Hello, I'm new here, I found this forum searching for how to use DMT properly.

After alot of trial and fails, with alot of different methods, including glass bulb vaporizer, 2 litre bottle with tinfoil, water bong, and finally electronic portable vaporizer i found the ultimate way.

The correct vaping temperature for DMT is 150C. Much higher, it will get harsh, and it will be burnt. At 150C, you can pull it without feeling much resistance at all 😊

The vaporizer i use is crafty. You can use an iphone or android app to set the temperature to 150C. Pretty high tech. It looks like this:

<http://imgur.com/a/6zNXS>

What you need is something in the bottom of the vaporizer, so that the DMT doesnt just vanish, because DMT melts into liquid before it transforms into vapor/smoke.

With crafty, you get a steel filter you can just put in the bottom, like in the image above. (For future reference, if the image above is gone, you can probably use a layer of oregano or just some aluminium foil to catch the DMT when it melts). Then just sprinkle some DMT on top. (i used 30mg to get where i wanted).

Heat to 150C, lean back in your sofa, put on any music that makes you feel good (for me owl city is nice), and smoke from the vaporizer like you would smoke anything else. It comes on slowly, so there is no need at all to be afraid to be thrown into space. Everything happens in your own comfortable speed. You pull in, holding it for maybe 10 seconds roughly (no need to get uncomfortable), then blowing out and repeat until you are where you want. For me it took roughly 5-6 draws to get me right at the edge of breakthrough. So obviously just continue if you want to go further 😊

Im hoping this guide will help any people that wants to vaporize DMT with an electronic vape in the future!

as for the effects, check this out. what i was looking at when i started:

<http://i.imgur.com/t44nNrH.jpg>

the ELK hanging on the wall there? you see that? it transformed into something like this:

<http://i.imgur.com/kLmQsxs.jpg>

Thank you for making this thread.

How long do the Liquid Pads / Upper & Lower Mesh Screens last?

How many extra ones of each do you recommend to order with the Crafty?

How and when do you clean the Crafty?

So you just place DMT over the Liquid Pad with nothing else in there but the Liquid pad? What amount, what's the most you tried?

Do the Liquid pads get cleaned?

Is it 150°C or 180°C per this post:

The Traveler wrote:**The boiling point of DMT freebase seems to be around 160C and with a vaporizer you might want to set the temperature around 180C for a solid and constant vaporization.**

I myself am testing with the Plenty vaporizer and using the liquid pad that you get with it, I can

vape around 5-10mg of DMT in one pull, depending on your lung capacity and how deep you want to inhale. So to vape 25mg of DMT freebase with the Plenty you need around 3 deep pulls.

awesome info - many thanks!

i own a Crafty as well as the Mighty, which is the larger, dual battery version of the Crafty that does not use an app for temp control. therefore, i am super-interested in trying this out.

i have only one question: do you pre-melt onto the liquid pad, or just load it up and screw on the top mouthpiece?

thanks a lot! cheers! 😊

Thank you for this. Ive spent hundreds of dollars over the past few years trying to find the perfect electronic vaporizer for spice. I gave up my search almost a year ago as all the ones ive tried have ended up burning my elf dust. Ill have to give this one a shot!

Changa or enhanced leaf generally works best for electronic vapes.

GVG is best for xtal 😊

Just looked it up. Definitely sold on this! Storz & Bickel FTW. I think i might get 2 one for spice and the other for harmalas. I was already looking at their Plenty vaporizer but wasnt sure how I felt about the power cord.

I have a gvg. However, i have a problem with my arc turbo flames that stop working intermittently. Interestingly, it always seems to be when im going for a breakthrough dose. I just got some premium vector butane but havent refilled the lighters yet. Ive been left with psychedelic blue balls too many times too count.

I use a cheap bulb pipe and a heat gun from hardware store that has adj temp settings. I also install

a vinyl tube to lengthen pipe from my face and partially melt closed the mouth tip to restrict air flow to allow for a slow even hit allowing the vapor to expand in my lungs more slowly. the heat gun distance from the pipe and temp take a few tries to get down, but once you do it is very smooth for large hits.

eDNA - sure!

the key is in the "small print"...in the instruction booklet i found something i had missed previously: it says if the bowl is not completely filled, it is best to place a liquid pad on top of the material. i tried that and the results were quite pleasing. i have played around with temps, but 370-375F was quite lovely. these were sub-breakthrough; that's exactly what i wanted as i experimented. this was with "Electric Sheep".

i have experimented with other hand-held vapes; the Mighty was the only one i found that could produce consistent and pleasing experiences. i tried the Arizer air, and neglected to place a screen in the glass tube, and the voyage was spent picking pieces of material from my mouth! yuk. very distracting.

i have also done some research using eCig/ejuice concoctions: while it is certainly a viable conduit, it is, essentially, pretty immeasurable if using a tank. i should add, however, with an experienced vaper using modern sub ohm tanks available (i used the Arctic with a .5ohm coil at a really low 25watts), hyperspace is only a couple of drags away. yet, i like to be precise; with those types of clouds, it is near impossible to know. using a dripper might bring more accuracy; i like the convenience of tanks...especially while attempting to launch.

but, in the end, the Mighty is a beast!!! best i've tried so far. the "Crafty" would probably work just as well; it just has half the battery life.

hope that helps!

Thank you for posting.

First of all, what do you think of post #1 in this thread where the temperature of 150°C was mentioned in that context vs. 180°C mentioned for other devices on the forum...

In your context the liquid pad went on top but obviously for the original context it goes on the bottom if Crafty/Mighty are used, right?

So very basic questions, about precise steps:

Out of the box never turned on Crafty/Mighty:

Liquid pad on bottom, 50mg on top (less would be a good idea for beginners). Temperature set to... what... 150°C precisely?

And then you wait until what, you see smoke coming out, or certain precise time period...?

And finally, if the Crafty/Mighty are flat out dropped, there is no danger as there would be if other devices with very hot parts were dropped and made contact with things they should not make contact with, correct?

Thanks again.

my experience with the Mighty is only with Changa; for that i find it immensely great.

i would not use the Mighty/Crafty/other electronic vape with xtals....but that's just me.

IMO - xtal should only be experienced with the GVG; after much research, i concur with the majority of folks here - the GVG simply cannot be beat for pure experience success, once technique is mastered.

i should add, however, that with the GVG i have found the BEST way (once again, for me) is using a Health Stone as the "launch pad" - it fits perfectly in the lower chamber, with the 2nd glass piece placed on top. after i tried that, nothing came close.

yup - everyone was right....the GVG is king. 🍌

peace

All right. For better or for worse *if* just *if* the Crafty/Mighty were the only things available, would you comment on your thoughts as far as how it would be used, as obvious as this is to anyone remotely familiar with the process, can you post for people who have never had any experience whatsoever with this or anything else...

Separate from that, the Storz & Bickel pricing of the Crafty/Mighty make them simply impossible to compare value-wise - they are just so almost unjustifiably expensive.

However, if, again just *if* the price was the same between them and the GVG, could you separately post about the limitations (other than the price and the battery) that make the Crafty/Mighty inferior to GVG?

first, let me say i am no expert by any means. i have just experimented with things; learning from mistakes, failures and occasionally nailing it and having a beautiful success. that being said...

honestly, at this point if i had to choose, the GVG would win. it can be used for both leaf and xtal. perhaps, according to some, not so great for leaf, but it does work. after all, that is what it was created for; cannabis use. for xtal, it truly is unsurpassed. get a Health Stone and you are set for life.

the money spent on an electronic vape is mainly for convenience and stealth. and for some, that cost is not justifiable nor possible. i understand that. is it worth the \$\$\$? if one can afford it, it is....if one cannot, then no. not having to deal with a flame and glass whilst blasting off is luxurious, but not necessary.

to reiterate, i am NO expert. i am a humble explorer, relatively new here, and trying to be a sponge for information, helping out when i can.

best of luck to you in your voyages 😊

Is one able to get the smell out of it afterwards? I've recently bought a crafty but I'm hesitating to use it for DMT/Changa because I'm afraid the smell will stick to it.

Everything is always okay in the end, if it's not, then it's not the end.

The smell is absolutely a problem according to multiple forum postings. Some suggest buying an extra mouth piece to help with this.

It would be nice if there was a post on detailed cleaning immediately after use, starting with how soon to do it and exactly what to use and how.

I think the convenience of Crafty/Might here is if you have no one to help/guide you to the point of "once you figure out how to use it" stage other devices *require*. The convenience of Crafty/Mighty is not having to deal with heat/torches/flames. With Crafty/Mighty, I think there is no worry about the hot device, so you can be free to engage yourself in other things... My impression is that you can freely drop it and it won't harm you or set anything on fire. I hope I'm not wrong on this.

The \$ is a problem. A big problem. But the worry of having to waste time and other things on learning other devices might be expensive too.

I mean it's one thing if you have someone showing you what to do but if you are alone, on your own, you may not be mastering this on the first try if you use anything other than the Crafty/Mighty... and if that is wrong, then the Crafty/Mighty are not worth the big bucks to beginners.

Some dislike the smell.

I actually like it.

Some describe it as like a plastic smell.

I describe it as a smell that is not of our world.

It doesn't smell like plastic to me; It smells like energy from another dimension.

Like a mystical sacrament.

Ahh...thank you. In fact I'm not afraid of the mouth piece or the cooling unit (the whole top thingy) becoming smelly. A quick rinse with IPA will solve this. At least it did with all my other smoking devices. But what about the herb chamber? Will wiping it with an IPA dipped q-tip (or how ever those cotton sticks you clean your ears with are called) be sufficient?

That's my main concern. Guess I'll have to find out.

Everything is always okay in the end, if it's not, then it's not the end.

👍 Yep Ducdevil, luv the smell it is otherwordly. Although I have convinced myself that it's an essence present in the scent of many different species of trees. In spring I detected the faint undertone of spice while walking in the bush a park or in suburban street. I recognise it in the scent of citrus trees also, think I'm in love. 💖

This excites me very much! I am considering getting the Mighty but I have read varied reports saying that the DMT vapes faster and the herb with MAOI vapes slower than so it's just like pure DMT rather than Changa. Can you please confirm or invalidate this statement?

I really want the Mighty for convenience. No risk of fire or messing around with lighters when attempting breakthrough. I was hoping you could also let me know how many draws it takes for you to breakthrough? I wasn't sure whether the fact it vapes on the fly would mean more draws and more time?

Hello,

Please tell me where I can find those "Heatlh Stone" as pads that you mention, I have a GVG and I need to put it to use..

Thanks!

At Aqualabs Technology in the US.

A quick Google search on "Health Stone Glass" should lead you straight there 😊

Actually, 4 years ago, when I discovered DMT and the Nexus, I used a Health Stone Glass vape a lot for DMT.

I was even using it more than the GVG for pure spice, as it was very easy to load : just weigh your spice, put it on the stone, heat it from afar with the torch lighter, and slowly bring the flame closer once the DMT melted.

The nice thing is that I could pre-load the stone soon after a travel so whenever I felt the call, I would just grab the pipe and the lighter, and 15 seconds later I was gone... It's the best way I had found back then to bypass the preflight stress, it just doesn't leave any time for the mind to find reasons not to do it 😊

I also did that with the GVG, BTW, it was much more practical than building copper pads myself : just melt it on top of the stone instead of below on a pad.

Back on topic, I'm investigating the e-vape route on the steps of ducdevil for the moment. I got all the gear (75W box mod and sub-ohm clearo, 30/70 juice, FB DMT & Harmalas), just need to find my DMT balls back in order to experiment

thought i'd chime in here

i have found, as i mentioned, the HSG pieces to be wonderful. as "Silly(c)One" said, one can pre-load stones (perhaps labeling for dose identification) and if stored airtight, will last as long as you might need. they readily accept and absorb the spice making it the perfect delivery method for almost any type of setup. i should add that the stone does fit almost perfectly in the GVG - perhaps a bit snug and the top piece does not fall into place as perfectly, yet it does not impede effectiveness.

a tip i crafted: instead of heating the stone either from a distance or from above (i realized that one second too long or too close and POOF! some of the spice vaporizes making the dose inaccurate.) rather, i place the stone on some glass and heat the stone from ***underneath*** - just aim the torch at the bottom edge of the stone. the heat builds quickly in the stone and the spice just melts straight

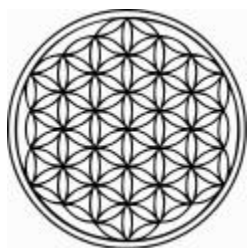

into it without vaporizing. easy to control it too - no risk of spending the spice or losing a bit to premature vaporization!

another tip i found: for larger doses, piling that much spice onto the stone at once is tricky - it falls off while weighing, etc. just pre-melt half of it first, then add some more and do it again. the stone is quite tall/thick - it won't reach the bottom of the stone at all.

have fun!

For those looking for a quick and reliable 150C-180C I suggest using the Harbor Freight heat gun with 12 settings. The lowest setting will get a glass pipe to 155C-180C. We verified this with a no-touch thermometer. It also has a built in stand in the handle so once you turn it on, you can put it down and simply hold your pipe on top of the heat outlet.

Thank you so much. I couldn't find much information about vaping it. A few questions:

Do you use freebase DMT for this? or do you also need vaping a MAOI first?

I own the CF Vaporizer, the lowest setting is 355F - 179C, it is the lowest. Are you sure lower is better?

I ask this because I read somewhere that vaporizers were not powerful enough to combust DMT but I know a lot of info comes from 2011 when the technology was just started being use.

Also, when I use a vaporizer with weed I normally need less weed. Don't know if this should also apply to DMT.

What do you think of starting my first DMT experience with 15mg?

Also what about nausea or unpleasantness?

Is the experience more positive or that's just very subjective?

Just tried DMT for the first time using my crafty and found 180C to be far more effective. Initially I sprinkled 40mg on the liquid pad and vaped at 150C. I believe I entered what I've heard to be "The tunnel" but did not achieve breakthrough. This may have been due to improper inhalation technique but I did notice little to no vapor being produced. Waited roughly an hour before vaping another 40mg at 180C. After two hits my head was pulled apart by a loving presence, then carefully reassembled in a better state.

SWIM has been wondering about these e-nails that are in the glass shops around her town. She said they're built for a wide range of mj formulations that are legal where she's from. Resin, oil, leaf, they all have a different ideal temperature and the e-nail lets you dial in exactly what you need. The rig is big and excessive for sure, but she said the glass dome makes it easy to see exactly what is happening. She suggested it might be a good way to go.

More than is needed? Yes. But: One rig to rule them all. There's a beauty in that.

I just used the crafty tonight after drinking some harmalas (180mg straight from rue).

I load a drip pad with 100mg of ~DMT from plant extract and from there you choose your own adventure. That lasts for about a dozen 185C hits (defined as inhaling long enough to change the LED color from green to red).

One thing I learned is that you got to clean the mouth piece from time to time because it clogs up with condensed vapors. Soaking in IPA works well. You can dry the IPA and add the resulting goo to a plant extraction. Another thing I learned is to modify the drip pad, you can cut out the top to make a small bowl shape to pack your crystal/goop - this way it does not stick up and will not crash into the mouth piece when you close it up - yep, I've done that before

The pad can hold 4 drops of oil (~200mg?) so cutting some off the top to accept 100mg of crystals should not be an issue.

It's great to travel and share with the right open minded and loving friends. Also nice to not have to deal with a lighter if somewhat high already 🤪

I bought the crafty years ago because of this very thread - so thank you for that. Tonight was beautiful, thank you Nexus.

Hi everyone,

I have had decent results with the iolite Wispr 2 to waporize spice, but in my opinion the GVG is definitely a winner here to achieve breakthrough.

For a one hit breakthrough, this is the best i have tried, and a lot cheaper than buying a gvg, mighty or crafty. The e-mesh method. 30 mg gone in 5 secs.

Agree.... I have tried all these devices and absolutely nothing beats the mesh tanks! One hit and done!

Hey!

I'm sorry to ask for something that I should be able to find out on my own with google, but I couldn't. What's that device exactly? How much does it cost? Thanks :)

EDIT: I haven't read the full thread yet, but at least, I've found it: <https://www.dmt-nexus.me...aspx?g=posts&t=87004>

Teamleary hi brother, read up on the E-mesh thread first, and I will be happy to help you out if you have any questions. Please ask in the other thread.

Blessings

Man I would love to try one of these! That price tag tho...ouch. Looks like a really nice device overall though.

Ive been using the Pax 3, its still quite pricey at around £200, however you can pick them up second

hand a bit cheaper. Great stealth, and its nice and gentle, I guess good for new explorers.

I have been mostly unsuccessful using glass pipes, and only managed to reach the waiting room when a friend administered the spice. im currently exploring Harmalas and I am hopeful that a changa mix will be more effective.

Do or do not, there is no try

Has anybody tried mixing PG and DMT together (like the ccell recipe) 1g DMT: 1ml PG?

Seems this would be the one of the best ways to use Storz and Bickel vapes. I've got a Mighty, and a Plenty to try out, but am waiting on extraction material...

Dosing the liquid pad with an eye dropper would make calculating the dose spot on.

The Plenty has one of the biggest vape chambers around (bigger than a volcano, I believe), and might be the best option to try...

Why are so many people mentioning vaporization temps of 150C, 160C and 180C? Are you talking about DMT Salts or DMT Freebase? DMT Freebase vaporizes at around 70C. Can you please clarify this point? If I go ahead and purchase an expensive Crafty, I want to be sure that it works as intended. Right now, I am now sure. If I had a Crafty I would set it at 70C and slowly move up to make sure that I don't burn the spice. Thank you for anyone who can clarify this point because I read a ton on the internet and the melting point temp is all over the place...

Also, I am looking at the Yocan Evolve Plus as I read many positive experiences with this device for the purpose of vaporizing DMT when used with a ceramic donut. But the question remains, if they are using DMT salts, perhaps it is working fine but if I use DMT Freebase it might burn since melting point is so low.

Salutations Ponymayou,

Although i can't help you choose the ultimate tool for a favourite enlightening substance there's some apparent confusion to clear about identifying "ideal" temperatures from pocket cannabis vaporizers. For example fancy/expensive precision-regulated "Hot Dry Air Ovenizers" (as i like to call those) simply belong to one class of devices usually featured with a relatively slow/steady ritual, so if we consider that energy never travels nor transforms into heat at infinite speed then please lets keep in mind all digital temperature readings can only report an event of the past in similar thermostatic realms - which practically brings us back to the dark ages of post-war soldering irons... Meanwhile some mission-critical laboratory analysis adopted Pulse Heating since at least the late '80s, with temperature now defining energy as a function of susceptor material and mass, hence limiting the amount of bowl workload reflecting energy changed into (heat) work instead. One method causes denaturation while the other minimizes it, in other words it's only to be expected when "cooking"

occurs in an oven, which makes me think if in need for the superior features of a Pulse Heating method then why start with a slow thermostatic setup posing as the wrong solution trying to fix the wrong problem anyway!??

Even the venerable GVG won't provide universal access to "Micro-Bursting" as i came to understand it, possibly because this 20-years old design and its associated ritual were meant to stick with the relatively slow-steady market at the cost of requiring excellent lungs control & skills. The good news being that such orientation can be corrected in selected models which won't threaten to break in pieces when modified, for example the Aluminium "Classic" look or Bronze/Sherlock not to mention them.

Good day, have fun!!

The melting point reported for the freebase is a bit variable, but DMT isn't volatile enough to vaporize effectively near the melting point. The boiling point of freebase is somewhere around 160°C... at extremely low pressures (and the boiling point is when vapor pressure is equal to the pressure of the surrounding air, the 160°C measurement was at 80 Pa, so less than 1/1000 of atmospheric). The temperatures people are discussing are effective for getting vapor without burning it (at atmospheric

pressure).

The melting point values are almost bimodal IIRC, and relatively recently (compared to many of the references) DMT was found to be polymorphic, meaning it can crystallize into multiple (2) structures.

After some thought about the crafty/mighty I have arrived to some conclusions, correct me if I'm wrong.

People have successfully reached hyperspace at different temps but apparently the closer to 200°C ~ the better?

Given the small loading chamber a bigger dosage (>40mg) would prove to be difficult to load on the liquid pad. Maybe you could take better advantage of the volume of the pad by premelting the fb xtals on the liquid pad (possibly even one placed on a dosing capsule for liquids)

Apart from the traditional methods of premelting, couldn't one just warm up a bit the vape unit? And watch closely as the stuff melts all in the pad, turning off the heat quick enough not to vaporize it?

Now why wouldn't u operate the unit without the cooling cap on?

Lastly, from my understanding a key part of a b-trough is to deliver as much vape to your lungs in the first draw as possible .. but with such portable devices, you're being forced to take multiple draws which will render mild results. Also, what do u do if your stuff vaporizes while u hold in between tokes ? That's why my guess is : go with plenty/vulcano or the good ol' sandwich

I do not engage in, nor I condone illegal activities! Most of what I write is on behalf of people I've bumped into, usually several years ago and in countries where the things I mention are legal. Swim out

I have an Arizer Solo portable vaporizer which has a lowest heat setting of 185°C.

I usually sandwich the DMT between some herb, so the DMT powder is heated by the hot air that you draw into your lungs rather than directly by the heating element, I suspect that the air temperature is much lower.

My device switches off to save power 12 minutes after switching on. With 40mg of DMT, I get most of the effect (enough for a breakthrough) in the first 12 minutes but I can still get some effect within the first few minutes of switching it on a second time, although I'm usually tripping so don't bother.

Hey EndoUnit,

All I can say is when I was trying with the crafty, I tried 20 different types of temp set up/pads-no pads/"sandwich method like" etc., and tho I had some pleasant experience, I could never take 20mg in less than 3 or 4 hits. So, of course, not even close to a BT.

And It's a pretty expensive device. I had it, because of MJ, so I don't care, but you know, if someone were to consider buying it for DMT, I would want them to know that it can be hard to play with.

On the other hand, if you don't want the GVG and are looking for an electronic method, the e-mesh technique is far more efficient.

The information of 70 °c is totally wrong.

It is the value from wikipedia, but somebody wrote it there and it was not changed since ages. Even when you dont know the molecule it is totally rubbish, as even the benzene ring of DMT would have a boiling point of 80 °C if you could just cut it off.

So just ignore this value - the vaporization temp is indeed at least 155 °C and lower than 190 °C.

I even tested the melting point of some samples and 1 was not melting at 70 °C, even though it was super pure.

Salts may not even vaporize at all, but more decompose as a black tar, but not tested, this would also be not relevant as it would be super harsh to inhale I guess 😞 These salts may have a vap temp of 400 °C+, nothing one could use for anything.

IMO only if one shall persist in rejecting relevant Bi-Energy correctives for a 20 years old design, which implies a need to leave glass restrictions to purists in the 1st place and then a brave switch to electromagnetic Induction Heat as this would get rid of low-voltage/high-current issues by turning the susceptor into a "secondary" circuit in some power transformer anyway.

If at least there were rational efforts made to avoid wasting heat by adoption of an Hybrid Core structure that clearly supports my alternative "slingshot" method/ritual as already described and demonstrated many months ago, but no, this alone has to wait while still pretending the e-mesh energy budget is anything like optimized. Calling a rheostat emulation "electronic" as a bonus...

Good day, have fun!!

Done quite a lot of research. The apx pulsar volt has the most consistent reviews out of any device commonly used for dmt. Easiest handling, foolproof, 3 hits or less to breakthrough, and efficient with needing very little spice to blast off

I am using Volcano Classic

this is from the manual

settings:in Celzius

1=130C

2=142

3=154

4=166

5=178

6=190

7=202

8=214

9=226

I have used it @#8 and it works,can't recommend on breakthrough as only going to waiting room stages,I can take the ballon in 3 drags,but using 10-20mg

I can agree with this,I use Volcano for MJ and I like to spice up my lower dose trip with DMT so it works great,if me and my mate fill with 20mg and share the ballon we just get it right,
I am not aiming for a breaktrough yet...

With MJ I can do the full bag in 3 drags so can't see it a problem if I used 40-50mg(never tried) to BT however.

I make my own bags with S&B original bags and using mesh

After 6 (six) years, finally, the answer:

One Liquid Pad

One Metal Screen on top of the Liquid Pad

With the Vaporizer top removed, place Liquid Pad in - and then place Metal Screen on top of the Liquid Pad.

Make sure no product is on the sides, just on top of the Metal Screen - evenly spread.

Do not put the Vaporizer top back on yet.

With top off - Activate 150° C and wait till it hits 150° C or so. It will start melting. Wait to see it start melting.

Now increase temperature to 180° C

Put the top back on.

Wait till 180° C

Immediately inhale slowly and deeeeply at 180° C

After first inhale - increase by three degrees to 183° C

Slowly and deeeeply inhale at 183° C

After second inhale - increase by three degrees to 186° C

Slowly and deeeeply inhale at 186° C

Three deep inhales should be enough.

Hi everyone,

I just got a crafty+ and went on my first journey ever yesterday. It was fantastic.

I believe my smoking technique might be a bit jazzed though because I am nowhere near a breakthrough and not even sure if that is achievable with this device (?)

A few questions to those of you with more experience;

Currently I put spice on the liquid pad and start vaping at 165c. It works alright, but what I don't understand is that after one long big inhale (and holding it in), the machine is still warm and vaping. So I suppose during this time I am loosing a lot of mist/spice. I've seen mist leaking out of the machine during this time.

With a lighter for example you can stop the flame during your hold. So how does one "stop the vape" during a hold? Do you guys have it set that it only heats for a few seconds before turning off, so you can turn it on again for the next inhale?

I've also seen posts about pre-melting, why is that a good thing?

Thank you very kindly for any replies.
