Famous Dark Net Marketplaces to buy Exploits – 0 day Vulnerabilities- Malwares for Research

POSTED ON [JUNE 10, 2015](#)

The best way to access deep web is through a service called Tor (or TOR), also known as 'The Onion Router'. Installing TOR like installing a new browser as TOR comes with its own browser. The TOR browser itself is built upon Firefox browser's platform, so if you have ever used Firefox you will find it extremely easy to use TOR browser.

You can use Tor to surf the Internet anonymously. Thus it's very difficult for private companies and governments to spy on you, if you set up TOR with some precautions like not allowing DNS leakage mentions **malware reverse engineer and exploit programming training** professor **Chris Havens** from International institute of cyber security. With Tor you can visit anonymous websites on the Tor network. The anonymous marketplace is one of the largest and most popular sections of the Darknet.

The URL of Dark web websites are different from ordinary URLs. The URLs are composed of random-looking strings of characters followed by .onion. The other networks like Tor are **The Freenet Project**, which is similar to Tor but also allows the creation of private networks, which only specific people can access.

Another Darknet system is called **IzP** (the Invisible Internet Project), which is similar to Tor, and it offers secure email, file storage, file sharing, blogging and chat.

Many users who use Tor like network uses an extra layer of protection by connecting using a virtual private network, or VPN and this make very difficult for somebody to track them mentions malware reverse engineer and exploit programming trainer.

Most of the trading is done in TOR network using virtual Crypto currency like Bitcoin, Darkcoin etc. Crypto currency and privacy networks are distributed computing projects, in which network of computers nodes operate the powerful web server.

Crypto currencies monetize people's involvement with providing darknet services by integrating them in the system. Bitcoins are mathematically generated as the computers in this network execute difficult number-crunching tasks, a procedure known as Bitcoin "mining". The mathematics of the Bitcoin system were set up so that it becomes progressively more difficult to "mine" Bitcoins over time, and the total number that can ever be mined is limited to around 21m. The entire network is used to monitor and verify both the creation of new Bitcoins through mining, and the transfer of Bitcoins between users. A log is collectively maintained of all transactions, with every new transaction broadcast across the Bitcoin network. Bitcoins can be bought and sold in return for traditional currency on several exchanges, and can also be directly transferred across the internet from one user to another by using appropriate software. This makes Bitcoin a potentially attractive currency in which to settle international transactions, without messing around with bank charges or exchange rates.

There are lot of websites that can be use to buy and sell stuff in deep web, these are normally called marketplaces. We are going to cover some of the marketplace where you can buy and sell exploits, vulnerabilities, oday stuff, malware, virus etc. While communicating in these market place make you use an escrow system provided by the website or third party to make sure of whatever you buy or sell.

Below are list of some websites/market places for technology related stuff like zero day vulnerabilities, exploits, malwares and hackers etc. In no way we are promoting trade of malware, exploits and vulnerabilities; this information is just for research and educational purposes. Hacking somebody or spreading malware is a criminal offense and these websites should be used to find new vulnerabilities and exploits in the market so that you can secure your networks against them.

The RealDeal Market

A Multisig marketplace originally for private exploits, source code, hardware, hacking services and more. The market is focused on exploits and vulnerabilities. This site is famous for programming related stuff.

<http://trdealmgn4uvm42g.onion.city/>

Cebolla Chan

It is a forum based in Spanish. You can find lot of people promoting different types of exploits and hacks. You can contact the seller and trade them through third party escrow system. It is more famous in Mexico, Brazil and Argentina.

As per malware reverse engineer and exploit programming training professor Chris Havens above are some of the marketplaces for beginners. For advance users you will have to go into more deep layers of Deep web and know the industry experts and dealers. However to be anonymous you can use bitcoin mixing services like

Shared Coin: <https://sharedcoin.com/>

Coinmixer.io: <https://bitmixer.io/>

This provides privacy for your transactions by combining your transaction with other people's. Also you can use open Source Multisig solution while trading and use PGP verification services like mentioned below.

Vendor PGP key Search: <http://lbnuqoq5na3mzkgv.onion>
