“protected network” such as “access the protected network only as required to remedy a condition that caused the quarantine to be imposed”).

D. Motivation to Combine Gleichauf and Ovadia

62. In my opinion, a POSITA when considering the teachings of Gleichauf would have also considered the teachings of Ovadia, as both relate to providing secure access when an individual computerized device connects to a network. EX1004, 3:4-9; EX1005, 1:8-11. A POSITA would have been motivated to combine the teachings of Gleichauf and Ovadia for multiple reasons and doing so would have been within the POSITA’s skillset. The combination would have been obvious because it merely uses known techniques (e.g., Ovadia’s trusted platform module security infrastructure and digital signatures) to improve a similar method (e.g., Gleichauf’s authentication and authorization of devices seeking network access) in the same way.

63. In my opinion, a POSITA would have been motivated to take advantage of Ovadia’s use of a trusted platform module—as described in the Trusted Computing Group “platform-independent industry specification”—because it would standardize Gleichauf’s posture credentials. EX1005, 4:32-35; EX1014, 2 (TCG was formed as an “industry-standards organization with the aim of enhancing the security of the computing environment in disparate computer platforms.”). A TCG-defined TPM can advantageously be used to provide asset

protected network” such as “access the protected network only as required to remedy a condition that caused the quarantine to be imposed”).

D. Motivation to Combine Gleichauf and Ovadia

62. In my opinion, a POSITA when considering the teachings of Gleichauf would have also considered the teachings of Ovadia, as both relate to providing secure access when an individual computerized device connects to a network. EX1004, 3:4-9; EX1005, 1:8-11. A POSITA would have been motivated to combine the teachings of Gleichauf and Ovadia for multiple reasons⁹ and doing so would have been within the POSITA’s skillset. The combination would have been obvious because it¹⁰ merely uses known techniques (e.g., Ovadia’s trusted platform module security infrastructure and digital signatures) to improve a similar method¹².g., Gleichauf’s¹¹ authentication and authorization of devices seeking network access) in the same way.

¹⁴ ¹³ In my opinion, a POSITA would have been motivated to take advantage of Ovadia’s use of a¹⁵ trusted platform module—as described in the Trusted Computing Group “platform-independent industry specification”—because it would standardize Gleichauf’s posture credentials.¹⁶ EX1005, 4:32-35; EX1014, 2 (TCG was formed as an “industry-standards organization with the aim of enhancing the security of the computing environment in disparate computer¹⁷ platforms.”). A TCG-defined TPM can advantageously be used to provide asset

protected network” such as “access the protected network only as required to remedy a condition that caused the quarantine to be imposed”).

D. Motivation to Combine Gleichauf and Ovadia

62. In my opinion, a POSITA when considering the teachings of Gleichauf would have also considered the teachings of Ovadia, as both relate to providing secure access when an individual computerized device connects to a network. EX1004, 3:4-9; EX1005, 1:8-11. A POSITA would have been motivated to combine the teachings of Gleichauf and Ovadia for multiple reasons and doing so would have been within the POSITA’s skillset. The combination would have been obvious because it merely uses known techniques (e.g., Ovadia’s trusted platform module security infrastructure and digital signatures) to improve a similar method (e.g., Gleichauf’s authentication and authorization of devices seeking network access) in the same way.

63. In my opinion, a POSITA would have been motivated to take advantage of Ovadia’s use of a trusted platform module—as described in the Trusted Computing Group “platform-independent industry specification”—because it would standardize Gleichauf’s posture credentials. EX1005, 4:32-35; EX1014, 2 (TCG was formed as an “industry-standards organization with the aim of enhancing the security of the computing environment in disparate computer platforms.”). A TCG-defined TPM can advantageously be used to provide asset

tracking functionalities, collect and report (in a trusted manner) platform configuration information, and secure client-server communications. EX1014, 2-4; EX1016, ¶11 (“The TCPA architecture includes an isolated computing engine, or trusted platform module (TPM) (not shown), whose processes can be trusted because they cannot be altered. ... Additionally, the TPM may encrypt or wrap data, such as a key, and may bind or seal an internally generated asymmetric key pair to a particular TPM and/or a particular platform configuration.”); EX1012, 2:8-11 (TCPA is the former name of TCG); EX1019, ¶¶3-4. Put differently, following the industry standard, as described in Ovadia, would benefit Gleichauf’s system by formatting a device’s posture credentials consistently and with substantially the same information, regardless of the device’s manufacturer or components. This would also allow Gleichauf’s policy server to process posture credentials that were received, in a trusted manner, more efficiently and in substantially the same way regardless of the device providing the credentials. Following the industry standard would also promote the interoperability of devices from diverse manufacturers. Ensuring the interoperability of devices is a common and important goal in the computer networking arts.

4. Ovadia describes applying technology from the “Trusted Computing Group (TCG)” which addresses “network security” and “covers trust in computing platforms in general.” EX1005, 4:16-35. A POSITA would thus have understood

tracking functionalities, collect and report (in a trusted manner) platform configuration information, and secure client-server communications. EX1014, 2-4; EX1016, ¶11 (“The TCPA architecture includes an isolated computing engine, or trusted platform module (TPM) (not shown), whose processes can be trusted because they cannot be altered. ... Additionally, the TPM may encrypt or wrap data, such as a key, and may bind or seal an internally generated asymmetric key pair to a particular TPM and/or a particular platform configuration.”); EX1012, 2:8-11 (TCPA is the former name of TCG); EX1019, ¶¶3-4. Put differently, following the industry standard, as described in Ovadia, would benefit Gleichauf’s system by formatting a device’s posture credentials consistently and with substantially the same information, regardless of the device’s manufacturer or components. This would also allow Gleichauf’s policy server to process posture credentials that were received, in a trusted manner, more efficiently and in substantially the same way regardless of the device providing the credentials. Following the industry standard would also promote the interoperability of devices from diverse manufacturers. Ensuring the interoperability of devices is a common and important goal in the computer networking arts.

64. Ovadia describes applying technology from the “Trusted Computing Group (TCG)” which addresses “network security” and “covers trust in computing platforms in general.” EX1005, 4:16-35. A POSITA would thus have understood

that the trusted computing and authentication technologies described in Ovadia are not limited to the wireless networks Ovadia describes but instead are generally applicable to networks—like Gleichauf’s—that condition network access on authentication and authorization of client devices.

5. In my opinion, the combination also would have been obvious because it applies the known technique of digitally signing an attestation about the state of a device to make its authentication more secure (as in Ovadia) with the known network authorization process of analyzing a device’s security posture credentials, including its authentication (as in Gleichauf) to yield predictable results. In my opinion, a POSITA would have been familiar with the use of digital signatures to prove the integrity and authenticity of network communications and would have recognized that Ovadia’s digital signature technique would improve Gleichauf’s process by increasing resistance to forged or tampered-with posture credentials. EX1008, ¶33. In my opinion, a POSITA also would have recognized that use of a digital signature would improve Gleichauf’s process by enabling the policy server to confirm that the posture credentials originated with the device attempting to access the network.

66. In my opinion, POSITA also would have been motivated to combine the teachings of Gleichauf and Ovadia because Ovadia provides additional details regarding implementation of Gleichauf’s techniques. Gleichauf provides that

that the trusted computing and authentication technologies described in Ovadia are not limited to the wireless networks Ovadia describes but instead are generally applicable to networks—like Gleichauf’s—that condition network access on authentication and authorization of client devices.

65. In my opinion, the combination also would have been obvious because it applies the known technique of digitally signing an attestation about the state of a device to make its authentication more secure (as in Ovadia) with the known network authorization process of analyzing a device’s security posture credentials, including its authentication (as in Gleichauf) to yield predictable results. In my opinion, a POSITA would have been familiar with the use of digital signatures to prove the integrity and authenticity of network communications and would have recognized that Ovadia’s digital signature technique would improve Gleichauf’s process by increasing resistance to forged or tampered-with posture credentials. EX1008, ¶33. In my opinion, a POSITA also would have recognized that use of a digital signature would improve Gleichauf’s process by enabling the policy server to confirm that the posture credentials originated with the device attempting to access the network.

66. In my opinion, §11 POSITA also would have been motivated to combine the teachings of Gleichauf and Ovadia because Ovadia provides additional details regarding implementation of Gleichauf’s techniques. Gleichauf provides that

“policy server 28 authenticates an identity of the computerized device 22 to generate an authentication result.” EX1004, 22:3-5. Ovadia explains that one way to authenticate a device is to check that device’s digital signature. EX1005, 16:30-32. It would have been obvious to a POSITA to use Ovadia’s digital signatures as a way of performing Gleichauf’s device authentication.

97. In my opinion, a POSITA would have had a reasonable expectation of success in combining Gleichauf and Ovadia. Notably, components of Ovadia’s trusted computing architecture have corresponding components in Gleichauf’s architecture, and a POSITA would have recognized how the descriptions provided for components in Ovadia would be applicable to the corresponding components in Gleichauf. For example, similar to the posture agent in Gleichauf, which gathers information about the device’s “configuration state,” Ovadia uses “an authentication agent to determine the state of a platform environment” and generate an “integrity measurement.” EX1004, 3:8, 12:21-31; EX1005, 4:40-43, 14:1-6; Fig. 8. Ovadia’s integrity measurement is stored in the trusted platform module. EX1005, 13:61-63, Fig. 8. The integrity measurement is then provided to an authentication server as part of authentication data in response to an authentication challenge, which is analogous to Gleichauf’s sending the posture credentials of a device to a policy server in response to requests to authenticate the device. EX1005, 4:43-45, 13:61-63, Fig. 8; EX1004, 10:63-11:3. Ovadia’s

“policy server 28 authenticates an identity of the computerized device 22 to generate an authentication result.” EX1004, 22:3-5. Ovadia explains that one way to authenticate a device is to check that device’s digital signature. EX1005, 16:30-32. It would have been obvious to a POSITA to use Ovadia’s digital signatures as a way of performing Gleichauf’s device authentication.

67. In my opinion, a POSITA would have had a reasonable expectation of success in combining Gleichauf and Ovadia. Notably, components of Ovadia’s trusted computing architecture have corresponding components in Gleichauf’s architecture,¹² and a POSITA would have recognized how the descriptions provided for components in Ovadia would be¹³ applicable to the corresponding components in Gleichauf.¹⁴ For example, similar to the posture agent in Gleichauf, which¹⁵ gathers information about the device’s “configuration state,” Ovadia¹⁶ uses “an authentication agent to determine the state of a platform environment” and generate an “integrity measurement.”¹⁷ EX1004, 3:8, 12:21-31; EX1005, 4:40-43, 14:1-6; Fig. 8. Ovadia’s integrity measurement is stored in the¹⁸ trusted platform module. EX1005, 13:61-63, Fig. 8. The integrity measurement is then provided to an authentication server as part of authentication data in response to an authentication¹⁹ challenge, which is analogous to Gleichauf’s sending the posture credentials of a device to a policy server in response to requests to authenticate the device. EX1005, 4:43-45, 13:61-63, Fig. 8; EX1004, 10:63-11:3. Ovadia’s

“policy server 28 authenticates an identity of the computerized device 22 to generate an authentication result.” EX1004, 22:3-5. Ovadia explains that one way to authenticate a device is to check that device’s digital signature. EX1005, 16:30-32. It would have been obvious to a POSITA to use Ovadia’s digital signatures as a way of performing Gleichauf’s device authentication.

67. In my opinion, a POSITA would have had a reasonable expectation of success in combining Gleichauf and Ovadia. Notably, components of Ovadia’s trusted computing architecture have corresponding components in Gleichauf’s architecture, and a POSITA would have recognized how the descriptions provided for components in Ovadia would be applicable to the corresponding components in Gleichauf. For example, similar to the posture agent in Gleichauf, which gathers information about the device’s “configuration state,” Ovadia uses “an authentication agent to determine the state of a platform environment” and generate an “integrity measurement.” EX1004, 3:8, 12:21-31; EX1005, 4:40-43, 14:1-6; Fig. 8. Ovadia’s integrity measurement is stored in the trusted platform module. EX1005, 13:61-63, Fig. 8. The integrity measurement is then provided to an authentication server as part of authentication data in response to an authentication challenge, which is analogous to Gleichauf’s sending the posture credentials of a device to a policy server in response to requests to authenticate the device. EX1005, 4:43-45, 13:61-63, Fig. 8; EX1004, 10:63-11:3. Ovadia’s

integrity measurement is “digitally signed with appropriate keys” before it is sent to the authentication server. EX1005, 13:63-64, Fig. 8. A POSITA would have understood that Ovadia’s trusted platform module generates and sends the integrity measurement because the integrity measurements are digitally signed with an Attestation Integrity Key (AIK) and “AIKs are only permitted to sign data generated by a TPM.” EX1005, 14:9, 5:35-36. In my opinion, it would have been obvious to a POSITA to implement Gleichauf’s posture agent with trusted platform module functionality, e.g., the ability to store, provide, and digitally sign integrity measurements, as taught in Ovadia, to provide security assurances available with digital signatures and limited-use integrity keys. Such a combination would have involved application of known techniques (e.g., trusted platform module functionality) to improve the network security of Gleichauf’s computerized devices in the same way in which Ovadia’s trusted platform module operates (e.g., storing, providing, and digitally signing integrity measurements). Such a combination would also have involved the combination of prior art elements (e.g., combining Ovadia’s well-known trusted platform module with Gleichauf’s computerized devices) according to known methods to yield predictable results (improved network security to Gleichauf’s computerized devices).

68. Both references also describe providing a message with an explanation to the user of the device if the posture credentials or integrity

integrity measurement is “digitally signed with appropriate keys” before it is sent to the authentication server. EX1005, 13:63-64, Fig. 8. A POSITA would have understood that Ovadia’s trusted platform module generates and sends the integrity measurement because the integrity measurements are digitally signed with an Attestation Integrity Key (AIK) and “AIKs are only permitted to sign data generated by a TPM.” EX1005, 14:9, 5:35-36. In my opinion, it would have been obvious to a POSITA to implement Gleichauf’s posture agent with ¹⁴trusted platform module functionality, e.g., the ability to store, provide, and digitally sign integrity measurements, as taught in Ovadia, to provide ¹⁵security assurances available with digital signatures and limited-use integrity keys. ¹⁶Such a combination would have involved application of known techniques (e.g., trusted platform module functionality) to improve the network security of Gleichauf’s computerized devices in the same way in which Ovadia’s trusted platform module operates (e.g., storing, providing, and digitally signing integrity measurements). Such a combination would also have involved the combination of prior art elements (e.g., combining Ovadia’s well-known trusted platform module with Gleichauf’s computerized devices) according to known methods to yield predictable results (improved network security to Gleichauf’s computerized devices).

¹⁸ ¹⁷ Both references also describe providing a message with an explanation to the user of the device if the posture credentials or integrity

Measurement is not accepted. EX1004, 4:50-67; EX1005, 16:62-65. In my opinion, the analogous architectures of Gleichauf's and Ovadia's respective systems— together with the fact that they both solve similar problems within the same field of network access authentication—would have provided a POSITA with a reasonable expectation of success in combining their disclosures. In my opinion, the predictability of their combination is also consistent with, and supported by, Gleichauf's and Ovadia's mutual acknowledgements that a POSITA would have had the skills to make “various changes in form and details” to their described embodiments. EX1004, 27:24-29; EX1005, 18:64-19:4.

79. In my opinion, the proposed combination permits but do not require physical incorporation of elements from Ovadia into Gleichauf. 8

9
E. **Motivation to Combine Gleichauf, Ovadia, and Lewis**

70. In my opinion, a POSITA when considering the teachings of Gleichauf and Ovadia would have also considered the teachings of Lewis, as all of the references relate to providing secure access when an individual computerized device connects to a network. EX1004, 3:4-9; EX1005, 1:8-11; EX1006, 4:7-9. In my opinion, a POSITA would have been motivated to combine the teachings of Gleichauf, Ovadia, and Lewis for multiple reasons and doing so would have been within the POSITA's skillset. The combination would have been obvious because it uses the known technique of redirection of device traffic to a quarantine server

measurement is not accepted. EX1004, 4:50-67; EX1005, 16:62-65. In my opinion, the analogous architectures of Gleichauf's and Ovadia's respective systems— together with the fact that they both solve similar problems within the same field of network access authentication—would have provided a POSITA with a reasonable expectation of success in combining their disclosures. In my opinion, the predictability of their combination is also consistent with, and supported by, Gleichauf's and Ovadia's mutual acknowledgements that a POSITA would have had the skills to make “various changes in form and details” to their described embodiments. EX1004, 27:24-29; EX1005, 18:64-19:4.

69. In my opinion, the proposed combination permits but do not require physical incorporation of elements from Ovadia into Gleichauf. 

 E. ¹⁰ **Motivation to Combine Gleichauf, Ovadia, and Lewis**

¹¹ In my opinion, a POSITA when considering the teachings of Gleichauf and Ovadia would have also considered the teachings of Lewis, as all of the references relate to providing secure access when an individual computerized device connects to a network. EX1004, 3:4-9; EX1005, 1:8-11; EX1006, 4:7-9. In my opinion, a POSITA would have been motivated to combine the teachings of Gleichauf, Ovadia, and Lewis for multiple reasons and doing so would have been within the POSITA's skillset. The combination would have been obvious because it ¹² uses the known technique of redirection of device traffic to a quarantine server

that serves a webpage to the device, as in Lewis, to improve a similar method of traffic redirection, as in Gleichauf, in the same way.

1. In my opinion, the combination would also have been obvious because it is merely the application of Lewis's known technique of serving a webpage to a quarantined device with information and remediation instructions to Gleichauf's and Ovadia's known methods of providing a notification message identifying reasons for quarantine, yielding predictable results. In my opinion, a POSITA would have known that serving a webpage with remediation instructions to a quarantined device from a quarantine server would beneficially provide information to the user while simultaneously preventing the device from accessing protected network resources. EX1006, 10:61-66, 13:63-14:1. Lewis's quarantine webpage would also be advantageous to Gleichauf's or Ovadia's notification message. Gleichauf discloses notifications in the form of "extensible messaging format, such as a Type-Length-Value (TLV) or an extensible markup language (XML) format" which "are well-defined, application independent form for representing information or data." EX1004, 20:56-60. In comparison, Lewis's webpage served by the quarantine server is displayed in the browser that a user already has opened. Therefore, modifying the XML/TVL notification approach in Gleichauf to Lewis's webpage based notifications would advantageously avoid

that serves a webpage to the device, as in Lewis, to improve a similar method of traffic redirection, as in Gleichauf, in the same way.

71. In my opinion, the combination would also have been obvious because it is merely the application of ¹⁰Lewis's known technique of serving a webpage to a quarantined device with information and remediation instructions to Gleichauf's and Ovadia's known methods of providing a notification message identifying reasons for quarantine, yielding predictable results. In my opinion, a POSITA would have known that serving a webpage with remediation instructions to a quarantined device from a quarantine server would beneficially provide information to the user while simultaneously preventing the device from accessing protected network resources. EX1006, 10:61-66, 13:63-14:1. Lewis's quarantine webpage would also be advantageous to Gleichauf's or Ovadia's notification message. Gleichauf discloses notifications in the form of "extensible messaging format, such as a Type-Length-Value (TLV) or an extensible markup language (XML) format" which "are well-defined, application independent form for representing information or data." EX1004, 20:56-60. In comparison, Lewis's webpage served by the quarantine server is displayed ¹¹in the browser that a user already has opened. Therefore, modifying the XML/TVL notification approach in Gleichauf to Lewis's webpage based notifications would advantageously avoid

necessitating additional software components running on the device to receive and display the notification message to the user. EX1004, 4:56-60; EX1005, 16:62-65.

72. In my opinion, serving a webpage from a quarantine server would also provide the quarantined device's user the option to proceed with the remediation or terminate the connection attempt. A user attempting to access the network from a fixed location (e.g., an office) may have time to proceed with remediation. In this instance, the webpage would direct the user to a remediation server that can resolve the security issues per Gleichauf. EX1004, 5:4-11. A user that does not have the time to remediate security issues (e.g., a user attempting access from an airport terminal) may opt to terminate the connection attempt. In my opinion, a POSITA would have understood the benefits of giving the user the option to choose their desired course of action.

73. Additionally, A POSITA at the time would have understood that directing a user to a quarantine server rather than a remediation server would provide business benefits as well. Patch management and its associated costs and complications was well known at the time. EX1027, xxi-xxii, 2. While it was possible to redirect a system joining to the network to a Microsoft Update server, which would be the remediation server of the patent, doing so might cause wasted bandwidth from duplicate download and would not allow an organization's IT service to track what updates were installed on the system. Instead, in my opinion,

necessitating additional software components running on the device to receive and display the notification message to the user. EX1004, 4:56-60; EX1005, 16:62-65.

72. In my opinion, serving a webpage from a quarantine server would also provide the quarantined device's user the option to proceed with the remediation or terminate the connection attempt. A user attempting to access the network from a fixed location (e.g., an office) may have time to proceed with remediation. In this instance, the webpage would direct the user to a remediation server that can resolve the security issues per Gleichauf. EX1004, 5:4-11. A user that does not have the time to remediate security issues (e.g., a user attempting access from an airport terminal) may opt to terminate the connection attempt. In my opinion, a POSITA would have understood the benefits of giving the user the option to choose their desired course of action.

73. Additionally, A POSITA at the time would have understood that directing a user to a quarantine server rather than a remediation server would provide business benefits as well. Patch management and its associated costs and complications was well known at the time. EX1027, xxi-xxii, 2. While it was possible to redirect a system joining to the network to a Microsoft Update server, which would be the remediation server of the patent, doing so might cause wasted bandwidth from duplicate download and would not allow an organization's IT service to track what updates were installed on the system. Instead, in my opinion,

POSITA would have understood that directing the system to a quarantine server would allow distribution of a locally-downloaded and cached version of system updates, saving network bandwidth, and would enable maintenance of a central database of what was installed and updated on each system. These are all part of normal IT operations and would be enabled by use of the quarantine server. Additionally, a system that required updates from several sources (e.g., Microsoft, Adobe, Oracle, etc.) could place those updates on one server, instead of requiring repeated attempts at joining the network and redirection to a variety of remediation servers.

4. In my opinion, a POSITA would have had a reasonable expectation of success in combining the teachings of Gleichauf and Ovadia with Lewis. As explained, Gleichauf's policy server sends a notification message to a quarantined device with information and remediation instructions. EX1004, 5:4-11. Put differently, the policy server identifies whether a device is to be quarantined and, if it is, what actions should be taken to remediate the security issue before the device is allowed access to the network. EX1004, 7:3-8, 4:60-63. A POSITA would have found it straight-forward to provide the contents of Gleichauf's notification message in a webpage since doing so would display the contents of the message to the user in the browser the user is already using. In my opinion, such a

a POSITA would have understood that directing the system to a quarantine server would allow distribution of a locally-downloaded and cached version of system updates, saving network bandwidth, and would enable maintenance of a central database of what was installed and updated on each system. These are all part of normal IT operations and would be enabled by use of the quarantine server. Additionally, a system that required updates from several sources (e.g., Microsoft, Adobe, Oracle, etc.) could place those updates on one server, instead of requiring repeated attempts at joining the network and redirection to a variety of remediation servers.

74. In my opinion, a POSITA would have had a reasonable expectation of success in combining the teachings of Gleichauf and Ovadia with Lewis. As explained, Gleichauf's policy server sends a notification message to a quarantined device with information and remediation instructions. EX1004, 5:4-11. Put differently, the policy server identifies whether a device is to be quarantined and, if it is, what actions should be taken to remediate the security issue before the device is allowed access to the network. EX1004, 7:3-8, 4:60-63. A POSITA would have found it straight-forward to provide the contents of Gleichauf's notification message in a ¹²webpage since doing so would display the contents ¹¹of the message to the user in the browser the user is already using. ¹³In my opinion, such a

Modification involves a software change that is straightforward and is within the skillset of a POSITA at the alleged time of invention.

75. In my opinion, the proposed combinations permit but do not require physical incorporation of elements from Lewis and Ovadia into Gleichauf.

F. Claim 1

76. In my opinion, claim 1 would have been obvious to a POSITA at the time of the invention, in view of the combination of Gleichauf, Ovadia, and Lewis.

1. [1pre] A method for protecting a network, comprising:

77. In my opinion, Gleichauf discloses a “computer-implemented method to control access to resources in a network.” EX1004, 27:61-62. Gleichauf’s method protects the network by decreasing the likelihood of malware or virus infection and ensuring that the device attempting to access the network is authorized and is the device it claims to be. EX1004, 5:55-60, 7:56-61, 8:16-31, 12:57-67.

2. [1a] detecting an insecure condition on a first host that has connected or is attempting to connect to a protected network,

78. In my opinion, Gleichauf discloses this limitation.

79. Gleichauf describes a “computerized device, such as a personal computer attempting to communicate with restricted resources in the network.” EX1004, 3:50-56, 8:1-4. Figure 1 illustrates the computerized device sending an access request to the network (“attempting to connect to a protected network”):

modification involves a software change that is straightforward and is within the skillset of a POSITA at the alleged time of invention.

75. In my opinion, the proposed combinations permit but do not require physical incorporation of elements from Lewis and Ovadia into Gleichauf.

F. Claim 1

76. In my opinion, claim 1 would have been obvious to a POSITA at the time of the invention, in view of the combination of Gleichauf, Ovadia, and Lewis.

1. [1pre] A method for protecting a network, comprising:

77. In my opinion, Gleichauf discloses a “computer-implemented method to control access to resources in a network.” EX1004, 27:61-62. Gleichauf’s method protects the network by decreasing the likelihood of malware or virus infection and ensuring that the device attempting to access the network is authorized and is the device it claims to be. EX1004, 5:55-60, 7:56-61, 8:16-31, 12:57-67.

2. [1a] detecting an insecure condition on a first host that has connected or is attempting to connect to a protected network,

78. In my opinion, Gleichauf discloses this limitation.

79. Gleichauf describes a “computerized device, such as a personal computer attempting to communicate with restricted resources in the network.” EX1004, 3:50-56, 8:1-4. Figure 1 illustrates the computerized device sending an access request to the network (“attempting to connect to a protected network”):

EX1004, FIG. 1. Gleichauf's computerized device is a *first host*, and, the network, which contains resources protected by access control measures, is a *protected network*. In my opinion, the computerized device's attempt to access the restricted network resources through an access request shows that the device has *connected* or is attempting to connect to the network.

70. Gleichauf's policy server detects an insecure condition in the computerized device. The device's attempt to connect to the network triggers a "posture based challenge-response" exchange where the device transmits its posture credentials to the network. EX1004, 11:29-32. The posture credentials contain "critical security information" including information about the "particular

EX1004, FIG. 1. Gleichauf's computerized device is a *first host*, and, the network, which contains resources protected by access control measures, is a *protected network*. In my opinion, the computerized device's attempt to access the restricted network resources through an access request shows that the device has *connected or is attempting to connect* to the network.

80. Gleichauf's policy server *detects an insecure condition* in the computerized device. The device's attempt to connect to the network triggers a "posture based challenge-response" exchange where the device transmits its posture credentials to the network.^[10] EX1004, 11:29-32. The posture credentials contain "critical security^[11] information" including information about the "particular

virus software and virus definition versions” installed on the device. EX1004, 3:36-45. The policy server analyzes these posture credentials and *detects* the absence “of an anti-virus application (e.g., or an up-to-date anti-virus application or virus definition file).” EX1004, 14:16-34. Devices that “are not configured with anti-virus or up-to-date anti-virus applications” are considered “vulnerable” because “network resources [may] become ‘infected’ with malware carried by the ‘vulnerable’ [computerized] user device 22.” EX1004, 22:38-59, 11:58-12:13. A device would also be vulnerable to any malware that might be transmitted by network resources. EX1004, 1:10-14, 8:52-56. Thus, in my opinion, the absence of an anti-virus application or up-to-date anti-virus application is an example of an *insecure condition*.

81. Gleichauf also describes other examples of a potential *insecure condition*, such as “the version of operating systems used by the user device 22 or the presence of updated ‘patches’ associated with the operating systems” and “when was the last time a local antivirus scan was executed.” EX1004, 1:65-2:3, 8:65-9:1, 3:36-45, 31:1-7. Gleichauf explains that there may be “known vulnerabilities in the device operating system, resident applications, associated security programs, and their respective configurations.” EX1004, 1:65-2:3. Additional examples of a potential *insecure condition* are discussed *infra* at [1d] in relation to the *attestation of cleanliness*.

virus software and virus definition versions” installed on the device. EX1004, 3:36-45. The policy server analyzes these posture credentials and *detects* the absence “of an anti-virus application (e.g., or an up-to-date anti-virus application or virus definition file).” EX1004, 14:16-34. Devices that “are not configured with anti-virus or up-to-date anti-virus applications” are considered “vulnerable” because “network resources [may] become ‘infected’ with malware carried by the ‘vulnerable’ [computerized] user device 22.” EX1004, 22:38-59, 11:58-12:13. A device would also be vulnerable to any malware that might be transmitted by network resources. EX1004, 1:10-14, 8:52-56. Thus, in my opinion, the absence of an anti-virus application or up-to-date anti-virus application is an example of an *insecure condition*.

¹⁰ Gleichauf also describes other examples of a potential *insecure condition*, such as “the version of operating systems used by the user device 22¹¹₁₂ the presence of updated ‘patches’ associated with the operating systems” and “when was the last time a local antivirus scan was executed.” EX1004, 1:65-2:3, 8:65-9:1, 3:36-45, 31:1-7. Gleichauf explains that there may be “known vulnerabilities in the device operating system, resident applications, associated security programs, and their respective configurations.” EX1004, 1:65-2:3. Additional examples of a potential *insecure condition* are discussed *infra* at [1d] in relation to the *attestation of cleanliness*.

52. In my opinion, by gathering information relating to a computerized device's vulnerabilities—such as the presence of an up-to-date anti-virus application and operating system patches or when an anti-virus scan was last run—Gleichauf discloses *detecting an insecure condition*.

3. [1b] wherein detecting the insecure condition includes contacting a trusted computing base associated with a trusted platform module within the first host,

83. In my opinion, the combination of Gleichauf and Ovadia discloses this limitation.

84. Gleichauf's computerized device includes a "posture agent" and one or more "posture plug-ins" installed on the device that collect information about the device's security posture. EX1004, 3:9-16. The posture agent accesses information collected by each plug-in using an API implemented by each plug-in manufacturer and prepares posture credentials that it transmits to the policy server for analysis and access control. EX1004, 9:24-39. Gleichauf's posture agent is "embodied as a software or hardware application." EX1004, 9:29-39. Since the posture credentials are used to secure access to the restricted resources, in my opinion, a POSITA would have understood that the combined functionality of the posture agent and plug-ins is part of the mechanism that provides such security. Thus, the combined functionality of the posture agent and plug-ins is a *trusted*

82. In my opinion, by gathering information relating to a computerized device's vulnerabilities—such as the presence of an up-to-date anti-virus application and operating system patches or when an anti-virus scan was last run—Gleichauf discloses *detecting an insecure condition*.

3. [1b] wherein detecting the insecure condition includes contacting a trusted computing base associated with a trusted platform module within the first host,

123. In my opinion, the combination of Gleichauf and Ovadia discloses this limitation.

154. 13 Gleichauf's computerized device 14 includes a "posture agent" 16 one or more "posture plug-ins" 18 installed on the device 17 that collect information about the device's security posture. EX1004, 3:9-16. 19 The posture agent accesses 22 information collected by each plug-in using 23 an API implemented by each plug-in manufacturer and prepares posture credentials that it transmits to the policy server for analysis and access control. EX1004, 9:24-39. Gleichauf's posture agent is "embodied as a software or hardware application." EX1004, 9:29-39. Since the posture credentials are used to secure access to the restricted resources, in my opinion, a POSITA would have understood that the combined functionality of the posture agent and plug-ins is part of the mechanism that provides such security. Thus, the combined functionality of the posture agent and plug-ins is a *trusted*

82. In my opinion, by gathering information relating to a computerized device's vulnerabilities—such as the presence of an up-to-date anti-virus application and operating system patches or when an anti-virus scan was last run—Gleichauf discloses *detecting an insecure condition*.

3. [1b] wherein detecting the insecure condition includes contacting a trusted computing base associated with a trusted platform module within the first host,

83. In my opinion, the combination of Gleichauf and Ovadia discloses this limitation.

84. Gleichauf's computerized device includes a "posture agent" and one or more "posture plug-ins" installed on the device that collect information about the device's security posture. EX1004, 3:9-16. The posture agent accesses information collected by each plug-in using an API implemented by each plug-in manufacturer and prepares posture credentials that it transmits to the policy server for analysis and access control. EX1004, 9:24-39. Gleichauf's posture agent is "embodied as a software or hardware application." EX1004, 9:29-39. Since the posture credentials are used to secure access to the restricted resources, in my opinion, a POSITA would have understood that the combined functionality of the posture agent and plug-ins is part of the mechanism that provides such security. Thus, the combined functionality of the posture agent and plug-ins is a trusted

82. In my opinion, by gathering information relating to a computerized device's vulnerabilities—such as the presence of an up-to-date anti-virus application and operating system patches or when an anti-virus scan was last run—Gleichauf discloses *detecting an insecure condition*.

3. [1b] wherein detecting the insecure condition includes contacting a trusted computing base associated with a trusted platform module within the first host,

83. In my opinion, the combination of Gleichauf and Ovadia discloses this limitation.

84. Gleichauf's computerized device includes a "posture agent" and one or more "posture plug-ins" installed on the device that collect information about the device's security posture. EX1004, 3:9-16. The posture agent accesses information collected by each plug-in using an API implemented by each plug-in manufacturer and prepares posture credentials that it transmits to the policy server for analysis and access control. EX1004, 9:24-39. Gleichauf's posture agent is "embodied as a software or hardware application." EX1004, 9:29-39. Since the posture credentials are used to secure access to the restricted resources, in my opinion, a POSITA would have understood that the combined functionality of the posture agent and plug-ins is part of the mechanism that provides such security. Thus, the combined functionality of the posture agent and plug-ins is a *trusted*

computing base within the computerized device that provides security Gleichauf's data communication system. §III(D)(1) (construction of "trusted computing base").

5. In my opinion, Ovadia discloses a security apparatus that employs a trusted platform module implementing the Trusted Computing Group "main specification (Version 1.2, October 2003...)." EX1005, 4:16-47. The main specification from TCG is the Trusted Platform Module Main Specification:

EX1014, iv. EX1015.

86. Ovadia's trusted platform module implements the Trusted Platform Module main specification from the TCG and includes a "cryptographic co-

computing base within the computerized device that provides security Gleichauf's data communication system. §III(D)(1) (construction of "trusted computing base").

85. In my opinion, Ovadia discloses a security apparatus that employs a trusted platform module implementing the Trusted Computing Group "main specification (Version 1.2, October 2003...)." EX1005, 4:16-47. The main specification from TCG is the Trusted Platform Module Main Specification:

EX1014, iv. EX1015.

86. Ovadia's trusted platform module implements the Trusted Platform Module main specification from the TCG and includes a "cryptographic co-

processor,” “non-volatile (NV) memory,” and an “execution engine.” EX1005,

4:46-55, Fig. 2. Since Ovadia’s trusted platform module implements the Trusted Platform Module main specification, in my opinion, it would have been obvious to a POSITA that the non-volatile memory stores cryptographic keys because that is how it is described in the main specification. EX1013, 19; EX1008, 19; EX1005,

FIG. 2:

87. Further, Gleichauf’s policy server *contacts* the computerized device’s posture agent, which prompts the posture agent to collect the device’s posture credentials from the posture plug-ins. EX1004, 4:7-11, 3:28-36. Gleichauf’s Figure 1, below, shows the posture agent *within* the device:

EX1004, FIG. 1. In my opinion, it would have been obvious to a POSITA that the *trusted platform module* would likewise be *within* the device. Therefore, in my opinion, Ovadia's *trusted platform module* is a *trusted platform module* as claimed. III(D)(2) (construction of "trusted platform module"). Furthermore, in my opinion, the "computerized device" constitutes the hardware portion of the *trusted computing base*.

88. Ovadia's *trusted platform module* "may be embodied as a hardware device (most common) or via software." EX1005, 4:24-26. Like Gleichauf's

posture agent, Ovadia's trusted platform module is used "to verify [that] a current configuration of a subscriber station platform is an authorized configuration."

EX1006, Abstract. The configuration (called the integrity measurement) includes information about the subscriber station, including the "current measurement of the firmware and/or software" of the station. EX1006, 13:57-14:12.

89. In my opinion, a POSITA would have been motivated to combine the teachings of Gleichauf and Ovadia and doing so would have been within the POSITA's skillset. §IV(D) (motivation to combine). A POSITA would have appreciated the value in implementing Gleichauf's posture agent with trusted platform module functionality. §IV(D) (motivation to combine). The TCG, which prepares the TCG specification discussed above, is "an industry consortium concerned with platform and network security." EX1005, 4:31-32. The TCG specification is a "platform-independent industry specification that covers trust in computing platforms" as well as how to implement and use trusted platform modules. EX1005, 4:32-35, 4:22-24. Implementing Gleichauf's posture agent with trusted platform module functionality would provide consistency among posture credentials generated by such posture agents operating on various computerized devices. On the device side, a posture agent implemented with trusted platform module functionality would operate consistent with the TCG specification, regardless of the device it is running on, and operation of such trusted platform

posture agent, Ovadia's trusted platform module is used "to verify [that] a current configuration of a subscriber station platform is an authorized configuration."

EX1006, Abstract. The configuration (called the integrity measurement) includes information about the subscriber station, including the "current measurement of the firmware and/or software" of the station. EX1006, 13:57-14:12.

89. In my opinion, a POSITA would have been motivated to combine the teachings of Gleichauf and Ovadia and doing so would have been within the POSITA's skillset. §IV(D) (motivation to combine). EX1006, Abstract. The configuration (called the integrity measurement) includes information about the subscriber station, including the "current measurement of the firmware and/or software" of the station. EX1006, 13:57-14:12.

89. In my opinion, a POSITA would have been motivated to combine the teachings of Gleichauf and Ovadia and doing so would have been within the POSITA's skillset. §IV(D) (motivation to combine). A POSITA would have appreciated the value in implementing Gleichauf's posture agent with trusted platform module functionality. §IV(D) (motivation to combine). The TCG, which prepares the TCG specification discussed above, is "an industry consortium concerned with platform and network security." EX1005, 4:31-32. The TCG specification is a "platform-independent industry specification that covers trust in computing platforms" as well as how to implement and use trusted platform modules. EX1005, 4:32-35, 4:22-24. Implementing Gleichauf's posture agent with trusted platform module functionality would provide consistency among posture credentials generated by such posture agents operating on various computerized devices. On the device side, a posture agent implemented with trusted platform module functionality would operate consistent with the TCG specification, regardless of the device it is running on, and operation of such trusted platform

modules would be consistent throughout the adopting industry. In my opinion, on the network side, a policy server receiving Gleichauf's posture credentials would process them more quickly and with more confidence. Indeed, the policy server would be able to process all received posture credentials in substantially the same way because such credentials would have been gathered in substantially the same way. In the combination, Gleichauf's posture agent would be implemented with trusted platform module functionality, i.e., a *trusted platform module*, per Ovadia.

90. For example, in my opinion, one straight-forward way a POSITA would have implemented Gleichauf's posture agent with trusted platform module functionality would be for the posture agent software to be executed in combination with the execution engine in Ovadia's trusted platform module. EX1005, Fig. 2. The posture agent implemented with trusted platform module functionality would interface with Gleichauf's posture plug-ins in the same way disclosed in Gleichauf by using the "posture plug-in API [application programming interface]" to collect information requested by Gleichauf's policy server. EX1004, 9:24-28. With the posture agent executing in combination with the trusted platform module execution engine, the information collected by the posture agent would be "data generated by a TPM" and thus eligible for digital signature under the Trusted Platform Module main specification. EX1005, 5:36.

modules would be consistent throughout the adopting industry. In my opinion, on the network side, a policy server receiving Gleichauf's posture credentials would process them more quickly and with more confidence. Indeed, the policy server would be able to process all received posture credentials in substantially the same way because such credentials would have been gathered in substantially the same way. In the combination, Gleichauf's posture agent would be implemented with trusted platform module functionality, i.e., a *trusted platform module*, per Ovadia.

90. For example, in my opinion, one straight-forward way a POSITA would have implemented Gleichauf's posture agent with trusted platform module functionality would be for the posture agent software to be executed¹² in combination with the execution engine in Ovadia's¹³ trusted platform module. EX1005, Fig. 2. The posture agent implemented with¹⁴ trusted platform module functionality would interface with Gleichauf's posture plug-ins in the same way disclosed in Gleichauf by using the "posture plug-in¹⁵ API [application programming interface]" to collect information requested by Gleichauf's policy server. EX1004, 9:24-28. With the posture agent executing in combination with the trusted platform module execution engine, the information collected by the posture agent would be "data generated by a TPM" and thus eligible for digital signature under the¹⁶ Trusted Platform Module main specification. EX1005, 5:36.

1. As another example, in an implementation of Gleichauf's posture agent with trusted platform module functionality the posture agent software would simply be integrated with a software-implemented trusted platform module. EX1005, 4:24-26 ("TPM functionality may be embodied... via software."). In my opinion, with the posture agent (part of the *trusted computing base*) executing on the TPM hardware or integrated with the TPM software, the functionality of the posture agent and posture plug-ins would be *associated with a trusted platform module*.

4. [1c] [wherein detecting the insecure condition includes ...] receiving a response, and

92. In my opinion, Gleichauf discloses this limitation. Gleichauf's posture agent responds to the policy server's request by collecting the computerized device's posture credentials from the one or more posture plug-ins and transmitting the credentials in a posture response to the policy server. EX1004, 3:28-36, 4:11-15. Gleichauf's Figure 1 illustrates the transmission and reception of posture credentials:

91. As another example, in an implementation of Gleichauf's posture agent with trusted platform module functionality the posture agent software would simply be integrated with a software-implemented trusted platform module. EX1005, 4:24-26 ("TPM functionality may be embodied... via software."). In my opinion, with the posture agent (part of the *trusted computing base*) executing on the TPM hardware or integrated with the TPM software, the functionality of the posture agent and posture plug-ins would be *associated with a trusted platform module*.

**4. [1c] [wherein detecting the insecure condition includes ...]
receiving a response, and**

92. In my opinion, Gleichauf discloses this limitation. Gleichauf's posture agent responds to the policy server's request by collecting the computerized device's posture credentials from the one or more posture plug-ins and transmitting the credentials in ¹¹posture response ¹⁰the policy server. EX1004, 3:28-36, 4:11-15. Gleichauf's Figure 1 illustrates ¹²¹³¹⁴transmission and reception of posture credentials:

EX1004, FIG. 1. Thus, in my opinion, the policy server “receiv[es] a response” to its request for the posture credentials. ⁷

8. [1d] [wherein detecting the insecure condition includes ...]
9. determining whether the response includes a valid digitally signed attestation of cleanliness,

93. In my opinion, the combination of Gleichauf and Ovadia discloses this limitation.

94. As discussed above, Gleichauf's posture response includes posture credentials. §IV(F)(4) (limitation 1c). The posture credentials received by the policy server contain information such as "what particular virus software and virus definition versions are installed," "when was the last time a local antivirus scan

EX1004, FIG. 1. Thus, in my opinion, the policy server “receiv[es] a response” to its request for the posture credentials.

5. [1d] [wherein detecting the insecure condition includes ...] determining whether the response includes a valid digitally signed attestation of cleanliness,

93. In my opinion, the combination of Gleichauf and Ovadia discloses this limitation.

94. As discussed above, Gleichauf’s posture response includes posture credentials.¹² V(F)(4) (limitation 1c). The posture credentials received by the policy server contain information such as¹⁴ what¹³ particular virus software and virus definition versions are installed,” “when was the last time a local antivirus scan

was executed,” “what operating system patches are installed,” and “types and versions of software applications” on the device, each individually and collectively providing an *attestation of cleanliness*. EX1004, 3:36-49.

95. The policy server analyzes and “validate[s] the posture credentials” (i.e., “determining whether the response includes a valid ... attestation of cleanliness”). EX1004, 10:30-33. For example, the policy server checks for (i.e., “determin[es]”) the presence of an anti-virus application. EX1004, 10:30-33. If a current anti-virus application is present, the computerized device will be allowed to access the network resources, which demonstrates that the policy server deemed the response to include “a valid ... attestation of cleanliness.” EX1004, 11:45-58. If a current anti-virus application is absent, the device’s access to the network will be restricted, which demonstrates that the policy server deemed the response to lack “a valid ... attestation of cleanliness.” EX1004, 11:58-67.

96. The posture agent “securely transmit[s]” posture credentials to the policy server. EX1004, 11:3-12.

97. Ovadia provides further details about secure transmission of a device’s configuration information for the purpose of requesting access to a network. Like the device in Gleichauf, Ovadia’s subscriber station seeking network access uses its trusted platform module to respond to an authentication request by taking a “current measurement of the firmware and/or software configuration” and

was executed,” “what operating system patches are installed,” and “types and versions of software applications” on the device, each individually and collectively providing an *attestation of cleanliness*. EX1004, 3:36-49.

95. The policy server analyzes and “validate[s] the posture credentials” (i.e., “determining whether the response includes a valid ¹⁰ attestation of ¹³ cleanliness”). EX1004, ¹¹ 10:30-33. For example, the policy server ¹² checks for (i.e., ¹⁴ “determin[es]”) the presence of an ¹⁵ anti-virus application. EX1004, 10:30-33. If a ¹⁶ current anti-virus application is present, the computerized device will be allowed to ¹⁷ access the network resources, which demonstrates that the policy server ¹⁸ deemed ¹⁹ the response to include “a valid ... attestation of cleanliness.” EX1004, 11:45-58. If a current anti-virus application is absent, the device’s access to the network will be restricted, which demonstrates that the policy server deemed the response to lack “a valid ... attestation of cleanliness.” EX1004, 11:58-67.

96. The posture agent “securely transmit[s]” posture credentials to the policy server. EX1004, 11:3-12.

97. Ovadia provides further details ²⁰ about ²¹ secure transmission of a device’s configuration information for the purpose of requesting access to a network. Like the device in Gleichauf, Ovadia’s subscriber station seeking network access uses its trusted platform module to respond to an authentication request by taking a “current measurement of the firmware and/or software configuration” and

was executed,” “what operating system patches are installed,” and “types and versions of software applications” on the device, each individually and collectively providing an *attestation of cleanliness*. EX1004, 3:36-49.

95. The policy server analyzes and “validate[s] the posture credentials” (i.e., “determining whether the response includes a valid ... *attestation of cleanliness*”). EX1004, 10:30-33. For example, the policy server checks for (i.e., “determin[es]”) the presence of an anti-virus application. EX1004, 10:30-33. If a current anti-virus application is present, the computerized device will be allowed to access the network resources, which demonstrates that the policy server deemed the response to include “a valid ²¹ *attestation of cleanliness*.” ²⁰ EX1004, 11:45-58. If a current anti-virus application is absent, the device’s access to the network will be restricted, which demonstrates that the policy server deemed the response to lack “a valid ... *attestation of cleanliness*.” EX1004, 11:58-67.

96. The ²² posture agent “securely transmit[s]” posture credentials to the policy server. EX1004, 11:3-12.

97. Ovadia provides further details ²⁴ ²⁵ about ²⁶ secure transmission of a device’s configuration information for the purpose of ²⁸ requesting access to a network. Like ²⁹ the device in Gleichauf, Ovadia’s subscriber station seeking network access uses its trusted platform module to respond to an authentication request by taking a “current measurement of the firmware and/or software configuration” and

was executed,” “what operating system patches are installed,” and “types and versions of software applications” on the device, each individually and collectively providing an *attestation of cleanliness*. EX1004, 3:36-49.

95. The policy server analyzes and “validate[s] the posture credentials” (i.e., “determining whether the response includes a valid ... *attestation of cleanliness*”). EX1004, 10:30-33. For example, the policy server checks for (i.e., “determin[es]”) the presence of an anti-virus application. EX1004, 10:30-33. If a current anti-virus application is present, the computerized device will be allowed to access the network resources, which demonstrates that the policy server deemed the response to include “a valid ... *attestation of cleanliness*.” EX1004, 11:45-58. If a current anti-virus application is absent, the device’s access to the network will be restricted, which demonstrates that the policy server deemed the response to lack “a valid ... *attestation of cleanliness*.” EX1004, 11:58-67.

96. The posture agent “securely transmit[s]” posture credentials to the policy server. EX1004, 11:3-12.

97. Ovadia provides further details about secure transmission of a device’s configuration information for the purpose of requesting access to a network. Like the device in Gleichauf, Ovadia’s subscriber station seeking network access uses its trusted platform module to respond to an authentication request by taking a “current measurement of the firmware and/or software configuration” and

uses this as a “current integrity measurement.” EX1005, 14:1-6. The integrity measurement is stored in the trusted platform module. EX1005, 13:61-63, Fig. 7. The integrity measurement is then used to produce a value that is “**digitally signed** with the SS’s subscriber station’s AIK [Attestation Integrity Key] private key, and sent to the AS [Authentication Server].” EX1005, 14:6-10. The subscriber station “is authenticated” and allowed access to the network if the integrity measurement is acceptable and “the digital signature is authentic.” EX1005, 14:13-23, 16:66-17:6.

98. In my opinion, a POSITA would have been motivated to combine the teachings of Gleichauf and Ovadia and would have had the skills to do so. §IV(D) (motivation to combine). A POSITA would have understood that Ovadia’s digital signature decreases the risk of accepting credentials that have been altered by a malicious actor. Furthermore, a POSITA would understand that Ovadia’s digital signature provides the necessary confidence that the credentials have not been altered. As discussed above, in the combination, Gleichauf’s posture credentials would be prepared by a posture agent implemented with trusted platform module functionality (as taught by Ovadia). §IV(F)(3) (limitation 1b). In my opinion, a POSITA would have recognized that digitally signing Gleichauf’s posture credentials (as taught by Ovadia) would provide a mechanism for Gleichauf’s policy server (which evaluates those credentials) to confirm that the posture

uses this as a “current integrity measurement.” EX1005, 14:1-6. The integrity measurement is stored in the trusted platform module. EX1005, 13:61-63, Fig. 8. The integrity measurement is then used to produce a value that is “**digitally signed** with the SS’s [subscriber station’s] AIK [Attestation Integrity Key] private key, and sent to the AS [Authentication Server].” EX1005, 14:6-10. The subscriber station “is authenticated” and allowed access to the network if the integrity measurement is acceptable and “the digital signature is authentic.” EX1005, 14:13-23, 16:66-17:6.

98. In my opinion,¹³¹⁴ a POSITA would have been motivated to combine the teachings of Gleichauf and¹⁵ Ovadia and would have had the skills to do so. §IV(D) (motivation to combine). A POSITA would have understood that Ovadia’s digital signature decreases the risk of accepting credentials that have been altered by a malicious actor. Furthermore, a POSITA would understand that Ovadia’s digital signature provides the necessary confidence that the credentials have not been altered. As discussed above, in the combination, Gleichauf’s posture credentials would be prepared by a posture agent implemented with trusted platform module functionality (as taught by Ovadia). §IV(F)(3) (limitation 1b). In my opinion, a POSITA would have recognized that digitally signing Gleichauf’s posture credentials (as taught by Ovadia) would provide a mechanism for Gleichauf’s policy server (which evaluates those credentials) to confirm that the posture

credentials have not been forged or tampered with. Ovadia explains that a device's integrity measurements (e.g., posture credentials) are digitally signed with an Attestation Integrity Key (AIK), and that "AIKs are only permitted to sign data generated by a TPM." X1005, 14:9, 5:35-36. Since only the trusted platform module (Gleichauf's posture agent implemented with trusted platform module functionality (§IV(F)(3) (limitation 1b)) could produce a valid digital signature and the trusted platform module would only sign posture credentials that it prepares itself, Gleichauf's policy server would have an assurance that posture credentials with a valid digital signature were authentic and correct. But differently, the policy server would be assured that a virus or other malware on the computing device had not tampered with or forged the posture credentials to hide their presence on the computing device. In my opinion, it would have been obvious to a POSITA to apply Ovadia's teaching of digitally signing an integrity measurement of a device's configuration information to Gleichauf's transmission of a device's posture credentials. In the combination, Gleichauf's posture credentials, prepared by the posture agent implemented with trusted platform module functionality, would be digitally signed, as taught by Ovadia. In my opinion, a POSITA would have further found it obvious to substitute Ovadia's teachings of digitally signing the integrity measurement for Gleichauf's generic recitation of secure transmission. §IV(D) (motivation to combine).

credentials have not been forged or tampered with. ¹⁰ Ovadia explains that a device's integrity measurements (e.g., posture credentials) are digitally signed with an Attestation Integrity Key (AIK), and that "AIKs are only permitted to sign data generated by a TPM." EX1005, 14:9, 5:35-36. Since only the trusted platform module (Gleichauf's posture agent implemented with trusted platform module functionality (§IV(F)(3) (limitation 1b)) could produce a valid digital signature and the trusted platform module would only sign posture credentials that it prepares itself, Gleichauf's policy server would have an assurance that posture credentials with a valid digital signature were authentic and correct. Put differently, the policy server would be assured that a virus or other malware on the computing device had not tampered with or forged the posture credentials to hide ¹¹ their presence on the computing device. In my opinion, it would have been obvious to a POSITA to apply Ovadia's teaching of digitally signing an integrity measurement of a device's configuration information to Gleichauf's transmission of a device's posture credentials. In the combination, Gleichauf's posture credentials, prepared by the posture agent implemented with ¹² trusted platform module functionality, would be digitally signed, as taught by Ovadia. ¹³ In my opinion, a POSITA would have further found it obvious to substitute Ovadia's teachings ¹⁴ of ¹⁵ digitally signing the integrity measurement for Gleichauf's generic recitation of secure transmission. §IV(D) (motivation to combine).

5. [1e] wherein the valid digitally signed attestation of cleanliness includes at least one of an attestation that the trusted computing base has ascertained that the first host is not infested, and an attestation that the trusted computing base has ascertained the presence of a patch or a patch level associated with a software component on the first host;

9. In my opinion, Gleichauf discloses and/or renders this limitation obvious.

100. The computerized device's posture credentials transmitted to the policy server (the "attestation of cleanliness" in §IV(F)(5) (limitation 1d)), contain information about "the last time a local antivirus scan was executed." EX1004, 3:41. Gleichauf expressly contemplates that failure to show "timely execution of the anti-virus application" is failure to show cleanliness and results in restrictions on network access. EX1004, 22:38-47. In my opinion, it would have been understood to a POSITA that the opposite showing would have had the opposite effect. In other words, it would have been well understood from the disclosure that a posture credential that does show timely execution of the anti-virus application is to be treated as "an attestation that the trusted computing base has ascertained that the first host is not infested."

101. The posture credentials also contain information about "what particular virus software and virus definition versions are installed," "what operating system patches are installed," and what "types and versions of software applications" are on the device. EX1004, 3:36-49. In my opinion, such information

6. [1e] wherein the valid digitally signed attestation of cleanliness includes at least one of an attestation that the trusted computing base has ascertained that the first host is not infested, and an attestation that the trusted computing base has ascertained the presence of a patch or a patch level associated with a software component on the first host;

99. In my opinion, Gleichauf discloses and/or renders this limitation obvious.

100. The computerized device's posture credentials transmitted to the policy server (the "attestation of cleanliness" in §IV(F)(5) (limitation 1d)), contain information about "the last time a local antivirus scan was executed." EX1004, 3:41. Gleichauf expressly contemplates that failure to show "timely execution of the anti-virus application" is a failure to show cleanliness and results in restrictions on network access. EX1004, 22:38-47. In my opinion, it would have been understood to a POSITA that the opposite showing would have had the opposite effect. In other words, it would have been well understood from the disclosure that a posture credential that does show timely execution of the anti-virus application to be treated as "an attestation that the trusted computing base has ascertained that the first host is not infested."

101. The posture credentials also contain information about what particular virus software and virus definition versions are installed, "what operating system patches are installed," and what "types and versions of software applications" are on the device. EX1004, 3:36-49. In my opinion, such information

4
5 Declaration of Gary Shields, Ph.D.
6 Concerning patches associated with software is “an attestation that the trusted
computing base has ascertained the presence of a patch or a patch level associated
with a software component on the first host.”

10. Gleichauf's posture agent prepares posture credentials from information it collects from posture plug-ins. X1004, 3:9-16, 9:24-39. The posture agent "is also responsible for determining whether the posture of the computer device 22 has changed by learning of any changes from the posture plug-ins 32 through the posture plug-in API." X1004, 9:50-53. In my opinion, the combined functionality of the posture agent and plug-ins, i.e., *trusted computing base*, thus "*ascertains*" the security posture of the device.

103. In my opinion, Gleichauf's disclosures regarding the claimed *attestation* are substantially the same as those of the '705 patent specification. The '705 patent states:

In some embodiments, the query for cleanliness (1302) may be responded to by anti-contagion software, such as antivirus software, with **assertions about the currency of a scan, such as the last time a scan was performed, or a version associated with a current anti-contagion software or definition file in use, wherein a sufficiently updated software and/or scan may act as a cleanliness assertion.**

EX1001, 14:12-19.

104. In my opinion, a POSITA would have understood Gleichauf's disclosure that posture credentials contain information about "the last time a local

concerning patches associated with software is “an attestation that the trusted computing base has ascertained the presence of a patch or a patch level associated with a software component on the first host.”

102. Gleichauf's posture agent prepares posture credentials from information it collects from posture plug-ins. EX1004, 3:9-16, 9:24-39. The posture agent “is also responsible for determining whether the posture of the computer device 22 has changed by learning of any changes from the posture plug-ins 32 through the posture plug-in API.” EX1004, 9:50-53. In my opinion, the combined functionality of the posture agent and plug-ins, i.e., trusted computing base, thus “ascertains” the security posture of the device.

103. In my opinion, Gleichauf's disclosures regarding the claimed attestation are substantially the same as those in the '705 patent specification. The '705 patent states:

In some embodiments, the query for cleanliness (1302) may be responded to by anti-contagion software, such as antivirus software, with **assertions about the currency of a scan, such as the last time a scan was performed, or a version associated with a current anti-contagion software or definition file in use, wherein a sufficiently updated software and/or scan may act as a cleanliness assertion.**

EX1001, 14:12-19.

104. In my opinion, a POSITA would have understood Gleichauf's disclosure that posture credentials contain information about “the last time a local

antivirus scan was "executed" (EX1004, 3:36-49) to equate to the '705 patent's note

about the currency of a virus scan.

7. [1f] When it is determined that the response does not include a valid digitally signed attestation of cleanliness, quarantining the first host, including by preventing the first host from sending data to one or more other hosts associated with the protected network,

105. In my opinion, Gleichauf discloses and/or renders this limitation obvious.

106. As I explained in §IV(F)(5) (limitation 1d), Gleichauf's policy server reviews and validates posture credentials. EX1004, 10:30-33, 11:45-58. The policy server reviews the credentials for compliance with network admission policy, e.g., for the presence of an anti-virus application and/or the timeliness of the last virus scan. EX1004, 11:45-58, 22:38-42.

107. Further, Gleichauf describes using the posture credentials to determine whether to place the device in quarantine ("*quarantining the first host*"). EX1004, 4:24-27, 7:3-8. There are many reasons why a device might be placed into quarantine, including if it is found to be out of compliance with a network admission policy (EX1004, 4:50-56), if its behavior is found to be anomalous, suggesting that it may have been compromised (EX1018, ¶39), or if it is found to be infected with a virus or has been hijacked by an unauthorized entity. EX1009, 4:8-14.

antivirus scan was executed” (EX1004, 3:36-49) to equate to the ’705 patent’s note about the currency of a virus scan.

7. [1f] when it is determined that the response does not include a valid digitally signed attestation of cleanliness, quarantining the first host, including by preventing the first host from sending data to one or more other hosts associated with the protected network,

105. In my opinion, Gleichauf discloses and/or renders this limitation obvious.

106. As I explained in §IV(F)(5) (limitation 1d), Gleichauf’s policy server reviews and validates posture credentials. EX1004, 10:30-33, 11:45-58. The policy server reviews the credentials for compliance with network admission policy, e.g., for the presence of an anti-virus application and/or the timeliness of the last virus scan. EX1004, 11:45-58, 22:38-42.

107. Further, Gleichauf describes using the posture credentials to determine whether to place the device in quarantine (“*quarantining the first host*”). EX1004, 4:24-27, 7:3-8. There are many reasons why a device might be placed into quarantine, including if it is found to be out of compliance with a network admission policy (EX1004, 4:50-56), if its behavior is found to be anomalous, suggesting that it may have been compromised (EX1018, ¶39), if it is found to be infected with a virus or has been hijacked by an unauthorized entity. EX1009, 4:8-14.

antivirus scan was executed” (EX1004, 3:36-49) to equate to the ’705 patent’s note about the currency of a virus scan.

7. [1f] when it is determined that the response does not include a valid digitally signed attestation of cleanliness, quarantining the first host, including by preventing the first host from sending data to one or more other hosts associated with the protected network,

105. In my opinion, Gleichauf discloses and/or renders this limitation obvious.

106. As I explained in §IV(F)(5) (limitation 1d), Gleichauf’s policy server reviews and validates posture credentials. EX1004, 10:30-33, 11:45-58. The policy server reviews the credentials for compliance with network admission policy, e.g., for the presence of an anti-virus application and/or the timeliness of the last virus scan. EX1004, 11:45-58, 22:38-42.

107. Further, Gleichauf describes using the posture credentials to determine whether to place the device in quarantine (“*quarantining the first host*”). EX1004, 4:24-27, 7:3-8. There are many reasons why a device might be placed into quarantine, including if it is found to be out of compliance with a network admission policy (EX1004, 4:50-56), if its behavior is found to be anomalous, suggesting that it may have been compromised (EX1018, ¶39), or if it is found to be infected with a virus or has been hijacked by an unauthorized entity. EX1009, 4:8-14.

08. If the policy server “fails to detect the presence of, or a listing of, the anti-virus” application or definition in the device’s posture credentials, the device is out of compliance with network admission policy (i.e., *it is determined that the response does not include a valid digitally signed attestation of cleanliness*”).

EX1004, 11:59-60. Gleichauf provides that “devices that are out of compliance with admission requirements [are assigned] to a quarantine.” EX1004, 4:50-56. Placement in quarantine causes the network (and more specifically, data communication device 26 acting on directions from the policy server) to “restrict or completely reject communications from the user device 22 to the resources 25 within the network 24.” EX1004, 11:58-67,.

FIG. 1. The resources 25-1 through 25-N are other hosts within the computerized data network. EX1004, 9:65-67 (“The network resources 25-1, 25-2, 25-N, in one

108. If the policy server “fails to detect the presence of, or a listing of, the anti-virus” application or definition in the device’s posture credentials, the device is out of compliance with network admission policy (i.e., “*it is determined that the response does not include a valid digitally signed attestation of cleanliness*”).

EX1004, 11:59-60. Gleichauf provides that “devices that are out of compliance with admission requirements [are assigned] to a quarantine.” EX1004, 11:50-56.

Placement in quarantine causes the network (and more specifically, data communication device 26 acting on directions from the policy server) to “restrict or completely reject communications from the user device 22 to the resources 25 within the network 24.” EX1004, 11:58-67,.

FIG. 1. The resources 25-1 through 25-N are other hosts within the computerized data network. EX1004, 9:65-67 (“The network resources 25-1, 25-2, 25-N, in one

arrangement, are configured as servers that contain content accessible by the user device 22 via the network 24”). Unless the first host is quarantined, for example, the network resources 25-1 through 25-N run the risk of becoming infected through the first host. EX1004, 8:21-28 (“By detecting the real-time security state of the computerized device prior to providing the computerized device with access to the network resources, thereby limiting at-risk or vulnerable computerized devices from accessing the network resources and minimizing the risk that the network resources receive or transmit malware”). Therefore, in my opinion, restricting or completely rejecting communications from the computerized device to network resources, e.g., resources 25-1 through 25-N, discloses *preventing the first host from sending data to one or more other hosts associated with the protected network*.

8. [1g] wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes receiving a service request sent by the first host,

109. In my opinion, Gleichauf discloses this limitation.

110. Gleichauf describes how the computerized device transmits an “access request” or “signaling request” in an “attempt to access the network resources within the network.” EX1004, 3:50-56, 8:1-4. Such access attempts can occur even after the device has been placed in quarantine. EX1004, 13:52-65. A request to access network resources is a “*service request*.” The request is received and acted

arrangement, are configured as servers that contain content accessible by the user device 22 via the network 24”). Unless the first host is quarantined, for example, the network resources 25-1 through 25-N run the risk of becoming infected through the first host. EX1004, 8:21-28 (“By detecting the real-time security state of the computerized device prior to providing the computerized device with access to the network resources, thereby limiting at-risk or vulnerable computerized devices from accessing the network resources and minimizing the risk that the network resources receive or transmit malware”). Therefore, in my opinion, restricting or completely rejecting communications from the computerized device to network resources, e.g., resources 25-1 through 25-N, discloses *preventing the first host from sending data to one or more other hosts associated with the protected network*.

8. [1g] wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes receiving a service request sent by the first host,

109. In my opinion, Gleichauf discloses this limitation.

10. Gleichauf describes how the computerized device transmits an “access request” or “signaling request” in an “attempt to access the network resources within the network.” EX1004, 3:50-56, 8:1-4. Such access attempts can occur even after the device has been placed in quarantine. EX1004, 13:52-65. A request to access network resources is a “*service request*.” The request is received and acted

upon by [5] data communications [4] device. EX1004, 3:60-65. Therefore, in my

opinion, Gleichauf discloses “receiving a service request sent by the first host.”

- [7]. [1h] [wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes...] serving a quarantine notification page to the first host when the service request comprises a web server request, and

111. In my opinion, the combination of Gleichauf and Lewis discloses and/or renders this limitation obvious.

112. As I explained in §IV(F)(7) (limitation 1f), Gleichauf discloses that a computerized device that is out of compliance with network admission policy is quarantined. [8] EX1004, 4:50-56. Communications from a quarantined device [9] are restricted or rejected. EX1004, 11:58-67. Limited communications to certain destinations, such as a remediation server, may be permitted. EX1004, 14:62-66. For example, Gleichauf provides that “a redirect access instruction” is applied to “HTTP traffic.” EX1004, 15:55-67. In my opinion, a POSITA would have known that HTTP traffic includes a *web server request* because hyper-text transfer protocol (HTTP) is the protocol used for communications between web browsers and web servers. This is evidenced by the fact that Gleichauf refers to the redirection as a “URL Redirect.” EX1004, 15:45. In my opinion, a POSITA would have been familiar with URL redirection, which was a common technique used to forcibly provide an alternative response to a client’s request for a webpage.

upon by a data communications device. EX1004, 3:60-65. Therefore, in my

opinion, Gleichauf discloses “receiving a service request sent by the first host.”

9. [1h] [wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes...] serving a quarantine notification page to the first host when the service request comprises a web server request, and

111. In my opinion, the combination of Gleichauf and Lewis discloses and/or renders this limitation obvious.

112. As I explained in §IV(F)(7) (limitation 1f), Gleichauf discloses that a computerized device that is out of compliance with network admission policy is quarantined. EX1004, 4:50-56. Communications from a quarantined device are restricted or rejected. EX1004, 11:58-67. Limited communications to certain destinations, such as a remediation server, may be permitted. EX1004, 14:62-66. For example, Gleichauf provides that “a redirect access instruction” is applied to “HTTP traffic.” EX1004, 15:55-67. In my opinion, a POSITA would have known that HTTP traffic includes a *web server request* because hyper-text transfer protocol (HTTP) is the protocol used for communications between web browsers and web servers. This is evidenced by the fact¹⁰₁₁¹² that Gleichauf refers to the redirection as a “URL Redirect.” EX1004, 15:45. In my opinion, a POSITA would have been familiar with URL redirection, which was a common technique used to forcibly provide an alternative response to a client’s request for a webpage.

EX1017, ¶3. This technique is commonly used to redirect a user's web browser to a login page at a hotel or airport. EX1010, 4:56-57; EX1011, ¶44.

113. Further, Gleichauf describes providing one or more notification messages" for display to a user "indicating that the device has been quarantined." EX1004, 4:56-63, 21:1-12. The message may include "a link to a remediation server or the IP address of the remediation server." EX1004, 1:1-12.

114. Similar to Gleichauf, Lewis also discloses the use of redirection with a client device that is quarantined. EX1006, 4:24-31. When a user of the device opens a web browser (which would generate a "service request compris[ing] a web server request"), an initial domain name service (DNS) request from the device is redirected to a quarantine server. EX1006, 13:7-12. The quarantine server receives the DNS request and supplies a default webpage on the quarantine server to the device ("serving a quarantine notification page to the first host"). EX1006, 13:12-15. The webpage informs the user that the device "is in quarantine and corrective action must be taken." EX1006, 10:61-66.

115. In my opinion, a POSITA would have been motivated to combine the teachings of Gleichauf, Ovadia, and Lewis and would have had the skill to do so. §IV(E) (motivation to combine). A POSITA would have appreciated the security benefits of redirecting HTTP traffic from Gleichauf's device to a quarantine server (per Lewis), rather than a remediation server. The user of the quarantined device

EX1017, ¶3. This technique is commonly used to redirect a user's web browser to a login page at a hotel or airport. EX1010, 4:56-57; EX1011, ¶44.

113. Further, Gleichauf describes providing “one or more notification messages” for display to a user “indicating that the device has been quarantined.” EX1004, 4:56-63, 21:1-12. The message may include “a link to a remediation server or the IP address of the remediation server.” EX1004, 21:1-12.

114. Similar to Gleichauf, Lewis also discloses the use of redirection with a client device that is quarantined. EX1006, 4:24-31. When a user of the device opens a web browser (which would generate a “*service request compris[ing] a web server request*”), [11] initial domain name service (DNS) request from the device is redirected to a quarantine [12] server. EX1006, 13:7-12. The quarantine server receives the DNS request and supplies [13] a default webpage on the quarantine server [14] to the device (“*serving a quarantine notification page to the first host*”). [15] EX1006, 13:12-15. The webpage informs the user that the device “is in quarantine and corrective action must be [16] taken.” EX1006, 10:61-66.

115. In my opinion, [17] POSITA would have been motivated to combine the teachings of Gleichauf, Ovadia, and Lewis and would have had the skill to do so. §IV(E) (motivation to combine). A POSITA would have appreciated the security benefits of redirecting HTTP traffic from Gleichauf's device to a quarantine server (per Lewis), rather than a remediation server. The user of the quarantined device

EX1017, ¶3. This technique is commonly used to redirect a user's web browser to a login page at a hotel or airport. EX1010, 4:56-57; EX1011, ¶44.

113. Further, Gleichauf describes providing “one or more notification messages” for display to a user “indicating that the device has been quarantined.” EX1004, 4:56-63, 21:1-12. The message may include “a link to a remediation server or the IP address of the remediation server.” EX1004, 21:1-12.

114. Similar to Gleichauf, Lewis also discloses the use of redirection with a client device that is quarantined. EX1006, 4:24-31. When a user of the device opens a web browser (which would generate a “*service request compris[ing] a web server request*”), an initial domain name service (DNS) request from the device is redirected to a quarantine server. EX1006, 13:7-12. The quarantine server receives the DNS request and supplies a default webpage on the quarantine server to the device (“*serving a quarantine notification page to the first host*”). EX1006, 13:12-15. The webpage informs the user that the device “is in quarantine and corrective action must be taken.” EX1006, 10:61-66.

115. In my opinion, a POSITA would have been motivated to combine the teachings of Gleichauf, Ovadia, and Lewis and would have had the skill to do so. §IV(E) (motivation to combine). A POSITA would have appreciated the security benefits of redirecting HTTP traffic from Gleichauf's device to a quarantine server (per Lewis), rather than a remediation server. The user of the quarantined device

would receive information about the quarantine reasons via a webpage served by the quarantine server. The user would then have the option to either proceed with remediation or terminate the connection attempt. A user may elect to terminate the connection attempt, for example, if the user does not desire to have their device configuration changed or if the user is in a hurry and does not have time to remediate the identified issues. In the combination, HTTP traffic from a quarantined device would be redirected to a quarantine server as taught by Lewis. The quarantine server would then serve a webpage to the user, as taught by Lewis. The webpage would inform the user that the device is in quarantine (a “*quarantine notification page*”).

10.[11] in the event the service request comprises a DNS query, providing in response an IP address of a quarantine server configured to serve the quarantine notification page if a host name that is the subject of the DNS query is not associated with a remediation host configured to provide data usable to remedy the insecure condition; and

116. In my opinion, the combination of Gleichauf and Lewis discloses and/or renders this limitation obvious.

117. As I discussed in §IV(F)(7) (limitation 1f), Gleichauf discloses that a computerized device that is out of compliance with a network admission policy is quarantined and that communications from a quarantined device to protected resources in the network are restricted or rejected. EX1004, 4:50-56, 11:58-67.

would receive information about the quarantine reasons via a webpage served by the quarantine server. The user would then have the option to either proceed with remediation or terminate the connection attempt. A user may elect to terminate the connection attempt, for example, if the user does not desire to have their device configuration changed or if the user is in a hurry and does not have time to remediate the identified issues. In the combination, HTTP traffic from a quarantined device would be redirected to a quarantine server as taught by Lewis. The quarantine server would then serve a webpage to the user, as taught by Lewis. The webpage would inform the user that the device is in quarantine (a “*quarantine notification page*”).

10.[11] in the event the service request comprises a DNS query, providing in response an IP address of a quarantine server configured to serve the quarantine notification page if a host name that is the subject of the DNS query is not associated with a remediation host configured to provide data usable to remedy the insecure condition; and

116. In my opinion, the combination of Gleichauf and Lewis discloses and/or renders this limitation obvious.

12 7. As I discussed in §IV(F)(7) (limitation 1f), Gleichauf discloses that a computerized device that is out of compliance with 13 network admission policy is 14 quarantined and that communications from a quarantined device to protected resources in the network are restricted or rejected. 15 X1004, 4:50-56, 11:58-67.

18. In my opinion, Gleichauf discloses a remediation server, shown in

Fig. 1:

EX1004, FIG. 1. The remediation server “is configured to upgrade or provide up-to-date patches to the operating system or applications, such as anti-virus applications, associated with the computerized device”⁵ a “remediation host configured to provide data usable to remedy the insecure condition”).⁶ EX1004, 5:4-11.⁸ HTTP traffic from the device directed to the remediation server is permitted while HTTP⁹ traffic directed to other destinations is redirected. EX1004, 14:62-66, 15:55-67.

119. In my opinion, it would have been obvious to a POSITA that HTTP traffic, such as that from Gleichauf’s device, is usually preceded by a DNS query

118. In my opinion, Gleichauf discloses a remediation server, shown in

Fig. 1:

EX1004, FIG. 1. The remediation server “is configured to upgrade or provide up-to-date patches to the operating system or applications, such as anti-virus applications, associated with the computerized device” (a “remediation host configured to provide data usable to remedy the insecure condition”). EX1004, 5:4-11. HTTP traffic from the device directed to the remediation server is permitted while HTTP traffic directed to other destinations is redirected. EX1004, 14:62-66, 15:55-67.

119. In my opinion, it would have been obvious to a POSITA that HTTP traffic, such as that from Gleichauf’s device, is usually preceded by a DNS query

(i.e., “*and in the event the service request comprises a DNS query*”). The DNS query is used to obtain the internet protocol (IP) address of a named server, which would be a web server in the case of HTTP traffic. The device accesses webpage by sending an HTTP request to the DNS-resolved IP address. These steps were commonly known and ubiquitously employed by web browsers in the prior art. EX1010, 5:49-63.

120. Further, Lewis describes a “hijack DNS component 421 for intercepting DNS queries from quarantined clients.” EX1006, 11:15-17. The operation of the hijack DNS component is such that “[w]henver the client performs name resolution on any address, it will receive the IP [address] of QS [quarantine server].” EX1006, 14:22-23. As discussed at [1h], Lewis’s quarantine server (QS) provides a default webpage including a *quarantine notification*. The default webpage informs the user that the device is in quarantine and what corrective action must be taken for the device to be released from quarantine. EX1006, 10:61-66, 13:12-15. Thus, in my opinion, the IP address of Lewis’s quarantine server is an IP address of a quarantine server configured to serve the *quarantine notification*.

121. Additionally, both Gleichauf and Lewis describe allowing a device placed in quarantine to communicate with one or more servers to fix the issues that led to it being quarantined. EX1004, 5:4-13; EX1007, 13:12-17, 14:17-31. In my

(i.e., “*and in the event the service request comprises a DNS query*”). The DNS query is used to obtain the internet protocol (IP) address of a named server, which would be a web server in the case of HTTP traffic. The device accesses a webpage by sending an HTTP request to the DNS-resolved IP address. These steps were commonly known and ubiquitously employed by web browsers in the prior art. EX1010, 5:49-63.

120. Further, Lewis describes a “hijack DNS component 421 for intercepting DNS queries from quarantined clients.” EX1006, 11:15-17. The operation of the hijack DNS component is such that “[w]henver the client performs name resolution on any address, it will receive the IP [address] of QS [quarantine server].” EX1006, 14:22-23. As discussed at [1h], Lewis’s quarantine server (QS) provides a default^[11] webpage including a *quarantine notification*. The default^[12] webpage informs the user that the device is in quarantine and what corrective action must be taken for the device to be released from quarantine. EX1006, 10:61-66, 13:12-15. Thus, ^[13]in my opinion, the IP address of Lewis’s quarantine server^[15] is an IP address of a quarantine server configured to serve the *quarantine notification*.

^[16]21. Additionally, both Gleichauf and Lewis describe allowing a device placed in quarantine to communicate with one or more servers to fix the^[17] issues that led to it being quarantined. EX1004, 5:4-13; EX1007, 13:12-17, 14:17-31. In my

In my opinion, it would have been well understood and obvious to a POSITA that communications with such servers would be preceded by a DNS request to resolve the remediation server's name into its IP address. This is because servers are frequently known and referred to by their domain name; however, the domain name cannot directly be used to address an IP packet to the server. The domain name must first be resolved, using DNS, into the server's IP address. The IP address is then specified as the destination for the IP packet. In my opinion, a POSITA would have been familiar with the use and operation of DNS.

122. Gleichauf describes allowing a device in quarantine to communicate with a remediation server “to upgrade or provide up-to-date patches to applications, such as anti-virus applications.” EX1004, 16:14-16. Hence, it would have been obvious to a POSITA for a DNS server (responding to a request to resolve the IP address of the remediation server) to provide the correct IP address of the remediation server. In my opinion, it would have been obvious to a POSITA to adapt the functionality of a hijack DNS component, e.g., that of Lewis, to provide the correct IP address resolution to DNS queries relating to servers involved with device remediation. For all other queries, the hijack DNS component would function as described in Lewis by answering such DNS queries with the IP address of a quarantine server. Thus, in my opinion, the combined teachings of Gleichauf and Lewis render obvious responding to a DNS query with the IP

opinion, it would have been well understood and obvious to a POSITA that communications with such servers would be preceded by a DNS request to resolve the remediation server's name into its IP address. This is because servers are frequently known and referred to by their domain name; however, the domain name cannot directly be used to address an IP packet to the server. The domain name must first be resolved, using DNS, into the server's IP address. The IP address is then specified as the destination for the IP packet. In my opinion, a POSITA would have been familiar with the use and operation of DNS.

122. Gleichauf describes allowing a device in quarantine to communicate with a remediation server “to upgrade or provide up-to-date patches to applications, such as anti-virus applications.” X1004, 16:14-16. Hence, it would have been obvious to a POSITA for a DNS server (responding to a request to resolve the IP address of the remediation server) to provide the correct IP address of the remediation server. In my opinion, it would have been obvious to a POSITA to adapt the functionality of a hijack DNS component, e.g., that of Lewis, to provide the correct IP address resolution to DNS queries relating to servers involved with device remediation. For all other queries, the hijack DNS component would function as described in Lewis by answering such DNS queries with the IP address of a quarantine server. Thus, in my opinion, the combined teachings of Gleichauf and Lewis render obvious responding to a DNS query with the IP

opinion, it would have been well understood and obvious to a POSITA that communications with such servers would be preceded by a DNS request to resolve the remediation server's name into its IP address. This is because servers are frequently known and referred to by their domain name; however, the domain name cannot directly be used to address an IP packet to the server. The domain name must first be resolved, using DNS, into the server's IP address. The IP address is then specified as the destination for the IP packet. In my opinion, a POSITA would have been familiar with the use and operation of DNS.

122. Gleichauf describes allowing a device in quarantine to communicate with a remediation server “to upgrade or provide up-to-date patches to applications, such as anti-virus applications.” EX1004, 16:14-16. Hence, it would have been obvious to a POSITA for a DNS server (responding to a request to resolve the IP address of the remediation server) to provide the correct IP address of the remediation server. In my opinion, it would have been obvious to a POSITA to adapt the functionality of a hijack DNS component, e.g., that of Lewis, to provide the correct IP address resolution to DNS queries relating to servers involved with device remediation. For all other queries, the hijack DNS component would function as described in Lewis by answering such DNS queries with the IP address of a quarantine server. Thus, in my opinion, the combined teachings of Gleichauf and Lewis render obvious responding to a DNS query with the IP

address of a quarantine server *if a host name that is the subject of the DNS query is not associated with a remediation host configured to provide data usable to remedy the insecure condition.*

423. In my opinion, a POSITA would have been motivated to combine the teachings of Gleichauf, Ovadia, and Lewis and would have had the skills to do so. §IV(E) (motivation to combine). A POSITA would have appreciated the need to ensure that a device placed into quarantine would be able to access the server necessary to remediate its security problem and thereafter gain full access to the network. Gleichauf contemplates identifying the remediation server by name since it provides “a link to a remediation server,” which Gleichauf distinguishes from providing “the IP address of the remediation server.” EX1004, 21:8-12. Gleichauf further explains that the “link” to the remediation server would be provided as a Universal Resource Link (URL). EX1004, 21:3-4. It was well known that a “URL typically includes the domain name of the provider of the identified resource.” EX1013, 9:12-14. Thus, in my opinion, a POSITA would have found it obvious from Gleichauf’s statement—that the remediation server is identified via URL—for the server to be identified to a quarantined device by its domain name. It would have been obvious and understood to a POSITA that the device needing to communicate with the remediation server would send a DNS query to obtain the IP address corresponding to the domain name of the server. In the combination, the

address of a quarantine server *if a host name that is the subject of the DNS query is not associated with a remediation host configured to provide data usable to remedy the insecure condition.*

123. In my opinion, a POSITA would have been motivated to combine the teachings of Gleichauf, Ovadia, and Lewis and would have had the skills to do so.

§IV(E) (motivation to combine). A POSITA would have appreciated the need to ensure that a device placed into quarantine would be able to access the server necessary to remediate its security problem and thereafter gain full access to the network. Gleichauf contemplates identifying the remediation server by name since it provides “a link to a remediation server,” which Gleichauf distinguishes from providing “the IP address of the remediation server.”¹¹ X1004, 21:8-12. Gleichauf further explains that the “link” to the remediation server would be provided as a Universal Resource Link (URL).¹² X1004, 21:3-4. It was well known that a “URL typically includes the domain name of the provider of the identified resource.”

¹⁴ X1013, 9:12-14. Thus, in my opinion, a POSITA would have found it obvious from Gleichauf’s statement—that the remediation server is identified via URL—for the server to be identified to a quarantined device by its domain name. It would have been obvious and understood to a POSITA that the device needing to communicate with the remediation server would send a DNS query to obtain the IP address corresponding to the domain name of the server.¹⁸ In the combination, the

address of a quarantine server *if a host name that is the subject of the DNS query is not associated with a remediation host configured to provide data usable to remedy the insecure condition.*

123. In my opinion, a POSITA would have been motivated to combine the teachings of Gleichauf, Ovadia, and Lewis and would have had the skills to do so. §IV(E) (motivation to combine). A POSITA would have appreciated the need to ensure that a device placed into quarantine would be able to access the server necessary to remediate its security problem and thereafter gain full access to the network. Gleichauf contemplates identifying the remediation server by name since it provides “a link to a remediation server,” which Gleichauf distinguishes from providing “the IP address of the remediation server.” EX1004, 21:8-12. Gleichauf further explains that the “link” to the remediation server would be provided as a Universal Resource Link (URL). EX1004, 21:3-4. It was well known that a “URL typically includes the domain name of the provider of the identified resource.” EX1013, 9:12-14. Thus, in my opinion, a POSITA would have found it obvious from Gleichauf’s statement—that the remediation server is identified via URL—for the server to be identified to a quarantined device by its domain name. It would have been obvious and understood to a POSITA that the device needing to communicate with the remediation server would send a DNS query to obtain the IP address corresponding to the domain name of the server. In the combination, the

DNS response provided to the device would include the correct IP address of the remediation server so that the device could resolve its security problems and exit quarantine (e.g., obtain update virus definitions).

1. [1j] permitting the first host to communicate with the remediation host.

124. In my opinion, Gleichauf discloses this limitation.

125. As I explained in §IV(F)(7) (limitation 1f), Gleichauf discloses that a computerized device out of compliance with network admission policy is quarantined and communications from the device to network resources are restricted or rejected. EX1004, 4:50-56, 11:58-67. HTTP traffic from the device to a remediation server is permitted, however (i.e., “*permitting the first host to communicate with the remediation host*”). EX1004, 14:62-66.

G. Claim 2 - A method as recited in claim 1, wherein detecting an insecure condition further includes at least one of the following: scanning for a vulnerability, scanning for malicious data, determining whether a security software is installed, and detecting anomalous network traffic.

126. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

127. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses [a] method as recited in claim 1. See §IV(F) (claim 1).

128. In my opinion, Gleichauf renders obvious this additional limitation.

DNS response provided to the device would include the correct IP address of the remediation server so that the device could resolve its security problems and exit quarantine (e.g., obtain update virus definitions).

11.[1j] permitting the first host to communicate with the remediation host.

124. In my opinion, Gleichauf discloses this limitation.

125. As I explained in §IV(F)(7) (limitation 1f), Gleichauf discloses that a computerized device out of compliance with network admission policy is quarantined and communications from the device to network resources are restricted or rejected. EX1004, 4:50-56, 11:58-67. HTTP traffic from the device to a remediation server is permitted, however (i.e., “*permitting the first host to communicate with the remediation host*”). EX1004, 14:62-66.

15. Claim 2 - A method as recited in claim 1, wherein detecting an insecure condition further includes at least one of the following: scanning for a vulnerability, scanning for malicious data, determining whether a security software is installed, and detecting anomalous network traffic.

126. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

127. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

128. In my opinion, Gleichauf renders obvious this additional limitation.

29. As I explained in §IV(F)(2) (limitation 1a), Gleichauf teaches that a policy server *detects an insecure condition* in the computerized device by reviewing the device's posture credentials. EX1004, 3:36-45, 11:29-32, 11:58-12:3, 14:16-34, 22:39-59.

30. The posture credentials include information about “the last time a local antivirus scan was executed,” and a device that is “not configured with anti-virus or up-to-date anti-virus applications” and is “vulnerable.” EX1004, 3:36-49, 22:54-56. The failure to show “timely execution of the anti-virus application” is another indication that the device is “vulnerable” and in an *insecure condition*. EX1004, 22:38-59. In my opinion, a POSITA would have understood that checking for an anti-virus application and the recency of an anti-virus scan each constitute “*scanning for a vulnerability*.”

131. The posture credentials also contain information about whether the device can “resist reception or transmission of... content (spam and/or data theft).” EX1004, 8:52-56. In my opinion, a POSITA would have understood that spam is a type of “*malicious data*” because it is unsolicited. A POSITA would also have understood that the disclosed device would be “*scanned*” to determine whether the device can resist reception or transmission of spam. Furthermore, malicious data is known in the art to generate “*anomalous network traffic*.” Thus, in my opinion, a

129. As I explained in §IV(F)(2) (limitation 1a), Gleichauf teaches that a policy server *detects an insecure condition* in the computerized device by reviewing the device's posture credentials. EX1004, 3:36-45, 11:29-32, 11:58-12:3, 14:16-34, 22:39-59.

130. The posture credentials include information about “the last time a local antivirus scan was executed,” and a device that is “not configured with anti-virus or up-to-date anti-virus applications”¹² and is “vulnerable.”¹¹ EX1004, 3:36-49, 22:54-56. The failure to show “timely execution of the anti-virus application”¹³ another indication that the device is “vulnerable” and in an *insecure condition*.¹⁷ EX1004, 22:38-59.¹⁸ In my opinion, a POSITA would have understood that checking for an anti-virus application and the recency of an anti-virus scan each constitute “*scanning for a vulnerability*.”¹⁴¹⁵¹⁶¹⁹

²⁰ 1. The posture credentials also contain information about whether the device can “resist reception or transmission of... content (spam and/or data theft).”²¹ EX1004, 8:52-56. In my opinion, a POSITA would have understood that spam is a type of “*malicious data*” because it is unsolicited. A POSITA would also have understood that the disclosed device would be “*scanned*” to determine whether the device can resist reception or transmission of spam. Furthermore, malicious data is known in the art to generate “*anomalous network traffic*.” Thus, in my opinion, a

129. As I explained in §IV(F)(2) (limitation 1a), Gleichauf teaches that a policy server *detects an insecure condition* in the computerized device by reviewing the device's posture credentials. EX1004, 3:36-45, 11:29-32, 11:58-12:3, 14:16-34, 22:39-59.

130. The posture credentials include information about “the last time a local antivirus scan was executed,” and a device that is “not configured with anti-virus or up-to-date anti-virus applications” and is “vulnerable.” EX1004, 3:36-49, 22:54-56. The failure to show “timely execution of the anti-virus application” is another indication that the device is “vulnerable” and in an *insecure condition*. EX1004, 22:38-59. In my opinion, a POSITA would have understood that checking for an anti-virus application and the recency of an anti-virus scan each constitute “*scanning for a vulnerability*.”

131. The posture credentials also contain information about whether the device can “resist reception or transmission of... content (spam and/or data theft).” EX1004, 8:52-56. In my opinion, a POSITA would have understood that spam is a type of “*malicious data*” because it is unsolicited. A POSITA would also have understood that the disclosed device would be “*scanned*” to determine whether the device can resist reception or transmission of spam. Furthermore, malicious data is known in the art to generate “*anomalous network traffic*.” Thus, in my opinion, a

Detection of spam is a detection of anomalous network activity, and therefore is an identification of an insecure condition, thereby meeting the claim language.

132. The posture credentials further include information about the presence or absence of anti-virus software, whether the anti-virus software is up-to-date, and the status of a firewall application. EX1004, 3:36-49, 8:62-65. In my opinion, a POSITA would have understood that an anti-virus and intrusion prevent software (e.g., a firewall) are types of “*security software*” because they can detect and prevent virus and other security infestations. Reviewing the posture credentials for information about the presence or absence of anti-virus software or firewall application involves “*determining whether a security software is installed.*”

H. Claim 3 – A method as recited in claim 1, wherein detecting an insecure condition includes determining that the first host should be quarantined until an update to an operating system has been installed.

133. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

134. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses [a] *method as recited in claim 1. See §IV(F) (claim 1).*

135. In my opinion, Gleichauf renders this additional limitation obvious.

136. As I explained in §IV(F)(2) (limitation 1a), Gleichauf teaches that a policy server *detects an insecure condition* in the computerized device by

detection of spam is a detection of anomalous network activity, and therefore is an identification of an insecure condition, thereby meeting the claim language.

132. The posture credentials further include information about the presence or absence of anti-virus software, whether the anti-virus software is up-to-date, and the status of a firewall application. EX1004, 3:36-49, 8:62-65. In my opinion, a POSITA would have understood that an anti-virus and intrusion prevent software (e.g., a firewall) are types of “*security software*” because they can detect and prevent virus and other security infestations. Reviewing the posture credentials for information about the presence or absence of anti-virus software or firewall application involves “*determining whether a security software is installed.*”

H. Claim 3 – A method as recited in claim 1, wherein detecting an insecure condition includes determining that the first host should be quarantined until an update to an operating system has been installed.

133. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

134. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

135. In my opinion, Gleichauf renders this additional limitation obvious.

136. As I explained in §IV(F)(2) (limitation 1a), Gleichauf teaches that a policy server *detects an insecure condition* in the computerized device by

reviewing posture credentials. EX1004, 3:36-45, 11:29-32, 11:58-12:3, 14:16-34, 22:39-59.

37. The posture credentials contain information about “operating system patches [that] are installed within the computing system” (i.e., “updates to an operating system”). EX1004, 3:36-49. Gleichauf explains, and in my opinion a POSITA would have known, that an outdated operating system may make the device “vulnerable” to network threats. EX1004, 1:65-2:3, 4:50-56. When the device is quarantined, the policy server can transmit a notification message to the device that may “include a link to a remediation server” where the remediation server “is configured to upgrade or provide up-to-date patches to the operating system.” EX1004, 21:8-12, 5:8-11. Once remediated, the device “should be admitted” into the network. EX1004, 5:11-13. In my opinion, a POSITA would have understood (and found it obvious) from Gleichauf’s description of quarantining devices with outdated operating systems and of providing operating system updates, to quarantine a device “until an update to an operating system has been installed.”

I. Claim 4 - A method as recited in claim 1, wherein detecting an insecure condition includes configuring an operating system to quarantine the first host upon initial startup after installation of the operating system.

138. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

reviewing posture credentials. EX1004, 3:36-45, 11:29-32, 11:58-12:3, 14:16-34, 22:39-59.

137. The posture credentials contain information about “operating system patches [that] are installed within the computing system” (i.e., “*updates to an operating system*”). EX1004, 3:36-49. Gleichauf explains, and in my opinion a

POSITA would have known, that an outdated operating system may make the device “vulnerable” to network threats. EX1004, 1:65-2:3, 4:50-56. When the device is quarantined, the policy server can transmit a notification message to the device that may “include a link to a remediation server” where the remediation server “is configured to upgrade or provide up-to-date patches to the operating system.” EX1004, 21:8-12, 5:8-11. Once remediated, the device “should be admitted” into the network. EX1004, 5:11-13. In my opinion, a POSITA would have understood (and found it obvious) from Gleichauf’s description of quarantining devices with outdated operating systems and of providing operating system updates, to quarantine a device “*until an update to an operating system has been installed.*”

I. Claim 4 - A method as recited in claim 1, wherein detecting an insecure condition includes configuring an operating system to quarantine the first host upon initial startup after installation of the operating system.

138. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

39. As I explained above, the combination of Gleichauf, Ovadia, and

Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

140. In my opinion, Gleichauf renders this additional limitation obvious.

Gleichauf discloses a posture plugin that executes on the device and indicates a security posture. EX1004, 8:45-52. In one embodiment, the posture plugin is maintained by the operating system of the computerized device. EX1004, 8:65-67, 9:21-24. Gleichauf's policy server receives the security posture information from the posture plugin and uses these credentials to determine whether to quarantine the computerized device. EX1004, 9:29-34. A POSITA would have understood and found obvious that because the operating system has access to the posture information generated by the posture plugin, the operating system can quarantine the device upon startup, such in those situations where the computerized device has installed a new version of the operating system, but has not verified the new version with the policy server.

J. Claim 5

141. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

1. [5pre] A method as recited in claim 1, wherein permitting the first host to communicate with the remediation host includes:

142. As I explained above, the combination of Gleichauf, Ovadia, and

Lewis discloses *[a] method as recited in claim 1. §IV(F) (claim 1).*

4. [5a] detecting an outbound communication from the first host;
and

43. In my opinion, Gleichauf discloses and/or renders obvious this limitation.

144. Gleichauf's quarantined device receives a notification message from the policy server "indicating that the device has been quarantined and needs to be remediated" and including "a link to a remediation server." EX1004, 21:5-12. The device responds to the message by activating the link and being directed to the remediation server. EX1004, 21:20-23.

145. In my opinion, a POSITA would have understood that the device activating the link directing it to the remediation server includes an "outbound communication from the first host" to the remediation server. Gleichauf explains that data communications device 26 "is configured to detect attempted connections to the network 24 by the user device." EX1004, 10:6-11, 12:57-67. A POSITA would have understood that directing the device to the remediation server—a server that is not part of the device—would be an "outbound communication from the first host." In my opinion, a POSITA would also have understood that the data communications device 26 would "detect[]" an outbound communication when it is applying access instructions that govern the device's permitted level of network access. EX1004, 13:52-65, 14:3-7, 14:20-34, 22:38-47.

2. [5a] detecting an outbound communication from the first host;
and

143. In my opinion, Gleichauf discloses and/or renders obvious this limitation.

144. Gleichauf's quarantined device receives a notification message from the policy server "indicating that the device has been quarantined and needs to be remediated" and including "a link to a remediation server." EX1004, 21:5-12. The device responds to the message by activating the link and being directed to the remediation server. EX1004, 21:20-23.

145. In my opinion, a POSITA would have understood that the device activating the link directing it to the remediation server includes an "*outbound communication from the first host*" to the remediation server. Gleichauf explains that data communications device 26 "is configured to **detect attempted connections** to the network 24 by the user device." EX1004, 10:6-11, 12:57-67. A POSITA would have understood that directing the device to the remediation server—a server that is not part of the device—would be an "*outbound communication from the first host*." In my opinion, a POSITA would also have understood that the data communications device 26 would "*detect[]*" an outbound communication when it is applying access instructions that govern the device's permitted level of network access. EX1004, 13:52-65, 14:3-7, 14:20-34, 22:38-47.

5. [5b] forwarding the outbound communication if it is addressed to the remediation host.

146. In my opinion, Gleichauf discloses and/or renders this limitation obvious.

147. Gleichauf discloses that communications from a quarantined device are restricted or rejected. §IV(J)(2) (limitation 5a); EX1004, 22:38-47. A quarantined device is generally permitted to engage in HTTP communication with a remediation server. EX1004, 14:62-66. In my opinion, a POSITA would have understood that permitting HTTP traffic from a device to a remediation server, per Gleichauf, would entail the data communications device 26 “*forwarding the outbound communication if it is addressed to the remediation host.*”

K. Claim 6

148. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

1. [6pre] A method as recited in claim 1, wherein preventing the first host from sending data to the one or more other hosts includes:

149. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

2. [6a] detecting an outbound communication from the first host; and

150. In my opinion, Gleichauf discloses and/or renders obvious this limitation. §IV(J)(2) (limitation 5a).

3. [5b] forwarding the outbound communication if it is addressed to the remediation host.

146. In my opinion, Gleichauf discloses and/or renders this limitation obvious.

147. Gleichauf discloses that communications from a quarantined device are restricted or rejected. §IV(J)(2) (limitation 5a); EX1004, 22:38-47. A quarantined device is generally permitted to engage in HTTP communication with a remediation server. EX1004, 14:62-66. In my opinion, a POSITA would have understood that permitting HTTP traffic from a device to a remediation server, per Gleichauf, would entail the data communications device 26 “*forwarding the outbound communication if it is addressed to the remediation host.*”

K. Claim 6

148. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

1. [6pre] A method as recited in claim 1, wherein preventing the first host from sending data to the one or more other hosts includes:

149. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

2. [6a] detecting an outbound communication from the first host; and

150. In my opinion, Gleichauf discloses and/or renders obvious this limitation. §IV(J)(2) (limitation 5a).

4. [6b] redirecting the outbound communication to a quarantine server if it comprises a request for an approved service and is not addressed to a remediation host.

51. In my opinion, the combination of Gleichauf and Lewis discloses and/or renders obvious this limitation.

152. Gleichauf restricts or rejects communications from a quarantined device. EX1004, 11:58-67. Gleichauf explains that communications are permitted “only to certain destination addresses, e.g., IP address of remediation server, and only to certain protocols or ports, e.g., HTTP traffic.” EX1004, 14:62-66. In my opinion, a POSITA would have understood Gleichauf to teach that a quarantined device may be limited to communications with a remediation server using only HTTP (an “approved service”).

153. As discussed in §IV(F)(10) (limitation 1i), Gleichauf discloses that HTTP traffic (an “approved service”) from the device to a remediation server is permitted. EX1004, 14:62-66. However, HTTP traffic from the device to other destinations (“not addressed to a remediation host”) will be subject to a “redirect access instruction” that will “direct the computerized device 22 (e.g., HTTP traffic from the computerized device 22) to a remediation server.” EX1004, 15:55-16:6. As I discussed above at §§IV(F)(9)-(10) (limitations 1h-1i), in my opinion, it would have been obvious to a POSITA, in view of Lewis, to redirect unauthorized

3. [6b] redirecting the outbound communication to a quarantine server if it comprises a request for an approved service and is not addressed to a remediation host.

151. In my opinion, the combination of Gleichauf and Lewis discloses and/or renders obvious this limitation.

152. Gleichauf restricts or rejects communications from a quarantined device. EX1004, 11:58-67. Gleichauf explains that communications are permitted “only to certain destination addresses, e.g., IP address of remediation server, **and only to certain protocols or ports**, e.g., HTTP traffic.” EX1004, 14:62-66. In my opinion, a POSITA would have understood Gleichauf to teach that a quarantined device may be limited to communications with a remediation server using only HTTP (an “*approved service*”).

153. As discussed in §IV(F)(10) (limitation 1i), Gleichauf discloses that HTTP traffic (an “*approved service*”) from the device to a remediation server is permitted. EX1004, 14:62-66. However, HTTP traffic from the device to other destinations (“*not addressed to a remediation host*”) will be subject to a “**redirect** access instruction” that will “direct the computerized device 22 (e.g., HTTP traffic from the computerized device 22) to a remediation server.” EX1004, 15:55-16:6. As I discussed above at §§IV(F)(9)-(10) (limitations 1h-1i), in my opinion, it would have been obvious to a POSITA, in view of Lewis, to *redirect* unauthorized

access requests to a *quarantine server* that would inform the user of their device's quarantine status via a quarantine notification page. EX1006, 11:15-17, 14:22-23.

L. **Claim 7 – A method as recited in claim 1, wherein quarantining the first host further includes preventing the first host from receiving via the protected network data not related to remediation of the insecure condition.**

54. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

155. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

156. As explained in §IV(F)(7) (limitation 1f), Gleichauf discloses that a computerized device that is out of compliance with network admission policy is quarantined. EX1004, 4:50-56. Outbound communications from a quarantined device are not permitted to destinations that are not the remediation server. EX1004, 11:58-67, 14:62-66. From this disclosure, it would have been obvious and well understood to a POSITA that inbound communications would be similarly subject to access restrictions. If outbound requests from the quarantined device are not permitted to non-remediation destinations, the quarantined device is effectively prevented from receiving information that it would have received in response to such requests. Since Gleichauf teaches that a device in quarantine may only communicate with remediation-related servers, it would have been obvious and understood to a POSITA that Gleichauf's system prevents the quarantined

access requests to a *quarantine server* that would inform the user of their device's quarantine status via a quarantine notification page. EX1006, 11:15-17, 14:22-23.

L. Claim 7 – A method as recited in claim 1, wherein quarantining the first host further includes preventing the first host from receiving via the protected network data not related to remediation of the insecure condition.

154. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

155. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

156. As explained in §IV(F)(7) (limitation 1f), Gleichauf discloses that a computerized device that is out of compliance with network admission policy is quarantined. EX1004, 4:50-56. Outbound communications from a quarantined device are not permitted to destinations that are not the remediation server. EX1004, 11:58-67, 14:62-66. From this disclosure, it would have been obvious and well understood to a POSITA that inbound communications would be similarly subject to access restrictions. If outbound requests from the quarantined device are not permitted to non-remediation destinations, the quarantined device is effectively prevented from receiving information that it would have received in response to such requests. Since Gleichauf teaches that a device in quarantine may only communicate with remediation-related servers, it would have been obvious and understood to a POSITA that Gleichauf's system prevents the quarantined

device from receiving information not related to remediation (“*preventing ... from receiving via the protected network data not related to remediation of the insecure condition*”).

157. To the extent that this claim is interpreted as requiring the blocking of all non-remediation-related traffic from reaching the device, in my opinion, this restriction would have been obvious to a POSITA. Gleichauf is concerned with limiting or preventing the risk that network resources “receive or transmit malware” **from or to** “vulnerable computerized devices.” EX1004, Abstract, 8:52-55. That is why vulnerable devices are quarantined in an “isolated ... network segment” until the vulnerability has been remedied so that the device cannot receive such malware. EX1004, 4:25-26. It would thus have been obvious and understood to a POSITA that a device in quarantine would be restricted from receiving data not related to remediation in the same way that the device is restricted from transmitting data to non-remediation servers. In my opinion, a POSITA would have had a reasonable expectation of success in restricting communications to or from a quarantined device because Gleichauf describes allowing or preventing communications “between” the device and the network. EX1004, 14:3-7, 14:20-25.

158. Further, to the extent that Gleichauf does not explicitly disclose restricting inbound communications to quarantined devices, Lewis discloses that

device from receiving information not related to remediation (“*preventing ... from receiving via the protected network data not related to remediation of the insecure condition*”).

157. To the extent that this claim is interpreted as requiring the blocking of all non-remediation-related traffic from reaching the device, in my opinion, this restriction would have been obvious to a POSITA. Gleichauf is concerned with limiting or preventing the risk that network resources “receive or transmit malware” **from or to** “vulnerable computerized devices.” EX1004, Abstract, 8:52-55. That is why vulnerable devices are quarantined in an “isolated ... network segment” until the vulnerability has been remedied so that the device cannot receive such malware. EX1004, 4:25-26. It would thus have been obvious and understood to a POSITA that a device in quarantine would be restricted from receiving data not related to remediation in the same way that the device is restricted from transmitting data to non-remediation servers. In my opinion, a POSITA would have had a reasonable expectation of success in restricting communications to or from a quarantined device because Gleichauf describes allowing or preventing communications “between” the device and the network. EX1004, 14:3-7, 14:20-25.

158. Further, to the extent that Gleichauf does not explicitly disclose restricting inbound communications to quarantined devices, Lewis discloses that

The component responsible for quarantining the device (i.e., local enforcement component 314) also restricts inbound communication to the device. EX1006, 9:60-66 (“local enforcement component 314 is responsible for quarantining (i.e. restricting outside access to the local machine) when client 202 is in a quarantine state” and “is used to isolate the local client 202 from other machines” which “allows the client 202 to protect itself from being attacked if it finds itself insecure but not infected”). In my opinion, a POSITA would have found it obvious to modify Gleichauf’s system to implement Lewis’s limitations on inbound communications to provide its computerized devices with a more robust security protocol so that compromised computerized devices can protect themselves from further attacks. Such a modification would have involved the application of a known technique (restricting inbound communication) to improve similar devices (Gleichauf’s computerized device) in the same way (preventing a computerized device from being attacked from other machines on the LAN).

M. Claim 8 - A method as recited in claim 1, performed at an Internet service provider.

159. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

160. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

61. Gleichauf's computerized device attempts to communicate using the network, where the network is "a computer network, such as an enterprise network or the Internet, which includes the network resources 25, the data communications device 26, and the policy server 28." EX1005, 3:50-56, 9:57-64 Network resources 25 are "servers that contain content accessible by the . . . device." EX1005, 9:65-67.

62. In my opinion, a POSITA would have understood that the combination of the data communications device and policy server is an Internet service provider because the combination selectively provides access to the network, which Gleichauf explains is the Internet. The policy server determines whether to quarantine the device (by means of instructions to the data communications device) and protect the network. EX1004, 4:50-56, 10:30-33, 11:45-67. While in quarantine, the device is unable to communicate with network resources. EX1004, 11:58-67, 14:62-66. A POSITA would have therefore appreciated that the data communications device and policy server determine whether the device can access resources on the network, e.g., on the Internet. Thus, the data communications device and the policy server together operate to provide the device Internet access, which a POSITA would have understood to be the function of an "Internet service provider." Moreover, in my opinion, it would have

161. Gleichauf's computerized device attempts to communicate using the network, where the network is "a computer network, such an enterprise network or the **Internet**, which includes the network resources 25, the data communications device 26, and the policy server 28." EX1005, 3:50-56, 9:57-64 Network resources 25 are "servers that contain content accessible by the . . . device." EX1005, 9:65-67.

162. In my opinion, a POSITA would have understood that the combination of the data communications device and policy server¹¹ in *Internet service provider* because¹² the combination selectively provides access to the network, which Gleichauf explains is the Internet. The policy server¹³ determines whether to quarantine the device (by means of instructions to the data communications device) and protect the network. EX1004, 4:50-56, 10:30-33, 11:45-67. While in quarantine, the device is unable to communicate with network resources. EX1004, 11:58-67, 14:62-66. A POSITA would have therefore appreciated that the data communications device and policy server determine whether the device can access resources on the network, e.g., on the Internet. Thus, the data communications device and the policy server together operate to provide the¹⁴ device Internet access, which a POSITA would have understood to be the function of an "Internet service provider."¹⁵ Moreover, in my opinion, it would have

been obvious for the data communications device and policy server to be owned by a company that provides Internet service.

N. **Claim 9 - A method as recited in claim 1, wherein the software component on the first host is an operating system.**

163. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

164. As explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

165. In my opinion, Gleichauf discloses this limitation for at least the reasons provided above. §IV(H) (claim 3).

O. **Claim 10 - A method as recited in claim 1, wherein determining that the response does not include a valid digitally signed attestation of cleanliness includes determining that the software component on the first host is not sufficiently updated.**

166. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

167. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

168. Gleichauf further discloses that its computerized device's posture response includes posture credentials. The posture credentials contain information about the "particular **virus software and virus definition versions**" installed on the device. EX1004, 3:36-49, 8:56-9:5. If updated software or current virus

been obvious for the data communications device and policy server to be owned by a company that provides Internet service.

N. Claim 9 - A method as recited in claim 1, wherein the software component on the first host is an operating system.

163. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

164. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

165. In my opinion, Gleichauf discloses this limitation for at least the reasons provided above. §IV(H) (claim 3).

O. Claim 10 - A method as recited in claim 1, wherein determining that the response does not include a valid digitally signed attestation of cleanliness includes determining that the software component on the first host is not sufficiently updated.

166. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

167. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

168. Gleichauf further discloses that its computerized device's posture response includes posture credentials. The posture credentials contain information about the "particular **virus software and virus definition versions**" installed on the device. EX1004, 3:36-49, 8:56-9:5. If updated software or current virus

Definitions are not present, the device is quarantined and communications from it to the network will be restricted or completely rejected, because of a determination that the response does not include “a valid . . . attestation of cleanliness.” X1004, 11:58-67.

P. Claim 11 - A method as recited in claim 1, wherein determining that the software component on the first host is not sufficiently updated includes determining that a patch level associated with the software component on the first host is not sufficiently recent.

69. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

170. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

171. As I described above in limitation 1d, Gleichauf’s posture credentials received by the policy server contain information such as “what particular virus software and virus definition versions are installed,” “when was the last time a local antivirus scan was executed,” “what operating system patches are installed.” §IV(F)(5) (limitation 1d). To the extent that the patches inquiry is limited to the operating system, in my opinion, a POSITA would have understood and found obvious that the same inquiry related to patch level could be made with respect to the virus software installed on the host device.

definitions are not present, the device is quarantined and communications from it to the network will be restricted or completely rejected, because of a determination that the response does not include “a valid . . . attestation of cleanliness.” EX1004, 11:58-67.

P. Claim 11 - A method as recited in claim 1, wherein determining that the software component on the first host is not sufficiently updated includes determining that a patch level associated with the software component on the first host is not sufficiently recent.

169. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

170. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] method as recited in claim 1. See §IV(F) (claim 1).*

171. As I described above in limitation 1d, Gleichauf’s posture credentials received by the policy server contain information such as “what particular virus software and virus definition versions are installed,” “when was the last time a local antivirus scan was executed,” “what operating system patches are installed.” §IV(F)(5) (limitation 1d). To the extent that the patches inquiry is limited to the operating system, in my opinion, a POSITA would have understood and found obvious that the same inquiry related to patch level could be made with respect to the virus software installed on the host device.

Claim 12

72. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

1. [12pre] A system for protecting a network, comprising:

173. In my opinion, Gleichauf discloses this limitation.

174. Gleichauf teaches a “**robust network security architecture and system for controlling access to a network** depending on the configuration state or ‘security posture’ of a device when it attempts to connect to that network.”

EX1004, 3:4-9. Gleichauf’s system, and specifically its policy server, protects the network by reducing the risk of the network becoming infected with malware or suffering a virus outbreak. EX1004, 16-31.

2. [12a] a processor configured to:

175. In my opinion, Gleichauf discloses this limitation.

176. Gleichauf’s policy server operates to protect the network. §IV(F)(1)-(2) (limitations 1pre-1a). The policy server “includes a controller 209 formed of a memory 210 and a **processor 212**.” EX1004, 25:44-46. The processor 212 performs operations, such as those recited in limitations 12b-12l and claims 13-18 below, associated with protecting the network by reducing the risk of the network becoming infected by executing application 246 to perform the limitations described below. EX1004, 27:16-21 (“the credential analysis process 248 represents one or more portions of the logic instructions of the credential analysis

Q. Claim 12

172. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

1. [12pre] A system for protecting a network, comprising:

173. In my opinion, Gleichauf discloses this limitation.

174. Gleichauf teaches a “**robust network security architecture and system for controlling access to a network** depending on the configuration state or ‘security posture’ of a device when it attempts to connect to that network.” EX1004, 3:4-9. Gleichauf’s system, and specifically its policy server, protects the network by reducing the risk of the network becoming infected with malware or suffering a virus outbreak. EX1004, 8:16-31.

2. [12a] a processor configured to:

175. In my opinion, Gleichauf discloses this limitation.

176. Gleichauf’s policy server operates to protect the network. §IV(F)(1)-(2) (limitations 1pre-1a). The policy server “includes a controller 209 formed of a memory 210 and a **processor 212**.” EX1004, 25:44-46. The processor 212 performs operations, such as those recited in limitations 12b-12l and claims 13-18 below, associated with protecting the network by reducing the risk of the network becoming infected by executing application 246 to perform the limitations described below. EX1004, 27:16-21 (“the credential analysis process 248 represents one or more portions of the logic instructions of the credential analysis

application 246 while being executed or otherwise performed on, by, or in the processor 212 within the policy server 28”).

3. [12b] detect an insecure condition on a first host that has connected or is attempting to connect to a protected network,

177. In my opinion, Gleichauf discloses this limitation. §IV(F)(2)

(limitation 1a).

4. [12c] wherein detecting the insecure condition includes contacting a trusted computing base associated with a trusted platform module within the first host,

178. In my opinion, the Gleichauf-Ovadia combination discloses this

limitation. §IV(F)(3) (limitation 1b).

5. [12d] [wherein detecting the insecure condition includes ...] receiving a response, and

179. In my opinion, Gleichauf discloses this limitation. §IV(F)(4)

(limitation 1c).

6. [12e] [wherein detecting the insecure condition includes ...] determining whether the response includes a valid digitally signed attestation of cleanliness,

180. In my opinion, the Gleichauf-Ovadia combination discloses this

limitation. §IV(F)(5) (limitation 1d).

7. [12f] wherein the valid digitally signed attestation of cleanliness includes at least one of an attestation that the trusted computing base has ascertained that the first host is not infested, and an attestation that the trusted computing base

has ascertained the presence of a patch or a patch level associated with a software component on the first host;

81. In my opinion, Gleichauf discloses this limitation. §IV(F)(6)

(limitation 1e).

8. [12g] when it is determined that the response does not include a valid digitally signed attestation of cleanliness, quarantine the first host, including by preventing the first host from sending data to one or more other hosts associated with the protected network,

82. In my opinion, Gleichauf discloses this limitation. §IV(F)(7)

(limitation 1f).

9. [12h] wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes receiving a service request sent by the first host,

83. In my opinion, Gleichauf discloses this limitation. §IV(F)(8)

(limitation 1g).

10.[12i] [wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes...] serving a quarantine notification page to the first host when the service request comprises a web server request, and

184. In my opinion, the Gleichauf-Ovadia-Lewis combination discloses

this limitation. §IV(F)(9) (limitation 1h).

11.[12j] in the event the service request comprises a DNS query, providing in response an IP address of a quarantine server configured to serve the quarantine notification page if a host name that is the subject of the DNS query is not associated

has ascertained the presence of a patch or a patch level associated with a software component on the first host;

181. In my opinion, Gleichauf discloses this limitation. §IV(F)(6)

(limitation 1e).

8. [12g] when it is determined that the response does not include a valid digitally signed attestation of cleanliness, quarantine the first host, including by preventing the first host from sending data to one or more other hosts associated with the protected network,

182. In my opinion, Gleichauf discloses this limitation. §IV(F)(7)

(limitation 1f).

9. [12h] wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes receiving a service request sent by the first host,

183. In my opinion, Gleichauf discloses this limitation. §IV(F)(8)

(limitation 1g).

10.[12i] [wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes...] serving a quarantine notification page to the first host when the service request comprises a web server request, and

184. In my opinion, the Gleichauf-Ovadia-Lewis combination discloses

this limitation. §IV(F)(9) (limitation 1h).

11.[12j] in the event the service request comprises a DNS query, providing in response an IP address of a quarantine server configured to serve the quarantine notification page if a host name that is the subject of the DNS query is not associated

with a remediation host configured to provide data usable to remedy the insecure condition; and

85. In my opinion, the Gleichauf-Ovadia-Lewis combination discloses this limitation. §IV(F)(10) (limitation 1i).

12.[12k] permit the first host to communicate with the remediation host; and

186. In my opinion, Gleichauf discloses this limitation. §IV(F)(11) (limitation 1j).

13.[12l] a memory coupled to the processor and configured to provide instructions to the processor.

187. In my opinion, Gleichauf discloses this limitation.

188. Gleichauf's policy server "includes a controller 209 formed of a **memory 210** and a processor 212." EX1004, 25:41-46. A POSITA would have understood that memory 210 is coupled to processor 212 because they are part of the same controller 209.

89. Memory 210 is "*configured to provide instructions to the processor*" of the policy server because it is "encoded with **logic instructions (e.g., software code)** and/or data that form a credential analysis application 246" where "application 246 represents **software code, instructions and/or data ... that reside within memory ... accessible to the policy server 28.**" EX1004, 26:66-27:8.

R. Claim 13 - A system as recited in claim 12, wherein the processor is configured to detect an insecure condition at least in part by

with a remediation host configured to provide data usable to remedy the insecure condition; and

185. In my opinion, the Gleichauf-Ovadia-Lewis combination discloses this limitation. §IV(F)(10) (limitation 1i).

12.[12k] permit the first host to communicate with the remediation host; and

186. In my opinion, Gleichauf discloses this limitation. §IV(F)(11) (limitation 1j).

13.[12l] a memory coupled to the processor and configured to provide instructions to the processor.

187. In my opinion, Gleichauf discloses this limitation.

188. Gleichauf's policy server "includes a controller 209 formed of a **memory 210** and a processor 212." EX1004, 25:41-46. A POSITA would have understood that memory 210 is coupled to processor 212 because they are part of the same controller 209.

189. Memory 210 is "*configured to provide instructions to the processor*" of the policy server because it is "encoded with **logic instructions (e.g., software code)** and/or data that form a credential analysis application 246" where "application 246 represents **software code, instructions and/or data ... that reside within memory** ¹⁰ accessible to the policy server 28." EX1004, 26:66-27:8.

R. Claim 13 - A system as recited in claim 12, wherein the processor is configured to detect an insecure condition at least in part by

performing one or more of the following: scanning for a vulnerability, scanning for malicious data, determining whether a security software is installed, and detecting anomalous network traffic.

90. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

191. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] system as recited in claim 12. See §IV(Q) (claim 12).*

192. Furthermore, in my opinion, Gleichauf discloses and/or renders obvious this limitation. *See §IV(G) (claim 2).*

S. Claim 14 - A system as recited in claim 12, wherein the processor is configured to detect an insecure condition at least in part by determining that an initial startup after installation of an operating system is being performed.

193. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

194. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] system as recited in claim 12. See §IV(Q) (claim 12).*

195. Furthermore, in my opinion, the combination of Gleichauf and Lewis discloses and/or renders obvious this limitation. *See §IV(I) (claim 4).*

T. Claim 15 - A system as recited in claim 12, wherein the processor is configured to quarantine the first host at least in part by

preventing the first host from receiving via the protected network data not related to remediation of the insecure condition.

96. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

197. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] system as recited in claim 12. See §IV(P) (claim 12).*

198. Furthermore, in my opinion, the combination of Gleichauf and Lewis discloses and/or renders obvious this limitation. *See §IV(K) (claim 7).*

U. Claim 16 - A system as recited in claim 12, wherein the software component on the first host is an operating system.

99. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

200. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] system as recited in claim 12. See §IV(Q) (claim 12).*

201. Furthermore, in my opinion, Gleichauf discloses and/or renders obvious this limitation. *See §IV(N) (claim 9).*

97. Claim 17 - 10 system as recited in claim 12, wherein determining that the response does not include a valid digitally signed attestation of cleanliness includes determining that the software component on the first host is not sufficiently updated.

112. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

preventing the first host from receiving via the protected network data not related to remediation of the insecure condition.

196. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

197. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] system as recited in claim 12. See §IV(P) (claim 12).*

198. Furthermore, in my opinion, the combination of Gleichauf and Lewis discloses and/or renders obvious this limitation. *See §IV(K) (claim 7).*

U. Claim 16 - A system as recited in claim 12, wherein the software component on the first host is an operating system.

199. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

200. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses *[a] system as recited in claim 12. See §IV(Q) (claim 12).*

201. Furthermore, in my opinion, Gleichauf discloses and/or renders obvious this limitation. *See §IV(N) (claim 9).*

V. Claim 17 - A system as recited in claim 12, wherein determining that the response does not include a valid digitally signed attestation of cleanliness includes determining that the software component on the first host is not sufficiently updated.

202. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious.

203. As I explained above, the combination of Gleichauf, Ovadia, and

Lewis discloses *[a] system as recited in claim 12. See §IV(Q) (claim 12).*

204. Furthermore, in my opinion, Gleichauf discloses and/or renders

obvious this limitation. *See §IV(O) (claim 10).*

W. Claim 18 - A system as recited in claim 17, wherein determining that the software component on the first host is not sufficiently updated includes determining that a patch level associated with the software component on the first host is not sufficiently recent.

205. In my opinion, the combination of Gleichauf, Ovadia, and Lewis

renders this claim obvious.

206. As I explained above, the combination of Gleichauf, Ovadia, and

Lewis discloses *[a] system as recited in claim 17. See §IV(V) (claim 17).*

207. Furthermore, in my opinion, Gleichauf discloses and/or renders

obvious this limitation. *See §IV(P) (claim 11).*

X. Claim 19

208. In my opinion, the combination of Gleichauf, Ovadia, and Lewis

renders this claim obvious.

1. [19pre] A computer program product for protecting a network, the computer program product being embodied in a non-transitory computer readable medium and comprising computer instructions for:

209. In my opinion, Gleichauf discloses this limitation.

210. Gleichauf describes how a “computer program product 200

includes an application or logic instructions that are loaded into the computerized

device 22, data communications device 26, and policy server 28 to configure the

devices 22, 24, 26 to operate as part of the data communications system 20”

described throughout the reference. EX1004, 25:46-51, 3:4-9. In my opinion,

POSITA would have understood that Gleichauf’s computer program product

comprises computer instructions.

211. As I described for claim 12, Gleichauf’s policy server operates to protect the network and directs the operation of the data communications device 26. See §IV(Q)(2) (limitation 12a). The policy server includes a “*non-transitory computer readable medium*” in the form of memory 210 that stores “**logic instructions (e.g., software code) and/or data**” for operating the disclosed security architecture. EX1004, 26:66-27:8. Gleichauf’s system protects the network by reducing the risk of the network becoming infected with malware or suffering a virus outbreak. EX1004, 7:16-31.

2. [19a] detecting an insecure condition on a first host that has connected or is attempting to connect to a protected network,

212. In my opinion, Gleichauf discloses this limitation. §IV(F)(2) (limitation 1a).

3. [19b] wherein detecting the insecure condition includes contacting a trusted computing base associated with a trusted platform module within the first host,

213. In my opinion, Gleichauf discloses this limitation. §IV(F)(3) (limitation 1b).

device 22, data communications device 26, and policy server 28 to configure the

devices 22, 24, 26 to operate as part of the data communications system 20”

described throughout the reference. EX1004, 25:46-51, 3:4-9. In my opinion,

POSITA would have understood that Gleichauf’s computer program product

comprises computer instructions.

211. As I described for claim 12, Gleichauf’s policy server operates to protect the network and directs the operation of the data communications device 26. See §IV(Q)(2) (limitation 12a). The policy server includes a “*non-transitory computer readable medium*” in the form of memory 210 that stores “**logic instructions (e.g., software code) and/or data**” for operating the disclosed security architecture. EX1004, 26:66-27:8. Gleichauf’s system protects the network by reducing the risk of the network becoming infected with malware or suffering a virus outbreak. EX1004, 8:16-31.

2. [19a] detecting an insecure condition on a first host that has connected or is attempting to connect to a protected network,

212. In my opinion, Gleichauf discloses this limitation. §IV(F)(2) (limitation 1a).

3. [19b] wherein detecting the insecure condition includes contacting a trusted computing base associated with a trusted platform module within the first host,

213. In my opinion, Gleichauf discloses this limitation. §IV(F)(3) (limitation 1b).

4. [19c] [wherein detecting the insecure condition includes...]
receiving a response, and

14. In my opinion, the combination of Gleichauf and Ovadia discloses
this limitation. §IV(F)(4) (limitation 1c).

5. [19d] [wherein detecting the insecure condition includes...]
determining whether the response includes a valid digitally
signed attestation of cleanliness,

215. In my opinion, Gleichauf discloses this limitation. §IV(F)(5)
(limitation 1d).

6. [19e] wherein the valid digitally signed attestation of
cleanliness includes at least one of an attestation that the
trusted computing base has ascertained that the first host is not
infested, and an attestation that the trusted computing base
has ascertained the presence of a patch or a patch level
associated with a software component on the first host;

16. In my opinion, the combination of Gleichauf and Ovadia discloses
this limitation. §IV(F)(6) (limitation 1e).

7. [19f] when it is determined that the response does not include a
valid digitally signed attestation of cleanliness, quarantining
the first host, including by preventing the first host from
sending data to one or more other hosts associated with the
protected network,

17. In my opinion, Gleichauf discloses this limitation. §IV(F)(7)
(limitation 1f).

4. [19c] [wherein detecting the insecure condition includes...] receiving a response, and

214. In my opinion, the combination of Gleichauf and Ovadia discloses this limitation. §IV(F)(4) (limitation 1c).

5. [19d] [wherein detecting the insecure condition includes...] determining whether the response includes a valid digitally signed attestation of cleanliness,

215. In my opinion, Gleichauf discloses this limitation. §IV(F)(5) (limitation 1d).

6. [19e] wherein the valid digitally signed attestation of cleanliness includes at least one of an attestation that the trusted computing base has ascertained that the first host is not infested, and an attestation that the trusted computing base has ascertained the presence of a patch or a patch level associated with a software component on the first host;

216. In my opinion, the combination of Gleichauf and Ovadia discloses this limitation. §IV(F)(6) (limitation 1e).

7. [19f] when it is determined that the response does not include a valid digitally signed attestation of cleanliness, quarantining the first host, including by preventing the first host from sending data to one or more other hosts associated with the protected network,

217. In my opinion, Gleichauf discloses this limitation. §IV(F)(7) (limitation 1f).

4. [19g] wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes receiving a service request sent by the first host, 6

18. In my opinion, Gleichauf discloses this limitation. §IV(F)(8)

(limitation 1g).

9. [19h] [wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes...] serving a quarantine notification page to the first host when the service request comprises a web server request, and

219. In my opinion, the combination of Gleichauf, Ovadia, 8 and Lewis

discloses this limitation. §IV(F)(9) (limitation 1h).

10.[19i] in the event the service request comprises a DNS query, providing in response an IP address of a quarantine server configured to serve the quarantine notification page if a host name that is the subject of the DNS query is not associated with a remediation host configured to provide data usable to remedy the insecure condition; and

20. In my opinion, the combination of Gleichauf, Ovadia, and Lewis

discloses this limitation. §IV(F)(10) (limitation 1i).

11.[19j] permitting the first host to communicate with the remediation host.

221. In my opinion, Gleichauf discloses this limitation. §IV(F)(11)

(limitation 1j).

8. [19g] wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes receiving a service request sent by the first host,

218. In my opinion, Gleichauf discloses this limitation. §IV(F)(8)

(limitation 1g).

9. [19h] [wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes...] serving a quarantine notification page to the first host when the service request comprises a web server request, and

219. In my opinion, the combination of Gleichauf, Ovadia, and Lewis

discloses this limitation. §IV(F)(9) (limitation 1h).

- 10.[19i] in the event the service request comprises a DNS query, providing in response an IP address of a quarantine server configured to serve the quarantine notification page if a host name that is the subject of the DNS query is not associated with a remediation host configured to provide data usable to remedy the insecure condition; and

220. In my opinion, the combination of Gleichauf, Ovadia, and Lewis

discloses this limitation. §IV(F)(10) (limitation 1i).

- 11.[19j] permitting the first host to communicate with the remediation host.

221. In my opinion, Gleichauf discloses this limitation. §IV(F)(11)

(limitation 1j).

	Number: 10 [Old]: "secure, per Ovadia) to a known method (network authorization process that analyzes a device's posture credentials that contain critical security information about the device, including its authentication, per Gleichauf) ready for improvement to yield predictable results. Here, the improvement provided to Gleichauf's process by Ovadia's digital signature technique is resistance to forged or tampered-with posture credentials. A POSITA would have been familiar with the use of digital signatures to prove the integrity and authenticity of messages or other information communicated over a network. See, e.g., U.S. Patent Pub. No. 2006/0005009 at [0033] ("To ensure that the quoted value is not corrupted during communication, TPM 50 also can generate an attestation identity key (AIK) that is used to encrypt some or all of the quoted value. Attribute system 40 can communicate the encrypted quoted value and AIK to assurance system 42."). Gleichauf's process is also improved because the use of a digital signature allows the policy server to authenticate that the provided posture credentials originated with the device	Author: Text Replaced	Subject: Text	Date: Indeterminate

Comments from page 3 continued on next page

attempting to gain access to the network. See Ovadia at 16:30-32 ("AS"

[New]: "secure (as in Ovadia) with the known network authorization process of analyzing a device's security posture credentials, including its authentication (as in Gleichauf) to yield predictable results. In my opinion, a POSITA would have been familiar with the use of digital signatures to prove the integrity and authenticity of network communications and would have recognized that Ovadia's digital signature technique would improve Gleichauf's process by increasing resistance to forged or tampered-with posture credentials. EX1008, ¶133. In my opinion, a POSITA also would have recognized that use of a digital signature would improve Gleichauf's process by enabling the policy server to confirm that the posture credentials originated with the device attempting to access the network. 66. In my opinion,"

	Number: 5 [Old]: "versions are installed within the computer system." Gleichauf at 3:3645. The policy server 28 of the network analyzes these posture credentials and detects, for example, the absence of an anti-virus definition, of an anti-virus software, or recent execution of the anti-virus software, any of which indicate that the computerized device 22 can be considered to be "vulnerable." This "vulnerability" is identified because network resources may become "infected" with malware carried by "vulnerable" devices. A device would also be "vulnerable" to any malware that might be transmitted to it by various network resources. A POSITA would thus have understood Gleichauf gathering and analyzing posture credentials to render obvious "detecting an insecure condition": While connected to the network, the conventional computerized devices can be subject to receive malware, such as computer viruses, worms, spy-ware, spam, or other types of unauthorized applications or content (here after referred to as "malware"). Gleichauf at 1:10-14. The security posture of the user device 22 relates, for example, to the user device's 22 ability to resist reception or transmission of malware (e.g., viruses), content (spam and/or data theft), or access by unauthorized users. Gleichauf at [New]: "versions" installed on the device. EX1004, 3:36-45. The policy server analyzes these posture credentials and detects the absence "of an anti-virus application (e.g., or an up-to-date anti-virus application or virus definition file)." EX1004, 14:16-34. Devices that "are not configured with anti-virus or up-to-date anti-virus applications" are considered "vulnerable" because "network resources [may] become 'infected' with malware carried by the 'vulnerable' [computerized] user device 22." EX1004, 22:38-59, 11:58-12:13. A device would also be vulnerable to any malware that might be transmitted by network resources. EX1004, 1:10-14,"	Author: Text Replaced	Subject: Text	Date: Indeterminate

	Number: 8 [Old]: "station: The initial signup phase begins in a block 800, wherein a measurement of at least one of the SS platforms authorized firmware and software configuration(s) is performed to produce an integrity measurement corresponding to the authorized configuration(s). The integrity measurement is then stored in an appropriate PCR in a block 802, and sent to the AS as an authorized Config_ID in a block 804. As above, the integrity measurement may be encrypted and/or digitally signed with appropriate keys. The AS extracts the Config_ID and stores it in its database, which completes the initial signup process. In response to initiation of a post-signup access, the SS will receive an authentication request message or send the following in an authentication request. First, in a block 806, a current measurement of the firmware and/or software configuration (corresponding to the earlier measurement) is made to produce a current integrity measurement. The appropriate PCR is then hash-extended with the current integrity measurement in a block 808. The hash-extended PCR value is then extracted, digitally signed with the SS's AIK private key, and sent to the AS in a block 810. Upon receipt, the AS authenticates" [New]: "station, including the "current measurement of the firmware and/or software" of the station. 	Number: 5 [Old]: "form of "malicious data" because spam is unsolicited by the user of the computer and can result in the computer becoming infected with a virus or malware. 160. The posture credentials further contain information about, for example, the presence (or absence) of an anti-virus software, currency of an anti-virus definition, and the status of a firewall application. Gleichauf at 3:36-49; see also Gleichauf at 8:62-65 (reporting on the "status of intrusion prevention (e.g., firewall) applications"). A POSITA would have understood that an anti-virus software or firewall application is a type of "security software" because it can detect and prevent virus and other security infestations on the device. Reviewing the posture credentials for information about the presence or absence of anti-virus software or firewall application involves "determining whether a security software is installed" on the computerized device." [New]: "detection of spam is a detection of anomalous network activity, and therefore is an identification of an insecure condition, thereby meeting the claim language. 132. The posture credentials further include information about the presence or absence of anti-virus software, whether the anti-virus software is up-to-date, and the status of a firewall application. EX1004, 3:36-49, 8:62-65. In my opinion, a POSITA would have understood that an anti-virus and intrusion prevent software (e.g., a firewall) are types of "security software" because they can detect and prevent virus and other security infestations. Reviewing the posture credentials for information about the presence or absence of anti-virus software or firewall application involves "determining whether a security software is installed." H." [Old]: "168. A computerized device will be quarantined if it is out of compliance with the network admission policy. Gleichauf at 4:50-56. A POSITA would have understood that missing operating system patches can make a device vulnerable to various network threats and, as a result, can render the device out of compliance with network admission policy, consistent with Gleichauf's teachings. 169. Once the device is quarantined, the policy server can transmit a notification message to the device "indicating that the device has been quarantined and needs to be remediated." Gleichauf at 21:5-8. The notification message may also "include a link to a remediation server or the IP address of the remediation server 66 that a user may click on or an application on the user device 22 may process to remediate the user device 22 automatically." Gleichauf at 21:8-12. The remediation server "is configured to upgrade or provide up-to-date patches to the operating system or applications, such as anti-virus applications, associated with the computerized device." Gleichauf at 5:8-11. The computerized device "should be admitted into the original network if the remediation process was successful." Gleichauf at 5:11-13. A POSITA would have found it obvious from Gleichauf's discussion of a device with outdated operating systems being placed into quarantine and of providing operating system updates, to quarantine a device "until an update to an operating system has been installed." This is consistent with Gleichauf's teaching"
[New]: "POSITA would have known, that an outdated operating system may make the device "vulnerable" to network threats. EX1004, 1:65-2:3, 4:50-56. When the device is quarantined, the policy server can transmit a notification message to the device that may "include a link to a remediation server" where the remediation server "is configured to upgrade or provide up-to-date patches to the operating system." EX1004, 21:8-12, 5:8-11. Once remediated, the device "should be admitted" into the network. EX1004, 5:11-13. In my opinion, a POSITA would have understood (and found it obvious) from Gleichauf's description of quarantining devices with outdated operating systems and of providing operating system updates, to quarantine a device "until an update to an operating system has been installed." I. Claim 4 -A method as recited in claim 1, wherein detecting an insecure condition includes configuring an operating system to quarantine the first host upon initial startup after installation of the operating system. 138. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious."

	[Old]: "that the computerized device will be admitted into the original network, out of its quarantine, if the remediation process was successful. 170. Therefore, Gleichauf discloses "wherein detecting an insecure condition includes determining that the first host should be quarantined until an update to an operating system has been installed." 4. Claim 5 a. [5.0] A method as recited in claim 1, 171. See analysis at [1.0]-[1.10]. b. [5.1] wherein permitting the first host to communicate with the remediation host includes: 172. As discussed in [1.10], Gleichauf discloses that communications from a quarantined computerized device are restricted or rejected. Gleichauf at 11:58-67. HTTP traffic from the device to a remediation server, however, is permitted. Gleichauf at 14:62-66. Thus, Gleichauf discloses this limitation for the same reasons discussed in [1.10]. c. [5.2]"			
	[New]: "139. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses [a] method as recited in claim 1. See §IV(F) (claim 1). 140. In my opinion, Gleichauf renders this additional limitation obvious. Gleichauf discloses a posture plugin that executes on the device and indicates a security posture. EX1004, 8:45-52. In one embodiment, the posture plugin is maintained by the operating system of the computerized device. EX1004, 8:65-67, 9:21-24. Gleichauf's policy server receives the security posture information from the posture plugin and uses these credentials to determine whether to quarantine the computerized device. EX1004, 9:29-34. A POSITA would have understood and found obvious that because the operating system has access to the posture information generated by the posture plugin, the operating system can quarantine the device upon startup, such in those situations where the computerized device has installed a new version of the operating system, but has not verified the new version with the policy server. J. Claim 5 141. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious. 1. [5pre] A method as recited in claim 1, wherein permitting the first host to communicate with the remediation host includes: 142. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses [a] method as recited in claim 1. §IV(F) (claim 1)."

	[Old]: "server or the IP address of the remediation server 66 that a user may click on or an application on the user device 22 may process to remediate the user device 22 automatically." Gleichauf at 21:8-12. The computerized device responds to the notification message by "activat[ing] a link, associated with the notification message, to direct the computerized device 22 to the remediation server 66." Gleichauf at 21:20-23. 175. A POSITA would have understood that activating the link to direct the computerized device to the remediation server includes an "outbound communication" to the remediation server. In fact, Gleichauf's data communications device 26 is already "configured to detect attempted connections to the network 24 by the user device 22." Gleichauf at 10:6-11, 12:57-67. Since the remediation server is not a part of the computerized device (the "first host"), directing the computerized device to the remediation server would be an "outbound communication from the first host." 176. A POSITA would have further understood that the network "detects" the outbound communication from the first host. The specific access rights of the quarantined device to network resources is administered by the data communications device 26, based on admission instructions 48 provided by the policy server. Gleichauf at 22:38-47. The data communications device 26 receives (i.e., "detects") communications from the quarantined device and then either restricts or rejects them,"			
	[New]: "server." EX1004, 21:5-12. The device responds to the message by activating the link and being directed to the remediation server. EX1004, 21:20-23. 145. In my opinion, a POSITA would have understood that the device activating the link directing it to the remediation server includes an "outbound communication from the first host" to the remediation server. Gleichauf explains that data communications device 26 "is configured to detect attempted connections to the network 24 by the user device." EX1004, 10:6-11, 12:57-67. A POSITA would have understood that directing the device to the remediation server—a server that is not part of the device—would be an "outbound communication from the first host." In my opinion, a POSITA would also have understood that the data communications device 26 would "detect[]" an outbound communication when it is applying access"

	Number: 7 [Old]: "189. Gleichauf renders this limitation obvious. 190. As explained in [1.6], Gleichauf discloses placing into quarantine a computerized device that is out of compliance with network admission policy. Gleichauf at 4:50-56. Communications from a quarantined device to restricted resources in the network are restricted or rejected, unless they are directed to a remediation server. Gleichauf at 11:58-67, 14:62-66. In other words, Gleichauf discloses that outbound traffic is not permitted from the quarantined device to a destination that is not the remediation server: The access instruction 48 may permit traffic from user device 22 only to certain destination addresses, e.g. IP address of remediation server, and only to certain protocols or ports, e.g. HTTP traffic. Gleichauf at 14:62-66. 191. It would have been obvious to a POSITA that because a quarantined device is not permitted to transmit a request for information to a non-remediation server, the quarantined device is effectively prevented from receiving information that it would have received in response to the request. This is because such a request for information is blocked from ever reaching the non-remediation server, and hence" [New]: "154. In my opinion, the combination of Gleichauf, Ovadia, and Lewis renders this claim obvious. 155. As I explained above, the combination of Gleichauf, Ovadia, and Lewis discloses [a] method as recited in claim 1. See §IV(F) (claim 1). 156. As explained in §IV(F)(7) (limitation 1f), Gleichauf discloses that a computerized device that is out of compliance with network admission policy is quarantined. EX1004, 4:50-56. Outbound communications from a quarantined device are not permitted to destinations that are not the remediation server. EX1004, 11:58-67, 14:62-66. From this disclosure, it would have been obvious and well understood to a POSITA that inbound communications would be similarly subject to access restrictions. If outbound requests from the quarantined device are not permitted to non-remediation destinations, the quarantined device is effectively prevented from receiving information that it would have received in response to such requests. Since Gleichauf teaches that a device in quarantine may only communicate with remediation-related servers,"	Author: Text Replaced	Subject: Text	Date: Indeterminate
