best thing since straight to base

Hi everyone. I'm new here, thanks for the welcomes in the welcome place.

My story is in the introduction section. I joined here because I should have long ago, and to bring attention to a couple of threads on DMT-Nexus that I found googling around as I worked with these ecig devices. The ecig vaporizers have lead to a whole new way for DMT to fit into my life; and believe me, I've been trying to fit it in for a long time. e-cig doesn't mean the disposable things at gas station checkouts, it is a whole universe of parts for vaporizing solutions of nicotine, or guess what else.

So I didn't come up with any of this, but the two threads that I've seen on this forum are most certainly under-appreciated. It may be because when you read them they sound like people trying to work this out, and perhaps not coming to a clear conclusion. But that's not the way it is. This is simple, and great. Really.

[Rollingwood's Tek](#)

[PerPLexED/Lost Traveler/Unheimlich/MDMM thread](#)

So to simplify this before making it specific

----update 12/10/12 - I now think that dmt in 95% ethanol is better, as in Lost traveller's posts in the thread above. it's more concentrated and a more natural vehicle. Also, I now have experimented with

the [Dual Coil Tanks](#) and they are better, they make a bigger hit.

- 1) DMT is quite soluble in PEG-400, one of the less common e-cig solvents. It is much easier to manipulate a concentrated solution than a powder.
- 2) The newer "tank" type ecig cartridges hold liquids, and supply them to a vaporizing element. These are the type to look at. They are made to vaporize solutions of stuff.
- 3) You put a saturated PEG-400 / DMT solution into a "tank" cartridge and you are set. Anyone can breakthrough every time, it does take a few hits.

Benefits --

- 1) Always works. No learning curve. You can pull this sharpie sized electronic thing out of your pocket, hand it to a newbie, tell them to hit the button and take one draw after another, and it will get them as far as they want to go. They can drop it in their lap and it won't spill or burn them. You can pick it up and hand it to another person. It's that easy. Over 100 draws in even a small tank setup.
 - 2) Much more efficient with the spice than any way I've done it. In fact, I think the whole vaporized dose recommendations are changed somehow. I estimate that a common puff with one of the common vape setups has about 2-5 mg dmt in it. Three hits and you are past breakthrough and 6 good hits and you drop the device for sure. You can hit it pretty quickly. They make setups that create much bigger hits if you wanted.
 - 3) Ecig equipment is standardized, mass produced, relatively inexpensive for what you get, doesn't look sketchy. If a cop pulled it out of your pocket, he would think it was an ecigarette setup 'cause it is.
 - 4) You can add flavorings, I'm experimenting with this now.
 - 5) You can use it out and about much easier than other portables. Hit it at the rave or the concert. Pass it to a friend. Taking a small dose is fun. Sitting down and taking a big dose is funner.
- Ill put details in the next post, but that's the truth.

www.rueshop.com

Good quality Syrian rue (*Peganum harmala*) for an incredible price!

So the keys are -

edit add 12/10/12 - my thought have changed with experimentation. Use ethanol 95% 2 mls per gram of dmt, or it can be more concentrated. Still use the tank type cartridges, but the [Dual Coil Tanks](#) make a bigger hit.

A saturated DMT in PEG-400 solution. You can get about 0.5 grams into 3 mls of PEG-400, maybe a bit more. You can order PEG-400 from online e-cig vendors. It's thought to be safer than the other solvents that they use and is usually recommended for people who are allergic to glycerin. The brown bottle is PEG-400. The black sticks are the battery/handle part of an ecig setup. I've found the eco-t size/type to be a good compromise between size and battery life. You can "lock" them so that they don't go off in your pocket.

In the picture, the little vial is a saturated solution of DMT in PEG-400. The glass bottle has some active charcoal purified DMT, and the casserole dish has some that I just freeze precipitated from a direct to base extraction and will clean up soon.

The bottom right thing is an eco-t battery with the atomizer attached and a filled cartridge in it, two spare cartridges sitting next to it. This is what I think is the best setup. That's the whole rig, it holds over a cc of mixture, ie about 200 mg, and you can have other filled cartridges in your pocket ready to go if needed.

The vivanova tank pictured holds more and gives bigger hits and is rebuildable if it burns out. The green box is c3 smokimizers and are cheaper and disposable. Lots of these tanks work well. Once you get the batteries, all other brands of tanks fit on them if they use the most standard threads, called 510 threads.

foaf attached the following image(s):

 setups.JPG (239kb) downloaded **3,474** time(s).

To make it simple, here is my recommendation. This would be using the #1 company's products, Joye. There are many others, but most copy Joye. The threads that connect the battery to the atomizer/cartridge are standardized by Joye and called 510. If you get other brands, stick to 510 threads.

So a simplified shopping list includes

added - I now like ethanol better, 2 cc per gram dmt or more concentrated.

1) PEG-400 ([ecig solvent faq](#)) [Source](#)

2) [eco-t battery and charger](#)

3) [Regular atomizer head](#) and/or [High output atomizer head](#) called "low resistance"

4) [Empty tanks](#) can be refilled as many times as you want.

5) added - or instead of 3 and 4, I found [dual coil tanks](#) for significantly bigger hits and cheaper.

----edit add 12/4/12 ----

further down the thread it is suggested that this system doesnt make enough vapor and costs too much. If you want more vapor from the start and a cheaper price to start just get the battery and the [CE3 disposable tank](#)

or for even more vapor, but shorter battery life, get a dual coil tank.

[Dual Coil tank](#)

This is awesome! Thanks for the info. I had wondered if this was possible but hadn't really looked into it much yet. I already have an e-Go T, it totally changed the way I consumed THC (back before I quit), and I tried to turn as many people on to it as I could. Unfortunately I don't have any more DMT to try this with, and with the MHRB situation really don't know when/if I ever will.

But if some miracle lands it in my lap again I'll definitely give this method a try!

No direction but to follow what you know,

No direction but a faith in her decision,

No direction but to never fight her flow,

No direction but to trust the final destination.

I'm curious why you say that the preferred rig is the one that delivers a smaller amount. It's hard for me to imagine really breaking through taking multiple 5mg hits, although the idea of a delivery system like this is very intriguing for sure.

How much bigger are the hits produced by the Vivi Nova, and what are its relative drawbacks? If you could get up into the 20mg per hit range, then you would be on to something!

Quote:

I'm curious why you say that the preferred rig is the one that delivers a smaller amount.

Well, the Joye brand just works great. I actually havent tried, but have ordered, the atomizer head that makes a bigger hit, the so called low resistance. I can get to any level of this that I want to go to. It is more of an easing in than with a huge blast from a skillet or a bulb, but I think I like that better.

Unlike other methods where when you are half there, its hard to manage the mechanical aspects of another or another hit, that's not the case here. You can work it till you get there.

Quote:

If you could get up into the 20mg per hit range, then you would be on to something!

Oh this is on to something. But I see what you are thinking. Ive put 20 mg into vaporizers before, hit it hard with one or two hits and not gotten as far as I get with say 4 hits off of one of these. That is why I think this is more efficient with my spice.

Quote:

How much bigger are the hits produced by the Vivi Nova

The ViviNova can be fitted with any one of 3 different inexpensive replacable elements to adjust the size of the hit. I've only done the smaller one that it comes with, and it is about as much as I can take without coughing. Granted the vapor isn't all DMT.

I don't suggest that this is "better" than other great methods, but for on the go, about town, it has huge merit. I think its the only way Ill ever take it again. You will never be able to get as much of a dose into one hit with an ecig device as you could using straight DMT and a VG or other good vaporizer.

An interesting delivery method.

There are two problems with the GVG that this device might solve:

---- 1. Condensation. Even when the GVG is kept very clean, it's sometimes surprising how much vapor condenses on the glass.

---- 2. Failure to vape the full dose. Although my "choreboy" disc usually works very well, there are times when not everything gets vaporized, even though it appears to be at the time. Very frustrating when this happens!

Search my posts for "Ploom" and you'll see an ecig-type device I tried once. Unfortunately, it wasn't successful at all.

There are a couple of concerns I have with this new method:

---- 1. Inhaling polyethylene glycol vapor doesn't sound too appealing. How safe is it really? Is it harsh or unpleasant in any way?

---- 2. I'm used to a single inhalation for a full dose. Do you think it's possible to load a full dose (approx. 25 – 30mg) and get it all in one breath?

Looking forward to other's evaluations.

The PEG-400 has a bit of taste. It doesn't hurt the experience IMO. It's kind of a musty sweet taste. As far as safety goes, to a great degree I just rely on the mindless practical fact that it is deemed safe as an ecig base and ecig smokers would be vaping hundreds of times more of this than me. It is used in some intravenous preparations and is generally considered to be safe all around for ingestion. Used in foods and medicines.

I don't think this type of device will ever be able to give 10+ mg in a single puff, no. It isn't the right tool for a huge one hit blast off.

This is so awesome! I had this same idea a few weeks ago. I am glad someone figured this out, so I don't have to! It sounds perfect for me, as I don't like being ripped into hyperspace, but more easing into it.

Thanks!!!

Be an adult only when necessary.

Do you think this method could be modified for harmalas? Harmalas have a much higher vaporisation temp than spice; the iolite vaporiser cannot vape harmala extract and it reaches 190 celsius. I am very

interested in all the various methods behind these techniques.

But seeing as it is an atomizer, there is a chance that simply inhaling a very fine mist of harmala freebase dissolved in appropriate solvent would function the same as gaseous harmala.

For some reason (i.e. me not reading carefully enough) I thought this was an E-cig with an electric heating element. Upon more careful reading, I see it's an atomizer.

This makes it even more appealing! No heat means no possibility of thermally degrading the product. Maybe this is why a smaller dose is more effective?

I think I have to get one of these.

Thanks for all the info!

edit: After reading more, it seems that e-cigs both atomize

and

heat liquids? Now I'm confused.

Yeah you need heat I guess. Maybe to reduce the viscosity/provide enough energy to the mist to make it as fine as possible?

Here's my question: Why can't you just get a cleaned out perfume bottle with some DMT solution using a lung-safe solvent and spray-huff straight into your lungs a la asthma pumps? Removing the electronic aspect makes such a method even more reliable and safe.

Quote:

When using a nebulizer for inhalation therapy with medication to be administered directly to the lungs, it is important to note that inhaled aerosol droplets can only penetrate into the narrow branches of the lower airways if they have a small diameter of 1–5 micrometers. Otherwise they are only absorbed by the mouth cavity, where the effect is low.

This might lend a clue about both methods. I've always thought about what if someone could 'vape' LSD through this method. Since it is rather sensitive to temperatures I guess as regards the question of heat, the ability to deliver LSD in this fashion would be the *acid test*.

Quote:

Why can't you just get a cleaned out perfume bottle with some DMT solution using a lung-safe solvent and spray-huff straight into your lungs a la asthma pumps?

Because a perfume bottle is not capable of dispersing the dmt solution to the degree necessary. Yes, they create a mist, but a mist consisting of big droplets which condensate quickly. Huffing it straight from a spray mister is probably a setup for a horrible and painful experience.

The Idea to use ecigs is not new, but to my knowledge, it has always been an issue of finding a suitable solvent since DMT seems to be poorly soluble in Vegetable glycerine. It certainly is intriguing as a new method of efficient and convinient DMT delivery. More people would have to test it though.

I bought the Joye thing to test it out. Waiting to receive the PG400 liquid through the post. Will definitely share once I've tried it...

I'm actually pretty excited about this. I like how simple it sounds and like to be able to get slowly into it.

Needed

Ego t tank atomizer

Ego battery

VG e-liquid

Empty ego tank cartridges

Empty 10 ml e-liquid bottle

All of these can be found at any online e-cig retailer.

Add 1g dmt fb to empty e-liquid bottle

Add 10 drops VG e-liquid to 1g dmt freebase e-liquid bottle

Start your car. Turn the defrost full blast. Place mixture on top of defrost vent.

The dmt will dissolve into the VG e-liquid as it warms up.

Squeeze mixture from bottle into empty tank cartridge. You may have to re-warm several times throughout filling.

Push cartridge into atomizer. Screw on charged battery.

Solution will harden in cartridge. DO NOT vape hardened solution. Whenever you are ready to use, re-warm on defrost, or any other method, until solution is liquid, and no DMT salts can be seen.

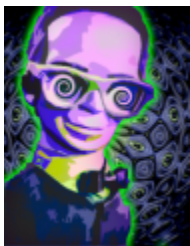

(Takes a couple minutes on defrost)

Vape away, and enjoy scentless (flavored, if you buy flavored VG e-liquid), anytime anywhere, on demand.

P.S. I believe you can concentrate the solution even further, with less VG e-liquid.

Not so fast everybody.

Being the device-curious person that I am, I ordered one of these (the JOYE eGo Mega) and some propylene glycol last week and got them today.

I tried it out first with plain propylene glycol (PG). It worked OK – produced a slightly sweet, nearly tasteless flavor.

Next, I dissolved about 100mg DMT into maybe 0.5ml PG and tried it out.

Observations:

The first thing I noticed is that you really have to draw hard when inhaling. The DMT must have changed the viscosity of the fluid – it required noticeably more effort to inhale than it did with the plain PG.

Second, the vapor is harsh! I'm not sure how it's heated inside the "atomizer", but the throat-feel reminded me very much of my early inexperienced days with burnt spice.

Finally, it takes many inhalations to get effects. (Maybe 10? I lost count.) And even then, I was still far from a breakthrough. With sublingual MAOI beforehand, it might be easier to reach a breakthrough, but the vapor is so harsh that my throat would probably give out before that point.

If I had to compare this device to other devices/methods, it reminds me most of "the machine", except

requiring much more effort to inhale.

The ecig + PG + postage was almost the same price as a GVG, so it really isn't a good choice economically.

I must say that I feel a bit foolish for spending money on this, but at least now I know. I'll continue to experiment with it for awhile, but my lungs can only take so much abuse.

One positive – it made me appreciate even more the elegant simplicity and supreme efficiency of the GVG!

Hmm, you speak probably of PEG-400 (polyethylene glycol 400) rather than about PG?

I agree that PEG-400 hardly for breathing, this its defect in contrast with Eton.

But earlier I did not manage to dissolve DMT in PG quite!

Yes – I have propylene glycol (PG), not polyethylene glycol (PEG-400).

DMT dissolves quite readily in the PG, especially if it's warmed a bit while combining.

The problem is with the device itself. It simply isn't designed to quickly deliver the volume of vapor necessary for use with DMT. My guess is that each long draw on the ecig actually vaporizes 1-2mg of liquid. That means you're getting maybe a milligram of DMT per draw. With excellent technique and luck, you might get 3mg per draw. And not only does it deliver a very small dose, it's also a very harsh dose! After 5 or 6 draws, my throat was feeling it – it felt very much like burnt spice.

DMT is metabolized rather quickly. A dose of 1mg will be mostly metabolized before you take the next. You could huff and puff for an hour on one of those ecigs, consuming 100+ mg of DMT in the process, and never get beyond very light effects.

I honestly can't see why anyone would want to use one of these for DMT delivery.

- Thank you for revision! I shall try once again to check dissolve DMT in PG - only from curiosity.

The value dissolve 0.2g/ml really too small for practical application.

For comparison: i used e-Liquid 1g DMT / 1ml Eton+VG (50/50) with best result deep loooong trip (with using MAOI in gelcaps).

Now i wanted find to change Eton on other (not self-evaporating) solvent with similar high ability of the dissolution DMT...

...

E-cig solved wrote about dissolved 1g DMT in 10 drops heated VG! This way opens the new prospects at condition of the decision of the problem of the preliminary heating cartridge e-cig before use.

...

For me, E-cig very suitable else and since during DEEP trip for continuations, it's necessary only to press on button and do 1-2 puffs!

...

Only to make sure in efficiency e-Cig (on example Ego-T) it is enough to dissolve 0.2g DMT in 0.1ml Eton (95%) , place this e-Liquid near/on spirals of atomizer and make one good puff! This so simply. Your trip will be long more than 5 minutes.

PG and VG dont work well. Thats why I said use PEG-400 and this is not intended to be a substite for the VG

I didn't just do this once and throw it at yall, Ive done it a ton.

probably should listen to the guy who invented straight to base (me), he kinda knows what he is talking about.

edit add - and I see you used the Joye ego mega. I dont know about this and it isnt a tank type cartridge from what I see. Mega means that it holds more volume, not that it makes more vapor. You didn't do anything that I recommended.

“Invented” straight to base? That’s quite an unsupported claim. And it doesn’t logically follow that you know what you’re talking about with respect to ecigs and their use with DMT.

DMT dissolves very easily in propylene glycol, and propylene glycol is the “standard” ecig fluid. The problem with this approach is not the fluid – it’s the device itself. The device was not designed to deliver vapor at the rate and volume necessary to make it comparable to other DMT vapor delivery devices. And the heating method produces harsh vapor.

If *you* get good results with an ecig, that’s great -- for *you*.

However, I’ve experimented with many different types of devices over the years, and the ecig simply doesn’t perform very well, especially considering the price of better-quality units.

Some inexpensive and better-performing alternatives:

Changa in an inexpensive pipe allows one to deliver doses of any size, and the smoke/vapor is not very harsh.

“The Machine”, when used with proper technique, can produce smooth vapor at any desired rate.

gibran2 is a fictional character. Any resemblance to anyone living or dead is purely coincidental.

You used a different solvent than I recommended and (edit asdd - turns out it wasnt a polyfill type) you used some mega cartomizer designed for holding large volumes of solutions in polyfill. no wonder .5 cc didnt work, that setup is for large volumes. tank setups work till the last drop and they work with small volumes or you can fill them up.

And it doesn’t logically follow that you know what you’re talking about with respect to ecigs and their use with DMT.

Look at my intro in the intro section. I realize that one isnt the other, but having multiple very successful additions to the entheogen world over the psat 10 year should give those who don't know either of us some reason to believe what someone says over another. And I know you have credibility here, but Im new here, so you have to look at my history for my credibility.

You didn't follow the most important points I made.

- 1) PEG-400 as the solvent
- 2) Tank type ecig setup. examples given.

I'd like to try and clarify a little bit to make sure the type of ecig that I've got will work.

I have an Ego-T, but AFAIK it doesn't use an "atomizer" (unless that's just another name for the tank?) It takes 510 cartridges with a heating element and some cotton inside. I've successfully used it many times for vaping BHO mixed 50/50 with PG. I've found that it works much better with that when using the "XL" cartridges with dual heating elements rather than the standard single element type.

If this is even the right type of device to use, do you think that a dual element cart would provide bigger hits with DMT the way it does with BHO?

No direction but to follow what you know,
No direction but a faith in her decision,
No direction but to never fight her flow,
No direction but to trust the final destination.

the tank types never have polyfill. there are dual element tank setups [dual coil tank](#) Polyfill systems work with this too, but once you are finished there is sure to be a good bit of dmt stuck in the polyfill and not easily recoverable. and they dont work till you put enough solution in to saturate the polyfill and then some.

the Joye system has a seperate atomizer and tank, many other have the two combined and they call that a cartomizer, just like the cartridges you allude to.

the cheapest way to get a tank setup that works with your current 510 batter is just to buy the ce3 http://www.myvaporstore....okymizer_XL_p/510ce3.htm disposable tank. It has the tank and the atomizer in one disposable piece. A box of 5 is \$10

It actually does make a bigger plume than the joye that I posted, and in retrospect might be a better suggestion for a first purchase, as it is cheaper and makes a bit more vapor.

And yes, dual element setups make more vapor. You can put the PEG-400 mix right on the polyfill of a dual cartomizer, but you will have some residual spice left in the polyfill once you are through. There are lots of ways to make this work.

Another point is that you don't really want the tanks or cartridges with large volumes because the battery runs out way before you use up a small tank, so whats the point, you have to regroup anyway. A big tank can work with small volumes, but a big polyfill cartridge needs lots of liquid to work.

foaf wrote:

You used a different solvent than I recommended and you used some mega cartomizer designed for holding large volumes of solutions in polyfill. no wonder .5 cc didnt work, that setup is for large volumes. tank setups work till the last drop and they work with small volumes or you can fill them up.

...

You didn't follow the most important points I made.

1) PEG-400 as the solvent

2) Tank type ecig setup. examples given.

The JOYE eGo Mega does NOT use a polyfill cartridge, it uses a “tank setup” as you have described. It’s a large empty tank (no absorbent polyfill in it).

You keep stressing using PEG-400 over PG – why? PG can hold a very concentrated solution of DMT. What is the benefit of PEG-400?

Regardless, it’s the ecig

design

that’s the problem. Let’s remember that ecigs are designed to provide cigarette smokers with a smokeless alternative that’s similar in “feel” to smoking a cigarette.

Vaporizing DMT is not like smoking a cigarette. The volume of vapor inhaled and the rate of inhalation is much different than when one is smoking a cigarette or an ecig.

If one wants to causally puff on an ecig to get 1-3mg of DMT per harsh throat-burning puff, then an ecig is acceptable.

An interesting idea, but as I’ve said, there are numerous inexpensive superior alternatives.

you mention ecig like it is one thing. it is a whole universe of different products.

as asked above, for instance, you can get a dual element tank that supposedly makes tons of vapor...
[dual coil tank](#) [another simpler one](#) and it fits right on the battery you already have.

I think Im going to get one, just to see how much vapor these systems can make, despite my satisfaction with the ce3 and the ego-tank systems.

and why do I recommend PEG-400, well, the other solvents don't work and it does. simple as that.

I really dont know about the joye ego mega you mention, its not the type Ive used or recommend but I just see this online, so that's why I thought it wasn't a tank, because they say that it isnt. there must be different types of mega if yours is a tank.

<http://www.thevaporpro.com/able-cartridges-3ml.html>

JOYE eGo mega 2.5ML Refillable Cartridges Hold 2.5ML of Juice. These cartridges uses the standard Joye Poly Fiber to hold the liquid in the cartridge. eGo mega 2.5ml Cartridges can only be used with eGo MEGA 2.5ml Atomizers. These carts are not to be used with Tank Atomizers. You can purchase the eGo mega 2.5ML Atomizers here. Cartridges can be used on any genuine joye eGo battery with the matching atomizer.

Ok, i got a cartomizer with wicks. You can unscrew the atomizer head and you can see, that there is some metal coil wrapped around the wicks. As i see it, the wicks get soaked in fluid, the metal coil warms up and vaporizes the liquid. So it's basically some kind of battery powered machine.

The biggest downside seems to be the fact, that, if you have to saturate the liquid, you need tons of spice to fill one cartridge, and there proopably will be a lot of residues left behind because of the wicks. Propably harder to recover than VG condensations.

So I guess the way forward with these kind of ecigs is to make a small solution beforehand and drop it directly on the coil. But how does one prepare small doses if you can saturate 1 drop with 100mg?

I also do not see why this should work more efficient than a machine, because it basically uses the same setup. One idea is, that the liquid works as some sort of heat buffer or encourages the dmt molecules to "come along" with the PEG molecules. Does anyone know how nicotine is actually vaporized in conjunction with the liquid. I may want to research that myself though.

Yes – they are all variations of the same design idea: You have a power source (battery), a heat source (wire coil), an absorbent material designed to absorb and hold liquid (wick), and a storage area for reserve fluid. (Along with buttons, switches, a mouthpiece and whatever bells and whistles a manufacturer decides to add.)

Dripping fluid containing DMT directly onto the heating coil would be similar to what happens with “The Machine”, but the DMT is diluted by the PEG-400 or other fluid.

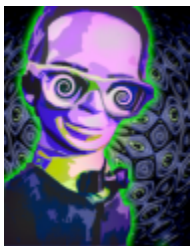

DMT in the wick isn’t all vaporized when heat is applied. My guess is that very little of what’s in the wick gets vaporized each heating cycle. This means that the DMT is exposed to high temperatures repeatedly, resulting in a degraded pyrolyzed by-product which is very harsh and unpleasant.

To my knowledge, all of these devices, regardless of variations, are designed to “simulate” the cigarette (or cigar) smoking experience. They can be used for DMT, but not as effectively as other less-expensive alternatives (after all, how much does an empty mini-Hennesy bottle and a bit of steel wool cost?)

gibran2 is a fictional character. Any resemblance to anyone living or dead is purely coincidental.

Really is not an ensemble of our ways and variants of the experiences really value Nexus? And really so necessary to use only one scale for determination whole found?

Here is and my position and my interests although and can not comply with position and interest immediately all surrounding me people, but this does not disturb me to respect them and have an interest to their standpoint.

Nexus - first of all information field, where each have freedom in choice and responsibility for its choice before itself.

And Nexus enables each this choice to do! Please, take it care.

sorry if I seemed confrontational..

anyway, in regards to the valid point that you dont get a big hit off of these things, I bought and tested a dual coil tank setup and the vapor production is much greater. And I may have overstated things when I said it could get you as far as you wanted. I meant it gets me and most of my crew as far as we want these days. but no, its not the best for dramatic rocket launches, although as mentioned, you can add this onto the tail of a launch pretty easily for the best of both.

[Dual Coil Tank](#). There are quite a few others.

foaf attached the following image(s):

 dualcoiltank.jpg (19kb) downloaded **971** time(s).

so I mixed another batch, this time more as Lost traveller recommends, and it is better.

just dmt in 95% ethanol, leaving out all the ecig solvents and putting it in a tank as above. I mixed it 1 gram in 2cc ethanol, dissolved easily. works great and tastes better than the PEG. Can get a pretty big dose with this and a dual coil tank as above. I don't know why I didn't do this at fist, it was already posted up, just not in a tank.

Finally-that is to say one more acknowledgement working Eton!

There is for you difference in sensations of trip between PEG vs Eton?

...

Little other information: i have tried to dissolve little Harmalas-fb in PEG.

This opens, but much slowly. The exact value i until has not measured.

I distrust that dissolved Harmalas can be vaporized like DMT. (Harmalas have dry sublimation) But this interesting, possible somehow use this solution (Harmalas in PEG)?

Ok almost another week, and a big weekend night out with the gang last night working these things.

Ive had the opportunity to turn on more people to DMT, granted lower dose and slower application than the usual techniques.

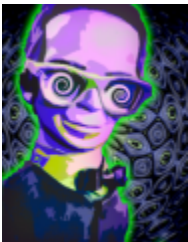

Ethanol in the single coil tanks works great, in the double coil tanks works great.

I posted to point out that this is perhaps the only way to bring a vaped dmt trip directly into bed. Unlike other hallucinogens, for me, DMT is like viagra. DMT ecig in the sack is highly recommended.

probably should listen to the guy who invented straight to base (me), he kinda knows what he is talking about.

I'd like to add a comment on this remark of yours:

Just because you 'invented' one thing doesn't make you automatically an authority on all your further claims. The DMT Nexus operates with the principles of science, meaning that we love to see claims backed up by for instance experimental data. Regardless of whether you invented straight-to-base (I can't imagine that anyone with chemistry background never tried to skip the acid step before 2003), all your further claims still require that you provide supporting proof.

Your help and knowledge is very much appreciated here at the Nexus, especially if you do possess extensive knowledge and insight into chemistry and related fields. But the Nexus is not a place to show off your ego with claims of inventing things. In my opinion that's a form of arrogance the world could do without.

To be on topic: Thank you for condensing this information and experimental data together, you're doing those experimenting with ecigs a big favor.

The spice extends life.

The spice expands consciousness.

The spice is vital to space travel.

S/B tek does not even work all that well anyway compared to other teks. Lots of people here have made up teks that work better than S/B. I dont see why that should be stated like it was in this context, unless your hung up on some ego thing.

Long live the unwoke.

In regards to a previous post I have been called out on... In retrospect, I should not have posted that that way. Fair enough.

I had my feelings hurt when I felt like gibran2 had summarily dismissed my observations and I let my inner asshole take over for a minute. Ill try to keep it in check.

And as stated in the beginning, I didn't think up any of this, but it is very cool, previously underappreciated. and in need of a cheerleader with the resources to buy a bunch of these different devices and try it different ways to help sort it out. I'm not through experimenting with these devices and the various ways to make solutions. And fwiw because the role of science in my approach was mentioned, I do have an advanced chemistry degree from a fancy school, although I am not currently a chemist by profession.

There are numerous claims as to what is the best way to vape DMT here..there are tons of these threads man so dont get too caught up in what others claim is the best or does not work or w/e people tend to want to say.

Ive even heard of people who like to snort the vapor from the air with a little glass tube as they boil the DMT on a spoon okay..so take personal preference with a grain of salt.

Long live the unwoke.

Although I haven't tried the ecig DMT method, it was Foaf who inspired me to continue my research on using them to vape BHO tinctures.

Based on my results with ethanol/glycerin tinctures of BHO, I would be very surprised if this is not an effective way to administer DMT. Specifically, I find that a good pull off a Joye C twist at 4 volts with a 1.5 ohm vaporizer can deliver whatever is present in approximately 15 ul of solution.

If you can dissolve DMT in said solvent at 1 gram per ml, you should easily be able to get more than ten mg in one pull (15 mg according to the above math). IME that is a good rate to minimize harshness while achieving a solid breakthrough.

I'd also like to add that I enjoy the ecig method for its portability. There aren't many truly stealth ways of vaping herbal tinctures in front of a bar or at a well-guarded music venue. With proper storage methods I have no

problem bringing tinctures in a used nicotine e-liquid vial almost anywhere. A dash of flavoring agent and perhaps even a dash of food coloring make it extremely stealth.

☺ Wassup everone!

Glad to see some people are finally coming around to the whole "personal vaporizer" idea! Let me tell you guys a couple more things you should know about it though.

1. DMT freebase WILL dissolve in any flavor E-liquid that is at least 50% propylene glycol (PG). No need for that PEG-400 stuff, nobody uses it anyways.
2. If you use the bridgeless atomizer as explained in my "tek", drip a few drops onto the coil, you will absolutely get an amazing hit that doesn't taste bad at all. Especially with grape flavor for some odd reason.
3. REMEMBER!, with this setup, the DMT still likes to run away from the heat, so use an atomizer or cartomizer with a BOTTOM coil.

I've been doing it this way for about a year now and i refuse to look back to the days of looking like a crackhead while vaping my DMT.

Lol, I don't mean to offend all the gvg users, just tellin' it how it is ☺

Enjoy!

The time is now...

Thanks for the advice! That's a sweet little rig you made.

I will say this in advance though...I've used pure BHO and have done much trial and error. In the end I chose my mixture based mostly on personal preference. The wax that I vape was just too much in pure form unless I'm dabbing a tiny amount (at least, for me it is). Cutting it into a tincture gives me more manageable hits.

But again, it's just personal preference. I used to use a rig similar to the altoid box to vape kief. I loved it, and that's what turned me on to the idea of using e cigs etc.

Really fun stuff regardless of what specific tek you use.

Okay, after climbing the learning curve, learning (some of) the lingo and diving in I'm now a convert to the ease and stealth and effectiveness of a vape pen for shatter.

I bought a Yocan Evolve that uses a dual coil. One problem I have with the concentrates is that it too seems to run from the heat and ends up getting pretty messy when it escapes the air flow hole at the top. A friend recommended the Evolve Plus, saying it remedies this somehow with the quad coil set up it uses.

My stash at the moment consists of about 50mg in a tiny choreboy pellet that would actually fit into the chamber and am thinking about seeing how that would work. I'll probably smoke a good dose of rue harmalas to give it a boost if I do.

Any recommendations, rejections? What's the word on dual vs quad, and any cents on my friend's advice regarding mitigating heat run with a quad?

#49 Posted : 2/27/2019 6:55:50 PM

One can actually fit up to 0.8g of dmt in about 1.5ml of 50/50 pg/vg e juice.
A couple of hits of that will hit hard.
Esp in big tank kind of pen.

I think you are thinking of the Evolve Plus "XL" with the quad coil. There are 3 Evolves the last time I checked, the

Evolve, the Evolve Plus and the Evolve Plus XL. I've broke through maybe 5 or so times with the plus, and another 10 maybe with the Plus XL. In my opinion they were comparable with a slight edge going to the XL because of ease of loading and better airflow. That said the very last time I tried it, I did 2-3 attempts and thought I was shut out. I took a shower, loaded up the same amount in my GVG and broke through with ease. Since then I got interested in perfecting my ccell palm, so haven't tried the Yocan again. It worked for me mostly, and I'm still not sure why it didn't the last time. But ultimately it wasn't enough of an improvement (it's still single load, so I have to carry gear with it if I'm on the road) to want to put that much work into. I did love it when it was working!
