How healthy are your mission-critical applications? What if you could reduce your time to identify and fix downtime incidents before they impact the business? What if you could reduce your overall application costs? You can — with HP OpenView you get a true end-to-end view of the entire application. According to Hurwitz & Associates, 90% of customers increased customer satisfaction by using HP OpenView Application Management Solutions. Over 90% of customers experienced a decrease in operation costs often by as much as 15%.

HP OpenView Application Management Solutions enable application owners to provide consistently well performing and available applications to support key business processes. With the introduction of the new HP OpenView Application Insight, HP OpenView can integrate into a common data level model performance of Applications and Business Services with metrics (response times and resource usage data) from multiple sources, on multiple components, at the data level so you can identify problems earlier, prioritize problems more accurately and resolve problems faster with fewer resources.

Visibility to applications and infrastructure result in problems being identified and resolved faster.

"HP OpenView has raised the bar in application performance management with Application Insight. The flexibility of the product's new service modeling capability allows us to represent the organization with greater precision. With Application Insight we'll be able to pinpoint and diagnose IT service performance issues more effectively. This is extremely important for us since our business is helping IT organizations better manage their IT service levels."

— Bob Balassi, CTO,
Maryville Technologies
