTF, and L-SIG are same as in 22.3.4.2 (Construction of L-STF), 22.3.4.3 (Construction of the L-LTF), and 22.3.4.4 (Construction of L-SIG) except for the value field parameters in L-SIG.

Table 22-3—Modulation-dependent parameters for Non-HT duplicate mode in TVWS band

Modulation	Coding rate (R)	Coded bits per subcarrier (N_{BPSC})	Coded bits per OFDM symbol (N_{CBPS})	Data bits per OFDM symbol (N_{DBPS})	Data rate (Mb/s) (TVWS band)
BPSK	1/2	1	48	24	6/X (see NOTE)
BPSK	3/4	1	48	36	9/X (see NOTE)
QPSK	1/2	2	96	48	12/X (see NOTE)
QPSK	3/4	2	96	72	18/X (see NOTE)
16-QAM	1/2	4	192	96	24/X (see NOTE)
16-QAM	3/4	4	192	144	36/X (see NOTE)
64-QAM	2/3	6	288	192	48/X (see NOTE)
64-QAM	3/4	6	288	216	54/X (see NOTE)
NOTE—In TVWS band, X depends on regulatory domain, i.e., 7.5 for 6 MHz and 7 MHz unit channels and 5.625 for 8 MHz channels.					

Interpretation of the bits R1-R4 in the SIGNAL field is modified as in Table 22-4 (RATE field in L-SIG).

Table 22-4—RATE field in L-SIG

R1-R4	Modulation	Coding rate
1101	BPSK	1/2
1111	BPSK	3/4
0101	QPSK	1/2
0111	QPSK	3/4
1001	16-QAM	1/2
1011	16-QAM	3/4
0001	64-QAM	2/3
0011	64-QAM	3/4

Table 22-5 (Timing-related constants in Non-HT PPDU) and Table 22-6 (Tone location in Non-HT PPDU) define the timing-related parameters for Non-HT format and location of occupied tones.

Table 22-5—Timing-related constants in Non-HT PPDU

Parameter	6 MHz	7 MHz	8 MHz	Description
N_{SD}	96	96	96	Number of complex data numbers per BCU
N_{SP}	8	8	8	Number of pilot values per BCU
N_{ST}	104	104	104	Total number of subcarriers per BCU
N_{SR}	58	58	58	Highest data subcarrier index per BCU
Δ_F	$\frac{6\text{ MHz}}{144} = 41\frac{2}{3}$ kHz	$\frac{7\text{ MHz}}{168} = 41\frac{2}{3}$ kHz	$\frac{8\text{ MHz}}{144} = 55\frac{5}{9}$ kHz	Subcarrier frequency spacing
T_{DFT}	24 μs	24 μs	18 μs	IDFT/DFT period
T_{GI}	6 μs = T_{DFT} /4	6 μs = T_{DFT} /4	4.5 μs = T_{DFT} /4	Guard interval duration
T_{GIS}	3 μs = T_{DFT} /8	3 μs = T_{DFT} /8	2.25 μs = T_{DFT} /8	Short guard interval duration

Other timing parameters are derived as in Table 17-5 (Timing-related parameters)using the definition of T_{FFT} in Table 22-5 (Timing-related constants in Non-HT PPDU). Table 22-6 (Tone location in Non-HT PPDU) defines the number of occupied tones and their location in all transmission modes. Zero denotes the DC tone of any contiguous segment.

Refer to Table 21-6 (Frequently used parameters) for parameters definition. The definitions in the table are applicable to Clause 22 (Television Very High Throughput (TVHT) PHY specification) with the exception that in each transmission mode in Clause 22 (Television Very High Throughput (TVHT) PHY specification) $N_{CBPSSI} = N_{CBPSS}$ for SU and MU PPDUs.

22.3 TVHT PHY sublayer

22.3.1 Introduction

See 21.3.1 (Introduction).

22.3.2 VHT PPDU format in TVWS bands

A single PPDU format is defined for this PHY: the VHT PPDU format in TVWS bands. Figure 22-1 (VHT PPDU format in TVWS bands) shows the VHT PPDU format in TVWS bands, with the timing parameters

(8 μs and 4 μs) in Figure 21-4 (VHT PPDU format) replaced by numbers from Table 22-8 (Timing-related parameters).

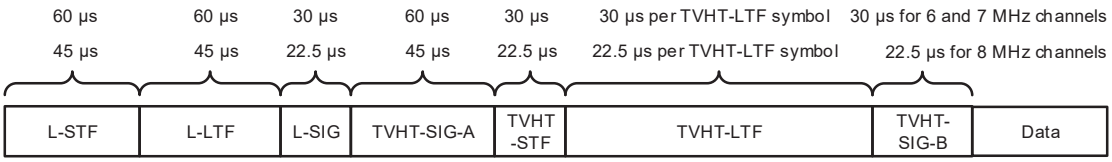

Figure 22-1—VHT PPDU format in TVWS bands

The fields of the VHT PPDU format in TVWS bands are summarized in Table 22-7 (Fields of the VHT PPDU in TVWS bands).

Table 22-7—Fields of the VHT PPDU in TVWS bands

Field	Description
L-STF	Non-HT Short Training field
L-LTF	Non-HT Long Training field
L-SIG	Non-HT SIGNAL field
TVHT-SIG-A	TVHT Signal A field
TVHT-STF	TVHT Short Training field
TVHT-LTF	TVHT Long Training field
TVHT-SIG-B	TVHT Signal B field
Data	The Data field includes the PSDU

The TVHT-SIG-A, TVHT-STF, TVHT-LTF, and TVHT-SIG-B fields exist only in VHT PPDU in TVWS bands. In a TVHT NDP, the Data field is not present. The number of symbols in the TVHT-LTF field, $N_{TVHTLTF}$, can be 1, 2, or 4 and is determined by the total number of space-time streams across all users being transmitted in the VHT PPDU in TVWS bands (see Table 21-13 (Number of VHT-LTFs required for different numbers of space-time streams)).

22.3.3 Transmitter block diagram

The transmit process for the L-SIG and TVHT-SIG-A fields of a VHT PPDU using one BCU is shown in Figure 21-5 (Transmitter block diagram for the L-SIG and VHT-SIG-A fields), with “TVHT” replacing “VHT” and with bandwidth corrected according to TVHT bandwidth.

The transmit process for generating the TVHT-SIG-B field of a VHT SU PPDU and VHT MU PPDU using one frequency segment is shown in Figure 21-5 (Transmitter block diagram for the L-SIG and VHT-SIG-A fields) and Figure 21-7 (Transmitter block diagram for the VHT-SIG-B field of a 20 MHz, 40 MHz, and 80 MHz VHT MU PPDU), respectively, with “TVHT” replacing “VHT” and with bandwidth corrected according to TVHT bandwidth.

The transmit process for generating the Data field of a SU PPDU in TVHT_MODE_1, TVHT_MODE_2C, or TVHT_MODE_4C with BCC and LDPC encodings, using one BCU, is shown Figure 21-10 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT SU PPDU with BCC encoding)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

and Figure 21-11 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT SU PPDU with LDPC encoding), respectively, with "TVHT" replacing "VHT" and with bandwidth corrected according to TVHT bandwidth. Single BCC encoder shall be assumed in Figure 21-10 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT SU PPDU with BCC encoding).

The transmit process for generating the Data field of a MU PPDU in TVHT_MODE_1, TVHT_MODE_2C, or TVHT_MODE_4C with BCC and LDPC encoding is shown in Figure 21-12 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT MU PPDU), with "TVHT" replacing "VHT" and with bandwidth corrected according to TVHT bandwidth. In the case of BCC encoding, single BCC encoder shall be assumed in Figure 21-12 (Transmitter block diagram for the Data field of a 20 MHz, 40 MHz, or 80 MHz VHT MU PPDU).

Figure 22-2 (Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with BCC encoding) and Figure 22-3 (Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with LDPC encoding) show the transmit process for generating the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with BCC and LDPC encoding, respectively, where the subcarrier allocation block allocates the subcarriers for the two IDFTs in each transmit path by the subcarrier mapper as described in 22.3.10.11 (OFDM modulation transmission in VHT format).

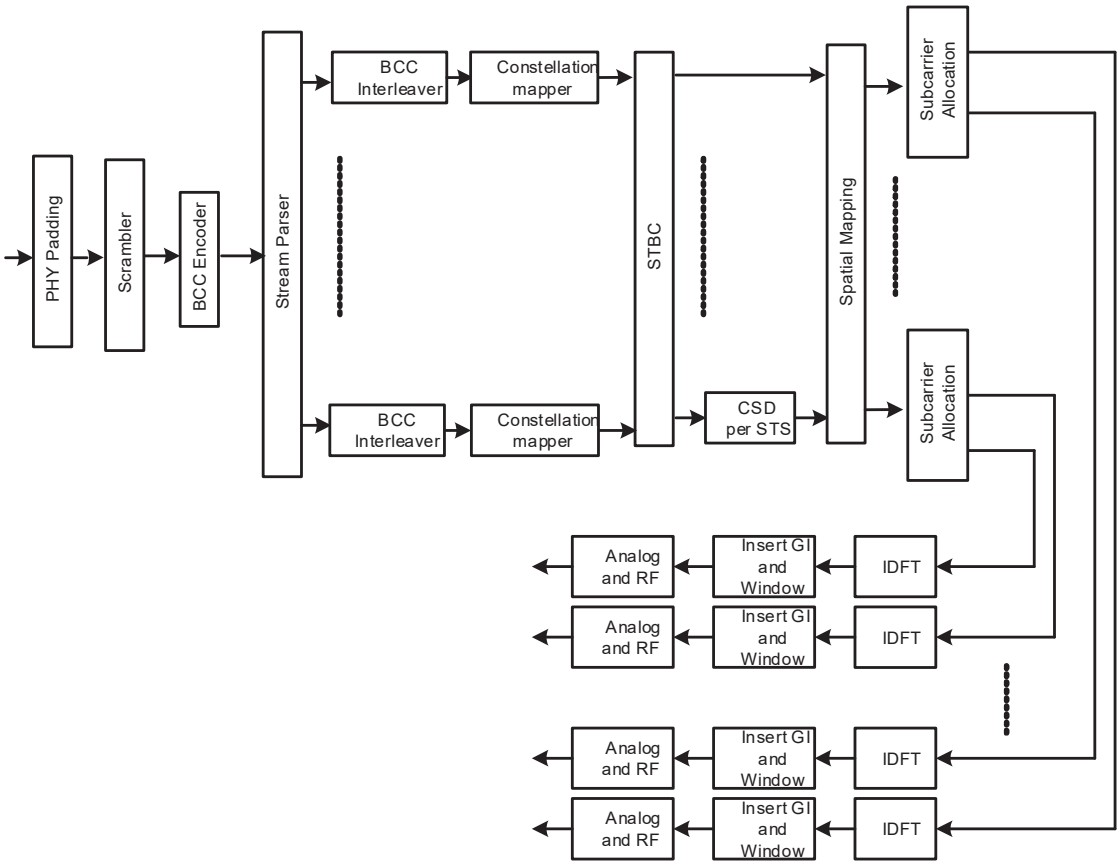

Figure 22-2—Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_-MODE_4N SU PPDU with BCC encoding

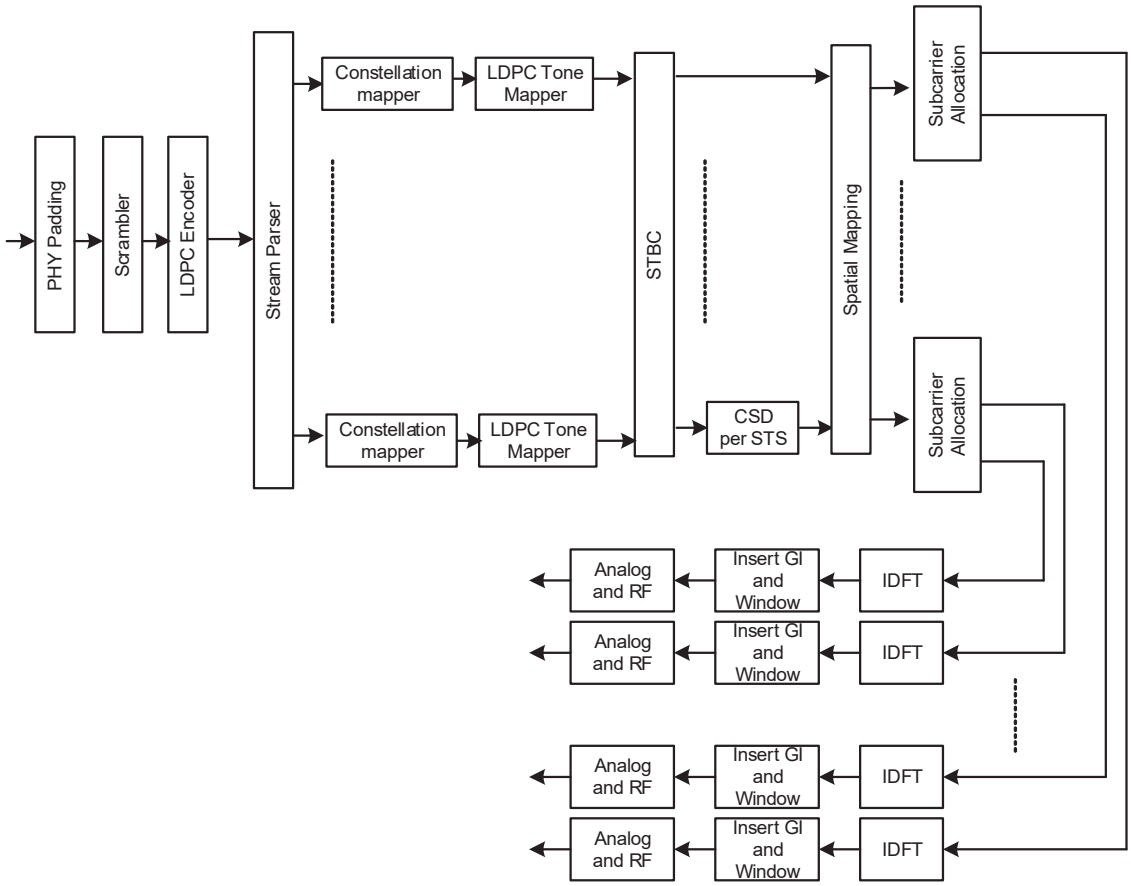

Figure 22-3—Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_-MODE_4N SU PPDU with LDPC encoding

22.3.4 Overview of the PPDU encoding process

22.3.4.1 General

This subclause provides an overview of the VHT PPDU in TVWS bands encoding process.

22.3.4.2 Construction of L-STF

Construct the L-STF field as defined in 22.3.8.2.2 (L-STF definition) following the procedure in 21.3.4.2 (Construction of L-STF) reading "Clause 22 (Television Very High Throughput (TVHT) PHY specification)" for references to "Clause 21 (Very High Throughput (VHT) PHY specification)" except the following:

c) Duplication and phase rotation: Duplicate the L-STF over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7 (Mathematical description of signals).

22.3.4.3 Construction of the L-LTF

Construct the L-LTF field as defined in L-LTF definition following the procedure in 21.3.4.3 (Construction of the L-LTF) reading "Clause 22 (Television Very High Throughput (TVHT) PHY specification)" for references to "Clause 21 (Very High Throughput (VHT) PHY specification)" except the following:

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

c) Duplication and phase rotation: Duplicate the L-LTF over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7 (Mathematical description of signals).

22.3.4.4 Construction of L-SIG

Construct the L-SIG field as the SIGNAL field defined by 22.3.8.2.4 (L-SIG definition) following the procedure in 21.3.4.4 (Construction of L-SIG) reading "Clause 22 (Television Very High Throughput (TVHT) PHY specification)" for references to "Clause 21 (Very High Throughput (VHT) PHY specification)" except the following:

a) For a VHT PPDU in TVWS bands, set the RATE subfield in the SIGNAL field R1-R4 to 1101. Set the Length, Parity, and Tail bits in the SIGNAL field as defined in 22.3.8.2.4 (L-SIG definition). Add calculated one bit parity and N_{tail} bits into the L-SIG symbol.

f) Duplication and phase rotation: Duplicate the L-SIG field over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7 (Mathematical description of signals).

22.3.4.5 Construction of TVHT-SIG-A

The TVHT-SIG-A field consists of two symbols, TVHT-SIG-A1 and TVHT-SIG-A2, constructed as defined in 22.3.8.3.3 (TVHT-SIG-A definition) following the procedure in 21.3.4.5 (Construction of VHT-SIG-A) reading "Clause 22 (Television Very High Throughput (TVHT) PHY specification)" for references to "Clause 21 (Very High Throughput (VHT) PHY specification)" except the following:

e) Pilot insertion: Insert pilots following the steps defined in 22.3.10.10 (Pilot subcarriers).

f) Duplication and phase rotation: Duplicate TVHT-SIG-A1 and TVHT-SIG-A2 over of the BCUs of the CH_BANDWIDTH. Apply the appropriate phase rotation as defined in 22.3.7 (Mathematical description of signals).

i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

22.3.4.6 Construction of TVHT-STF

Construct the TVHT-STF field for each BCU as defined in 22.3.8.3.4 (TVHT-STF definition) with channel bandwidth being 40 MHz, following the procedure in 21.3.4.6 (Construction of VHT-STF) reading "Clause 22 (Television Very High Throughput (TVHT) PHY specification)" for references to "Clause 21 (Very High Throughput (VHT) PHY specification)" except the following:

b) Phase rotation: Apply appropriate phase rotation as defined in 22.3.7 (Mathematical description of signals).

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-STF subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.4 (TVHT-STF definition).

22.3.4.7 Construction of TVHT-LTF

Construct the TVHT-LTF field for each BCU as defined in 22.3.8.3.5 (TVHT-LTF definition) with channel bandwidth being 40 MHz, following the procedure in 21.3.4.7 (Construction of VHT-LTF) reading "Clause 22 (Television Very High Throughput (TVHT) PHY specification)" for references to "Clause 21 (Very High Throughput (VHT) PHY specification)" except the following:

b) Phase rotation: Apply appropriate phase rotation as defined in 22.3.7 (Mathematical description of signals).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

g) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-LTF subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.5 (TVHT-LTF definition).

22.3.4.8 Construction of TVHT-SIG-B

The TVHT-SIG-B field is constructed per-user for each BCU as defined in 21.3.4.8 (Construction of VHT-SIG-B) with channel bandwidth being 40 MHz, reading "Clause 22 (Television Very High Throughput (TVHT) PHY specification)" for references to "Clause 21 (Very High Throughput (VHT) PHY specification)" except the following:

i) Pilot insertion: Insert pilots following the steps defined in 22.3.10.10 (Pilot subcarriers).

m) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7 (Mathematical description of signals).

o) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-SIG-B subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.6 (TVHT-SIG-B definition).

22.3.4.9 Construction of the Data field in an SU PPDU

22.3.4.9.1 Using BCC

The construction of the Data field in a VHT SU PPDU with BCC encoding proceeds as defined in 21.3.4.9.1 (Using BCC) reading "Clause 22 (Television Very High Throughput (TVHT) PHY specification)" for references to "Clause 21 (Very High Throughput (VHT) PHY specification)" except the following:

d) BCC encoder: Only one encoder is used.

f) Segment parser is omitted.

i) Segment deparser is omitted.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 22.3.8.3.2 (Cyclic shift for TVHT modulated fields).

n) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7 (Mathematical description of signals).

o) IDFT: When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 22.3.10.11 (OFDM modulation transmission in VHT format).

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

22.3.4.9.2 Using LDPC

The construction of the Data field in a VHT SU PPDU with LDPC encoding proceeds as defined in 21.3.4.9.2 (Using LDPC) reading "Clause 22 (Television Very High Throughput (TVHT) PHY specification)" for references to "Clause 21 (Very High Throughput (VHT) PHY specification)" except the following:

f) Segment parser is omitted.

i) Segment deparser is omitted.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 22.3.8.3.2 (Cyclic shift for TVHT modulated fields).

n) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7 (Mathematical description of signals). When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 21.3.10.11.1 (Transmission in VHT format).

o) IDFT: When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 22.3.10.11 (OFDM modulation transmission in VHT format).

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

22.3.4.10 Construction of the Data field in an MU PPDU

22.3.4.10.1 General

See 21.3.4.10.1 (General).

22.3.4.10.2 Using BCC

A Data field with BCC encoding is constructed using the process defined in 22.3.4.9.1 (Using BCC) before the spatial mapping block and repeated for each user that uses BCC encoding.

22.3.4.10.3 Using LDPC

A Data field with LDPC encoding is constructed using the process defined in 22.3.4.9.2 (Using LDPC) before the spatial mapping block and repeated for each user that uses LDPC encoding.

22.3.4.10.4 Combining to form an MU PPDU

The per-user data is combined as defined in 21.3.4.10.4 (Combining to form a VHT MU PPDU) except the following:

a) Spatial mapping: The Q matrix is applied as defined in 22.3.10.11 (OFDM modulation transmission in VHT format). The combining of all user data is done in this block.

b) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7 (Mathematical description of signals).

d) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7 (Mathematical description of signals).

e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 22.3.7 (Mathematical description of signals) and 22.3.8 (TVHT preamble) for details.

22.3.5 Modulation and coding scheme (MCS)

The MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the TVHT-SIG-A field for SU PPDUs and in the TVHT-SIG-B field for MU PPDUs. Rate-dependent parameters for the full set of MCSs are shown in Table 22-26 (TVHT MCSs for TVHT_MODE_1, NSS = 1) to Table 22-37 (TVHT MCSs for TVHT_MODE_4C and TVHT_MODE_4N, NSS = 4) (in 22.5 (Parameters for TVHT MCSs)). These tables give rate-dependent parameters for MCSs with indices 0 to 9, with number of spatial streams from 1 to 4 and bandwidth options of one, two, or four BCUs. Equal modulation (EQM) is applied to all streams for a particular user.

Table 22-26 (TVHT MCSs for TVHT_MODE_1, NSS = 1) to Table 22-29 (TVHT MCSs for TVHT_MODE_1, NSS = 4) show rate-dependent parameters for MCSs for one to four streams for one BCU

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

operation. Table 22-30 (TVHT MCSs for TVHT_MODE_2C and TVHT_MODE_2N, NSS = 1) to Table 22-33 (TVHT MCSs for TVHT_MODE_2C and TVHT_MODE_2N, NSS = 4) show rate-dependent parameters for MCSs for one to four streams for dual BCU operation. Table 22-34 (TVHT MCSs for TVHT_MODE_4C and TVHT_MODE_4N, NSS = 1) to Table 22-37 (TVHT MCSs for TVHT_MODE_4C and TVHT_MODE_4N, NSS = 4) show rate-dependent parameters for MCSs for one to four streams for quad BCU operation.

22.3.6 Timing-related parameters

Table 22-8 (Timing-related parameters) and Table 22-9 (Tone location) define the timing-related parameters for VHT format and location of occupied tones in TVWS bands.

Table 22-8—Timing-related parameters

Parameter	6 MHz	7 MHz	8 MHz	Description
N_{SD}	108	108	108	Number of complex data numbers per BCU
N_{SP}	6	6	6	Number of pilot values per BCU
N_{ST}	114	114	114	Total number of subcarriers per BCU
N_{SR}	58	58	58	Highest data subcarrier index per BCU
Δ_F	$\frac{6\text{ MHz}}{144} = 41\frac{2}{3}$ kHz	$\frac{7\text{ MHz}}{168} = 41\frac{2}{3}$ kHz	$\frac{8\text{ MHz}}{144} = 55\frac{5}{9}$ kHz	Subcarrier frequency spacing
T_{DFT}	24 μs	24 μs	18 μs	IDFT/DFT period
T_{GI}	6 μs = T_{DFT}/4	6 μs = T_{DFT}/4	4.5 μs = T_{DFT}/4	Guard interval duration

The rest of the timing parameters are derived as in Table 21-5 (Timing-related constants) using the definition of T_{DFT} in Table 22-8 (Timing-related parameters). Table 22-9 (Tone location) defines the number of

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

occupied tones and their location in all transmission modes. Zero denotes the DC tone of any contiguous segment.

Table 22-9—Tone location

Parameter	TVHT_ MODE_1	TVHT_ MODE_2C	TVHT_ MODE_2N	TVHT_ MODE_4C	TVHT_ MODE_4N	Description
N_{ST}	114	114	114	114	114	Total number of occupied subcarriers per BCU
N_{TT}	114	228	228	456	456	Total number of occupied subcarriers across all BCUs
Subcarrier index	–58 to –2 and +2 to +58	–130 to –74, –70 to –14, +14 to +70, and +74 to +130	–58 to –2 and +2 to +58 for each BCU	–274 to –218, –214 to –158, –130 to –74, –70 to –14, +14 to +70, +74 to +130, +158 to +214, and +218 to +274	–130 to –74, –70 to –14, +14 to +70, and +74 to +130 for each BCU	Location of occupied subcarriers for 6 MHz and 8 MHz channel units
Subcarrier index	–58 to –2 and +2 to +58	–142 to –86, –82 to –26, +26 to +82, and +86 to +142	–58 to –2 and +2 to +58 for each BCU	–310 to –254, –250 to –194, –142 to –86, –82 to –26, +26 to +82, +86 to +142, +194 to +250, and +254 to +310	–142 to –86, –82 to –26, +26 to +82, and +86 to +142 for each BCU	Location of occupied subcarriers for 7 MHz

Refer to Table 21-6 (Frequently used parameters) for the frequency parameters. The definitions in the table are applicable to Clause 22 (Television Very High Throughput (TVHT) PHY specification) with the exception that in each transmission mode in Clause 22 (Television Very High Throughput (TVHT) PHY specification) $N_{CBPSSI} = N_{CBPSS}$ for SU and MU PPDUs.

22.3.7 Mathematical description of signals

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5 (Mathematical conventions in the signal descriptions).

For all VHT PPDU in TVWS bands transmission modes the signal is transmitted on subcarriers as defined in Table 22-9 (Tone location).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

Let

$f_{c,\text{idx0}}$ = dot11CurrentTVHTChannelCenterFrequencyIndex0 (see Table 22-17 (Fields to specify TVHT channels))

$f_{c,\text{idx1}}$ = dot11CurrentTVHTChannelCenterFrequencyIndex1 (see Table 22-17 (Fields to specify TVHT channels))

$f_{\text{PW, idx}}$ = dot11CurrentPrimaryChannel (see Table 22-17 (Fields to specify TVHT channels)), where TVHT_W refers to a BCU of 6 MHz, 7 MHz, or 8 MHz

$f_{\text{CH, start}}$ = Channel starting frequency given in the operation class (E.1 (Country information and operating classes))

When dot11CurrentTVHTChannelWidth is TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, or TVHT_2W+2W, $f_{PW,idx}$ and $f_{c,idx1}$ shall have the relationship specified in Equation (22-1).

$$f_{\text{PW, idx}} = f_{c,\text{idx0}} + n_{\text{PW}} \tag{22-1}$$

where

$$N_{PW} = \begin{cases} 1 \text{ in TVHT_W and TVHT_W+W} \\ 2 \text{ in TVHT_2W and TVHT_2W+2W} \\ 4 \text{ in TVHT_4W} \end{cases}$$

n_{PW} is an integer with possible range $0 \le n_{\text{PW}} \le N_{PW} - 1$

When dot11CurrentTVHTChannelWidth is TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, or TVHT_2W+2W,

— The primary TVHT_W channel is the channel with TVHT_W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{\text{PW, idx}}$, where $f_{\text{PW, idx}}$ is given in Equation (22-1).

When dot11CurrentTVHTChannelWidth is TVHT_2W, TVHT_4W, or TVHT_2W+2W,

— The secondary TVHT_W channel is the channel with TVHT_W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{\text{SW, idx}}$, where $f_{\text{SW, idx}}$ is given in Equation (22-2).

$$f_{\text{SW, idx}} = \begin{cases} f_{\text{PW, idx}} + 1, & \text{if } n_{\text{PW}} \text{ is even} \\ f_{\text{PW, idx}} - 1, & \text{if } n_{\text{PW}} \text{ is odd} \end{cases} \tag{22-2}$$

When dot11CurrentTVHTChannelWidth is TVHT_W+W,

— The secondary TVHT_W channel is the channel with TVHT_W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{\text{SW, idx}}$, where $f_{\text{SW, idx}}$ is given in Equation (22-3).

$$f_{\text{SW, idx}} = f_{c,\text{idx1}} \tag{22-3}$$

When dot11CurrentTVHTChannelWidth is TVHT_2W, TVHT_4W, or TVHT_2W+2W,

— The primary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{\text{P2W, idx}} + 0.5 \times \text{TVHT_W}$ MHz, where $f_{\text{P2W, idx}}$ is given in Equation (22-4).

— The secondary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{S2W,\text{idx}} + 0.5 \times \text{TVHT_W}$ MHz, where $f_{S2W,\text{idx}}$ is given in Equation (22-5).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$$f_{\text{P2W, idx}} = f_{c,\text{ idx0}} + 2 \times n_{\text{P2W}} \quad 0 \le n_{\text{P2W}} \le N_{P2W} - 1 \quad N_{P2W} = \begin{cases} 1 \text{ in TVHT_2W and TVHT_2W+2W} \\ 2 \text{ in TVHT_4W} \end{cases} \tag{22-4}$$

When dot11CurrentTVHTChannelWidth is TVHT_4W,

— The secondary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{S2W,\text{ idx}} + 0.5 \times \text{TVHT_W}$ MHz, where $f_{S2W,\text{ idx}}$ is given in Equation (22-5).

$$f_{\text{S2W, idx}} = \begin{cases} f_{\text{P2W, idx}} + 2, & \text{if } n_{\text{P2W}} \text{ is even} \\ f_{\text{P2W, idx}} - 2, & \text{if } n_{\text{P2W}} \text{ is odd} \end{cases} \tag{22-5}$$

When dot11CurrentTVHTChannelWidth is TVHT_2W+2W,

— The secondary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{S2W,\text{ idx}} + 0.5 \times \text{TVHT_W}$ MHz, where $f_{S2W,\text{ idx}}$ is given in Equation (22-3).

The transmitted signal is defined in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (21-11) in Clause 21 (Very High Throughput (VHT) PHY specification).

$f_c^{(i_{Seg})}$ represents the center frequency of the PPDU transmitted in frequency segment i_{Seg} in each transmission mode in Clause 22 (Television Very High Throughput (TVHT) PHY specification).

Note that in TVHT_MODE_2C and TVHT_MODE_4C, the gap between the center frequencies of the adjacent segments is as shown in Table 22-9 (Tone location).

Table 22-10 (Center frequency of a PPDU transmitted in frequency segment iSeg) shows $f_c^{(i_{Seg})}$ as a function of dot11CurrentTVHTChannelWidth.

Table 22-10—Center frequency of a PPDU transmitted in frequency segment i_{Seg}

dot11CurrentTVHTChannelWidth	CH_BANDWIDTH	$f_c^{(i_{Seg})} = f_{\text{CH, start}} + \text{TVHT_W} \times f_{(i_{Seg})} + Correction$	
		$(f_{(0)}, Correction)$	$(f_{(1)}, Correction)$
TVHT_W	TVHT_W	$(f_{c,\text{ idx0}}, 0)$	—
TVHT_2W	TVHT_W	$(f_{\text{PW, idx}}, 0)$	—
	TVHT_2W	$(f_{c,\text{ idx0}}, 0.5 \times \text{TVHT_W})$	—

	TVHT_2W	$(f_{c,\text{ idx0}}, 0.5 \times \text{TVHT_W})$	
	TVHT_2W+2W	$(f_{c,\text{ idx0}}, 0.5 \times \text{TVHT_W})$	$(f_{c,\text{ idx1}}, 0.5 \times \text{TVHT_W})$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE—Transmitted signals in TVHT_MODE_2N and TVHT_MODE_4N might have different impairments such as phase offset or phase noise between the two frequency segments in TVHT_MODE_2N or TVHT_MODE_4N, which is not shown in Equation (21-11) for simplicity. See 22.3.17.3 (Transmit center frequency and symbol clock frequency tolerance).

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The signal transmitted on frequency segment i_{Seg} of transmit chain i_{TX} is described by Equation (21-12) in 21.3.7 (Mathematical description of signals). The timing boundaries for the various fields are shown in Figure 21-17 (Timing boundaries for VHT PPDU fields).

Each field is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (21-13) and where references to Table 21-5 (Timing-related constants), Table 21-6 (Frequently used parameters), Table 21-8 (Tone scaling factor and guard interval duration values for PHY fields), Table 22-9 (Tone location), Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU), and Table 21-11 (Cyclic shift values for the VHT modulated fields of a PPDU) are replaced by the corresponding descriptions in Clause 22 (Television Very High Throughput (TVHT) PHY specification) including Table 22-8 (Timing-related parameters), Table 22-9 (Tone location), Table 22-11 (Tone scaling factor and guard interval duration values for PHY fields), and Table 22-12 (Transmission mode and Gamma subk,m).

Table 22-11 (Tone scaling factor and guard interval duration values for PHY fields) summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$ as a function of number of BCUs (TVHT_MODE_1 has one BCU, TVHT_MODE_2C and TVHT_MODE_2N have two BCUs, and TVHT_MODE_4C and TVHT_MODE_4N have four BCUs).

Table 22-11—Tone scaling factor and guard interval duration values for PHY fields

Field	$N_{\text{Field}}^{\text{Tone}}$ as a function of the number of BCUs			Guard interval duration
	One	Two	Four	
L-STF	24	48	96	—
L-LTF	104	208	416	T_{GI2}
L-SIG	104	208	416	T_{GI}
TVHT-SIG-A	104	208	416	T_{GI}
TVHT-STF	24	48	96	-
TVHT-LTF	114	228	456	T_{GI}
TVHT-SIG-	114	228	456	T_{GI}
VHT-Data	114	228	484	T_{GI} or T_{GIS} (see NOTE 2)
NON_HT_DUP_OFDM-Data (see NOTE 1)	104	208	416	T_{GI}

NOTE 1—For notational convenience, NON_HT_DUP_OFDM-Data is used as a label for the Data field of a NON_HT PPDU with format type NON_HT_DUP_OFDM.
NOTE 2—T_{GI} denotes guard interval duration when TXVECTOR parameter GI_TYPE equals LONG_GI, T_{GIS} denotes short guard interval duration when TXVECTOR parameter GI_TYPE equals SHORT_GI.

This is an unapproved IEEE Standards Draft, subject to change.

In addition, the parameter $\Upsilon_{k,\mathrm{BW}}$ in Equation (21-13) is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m).

Table 22-12—Transmission mode and Gamma sub$_{k,\mathrm{M}}$

Transmission mode	$\Upsilon_{k,\mathrm{M}}$
TVHT_MODE_1, TVHT_MODE_2N	$\Upsilon_{k,1}$ per segment
TVHT_MODE_2C, TVHT_MODE_4N	$\Upsilon_{k,2}$ per two contiguous segments
TVHT_MODE_4C	$\Upsilon_{k,4}$

For TVHT_MODE_1 and TVHT_MODE_2N PPDU transmission,

$$\Upsilon_{k,1} = \begin{cases} 1, & k < 0 \\ j, & k \geq 0 \end{cases} \tag{22-6}$$

For TVHT_MODE_2C and TVHT_MODE_4N PPDU transmission,

$$\Upsilon_{k,2} = \begin{cases} 1, & k < -72 \text{ for 6 MHz and 8 MHz channels, } k < -84 \text{ for 7 MHz channels} \\ -1, & k \geq -72 \text{ for 6 MHz and 8 MHz channels, } k \geq -84 \text{ for 7 MHz channels} \end{cases} \tag{22-7}$$

For TVHT_MODE_4C PPDU transmission,

$$\Upsilon_{k,4} = \begin{cases} 1, & k < -216 \text{ for 6 MHz and 8 MHz channels, } k < -252 \text{ for 7 MHz channels} \\ -1, & -216 \leq k < 0 \text{ for 6 MHz and 8 MHz channels, } -252 \leq k < 0 \text{ for 7 MHz channels} \\ 1, & 0 \leq k < 72 \text{ for 6 MHz and 8 MHz channels, } 0 \leq k < 84 \text{ for 7 MHz channels} \\ -1, & k \geq 72 \text{ for 6 MHz and 8 MHz channels, } k \geq 84 \text{ for 7 MHz channels} \end{cases} \tag{22-8}$$

22.3.8 TVHT preamble

22.3.8.1 Introduction

A TVHT preamble is defined to carry the required information to operate in either single user or multi-user mode.

22.3.8.2 Non-TVHT portion of TVHT format preamble

22.3.8.2.1 Cyclic shift definition for pre-TVHT modulated fields

The cyclic shift value $T_{CS}^{i_{TX}}$ for the L-STF, L-LTF, L-SIG, and TVHT-SIG-A fields of the PPDU for transmit chain i_{TX} out of a total of N_{TX} is defined in Table 21-10 (Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU) with a scaling factor to account for the change in sampling clock frequency. The CSD delay values shall be multiplied by the corresponding correction values for the 6 MHz, 7 MHz, and 8 MHz channels, respectively.

The scaling factor for transmissions over 6 MHz and 7 MHz channels is 7.5.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

The scaling factor for transmissions over 8 MHz channels is 5.625.

As an example, the CSD value for antenna-2 with 2-transmit antennas is –200 ns, and the corresponding CSD value for 6 MHz channels is –1.5 μs.

22.3.8.2.2 L-STF definition

The L-STF field for each BCU in any transmission mode is defined by Equation (19-9) in 19.3.9.3.3 (L-STF definition).

The time domain representation of the signal on BCU i_{Seg} in transmit chain i_{TX} is specified in Equation (21-20), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m) and where N_{SR} and Δ_F are defined in Table 22-8 (Timing-related parameters).

22.3.8.2.3 L-LTF definition

The L-LTF field for each BCU in any transmission mode is defined by Equation (19-12) in 19.3.9.3.4 (L-LTF definition).

Note that these equations do not include the phase rotations as defined in Table 22-12 (Transmission mode and Gamma subk,m).

The time domain representation of the signal in transmit chain i_{TX} is specified in Equation (21-23), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m) and where N_{SR} is defined in Table 22-8 (Timing-related parameters).

22.3.8.2.4 L-SIG definition

The L-SIG field is used to communicate data rate and length information. The structure of the L-SIG field is defined in Figure 17-5 (SIGNAL field bit assignment).

In a VHT PPDU, the RATE field shall be set to the value corresponding to 6 Mb/s in the 20 MHz channel spacing column of Table 17-6 (Contents of the SIGNAL field).

In a NON_HT_DUP PPDU, the RATE field is defined in 17.3.4.2 (RATE field) using the L_DATARATE parameter in the TXVECTOR.

The LENGTH field shall be set to the value given by Equation (22-9).

$$\mathrm{LENGTH} = [(\mathrm{TXTIME} - (20 \cdot \text{scaling factor}))/(4 \cdot \text{scaling factor})] \times 3 - 3 \quad (22\text{-}9)$$

where the scaling factor is defined in 22.3.8.2.1 (Cyclic shift definition for pre-TVHT modulated fields) and TXTIME is defined in 22.4.3 (TXTIME and PSDU_LENGTH calculation). In a non-HT duplicate PPDU, the LENGTH field is defined in 17.3.4.3 (PHY LENGTH field) using the L_LENGTH parameter in the TXVECTOR.

The time domain waveform of the L-SIG field in each BCU is specified in Equation (21-25) using $N_{20\mathrm{MHz}} = 2$, where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m) and where the rest of the variables are specified in 22.3.7 (Mathematical description of signals).

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

22.3.8.3 TVHT portion of TVHT format preamble

22.3.8.3.1 Introduction

The TVHT portion of the VHT format preamble consists of the TVHT-SIG-A, TVHT-STF, TVHT-LTF, and TVHT-SIG-B fields.

Notational conventions are specified in 21.3.8.3.1 (Introduction).

22.3.8.3.2 Cyclic shift for TVHT modulated fields

The definition, application, and CSD values are defined in 21.3.8.3.2 (Cyclic shift for VHT modulated fields) with scaling factors as defined in 22.3.8.2.1 (Cyclic shift definition for pre-TVHT modulated fields).

22.3.8.3.3 TVHT-SIG-A definition

The TVHT-SIG-A field carries information required to interpret VHT PPDU in TVWS bands and is defined in 21.3.8.3.3 (VHT-SIG-A definition).

The time domain waveform of the TVHT-SIG-A field in each BCU is specified in Equation (21-28), where $N_{20MHz} = 2$ and where the rest of the variables are specified in 22.3.7 (Mathematical description of signals).

Fields in the TVHT-SIG-A fields are the same as in Table 21-12 (Fields in the VHT-SIG-A field) except for the description B0-B1 (BW) and B10-B21 in TVHT-SIG-A1. Description of B0-B1 is specified in Table 22-13 (B0-B1 (BW) in TVHT-SIG-A1)

Table 22-13—B0-B1 (BW) in TVHT-SIG-A1

B0-B1	TVHT_MODE
00	Not used
10	TVHT_MODE_1
01	TVHT_MODE_2C and TVHT_MODE_2N
11	TVHT_MODE_4C and TVHT_MODE_4N

Description of B10-B21 (N_{STS}/Partial AID) is specified as follows:

For an MU PPDU:

N_{STS} is divided into 4 user positions of 3 bits each. User position p, where

$0 \le p \le 3$, uses bits B(10+3p)-B(12+3p). The number of space-time streams for user u is indicated at user position p = USER_POSITION[u] where u = 0, 1, ..., NUM_USER – 1 and where the notation A[b] denotes the value of array A at index b. Zero space-time streams are indicated at positions not listed in the USER_POSITION array.

Set to 0 for 0 space time streams
Set to 1 for 1 space time stream
Set to 2 for 2 space time streams
Set to 3 for 3 space time streams
Values 4 to 7 are reserved

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For an SU PPDU:

B10-B12

Set to 0 for 1 space time stream
Set to 1 for 2 space time streams
Set to 2 for 3 space time streams
Set to 3 for 4 space time streams
Values 4 to 7 are reserved

B13-B21

Partial AID: Set to the value of the TXVECTOR parameter PARTIAL_AID. Partial AID provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.20 (Group ID and partial AID in VHT PPDUs)).

22.3.8.3.4 TVHT-STF definition

The TVHT-STF field for each BCU in any transmission mode is defined by Equation (21-30) in 21.3.8.3.4 (VHT-STF definition).

The time domain waveform of the TVHT-STF field in each BCU is specified in Equation (21-33), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m) and where N_{SR} is defined in Table 22-8 (Timing-related parameters).

22.3.8.3.5 TVHT-LTF definition

The TVHT-LTF field is defined in 21.3.8.3.5 (VHT-LTF definition).

The TVHT-LTF sequence transmitted for each BCU in any transmission mode is defined by Equation (21-37).

The time domain waveform of the TVHT-LTF field in each BCU is specified in Equation (21-43), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m) and where N_{SR} is defined in Table 22-8 (Timing-related parameters).

22.3.8.3.6 TVHT-SIG-B definition

The TVHT-SIG-B field for each BCU in any transmission mode is as defined in 21.3.8.3.6 (VHT-SIG-B definition) for 40 MHz bandwidth.

The 27 TVHT-SIG-B bits are first repeated twice, then BCC encoded, interleaved, and made into constellations as described by Figure 21-22 (VHT-SIG-B bits in 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz transmissions) and the corresponding text in 21.3.8.3.6 (VHT-SIG-B definition). If the channel bandwidth of the current PPDU is TVHT_W, then the IDFT is conducted as defined in 21.3.8.3.6 (VHT-SIG-B definition).

The time domain waveform for the TVHT-SIG-B field in each BCU in a VHT PPDU is the same as Equation (21-48) with channel bandwidth being 40 MHz. If the channel bandwidth of the current PPDU is larger than TVHT_W, then the TVHT-SIG-B subcarriers as described above are repeated in each BCU, with appropriate phase rotation factors $\Upsilon_{k,\mathrm{M}}$ being applied as shown in Table 22-12 (Transmission mode and Gamma subk,m), before conducting IDFT.

This is an unapproved IEEE Standards Draft, subject to change.

22.3.9 Transmission of NON_HT and HT PPDUs with multiple antennas

22.3.9.1 Transmission of NON_HT PPDUs with more than one antenna

A TVHT STA that transmits a NON_HT PPDU shall apply the cyclic shifts defined in 22.3.8.2.1 (Cyclic shift definition for pre-TVHT modulated fields) for L-STF, L-LTF, and L-SIG fields of the PPDU.

22.3.10 Data field

22.3.10.1 General

See 21.3.10.1 (General), with "TVHT" replacing "VHT".

22.3.10.2 SERVICE field

See 21.3.10.2 (SERVICE field), with "TVHT" replacing "VHT".

22.3.10.3 CRC calculation for TVHT-SIG-B

The CRC calculation and insertion is illustrated in Figure 21-23 (VHT-SIG-B and SERVICE field relationship).

The value of the CRC field shall be the 1s complement of Equation (21-60) with the values of N set to 21 for all Modes.

22.3.10.4 Scrambler

See 21.3.10.4 (Scrambler) with "TVHT" replacing "VHT".

22.3.10.5 Coding

See 21.3.10.5 (Coding) with "TVHT" replacing "VHT".

22.3.10.6 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoders are processed in groups of N_{CBPS} bits. Each of these groups is rearranged into N_{SS} blocks of N_{CBPSS} bits ($N_{SS,u}$ blocks of $N_{CBPSS,u}$ bits in the case of an MU transmission). This operation is referred to as "stream parsing" and is described in 21.3.10.6 (Stream parser).

22.3.10.7 Segment parser

The segment parser as described in 21.3.10.7 (Segment parser) is not used in Clause 22 (Television Very High Throughput (TVHT) PHY specification). All modes of operation use a common interleaver in the case of BCC or use a common tone mapper in the case of LDPC.

22.3.10.8 BCC interleaver

The BCC interleaver and deinterleaver for one BCU (TVHT_MODE_1) is as defined in 21.3.10.8 (BCC interleaver) for 40 MHz.

The BCC interleaver and deinterleaver for TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N reuse the same formulas as described in 21.3.10.8 (BCC interleaver) for 40 MHz

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

with new values for N_{COL} , N_{ROW}, and N_{ROT} as defined in Table 22-14 (Number of rows and columns in the interleaver).

Table 22-14—Number of rows and columns in the interleaver

Parameter	TVHT_MODE_1	TVHT_MODE_2C, TVHT_MODE_2N	TVHT_MODE_4C, TVTH_MODE_4N
N_{COL}	18	27	48
N_{ROW}	$6 \times N_{BPSCS}$	$8 \times N_{BPSCS}$	$9 \times N_{BPSCS}$
N_{ROT} ($N_{SS} \leq 4$)	29	46	78

22.3.10.9 Constellation mapping

22.3.10.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points is as described in 21.3.10.9.1 (General).

The streams of complex numbers in frequency subblock l for user u are denoted

$d'_{k,i,n,l,u}$; $k = 0, 1, \ldots, N_{SD} - 1$; $i = 1, \ldots, N_{SS,u}$; $n = 0, 1, \ldots, N_{SYM} - 1$;
$l = 0$ for all transmission modes.

22.3.10.9.2 LDPC tone mapping

The LDPC tone mapping for one BCU (TVHT_MODE_1) is as defined in 21.3.10.9.2 (LDPC tone mapping) for 40 MHz.

The LDPC tone mapping for TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N reuses the same formulas as described in 21.3.10.9.2 (LDPC tone mapping) for 40 MHz with values for D_{TM} as defined in Table 22-15 (LDPC Tone Mapping Distance for each transmission mode).

Table 22-15—LDPC Tone Mapping Distance for each transmission mode

Parameter	TVHT_MODE_1	TVHT_MODE_2C, TVHT_MODE_2N	TVHT_MODE_4C, TVHT_MODE_4N
D_{TM}	6	8	9

For all Clause 22 (Television Very High Throughput (TVHT) PHY specification) transmission Modes, the LDPC tone mapping for LDPC-coded streams corresponding to user u is done by permuting the stream of complex numbers

$d'_{k,i,n,l,u}$; $k = 0, 1, \ldots, N_{SD} - 1$; $i = 1, \ldots, N_{SS,u}$; $n = 0, 1, \ldots, N_{SYM} - 1$;
$l = 0$ for all transmission modes.

generated by the constellation mappers, to obtain

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

$d_{t(k),i,n,l,u}$; $k = 0, 1, \ldots, N_{SD} - 1$; $i = 1, \ldots, N_{SS,u}$; $n = 0, 1, \ldots, N_{SYM} - 1$;
$l = 0$ for all transmission modes.

where

$$t(k) = D_{TM}\left(k \bmod \frac{N_{SD}}{D_{TM}}\right) + \left\lfloor \frac{k \cdot D_{TM}}{N_{SD}} \right\rfloor \quad \text{for all transmission modes}$$

22.3.10.9.3 Segment deparser

The segment deparser is not used in Clause 22 (Television Very High Throughput (TVHT) PHY specification) as no segment parser is used in Clause 22 (Television Very High Throughput (TVHT) PHY specification).

22.3.10.9.4 Space-time block coding

See 21.3.10.9.4 (Space-time block coding) with "TVHT" replacing "VHT".

22.3.10.10 Pilot subcarriers

For TVHT_MODE_1 transmission, six pilot tones shall be inserted in subcarriers –53, –25, –11, 11, 25, and 53. The pilots are generated as described in 21.3.10.10 (Pilot subcarriers) for 40 MHz transmission.

When multiple BCUs are used (TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N), each BCU shall use the same pilot tones, which are generated as described in 21.3.10.10 (Pilot subcarriers) for 40 MHz transmission.

22.3.10.11 OFDM modulation transmission in VHT format

For TVHT transmissions, the signal from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$ shall be as specified in Equation (21-96), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m) and where N_{SR} and Δ_F are defined in Table 22-8 (Timing-related parameters).

For TVHT_MODE_1 transmission, parameters shall be selected to be the same with 40 MHz VHT transmission as defined in 21.3.10.11.1 (Transmission in VHT format).

For multi-segment transmissions TVHT_MODE_2C and TVHT_MODE_4C, each frequency segment shall follow the waveform as described in Equation (21-96), and the data and pilot subcarriers are allocated to the IDFT block according to the subcarrier mapping as specified in Table 22-9 (Tone location) in consecutive order from the lowest subcarrier to the highest subcarrier.

For multi-segment transmissions TVHT_MODE_2N and TVHT_MODE_4N, each frequency segment shall follow the waveform as described in Equation (21-96), and the data and pilot subcarriers are allocated by the subcarrier allocation block, as shown in Figure 22-2 (Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with BCC encoding), to the two IDFT blocks according to the subcarrier mapping as specified in Equation (21-96) and Table 22-9 (Tone location) in consecutive order from the lowest subcarrier to the highest subcarrier in each of the two frequency segments, the lower half of the subcarriers are mapped to the IDFT corresponding to the lower frequency segment, and the upper half of the subcarriers are mapped to the IDFT corresponding to the upper frequency segment.

This is an unapproved IEEE Standards Draft, subject to change.

22.3.10.12 Non-HT duplicate transmission

When the TXVECTOR parameter FORMAT is NON_HT and the TXVECTOR parameter NON_HT_MODULATION is NON_HT_DUP_OFDM, the transmitted PPDU shall be a non-HT duplicate. Multiple BCUs non-HT duplicate transmission is used to transmit to TVHT STAs that may be present in a part of a channel.

For non-HT duplicate transmission, the Data field shall be as defined in 21.3.10.12 (Non-HT duplicate transmission), with "TVHT" replacing "VHT" and with references to "Clause 22 (Television Very High Throughput (TVHT) PHY specification)" replacing references to "Clause 21 (Very High Throughput (VHT) PHY specification)", using the parameter values defined in Table 22-16 (Parameters for Non-HT duplicate transmissions). The Data field shall be as defined by Equation (21-101) with following modifications. $N_{20\mathrm{MHz}}$ is defined in Table 22-16 (Parameters for Non-HT duplicate transmissions). $K_{\mathrm{Shift}}(i)$ in Equation (21-101) is replaced by $K_{\mathrm{Shift}}(i) = (N_{20\mathrm{MHz}} - 1 - 2i) \cdot 32 + 8 \cdot \lfloor N_{20\mathrm{MHz}}/4 \rfloor + 8 \cdot \lfloor N_{20\mathrm{MHz}}/8 \rfloor - (16 \cdot \lfloor i/2 \rfloor)$.

$T_{\mathrm{CS}}^{i_{TX}}$ represents the cyclic shift of the transmit chain i_{TX} and is defined in 22.3.8.2.1 (Cyclic shift definition for pre-TVHT modulated fields). $N_{\mathrm{NON_HT_DUP_OFDM\text{-}Data}}^{\mathrm{Tone}}$ is defined in Table 22-16 (Parameters for Non-HT duplicate transmissions).

Table 22-16—Parameters for Non-HT duplicate transmissions

Parameter	TVHT_MODE_1	TVHT_MODE_2C	TVHT_MODE_2N	TVHT_MODE_4C	TVHT_MODE_4N
$N_{20\mathrm{MHz}}$	2	4	2	8	4
$N_{\mathrm{NON_HT_DUP_OFDM\text{-}Data}}^{\mathrm{Tone}}$	104	208	104	416	208

In addition, the parameter $\Upsilon_{k,BW}$ is replaced by $\Upsilon_{k,M}$ as defined in Table 22-12 (Transmission mode and Gamma subk,m). For a noncontiguous TVHT_W+W or TVHT_2W+2W non-HT duplicate transmission, data transmission in each frequency segment shall be as defined for a TVHT_W or TVHT_2W non-HT duplicate transmission, respectively.

22.3.11 SU-MIMO and MU-MIMO Beamforming

22.3.11.1 General

SU-MIMO and DL-MU-MIMO beamforming in TVWS band is used as defined in 21.3.11.1 (General) reading "Clause 22 (Television Very High Throughput (TVHT) PHY specification)" for references to "Clause 21 (Very High Throughput (VHT) PHY specification)" except for feedback report format described in 9.4.1.50 (TVHT Compressed Beamforming Report field).

22.3.11.2 Beamforming Feedback Matrix V

Beamforming Feedback Matrix V is constructed as defined in 21.3.11.2 (Beamforming Feedback Matrix V) reading "Clause 22 (Television Very High Throughput (TVHT) PHY specification)" for reference to "Clause 21 (Very High Throughput (VHT) PHY specification)" except for CSD values defined in 22.3.8.3.2 (Cyclic shift for TVHT modulated fields).

22.3.11.3 Group ID

See 21.3.11.4 (Group ID) with "TVHT" replacing "VHT".

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

22.3.12 TVHT preamble format for sounding PPDUs

The format of a VHT NDP PPDU in TVWS bands is constructed as defined Figure 22-1 (VHT PPDU format in TVWS bands).

NOTE—The number of TVHT-LTF symbols in the NDP is determined by the SU N_{STS} field in TVHT-SIG-A.

The TVHT NDP PPDU has the following properties:

— Uses the TVHT PPDU format but without the Data field.

— Is a TVHT SU PPDU as indicated by the TVHT-SIG-A field.

— Has the data bits of the TVHT-SIG-B field set to a fixed bit pattern (see 22.3.8.3.6 (TVHT-SIG-B definition)).

22.3.13 Regulatory requirements

See 21.3.13 (Regulatory requirements).

22.3.14 Channelization

A TVHT channel is specified by the four PLME MIB fields specified in Table 22-17 (Fields to specify TVHT channels).

Table 22-17—Fields to specify TVHT channels

Field	Meaning
dot11CurrentTVHTChannelWidth	Channel width. Possible values represent TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W.
dot11CurrentTVHTChannelCenterFrequencyIndex0	In TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C operation denotes the center frequency of the lowest TV channel. In TVHT_MODE_2N and TVHT_MODE_4N operation, denotes the center frequency of the lowest TV channel in the frequency segment that contains the primary channel. Valid range is 1 to 200. See Equation (22-10).
dot11CurrentTVHTChannelCenterFrequencyIndex1	In TVHT_MODE_2N and TVHT_MODE_4N operation, denotes the center frequency of the lowest TV channel in the frequency segment that does not contain the primary channel. Valid range is 1 to 200. See Equation (22-10). Undefined for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C operation.
dot11CurrentPrimaryChannel	Denotes the location of the primary TVHT_W channel. Valid range is 1 to 200. See Equation (22-11).

Given dot11CurrentTVHTChannelCenterFrequencyIndex0 and dot11CurrentTVHTChannelCenterFrequencyIndex1, the respective center frequency is given by Equation (22-10).

$$\text{Channel center frequency [MHz]} = \text{Channel starting frequency} + \text{TVHT_W} \times \text{dot11CurrentChannelCenterFrequencyIndex} + \text{ChannelCenterFrequencyCorrection} \quad (22\text{-}10)$$

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

where

Channel starting frequency is given by the Operating Class (E.1 (Country information and operating classes)) and

dot11CurrentTVHTChannelCenterFrequencyIndex is either dot11CurrentTVHTChannelCenterFrequencyIndex0 or dot11CurrentTVHTChannelCenterFrequencyIndex1 and

ChannelCenterFrequencyCorrection is

0 for TVHT_MODE_1 and TVHT_MODE_2N,

0.5 × TVHT_W for TVHT_MODE_2C and TVHT+MODE_4N ,

1.5 × TVHT_W for TVHT_MODE_4C.

NOTE—Channel starting frequency is the frequency that results in the regulatory domain's channel number being the RLAN channel number, i.e., the center frequency of the channel for index 0. For example, the center frequency of U.S. TV channel 2 is 57 MHz. The center frequency of U.S. TV channel 2 is obtained by Equation (22-10) as follows: Channel center frequency [MHz] = Channel starting frequency + TVHT_W × dot11CurrentTVHTChannelCenterFrequencyIndex + ChannelCenterFrequencyCorrection = (0.045 × 1000) + 6 × 2 + 0 = 57 MHz.

The center frequency of the primary TVHT_W channel is given by Equation (22-11).

$$\text{Primary channel center frequency [MHz]} = \text{Channel starting frequency} + \text{TVHT_W} \times \text{dot11CurrentPrimaryChannel} \quad (22\text{-}11)$$

The channel starting frequency is given by the Operating Class (see E.1 (Country information and operating classes)).

For TVHT_MODE_2N operation, any two non-identical channels may be used.

For TVHT_MODE_4N operation, any two channels that would each be allowed as TVHT_2W channels and whose center frequencies are separated by greater than TVHT_2W (difference between dot11CurrentTVHTChannelCenterFrequencyIndex0 and dot11CurrentTVHTChannelCenterFrequencyIndex1 corresponds to a frequency difference greater than 2) may be used.

For example, in the United States, a channel specified by

dot11CurrentTVHTChannelWidth = TVHT_2W (12 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 = 15
dot11CurrentPrimaryChannel = 16

is a 12 MHz channel with a center frequency of 482 MHz and the primary 6 MHz channel centered at 485 MHz.

A channel specified by

dot11CurrentTVHTChannelWidth = TVHT_4W (24 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 = 14
dot11CurrentPrimaryChannel = 17

is a 24 MHz channel with a center frequency of 482 MHz and the primary 6 MHz channel centered at 491 MHz.

A channel specified by

dot11CurrentTVHTChannelWidth = TVHT_2W+2W (12+12 MHz)

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

dot11CurrentTVHTChannelCenterFrequencyIndex0 =15
dot11CurrentTVHTChannelCenterFrequencyIndex1 = 40
dot11CurrentPrimaryChannel = 16

is an 12+12 MHz channel in which frequency segment 0 has 12 MHz bandwidth and center frequency of 482 MHz. Frequency segment 1 also has 12 MHz bandwidth and center frequency of 632 MHz. The primary 6 MHz channel is centered at 485 MHz.

22.3.15 Slot time

The slot time for the TVHT PHY shall be 24 μs for 6 MHz and 7 MHz channel units and 20 μs for 8 MHz channel units.

22.3.16 Transmit and receive port impedance

Transmit and receive antenna connector impedance for each transmit and receive antenna is defined in 17.3.8.7 (Transmit and receive impedance at the antenna connector).

22.3.17 TVHT transmit specification

22.3.17.1 Transmit spectrum mask

For transmission in TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C, the transmit spectral mask shall be as described for 40 MHz mask PPDU in 21.3.17.1 (Transmit spectrum mask) with the frequency axis multiplied by the frequency scaling factor as defined in Table 22-18 (Spectral mask frequency scaling factor for contiguous transmission).

Table 22-18—Spectral mask frequency scaling factor for contiguous transmission

Mode	Scaling for 6 MHz channels	Scaling for 7 MHz channels	Scaling for 8 MHz channels
TVHT_MODE_1	6 / 40	7 / 40	8 / 40
TVHT_MODE_2C	12 / 40	14 / 40	16 / 40
TVHT_MODE_4C	24 / 40	28 / 40	32 / 40

For transmission in mode TVHT_MODE_4N, the transmit spectral mask shall be as described for 80+80 MHz mask PPDU in 21.3.17.1 (Transmit spectrum mask) with the frequency axis multiplied by the frequency scaling factor as defined in Table 22-19 (Spectral mask frequency scaling factor for TVHT_MODE_4N).

Table 22-19—Spectral mask frequency scaling factor for TVHT_MODE_4N

Mode	Scaling for 6 MHz channels	Scaling for 7 MHz channels	Scaling for 8 MHz channels
TVHT_MODE_4N	12 / 80	14 / 80	16 / 80

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements (measured as defined in the relevant regulation) and the mask defined in this subclause.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

NOTE 2—For rules regarding TX center frequency leakage levels, see 22.3.17.4.2 (Transmit center frequency leakage).

For a TVHT_W+W mask PPDU of VHT or non-HT duplicate format, the overall transmit spectral mask is constructed in the following manner. First, the 40 MHz interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz frequency offset, and –40 dBr at 60 MHz frequency offset and above. The 40 MHz interim transmit spectral mask for frequency offsets in between 19 MHz and 21 MHz, 21 MHz and 40 MHz, and 40 MHz and 60 MHz shall be linearly interpolated in dB domain from the requirements for 19 MHz, 21 MHz, 40 MHz, and 60 MHz frequency offsets. Then the 40 MHz interim spectral mask frequency points are scaled as defined in Table 22-20 (Spectral mask frequency scaling factor for TVHT_MODE_2N) to produce a TVHT_W interim spectral mask. Then, the TVHT_W interim spectral mask is placed on each of the two segments to produce the TVHT_W+W interim spectral mask. Then, for each frequency at which both of the TVHT_W interim spectral masks have values greater than –40 dBr and less than –20 dBr, the sum of the two TVHT_W interim mask values (summed in linear domain) shall be taken as the overall TVHT_W+W interim spectral mask value. Next, for each frequency at which neither of the two TVHT_W interim masks has values greater than or equal to –20 dBr and less than or equal to 0 dBr, the higher value of the two interim masks shall be taken as the overall TVHT_W+W interim mask spectral value. Finally, for any frequency region where the TVHT_W+W interim mask value has not been defined yet, linear interpolation (in dB domain) between the nearest two frequency points with the TVHT_W+W interim spectral mask value defined shall be used to define the TVHT_W+W interim spectral mask value. The transmit spectrum shall not exceed the maximum of the TVHT_W+W interim transmit spectrum mask and –59 dBm/MHz at any frequency offset.

Table 22-20—Spectral mask frequency scaling factor for TVHT_MODE_2N

Mode	Scaling for 6 MHz channels	Scaling for 7 MHz channels	Scaling for 8 MHz channels
TVHT_MODE_2N	6 / 40	7 / 40	8 / 40

Example transmit spectral mask for a TVHT_W+W mask PPDU for BCU of 6 MHz and spacing of 12 MHz is shown in Figure 22-4 (Example transmit spectral mask for an 6+6 MHz mask PPDU).

22.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs. See 22.3.17.4.4 (Transmitter modulation accuracy (EVM) test) for the demodulation procedure of the PPDUs as well as the number of PPDUs and OFDM symbols to be used for testing.

Let $E_{i,avg}$ denote the average constellation energy of a BPSK modulated subcarrier i in a TVHT data symbol.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

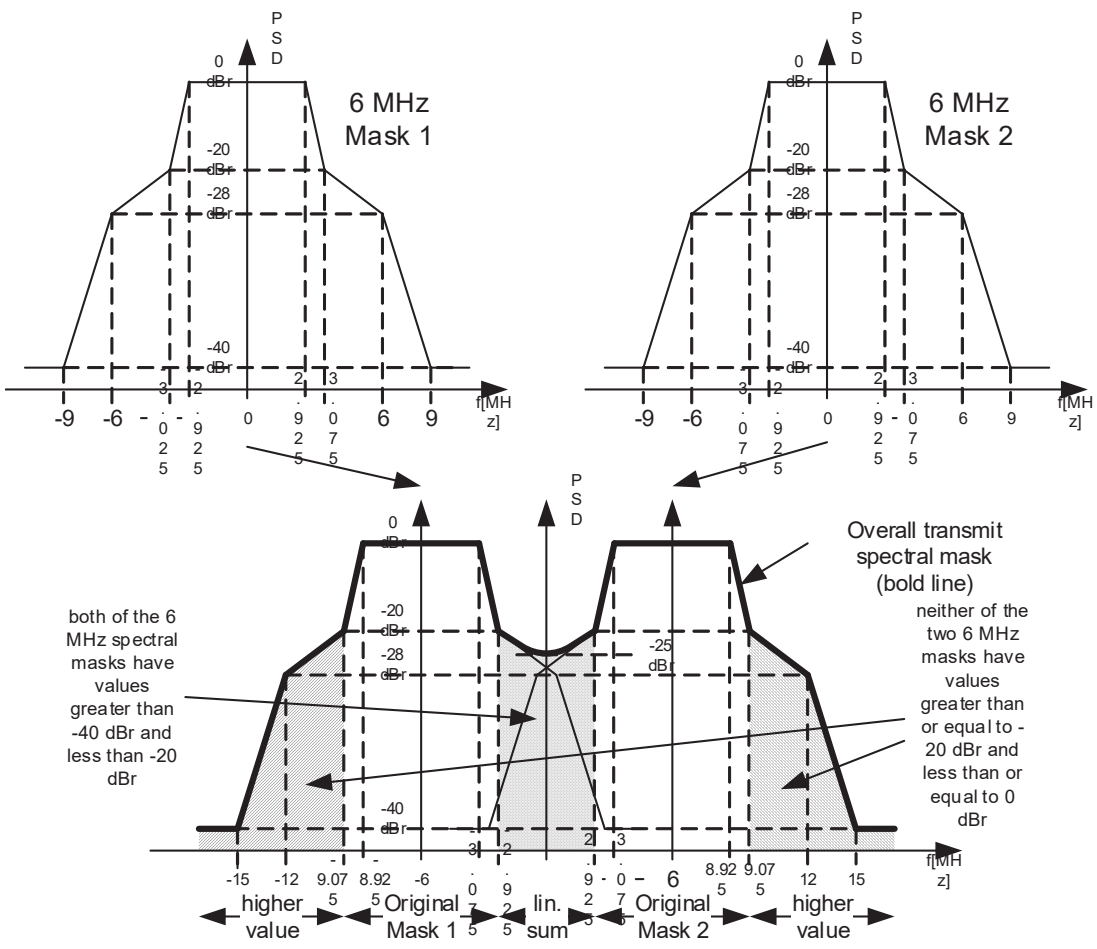

Figure 22-4—Example transmit spectral mask for an 6+6 MHz mask PPDU

For TVHT_MODE_1 contiguous non-HT duplicate or TVHT transmission having a bandwidth listed in Table 22-21 (Maximum transmit spectral flatness deviations), $E_{i,\,avg}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 22-21 (Maximum transmit spectral flatness deviations) from the average of $E_{i,\,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,\,avg}$ is done in the linear domain.

Table 22-21—Maximum transmit spectral flatness deviations

Format	Bandwidth of transmission (MHz)	Averaging subcarrier indices (inclusive)	Tested subcarrier indices (inclusive)	Maximum deviation (dB)
VHT	TVHT_W	–42 to –2 and +2 to +42	–42 to –2 and +2 to +42	±4
			–58 to –43 and +43 to +58	+4/–6
non-HT duplicate	TVHT_W	–42 to –33, –31 to –6, +6 to +31, and +33 to +42	–42 to –33, –31 to –6, +6 to +31, and +33 to +42	±4
			–43 to –58 and +43 to +58	+4/–6

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

For transmissions consisting of multiple contiguous or noncontiguous BCUs, each BCU shall meet the spectral flatness requirement for TVHT_MODE_1 transmission.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k (see 22.3.10.11 (OFDM modulation transmission in VHT format)) with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation.

22.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The transmitter center frequency maximum allowable deviation shall be ±25 ppm. Carrier (LO) and symbol clock frequencies for the all transmit chains and BCUs shall be derived from the same reference oscillator.

NOTE—For multi-channel operation, the signal phase of each BCU might be uncorrelated.

The symbol clock frequency tolerance shall be maximum ±25 ppm. The transmit center frequency and the symbol clock frequency for all transmit antennas and contiguous BCUs shall be derived from the same reference oscillator.

22.3.17.4 Modulation accuracy

22.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are defined in 22.3.17.4.2 (Transmit center frequency leakage) and 22.3.17.4.3 (Transmitter constellation error). The test method is described in 21.3.17.4.4 (Transmitter modulation accuracy (EVM) test).

22.3.17.4.2 Transmit center frequency leakage

For transmissions using all formats except noncontiguous where the RF LO falls outside both BCUs, TX LO leakage shall meet the following requirements:

— When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW (6/144 or 8/144) MHz shall not exceed the average power per subcarrier of the transmitted PPDU, or equivalently $(P - 10\log 10(N_{ST}))$, where P is the transmit power per antenna in dBm and N_{ST} is defined in Table 22-8 (Timing-related parameters).

— When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW (6/144 or 8/144) MHz shall not exceed the maximum of –32 dB relative to the total transmit power and –20 dBm, or equivalently $max(P - 32, -20)$, where P is the transmit power per antenna in dBm and N_{ST} is defined in Table 22-8 (Timing-related parameters).

For transmissions using TVHT_MODE_2N and TVHT_MODE_4N, where the RF LO falls outside both BCUs, the RF LO shall follow the spectral mask requirements as defined in 22.3.17.1 (Transmit spectrum mask).

22.3.17.4.3 Transmitter constellation error

For all modes defined in TVHT PHY, the requirements for transmit constellation RMS error are same as defined in 21.3.17.4.3 (Transmitter constellation error).

For non-HT duplicate transmissions, requirements defined in 17.3.9.7.4 (Transmitter constellation error) apply to all parts of the channel bandwidth. The channel bandwidth is determined by the TXVECTOR parameter CH_BANDWIDTH.

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

22.3.17.4.4 Transmitter modulation accuracy (EVM) test

For the transmit modulation accuracy test, the same methodology as that defined in 21.3.17.4.4 (Transmitter modulation accuracy (EVM) test) shall be applied per BCU (termed frequency segment in Clause 21 (Very High Throughput (VHT) PHY specification)). The channel bandwidth is determined by the TXVECTOR parameter CH_BANDWIDTH.

22.3.17.5 Time of Departure accuracy

For Time of Departure accuracy test, the test parameters defined in 21.3.17.5 (Time of Departure accuracy) shall be used for evaluation of TOD except the channel bandwidth, TTR and TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH. The channel bandwidth is determined by TXVECTOR parameter CH_BANDWIDTH in 22.2.2 (TXVECTOR and RXVECTOR parameters). TTR and TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH shall be multiplied by the corresponding scaling factor for the 6 MHz, 7 MHz, and 8 MHz channels, where the scaling factor is defined in 22.3.8.2.1 (Cyclic shift definition for pre-TVHT modulated fields).

22.3.18 TVHT receiver specification

22.3.18.1 General

See 21.3.18 (VHT receiver specification).

22.3.18.2 Receiver minimum input sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 22-22 (Receiver minimum input level sensitivity). The test in this subclause and the minimum sensitivity levels specified in Table 22-22 (Receiver minimum input level sensitivity) apply only to non-STBC modes, long GI, BCC, and VHT PPDU in TVWS bands.

22.3.18.3 Adjacent channel rejection

Adjacent channel rejection for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C follow the definition in the first paragraph of 21.3.18.2 (Adjacent channel rejection) and use the values in Table 22-23 (Minimum required adjacent and nonadjacent channel rejection levels).

Adjacent channel rejection for TVHT_MODE_2N (TVHT_W+W) and TVHT_MODE_4N (TVWT_2W+2W) follows the definition in the second paragraph of 21.3.18.2 (Adjacent channel rejection), where “80 MHz” is replaced by “TVHT_W” for TVHT_MODE_2N and “TVHT_2W” for TVHT_MODE_4N, and uses the values in Table 22-23 (Minimum required adjacent and nonadjacent channel rejection levels).

The definitions in the rest of 21.3.18.2 (Adjacent channel rejection) apply to Clause 22 (Television Very High Throughput (TVHT) PHY specification) using the values in Table 22-23 (Minimum required adjacent and nonadjacent channel rejection levels).

22.3.18.4 Nonadjacent channel rejection

Nonadjacent channel rejection for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C channels follows the definition in the first paragraph of 21.3.18.3 (Nonadjacent channel rejection) and use the values in Table 22-23 (Minimum required adjacent and nonadjacent channel rejection levels).

Nonadjacent channel rejection for TVHT_MODE_2N (TVHT_W+W) and TVHT_MODE_4N (TVWT_2W+2W) follows the definition in the second paragraph of 21.3.18.3 (Nonadjacent channel

256-QAM	3/4	–65	–62	–59	–64	–61	–58
256-QAM	5/6	–63	–60	–57	–62	–59	–56

rejection), where “80 MHz” is replaced by “TVHT_W” for TVHT_MODE_2N and “TVHT_2W” for TVHT_MODE_4N, and uses the values in Table 22-23 (Minimum required adjacent and nonadjacent channel rejection levels).

The definitions in the rest of 21.3.18.3 (Nonadjacent channel rejection) apply to Clause 22 (Television Very High Throughput (TVHT) PHY specification) using the values in Table 22-23 (Minimum required adjacent and nonadjacent channel rejection levels).

22.3.18.5 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –20 dBm, measured at each antenna for any baseband TVHT modulation.

22.3.18.6 CCA sensitivity

22.3.18.6.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

22.3.18.6.2 CCA sensitivity for operating classes requiring CCA-ED

For the operating classes requiring CCA-Energy Detect (CCA-ED), the PHY shall also indicate a medium busy condition when CCA-ED detects a channel busy condition.

For improved spectrum sharing, CCA-ED is required in some bands. The behavior class indicating CCA-ED is given in Table D-2 (Behavior limits). The operating classes requiring the corresponding CCA-ED

behavior class are given in E.1 (Country information and operating classes). The PHY of a STA that is operating within an operating class that requires CCA-ED shall operate with CCA-ED.

CCA-ED shall detect a channel busy condition when the received signal strength exceeds the CCA-ED threshold as given by dot11OFDMEDThreshold for the primary TVHT_W channel, dot11OFDMEDThreshold for the secondary TVHT_W channel (if present) and dot11OFDMEDThreshold + 3 dB for the secondary TVHT_2W channel (if present). The CCA-ED thresholds for the operating classes requiring CCA-ED are subject to the criteria in D.2.5 (CCA-ED threshold).

NOTE—The requirement to detect a channel busy condition as stated in 22.3.18.6.3 (CCA sensitivity for signals occupying the primary channel) and 22.3.18.6.4 (CCA sensitivity for signals not occupying the primary channel) is a mandatory energy detect requirement on all Clause 22 (Television Very High Throughput (TVHT) PHY specification) receivers. Support for CCA-ED is an additional requirement that relates specifically to the sensitivities described in D.2.5.

22.3.18.6.3 CCA sensitivity for signals occupying the primary channel

The PHY shall issue a PHY-CCA.indication(BUSY, {primary}) primitive if one of the conditions listed in Table 22-24 (Conditions for CCA BUSY on the primary channel) is met in an otherwise idle TVHT_W (TVHT_MODE_1), TVHT_2W (TVHT_MODE_2C), TVHT_4W (TVHT_MODE_4C), TVHT_W+W

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

(TVHT_MODE_2N), and TVHT_2W+2W (TVHT_MODE_4N) operating channel width. With >90% probability, the PHY shall detect the start of a PPDU that occupies at least the primary TVHT_W channel under the conditions listed in Table 22-24 (Conditions for CCA BUSY on the primary channel) within a period of aCCATime (see 22.4.4 (TVHT PHY)) and hold the CCA signal busy (PHY-CCA.indication(BUSY, channel-list)) for the duration of the PPDU.

Table 22-24—Conditions for CCA BUSY on the primary channel

Frequency segment width	Conditions
6 MHz	The start of a 6 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 6 MHz channel at or above –88 dBm.
7 MHz	The start of a 7 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 7 MHz channel at or above –88 dBm.
8 MHz	The start of a 8 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 8 MHz channel at or above –87 dBm.

The receiver shall issue a PHY-CCA.indication(BUSY, {primary}) primitive for any signal that exceeds a threshold equal to 20 dB above the minimum modulation and coding rate sensitivity (–88 + 20 = –68 dBm in the case of 6 MHz channel) in the primary TVHT_W channel within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the receiver shall not issue a PHY-CCA.indication(BUSY,{secondary}), PHY-CCA.indication(BUSY,{secondaryTVHT_2W}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

22.3.18.6.4 CCA sensitivity for signals not occupying the primary channel

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) primitive are not present and one of the following conditions is present in an otherwise idle TVHT_2W (TVHT_MODE_2C), TVHT_4W (TVHT_MODE_4C), TVHT_W+W (TVHT_MODE_2N), and TVHT_2W+2W (TVHT_MODE_4N) operating channel width:

— Any signal within the secondary channel at or above a threshold (–68 dBm for 6 MHz, –68 dBm for 7 MHz, and –67 dBm for 8 MHz) within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondaryTVHT_2W}) or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A TVHT_W non-HT duplicate or VHT PPDU in TVWS bands detected in the secondary channel at or above a threshold (–81 dBm for 6 MHz, –81 dBm for 7 MHz, and –80 dBm for 8 MHz) with >90% probability within a period aCCAMidTime (see 22.4.4 (TVHT PHY)).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondaryTVHT_2W}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) primitive and a PHY-CCA.indication(BUSY, {secondary}) primitive are not present and one of the following conditions is present in an otherwise idle TVHT_4W (TVHT_MODE_4C) and TVHT_2W+2W (TVHT_MODE_4N) operating channel width:

— Any signal within the secondary TVHT_2W channel at or above a threshold (–65 dBm for 12 MHz, –65 dBm for 14 MHz, and –64 dBm for 16 MHz) within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A TVHT_2W non-HT duplicate or VHT PPDU in TVWS bands detected in the secondary TVHT_2W channel at or above a threshold (–78 dBm for 6+6 MHz, –78 dBm for 7+7 MHz, and

This is an unapproved IEEE Standards Draft, subject to change.

–77 dBm for 8+8 MHz or 16 MHz) with >90% probability within a period aCCAMidTime (see 22.4.4 (TVHT PHY)).

— A TVHT_W non-HT duplicate or VHT PPDU in TVWS bands detected in any TVHT_W subchannel of the secondary TVHT_2W channel at or above a threshold (–81 dBm for 6 MHz, –81 dBm for 7 MHz, and –80 dBm for 8 MHz) with >90% probability within a period aCCAMidTime.

22.3.18.7 RSSI

See 21.3.18.6 (RSSI) with “TVHT” replacing “VHT”.

22.3.19 PHY transmit procedure

See 21.3.19 (PHY transmit procedure) with “TVHT” replacing “VHT”.

22.3.20 PHY receive procedure

See 21.3.20 (PHY receive procedure) with “TVHT” replacing “VHT”.

22.4 TVHT PLME

22.4.1 PLME SAP sublayer management primitives

See 21.4.1 (PLME SAP sublayer management primitives) with “TVHT” replacing “VHT”.

22.4.2 PHY MIB

See 21.4.2 (PHY MIB) with “tvht(10)” replacing “vht(9)”, “TVHT” replacing “VHT”, and “In4W” replacing “In80” and with the removal of “dot11VHTShortGIOptionIn160and80p80Implemented” and “dot11VHTShortGIOptionIn160and80p80Activated”.

22.4.3 TXTIME and PSDU_LENGTH calculation

See 21.4.3 (TXTIME and PSDU_LENGTH calculation) with “TVHT” replacing “VHT”.

22.4.4 TVHT PHY

The static TVHT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 19-25 (HT PHY characteristics) except parameters listed in Table 22-25 (TVHT PHY characteristics) and aPreambleLength, aSTFOneLength, aSTFTwoLength, aLTFOneLength, aLTFTwoLength, aPHYHeaderLength, and aPHYSigTwoLength, which are multiplied by 7.5 for 6 MHz and 7 MHz unit channels and by 5.625 for 8 MHz unit channels. The definitions for these characteristics are given in 6.5 (PLME SAP interface).

22.5 Parameters for TVHT MCSs

The rate-dependent parameters for one BCU mode (6 MHz, 7 MHz, and/or 8 MHz) and corresponding two and four BCU modes with N_{SS} = 1, …, 4 are given in Table 22-26 (TVHT MCSs for TVHT_MODE_1, NSS = 1) through Table 22-37 (TVHT MCSs for TVHT_MODE_4C and TVHT_MODE_4N, NSS = 4). Support for MCS 8 and 9 (when valid) is optional in all cases. A TVHT STA shall support single spatial stream MCSs within the range MCS 0 to MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Data Rate subfield values in the TVHT Supported MCS Set

Table 22-25—TVHT PHY characteristics

Characteristics	Value
aSlotTime	24 μs (BCUs: 6 MHz or 7 MHz) plus any coverage-class-dependent aAirPropagationTime (see Table 9-79 (Coverage Class field parameters)) 20 μs (BCUs: 8 MHz) plus any coverage-class-dependent aAirPropagationTime (see Table 9-79 (Coverage Class field parameters))
aSIFSTime	120 μs (BCUs: 6 MHz or 7 MHz) 90 μs (BCUs: 8 MHz)
aSignalExtension	0 μs
aCCATime	< 15 μs (6 MHz or 7 MHz) < 11.25 μs (8 MHz)
aCCAMidTime	< 94 μs (6 MHz or 7 MHz) < 70 μs (8 MHz)
aAirPropagationTime	As indicated by the coverage class (see 10.21.5 (Operation with coverage classes))
aPPDUMaxTime	20 ms
aPSDUMaxLength	1 401 120 octets (see NOTE 1)
aRxPHYStartDelay	(36 + 4 × the maximum possible value for $N_{VHT\text{-}LTF}$ supported + 4) × 7.5 (6 and 7 MHz channels) or 5.625 (8 MHz channels) (see NOTE 2)
NOTE 1—This is the maximum length in octets for SU PPDUs with a bandwidth of 32 MHz or 16+16 MHz, MCS9 and 4 spatial streams, limited by 973 possible Short GI data symbols in aPPDUMaxTime. NOTE 2—This value arises from the time to the end of TVHT-SIG-B (see Figure 22-1 (VHT PPDU format in TVWS bands)) plus the need to decode the first symbol of the Data field in order to extract the SERVICE field and check the CRC it contains.	

field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Data Rate subfield values in the TVHT Supported MCS Set field may result in a reduced MCS range (cut-off) for $N_{SS} = 2, \ldots, 4$. Support for 6 MHz, 7 MHz, or 8 MHz with $N_{SS} = 1$ is mandatory. Support for 6 MHz, 7 MHz, and 8 MHz with $N_{SS} = 2, \ldots, 4$ is optional. Support for two BCU modes with 12 MHz, 14 MHz, and 16 MHz or with 6+6 MHz, 7+7 MHz, and 8+8 MHz with $N_{SS} = 1, \ldots, 4$ is optional. Support for four BCU modes with 24 MHz, 28 MHz, and 32 MHz or with 12+12 MHz, 14+14 MHz, and 16+16 MHz with $N_{SS} = 1, \ldots, 4$ is optional. N_{ES} values were chosen to yield an integer number of punctured blocks per OFDM symbol. Note that N_{ES} values are 1 for all Clause 22 (Television Very High Throughput (TVHT) PHY specification) modulations.

Table 22-26 (TVHT MCSs for TVHT_MODE_1, NSS = 1) through Table 22-37 (TVHT MCSs for TVHT_MODE_4C and TVHT_MODE_4N, NSS = 4) define TVHT MCSs not only for SU transmission but also for user *u* of MU transmission. In the case of TVHT MCSs for MU transmission, the parameters, N_{SS}, R, N_{BPSCS}, N_{CBPS}, and N_{DBPS} are replaced with $N_{SS,u}$, R_u, $N_{BPSCS,u}$, $N_{CBPS,u}$, and $N_{DBPS,u}$, respectively.

In the MCS parameter tables that follow, data rates for a 400 ns GI are rounded to 1 decimal place.

Annex B

(normative)

Protocol Implementation Conformance Statement (PICS) proforma

B.1 Introduction

Editor's Note: Any occurrences of <year> throughout this clause will be replaced by the year of publication by the IEEE-SA publication editor.

The supplier of a protocol implementation that is claimed to comply with IEEE Std 802.11-<year> shall complete the following protocol implementation conformance statement (PICS) proforma.

A completed PICS proforma is the PICS for the implementation in question. The PICS is a statement of which capabilities and options of the protocol have been implemented. This annex might not be compatible with operation in any Regulatory Domain or describe combinations of usable features in any Regulatory Domain. The PICS has a number of uses, including use:

a) By the protocol implementer, as a checklist to reduce the risk of failure to comply with the standard through oversight;

b) By the supplier and acquirer, or potential acquirer, of the implementation, as a detailed indication of the capabilities of the implementation, stated relative to the common basis for understanding provided by the standard PICS proforma;

c) By the user, or potential user, of the implementation, as a basis for initially checking the possibility of interworking with another implementation (note that, while interworking is not guaranteed, failure to interwork can often be predicted from incompatible PICS proformas);

d) By a protocol tester, as the basis for selecting appropriate tests against which to assess the claim for compliance of the implementation.

B.2 Abbreviations and special symbols

B.2.1 Symbols for Status column

M mandatory
O optional
O.<n> optional — Support of at least one of the group of options labeled by the same numeral <n> is required. The scope of the group of options is limited to a single table (i.e., subclause) within the PICS.
pred: predicate identification

B.2.2 General abbreviations for Item and Support columns

N/A	not applicable
AD	address function
AVT	audio video transport
CF	implementation under test (IUT) configuration
DMG-M	directional multi-gigabit (DMG) medium access control (MAC) features

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

DMG-P	directional multi-gigabit (DMG) physical layer (PHY) features
DS	direct sequence
DSE	dynamic station enablement
ERP	extended rate physical layer (PHY)
FR	frame reception
FS	frame exchange sequence
FT	frame transmission
HRDS	high rate direct sequence
HTM	high throughput (HT) medium access control (MAC) features
HTP	high throughput (HT) physical layer (PHY) features
HWM	hybrid wireless mesh protocol (HWMP) path selection protocol capability
IW	interworking with external networks
MD	multidomain
MP	mesh protocol
OC	operating classes
OF	orthogonal frequency division multiplexing (OFDM)
PC	protocol capability
RM	radio management
QB	quality-of-service (QoS) base functionality
QD	quality-of-service (QoS) enhanced distributed channel access (EDCA)
QMF	quality-of-service Management frame
QP	quality-of-service (QoS) hybrid coordination function (HCF) controlled channel access (HCCA)
SM	spectrum management
TDLS	tunneled direct-link setup
TVHTM	television very high throughput medium access control (MAC) features
TVHTP	television very high throughput physical layer (PHY) features
TVWS	television white spaces
VHTM	Very High Throughput MAC
VHTP	Very High Throughput PHY
WNM	wireless network management
WS	white spaces

B.3 Instructions for completing the PICS proforma

B.3.1 General structure of the PICS proforma

The first parts of the PICS proforma, Implementation identification and Protocol summary, are to be completed as indicated with the information necessary to identify fully both the supplier and the implementation.

The main part of the PICS proforma is a fixed questionnaire, divided into subclauses, each containing a number of individual items. Answers to the questionnaire items are to be provided in the rightmost column, either by simply marking an answer to indicate a restricted choice (usually Yes or No) or by entering a value or a set or a range of values. (Note that there are some items where two or more choices from a set of possible answers may apply. All relevant choices are to be marked in these cases.)

Each item is identified by an item reference in the first column. The second column contains the question to be answered. The third column contains the reference or references to the material that specifies the item in the main body of this standard. The remaining columns record the status of each item, i.e., whether support is mandatory, optional, or conditional, and provide the space for the answers (see also B.3.4 (Conditional status)). Marking an item as supported is to be interpreted as a statement that all relevant requirements of the

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

subclauses and normative annexes, cited in the References column for the item, are met by the implementation.

A supplier may also provide, or be required to provide, further information, categorized as either Additional Information or Exception Information. When present, each kind of further information is to be provided in a further subclause of items labeled A<*I*> or X<*I*>, respectively, for cross-referencing purposes, where <*I*> is any unambiguous identification for the item (e.g., simply a numeral). There are no other restrictions on its format or presentation.

A completed PICS proforma, including any Additional Information and Exception Information, is the PICS for the implementation in question.

NOTE—Where an implementation is capable of being configured in more than one way, a single PICS might be able to describe all such configurations. However, the supplier has the choice of providing more than one PICS, each covering some subset of the implementation's capabilities, if this makes for easier and clearer presentation of the information.

B.3.2 Additional information

Items of Additional Information allow a supplier to provide further information intended to assist in the interpretation of the PICS. It is not intended or expected that a large quantity of information will be supplied, and a PICS can be considered complete without any such information. Examples of such Additional Information might be an outline of the ways in which an (single) implementation can be set up to operate in a variety of environments and configurations, or information about aspects of the implementation that are outside the scope of this standard but have a bearing upon the answers to some items.

References to items of Additional Information may be entered next to any answer in the questionnaire, and may be included in items of Exception Information.

B.3.3 Exception information

It may happen occasionally that a supplier wishes to answer an item with mandatory status (after any conditions have been applied) in a way that conflicts with the indicated requirement. No preprinted answer is found in the Support column for this. Instead, the supplier shall write the missing answer into the Support column, together with an X<*I*> reference to an item of Exception Information, and shall provide the appropriate rationale in the Exception Information item itself.

An implementation for which an Exception Information item is required in this way does not comply with this standard.

NOTE—A possible reason for the situation described above is that a defect in this standard has been reported, a correction for which is expected to change the requirement not met by the implementation.

B.3.4 Conditional status

The PICS proforma contains a number of conditional items. These are items for which both the applicability of the item itself, and its status if it does apply, mandatory or optional, are dependent upon whether certain other items are supported.

Where a group of items is subject to the same condition for applicability, a separate preliminary question about the condition appears at the head of the group, with an instruction to skip to a later point in the questionnaire if the N/A answer is selected. Otherwise, individual conditional items are indicated by a conditional symbol in the Status column.

This is an unapproved IEEE Standards Draft, subject to change.

A conditional symbol is of the form "<pred>:<S>" or "O" (or "O.<n>"), where "<pred>" is a predicate as described below, and "<S>" is one of the status symbols "M" or "O" (or "O.<n>").

If the value of a predicate is true, the conditional symbol is applicable, and yields the status given by S. If any applicable conditional symbol yields mandatory status, the conditional item has mandatory status. Otherwise, if any applicable conditional symbol (including one of the form "O" (or "O.<n>")) yields optional status, the conditional item has optional status. In either case, the support column is to be completed in the usual way. If no conditional symbol is applicable, the conditional item is not relevant and the N/A answer is to be marked.

A predicate is one of the following:

a) An item-reference for an item in the PICS proforma: the value of the predicate is true if the item is marked as supported, and is false otherwise.

b) An expression constructed by combining item-references using the boolean operators (in decreasing order of precedence) "NOT", "AND", and "OR", with or without the use of parenthetical groupings: the value of the predicate is true if the expression evaluates to true and is false otherwise.

NOTE—If optional feature F1 requires features F2 and F3, this can be represented in the PICS in one of two ways:

— The status for conditional items F2 and F3 is "F1:M" and the status for conditional item F1 is "O", or

— The status for conditional item F1 is "F2 AND F3:O".

If feature F1 is required if feature F2 or F3 is supported, and is optional otherwise, this can be represented in the PICS in one way:

— The status for conditional item F1 is "F2 OR F3:M" and "O".

If feature F1 is required if feature F2 or F3 is supported, and is not relevant otherwise, this can be represented in the PICS in one way:

— The status for conditional item F1 is "F2 OR F3:M".

If feature F1 is required if feature F2 is supported, is optional if feature F3 is supported, and is not relevant otherwise, this can be represented in the PICS in one way:

— The status for conditional item F1 is "F2:M" and "F3:O".

Conditional symbols can be given in any order.

Each item referenced in a predicate, or in a preliminary question for grouped conditional items, is indicated by an asterisk in the Item column.

B.4 PICS proforma—IEEE Std 802.11-<year>[64]

B.4.1 Implementation identification

Supplier	
Contact point for queries about the PICS	
Implementation Name(s) and Version(s)	
Other information necessary for full identification, e.g., name(s) and version(s) of the machines and/or operating systems(s), system names	

NOTE 1—Only the first three items are required for all implementations. Other information might be completed as appropriate in meeting the requirement for full identification.

NOTE 2—The terms Name and Version need to be interpreted appropriately to correspond with a supplier's terminology (e.g., Type, Series, Model).

B.4.2 Protocol summary

Identification of protocol standard	IEEE Std 802.11-<year>
Identification of amendments and corrigenda to this PICS proforma that have been completed as part of this PICS	Amd. : Corr. : Amd. : Corr. :
Have any exception items been required? (See B.3.3 (Exception information); the answer Yes means that the implementation does not comply with IEEE Std 802.11-<year>.)	Yes ☐ No ☐

Date of statement (yyyy-mm-dd)	

[64]*Copyright release for PICS proforma:* Users of this standard may freely reproduce the PICS proforma in this annex so that it can be used for its intended purpose and may further publish the completed PICS.

B.4.4 MAC protocol

B.4.4.1 MAC protocol capabilities

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol capabilities supported?			
PC1	Authentication service	4.5.4.2 (Authentication), 4.5.4.3 (Deauthentication), 11.21 (STAs communicating Data frames outside the context of a BSS), 12.2 (Framework)	CFInfraSTA AND not CFDMG:M CFIBSS OR CFDMG:M	Yes ☐ No ☐ N/A ☐
PC1.1	Authentication state	11.3 (STA authentication and association)	PC1:M	Yes ☐ No ☐
PC1.2	Open System authentication	12.2.2 (Security methods)	PC1 AND not CFDMG:M	Yes ☐ No ☐
PC1.3	Shared Key authentication	12.2.3 (RSNA STA capabilities), 12.5 (RSNA confidentiality and integrity protocols)	PC2:M	Yes ☐ No ☐ N/A ☐
* PC2	Wired equivalent privacy (WEP) algorithm This capability is deprecated (applicable only to systems that are backward compatible).	4.5.4.4 (Data confidentiality), 12.3.2 (Wired equivalent privacy (WEP))	O	Yes ☐ No ☐
PC2.1	WEP encryption procedure	12.3.2 (Wired equivalent privacy (WEP))	PC2:M	Yes ☐ No ☐ N/A ☐
PC2.2	WEP decryption procedure	12.3.2 (Wired equivalent privacy (WEP))	PC2:M	Yes ☐ No ☐ N/A ☐
PC3	Distributed coordination function (DCF)	10.2 (MAC architecture), 10.3 (DCF)	M	Yes ☐ No ☐
PC3.1	Network allocation vector (NAV) function	10.3.2.1 (CS mechanism), 10.3.4 (DCF access procedure), 10.4.3.3 (NAV operation during the CFP)	M	Yes ☐ No ☐

B.4.4.1 MAC protocol capabilities *(continued)*

Item	Protocol capability	References	Status	Support
PC3.2	Interframe space usage and timing	10.3.2.3 (IFS), 10.3.4 (DCF access procedure), 10.3.7 (DCF timing relations)	M	Yes ☐ No ☐
PC3.3	Random Backoff function	10.3.3 (Random backoff time)	M	Yes ☐ No ☐
PC3.4	DCF Access procedure	10.3.4.2 (Basic access), 10.3.4.5 (Control of the channel)	M	Yes ☐ No ☐
PC3.5	Random Backoff procedure	10.3.4.3 (Backoff procedure for DCF)	M	Yes ☐ No ☐
PC3.6	Recovery procedures and retransmit limits	10.3.4.4 (Recovery procedures and retransmit limits)	M	Yes ☐ No ☐
PC3.7	Request to send (RTS)/clear to send (CTS) procedure	10.3.2.4 (Setting and resetting the NAV), 10.3.2.5 (RTS/CTS with fragmentation), 10.3.2.7 (CTS and DMG CTS procedure)	M	Yes ☐ No ☐
PC3.8	Individually addressed MAC protocol data unit (MPDU) transfer	10.3.5 (Individually addressed MPDU transfer procedure)	M	Yes ☐ No ☐
PC3.9	Group addressed MPDU transfer	10.3.6 (Group addressed MPDU transfer procedure)	M	Yes ☐ No ☐
PC3.10	MAC-level acknowledgment	10.3.2.2 (MAC-Level Acknowledgments), 10.3.2.9 (Acknowledgment procedure)	M	Yes ☐ No ☐
PC3.11	Duplicate detection and recovery	10.3.2.11 (Duplicate detection and recovery)	M	Yes ☐ No ☐
PC3.12	Dynamic EIFS	10.3.7 (DCF timing relations)	O	Yes ☐ No ☐
* PC4	Point coordinator The PCF mechanism is obsolete. Consequently, this option may be removed in a later revision of the standard.	10.2 (MAC architecture), 10.4 (PCF)	not CFDMG AND CFAP:O	Yes ☐ No ☐ N/A ☐

B.4.4.3 Frame exchange sequences

Item	Frame exchange sequence	References	Status	Support
	Are the following frame exchange sequences supported?			
FS1	Basic frame exchange sequences	10.3.2.5 (RTS/CTS with fragmentation), 10.3.2.7 (CTS and DMG CTS procedure), 10.3.2.9 (Acknowledgment procedure), 10.3.5 (Individually addressed MPDU transfer procedure), 10.3.6 (Group addressed MPDU transfer procedure), 10.4.3 (PCF access procedure)	M	Yes ☐ No ☐
FS2	CF-frame exchange sequences	10.4.3 (PCF access procedure), 10.4.4 (PCF transfer procedure)	(PC4 OR PC5):M	Yes ☐ No ☐ N/A ☐

B.4.4.4 MAC addressing functions

Item	MAC Address function	References	Status	Support
	Are the following MAC Addressing functions supported?			
AD1	STA universal individual IEEE 802 address	9.2.4.3 (Address fields)	M	Yes ☐ No ☐
AD2	BSS identification (BSSID) generation	9.2.4.3 (Address fields), 11.1.4 (Acquiring synchronization, scanning)	M	Yes ☐ No ☐
AD3	Receive address matching	9.2.4.3 (Address fields), 9.3.2.1 (Format of Data frames)	M	Yes ☐ No ☐
AD4	Wildcard BSSID	9.2.4.3.4 (BSSID field), 9.3.2 (Data frames)	CFOCB:M	Yes ☐ No ☐ N/A ☐
AD5	MAC and PHY operation resumes with appropriate MIB attributes in less than 2 TU	11.21 (STAs communicating Data frames outside the context of a BSS)	CFOCB:M	Yes ☐ No ☐ N/A ☐

B.4.4.4 MAC addressing functions

Item	MAC Address function	References	Status	Support
AD6	Group addressed mesh Data frame addressing (3 address frame)	9.2.3 (General frame format), 9.2.4.1 (Frame Control field), 9.2.4.3 (Address fields), 9.3.5 (Frame addressing in an MBSS)	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD7	Individually addressed mesh Data frame addressing (4 address frame)	9.2.3 (General frame format), 9.2.4.1 (Frame Control field), 9.2.4.3 (Address fields), 9.3.5 (Frame addressing in an MBSS)	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD8	Proxied group addressed mesh Data frame addressing (4 address frame)	9.2.3 (General frame format), 9.2.4.1 (Frame Control field), 9.2.4.3 (Address fields), 9.2.4.7.3 (Mesh Control field), 9.3.5 (Frame addressing in an MBSS)	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD9	Proxied individually addressed mesh Data frame addressing (6 address frame)	9.2.3 (General frame format), 9.2.4.1 (Frame Control field), 9.2.4.3 (Address fields), 9.2.4.7.3 (Mesh Control field), 9.3.5 (Frame addressing in an MBSS)	CFMBSS:M	Yes ☐ No ☐ N/A ☐

B.4.4.4 MAC addressing functions

Item	MAC Address function	References	Status	Support
AD10	Multihop Action frame addressing (4 address frame)	9.2.3 (General frame format), 9.2.4.1 (Frame Control field), 9.2.4.3 (Address fields), 9.2.4.7.3 (Mesh Control field), 9.6.18 (Multihop Action frame details), 9.3.5 (Frame addressing in an MBSS)	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD11	TA filtering for mesh STA	9.2.4.3 (Address fields), 9.3.2.1 (Format of Data frames), 9.3.5 (Frame addressing in an MBSS)	CFMBSS:M	Yes ☐ No ☐ N/A ☐

B.4.5 Direct sequence PHY functions

Item	PHY feature	References	Status	Support
	PHY sublayer procedures	15.3 (DSSS PHY)		
DS1	Preamble prepend on transmit (TX)	15.3.1 (Overview)	M	Yes ☐ No ☐
DS1.1	PHY frame format	15.3.2 (PPDU format), 15.3.3 (PHY field definitions)	M	Yes ☐ No ☐
DS1.2	PHY integrity check generation	15.3.3 (PHY field definitions), 15.3.3.7 (PHY CRC field)	M	Yes ☐ No ☐
DS1.3	TX rate change capability	15.2.3.4 (RXVECTOR SIGNAL), 15.3.5 (PHY data modulation and modulation rate change)	M	Yes ☐ No ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.5 Direct sequence PHY functions *(continued)*

Item	PHY feature	References	Status	Support
DS1.4	Supported data rates	15.1 (Overview), 15.2.3.4 (RXVECTOR SIGNAL)	M	Yes ☐ No ☐
DS1.5	Data whitener scrambler	15.3.4 (PHY/ DSSS PHY data scrambler and descrambler)	M	Yes ☐ No ☐
DS1.6	Scrambler initialization	15.3.4 (PHY/ DSSS PHY data scrambler and descrambler)	M	Yes ☐ No ☐
DS2	Preamble process on receive (RX)	15.3.1 (Overview)		
DS2.1	PHY frame format	15.3.2 (PPDU format), 15.3.3 (PHY field definitions)	M	Yes ☐ No ☐
DS2.2	PHY integrity check verify	15.3.3 (PHY field definitions), 15.3.3.7 (PHY CRC field)	M	Yes ☐ No ☐
DS2.3	RX Rate change capability	15.2.3.4 (RXVECTOR SIGNAL), 15.3.5 (PHY data modulation and modulation rate change)	M	Yes ☐ No ☐
DS2.4	Data whitener descrambler	15.3.4 (PHY/ DSSS PHY data scrambler and descrambler)	M	Yes ☐ No ☐
DS3	Pseudonoise (PN) code sequence	15.4.4.4 (Spreading sequence)	M	Yes ☐ No ☐
DS4	Chipping continue on power-down	15.3.6 (Transmit PHY)	O	Yes ☐ No ☐
*DS5	Operating channel capability	15.3.6 (Transmit PHY), 15.4.4.3 (Channel Numbering of operating channels)		
* DS5.1	North America (FCC)	15.3.6 (Transmit PHY), 15.4.4.3 (Channel Numbering of operating channels)	DS5:O.1	Yes ☐ No ☐ N/A ☐

B.4.12 QoS base functionality

Item	Protocol capability	References	Status	Support
QB1	QoS frame format			
QB1.1	QoS frame format	9.3.1.2 (RTS frame format)–9.3.1.4 (Ack frame format), 9.3.2.1 (Format of Data frames), 9.3.3.3 (Beacon frame format), 9.3.3.6 (Association Request frame format)–9.3.3.9 (Reassociation Response frame format), 9.3.3.11 (Probe Response frame format), 9.3.3.14 (Action frame format)	not CFDMG AND CFQoS:M	Yes ☐ No ☐ N/A ☐
QB1.2	QoS frame format	9.3.1.2 (RTS frame format), 9.3.1.4 (Ack frame format), 9.3.1.8 (BlockAckReq frame format), 9.3.1.9 (BlockAck frame format), 9.3.1.11 (Poll frame format)–9.3.1.19 (Grant Ack frame format), 9.3.2.1 (Format of Data frames), 9.3.4.2 (DMG Beacon), 9.3.3.6 (Association Request frame format)–9.3.3.9 (Reassociation Response frame format), 9.3.3.11 (Probe Response frame format), 9.3.3.14 (Action frame format)	CFDMG:M	Yes ☐ No ☐ N/A ☐
QB2	Per traffic identifier (TID) duplicate detection	9.2.4.4 (Sequence Control field), 9.2.4.5 (QoS Control field), 10.3.2.11 (Duplicate detection and recovery)	CFQoS OR CFDMG:M	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.12 QoS base functionality *(continued)*

Item	Protocol capability	References	Status	Support
QB3	Decode of no-acknowledgment policy in QoS Data frames	9.2.4.5.4 (Ack Policy subfield), 10.22.2.7 (Multiple frame transmission in an EDCA TXOP), 10.22.2.11 (Retransmit procedures), 10.22.4.2 (Contention based admission control procedures), 10.22.4.3 (Controlled-access admission control)	CFQoS OR CFDMG:M	Yes ☐ No ☐ N/A ☐
QB4	Block acknowledgments (block ack)			
QB4.1	Immediate block ack Non-HT block ack is obsolete. Support for this mechanism might be removed in a later revision of the standard.	9.3.1.8.1 (Overview), 9.3.1.8.2 (Basic BlockAckReq variant), 9.3.1.9.1 (Overview), 9.3.1.9.2 (Basic BlockAck variant), 9.6.5 (Block Ack Action frame details), 10.24 (Block acknowledgment (block ack)) (except 10.24.7 (HT-immediate block ack extensions) and 10.24.8 (HT-delayed block ack extensions)), 11.5 (Block ack operation)	CFQoS:O CFHT OR CFDMG OR CFTVHT:M	Yes ☐ No ☐ N/A ☐

B.4.13 QoS enhanced distributed channel access (EDCA)

Item	Protocol capability	References	Status	Support
QD1	Support for four transmit queues with a separate channel access entity associated with each	10.2.4.2 (HCF contention based channel access (EDCA)), 10.22.2.1 (Reference model)	not CFDMG AND CFQoS:M	Yes ☐ No ☐ N/A ☐
QD2	Per-channel access function differentiated channel access	10.22.2.2 (EDCA backoff procedure), 10.22.2.4 (Obtaining an EDCA TXOP), 10.22.2.11 (Retransmit procedures)	not CFDMG AND CFQoS:M	Yes ☐ No ☐ N/A ☐
QD3	Multiple frame transmission support	10.22.2.7 (Multiple frame transmission in an EDCA TXOP)	CFQoS OR CFDMG:O	Yes ☐ No ☐ N/A ☐
QD4	Maintenance of within-queue ordering, exhaustive retransmission when sending non-QoS Data frames	10.22.2.11 (Retransmit procedures)	CFQoS OR CFDMG:M	Yes ☐ No ☐ N/A ☐
QD5	Interpretation of admission control mandatory (ACM) bit in EDCA Parameter Set element	9.4.2.13 (Extended Supported Rates and BSS Membership Selectors element), 10.22.4.2 (Contention based admission control procedures)	(CFSTAofAP AND (CFQoS OR CFDMG)):M (CFPBSSnotPCP AND CFDMG):	Yes ☐ No ☐ N/A ☐
QD6	Contention based admission control	9.4.2.14 (Power Constraint element), 9.4.2.15 (Power Capability element), 9.6.3.2 (Basic and DMG ADDTS Request frame format)– 9.6.3.4 (DELTS frame format), 10.22.4.2 (Contention based admission control procedures), 11.4 (TS operation)	(CFAP AND (CFQoS OR CFDMG)):O (CFSTAofAP AND (CFQoS OR CFDMG)):O (CFPCP AND CFDMG):O (CFPBSSnotPCP AND CFDMG):O	Yes ☐ No ☐ N/A ☐
QD7	Power management in an infrastructure BSS or in an IBSS	11.2 (Power management)	(CFAP AND CFQoS):O (CFIndepSTA AND CFQoS):O	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.13 QoS enhanced distributed channel access (EDCA) *(continued)*

Item	Protocol capability	References	Status	Support
QD8	Default EDCA parameters for communications outside context of BSS	9.4.2.29 (EDCA Parameter Set element), 10.22.2.2 (EDCA backoff procedure)	CFOCB:M	Yes ☐ No ☐ N/A ☐
QD9	Duration/ID rules for QoS STA	9.2.5 (Duration/ID field (QoS STA))	CFQoS	Yes ☐ No ☐ N/A ☐

B.4.14 QoS hybrid coordination function (HCF) controlled channel access (HCCA)

Item	Protocol Capability	References	Status	Support
QP1	Traffic specification (TSPEC) and associated frame formats	9.6.3 (QoS Action frame details)	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP2	HCCA rules	10.2.4.3 (HCF controlled channel access (HCCA)), 10.22.3 (HCF controlled channel access (HCCA)), 10.22.3.2 (HCCA procedure)–10.22.3.5 (HCCA transfer rules)	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP3	HCCA schedule generation and management	10.22.4 (Admission Control at the HC)	(CFAP AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP4	HCF frame exchange sequences	10.4.3 (PCF access procedure), 10.22.2 (HCF contention based channel access (EDCA))	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP5	Traffic stream (TS) management	11.4 (TS operation)	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐

B.4.14 QoS hybrid coordination function (HCF) controlled channel access (HCCA) *(continued)*

Item	Protocol Capability	References	Status	Support
QP6	Minimum TSPEC parameter set	10.22.4 (Admission Control at the HC)	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP7	Power management in an infrastructure BSS	11.2.2.5 (Power management with APSD), 11.2.2.6 (AP operation during the CP), 11.2.2.7 (AP operation during the CFP), 11.2.2.8 (Receive operation for STAs in PS mode during the CP), 11.2.2.9 (Receive operation for STAs in PS mode during the CFP), 11.2.2.10 (Receive operation using APSD), 11.2.2.11 (STAs operating in the active mode)	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐

B.4.15 Radio Management extensions

Item	Protocol Capability	References	Status	Support
	Are the following Radio Measurement capabilities supported?			
RM1	Radio Measurement Capability	9.4.1.4 (Capability Information field)	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2	Action frame protocol for measurements	9.6 (Action frame format details)	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.1	Radio Measurement Request frame	9.6.7.2 (Radio Measurement Request frame format)	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.2	Radio Measurement Report frame	9.6.7.3 (Radio Measurement Report frame format)	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.3	Link Measurement Request frame	9.6.7.4 (Link Measurement Request frame format)	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.4	Link Measurement Report frame	9.6.7.5 (Link Measurement Report frame format)	CFRM:M	Yes ☐ No ☐ N/A ☐

B.4.15 Radio Management extensions *(continued)*

Item	Protocol Capability	References	Status	Support
RM2.4.1	Link Measurement Report frame	9.6.7.5 (Link Measurement Report frame format)	not CF DMG AND CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.4.2	Link Measurement Report frame	9.6.7.5 (Link Measurement Report frame format), 9.4.2.149 (Relay Transfer Parameter Set element), 9.4.2.150 (Quiet Period Request element), 10.39 (DMG link adaptation)	CFDMG AND CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.5	Neighbor Report Request			
RM2.5.1	Generate and transmit Neighbor Report Request	9.6.7.6 (Neighbor Report Request frame format)	(CFRM AND CFSTAofAP):M	Yes ☐ No ☐ N/A ☐
RM2.5.2	Receive and process Neighbor Report Request	9.6.7.6 (Neighbor Report Request frame format)	(CFRM AND CFAP):M	Yes ☐ No ☐ N/A ☐
RM2.6	Neighbor Report Response			
RM2.6.1	Generate and transmit Neighbor Report Response	9.4.2.37 (Neighbor Report element), 9.6.7.7 (Neighbor Report Response frame format)	(CFRM AND CFAP):M	Yes ☐ No ☐ N/A ☐
RM2.6.2	Receive and process Neighbor Report Response	9.4.2.37 (Neighbor Report element), 9.6.7.7 (Neighbor Report Response frame format)	(CFRM AND CFSTAofAP):M	Yes ☐ No ☐ N/A ☐
RM3	General protocol for requesting and reporting of measurements	9.4.2.21 (Measurement Request element), 9.4.2.22 (Measurement Report element), 11.11 (Radio measurement procedures), 11.11.6 (Requesting and reporting of measurements)	CFRM:M	Yes ☐ No ☐ N/A ☐

This is an unapproved IEEE Standards Draft, subject to change.

B.4.17.1 HT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
HTM1.3	Signaling of STA and BSS capabilities in Beacon, Probe Response, (Re)Association Response frames	9.3.3.3 (Beacon frame format), 9.3.3.7 (Association Response frame format), 9.3.3.9 (Reassociation Response frame format), 9.3.3.11 (Probe Response frame format), 9.4.2.56 (HT Capabilities element)	(CFHT AND CFAP):M (CFTVHT AND CFAP):M	Yes ☐ No ☐ N/A ☐
HTM2	Signaling of HT operation	9.4.2.57 (HT Operation element)	(CFHT AND CFAP):M (CFTVHT AND CFAP):M	Yes ☐ No ☐ N/A ☐
HTM3	MPDU aggregation			
HTM3.1	Reception of A-MPDU	9.4.2.56.3 (A-MPDU Parameters field), 10.13.2 (A-MPDU length limit rules), 12.5 (RSNA confidentiality and integrity protocols)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM3.2	A-MPDU format	9.7.1 (A-MPDU format)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM3.3	A-MPDU contents	9.7.3 (A-MPDU contents)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM3.4	A-MPDU frame exchange sequences	10.22.2.7 (Multiple frame transmission in an EDCA TXOP)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM3.5	Transmission of A-MPDU	9.4.2.56.3 (A-MPDU Parameters field), 12.5 (RSNA confidentiality and integrity protocols)	CFHT:O CFVHT:M	Yes ☐ No ☐ N/A ☐
HTM4	MSDU aggregation			

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.17.1 HT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
HTM4.1	Reception of A-MSDUs	9.2.4.5 (QoS Control field), 9.3.2.2 (Aggregate MSDU (A-MSDU) format)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM4.2	A-MSDU format	9.3.2.2 (Aggregate MSDU (A-MSDU) format)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM4.3	A-MSDU content	9.3.2.2 (Aggregate MSDU (A-MSDU) format)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM4.4	Transmission of A-MSDUs	9.2.4.5 (QoS Control field), 9.3.2.2 (Aggregate MSDU (A-MSDU) format)	CFHT:O	Yes ☐ No ☐ N/A ☐
HTM5	Block Ack			
HTM5.1	Block ack mechanism	9.3.1.8 (BlockAckReq frame format), 9.3.1.9 (BlockAck frame format), 9.4.1.14 (Block Ack Parameter Set field), 10.24 (Block acknowledgment (block ack)), 11.16 (20/40 MHz BSS operation)	CFHT:M CFTVHT:M	Yes ☐ No ☐ N/A ☐
HTM5.2	Use of compressed bitmap between HT STAs	9.3.1.9.3 (Compressed BlockAck variant), 10.24.6 (Selection of BlockAck and BlockAckReq variants)	CFHT:M CFTVHT:M	Yes ☐ No ☐ N/A ☐
HTM5.3	HT-immediate block ack extensions	10.24.7 (HT-immediate block ack extensions)	CFHT:M CFTVHT:M	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.17.1 HT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
HTM5.4	HT-delayed block ack extensions HT-delayed block ack is obsolete. Support for this mechanism might be removed in a later revision of the standard.	10.24.8 (HT-delayed block ack extensions)	CFHT AND QB4.2:O CFTVHT AND QB4.2:O	Yes ☐ No ☐ N/A ☐
HTM5.5	Multiple TID Block Ack	9.3.1.8.5 (Multi-TID BlockAckReq variant), 9.3.1.9.4 (Multi-TID BlockAck variant), 10.29.2.7 (PSMP acknowledgment rules)	PC37:M	Yes ☐ No ☐ N/A ☐
HTM6	Protection mechanisms for different HT PHY options			
HTM6.1	Protection of RIFS PPDUs in the presence of non-HT STAs	10.26.3.3 (RIFS protection)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM6.2	Protection of RIFS PPDUs in an IBSS	10.26.3.3 (RIFS protection)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM6.3	Protection of HT-greenfield PPDUs in the presence of non-HT STAs	10.26.3.1 (General)	HTP1.3:M	Yes ☐ No ☐ N/A ☐
HTM6.4	Protection of HT-greenfield PPDUs in an IBSS	10.26.3.1 (General)	CFHT:M	Yes ☐ No ☐ N/A ☐
*HTM7	L-SIG TXOP protection mechanism The L-SIG TXOP protection mechanism is obsolete. Consequently, the L-SIG TXOP protection mechanism might be removed in a later revision of this standard.	10.26.5 (L-SIG TXOP protection)	CFHT:O	Yes ☐ No ☐ N/A ☐
HTM7.1	Update NAV according to L-SIG	10.26.5.4 (L-SIG TXOP protection NAV update rule)	HTM7:M	Yes ☐ No ☐ N/A ☐
HTM8	Duration/ID rules for A-MPDU	9.7.3 (A-MPDU contents)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM9	Truncation of TXOP as TXOP holder	10.22.2.9 (Truncation of TXOP)	CFHT:O CFTVHT:O	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.17.1 HT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
HTM10	Reception of +HTC frames	9.2.4.1.10 (+HTC/Order subfield), 9.4.2.56.5 (HT Extended Capabilities field), 10.9 (HT Control field operation)	CFHT:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
*HTM11	Reverse direction (RD) aggregation exchanges	10.28 (Reverse direction protocol)	CFHT:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
HTM11.1	Constraints regarding responses	10.28.4 (Rules for RD responder)	HTM11:M	Yes ☐ No ☐ N/A ☐
HTM12	Link adaptation			
HTM12.1	Use of the HT Control field for link adaptation in immediate response exchange	9.2.4.6 (HT Control field), 9.3.3.15 (Action No Ack frame format), 10.31.2 (Link adaptation using the HT variant HT Control field)	CFHT:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
HTM12.2	Link adaptation using explicit feedback mechanism	9.3.3.15 (Action No Ack frame format), 10.32.3 (Explicit feedback beamforming)	CFHT:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
HTM13	Transmit beamforming			
*HTM13.1	Transmission of beamformed PPDUs	10.32 (Transmit beamforming)	CFHT:O	Yes ☐ No ☐ N/A ☐
*HTM13.2	Reception of beamformed PPDUs	10.32 (Transmit beamforming)	CFHT:O	Yes ☐ No ☐ N/A ☐
*HTM13.3	Initiate transmit beamforming frame exchange with implicit feedback	10.32.2 (HT transmit beamforming with implicit feedback)	HTM13.1:O	Yes ☐ No ☐ N/A ☐
HTM13.3.1	Reception of sounding PPDUs	10.32.2 (HT transmit beamforming with implicit feedback)	HTM13.3:M	Yes ☐ No ☐ N/A ☐

B.4.17.1 HT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
HTM14	Antenna selection (ASEL)	9.2.4.6 (HT Control field), 9.4.2.56.7 (ASEL Capability field), 9.6.12.9 (Antenna Selection Indices Feedback frame format), 10.33 (Antenna selection (ASEL))	CFHT:O	Yes ☐ No ☐ N/A ☐
*HTM15	Null data packet (NDP)	10.34 (Null data packet (NDP) sounding)	CFHT:O	Yes ☐ No ☐ N/A ☐
HTM16	Space-time block coding (STBC) support			
HTM16.1	STBC beacon transmission The use of the STBC beacon transmission mechanism is deprecated.	11.1.3.2 (Beacon generation in non-DMG infrastructure networks)	HTP2.11:O	Yes ☐ No ☐ N/A ☐
HTM16.2	Dual CTS protection The use of the dual CTS mechanism is deprecated.	10.3.2.8 (Dual CTS protection)	HTP2.11:O	Yes ☐ No ☐ N/A ☐
HTM17	SM power save support			
*HTM17.1	AP support for non-AP STA dynamic and static SM power save mode	11.2.5 (SM power save)	(CFHT AND CFAP):M (CFTVHT AND CFAP):M	Yes ☐ No ☐ N/A ☐
*HTM17.2	STA support for localdynamic and static SM power save mode	11.2.5 (SM power save)	(CFHT AND CFIndepSTA): O (CFTVHT AND CFIndepSTA): O	Yes ☐ No ☐ N/A ☐
HTM17.3	Transmit SM power save state information using HT Capabilities element, or SM Power Save frame	9.6.12.3 (SM Power Save frame format), 11.2.5 (SM power save)	HTM17.2:M	Yes ☐ No ☐ N/A ☐
HTM17.4	Receive SM power save state information and support frame exchanges with STAs in SM power save mode	11.2.5 (SM power save)	HTM17.1:M	Yes ☐ No ☐ N/A ☐
HTM18	Mechanisms for coexistence of 20 MHz and 40 MHz channels	11.16 (20/40 MHz BSS operation)	CFHT:M	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.17.1 HT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
HTM19	Channel selection methods for 20/40 MHz operation	11.16.3 (Channel scanning and selection methods for 20/40 MHz operation)	(HTP2.3.4 AND CFAP):M	Yes ☐ No ☐ N/A ☐
HTM20	20/40 MHz operation	11.16 (20/40 MHz BSS operation)	HTP2.3.4:M	Yes ☐ No ☐ N/A ☐
HTM21	Phased coexistence operation (PCO) The PCO mechanism is obsolete. Consequently, the PCO mechanism might be removed in a later revision of this standard.			
*HTM21.1	PCO capability at AP	11.17 (Phased coexistence operation (PCO))	(CFHT AND CFAP):O	Yes ☐ No ☐ N/A ☐
HTM21.1.1	Rules for operation at a PCO active AP	9.6.12.5 (Set PCO Phase frame format), 11.17.2 (Operation at a PCO active AP)	HTM21.1:M	Yes ☐ No ☐ N/A ☐
*HTM21.2	STA support for PCO mode	11.17 (Phased coexistence operation (PCO))	(CFHT AND CFIndepSTA): O	Yes ☐ No ☐ N/A ☐
HTM21.2.1	Rules for operation at PCO active STA	9.6.12.5 (Set PCO Phase frame format), 11.17.3 (Operation at a PCO active non-AP STA)	HTM21.2:M	Yes ☐ No ☐ N/A ☐
HTM22	Management information base (MIB)			
HTM22.1	dot11PhyHTComplianceGroup	Annex C	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM22.2	dot11PhyMCSGroup	Annex C	CFHT:M	Yes ☐ No ☐ N/A ☐

B.4.17.2 HT PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
HTP1	PHY operating modes			
HTP1.1	Operation according to 18 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and/or Clause 19 (Extended Rate PHY (ERP) specification)	19.1.4 (PPDU formats)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP1.2	HT-mixed format	19.1.4 (PPDU formats)	CFHT:M	Yes ☐ No ☐ N/A ☐
*HTP1.3	HT-greenfield format	19.1.4 (PPDU formats)	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2	PHY frame format			
HTP2.1	HT-mixed format PPDU format	19.3.2 (PPDU format)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.2	HT-greenfield PPDU format	19.3.2 (PPDU format)	HTP1.3:M	Yes ☐ No ☐ N/A ☐
HTP2.3	Modulation and coding schemes (MCS)			
HTP2.3.1	MCS 0 to MCS 7 in 20 MHz with 800 ns guard interval (GI)			
HTP2.3.1.1	Support for 20 MHz with 800 ns GI MCS index 0	19.3.5 (Modulation and coding scheme (MCS)), 19.5 (Parameters for HT MCSs)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.2	Support for 20 MHz with 800 ns GI MCS index 1	19.3.5 (Modulation and coding scheme (MCS)), 19.5 (Parameters for HT MCSs)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.3	Support for 20 MHz with 800 ns GI MCS index 2	19.3.5 (Modulation and coding scheme (MCS)), 19.5 (Parameters for HT MCSs)	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.4	Support for 20 MHz with 800 ns GI MCS index 3	19.3.5 (Modulation and coding scheme (MCS)), 19.5 (Parameters for HT MCSs)	CFHT:M	Yes ☐ No ☐ N/A ☐

B.4.19 WNM extensions

Item	Protocol capability	References	Status	Support
WNM1	Extended Capabilities element	9.4.2.27 (Extended Capabilities element)	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM2	STA Statistics (Triggered) and Multicast Diagnostics	11.11.8 (Triggered autonomous reporting)	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM2.1	Protocol for Triggered Measurements	11.11.8 (Triggered autonomous reporting)	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM2.2	Triggered STA Statistics	9.4.2.21.9 (STA Statistics request), 9.4.2.22.9 (STA Statistics report), 9.6.7.2 (Radio Measurement Request frame format), 9.6.7.3 (Radio Measurement Report frame format), 11.11.9.5 (STA Statistics report)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM2.3	Multicast Diagnostics	9.4.2.21.13 (Multicast Diagnostics request), 9.4.2.22.12 (Multicast Diagnostics report), 9.6.7.2 (Radio Measurement Request frame format), 9.6.7.3 (Radio Measurement Report frame format), 11.11.19 (Multicast diagnostic reporting)	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM3	Event	11.24.2 (Event request and report procedures)	CFWNM:M	Yes ☐ No ☐ N/A ☐

B.4.19 WNM extensions *(continued)*

Item	Protocol capability	References	Status	Support
WNM4	Diagnostic	11.24.3 (Diagnostic request and report procedures)	CFWNM:M	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.19 WNM extensions *(continued)*

Item	Protocol capability	References	Status	Support
WNM4.1	Diagnostic Request frame	9.4.2.69 (Diagnostic Request element), 9.6.14.4 (Diagnostic Request frame format)	(CFWNM AND CFAP):M	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.19 WNM extensions *(continued)*

Item	Protocol capability	References	Status	Support
WNM4.2	Diagnostic Report frame	9.4.2.70 (Diagnostic Report element), 9.6.14.5 (Diagnostic Report frame format)	(CFWNM AND CFIndepSTA) :M	Yes ☐ No ☐ N/A ☐
WNM4.3	Configuration Profile Diagnostic Type	9.4.2.70.3 (Configuration Profile report), 11.24.3.2 (Configuration Profile report)	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM4.4	Manufacturer Information STA Report Diagnostic Type	9.4.2.70.2 (Manufacturer Information STA Report), 11.24.3.3 (Manufacturer information STA report)	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM4.5	Association Diagnostic Type	9.4.2.69.2 (Association Diagnostic request), 9.4.2.70.4 (Association Diagnostic report), 11.24.3.4 (Association diagnostic)	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM4.6	IEEE Std 802.1X Authentication Diagnostic Type	9.4.2.69.3 (IEEE Std 802.1X Authentication Diagnostic request), 9.4.2.70.5 (IEEE Std 802.1X Authentication Diagnostic report), 11.24.3.5 (IEEE Std 802.1X authentication diagnostic)	(CFWNM AND PC34):M	Yes ☐ No ☐ N/A ☐

B.4.19 WNM extensions *(continued)*

Item	Protocol capability	References	Status	Support
WNM5	Location	9.4.2.71 (Location Parameters element), 11.24.4 (Location track procedures)	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM5.1	Location Civic request/report	11.11.9.9 (Location Civic report)	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM5.2	Location Identifier request/report	11.11.9.10 (Location Identifier report)	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM5.3	Location Track Notification	9.6.8.17 (Location Track Notification frame format), 11.24.4 (Location track procedures)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM5.3.1	Time of Departure Notifications	9.4.2.71 (Location Parameters element), 11.24.4 (Location track procedures)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM5.3.2	Motion Detection Notifications	9.4.2.71 (Location Parameters element), 11.24.4 (Location track procedures)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM5.4	Location Configuration Request frame	9.4.2.71 (Location Parameters element), 9.6.14.6 (Location Configuration Request frame format)	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM5.4.1	Normal Indication	9.4.2.71 (Location Parameters element), 9.6.14.6 (Location Configuration Request frame format)	CFWNM:O	Yes ☐ No ☐ N/A ☐

B.4.19 WNM extensions *(continued)*

Item	Protocol capability	References	Status	Support
WNM5.4.2	Motion Indication	9.4.2.71 (Location Parameters element), 9.6.14.6 (Location Configuration Request frame format)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM5.5	Location Configuration Response frame	9.4.2.71 (Location Parameters element), 9.6.14.7 (Location Configuration Response frame format)	CFWNM:M	Yes ☐ No ☐ N/A ☐
*WNM6	Multiple BSSID Support	11.1.3.8 (Multiple BSSID procedure), 11.1.4 (Acquiring synchronization, scanning), 11.11.14 (Multiple BSSID Set)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM6.1	Multiple BSSID element	9.4.2.46 (Multiple BSSID element)	WNM6:M	Yes ☐ No ☐ N/A ☐
WNM6.2	Multiple BSSID-index element	9.4.2.74 (Multiple BSSID-Index element)	WNM6:M	Yes ☐ No ☐ N/A ☐
WNM7	BSS transition management	11.24.7 (BSS transition management for network load balancing)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM7.1	Neighbor Report element	9.4.2.37 (Neighbor Report element)	(CFWNM AND CFAP):M	Yes ☐ No ☐ N/A ☐
WNM7.2	BSS Transition Management Query frame	9.6.14.8 (BSS Transition Management Query frame format)	(CFWNM AND CFAP):M	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.

B.4.19 WNM extensions *(continued)*

Item	Protocol capability	References	Status	Support
WNM7.3	BSS Transition Management Request frame	9.6.14.9 (BSS Transition Management Request frame format)	(CFWNM AND CFIndepSTA):M	Yes ☐ No ☐ N/A ☐
WNM7.4	BSS Transition Management Response frame	9.6.14.10 (BSS Transition Management Response frame format)	(CFWNM AND CFIndepSTA):M	Yes ☐ No ☐ N/A ☐
*WNM8	FMS	11.2.2.16 (FMS power management)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM8.1	FMS Request frame	9.6.14.11 (FMS Request frame format)	(CFIndepSTA AND WNM8):M	Yes ☐ No ☐ N/A ☐
WNM8.2	FMS Response frame	9.6.14.12 (FMS Response frame format)	(CFAP AND WNM8):M	Yes ☐ No ☐ N/A ☐
WNM9	Proxy ARP	11.24.14 (Proxy ARP (including Proxy Neighbor Discovery) service)	CFWNM:O	Yes ☐ No ☐ N/A ☐
*WNM10	Collocated Interference Reporting	11.24.10 (QoS Traffic capability procedure)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM10.1	Collocated Interference Request frame	9.6.14.13 (Collocated Interference Request frame format)	WNM10:M	Yes ☐ No ☐ N/A ☐
WNM10.2	Collocated Interference Report frame	9.6.14.14 (Collocated Interference Report frame format)	WNM10:M	Yes ☐ No ☐ N/A ☐
*WNM11	BSS max idle period	11.24.13 (BSS max idle period management)	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM11.1	BSS Max Idle Period element	9.4.2.79 (BSS Max Idle Period element)	WNM11:M	Yes ☐ No ☐ N/A ☐
*WNM12	TFS	11.24.12 (TFS procedures)	CFWNM:O	Yes ☐ No ☐ N/A ☐

B.4.19 WNM extensions *(continued)*

Item	Protocol capability	References	Status	Support
WNM12.1	TFS Request frame	9.4.2.80 (TFS Request element), 9.6.14.15 (TFS Request frame format)	WNM12:M	Yes ☐ No ☐ N/A ☐
WNM12.2	TFS Response frame	9.4.2.81 (TFS Response element), 9.6.14.16 (TFS Response frame format)	WNM12:M	Yes ☐ No ☐ N/A ☐
WNM12.3	TFS Notify frame	9.6.14.17 (TFS Notify frame format)	(CFAP AND WNM12):M (CFIndepSTA AND WNM12):O	Yes ☐ No ☐ N/A ☐
*WNM13	WNM sleep mode	11.2.2.18 (WNM sleep mode)	WNM12:O	Yes ☐ No ☐ N/A ☐
WNM13.1	WNM Sleep Mode Request frame	9.4.2.82 (WNM Sleep Mode element), 9.6.14.19 (WNM Sleep Mode Request frame format)	WNM13:M	Yes ☐ No ☐ N/A ☐
WNM13.2	WNM Sleep Mode Response frame	9.4.2.82 (WNM Sleep Mode element), 9.6.14.20 (WNM Sleep Mode Response frame format)	WNM13:M	Yes ☐ No ☐ N/A ☐
*WNM14	TIM Broadcast	11.2.2.17 (TIM Broadcast)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM14.1	TIM Broadcast Request frame	9.4.2.83 (TIM Broadcast Request element), 9.6.14.21 (TIM Broadcast Request frame format)	WNM14:M	Yes ☐ No ☐ N/A ☐

B.4.19 WNM extensions *(continued)*

Item	Protocol capability	References	Status	Support
WNM14.2	TIM Broadcast Response frame	9.4.2.84 (TIM Broadcast Response element), 9.6.14.22 (TIM Broadcast Response frame format)	WNM14:M	Yes ☐ No ☐ N/A ☐
WNM14.3	TIM Broadcast frame	9.6.15.2 (TIM frame format)	WNM14:M	Yes ☐ No ☐ N/A ☐
*WNM15	QoS Traffic Capability	11.24.10 (QoS Traffic capability procedure)	(CFWNM AND CFIndepSTA) :O	Yes ☐ No ☐ N/A ☐
WNM15.1	QoS Traffic Capability element	9.4.2.78 (QoS Traffic Capability element)	WNM15:M	Yes ☐ No ☐ N/A ☐
WNM15.2	QoS Traffic Capability update frame	9.6.14.23 (QoS Traffic Capability Update frame format)	WNM15:M	Yes ☐ No ☐ N/A ☐
WNM16	AC Station Count	11.24.11 (AC Station Count)	(CFWNM AND CFIndepSTA) :O	Yes ☐ No ☐ N/A ☐
WNM17	Timing Measurement	11.24.5 (Timing measurement procedure)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM17.1	Timing Measurement Request	9.6.14.28 (Timing Measurement Request frame format)	WNM17:M	Yes ☐ No ☐ N/A ☐
WNM17.2	Timing Measurement	9.6.15.3 (Timing Measurement frame format)	WNM17:M	Yes ☐ No ☐ N/A ☐
*WNM18	Channel Usage	11.24.15 (Channel usage procedures)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM18.1	Channel Usage Request frame	9.4.2.86 (Channel Usage element), 9.6.14.24 (Channel Usage Request frame format)	WNM18:M	Yes ☐ No ☐ N/A ☐

B.4.19 WNM extensions *(continued)*

Item	Protocol capability	References	Status	Support
WNM22	WNM notification	11.24.17 (WNM notification)	(CFWNM AND CFHT):O (CFWNM AND CFTVHT):O	Yes ☐ No ☐ N/A ☐
WNM22.1	WNM Notification Request frame	9.6.14.29 (WNM Notification Request frame format)	WNM21:M	Yes ☐ No ☐ N/A ☐
WNM22.2	WNM Notification Response frame	9.6.14.30 (WNM Notification Response frame format)	WNM21:M	Yes ☐ No ☐ N/A ☐
WNM23	Fine timing measurement	11.24.6 (Fine timing measurement procedure)	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM23.1	Fine timing measurement request (including LCI and/or location civic request)	9.6.8.32 (Fine Timing Measurement Request frame format)	WNM23:M	Yes ☐ No ☐ N/A ☐
WNM23.2	Fine timing measurement (including LCI and/or location civic report)	9.6.8.33 (Fine Timing Measurement frame format)	WNM23:M	Yes ☐ No ☐ N/A ☐
WNM23.3	Request neighbor LCI and/or civic locations within neighbor report request	11.11.10.2 (Requesting a neighbor report)	(CFIndepSTA OR CFMBSS) AND WNM23:M	Yes ☐ No ☐ N/A ☐
WNM23.4	Report neighbor LCI and/or civic locations within neighbor report response	11.11.10.2 (Requesting a neighbor report)	CFAP AND WNM23:M	Yes ☐ No ☐ N/A ☐
WNM23.5	Transmitter of Fine Timing Measurement Range request and receiver of Fine Timing Measurement Range report	11.11.9.11 (Fine Timing Measurement Range report)	WNM23:M	Yes ☐ No ☐ N/A ☐
WNM23.6	Receiver of Fine Timing Measurement Range request and transmitter of Fine Timing Measurement Range report	11.11.9.11 (Fine Timing Measurement Range report)	(CFIndepSTA OR CFMBSS) AND WNM23:M	Yes ☐ No ☐ N/A ☐

B.4.20 Interworking (IW) with external networks extensions

Item	Protocol capability	References	Status	Support
	Are the following Interworking with External Networks capabilities supported?			
IW1	Interworking capabilities and Information	9.4.2.92 (Interworking element), 11.25.2 (Interworking capabilities and information)	CFIW:M	Yes ☐ No ☐ N/A ☐
IW1.1	Interworking element	9.4.2.92 (Interworking element)	IW1:M	Yes ☐ No ☐ N/A ☐
IW1.2	Access network type	9.4.2.92 (Interworking element)	IW1:M	Yes ☐ No ☐ N/A ☐
IW1.3	Venue type	9.4.2.92 (Interworking element)	IW1:M	Yes ☐ No ☐ N/A ☐
IW1.4	HESSID	9.4.2.92 (Interworking element)	IW1:M	Yes ☐ No ☐ N/A ☐
IW2	Generic Advertisement Service	11.25.3 (Interworking procedures: generic advertisement service (GAS))	CFIW:M	Yes ☐ No ☐ N/A ☐
IW2.1	Advertisement Protocol element	9.4.2.93 (Advertisement Protocol element)	IW2:M	Yes ☐ No ☐ N/A ☐
*IW2.2	GAS Protocol	11.25.3.1 (GAS Protocol)	IW2:M	Yes ☐ No ☐ N/A ☐
*IW2.2.1	GAS frames	9.6.8 (Public Action details)	IW2:M	Yes ☐ No ☐ N/A ☐
IW2.2.2	Access network query protocol	9.4.5 (Access network query protocol (ANQP) elements)	IW2.2:M	Yes ☐ No ☐ N/A ☐
IW2.2.3	Query List	9.4.5.2 (Query List ANQP-element)	IW2.2.1:M	Yes ☐ No ☐ N/A ☐
IW2.2.4	Capability List	9.4.5.3 (Capability List ANQP-element)	IW2.2.1:M	Yes ☐ No ☐ N/A ☐
IW2.2.5	Venue Name	9.4.5.4 (Venue Name ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.20 Interworking (IW) with external networks extensions *(continued)*

Item	Protocol capability	References	Status	Support
IW2.2.6	Emergency Call Number	9.4.5.5 (Emergency Call Number ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.7	Network Authentication Type	9.4.5.6 (Network Authentication Type ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.8	Roaming Consortium	9.4.5.7 (Roaming Consortium ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.9	IP Address Type Availability	9.4.5.9 (IP Address Type Availability ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.10	NAI Realm	9.4.5.10 (NAI Realm ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.11	3GPP Cellular Network	9.4.5.11 (3GPP Cellular Network ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.12	AP Geospatial Location	9.4.5.12 (AP Geospatial Location ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.13	AP Civic Location	9.4.5.13 (AP Civic Location ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.14	AP Location Public Identifier URI/ FQDN	9.4.5.14 (AP Location Public Identifier URI/ FQDN ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.15	Domain Name	9.4.5.15 (Domain Name ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.16	Emergency Alert URI	9.4.5.16 (Emergency Alert URI ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.20 Interworking (IW) with external networks extensions *(continued)*

Item	Protocol capability	References	Status	Support
IW2.2.17	Emergency NAI	9.4.5.17 (Emergency NAI ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.18	Vendor Specific	9.4.5.8 (Vendor Specific ANQP-element)	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.19	MIH IS	9.4.2.93 (Advertisement Protocol element), 11.25.4 (Interworking procedures: IEEE Std 802.21 MIH support)	IW2:O	Yes ☐ No ☐ N/A ☐
IW2.2.20	MIH Event and Command Services Discovery	9.4.2.93 (Advertisement Protocol element), 11.25.4 (Interworking procedures: IEEE Std 802.21 MIH support)	IW2.2:O	Yes ☐ No ☐ N/A ☐
IW2.2.21	Emergency Alert System (EAS)	9.4.2.93 (Advertisement Protocol element), 9.4.2.97 (Emergency Alert Identifier element)	IW2.2:O	Yes ☐ No ☐ N/A ☐
IW2.2.22	Advertisement Protocol ID, Vendor Specific	9.4.2.93 (Advertisement Protocol element)	IW2.2:O	Yes ☐ No ☐ N/A ☐
IW2.2.23	TDLS Capability	9.4.5.18 (TDLS Capability ANQP-element)	IW2.21:O	Yes ☐ No ☐ N/A ☐
IW2.2.24	Neighbor Report	9.4.5.19 (Neighbor Report ANQP-element)	IW2.21:O	Yes ☐ No ☐ N/A ☐
IW2.3	GAS Initial Request frame	9.6.8.12 (GAS Initial Request frame format)	IW2:M	Yes ☐ No ☐ N/A ☐
IW2.4	GAS Initial Response frame	9.6.8.13 (GAS Initial Response frame format)	IW2:M	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.20 Interworking (IW) with external networks extensions *(continued)*

Item	Protocol capability	References	Status	Support
IW2.5	GAS Comeback Request frame	9.6.8.14 (GAS Comeback Request frame format)	IW2:M	Yes ☐ No ☐ N/A ☐
IW2.6	GAS Comeback Response frame	9.6.8.15 (GAS Comeback Response frame format)	IW2:M	Yes ☐ No ☐ N/A ☐
IW3	QoS Mapping from External Networks	10.22.4.2 (Contention based admission control procedures), 10.22.4.3 (Controlled-access admission control), 11.25.9 (Interworking procedures: support for QoS mapping from external networks)	CFIW:O	Yes ☐ No ☐ N/A ☐
IW3.1	QoS Map element	9.4.2.95 (QoS Map element)	IW3:M	Yes ☐ No ☐ N/A ☐
IW3.2	Transport of QoS Map	11.25.9 (Interworking procedures: support for QoS mapping from external networks)	IW3:M	Yes ☐ No ☐ N/A ☐
IW3.3	QoS Map Configure	9.6.3.6 (QoS Map Configure frame format)	IW3:M	Yes ☐ No ☐ N/A ☐
IW4	MIH Support	6.4 (MAC state generic convergence function (MSGCF)), 11.25.4 (Interworking procedures: IEEE Std 802.21 MIH support)	CFIW:O	Yes ☐ No ☐ N/A ☐
IW4.1	MAC state generic convergence function support	6.4 (MAC state generic convergence function (MSGCF))	IW4:M	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.20 Interworking (IW) with external networks extensions *(continued)*

Item	Protocol capability	References	Status	Support
IW4.2	Informational events	6.4.5 (Convergence function informational events)	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.3	ESS status reporting	6.4.7 (ESS status reporting)	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.4	Network configuration	6.4.8 (Network configuration)	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.5	Network events	6.4.9 (Network events)	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.6	Network command interface	6.4.10 (Network command interface)	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.7	Mobility management	6.4.11 (MAC state SME SAP—mobility management)	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.8	Network configuration	6.4.8 (Network configuration)	IW4:M	Yes ☐ No ☐ N/A ☐
IW5	Extended channel switch enabled	9.4.2.58 (20/40 BSS Intolerant Channel Report element), 11.1.4 (Acquiring synchronization, scanning)	(CF3G6 AND DSE9):M	Yes ☐ No ☐ N/A ☐
IW6	Expedited Bandwidth Request	9.4.2.94 (Expedited Bandwidth Request element)	CFIW:O	Yes ☐ No ☐ N/A ☐
IW7	SSPN Interface	11.25.5 (Interworking procedures: interactions with SSPN)	CFIW:O	Yes ☐ No ☐ N/A ☐

B.4.21 Mesh protocol capabilities

B.4.21.1 General mesh support

Item	Protocol capability	Reference	Status	Support
*MP1	Support of mesh capability	4.3.20 (Mesh BSS), 14.1 (Mesh STA dependencies)	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP1.1	Mesh BSS scanning	14.2.2 (Mesh identifier), 14.2.6 (Scanning mesh BSSs)	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.2	Candidate peer mesh STA determination	14.2.7 (Candidate peer mesh STA)	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.3	Active mesh profile determination	14.2.3 (Mesh profile), 14.2.4 (Mesh STA configuration)	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.4	Establishing a mesh BSS	14.2.8 (Establishing or becoming a member of a mesh BSS)	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.5	Becoming a member of a mesh BSS	14.2.8 (Establishing or becoming a member of a mesh BSS)	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.6	Announcement of mesh profile and supplemental information for the mesh discovery	14.2.3 (Mesh profile), 14.2.5 (Supplemental information for the mesh discovery)	MP1:M	Yes ☐ No ☐ N/A ☐
*MP2	Mesh peering management (MPM) framework	14.3 (Mesh peering management (MPM))	CFMBSS: M	Yes ☐ No ☐ N/A ☐
*MP2.1	Mesh peering management (MPM) protocol	14.3 (Mesh peering management (MPM))	MP2:M	Yes ☐ No ☐ N/A ☐
MP2.1.1	Processing of Mesh Peering Open frame	14.3.6 (Mesh peering open)	MP2.1:M	Yes ☐ No ☐ N/A ☐
MP2.1.2	Processing of Mesh Peering Confirm frame	14.3.7 (Mesh peering confirm)	MP2.1:M	Yes ☐ No ☐ N/A ☐
MP2.1.3	Processing of Mesh Peering Close frame	14.3.8 (Mesh peering close)	MP2.1:M	Yes ☐ No ☐ N/A ☐
MP2.1.4	MPM finite state machine	14.4 (Mesh peering management finite state machine (MPM FSM))	MP2.1:M	Yes ☐ No ☐ N/A ☐
*MP2.2	Authenticated mesh peering exchange (AMPE)	14.5 (Authenticated mesh peering exchange (AMPE))	MP2:O	Yes ☐ No ☐ N/A ☐
MP2.2.1	Mesh authentication using SAE	12.4 (Authentication using a password), 14.3.3 (Mesh authentication)	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.2	Mesh authentication using IEEE Std 802.1X	4.10 (IEEE Std 802.11 and IEEE Std 802.1X-2010), 14.3.3 (Mesh authentication)	MP2.2:O	Yes ☐ No ☐ N/A ☐

B.4.21.1 General mesh support *(continued)*

Item	Protocol capability	Reference	Status	Support
MP2.2.3	Protected mesh peering Management frame processing	14.5.3 (Construction and processing AES-SIV-protected mesh peering Management frames), 14.5.3 (Construction and processing AES-SIV-protected mesh peering Management frames)	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.4	Mesh pairwise master key security association (PMKSA) caching	12.6.12 (RSNA authentication in an MBSS)	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.5	AMPE finite state machine	14.5.6 (AMPE finite state machine)	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.6	MGTK distribution	14.5.4 (Distribution of group transient keys in an MBSS)	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.7	MGTK update	14.6 (Mesh group key handshake)	MP2.2:O	Yes ☐ No ☐ N/A ☐
MP3	Mesh STA beaconing	14.13.3 (Beaconing)	CFMBSS: M	Yes ☐ No ☐ N/A ☐
*MP4	Mesh STA synchronization	14.13.2 (Extensible synchronization framework)	CFMBSS: M	Yes ☐ No ☐ N/A ☐
*MP4.1	Neighbor offset synchronization method	14.13.2 (Extensible synchronization framework)	MP4:M	Yes ☐ No ☐ N/A ☐
MP4.1.1	Calculation of TSF offset	14.13.2.2.2 (Timing offset calculation)	MP4.1:M	Yes ☐ No ☐ N/A ☐
MP4.1.2	Clock drift adjustment	14.13.2.2.3 (Clock drift adjustment)	MP4.1:M	Yes ☐ No ☐ N/A ☐
*MP4.2	Mesh beacon collision avoidance (MBCA)	14.13.4 (Mesh beacon collision avoidance (MBCA))	MP4:O	Yes ☐ No ☐ N/A ☐
MP4.2.1	Beacon timing advertisement	14.13.4.2 (Beacon timing advertisement)	MP4.2:M	Yes ☐ No ☐ N/A ☐
MP4.2.2	TBTT selection	14.13.4.3 (TBTT selection)	MP4.2:M	Yes ☐ No ☐ N/A ☐
MP4.2.3	TBTT adjustment	14.13.4.4 (TBTT adjustment)	MP4.2:M	Yes ☐ No ☐ N/A ☐
MP4.2.4	Frame transmission across reported TBTT	14.13.4.5 (Frame transmission across reported TBTT)	MP4.2:O	Yes ☐ No ☐ N/A ☐
MP4.2.5	Delayed beacon transmission	14.13.4.6 (Delayed beacon transmissions)	MP4.2:O	Yes ☐ No ☐ N/A ☐
*MP5	MCCA	10.23.3 (MCF controlled channel access (MCCA))	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP5.1	MCCAOP Advertisement	10.23.3.7 (MCCAOP advertisement)	MP5:M	Yes ☐ No ☐ N/A ☐

B.4.21.1 General mesh support *(continued)*

Item	Protocol capability	Reference	Status	Support
MP5.2	Neighbor MCCAOP Recognition	10.23.3.4 (Neighborhood MCCAOP periods at a mesh STA), 10.23.3.5 (MCCA access fraction (MAF))	MP5:M	Yes ☐ No ☐ N/A ☐
MP5.3	MCCAOP Setup	10.23.3.6 (MCCAOP setup procedure)	MP5:M	Yes ☐ No ☐ N/A ☐
MP5.4	Access during MCCAOPs	10.23.3.9 (Access during MCCAOPs)	MP5:M	Yes ☐ No ☐ N/A ☐
MP5.5	MCCAOP teardown	10.23.3.8 (MCCAOP teardown)	MP5:M	Yes ☐ No ☐ N/A ☐
*MP6	Intra mesh congestion control	14.12 (Intra-mesh congestion control)	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP6.1	Local congestion monitoring and detection	14.12 (Intra-mesh congestion control)	MP6:M	Yes ☐ No ☐ N/A ☐
MP6.2	Congestion control signaling	14.12 (Intra-mesh congestion control)	MP6:M	Yes ☐ No ☐ N/A ☐
MP6.3	Local rate control	14.12 (Intra-mesh congestion control)	MP6:M	Yes ☐ No ☐ N/A ☐
*MP7	MBSS channel switch procedure	11.9.8 (Selecting and advertising a new channel), 11.10.3 (Selecting and advertising a new channel and/or operating class)	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP7.1	Transmission of channel switch advertisement	11.9.8 (Selecting and advertising a new channel), 11.10.3 (Selecting and advertising a new channel and/or operating class)	MP7:M	Yes ☐ No ☐ N/A ☐
MP7.2	Propagation of channel switch advertisement	11.9.8 (Selecting and advertising a new channel), 11.10.3 (Selecting and advertising a new channel and/or operating class)	MP7:M	Yes ☐ No ☐ N/A ☐
*MP8	Mesh power save operation (operation in light or deep sleep mode)	14.14 (Power save in a mesh BSS)	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP8.1	Link-specific mesh power management mode setting	14.14.2.2 (Peer-specific mesh power management modes), 14.14.8 (Operation in peer-specific and nonpeer mesh power management modes)	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.2	Nonpeer mesh power management mode setting	14.14.2.3 (Nonpeer mesh power management modes)	MP8:M	Yes ☐ No ☐ N/A ☐

B.4.21.1 General mesh support *(continued)*

Item	Protocol capability	Reference	Status	Support
MP8.3	Light sleep mode operation	14.14.8.4 (Operation in light sleep mode for a mesh peering)	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.4	Deep sleep mode operation	14.14.8.5 (Operation in deep sleep mode for a mesh peering)	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.5	STA power state transitions	14.14.3 (Mesh power management mode indications and transitions)	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.6	Mesh awake window operation	14.14.6 (Mesh awake window)	MP8:M	Yes ☐ No ☐ N/A ☐
*MP9	Mesh power save support	14.14 (Power save in a mesh BSS)	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP9.1	TIM transmission	14.14.4 (TIM transmissions in an MBSS)	MP9:M	Yes ☐ No ☐ N/A ☐
MP9.2	Link-specific mesh power management modes determination	14.14.2 (Mesh power management modes)	MP9:M	Yes ☐ No ☐ N/A ☐
MP9.3	Group addressed frame transmission	14.14.7 (Power save support)	MP9:M	Yes ☐ No ☐ N/A ☐
MP9.4	Frame transmission to a mesh STA in light sleep mode	14.14.7 (Power save support), 14.14.9 (Mesh peer service periods)	MP9:M	Yes ☐ No ☐ N/A ☐
MP9.5	Frame transmission to a mesh STA in deep sleep mode	14.14.7 (Power save support), 14.14.9 (Mesh peer service periods)	MP9:M	Yes ☐ No ☐ N/A ☐
MP10	Airtime link metric computation	14.9 (Airtime link metric)	CFMBSS: M	Yes ☐ No ☐ N/A ☐
*MP11	Link metric reporting	14.8.3 (Link metric reporting)	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP11.1	Autonomous link metric reporting	14.8.3 (Link metric reporting)	MP11:O	Yes ☐ No ☐ N/A ☐
MP11.2	Link metric reporting upon request	14.8.3 (Link metric reporting)	MP11:M	Yes ☐ No ☐ N/A ☐
*MP12	Proxy operation	14.11.4 (Proxy information and proxy update)	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP12.1	Data forwarding at proxy mesh gate	14.11.3 (Data forwarding at proxy mesh gates)	MP12:M	Yes ☐ No ☐ N/A ☐
MP12.2	Maintenance of proxy information	14.11.4.2 (Proxy information)	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP12.3	Proxy update using Proxy Update and Proxy Update Confirmation frames	14.11.4 (Proxy information and proxy update)	CFMBSS: M	Yes ☐ No ☐ N/A ☐

B.4.21.1 General mesh support *(continued)*

Item	Protocol capability	Reference	Status	Support
MP12.4	Proxy update using HWMP Mesh Path Selection frames	14.10.9 (Path request (PREQ) mechanism), 14.10.10 (Path reply (PREP) mechanism), 14.10.11 (Path error (PERR) mechanism)	HWM1:M	Yes ☐ No ☐ N/A ☐
*MP13	Gate announcement	14.11.2 (Gate announcement (GANN))	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP13.1	GANN transmission	14.11.2 (Gate announcement (GANN))	MP13:O	Yes ☐ No ☐ N/A ☐
MP13.2	GANN reception and propagation	14.11.2 (Gate announcement (GANN))	CFMBSS: M	Yes ☐ No ☐ N/A ☐
*MP14	Mesh Control field handling	9.2.4.7.3 (Mesh Control field)	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP14.1	Address Extension recognition	9.2.4.7.3 (Mesh Control field), 9.3.5 (Frame addressing in an MBSS)	MP14:M	Yes ☐ No ☐ N/A ☐
MP14.2	Mesh TTL handling	9.2.4.7.3 (Mesh Control field), 10.35.3 (Addressing and forwarding of individually addressed mesh Data frames), 10.35.4 (Addressing and forwarding of group addressed mesh Data frames), 10.35.5 (Addressing of Management frames and MMPDU forwarding)	MP14:M	Yes ☐ No ☐ N/A ☐
MP14.3	Mesh Sequence Number handling	9.2.4.7.3 (Mesh Control field), 10.35.3 (Addressing and forwarding of individually addressed mesh Data frames), 10.35.4 (Addressing and forwarding of group addressed mesh Data frames), 10.35.5 (Addressing of Management frames and MMPDU forwarding), 10.35.6 (Detection of duplicate MSDUs/ MMPDUs)	MP14:M	Yes ☐ No ☐ N/A ☐
*MP15	MSDU/MMPDU forwarding	10.35 (Mesh forwarding framework)	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP15.1	Individually addressed MSDU forwarding	10.35.3 (Addressing and forwarding of individually addressed mesh Data frames)	MP15:M	Yes ☐ No ☐ N/A ☐

B.4.21.1 General mesh support *(continued)*

Item	Protocol capability	Reference	Status	Support
MP15.2	Group addressed MSDU forwarding	10.35.4 (Addressing and forwarding of group addressed mesh Data frames)	MP15:M	Yes ☐ No ☐ N/A ☐
MP15.3	MMPDU forwarding	10.35.5 (Addressing of Management frames and MMPDU forwarding)	MP15:M	Yes ☐ No ☐ N/A ☐
MP15.4	Detection of duplicate MSDUs/ MMPDUs	10.35.6 (Detection of duplicate MSDUs/ MMPDUs)	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP15.5	Treatment of unknown destination	10.35.8 (MSDU forwarding and unknown destination)	CFMBSS: M	Yes ☐ No ☐ N/A ☐

B.4.21.2 HWMP path selection protocol capabilities

Item	Protocol capability	Reference	Status	Support
*HWM1	Hybrid wireless mesh protocol (HWMP)	14.10 (Hybrid wireless mesh protocol (HWMP))	CFMBSS:M	Yes ☐ No ☐ N/A ☐
*HWM1.1	On-demand path selection	14.10.3 (On-demand path selection mode)	HWM1:M	Yes ☐ No ☐ N/A ☐
HWM1.1.1	PREQ processing for on-demand path selection	14.10.9 (Path request (PREQ) mechanism)	HWM1.1:M	Yes ☐ No ☐ N/A ☐
HWM1.1.2	PREP processing for on-demand path selection	14.10.10 (Path reply (PREP) mechanism)	HWM1.1:M	Yes ☐ No ☐ N/A ☐
HWM1.1.3	PERR processing for on-demand path selection	14.10.11 (Path error (PERR) mechanism)	HWM1.1:M	Yes ☐ No ☐ N/A ☐
*HWM1.2	Proactive tree building	14.10.4 (Proactive tree building mode)	HWM1:M	Yes ☐ No ☐ N/A ☐
HWM1.2.1	PREQ processing for proactive tree building	14.10.9 (Path request (PREQ) mechanism)	HWM1.2:M	Yes ☐ No ☐ N/A ☐
HWM1.2.2	PREP processing for proactive tree building	14.10.10 (Path reply (PREP) mechanism)	HWM1.2:M	Yes ☐ No ☐ N/A ☐
HWM1.2.3	PERR processing for proactive tree building	14.10.11 (Path error (PERR) mechanism)	HWM1.2:M	Yes ☐ No ☐ N/A ☐
HWM1.2.4	RANN processing	14.10.12 (Root announcement (RANN) mechanism)	HWM1.2:M	Yes ☐ No ☐ N/A ☐
HWM2	Maintenance of forwarding information	10.35.2 (Forwarding information), 14.10.8.4 (Forwarding information)	MP15:M	Yes ☐ No ☐ N/A ☐

B.4.22 QMF extensions

Item	Protocol capability	References	Status	Support
QMF1	Extended Capabilities element	9.4.2.27 (Extended Capabilities element)	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF2	Channel access procedures for QMFs	10.2.4.2 (HCF contention based channel access (EDCA))	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF3	Duplicate detection and recovery for QMFs	10.3.2.11 (Duplicate detection and recovery)	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF4	QMF policy Configuration	11.26.2 (QMF policy advertisement and configuration procedures)	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF5	Interpreting QMF priority	11.26.3 (Interpreting QMF access categories)	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF6	CCMP cryptographic encapsulation for QMFs	12.5.3.3 (CCMP cryptographic encapsulation)	(CFQMF AND PC34.1.10):M	Yes ☐ No ☐ N/A ☐

B.4.23 RobustAVT extensions

Item	Protocol capability	References	Status	Support
AVT1	Extended Capabilities element	9.4.2.27 (Extended Capabilities element)	CFAVT:M	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.23 RobustAVT extensions *(continued)*

Item	Protocol capability	References	Status	Support
AVT2	Groupcast with Retries (GCR)	11.24.16.3.2 (GCR group membership procedures), 11.24.16.3.3 (GCR setup procedures), 11.24.16.3.4 (GCR frame exchange procedures), 11.24.16.3.5 (Concealment of GCR transmissions), 11.24.16.3.6 (GCR unsolicited retry)	(CFHT AND CFAVT AND WNM19):M (CFTVHT AND CFAVT AND WNM19):M	Yes ☐ No ☐ N/A ☐
			(CFAP AND CFAVT AND WNM19 AND HTM4.4):M	Yes ☐ No ☐ N/A ☐
AVT2.1	Advanced GCR	9.4.2.27 (Extended Capabilities element), 10.24.10 (GCR block ack), 11.24.16.3.7 (GCR block ack), 11.24.16.3.8 (GCR-SP)	(CFAVT AND QB5):O	Yes ☐ No ☐ N/A ☐
AVT3	Alternate EDCA transmit queues	10.2.4.2 (HCF contention based channel access (EDCA))	CFAVT AND CFHT:O	Yes ☐ No ☐ N/A ☐
AVT4	Stream Classification Service (SCS)	11.27.2 (SCS procedures)	CFAVT:O	Yes ☐ No ☐ N/A ☐
AVT4.1	SCS Request frame	9.6.19.2 (SCS Request frame format)	AVT4:M	Yes ☐ No ☐ N/A ☐
AVT4.2	SCS Response frame	9.6.19.3 (SCS Response frame format)	AVT4:M	Yes ☐ No ☐ N/A ☐
AVT4.3	Drop eligibility indicator (DEI)	11.27.2 (SCS procedures)	(CFHT AND AVT4):M (CFTVHT AND AVT4):M	Yes ☐ No ☐ N/A ☐
ATV5	Overlapping Basic Service Set (OBSS) Management	9.4.2.27 (Extended Capabilities element), 11.28 (Procedures to manage OBSS)	(CFAP AND (QP2 OR QD6) AND CFAVT):M	Yes ☐ No ☐ N/A ☐

B.4.23 RobustAVT extensions *(continued)*

Item	Protocol capability	References	Status	Support
ATV5.1	AP PeerKey	12.11 (AP PeerKey support)	AVT5:O	Yes ☐ No ☐ N/A ☐
ATV5.2	QLoad Report	11.28.2 (QLoad Report element) 9.4.2.123 (QLoad Report element) 9.6.8.20 (QLoad Request frame format) 9.6.8.21 (QLoad Report frame format) 9.6.8.21 (QLoad Report frame format)	AVT5:M	Yes ☐ No ☐ N/A ☐
AVT5.2.1	QLoad Report element		AVT5.2:M	Yes ☐ No ☐ N/A ☐
AVT5.2.2	QLoad Request frame		AVT5.2:M	Yes ☐ No ☐ N/A ☐
AVT5.2.3	QLoad Report frame		AVT5.2:M	Yes ☐ No ☐ N/A ☐
AVT5.2.4	Protected QLoad Report		(AVT5.2 AND AVT5.1):O	Yes ☐ No ☐ N/A ☐
AVT5.3	HCCA TXOP Update Count element	9.4.2.124 (HCCA TXOP Update Count element)	(AVT5 AND QP2):O	Yes ☐ No ☐ N/A ☐
AVT5.3.1	HCCA TXOP Negotiation	11.28.3 (HCCA TXOP negotiation)	AVT5.3:O	Yes ☐ No ☐ N/A ☐
AVT5.3.2	Protected HCCA TXOP Negotiation	11.28.3 (HCCA TXOP negotiation)	(AVT5.3 AND ATV5.1):O	Yes ☐ No ☐ N/A ☐
AVT6	GCR for Mesh	9.4.2.27 (Extended Capabilities element), 10.24.10 (GCR block ack), 11.24.16.3.6 (GCR unsolicited retry), 11.24.16.3.7 (GCR block ack)	(WNM19 AND HTM4.4 AND CFHT AND CFAVT AND CFMBSS):O (WNM19 AND HTM4.4 AND CFTVHT AND CFAVT and CFMBSS):O	Yes ☐ No ☐ N/A ☐

B.4.24 DMG features

B.4.24.1 DMG MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
DMG-M1	DMG capabilities signaling			

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.24.1 DMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
DMG-M1.1	DMG Capabilities element	9.4.2.128 (DMG Capabilities element)	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.6 (Association Request frame format), 9.3.3.8 (Reassociation Request frame format), 9.3.3.10 (Probe Request frame format), 9.4.2.128 (DMG Capabilities element)	(CFDMG AND (CFSTAofAP OR CFIBSS OR CFPBSSnotPCP)):M	Yes ☐ No ☐ N/A ☐
DMG-M1.3	Signaling of STA and BSS capabilities in DMG Beacon, Probe Response, (Re)Association Response frames	9.3.3.7 (Association Response frame format), 9.3.3.9 (Reassociation Response frame format), 9.3.3.11 (Probe Response frame format), 9.3.4.2 (DMG Beacon), 9.4.2.128 (DMG Capabilities element)	(CFDMG AND (CFAP OR CFPCP)):M	Yes ☐ No ☐ N/A ☐
DMG-M2	Signaling of DMG operation	9.4.2.129 (DMG Operation element)	(CFDMG AND (CFAP OR CFPCP)):M	Yes ☐ No ☐ N/A ☐
DMG-M3	MSDU aggregation			

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.24.1 DMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
DMG-M3.1	Reception of Basic A-MSDUs	9.2.4.5 (QoS Control field), 9.3.2.2.2 (Basic A-MSDU subframe format)	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M3.2	Basic A-MSDU format	9.3.2.2.2 (Basic A-MSDU subframe format)	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M3.3	Basic A-MSDU content	9.3.2.2.2 (Basic A-MSDU subframe format)	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M3.4	Transmission of Basic A-MSDUs	9.2.4.5 (QoS Control field), 9.3.2.2.2 (Basic A-MSDU subframe format)	CFDMG:O	Yes ☐ No ☐ N/A ☐
*DMG-M3.5	Reception of Short A-MSDU	9.2.4.5 (QoS Control field), 9.3.2.2.2 (Basic A-MSDU subframe format)	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M3.6	Short A-MSDU format	9.3.2.2.3 (Short A-MSDU subframe format)	(DMG-M3.5 OR DMG-M3.8):M	Yes ☐ No ☐ N/A ☐
DMG-M3.7	Short A-MSDU content	9.3.2.2.3 (Short A-MSDU subframe format)	(DMG-M3.5 OR DMG-M3.8):M	Yes ☐ No ☐ N/A ☐
*DMG-M3.8	Transmission of Short A-MSDU	9.2.4.5 (QoS Control field), 9.3.2.2.3 (Short A-MSDU subframe format)	CFDMG:O	Yes ☐ No ☐ N/A ☐

B.4.25 Very high throughput (VHT) features

B.4.25.1 VHT MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
VHTM1	VHT capabilities signaling			
VHTM1.1	VHT Capabilities element	9.4.2.158.1 (VHT Capabilities element structure)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.6 (Association Request frame format), 9.3.3.8 (Reassociation Request frame format), 9.3.3.10 (Probe Request frame format), 9.4.2.158.1 (VHT Capabilities element structure)	(CFVHT AND CFIndepSTA): M (CFVHT AND CFMBSS):M	Yes ☐ No ☐ N/A ☐
VHTM1.3	Signaling of STA and BSS capabilities in Beacon, Probe Response, (Re)Association Response frames	9.3.3.3 (Beacon frame format), 9.3.3.7 (Association Response frame format), 9.3.3.9 (Reassociation Response frame format), 9.3.3.11 (Probe Response frame format), 9.4.2.158 (VHT Capabilities element)	(CFVHT AND CFAP):M (CFVHT AND CFMBSS):M	Yes ☐ No ☐ N/A ☐
VHTM2	Signaling of VHT operation	9.4.2.159 (VHT Operation element)	(CFVHT AND CFAP):M (CFVHT AND CFMBSS):M (CFVHT AND CFIBSS):M	Yes ☐ No ☐ N/A ☐
VHTM3	Link adaptation			

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.25.1 VHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
VHTM3.1	Use of the VHT variant HT Control field for link adaptation in immediate response exchange.	9.2.4.6 (HT Control field), 9.3.3.15 (Action No Ack frame format), 10.31.3 (Link adaptation using the VHT variant HT Control field)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM4	Transmit beamforming			
*VHTM4.1	SU Beamformer Capable	9.4.2.158 (VHT Capabilities element)	CFVHT:O	Yes ☐ No ☐ N/A ☐
*VHTM4.2	SU Beamformee Capable	9.4.2.158 (VHT Capabilities element)	CFVHT:O	Yes ☐ No ☐ N/A ☐
*VHTM4.3	MU Beamformer Capable	9.4.2.158 (VHT Capabilities element)	CFAP AND VHTM4.1:O	Yes ☐ No ☐ N/A ☐
*VHTM4.4	MU Beamformee Capable	9.4.2.158 (VHT Capabilities element)	CFIndepSTA AND VHTM4.2:O	Yes ☐ No ☐ N/A ☐
VHTM4.5	Transmission of null data packet	10.34 (Null data packet (NDP) sounding)	VHTM4.1:M	Yes ☐ No ☐ N/A ☐
VHTM4.6	Reception of null data packet	10.34 (Null data packet (NDP) sounding)	VHTM4.2:M	
VHTM5	VHT Sounding Protocol			
VHTM5.1	VHT sounding protocol as SU beamformer	10.34.5 (VHT sounding protocol)	VHTM4.1:M	Yes ☐ No ☐ N/A ☐
VHTM5.2	VHT sounding protocol as SU beamformee	10.34.5 (VHT sounding protocol)	VHTM4.2:M	Yes ☐ No ☐ N/A ☐
VHTM5.3	VHT sounding protocol as MU beamformer	10.34.5 (VHT sounding protocol)	VHTM4.3:M	Yes ☐ No ☐ N/A ☐
VHTM5.4	VHT sounding protocol as MU beamformee	10.34.5 (VHT sounding protocol)	VHTM4.4:M	Yes ☐ No ☐ N/A ☐
VHTM6	TXOP Sharing

B.4.25.1 VHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
VHTM6.1	Sharing of EDCA TXOP	10.22.2.6 (Sharing an EDCA TXOP)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM6.2	Use of Primary and Secondary AC	10.22.2.6 (Sharing an EDCA TXOP)	VHTM6.1:M	Yes ☐ No ☐ N/A ☐
VHTM7	VHT TXOP power saving	11.2.2.19 (VHT TXOP power save)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM8	BSS Operation			
VHTM8.1	Use of primary 20 MHz, secondary 20 MHz, and secondary 40 MHz channels	10.3.2.6 (VHT RTS procedure), 10.3.2.7 (CTS and DMG CTS procedure)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM8.2	Use of secondary 80 MHz channels for 160 MHz and 80+80 MHz	11.40.1 (Basic VHT BSS functionality)	(VHTP3.4 OR VHTP3.5):M	Yes ☐ No ☐ N/A ☐
VHTM8.3	CCA on primary 20 MHz, secondary 20 MHz, and secondary 40 MHz channels	11.40.5 (NAV assertion in a VHT BSS)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM8.4	CCA on secondary 80 MHz channels for 160 MHz and 80+80 MHz	11.40.5 (NAV assertion in a VHT BSS)	(VHTP3.4 OR VHTP3.5):M	Yes ☐ No ☐ N/A ☐
VHTM9	Group ID			
VHTM9.1	Transmission of Group ID Management frame	9.6.23.3 (Group ID Management frame format)	VHTM4.3:M	Yes ☐ No ☐ N/A ☐
VHTM9.2	Reception of Group ID Management frame	9.6.23.3 (Group ID Management frame format)	VHTM4.4:M	
VHTM10	Bandwidth signaling			
VHTM10.1	Support for non-HT bandwidth signaling and static operation	10.3.2.6 (VHT RTS procedure)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM10.2	Support for non-HT bandwidth signaling and dynamic operation	10.3.2.6 (VHT RTS procedure)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM11	VHT single MPDU format	10.13.7 (Setting the EOF field of the MPDU delimiter)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM12	Partial AID in VHT PPDU	10.20 (Group ID and partial AID in VHT PPDUs)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM13	Extended BSS Load element	9.4.2.160 (Extended BSS Load element)	CFVHT:O	Yes ☐ No ☐ N/A ☐

B.4.25.1 VHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
VHTM13.1	Transmission of the Extended BSS Load element	9.4.2.160 (Extended BSS Load element)	CFAP AND CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM14	Quiet Channel element			
VHTM14.1	Transmission of Quiet Channel element by an AP or mesh station in Beacon and Probe Response frames	9.3.3.3 (Beacon frame format), 9.3.3.11 (Probe Response frame format), 9.4.2.165 (Quiet Channel element), 11.9.3 (Quieting channels for testing)	(CFAP OR CFMBSS) AND CFSM AND CFVHT AND VHTP3.4:O	Yes ☐ No ☐ N/A ☐
VHTM14.2	Transmission of Quiet Channel element by an independent station or mesh station in Beacon and Probe Response frames	9.3.3.3 (Beacon frame format), 9.3.3.11 (Probe Response frame format), 9.4.2.165 (Quiet Channel element), 11.9.3 (Quieting channels for testing)	(CFIndepSTA OR CFMBSS) AND CFSM AND CFVHT AND VHTP3.4:O	Yes ☐ No ☐ N/A ☐
VHTM14.3	Reception of Quiet Channel element by an independent station or mesh station in Beacon and Probe Response frames	9.3.3.3 (Beacon frame format), 9.3.3.11 (Probe Response frame format), 9.4.2.165 (Quiet Channel element), 11.9.3 (Quieting channels for testing)	(CFIndepSTA OR CFMBSS) AND CFSM AND CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM15	Space-time block coding (STBC)			
VHTM15.1	STBC operation	9.4.2.158 (VHT Capabilities element), 10.17 (STBC operation)	VHTP9:M	Yes ☐ No ☐ N/A ☐
VHTM15.2	Transmission of at least 2x1 STBC	9.4.2.158.2 (VHT Capabilities Information field)	VHTP9:O.1	Yes ☐ No ☐ N/A ☐

This is an unapproved IEEE Standards Draft, subject to change.

B.4.25.1 VHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
VHTM15.3	Reception of 1 STBC spatial stream	9.4.2.158.2 (VHT Capabilities Information field)	VHTP9:O.1	Yes ☐ No ☐ N/A ☐
VHTM15.4	Reception of 2 STBC spatial streams	9.4.2.158.2 (VHT Capabilities Information field)	VHTM15.3:O	Yes ☐ No ☐ N/A ☐
VHTM15.5	Reception of 3 STBC spatial streams	9.4.2.158.2 (VHT Capabilities Information field)	VHTM15.4:O	Yes ☐ No ☐ N/A ☐
VHTM15.6	Reception of 4 STBC spatial streams	9.4.2.158.2 (VHT Capabilities Information field)	VHTM15.5:O	Yes ☐ No ☐ N/A ☐
VHTM16	Highest Supported Long GI Data Rate			
VHTM16.1	Tx Highest Supported Long GI Data Rate	9.4.2.158.3 (Supported VHT-MCS and NSS Set field)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM16.2	Rx Highest Supported Long GI Data Rate	9.4.2.158.3 (Supported VHT-MCS and NSS Set field)	CFVHT:M	Yes ☐ No ☐ N/A ☐
NOTE—Required support for MCS might be limited by the declaration of Tx and Rx Highest Supported Long GI Data Rates.				

B.4.25.2 VHT PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
VHTP1	PHY operating modes			
VHTP1.1	Operation according to Clause 18 (Orthogonal frequency division multiplexing (OFDM) PHY specification) (Orthogonal frequency division multiplexing (OFDM) PHY specification) and/or Clause 20 (High Throughput (HT) PHY specification) (High Throughput)	21.1.4 (PPDU formats)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP2	VHT format	21.3.2 (VHT PPDU format)	CFVHT:M	Yes ☐ No ☐ N/A ☐

B.4.25.2 VHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
VHTP3	BSS bandwidth			
VHTP3.1	20 MHz operation	11.40.1 (Basic VHT BSS functionality)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP3.2	40 MHz operation	11.40.1 (Basic VHT BSS functionality)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP3.3	80 MHz operation	11.40.1 (Basic VHT BSS functionality)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP3.4	160 MHz operation	11.40.1 (Basic VHT BSS functionality)	CFVHT:O VHTP3.5:M	Yes ☐ No ☐ N/A ☐
VHTP3.5	80+80 MHz operation	11.40.1 (Basic VHT BSS functionality)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP4	Bandwidth indication	17.3.5.5 (PHY DATA scrambler and descrambler)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP5	PHY timing parameters			
VHTP5.1	Values in 20 MHz channel	21.3.6 (Timing-related parameters)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP5.2	Values in 40 MHz channel	21.3.6 (Timing-related parameters)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP5.3	Values in 80 MHz channel	21.3.6 (Timing-related parameters)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP5.4	Values in 160 MHz channel	21.3.6 (Timing-related parameters)	VHTP3.4:M	Yes ☐ No ☐ N/A ☐
VHTP5.5	Values in 80+80 MHz channel	21.3.6 (Timing-related parameters)	VHTP3.5:M	Yes ☐ No ☐ N/A ☐
VHTP6	VHT preamble	21.3.8 (VHT preamble)	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP7	Use of LDPC Code	21.3.10.5.4 (LDPC coding)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8	Modulation and coding schemes (MCS)			
VHTP8.1	CBW20, CBW40 and CBW80	21.5 (Parameters for VHT-MCSs)		
VHTP8.1.1	VHT-MCS with Index 0-7 and $N_{SS} = 1$	21.5 (Parameters for VHT-MCSs)	CFVHT:M	Yes ☐ No ☐ N/A ☐

B.4.25.2 VHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
VHTP8.1.2	VHT-MCS with Index 0-8 and $N_{SS} = 1$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.1:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.3	VHT-MCS with Index 0-9 and $N_{SS} = 1$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.2:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.4	VHT-MCS with Index 0-7 and $N_{SS} = 2$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.5	VHT-MCS with Index 0-8 and $N_{SS} = 2$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.4:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.6	VHT-MCS with Index 0-9 and $N_{SS} = 2$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.5:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.7	VHT-MCS with Index 0-7 and $N_{SS} = 3$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.8	VHT-MCS with Index 0-8 and $N_{SS} = 3$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.7:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.9	VHT-MCS with Index 0-9 and $N_{SS} = 3$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.7:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.10	VHT-MCS with Index 0-7 and $N_{SS} = 4$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.11	VHT-MCS with Index 0-8 and $N_{SS} = 4$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.10:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.12	VHT-MCS with Index 0-9 and $N_{SS} = 4$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.11:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.13	VHT-MCS with Index 0-7 and $N_{SS} = 5$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.14	VHT-MCS with Index 0-8 and $N_{SS} = 5$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.13:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.15	VHT-MCS with Index 0-9 and $N_{SS} = 5$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.14:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.16	VHT-MCS with Index 0-7 and $N_{SS} = 6$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.17	VHT-MCS with Index 0-8 and $N_{SS} = 6$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.16:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.18	VHT-MCS with Index 0-9 and $N_{SS} = 6$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.17:O	Yes ☐ No ☐ N/A ☐

B.4.25.2 VHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
VHTP8.1.19	VHT-MCS with Index 0-7 and $N_{SS} = 7$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.20	VHT-MCS with Index 0-8 and $N_{SS} = 7$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.19:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.21	VHT-MCS with Index 0-9 and $N_{SS} = 7$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.20:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.22	VHT-MCS with Index 0-7 and $N_{SS} = 8$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.23	VHT-MCS with Index 0-8 and $N_{SS} = 8$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.22:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.24	VHT-MCS with Index 0-9 and $N_{SS} = 8$	21.5 (Parameters for VHT-MCSs)	VHTP8.1.23:O	Yes ☐ No ☐ N/A ☐
VHTP8.2	CBW160	21.5 (Parameters for VHT-MCSs)		
VHTP8.2.1	VHT-MCS with Index 0-7 and $N_{SS} = 1$	21.5 (Parameters for VHT-MCSs)	VHTP3.4:M	Yes ☐ No ☐ N/A ☐
VHTP8.2.2	VHT-MCS with Index 0-8 and $N_{SS} = 1$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.1:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.3	VHT-MCS with Index 0-9 and $N_{SS} = 1$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.2:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.4	VHT-MCS with Index 0-7 and $N_{SS} = 2$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.5	VHT-MCS with Index 0-8 and $N_{SS} = 2$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.4:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.6	VHT-MCS with Index 0-9 and $N_{SS} = 2$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.5:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.7	VHT-MCS with Index 0-7 and $N_{SS} = 3$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.8	VHT-MCS with Index 0-8 and $N_{SS} = 3$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.7:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.9	VHT-MCS with Index 0-9 and $N_{SS} = 3$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.8:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.10	VHT-MCS with Index 0-7 and $N_{SS} = 4$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐

B.4.25.2 VHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
VHTP8.2.11	VHT-MCS with Index 0-8 and $N_{SS} = 4$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.10:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.12	VHT-MCS with Index 0-9 and $N_{SS} = 4$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.11:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.13	VHT-MCS with Index 0-7 and $N_{SS} = 5$	21.5 (Parameters for VHT-MCSs)	CFVHT9:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.14	VHT-MCS with Index 0-8 and $N_{SS} = 5$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.13:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.15	VHT-MCS with Index 0-9 and $N_{SS} = 5$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.14:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.16	VHT-MCS with Index 0-7 and $N_{SS} = 6$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.17	VHT-MCS with Index 0-8 and $N_{SS} = 6$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.16:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.18	VHT-MCS with Index 0-9 and $N_{SS} = 6$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.17:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.19	VHT-MCS with Index 0-7 and $N_{SS} = 7$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.20	VHT-MCS with Index 0-8 and $N_{SS} = 7$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.19:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.21	VHT-MCS with Index 0-9 and $N_{SS} = 7$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.20:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.22	VHT-MCS with Index 0-7 and $N_{SS} = 8$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.23	VHT-MCS with Index 0-8 and $N_{SS} = 8$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.22:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.24	VHT-MCS with Index 0-9 and $N_{SS} = 8$	21.5 (Parameters for VHT-MCSs)	VHTP8.2.23:O	Yes ☐ No ☐ N/A ☐
VHTP8.3	CBW80+80	21.5 (Parameters for VHT-MCSs)		
VHTP8.3.1	VHT-MCS with Index 0-7 and $N_{SS} = 1$	21.5 (Parameters for VHT-MCSs)	VHTP3.5:M	Yes ☐ No ☐ N/A ☐
VHTP8.3.2	VHT-MCS with Index 0-8 and $N_{SS} = 1$	21.5 (Parameters for VHT-MCSs)	VHTP8.3.1:O	Yes ☐ No ☐ N/A ☐

B.4.25.2 VHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
VHTP8.3.20	VHT-MCS with Index 0-8 and $N_{SS} = 7$	21.5 (Parameters for VHT-MCSs)	VHTP8.3.19:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.21	VHT-MCS with Index 0-9 and $N_{SS} = 7$	21.5 (Parameters for VHT-MCSs)	VHTP8.3.20:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.22	VHT-MCS with Index 0-7 and $N_{SS} = 8$	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.23	VHT-MCS with Index 0-8 and $N_{SS} = 8$	21.5 (Parameters for VHT-MCSs)	VHTP8.3.22:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.24	VHT-MCS with Index 0-9 and $N_{SS} = 8$	21.5 (Parameters for VHT-MCSs)	VHTP8.3.23:O	Yes ☐ No ☐ N/A ☐
VHTP8.4	Transmit and receive support for 400 ns GI	21.5 (Parameters for VHT-MCSs)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP9	Space-time block coding (STBC)	21.3.10.9.4 (Space-time block coding)	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP10	Non-HT duplicate format	21.3.10.12 (Non-HT duplicate transmission)	CFVHT:M	Yes ☐ No ☐ N/A ☐

B.4.26 TVWS functions

Item	Protocol capability	References	Status	Support
WS1	Fixed STA TVWS operation	11.44 (Operation under the control of a GDB), Annex D, E.2.5 (TVWS band in the United States and Canada (54 MHz to 698 MHz))	CFTVHT:O	Yes ☐ No ☐ N/A ☐
WS2	Master STA TVWS operation	11.44 (Operation under the control of a GDB), 11.44.2 (GDD enabling STA operation), Annex D, E.2.5 (TVWS band in the United States and Canada (54 MHz to 698 MHz))	CFTVHT:O	Yes ☐ No ☐ N/A ☐

B.4.26 TVWS functions

Item	Protocol capability	References	Status	Support
*WS3	Client STA TVWS operation	11.44.3 (GDD dependent STA operation), Annex D, E.2.5 (TVWS band in the United States and Canada (54 MHz to 698 MHz))	CFTVHT:O	Yes ☐ No ☐ N/A ☐
WS3.1	GDD dependent STA TVWS behavior	11.44.3 (GDD dependent STA operation), Annex D, E.2.5 (TVWS band in the United States and Canada (54 MHz to 698 MHz))	WS3:M	Yes ☐ No ☐ N/A ☐
WS4	Channel Availability Query	9.4.5.2 (Query List ANQP-element), 9.6.8.25 (Channel Availability Query frame format), 11.44.4 (Channel availability query (CAQ) procedure)	CFTVHT:M	Yes ☐ No ☐ N/A ☐
WS5	Channel Schedule Management	9.4.5.3 (Capability List ANQP-element), 9.6.8.26 (Channel Schedule Management frame format), 11.44.5 (Channel schedule management (CSM) procedures)	CFTVHT:M	Yes ☐ No ☐ N/A ☐
WS6	Contact Verification Signal	9.6.8.27 (Contact Verification Signal frame format), 11.44.6 (Contact verification signal (CVS))	CFTVHT:M	Yes ☐ No ☐ N/A ☐
*WS7	Network Channel Control	6.3.101 (Network channel control management), 9.4.5.4 (Venue Name ANQP-element), 9.6.8.30 (Network Channel Control frame format), 11.44.7 (Network channel control (NCC) procedures)	CFTVHT:M	
WS7.1	NCC Requesting STA	11.44.7.2 (NCC requesting STA)	CFTVHT:M	Yes ☐ No ☐ N/A ☐
WS7.2	NCC Responding STA	11.44.7.3 (NCC responding STA)	CFTVHT:O	Yes ☐ No ☐ N/A ☐

B.4.26 TVWS functions

Item	Protocol capability	References	Status	Support
WS8	White Space Map Announcement	9.4.2.170 (White Space Map element), 9.6.8.31 (White Space Map Announcement frame format), 11.44.9 (White space map (WSM))	CFTVHT:M	Yes ☐ No ☐ N/A ☐

B.4.26.1 TVHT MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
TVHTM1	TVHT Capabilities element			
TVHTM1.1	VHT Capabilities element	9.4.2.158.1 (VHT Capabilities element structure)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.6 (Association Request frame format), 9.3.3.8 (Reassociation Request frame format), 9.3.3.10 (Probe Request frame format), 9.4.2.158.1 (VHT Capabilities element structure)	(CFTVHT AND CFIndepSTA): O (CFTVHT AND CFMBSS):O	Yes ☐ No ☐ N/A ☐
TVHTM1.3	Signaling of STA and BSS capabilities in Beacon, Probe Response, (Re)Association Response frames	9.3.3.3 (Beacon frame format), 9.3.3.7 (Association Response frame format), 9.3.3.9 (Reassociation Response frame format), 9.3.3.11 (Probe Response frame format), 9.4.2.158 (VHT Capabilities element)	(CFTVHT AND CFAP):O (CFTVHT AND CFMBSS):O	Yes ☐ No ☐ N/A ☐

B.4.26.1 TVHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTM2	Signaling of VHT operation	9.4.2.159 (VHT Operation element)	(CFTVHT AND CFAP):O (CFTVHT AND CFMBSS):O (CFTVHT AND CFIBSS):O	Yes ☐ No ☐ N/A ☐
TVHTM3	Link adaptation			
TVHTM3.1	Use of the VHT variant HT Control field for link adaptation in immediate response exchange	9.2.4.6 (HT Control field), 9.3.3.15 (Action No Ack frame format), 10.28.3 (Rules for RD initiator)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM4	Transmit beamforming			
*TVHTM4.1	SU Beamformer Capable	9.4.2.158 (VHT Capabilities element)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
*TVHTM4.2	SU Beamformee Capable	9.4.2.158 (VHT Capabilities element)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
*TVHTM4.3	MU Beamformer Capable	9.4.2.158 (VHT Capabilities element)	CFAP AND TVHTM4.1:O	Yes ☐ No ☐ N/A ☐
*TVHTM4.4	MU Beamformee Capable	9.4.2.158 (VHT Capabilities element)	CFIndepSTA AND TVHTM4.2:O	Yes ☐ No ☐ N/A ☐
TVHTM4.5	Transmission of null data packet	10.31 (Link adaptation)	TVHTM4.1:M	Yes ☐ No ☐ N/A ☐
TVHTM4.6	Reception of null data packet	10.31 (Link adaptation)	TVHTM4.2:M	Yes ☐ No ☐ N/A ☐
TVHTM5	VHT sounding protocol			
TVHTM5.1	VHT sounding protocol as SU beamformer	10.34.5 (VHT sounding protocol)	TVHTM4.1:M	Yes ☐ No ☐ N/A ☐
TVHTM5.2	VHT sounding protocol as SU beamformee	10.34.5 (VHT sounding protocol)	TVHTM4.2:M	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.26.1 TVHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTM5.3	VHT sounding protocol as MU beamformer	10.34.5 (VHT sounding protocol)	TVHTM4.3:M	Yes ☐ No ☐ N/A ☐
TVHTM5.4	VHT sounding protocol as MU beamformee	10.34.5 (VHT sounding protocol)	TVHTM4.4:M	Yes ☐ No ☐ N/A ☐
TVHTM6	TXOP Sharing			
TVHTM6.1	Sharing of EDCA TXOP	9.19.2.3a	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM6.2	Use of Primary and Secondary AC	9.19.2.3a	TVHTM6.1:M	Yes ☐ No ☐ N/A ☐
TVHTM7	VHT TXOP power saving	10.2.1.4a	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM8	BSS Operation			
TVHTM8.1	Use of primary TVHT_W, secondary TVHT_W, and secondary TVHT_2W channels	11.43 (Basic TVHT BSS functionality)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM8.2	CCA on primary TVHT_W, secondary TVHT_W, and secondary TVHT_2W channels	11.43 (Basic TVHT BSS functionality)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM9	Group ID			
TVHTM9.1	Transmission of Group ID Management frame	9.6.23.3 (Group ID Management frame format)	TVHTM4.3:M	Yes ☐ No ☐ N/A ☐
TVHTM9.2	Reception of Group ID Management frame	9.6.23.3 (Group ID Management frame format)	TVHTM4.4:M	Yes ☐ No ☐ N/A ☐
TVHTM10	Bandwidth signaling			
TVHTM10.1	Support for non-HT bandwidth signaling and static operation	9.3.2.5a	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTM10.2	Support for non-HT bandwidth signaling and dynamic operation	9.3.2.5a	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM11	VHT single MPDU format	10.13.8 (Transport of VHT single MPDUs)	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTM12	Partial AID in VHT PPDU	10.20 (Group ID and partial AID in VHT PPDUs)	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTM13	Extended BSS Load element	9.4.2.160 (Extended BSS Load element)	CFTVHT:O	Yes ☐ No ☐ N/A ☐

B.4.26.1 TVHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTM13.1	Transmission of the Extended BSS Load element	9.4.2.160 (Extended BSS Load element)	CFAP AND CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM14	Quiet Channel element			
TVHTM14.1	Transmission of Quiet Channel element by an AP or mesh STA in Beacon and Probe Response frames	9.3.3.3 (Beacon frame format), 9.3.3.11 (Probe Response frame format), 9.4.2.165 (Quiet Channel element), 11.9.3 (Quieting channels for testing)	(CFAP OR CFMBSS) AND CFSM AND CFTVHT AND TVHTP3.4:O	Yes ☐ No ☐ N/A ☐
TVHTM14.2	Transmission of Quiet Channel element by an independent STA or mesh STA in Beacon and Probe Response frames	9.3.3.3 (Beacon frame format), 9.3.3.11 (Probe Response frame format), 9.4.2.165 (Quiet Channel element), 11.9.3 (Quieting channels for testing)	(CFIndepSTA OR CFMBSS) AND CFSM AND CFTVHT AND TVHTP3.4:O	Yes ☐ No ☐ N/A ☐
TVHTM14.3	Reception of Quiet Channel element by an independent STA or mesh STA in Beacon and Probe Response frames	9.3.3.3 (Beacon frame format), 9.3.3.11 (Probe Response frame format), 9.4.2.165 (Quiet Channel element), 11.9.3 (Quieting channels for testing)	(CFIndepSTA OR CFMBSS) AND CFSM AND CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM15	Space-time block coding (STBC)			
TVHTM15.1	STBC operation	9.4.2.158 (VHT Capabilities element), 10.15 (DMG A-PPDU operation)	TVHTP9:M	Yes ☐ No ☐ N/A ☐
TVHTM15.2	Transmission of at least 2x1 STBC	9.4.2.158 (VHT Capabilities element)	TVHTP9:O.1	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.26.1 TVHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTM15.3	Reception of 1 STBC spatial stream	9.4.2.158 (VHT Capabilities element)	TVHTP9:O.1	Yes ☐ No ☐ N/A ☐
TVHTM15.4	Reception of 2 STBC spatial stream	9.4.2.158 (VHT Capabilities element)	TVHTM15.3:O	Yes ☐ No ☐ N/A ☐
TVHTM15.5	Reception of 3 STBC spatial stream	9.4.2.158 (VHT Capabilities element)	TVHTM15.4:O	Yes ☐ No ☐ N/A ☐
TVHTM15.6	Reception of 4 STBC spatial stream	9.4.2.158 (VHT Capabilities element)	TVHTM15.5:O	Yes ☐ No ☐ N/A ☐
TVHTM16	Highest Supported Long GI Data Rate			
TVHTM16.1	Tx Highest Supported Long GI Data Rate	9.4.2.158.3 (Supported VHT-MCS and NSS Set field)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM16.2	Rx Highest Supported Long GI Data Rate	9.4.2.158.3 (Supported VHT-MCS and NSS Set field)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
NOTE—Required support for MCS might be limited by the declaration of Tx and Rx Highest Supported Long GI Data Rates.				

B.4.26.2 TVHT PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
TVHTP1	PHY operating modes			Yes ☐ No ☐ N/A ☐
TVHTP2	VHT format	21.3.2 (VHT PPDU format)	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP3	BSS bandwidth			
TVHTP3.1	TVHT_W operation	11.43 (Basic TVHT BSS functionality)	CFTVHT:M	Yes ☐ No ☐ N/A ☐

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

B.4.26.2 TVHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTP3.2	TVHT_2W operation	11.43 (Basic TVHT BSS functionality)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP3.3	TVHT_W+W operation	11.43 (Basic TVHT BSS functionality)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP3.4	TVHT_4W operation	11.43 (Basic TVHT BSS functionality)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP3.5	TVHT_2W+2W operation	11.43 (Basic TVHT BSS functionality)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP4	Bandwidth indication	17.3.5.5 (PHY DATA scrambler and descrambler)	CFVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP5	PHY timing parameters			
TVHTP5.1	Values in 6 MHz channel	22.3.6 (Timing-related parameters)	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP5.2	Values in 7 MHz channel	22.3.6 (Timing-related parameters)	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP5.3	Values in 8 MHz channel	22.3.6 (Timing-related parameters)	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP5.4	Values in non-HT 6 MHz, 7 MHz, and 8 MHz channels	22.2.4 (Support for NON_HT and HT formats)	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP6	TVHT preamble	22.3.8 (TVHT preamble)	CFTVHT:M	Yes ☐ No ☐ N/A ☐

B.4.26.2 TVHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTP7	Use of LDPC Code	11.5.4 (Error recovery upon a peer failure), 21.3 (VHT PHY)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP8	Modulation and coding schemes (MCS)			
TVHTP8.1	TVHT_MODE_1	22.5 (Parameters for TVHT MCSs)		
TVHTP8.1.1	TVHT-MCS with Index 0-7 and $N_{SS} = 1$	22.5 (Parameters for TVHT MCSs)	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP8.1.2	TVHT-MCS with Index 0-8 and $N_{SS} = 1$	22.5 (Parameters for TVHT MCSs)	TVHTP8.1.1:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.3	TVHT-MCS with Index 0-9 and $N_{SS} = 1$	22.5 (Parameters for TVHT MCSs)	TVHTP8.1.2:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.4	TVHT-MCS with Index 0-7 and $N_{SS} = 2$	22.5 (Parameters for TVHT MCSs)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.5	TVHT-MCS with Index 0-8 and $N_{SS} = 2$	22.5 (Parameters for TVHT MCSs)	TVHTP8.1.4:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.6	TVHT-MCS with Index 0-9 and $N_{SS} = 2$	22.5 (Parameters for TVHT MCSs)	TVHTP8.1.5:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.7	TVHT-MCS with Index 0-7 and $N_{SS} = 3$	22.5 (Parameters for TVHT MCSs)	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.8	TVHT-MCS with Index 0-8 and $N_{SS} = 3$	22.5 (Parameters for TVHT MCSs)	TVHTP8.1.7:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.9	TVHT-MCS with Index 0-9 and $N_{SS} = 3$	22.5 (Parameters for TVHT MCSs)	TVHTP8.1.7:O	Yes ☐ No ☐ N/A ☐

Annex C

(normative)

ASN.1 encoding of the MAC and PHY MIB

C.1 General

The MIB for the current revision of IEEE Std 802.11 is available online at the following URL: http://www.ieee802.org/11/802.11mib.txt. The MAC and PHY MIBs are described in Abstract Syntax Notation One (ASN.1), defined in ISO/IEC 8824-1:1995, ISO/IEC 8824-2:1995, ISO/IEC 8824-3:1995 and ISO/IEC 8824-4:1995.

Editor Note: Any <year> below will be replaced by the year of publication by the IEEE-SA publication editor.

C.2 Guidelines for IEEE Std 802.11 MIB Authors/Editors

The MIB may be compiled using the "smitools" package from the Institute of Operating Systems and Computer Networks at the Technical University of Braunschweig, Germany. These tools may be accessed online using the following URL: http://www.ibr.cs.tu-bs.de/bin/smitools.cgi.

Using this tool, the MIB should compile without generating warnings of severity 3 or lower.

Specific points that authors and editors should pay attention to:

- The MIB should compile as specified above prior to submission to IEEE-SA RevCom.
- Use only the 7-bit US-ASCII character-set. In particular, use only straight single and double quotes.
- Do not use symbols such as <greek-mu> in units, instead spell out the units fully, i.e., "microseconds."
- Follow the guidelines for writing MIB modules in http://www.rfc-editor.org/rfc/rfc4181.txt (including any updates thereto).
- Pay attention to IETF recommendations on object types.
- When adding a lot of new objects, consider adding a new module.
- Consider seeking advice from an IETF MIB Doctor when creating significant new material. The IEEE has an arrangement with the IETF whereby the IEEE may ask for a MIB Advisor from the IETF MIB Doctors.
- When an object is deprecated, add a line to the Description indicating why (IETF convention).

C.3 MIB Detail

    REVISION    "201211270000Z"
    DESCRIPTION "IEEE Std 802.11-<year>

        Note that not all objects within this MIB are referenced by a group, and
        not all groups are referenced by a MODULE-COMPLIANCE statement.   Some
        existing groups and the dot11Compliance MODULE-COMPLIANCE have been modi-
        fied since the previous revision of this standard."

    REVISION    "201203300000Z"
    DESCRIPTION "IEEE Std 802.11-2012.

        Note that not all objects within this MIB are referenced by a group, and
        not all groups are referenced by a MODULE-COMPLIANCE statement.   Some
        existing groups and the dot11Compliance MODULE-COMPLIANCE have been modi-
        fied since the previous revision of this standard.

        Implementations should not claim compliance to dot11Compliance."

dot11StationConfigEntry OBJECT-TYPE
    SYNTAX Dot11StationConfigEntry
    MAX-ACCESS not-accessible
    STATUS current
    DESCRIPTION
        "An entry in the dot11StationConfigTable. It is possible for there to be
        multiple IEEE Std 802.11 interfaces on one agent, each with its unique MAC
        address. The relationship between an IEEE Std 802.11 interface and an
        interface in the context of the Internet-standard MIB is one-to-one. As
        such, the value of an ifIndex object instance can be directly used to
        identify corresponding instances of the objects defined herein.

        ifIndex - Each IEEE Std 802.11 interface is represented by an ifEntry.
        Interface tables in this MIB module are indexed by ifIndex."

```
    DESCRIPTION
        "This is a control variable.
        It is written by the SME or external management entity.
        Changes take effect for the next MLME-START.request primitive.

        The purpose of dot11StationID is to allow a manager to identify a station
        for its own purposes. This attribute provides for that eventuality while
        keeping the true MAC address independent. Its syntax is MAC address, and
        the default value is the station's assigned, unique MAC address."

dot11OperationalRateSet OBJECT-TYPE
    SYNTAX OCTET STRING (SIZE(1..126))
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
        "This is a status variable.
        It is written by the SME when joining or establishing a BSS.

        This attribute specifies the set of non-HT data rates at which the station
        is able to receive data. Each octet contains a value representing a rate.
        Each rate is within the range 2 to 127, corresponding to data rates in
        increments of 500 kb/s from 1 Mb/s to 63.5 Mb/s, and is supported (as
        indicated in the supported rates table) for receiving data. This value is
        reported in transmitted Beacon, Probe Request, Probe Response, Association
        Request, Association Response, Reassociation Request, and Reassociation
        Response frames, and is used to determine whether a BSS with which the
        station might synchronize is suitable. It is also used when starting a
        BSS, as specified in 6.3.4 (Synchronization)."

dot11CountryString OBJECT-TYPE
    SYNTAX OCTET STRING (SIZE(3))
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
        "This is a control variable.
        It is written by the SME.
        Changes take effect for the next MLME-START.request primitive.

        This attribute identifies the country or noncountry entity in which the
        station is operating. If it is a country, the first two octets of this
        string is the two character country code as described in document ISO
        3166-1. The third octet is one of the following:

        1. an ASCII space character, if the regulations under which the station is
        operating encompass all environments for the current frequency band in the
        country,

        2. an ASCII 'O' character, if the regulations under which the station is
        operating are for an outdoor environment only, or

        3. an ASCII 'I' character, if the regulations under which the station is
        operating are for an indoor environment only.

        4. an ASCII 'X' character, if the station is operating under a noncountry
        entity. The first two octets of the noncountry entity is two ASCII 'XX'
        characters.

        5. the hexadecimal representation of the Operating Class table number cur-
        rently in use, from the set of tables defined in Annex E, e.g., Table E-1
        (Operating classes in the United States) is represented as x'01'."

This is an unapproved IEEE Standards Draft, subject to change.

```
        This attribute specifies the type of STA mode for the purpose of channel
        availability query requirements. This value is used to set the desired
        channel availability query request parameters in using GAS frames carrying
        Channel Availability Query element of RLQP. When set to gddap, the STA
        indicates that it operates as a personal/portable AP STA after channel
        availability query.
        When set to gddnonapsta, the STA indicates that it operates as a personal/
        portable non-AP STA after channel availability query. When set to
        gddfixedsta, the STA indicates that it operates as a fixed STA after chan-
        nel availability query. When set to any other values, its use is reserved,
        and remains unspecified."

    DESCRIPTION
        "This is a control variable.
        It is written by an external management entity.
        Changes take effect as soon as practical in the implementation.

        The PSK, for when RSNA in PSK mode is the selected AKM suite, is config-
        ured by dot11RSNAConfigPSKValue.

        An alternative manner of setting the PSK uses the password-to-key algo-
        rithm defined in J.4 (Suggested pass-phrase-to-PSK mapping). This variable
        provides a means to enter a pass-phrase. When this object is written, the
        RSNA entity uses the password-to-key algorithm specified in J.4 (Suggested
        pass-phrase-to-PSK mapping) to derive a preshared and populate dot11RSNA-
        ConfigPSKValue with this key.
        This object is logically write-only. Reading this variable returns unsuc-
        cessful status or null or 0."

   DESCRIPTION
      "This is a control variable.
      It is written by an external management entity.
      Changes take effect as soon as practical in the implementation.

      This attribute specifies the Mobility Domain identifier (MDID) of this
      entity.

      The MDID is used to indicate a group of APs, within an ESS, between which
      a STA can use fast BSS transition services. Fast BSS transitions are
      allowed only between APs that have the same MDID and are within the same
      ESS. They are not allowed between APs with different MDIDs or in different
      ESSs.
```

Copyright © 2016 IEEE. All rights reserved.
This is an unapproved IEEE Standards Draft, subject to change.

```
        Since fast BSS transition services are defined only within the scope of an
        ESS, there is no requirement that MDIDs be unique across ESSs."

    MAX-ACCESS not-accessible
    STATUS current
    DESCRIPTION
        "An entry in the dot11WirelessMgmtOptionsTable. For all Wireless Manage-
        ment features, an Activated MIB variable is used to activate/enable or
        deactivate/disable the corresponding feature. An Implemented MIB variable
        is used for an optional feature to indicate whether the feature is imple-
        mented. A mandatory feature does not have a corresponding Implemented MIB
        variable. It is possible for there to be multiple IEEE Std 802.11 inter-
        faces on one agent, each with its unique MAC address. The relationship
        between an IEEE Std 802.11 interface and an interface in the context of
        the Internet-standard MIB is one-to-one. As such, the value of an ifIndex
        object instance can be directly used to identify corresponding instances
        of the objects defined herein. ifIndex - Each IEEE Std 802.11 interface is
        represented by an ifEntry. Interface tables in this MIB module are indexed
        by ifIndex."

dot11WirelessMGTEventTable OBJECT-TYPE
   SYNTAX SEQUENCE OF Dot11WirelessMGTEventEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
      "Group contains the current list of WIRELESS Management reports that have
      been received by the MLME. The report tables shall be maintained as FIFO
      to preserve freshness, thus the rows in this table can be deleted for mem-
      ory constraints or other implementation constraints determined by the ven-
      dor.
      New rows shall have different RprtIndex values than those deleted within
      the range limitation of the index. One easy way is to increment the
      EventIndex for new reports being written in the table."

```
-- ************************************************************************
-- * IEEE Std 802.11 RM and WNM Interface MIB
-- ************************************************************************

-- * The primary interface to the radio measurements and Wireless
-- * Network Management functions is meant to be real-time information
-- * obtained through the request/response mechanisms of RM and WNM.
-- * A secondary interface to the measurements and management functions
-- * is through retention of information in this MIB. Non-SNMP requests
-- * for information are obtained via object IDs (OIDs) through the NDIS
-- * or wireless interfaces in the operating systems. SNMP requests for
-- * information are obtained via SNMP SETs and GETs (see [B25]).

-- *  dot11RMRequest and dot11RMReport Usage
-- *
-- * The dot11RMRequest and dot11RMReport portions of the RM MIB
-- * provide access to the Radio Measurement service. By performing
-- * SET operations on the various dot11RMRequest MIB objects,
-- * radio measurements may be initiated directly on the local STA or
-- * on any peer station within the same BSS. Subsequently, by
-- * performing GET operations on the various dot11RMReport MIB
-- * objects the results of the requested measurements may be
-- * retrieved.
-- *
-- * In the diagram below, a radio measurement could be initiated
-- * for STA x by performing a MIB.set operation on the RM MIB of
-- * STA x and specifying the MAC address of STA x in
-- * dot11RMRqstTargetAdd. Additionally, it is possible to have STA x
-- * request a measurement from STA y by performing a MIB.set operation
-- * on the SME MIB of STA x and specifying the MAC address of STA y in
-- * dot11RMRqstTargetAdd. In both cases the result of the measurements
-- * can be retrieved by performing a MIB.get operation on the RM MIB
-- * of STA x upon completion of the measurement.
-- *
-- *
-- *          MIB.Set                                        MIB.Set
-- *             or                                             or
-- *          MIB.Get                                        MIB.Get

-- *
-- * Each STA maintains a single dot11RMRequestTable in the SME MIB
-- * used to initiate RM Measurement Requests. Each dot11RMRequestEntry
-- * in the table represents an individual Measurement Request that
-- * makes up a complete Measurement Request frame.
-- * Multiple Measurement Requests may be concatenated into a single
```

This is an unapproved IEEE Standards Draft, subject to change.

```
-- * Measurement Request frame by setting the same
-- * dot11RMRqstToken value into multiple dot11RMRequestEntrys.
-- *
-- * Each row, dot11RMRequestEntry, of the dot11RMRequestTable
-- * provides read-create access for the initiation of a measurement
-- * request. The dot11RMRequestNextIndex object can be used to
-- * determine which is the next available row. Each row corresponding to
-- * one measurement in the sequence is created with a dot11RMRqstRowStatus
-- * equal to notInService. Once the dot11RMRequestEntry(s) have been
-- * created for a desired measurement sequence the corresponding
-- * dot11RMRqstRowStatus(s) objects are set to active to indicate that
-- * the SME can trigger the appropriate MLME primitives. Upon processing
-- * the request, the SME returns the corresponding dot11RMRqstRowStatus(s)
-- * object to notInService and are now available for additional
-- * measurement requests.
-- *
-- * After a radio measurement is complete the RM populates the RMReport
-- * objects with the results of the measurement. Each STA maintains a set
-- * of RMReport tables, one corresponding to each measurement type. The
-- * results of the entire measurement sequence are spread across the tables
-- * based on the type of measurements requested. Each xxxReportEntry
-- * within a xxxReportTable contains a xxxRprtRqstToken that corresponds
-- * to the original dot11RMRqstToken in the measurement request. So the
-- * results of the measurement can be collected by searching the appropriate
-- * xxxReportTables and retrieve any reports with the matching request
-- * token.
-- *
-- * Similar structures and mechanisms are used for WNM
-- * Request and Reports. The WNM MIB definitions follow the RM MIB definitions
-- * in this Annex.

dot11RMRequestNextIndex OBJECT-TYPE
   SYNTAX Unsigned32(0..65535)
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
      "This is a status variable.
      It is written by the SME when able to accept a new request.

      Identifies a hint for the next value of dot11RMRqstIndex to be used in a
      row creation attempt for dot11RMRequestTable. If no new rows can be cre-
      ated for some reason, such as memory, processing requirements, etc., the
      SME sets this attribute to 0. It updates this attribute to a proper value
      other than 0 as soon as it is capable of receiving new measurement
      requests. The nextIndex is not necessarily sequential nor monotonically
      increasing."

```
    SYNTAX SEQUENCE OF Dot11RMRequestEntry
    MAX-ACCESS not-accessible
    STATUS current
    DESCRIPTION
        "This group contains the current list of requests for RM reports to be
        issued and have been issued until removed. A network manager adds an RM
        request by creating a row with createAndWait row status and then filling
        in the request parameters/attributes. The request becomes active to be
        issued when the row status is set to Active. The columnar objects or
        attributes other than the rowStatus are not written if the rowStatus is
        Active. The request rows can be deleted, if commanded by a network manager
        via changing the value of dot11RMRqstRowStatus to Destroy. This may leave
        orphaned rows if a manager crashes and forgets which rows are being used
        by it. One recommended way to manage orphaned or finished rows is to
        delete rows if their dot11RMRqstRowStatus remains other than Active for
        longer than a period (recommend at least 5 minutes, IETF RFC 2579). Or
        another recommended way is to delete older rows as needed based on their
        dot11RMRqstTimeStamp values. This can be done by the agent as well as the
        manager. "

    STATUS current
    DESCRIPTION
        "This is a control variable.
        It is written by an external management entity when the table entry is
        created, i.e., when requesting a measurement..
        Changes take effect when dot11RMRqstRowStatus is set to Active.

        This attribute indicates a unique string to identify a group of rows to be
        issued as parallel or sequential measurements. To guarantee the uniqueness
        of this token across multiple network managers, it is recommended that
        this token be prefixed with the IP address of the network manager creating
        this row. This token is not necessarily equivalent to the measurement
        tokens in RM request frames. If this attribute is an empty string, then
        this row of request is independent from other requests."

   DESCRIPTION
      "This is a control variable.
      It is written by an external management entity when requesting a measure-
      ment.
      Changes take effect when dot11RMRqstRowStatus is set to Active.

      This attribute indicates the channel load reporting condition reference
      value. The measured Channel Load is compared to this reference value and a
      report is issued if the reporting condition is satisfied. The reference
      value is in the same units as Channel Load and represents the fractional
      time of the measurement duration during which the STA determined the chan-
      nel to be busy. This attribute is valid only if the dot11RMRqstType is 3,
      indicating a Channel Load request, and is ignored otherwise."

dot11NoiseHistogramRprtAntennaID OBJECT-TYPE
    SYNTAX Unsigned32(0..255)
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
        "This is a status variable.
        It is written by the SME when a measurement report is completed.

        This attribute indicates the identifying number for the antenna used for
        this measurement. The value 0 indicates that the antenna identifier is
        unknown. The value 255 indicates that the measurement was made with multi-
        ple antennas or that the antenna ID is unknown. The value 1 is used for a
        STA with only one antenna. STAs with more than one antenna assign Antenna
        IDs to each antenna as consecutive, ascending numbers. Each Antenna ID
        number represents a unique antenna characterized by a fixed relative posi-
        tion, a fixed relative direction, and a peak gain for that position and
        direction."

```
    SYNTAX Unsigned32(0..255)
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
       "This is a status variable.
       It is written by the SME when a measurement report is completed.

       This attribute indicates the identifying number for the antenna used for
       this measurement. The value 0 indicates that the antenna identifier is
       unknown. The value 255 indicates that this measurement was made with mul-
       tiple antennas. The value 1 is used for a STA with only one antenna. STAs
       with more than one antenna assign Antenna IDs to each antenna as consecu-
       tive, ascending numbers. Each  Antenna ID number represents a unique
       antenna characterized by a fixed relative position, a fixed relative
       direction, and a peak gain for that position and direction."
