

AFFIDAVIT OF TANYA ZEIF

1. I am a Records Request Processor at the Internet Archive. I make this declaration of my own personal knowledge.
2. The Internet Archive is a website that provides access to a digital library of Internet sites and other cultural artifacts in digital form. Like a paper library, we provide free access to researchers, historians, scholars, and the general public. The Internet Archive has partnered with and receives support from various institutions, including the Library of Congress.
3. The Internet Archive has created a service known as the Wayback Machine. The Wayback Machine makes it possible to browse more than 450 billion pages stored in the Internet Archive's web archive. Visitors to the Wayback Machine can search archives by URL (i.e., a website address). If archived records for a URL are available, the visitor will be presented with a display of available dates. The visitor may select one of those dates, and begin browsing an archived version of the Web. Links on archived files in the Wayback Machine point to other archived files (whether HTML pages or other file types), if any are found for the URL indicated by a given link. For instance, the Wayback Machine is designed such that when a visitor clicks on a hyperlink on an archived page that points to another URL, the visitor will be served the archived file found for the hyperlink's URL with the closest available date to the initial file containing the hyperlink.
4. The archived data made viewable and browseable by the Wayback Machine is obtained by use of web archiving software that automatically stores copies of files available via the Internet, each file preserved as it existed at a particular point in time.
5. The Internet Archive assigns a URL on its site to the archived files in the format `http://web.archive.org/web/[Year in yyyy][Month in mm][Day in dd][Time code in hh:mm:ss]/[Archived URL]` aka an "extended URL". Thus, the extended URL `http://web.archive.org/web/19970126045828/http://www.archive.org/` would be the URL for the record of the Internet Archive home page HTML file (`http://www.archive.org/`) archived on January 26, 1997 at 4:58 a.m. and 28 seconds (1997/01/26 at 04:58:28). The date indicated by an extended URL applies to a preserved instance of a file for a given URL, but not necessarily to any other files linked therein. Thus, in the case of a page constituted by a primary HTML file and other separate files (e.g., files with images, audio, multimedia, design elements, or other embedded content) linked within that primary HTML file, the primary HTML file and the other files will each have their own respective extended URLs and may not have been archived on the same dates.

6. Attached hereto as Exhibit A are true and accurate copies of browser screenshots of the Internet Archive's records of the archived files for the URLs and the dates specified in the attached coversheet of each screenshot.
7. Attached hereto as Exhibit B are true and accurate copies of the Internet Archive's records of the archived files for the URLs and the dates specified in the attached coversheet of each file.
8. I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct.

- ### Description

Are you looking for the best replacement cartridge for your FLIP Vape Pen? Our .5ml round tip, wickless, ceramic coil 510 cartridge is the perfect fit! That's right, now you can continue using OZVAPE's great vape products while going 100% wickless! We recommend these specifically for the FLIP due to the perfect positioning with the round tip, so you can always vape in anatomically correct comfort.

Features:

- Internally heated ceramic element
- Multiple intake hole sizes
- Wickless and Coil-less design – your oil is heated directly from the ceramic element
- Best cartridge available for 2-3 fills

This .5ml ceramic cartridge is for use with any 510 Thread Vape Pen Battery with 3.7 Volts or higher, including these best selling vape pens.

- FLUP3 ULTRA
- Var-Volt: Variable Voltage Battery
- 510 Thread Vapo Battery - 3.7 Volt, Button-Activated or Buttonless

*Will not work with lower voltage batteries, such as our Original Buttonless Battery.

Features a 1.66mm intake hole size for use with a wide range of oil thickness.

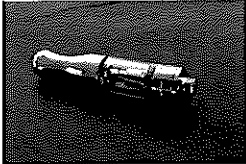

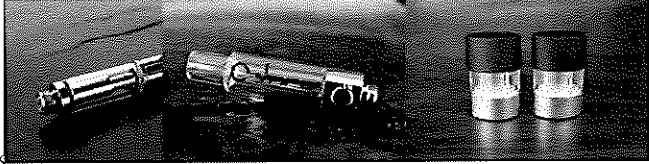

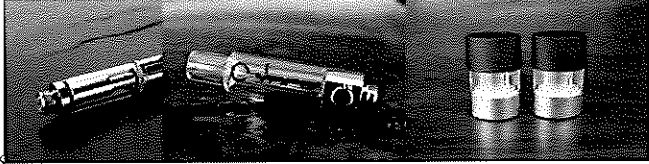

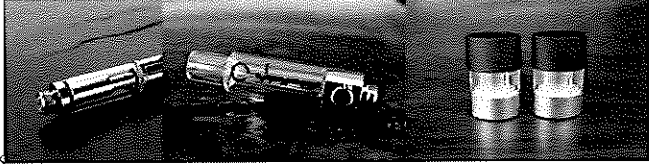

That means that you should screw this right on to the 610 thread of our [RUP Parium](#), 3.7 volt button vape pen battery, [RUP Vape Pen](#), [Variable Voltage Pen](#). Then go ahead and rip the cleanest and smoothest tasting hit that you have experienced to date!"

Another great thing about these no wick vape cartridges is that they can be used 2-3 times. There is no wick to burn out and we recommend 2-3 refills.

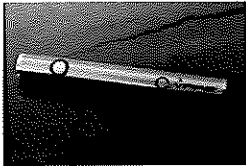

If you have ever had trouble filling a vape cartridge then you will find a pleasant surprise when filling the ceramic vape cartridges at OZMAPE. There is inlet and juxtaposed air outlet that allows the oil to easily flow in without any pressure buildup, overflow or back flow.

If you are looking for a few cartridges for personal use you can go ahead and buy right now. If you are looking for a larger number of cartridges for your business or brand we can also work with you in producing the most dependable logo vape cartridges. Just contact us at our [wholesale vape pen page](#).

***Will not work with lower voltage batteries.**

Get ready for the future of oil vape cartridges! While everyone else has been catching up with the quality of our glass and ceramic vape cartridges, we have been continuing to perfect the puff with our cutting edge 510 thread ceramic vape cartridges. That's right, now you can continue using O2VAPE's great vape products while going 100% wickless!

Features:

Porta Sophia Exhibit 1072, Page 14 of 75

- Wickless and Coil-less design – your oil is heated directly from the ceramic element
- Best cartridge available for 2-3 fills

****We don't recommend using these cartridges with our original buttonless pen model since they require a higher voltage to get to the perfect temperature for your oil. That means that you should screw this right on to the 510 thread of our 3.7 volt button vape pen battery, FLIP Vape Pen, Variable Voltage Pen or on to our Duo Wax and Oil Vape Pen. Then go ahead and rip the cleanest and smoothest tasting hit that you have experienced to date!****

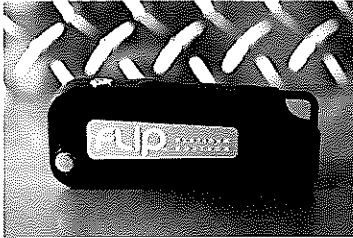

Worried about having to throw away a cartridge after a single use? Ceramic cartridges are wickless and have an internal coil that doesn't touch your oil. That reduces residue and clogging which means you can fill these 2-3 times and still get a great taste and clean pull.

Check our guide on filling a vape cartridge. You'll realize that the upgraded filling holes allows oil applicators to smoothly and easily fill without overflow or a sticky mess in the end. The wide open mouth allows easy filling, even with the thickest oils.

Another great thing about these no wick vape cartridges is that they can be used 2-3 times. There is no wick to burn out and they can last for 2-3 fills.

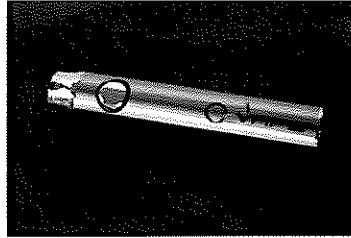

If you are looking for a few cartridges for personal use you can go ahead and buy right now. If you are looking for a larger number of cartridges for your business or brand we can also work with you in producing the most dependable logo vape cartridges. Just contact us at our wholesale vape pen page.

VISIT SITE

Strength: 500mg | Capacity: 1ml |
Compatibility: 510 threaded battery

The Pinnacle CBD cartridge contains 1mL of 500mg CBD e-liquid and is available in three different terpene profiles: trainwreck (sativa), granddaddy purple (indica), and blue dream (hybrid), with each having their own unique flavor and benefits. Trainwreck is known to improve one's mood and also relieve migraine and chronic pain. Granddaddy purple eases pain of different types, and can also be helpful for those who suffer from insomnia, anxiety, and nausea. Lastly, blue dream, boosts energy and also reduces stress. Going back to the Pinnacle CBD cartridge, it makes taking CBD easier – all you have to do is vape it with your device of choice and dispose of it when it's empty. It also contains less than 0.3% of THC.

VISIT SITE

Strength: 250mg each pod | Compatible with Juul device

Because of consumers' demand for more potent relief from their e-liquids, Naturally Peaked started making extra strength pods with 250mg of CBD in each of them -- working out to 1000mg of CBD-isolate extract per pack. The CBD-isolate extract in these pods is mixed with naturally occurring terpenes for good measure. There are six flavors to choose from pineapple express (Sativa), clementine (Sativa), blue dream (hybrid), gelato (Indica), watermelon (Indica), and skittles (Indica). Another great thing about these pods being available in a lot of flavors is that you get to choose which type will suit you best based on what you'd like to use it for. These pods contain no nicotine or THC, so you won't have to worry about that.

What Are Pre-Filled CBD Cartridges?

CBD cartridges that are pre-filled are small vape tanks that contain CBD vape juice or CBD oil, a coil, and wicking. They are the most often used device for inhaling CBD, and they are also the most popular type of CBD vape device. They are also the most popular type of CBD vape device.

most commonly used type of threading, any cartridge that uses it is universal for all intents and purposes. Vapers who use CBD pods with 510 threads are not limited to using proprietary devices.

A lot of users on the internet claim that some CBD pods that are disposable can be refilled and reused several times if they are made from high-quality parts and materials. **However, doing this is inadvisable** because there is a significant chance of breaking the pod and voiding the warranty. It is best to dispose of the pod when done with it. Vapers who want to **refill their cartridges should buy refillable ones.**

Pre-filled pods are very popular right now for several reasons. Firstly, they already come filled, so the user does not have to worry about buying a bottle of CBD vape juice. Another reason why they are so well-liked is that the user can slide the pod onto the battery and enjoy it. Finally, one of the biggest reasons vapers are fond of them is that they are small, pocketable, and portable.

What Are Refillable CBD Cartridges?

Refillable pods are empty, but like the pre-filled pods, they also contain a coil and wicking. The user has to fill them with CBD vape liquid, THC oil, or nicotine e-juice.

The main advantage of using these kinds of pods is that they are more affordable in the long run than pre-filled cartridges or disposables. The reason they are more cost-effective is that **the user does not have to spend extra money on new pods** every time they run out of CBD juice. Also, the user is not stuck with one flavor until the cartridge runs out; he can use whatever flavor he wants in the pod or mix flavors.

What Are CBD Juul Pods?

CBD Juul pods are cartridges filled with CBD that are compatible with a Juul battery. Using Juul compatible pods is a perfect way to a CBD buzz with a Juul device. **Since Juul batteries and pods are easy to use, the vaper only has to slide the cartridge in and start vaping.** Ease of use and convenience is the main advantage of using CBD Juul pods, but the disadvantage is that CBD pods for Juul devices are much more expensive than regular JUUL cartridges with nicotine salts.

Are CBD Juul Pods Safe?

CBD Juul pods are no better or worse than any other pod when it comes to health effects unless the other pod is constructed from cheap materials that become toxic when heated. Little is known about the long term negative health effects CBD has on the human body; however, there are several short term effects and side-effects of which researchers are aware.

Short term effects of vaping CBD are usually **irritated airways and dry mouth, as well as indigestion.** People with low blood pressure should not use CBD in any form since it can react with the medication used for treating this condition. People living with Asthma should vape carefully because the inhaled vapor can trigger an asthmatic attack. Women who are pregnant or nursing should not use CBD. Some early research suggests that CBD can make muscle movement and tremors in people with Parkinson's disease more laborious.

The Best Places to Buy CBD Cartridges

The two places where CBD pods can most commonly be bought **online or at brick and mortar stores.** There are advantages and disadvantages to both options.

- Online shopping is popular with vapers because it is convenient.

- There is no standing in line to try a cartridge, and there is no needing enough cash on hand to find the preferred device.

- CBD users can find everything from the comfort of their homes without having to go anywhere.

This method of shopping is especially convenient for vapers in rural locations where vape shops are few and far between.

- Another advantage of online shopping is **having the ability to compare prices**.

When looking for pods online, the vaper can look through the catalogs of dozens of stores until a **suitable price is found**. Comparing prices is not an easy thing for vapers who restrict themselves to shopping at one or two vaping shops in their town.

While online shopping is very convenient, brick and mortar stores are a great option, too.

- The primary reason why going to a store is a good idea is that the user can inspect and try the pod before buying.

Doing this is a great idea **when purchasing a product for the first time**.

Another advantage of choosing a store over an online vendor is that

- the person at the desk can **help the customer find the right product and explain things about it** that the user manual does not.

Category	Product	Price
Best CBD vape cartridge	JustCBD Vape Cartridge	\$19.99
Best CBD prefilled cartridge	Fresh Leaf 200mg OG Kush Cartridge	\$34.95
Best Flavored CBD prefilled Cartridge	CBD Apple Cinnamon Muffin Vape Cartridge	\$40.00
Best cbd juul pods	Naturally Peaked CBD Juul Pods	\$49.99 – \$99.99
Best Refillable CBD vape cartridge	Rose Gold Glass Tank	\$14.95
Best-Price Refillable CBD vape tank	Ceramic 510 Oil Dab Cartridge for Vape Pen C4CELL	\$8.99

FAQs about CBD Cartridges

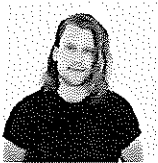

Final thoughts about CBD cartridges

CBD pods are a great way to get the proper dosage of CBD, and what is even better about them is that there are options for refillable and non-refillable cartridges. Non-refillable pods are a good purchase for vapers who like to be more hands-on with their devices. Using these kinds of pods is also a great idea because they are more affordable and cost-effective.

CBD users who want something easy and convenient to use, and do not care about paying a little extra in the long run, should choose non-refillable pods. When using them, all the vaper has to do is plug into the battery and start vaping.

What kind of pods do you like? Let us know in the comments section if you prefer using refillable or non-refillable cartridges. Also, feel free to let everyone know if there is a particular brand you enjoy using.

E-cigarettes rigged by drug users to smoke hallucinogen DMT

Published time: 7 Jan, 2015 16:40

Edited time: 7 Jan, 2015 16:51

Get short URL

Reuters / Eduardo Munoz © Reuters

Drug users have discovered a method of adapting electronic cigarettes to vaporize a potent class A hallucinogen known as dimethyltryptamine or DMT.

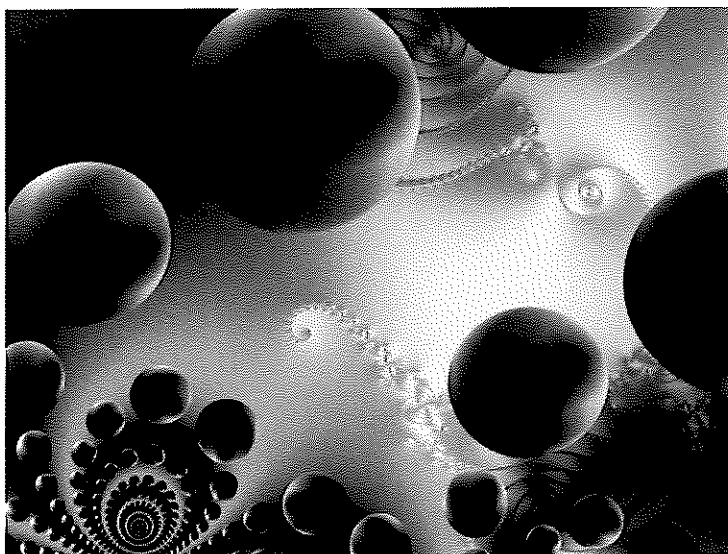

The straightforward "hack" is being discussed openly on multiple web forums, with DMT enthusiasts describing how simple it is to consume the drug using an electronic cigarette and a little dexterity.

Certain e-cigarettes reportedly generate precisely the correct temperature needed to vaporize the drug.

Described as "*the spirit molecule*" by some users, DMT is estimated to be one of the strongest hallucinogens in the world. It is considerably more powerful than comparable drugs such as LSD. If smoked through a pipe, however, its effects are more transient.

Depending on the dose consumed and means of ingestion, DMT's effects range from short-lived mild hallucinations to much more immersive and hypnotic experiences.

Many who consume DMT report having deeply spiritual experiences, often traveling to other 'realms.'

Users say ingestion of the powerful drug encourages intricate visions of glistening gateways, mechanical elves, aliens, temples of pulsating light, pyramids, and Egyptian gods.

Others say smoking DMT can unveil a taste of the collective unconscious, frightening forces, seismic shifts in perception and finally an abrupt return to reality.

One user described his experience of vaping the drug on the social media platform Reddit.

A sideways glance at the news

New episodes weekly

"Two or three hits handed me a hefty incapacitation [sic] and quite the journey."

Although modifying an e-cigarette in preparation for smoking DMT is relatively simple, errors in this process could prove dangerous. Reports have surfaced online of people claiming to have felt a burning sensation on their lungs while attempting to smoke the drug in this manner.

DMT comes from a naturally occurring chemical compound found in many plants and species. South American tribes often use it in shamanic rituals. Its discovery is generally credited to Brazilian chemist, Oswaldo Gonçalves de Lima.

The drug's psychotropic effects were first explored scientifically in the mid-1950s by Hungarian psychologist and chemist, Dr Stephen Szára.

American writer, ethnobotanist, psychonaut and self-described anarchist Terence McKenna (1946 –2000) wrote extensively on the subject of DMT, and the role of psychedelic narcotics in society.

Noted for his in-depth knowledge of shamanism, mysticism and biology, McKenna's work also broached the relationship between psychedelic drugs and metaphysics.

McKenna experimented liberally with smoking DMT. In his book, *The Archaic Revival, Tryptamine Hallucinogens and Consciousness*, he wrote about his experience with the drug.

"Once smoked, the onset of the experience begins in about 15 seconds. One falls immediately into a trance," he said.

At another juncture, McKenna described the feeling of taking DMT *"as though one had been struck by noetic lightning."*

"The ordinary world is almost instantaneously replaced, not only with a hallucination, but a hallucination whose alien character is its utter alienness. Nothing in this world can prepare one for the impressions that fill your mind when you enter the DMT sensorium," he said.

For decades the drug has been quite rare. But it has surged in popularity recently as a result of online narcotics markets.

Marketed predominantly as an odorless powder, tiny amounts of DMT are said to produce extremely strong effects. It is generally not sold on the street, and isn't physiologically addictive.

Smoking DMT, however, can cause nausea, intense fear and throat and lung irritation.

Harry Shapiro of the British charity Drugscope said e-cigarettes are an ideal tool for consuming a wide spectrum of drugs.

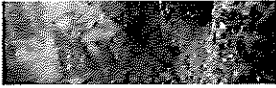

"This [DMT] is a very powerful hallucinogenic drug, there's no doubt about that," he told the Mirror.

"You can adapt those e-cigs to smoke just about anything. Not just what you're supposed to."

How to Build a Better Spaceship

TeaTime | Musings | Thursday, May 23th, 2014

"Do you want to see my spaceship?"

Phoenix leaned back against my deflating air mattress and flashed me a mischievous grin. My tent door was hanging wide open and I wondered exactly what it was that he was about to whip out of his pants; but the festival that surrounded us had long since devolved past the point where it really made much of a difference, so I just raised an eyebrow and waited to see what his game was.

To my surprise he produced what appeared to be an innocuous e-cigarette. It was the refillable kind that has liquid in it. He handed it to me with an exaggerated flourish. I shrugged. "I've heard that you can put hash oil in these", I said. Phoenix stently shook his head and indicated that I should try it.

It had been a long night and it took me a second to figure out how to operate the darn thing. (Find the little button, then push it and suck on the nipple end, duh...) And when I finally did manage to hit it, I almost dropped it. I did the smoking version of a spit-take, in fact, which my friend seemed to think was hilarious. My breath tasted like burning lawn furniture. "Holy shit!" I exclaimed. "Did you make this? Does it work?"

He told me that he did, and that it does. The one that I handed back to him, he told me as he took a long slow toke, was loaded to pass around socially. It just colored things up a little bit. "This one", he said, proffering a second, apparently identical, device, "is the Real Deal."

I could tell that we were puffing on the Next Big Thing. I've tried a lot of different methods for smoking DMT, and each of them has its pros and cons. A good old-fashioned crack pipe works just fine, for instance, but it really does look rather naughty. Plus it's always just a little bit sketchy to pass out within arms reach of recently red-hot glass. Sprinkling the spice on top of a bowl of marijuana or some other smokable substrata is hit and miss, in my experience. It works well enough for pop-ups, which is my term for the under-rated practice of intentional threshold dosing, but it's not a very effective method if one is actually trying to hit the center of the target.

I've used old light bulbs, and I ended up cutting myself once. I've taken knife hits of DMT, which was technically challenging and seemed wasteful. Traditional vaporizers like the glass and tube "dab machine" work great, but they are big, conspicuous, and will forever smell of DMT if used even once for smoking tryptamines. As for the Volcano and its cousins, the machines that result in a plastic bag full of smoke are simply too much equipment for the job, though they do amusingly make that crumpling bread wrapper sound that Terence McKenna so infamously associated with the opening phase of the breakthrough experience.

I've personally tended towards repurposing top of a kerosene lantern. I just put one end of it to my lips and hold my hand over the other end, slowly sucking a little bit of air through whilst heating it from the bottom with a torch lighter until the entire chamber is full of smoke. Then I just take my hand off of the gigantic carb and slam a whole big lungful all at once. With a friend holding the hot glass for me, of course.

This funny little electronic vaporizer was definitely the best thing yet! I cautiously test piloted the second spaceship, too. The hyperdrive seemed to be fully functional, as advertised, and the takeoff was unexpectedly smooth. Phoenix thinks that the glycerin carrier liquid slows down the DMT absorption rate. Regardless of the reason, the e-cig was an unsettlingly delightful, instantaneously convenient, and marvelously inconspicuous launch vehicle.

I convinced my friend to download his alchemical secrets to me, and I'm naturally quite keen to share what I learned. So here you go!

Gramma Phoenix's Spaceship Recipe

The DMT is first dissolved in warm ethanol, using the minimum alcohol to get all of the DMT into solution at around 150 Fahrenheit. It is best to use a double boiler on an electric burner to avoid risk of fire and overheating. Everclear or equivalent food-grade ethanol works well. The alcohol will be boiled off/evaporated in a following step.

To the ethanol and DMT solution, a mixture of 40% glycerin and 60% propylene is added. Apparently glycerin by itself is too thick to pull into most syringes and it doesn't quite flow right in e-cig tanks.

Gently heat and stir the resulting mixture until no alcohol smell remains. Once it has cooled to below 100F, a graduated syringe is used to insert the thick liquid into the refillable e-cig reservoir, just as one would do with nicotine liquid.

For the lighter, social dose, 0.25 gram of DMT are used per 4 ml glycerin/glycol. For the hyperdrive potency, the ratio is 1g per 2.5ml.

Phoenix also notes that the spice crystallizes out of the solution over time. If this happens just gently warm the whole cartridge in a double boiler with water in it and shake it up. The carts are designed to be boiled clean and are watertight. This process should keep it liquefied for at least 12 hours. The more concentrated solutions crystallize more quickly and may need to be warmed in order to liquefy it again.

Having tested the results myself, I can personally speak to the efficacy of this particular method directly. This is obviously still an evolving practice, and your mileage may vary. It seems to me like it's worth a bit of experimentation to try to dial this thing in, though. Please let us know what you find.

Safe and happy travels!

[Erowid Note: While we were preparing to publish this essay, a couple of Reddit posts were published with recipes for making DMT solutions for e-cigarettes. The huge increase in availability and variety of portable nicotine vaporizers and their development for use with cannabinoids has lead to them being used for many other smokable drugs as well.]

http://www.reddit.com/r/Drugs/comments/26kh2z/how_to_make_a_stable_high_percentage_liquefied/

The Nook has a thread about recipes for this type of spaceship fuel from 2012, but it requires registration to view:

<http://www.thenook.org/forum/index.php?showtopic=84359&st=0>

Other recipes include ethyl alcohol in the final smoking mixture to varying degrees to slow recrystallization, though this leads to a harsher smoking experience.]

I always look forward to your column and as ever, I'm not disappointed! You always seem to come up with some useful nugget of info or fascinating insight. So thanks!

I'd like to bring attention to Changa/Enhanced Leaf as a further alternative. It has the advantages mentioned in your article i.e. the material itself doesn't look suspicious and can be smoked in a variety of devices such as wooden pipe, chillum or even just rolled into a paper "joint". Over and above the e-cig method, there are no batteries to run out and no problems with solidifying/crystallization.

Comment by James — May 29, 2014 @ 11:20 am

he was really excited to have met ya at the flowing storm, good work with gettin him published here :)

Comment by Amanda — June 4, 2014 @ 5:59 am

We have been working on this method for quite a while and have found

then we are not producing results anywhere near the gvg.

The questions I had about your article:

1) Why would you have a vape pen with a light mixture (too light to produce threshold effects IMO) that is only capable of low dose effects when a single hit off the pen with a stronger mixture would produce equal effects?

2) I have in my possession a 1:1 ratio mixture of 100% pg (1ml) and DMT (1g) that has not shown any signs of recrystallizing in 11 months. Yet the article states it should start doing so after approx 12 hours. I wonder why.

I simply dumped the freebase into the PG and it slowly dissolved. There was no need for heating anything or using ethanol.

best thing since straight to base ☺

Hi everyone. I'm new here, thanks for the welcomes in the welcome place.

My story is in the introduction section. I joined here because I should have long ago, and to bring attention to a couple of threads on DMT-Nexus that I found googling around as I worked with these e cig devices. The e cig vaporizers have lead to a whole new way for DMT to fit into my life; and believe me, I've been trying to fit it in for a long time. e-cig doesn't mean the disposable things at gas station checkouts, it is a whole universe of parts for vaporizing solutions of nicotine, or guess what else.

So I didn't come up with any of this, but the two threads that I've seen on this forum are most certainly under-appreciated. It may be because when you read them they sound like people trying to work this out, and perhaps not coming to a clear conclusion. But that's not the way it is. This is simple, and great. Really.

Rollingwood's Tek

PerFlexED/Lost Traveler/Unhelm/Idm/MDMM Thread

So to simplify this before making it specific

----update 12/10/12 - I now think that dmt in 95% ethanol is better, as in Lost traveller's posts in the thread above. It's more concentrated and a more natural vehicle. Also, I now have experimented with the Dual Coil Tanks and they are better, they make a bigger hit.

- 1) DMT is quite soluble in PEG-400, one of the less common e-cig solvents. It is much easier to manipulate a concentrated solution than a powder.
- 2) The newer "tank" type e cig cartridges hold liquids, and supply them to a vaporizing element. These are the type to look at. They are made to vaporize solutions of stuff.
- 3) You put a saturated PEG-400 / DMT solution into a "tank" cartridge and you are set. Anyone can breakthrough every time, it does take a few hits.

Benefits --

- 1) Always works. No learning curve. You can pull this sharpie sized electronic thing out of your pocket, hand it to a newbie, tell them to hit the button and take one draw after another, and it will get them as far as they want to go. They can drop it in their lap and it won't spill or burn them. You can pick it up and hand it to another person. It's that easy. Over 100 draws in even a small tank setup.
- 2) Much more efficient with the spice than any way I've done it. In fact, I think the whole vaporized dose recommendations are changed somehow. I estimate that a common puff with one of the common vape setups has about 2-5 mg dmt in it. Three hits and you are past breakthrough and 6 good hits and you drop the device for sure. You can hit it pretty quickly. They make setups that create much bigger hits if you wanted.
- 3) E cig equipment is standardized, mass produced, relatively inexpensive for what you get, doesn't look sketchy. If a cop pulled it out of your pocket, he would think it was an e-cigarette setup 'cause it is.
- 4) You can add flavorings, I'm experimenting with this now.
- 5) You can use it out and about much easier than other portables. Hit it at the rave or the concert. Pass it to a friend. Taking a small dose is fun. Sitting down and taking a big dose is funner.

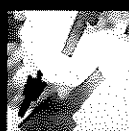

I'll put details in the next post, but that's the truth.

So the keys are -

edit add 12/10/12 - my thought have changed with experimentation. Use ethanol 95% 2 mls per gram of dmt, or it can be more concentrated. Still use the tank type cartridges, but the Dual Coil Tanks make a bigger hit.

A saturated DMT in PEG-400 solution. You can get about 0.5 grams into 3 mls of PEG-400, maybe a bit more. You can order PEG-400 from online e-cig vendors. It's thought to be safer than the other solvents that they use and is usually recommended for people who are allergic to glycerin. The brown bottle is PEG-400. The black sticks are the battery/handle part of an e cig setup. I've found the eco-t size/type to be a good compromise between size and battery life. You can "lock" them so that they don't go off in your pocket.

In the picture, the little vial is a saturated solution of DMT in PEG-400. The glass bottle has some active charcoal purified DMT, and the casserole dish has some that I just freeze precipitated from a direct to base extraction and will clean up soon.

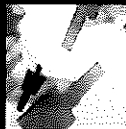

The bottom right thing is an eco-t battery with the atomizer attached and a filled cartridge in it, two spare cartridges sitting next to it. This is what I think is the best setup. That's the whole rig, it holds over a cc of mixture, is about 200 mg, and you can have other filled cartridges in your pocket ready to go if needed.

The vivanova tank pictured holds more and gives bigger hits and is rebuildable if it burns out. The green box is c3 smokimizers and are cheaper and disposable. Lots of these tanks work well. Once you get the batteries, all other brands of tanks fit on them if they

To make it simple, here is my recommendation. This would be using the #1 company's products, Joye. There are many others, but most copy Joye. The threads that connect the battery to the atomizer/cartridge are standardized by Joye and called 510. If you get other brands, stick to 510 threads.

So a simplified shopping list includes

added - I now like ethanol better, 2 cc per gram dmt or more concentrated.

1) PEG-400 (edg solvent fog) Source

2) eco-t battery and charger

3) Regular atomizer head and/or High output atomizer head called "low resistance"

4) Empty tanks can be refilled as many times as you want.

5) added - or instead of 3 and 4, I found dual coil tanks for significantly bigger hits and cheaper.

----edit add 12/4/12 ----

further down the thread it is suggested that this system doesnt make enough vapor and costs too much. If you want more vapor from the start and a cheaper price to start just get the battery and the CE3 disposable tank

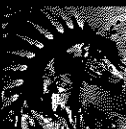

or for even more vapor, but shorter battery life, get a dual coil tank.
Dual Coil tank

This is awesome! Thanks for the info. I had wondered if this was possible but hadn't really looked into it much yet. I already have an e-Go T, it totally changed the way I consumed THC (back before I quit), and I tried to turn as many people on to it as I could. Unfortunately I don't have any more DMT to try this with, and with the MHRB situation really don't know when/if I ever will. ☹️ But if some miracle lands it in my lap again I'll definitely give this method a try!

No direction but to follow what you know,
No direction but a faith in her decision,
No direction but to never fight her flow,
No direction but to trust the final destination.

I'm curious why you say that the preferred rig is the one that delivers a smaller amount. It's hard for me to imagine really breaking through taking multiple 5mg hits, although the idea of a delivery system like this is very intriguing for sure.

How much bigger are the hits produced by the Vivi Nova, and what are its relative drawbacks? If you could get up into the 20mg per hit range, then you would be on to something!

Well, the Joye brand just works great. I actually haven't tried, but have ordered, the atomizer head that makes a bigger hit, the so called low resistance. I can get to any level of this that I want to go to. It is more of an easing in than with a huge blast from a skillet or a bulb, but I think I like that better.

Unlike other methods where when you are half there, its hard to manage the mechanical aspects of another or another hit, that's not the case here. You can work it till you get there.

Quote:

Oh this is on to something. But I see what you are thinking. I've put 20 mg into vaporizers before, hit it hard with one or two hits and not gotten as far as I get with say 4 hits off of one of these. That is why I think this is more efficient with my spice.

Quote:
How much bigger are the hits produced by the Vivi Nova

The ViviNova can be fitted with any one of 3 different inexpensive replaceable elements to adjust the size of the hit. I've only done the smaller one that it comes with, and it is about as much as I can take without coughing. Granted the vapor isn't all DMT.

I don't suggest that this is "better" than other great methods, but for on the go, about town, it has huge merit. I think its the only way I'll ever take it again. You will never be able to get as much of a dose into one hit with an edg device as you could using straight DMT and a VG or other good vaporizer.

An interesting delivery method.

There are two problems with the GVG that this device might solve:

---- 1. Condensation. Even when the GVG is kept very clean, it's sometimes surprising how much vapor condenses on the glass.

---- 2. Failure to vape the full dose. Although my "choreboy" disc usually works very well, there are times when not everything gets vaporized, even though it appears to be at the time. Very frustrating when this happens!

Search my posts for "Ploom" and you'll see an ecig-type device I tried once. Unfortunately, it wasn't successful at all.

There are a couple of concerns I have with this new method:

---- 1. Inhaling polyethylene glycol vapor doesn't sound too appealing. How safe is it really? Is it harsh or unpleasant in any way?

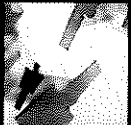

---- 2. I'm used to a single inhalation for a full dose. Do you think it's possible to load a full dose (approx. 25 - 30mg) and get it all in one breath?

Looking forward to other's evaluations.

The PEG-400 has a bit of taste. It doesn't hurt the experience IMO. It's kind of a musty sweet taste. As far as safety goes, to a great degree I just rely on the mindless practical fact that it is deemed safe as an ecig base and ecig smokers would be vaping hundreds of times more of this than me. It is used in some intravenous preparations and is generally considered to be safe all around for ingestion. Used in foods and medicines.

I don't think this type of device will ever be able to give 10+ mg in a single puff, no. It isn't the right tool for a huge one hit blast off.

This is so awesome! I had this same idea a few weeks ago. I am glad someone figured this out, so I don't have to! It sounds perfect for me, as I don't like being ripped into hyperspace, but more easing into it.

Thanks!!!

Do you think this method could be modified for harmalas? Harmalas have a much higher vaporisation temp than spice; the iohle vaporiser cannot vape harmala extract and it reaches 190 celsius. I am very interested in all the various methods behind these techniques.

But seeing as it is an atomizer, there is a chance that simply inhaling a very fine mist of harmala freebase dissolved in appropriate solvent would function the same as gaseous harmala.

For some reason (i.e. me not reading carefully enough) I thought this was an E-cig with an electric heating element. Upon more

This makes it even more appealing! No heat means no possibility of thermally degrading the product. Maybe this is why a smaller dose is more effective?

I think I have to get one of these.

Thanks for all the info!

edit: After reading more, it seems that e-cigs both atomize and heat liquids? Now I'm confused. ☹

Yeah you need heat I guess. Maybe to reduce the viscosity/provide enough energy to the mist to make it as fine as possible?

Here's my question: Why can't you just get a cleaned out perfume bottle with some DMT solution using a lung-safe solvent and spray-huff straight into your lungs a la asthma pumps? Removing the electronic aspect makes such a method even more reliable and safe.

Quote:

When using a nebulizer for Inhalation therapy with medication to be administered directly to the lungs, it is important to note that inhaled aerosol droplets can only penetrate into the narrow branches of the lower airways if they have a small diameter of 1-5 micrometers. Otherwise they are only absorbed by the mouth cavity, where the effect is low.

This might lend a clue about both methods. I've always thought about what if someone could 'vape' LSD through this method. Since it is rather sensitive to temperatures I guess as regards the question of heat, the ability to deliver LSD in this fashion would be the *acid test*.

Why can't you just get a cleaned out perfume bottle with some DMT solution using a lung-safe solvent and spray-huff straight into your lungs a la asthma pumps?

Because a perfume bottle is not capable of dispersing the dmt solution to the degree necessary. Yes, they create a mist, but a mist consisting of big droplets which condensate quickly. Huffing it straight from a spray mister is probably a setup for a horrible and painful experience.

The idea to use e-cigs is not new, but to my knowledge, it has always been an issue of finding a suitable solvent since DMT seems to be poorly soluble in Vegetable glycerine. It certainly is intriguing as a new method of efficient and convenient DMT delivery. More people would have to test it though.

I bought the Joye thing to test it out. Waiting to receive the PG400 liquid through the post. Will definitely share once I've tried it...

I'm actually pretty excited about this. I like how simple it sounds and like to be able to get slowly into it.

Needed

- Ego t tank atomizer
- Ego battery
- VG e-liquid
- Empty ego tank cartridges
- Empty 10 ml e-liquid bottle

All of these can be found at any online e-cig retailer.

Add 1g dmt fb to empty e-liquid bottle

Add 10 drops VG e-liquid to 1g dmt freebase e-liquid bottle

Start your car. Turn the defrost full blast. Place mixture on top of defrost vent.

The dmt will dissolve into the VG e-liquid as it warms up.

Squeeze mixture from bottle into empty tank cartridge. You may have to re-warm several times throughout filling.

Push cartridge into atomizer. Screw on charged battery.

Solution will harden in cartridge. DO NOT vape hardened solution. Whenever you are ready to use, re-warm on defrost, or any other method, until solution is liquid, and no DMT salts can be seen. (Takes a couple minutes on defrost)

Vape away, and enjoy scentless (flavored, if you buy flavored VG e-liquid), anytime anywhere, on demand.

P.S. I believe you can concentrate the solution even further, with less VG e-liquid.

Not so fast everybody.

Being the device-curious person that I am, I ordered one of these (the JOYE eGo Mega) and some propylene glycol last week and got them today.

I tried it out first with plain propylene glycol (PG). It worked OK - produced a slightly sweet, nearly tasteless flavor.

Next, I dissolved about 100mg DMT into maybe 0.5ml PG and tried it out.

Observations:

The first thing I noticed is that you really have to draw hard when inhaling. The DMT must have changed the viscosity of the fluid - it required noticeably more effort to inhale than it did with the plain PG.

Second, the vapor is harsh! I'm not sure how it's heated inside the "atomizer", but the throat-feel reminded me very much of my early inexperienced days with burnt spice.

Finally, it takes many inhalations to get effects. (Maybe 10? I lost count.) And even then, I was still far from a breakthrough. With sublingual MAOI beforehand, it might be easier to reach a breakthrough, but the vapor is so harsh that my throat would probably give out before that point.

If I had to compare this device to other devices/methods, it reminds me most of "the machine", except requiring much more effort to inhale.

The edig + PG + postage was almost the same price as a GVG, so it really isn't a good choice economically.

I must say that I feel a bit foolish for spending money on this, but at least now I know. I'll continue to experiment with it for awhile, but my lungs can only take so much abuse.

One positive - it made me appreciate even more the elegant simplicity and supreme efficiency of the GVG!

E-CIGARETTE, OR VAPING, PRODUCTS VISUAL DICTIONARY

U.S. Department of
Health and Human Services
Centers for Disease
Control and Prevention

-
- This product is intended for **educational purposes only for public health officials and healthcare providers.**
 - The devices and brands presented in this pamphlet are intended to highlight the different e-cigarette, or vaping, product generations and substances used in these devices. **The use of brand names does not constitute product endorsement.**
 - Contents of this pamphlet **should not be modified.**
 - **Note for Accessibility:** Explanation of graphics on pages 13, 15, and 17 can be found in Appendix on page 25.

E-Cigarette, or Vaping, Products

E-cigarette, or vaping, products can be used to deliver nicotine, cannabis (THC, CBD), flavorings, chemicals, and other substances.

They are known by many different names and come in many shapes, sizes and device types. Devices may be referred to as

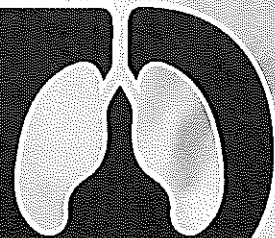

- E-cigs
- Vapes
- Vape pens, dab pens, and dab rigs
- Tanks
- Mods
- Pod-Mods
- Electronic nicotine delivery systems (ENDS)

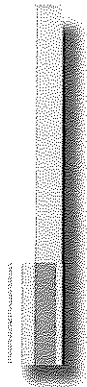

Use of e-cigarette, or vaping, products is sometimes referred to as “vaping” or “juuling.” E-cigarette, or vaping, products used for dabbing are sometimes called “dab” pens.

with prefilled
or refillable
cartridge**

3rd

GENERATION

**Tanks or Mods
(refillable)**

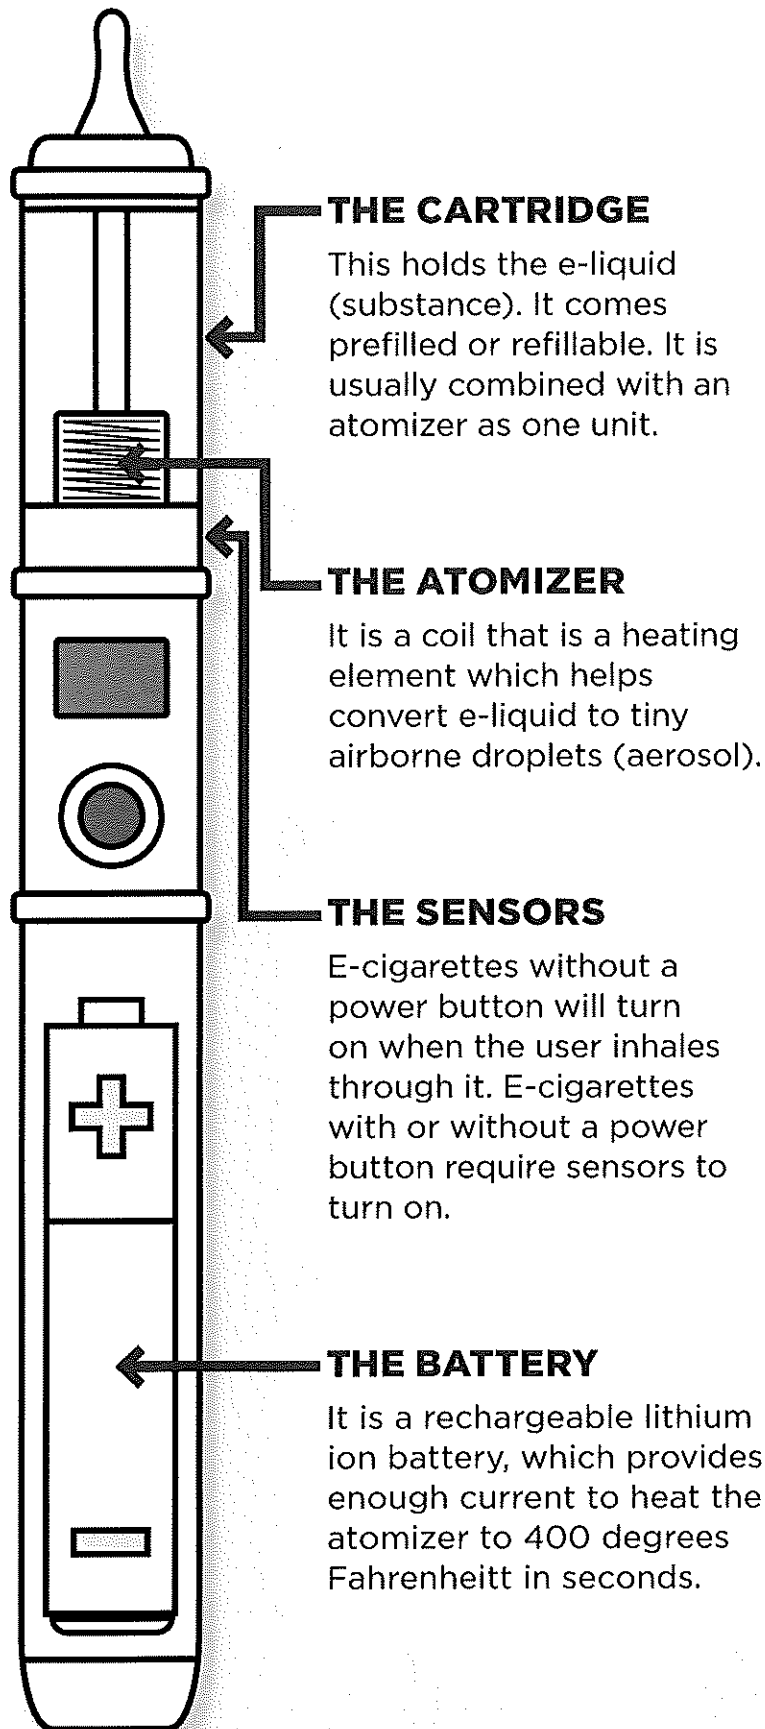

4th

GENERATION

**Pod Mods
(prefilled or
refillable)**

THE E-CIGARETTE

THE CARTRIDGE

This holds the e-liquid (substance). It comes prefilled or refillable. It is usually combined with an atomizer as one unit.

THE ATOMIZER

It is a coil that is a heating element which helps convert e-liquid to tiny airborne droplets (aerosol).

THE SENSORS

E-cigarettes without a power button will turn on when the user inhales through it. E-cigarettes with or without a power button require sensors to turn on.

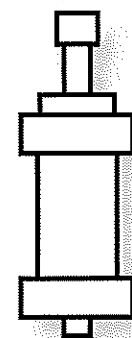

THE BATTERY

It is a rechargeable lithium ion battery, which provides enough current to heat the atomizer to 400 degrees Fahrenheit in seconds.

Mod Box

It is a 3rd generation device that is modifiable ("Mod") allowing users to change the voltage, coils and wicks.

Sub-Ohm Tank

It is made of plastic or metal with transparent casing so liquid levels can be seen. It contains a lower resistance coil that allows the liquid to heat up faster.

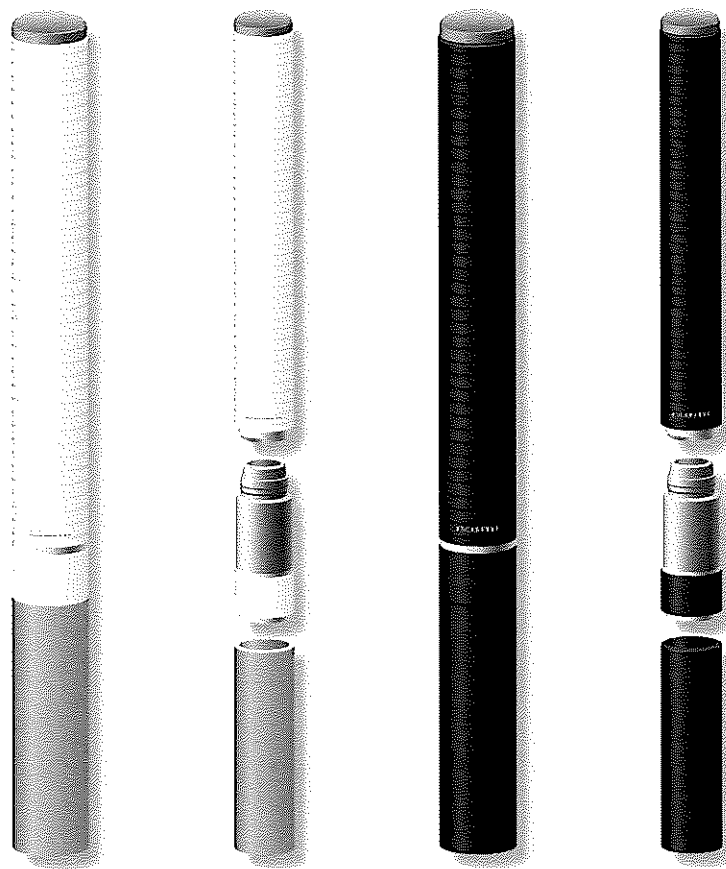

Cartridge

It is made of plastic or metal with transparent casing so liquid levels can be seen. It contains an atomizer that heats up the e-liquid.

E-Liquid

E-liquid is contained in a pod, cartridge or tank. It is made up of a mixture of substances that includes nicotine, cannabis, and/or flavoring.

Disposable E-cigarettes

- A type of e-cigarette designed to be used one time, only.
- These devices are not rechargeable or refillable.
- They are discarded when it runs out of charge or e-liquid.
- They are designed to mimic the look and feel of combustible cigarettes. These are sometimes referred to as “cigalikes”

E-Cigarettes with Prefilled or Refillable Cartridge

- A type of rechargeable e-cigarette, or vaping, product designed to be used multiple times.
- E-liquid comes in prefilled or refillable cartridges. Substances may include nicotine, cannabis (THC, CBD), flavoring, solvents, or other substances.
- The cartridge is attached to a battery pen—which contains the battery.
- Cartridge and battery pen are typically purchased separately. They can be bought in starter packs.

Tanks or Mods

- A type of rechargeable e-cigarette, or vaping, product designed to be used multiple times.
- They are modifiable devices (“mods”), allowing users to customize the substances in the device.

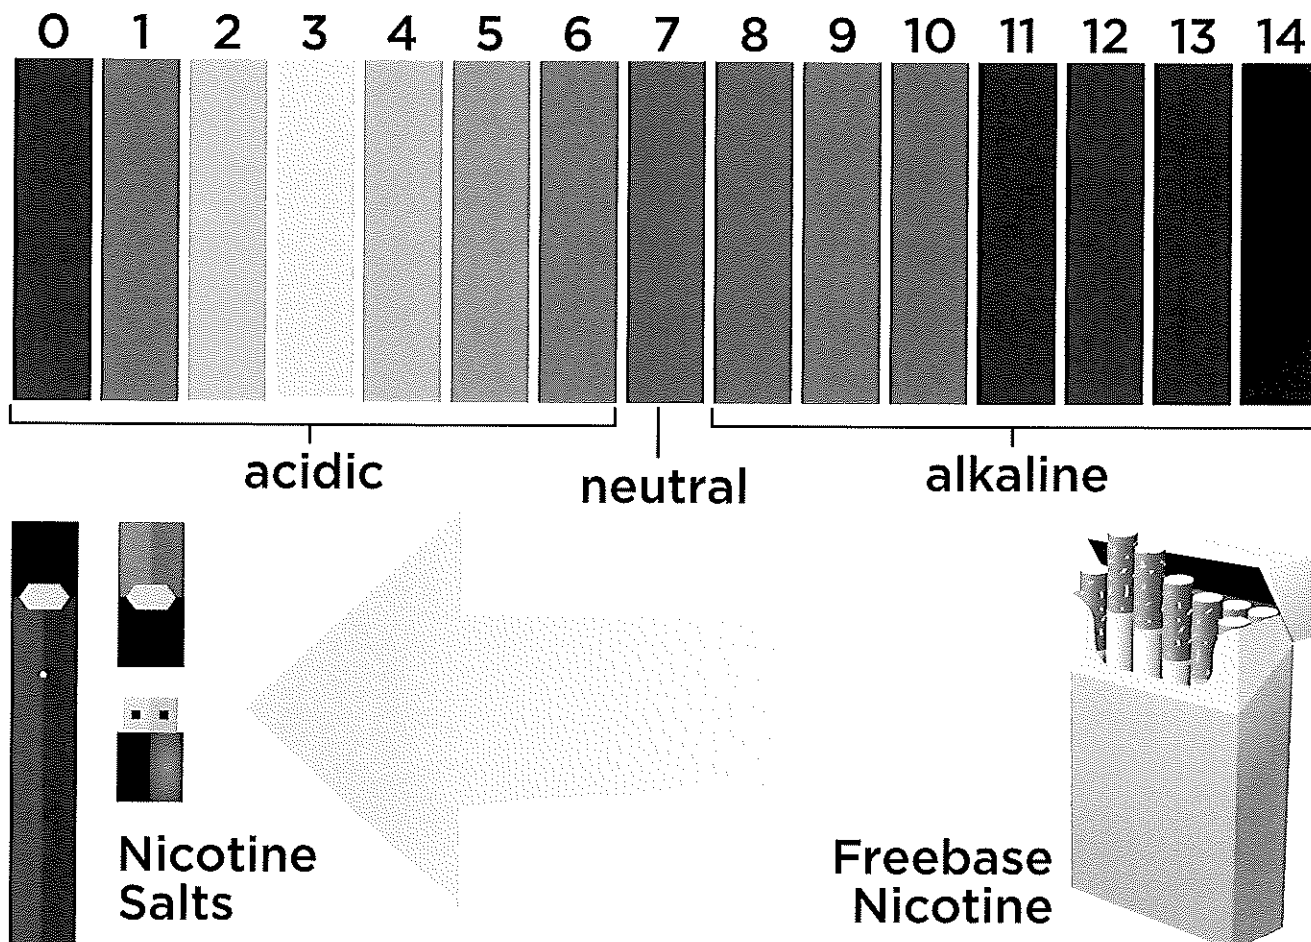

Sub-Ohm Tank

- Sub-ohm tank contains low resistance coils. It is designed to create a large cloud (aerosol) with a stronger delivery or hit of nicotine or other substances.

Pod Mods

- Pod Mod is an e-cigarette, or vaping, product with a prefilled or refillable “pod” or pod cartridge with a modifiable (mod) system (“Pod-Mods”)
- These are other examples of fourth generation devices. Pod Mods come in many shapes, sizes, and colors.
- Common Pod Mod brands include JUUL® and Suorin®
- There are compatible prefilled pod cartridges that contain nicotine, THC, or CBD with or without flavoring.

For accessibility, explanation of graphic can be found in [Appendix, page 25](#).

Pod Mods

- Pod Mods typically use nicotine salts rather than the freebase nicotine used in most other e-cigarette, or vaping, products.
- Nicotine salts, which have a lower pH than free base nicotine, allow particularly high levels of nicotine to be inhaled more easily and with less irritation to the throat than freebase nicotine.

Vaporizers

- An inhalation device used to release the active substances of organic or inorganic materials in the form of an aerosol through the application of non-combusting heat
- Vaporizers can be used to aerosolize dry herbs, wax, and oil. For example, vaporizers are used to heat marijuana to a point where its active ingredients (e.g., THC) are released in an aerosol and inhaled.

How to Classify the User's E-Cigarette, or Vaping, Product

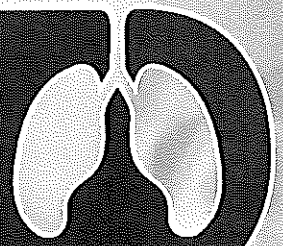

For an accessible explanation of schematic below on how to classify e-cigarettes, go to [Appendix, page 25](#).

Important notes:

1. E-liquids can contain nicotine, THC, CBD, flavors, or other solvents.
2. Marijuana herb, hash oil, dab wax are used with vaporizers.

Substances

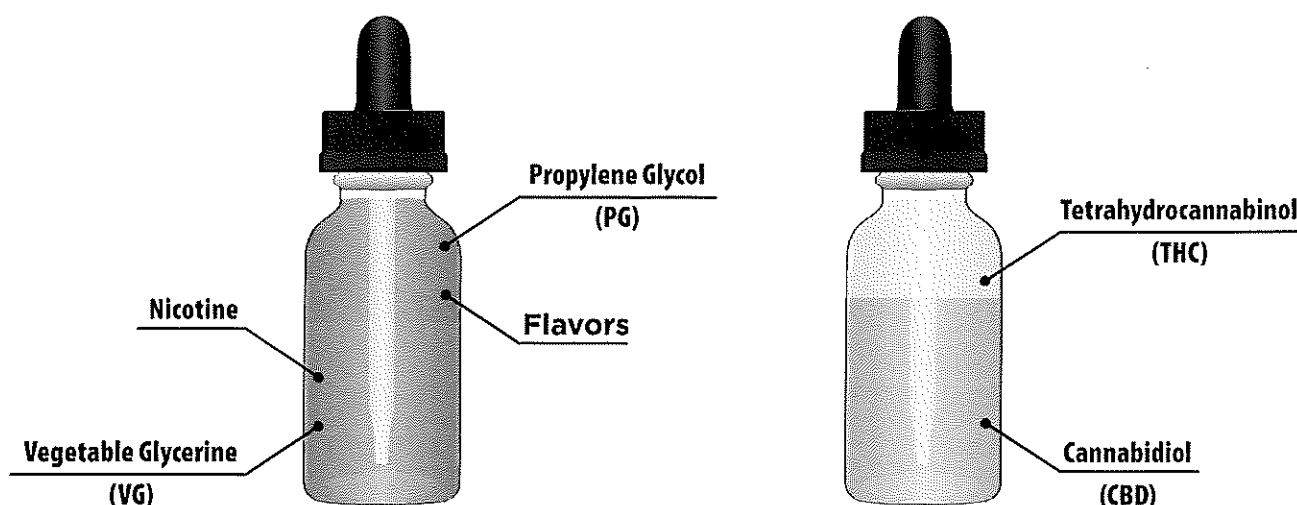

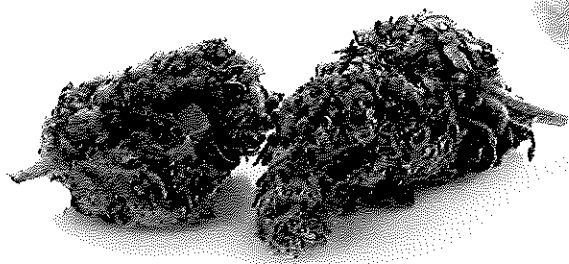

E-Liquid

- E-liquid is the liquid that is converted into an aerosol by an e-cigarette, or vaping, product. It is typically a mixture of water, food grade flavoring, a choice of nicotine levels, cannabis (THC, CBD), propylene glycol (PG) or vegetable glycerin (VG).
- PG and VG are humectants used in e-liquid to produce aerosols that simulate combustible tobacco cigarette smoke.
- The ratio of PG and VG in the e-liquid can change based on whether flavor (higher levels of PG) or plume (higher levels of VG) is desired.

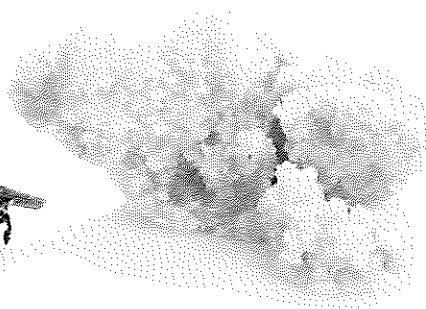

For accessibility, explanation of regular e-liquid vs. cannabis e-liquid graphic below can be found in [Appendix, page 25](#).

REGULAR E-LIQUID VS. CANNABIS E-LIQUID

Marijuana Bud

Crumble

Wax

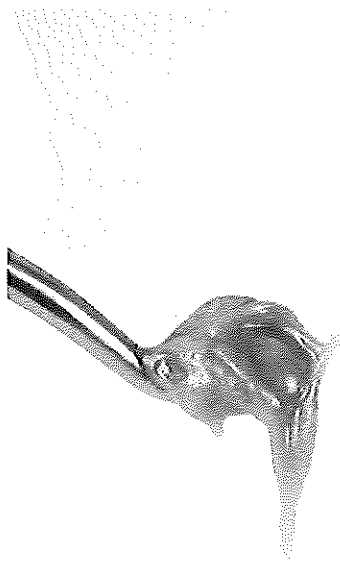

Dry Sift/Kief

Marijuana

- Also called weed, herb, pot, grass, bud, ganja, Mary Jane, and a vast number of other slang terms—is a greenish-gray mixture of the dried flowers of *Cannabis sativa*.
- THC is the main psychoactive chemical in marijuana.
- THC and terpenes (aromatic oils) are extracted from marijuana as THC concentrates, hash oil, and wax. These derived products, crumble, shatter, wax, and dry sift/kief, have a high dosage of THC.
- Marijuana contains much more THC than hemp, while hemp has more cannabidiol (CBD).

Dab Rig

Concentrate

Torch

Dabbing

- Dabbing or dibbing is a process that allows the user to inhale a high concentration of THC by aerosolizing of a concentrate that has been placed on a hot surface (the "nail").
- Dabbing is also a term used when using THC concentrates and wax in a dab pen or a vaporizer.

CBD

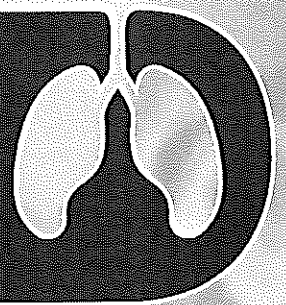

- CBD stands for cannabidiol and it is derived from cannabis, marijuana and hemp.
- CBD is the main ingredient in hemp and the second main ingredient in marijuana after THC.
- CBD is not a psychoactive substance.

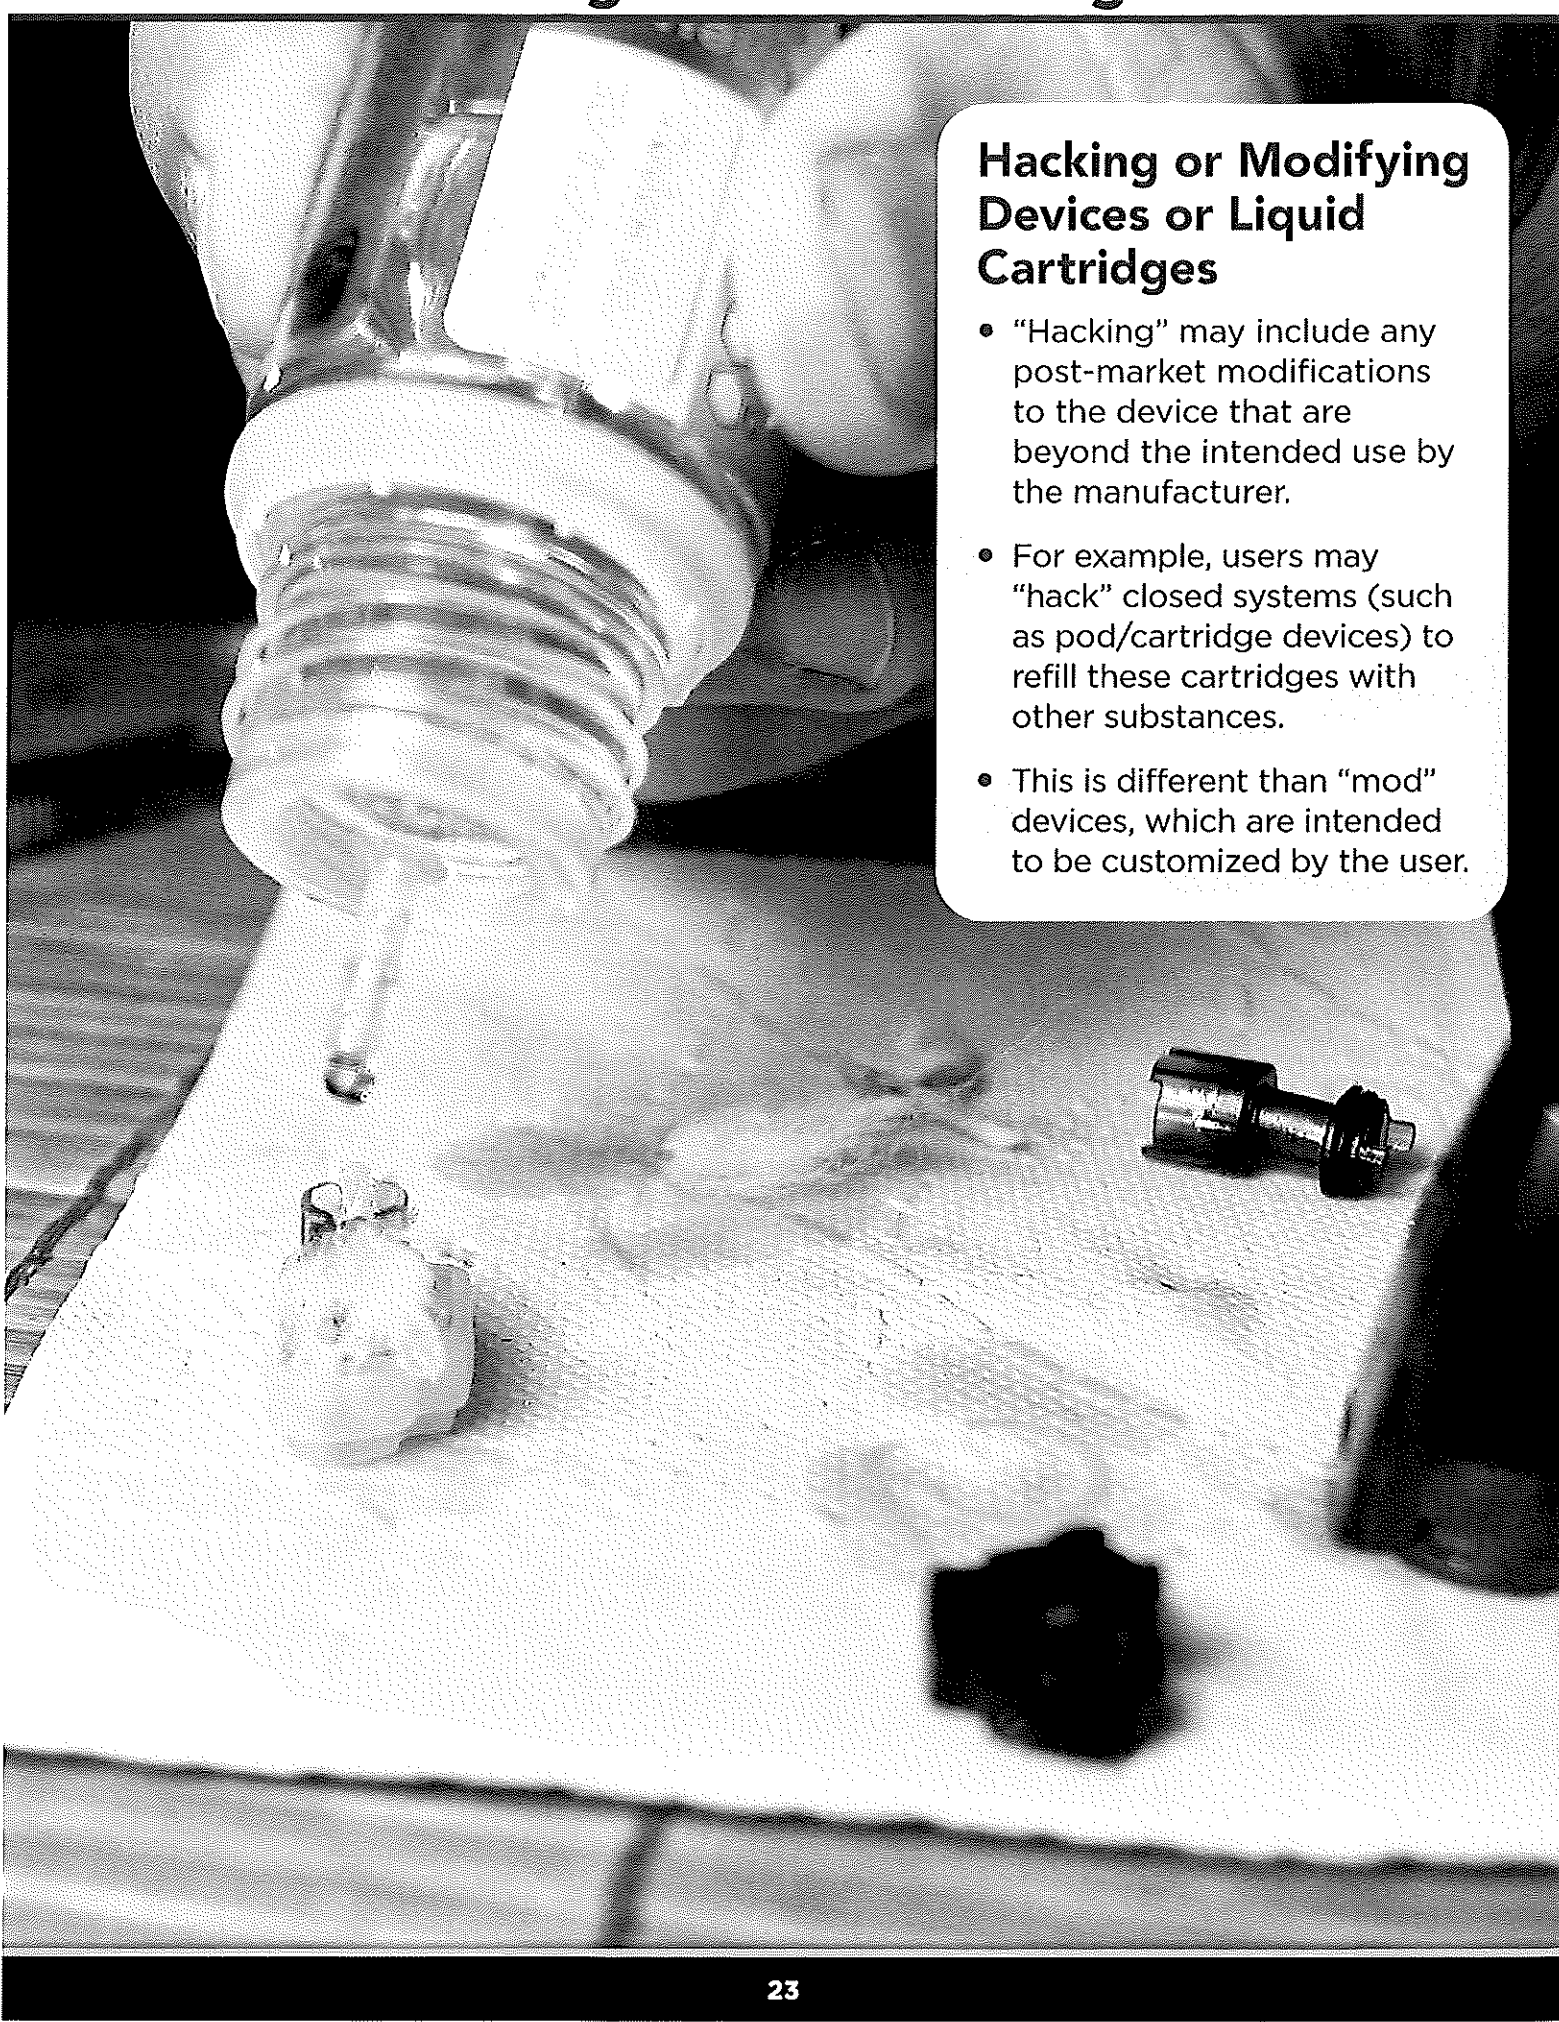

Synthetic Cannabinoids

- Synthetic cannabinoids are a class of synthetic molecules that bind to cannabinoid receptors in the brain and body (the same receptors to which THC and CBD attach).
- They are “designer drugs” that are usually smoked and have been marketed as herbal incense, or “herbal smoking blends”.
- They are sold under common names like K2, Spice, Black Mamba, Kronic and Synthetic Marijuana.

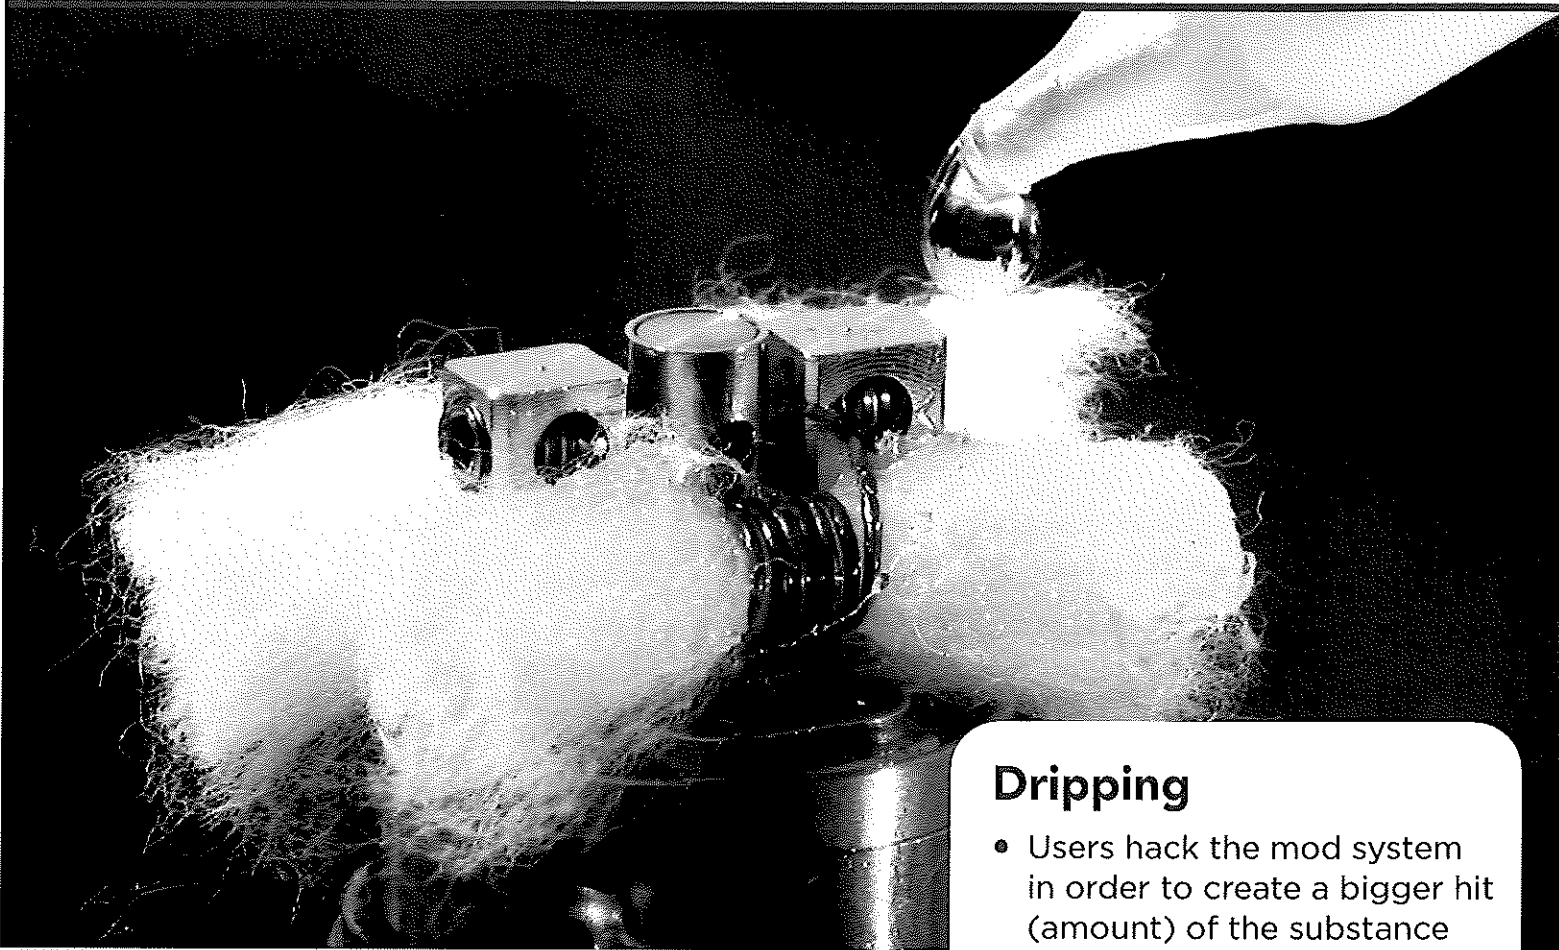

Hacking or Modifying

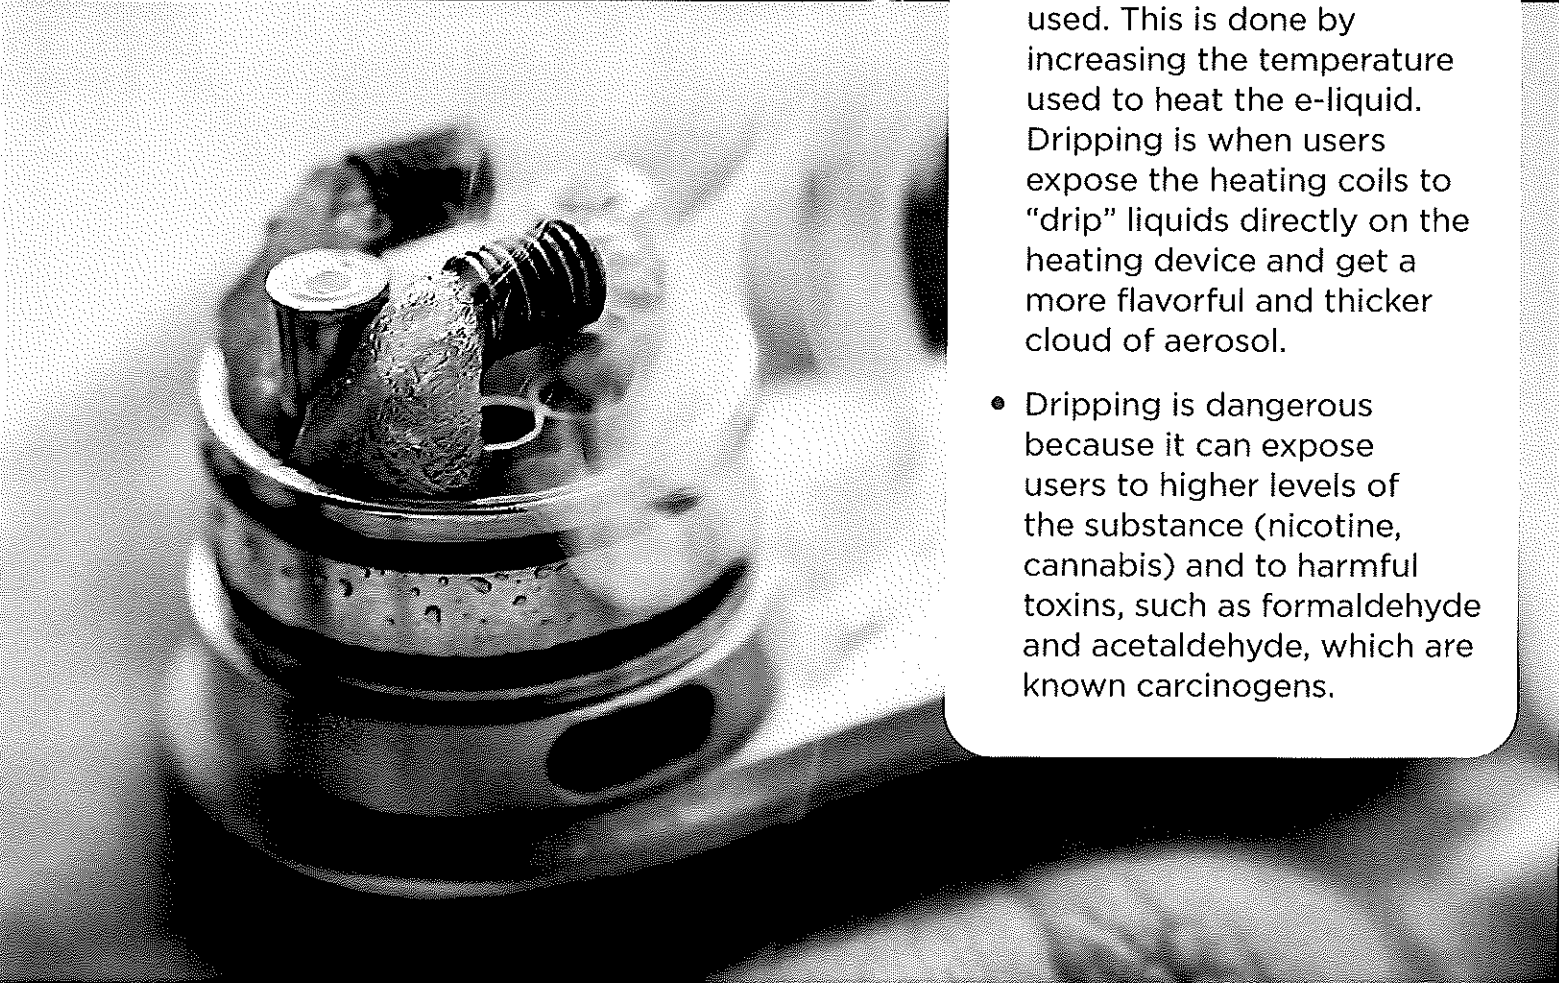

Hacking or Modifying Devices or Liquid Cartridges

- “Hacking” may include any post-market modifications to the device that are beyond the intended use by the manufacturer.
- For example, users may “hack” closed systems (such as pod/cartridge devices) to refill these cartridges with other substances.
- This is different than “mod” devices, which are intended to be customized by the user.

Dripping

- Users hack the mod system in order to create a bigger hit (amount) of the substance used. This is done by increasing the temperature used to heat the e-liquid. Dripping is when users expose the heating coils to "drip" liquids directly on the heating device and get a more flavorful and thicker cloud of aerosol.
- Dripping is dangerous because it can expose users to higher levels of the substance (nicotine, cannabis) and to harmful toxins, such as formaldehyde and acetaldehyde, which are known carcinogens.

Explanation of Graphics for Accessibility

Page 13—Graphic accompanying Pod Mods: This is an illustration of a colorful pH range from pH 0 to 14. pH 0 to 6 is indicated as acidic. pH 7 is indicated as neutral. pH 8 to 14 is indicated as alkaline. Below is a regular cigarette pack with freebase nicotine that has a high pH which is alkaline. Fourth generation e-cigarette, vaping, products contain nicotine salts that has a low pH which is acidic. ([page 13](#))

Page 15—How to Classify the User's E-Cigarette, or Vaping, Product: This is a schematic to help classify e-cigarette, or vaping, products based on the substance and device the e-liquid is contained in. Classifying e-cigarettes, or vaping, products correctly will aid public health officials and healthcare providers in reporting devices used by users experiencing symptoms from these products.

Important notes:

3. E-liquids can contain nicotine, THC, CBD, flavors, or other solvents.
4. Marijuana herb, hash oil, dab wax are used with vaporizers.

First question to ask, is the e-liquid contained in a disposable e-cigarette, cartridge, tank or pod?

- If it is a disposable e-cigarette then the device is classified as a first generation device.
- If it is a cartridge then a second question is asked. Is the cartridge also called a pod cartridge or contains nicotine salts? If the answer is no, then it is a second generation device. If the answer is yes then it is a fourth generation device.
- If it is a tank or a sub-ohm tank then the device is classified as a third generation device.
- If it is a pod then the device is classified as a fourth generation device.
- If the user is using marijuana herb, oil, or dab wax then the device is either a vaporizer, dab rig or dab pen. ([page 15](#))

Page 17—Illustrative example of differences between regular e-liquid and cannabis e-liquid. Regular e-liquid contains nicotine, propylene glycol, vegetable glycerin, and flavors. Cannabis e-liquid contains Tetrahydrocannabinol (THC) and Cannabidiol (CBD). ([page 17](#))
