Authorization or Opt-Out of Authorization to Permit Access:

When this Application Data Sheet is properly signed and filed with the application, applicant has provided written authority to permit a participating foreign intellectual property (IP) office access to the instant application-as-filed (see paragraph A in subsection 1 below) and the European Patent Office (EPO) access to any search results from the instant application (see paragraph B in subsection 1 below).

Should applicant choose not to provide an authorization identified in subsection 1 below, applicant **must opt-out** of the authorization by checking the corresponding box A or B or both in subsection 2 below.

NOTE: This section of the Application Data Sheet is **ONLY** reviewed and processed with the **INITIAL** filing of an application. After the initial filing of an application, an Application Data Sheet cannot be used to provide or rescind authorization for access by a foreign IP office(s). Instead, Form PTO/SB/39 or PTO/SB/69 must be used as appropriate.

1. Authorization to Permit Access by a Foreign Intellectual Property Office(s)

A. Priority Document Exchange (PDX) - Unless box A in subsection 2 (opt-out of authorization) is checked, the undersigned hereby **grants the USPTO authority** to provide the European Patent Office (EPO), the Japan Patent Office (JPO), the Korean Intellectual Property Office (KIPO), the State Intellectual Property Office of the People's Republic of China (SIPO), the World Intellectual Property Organization (WIPO), and any other foreign intellectual property office participating with the USPTO in a bilateral or multilateral priority document exchange agreement in which a foreign application claiming priority to the instant patent application is filed, access to: (1) the instant patent application-as-filed and its related bibliographic data, (2) any foreign or domestic application to which priority or benefit is claimed by the instant application and its related bibliographic data, and (3) the date of filing of this Authorization. See 37 CFR 1.14(h)(1).

B. Search Results from U.S. Application to EPO - Unless box B in subsection 2 (opt-out of authorization) is checked, the undersigned hereby **grants the USPTO authority** to provide the EPO access to the bibliographic data and search results from the instant patent application when a European patent application claiming priority to the instant patent application is filed. See 37 CFR 1.14(h)(2).

The applicant is reminded that the EPO's Rule 141(1) EPC (European Patent Convention) requires applicants to submit a copy of search results from the instant application without delay in a European patent application that claims priority to the instant application.

2. Opt-Out of Authorizations to Permit Access by a Foreign Intellectual Property Office(s)

☐ A. Applicant **DOES NOT** authorize the USPTO to permit a participating foreign IP office access to the instant application-as-filed. If this box is checked, the USPTO will not be providing a participating foreign IP office with any documents and information identified in subsection 1A above.

☐ B. Applicant **DOES NOT** authorize the USPTO to transmit to the EPO any search results from the instant patent application. If this box is checked, the USPTO will not be providing the EPO with search results from the instant application.

NOTE: Once the application has published or is otherwise publicly available, the USPTO may provide access to the application in accordance with 37 CFR 1.14.

BACKGROUND OF THE INVENTION

Field of the Art

[001] The disclosure relates to the field of computer technology, more specifically to the field of computer architectures for enterprise data collection, analysis, and transmission to cloud-based services.

Discussion of the State of the Art

[002] As cloud-based computing services become more popular, management of the data collection from a business and transmission of that data to a cloud-based service become more complicated. Large business enterprises can have thousands of computers and peripherals, many of which are now mobile devices. Collection, management, and security of data from those many devices becomes particularly important where data is being transferred to a cloud-based service.

[003] When a large business enterprise uses a cloud-based computing service, heterogeneous data transfer between cloud services and large offices or campuses for organizations presents numerous problems, including lack of reliable data collection methods, poor standardized support for connection-oriented protocols by network appliances, security concerns with unfiltered or poorly filtered data, and bandwidth concerns with constantly streaming data which may result in network slowdown due to unprioritized data transfer. Additionally, larger business enterprises may have thousands of computing devices sending data to a cloud-based service on separate connections, and each such connection represents an additional security risk. Further, current data collection and models do not scale well for adding new data sources and flexible ad-hoc queries, resulting in too much data being passed, no context for data and data sources oftentimes, unqueryable data and data sources, inability to flexibly and quickly add new data sources such as new devices or user accounts which generate new data for analysis, and log management and data storage become expensive and disorganized.

[004] The problem is compounded by the use of black box threat detection methods, where data management and security optimization are not possible for each organization or user of a cloud-based service. Particularly in the context of data ingestion systems, it is often unclear from a data stream what portion of the data results in triggering of certain security alerts, requiring many costly hours of analytics at best, or resulting in missed errors or security concerns at worst.

[005] What is needed is a computer architecture and methodology that allows for collection, aggregation, analysis, transformation, and secure transmission of data from a multitude of computing devices and peripherals at a business enterprise network to a cloud-based service.

SUMMARY OF THE INVENTION

[006] Accordingly, the inventor has conceived, and reduced to practice, a system and method that uses midservers integrated with the business enterprise computer infrastructure and the cloud-based infrastructure to collect, aggregate, analyze, transform, and securely transmit data from a multitude of computing devices and peripherals at an external network to a cloud-based service. The following non-limiting summary of the invention is provided for clarity, and should be construed consistently with embodiments described in the detailed description below.

[007] According to a preferred embodiment, a system for ingestion of data into a cloud-based service from an external network is disclosed, comprising: a midserver configured to function as an interface between an external network and a cloud-based service comprising at least a processor, a memory, and a plurality of programming instructions stored in the memory and operating on the processor: receive data from a plurality of computing devices on the external network; run one or more containerized services to process the received data; and securely transmit the processed data to a cloud-based service.

[008] According to another preferred embodiment, a method for ingestion of data into a cloud-based service from an external network is disclosed, comprising the steps of: installing a midserver as an interface between an external network and a cloud-based service, the midserver comprising at least a processor, a memory, and a plurality of programming instructions stored in the memory and operating on the processor: receiving data from a plurality of computing devices on the external network; running one or more containerized services to process the received data; and securely transmitting the processed data to a cloud-based service.

[009] According to an aspect of an embodiment, the containerized services include one or more of the following types of containerized services: traffic processors, sensors, management services, and utilities.

[010] According to an aspect of an embodiment, the midserver is installed at the same location from which some part of the external network is operated.

BRIEF DESCRIPTION OF THE DRAWING FIGURES

DETAILED DESCRIPTION

[030] The inventor has conceived, and reduced to practice, a system and method that uses midservers located between the business enterprise computer infrastructure and the cloud-based

infrastructure to collect, aggregate, analyze, transform, and securely transmit data from a multitude of computing devices and peripherals at an external network to a cloud-based service.

[031] One method of data collection from large business enterprises for cloud-based computing is through agent based monitoring. In agent-based monitoring, software "agents" are installed on each computing device to collect data and then forward the data to the cloud-based service. Using agent-based monitoring, it may be necessary to install hundreds or thousands of agents on an external network to collect the required data. Each of these agents, in turn, establish an outgoing network connection to provide data to the cloud-based service. While secure transport protocols such as TLS can ensure data security, the overall number of connections to monitor at the business network edge increases substantially. This causes even more noise for network defenders to sift through. By aggregating data at midservers multiple connections can be presented over the network as a single secure connection to enterprise cloud-based systems (wlog using standard VPN or similar encryption-based network transport technologies). Thousands of connections from a large business enterprise can be reduced to a single connection or a small number of connections. It should be noted that another method of gathering data from a business enterprise network is through port mirroring. The terms "agent" and "port mirroring" are exemplary only, and do not exclude other methods of gathering data from a business enterprise network.

[032] Midserver architecture also solves the problem that not all devices support secure data transport. For example, many devices do not natively support sending system log messages using TLS. In order to support system log traffic the data must be wrapped in a secure protocol before leaving the network. A midserver can provide this type of capability by collecting and wrapping the data before it leaves the network.

[033] Midservers can optimize the ingestion of data into the cloud-based service by transforming the data prior to forwarding upstream. It is possible to process the data on the external network computers using an agent or additional software, but this adds complexity to the agent or requires more software installed on customer site. A midserver can act as a local

processing station (often called "pre-processing") for data transformations such as compression, protocol wrapping, port bending, and many others.

[034] Midservers can be used to prevent data loss during transmission, especially for network data that is transitory in nature. For many protocols the sender/receiver can adjust for a degraded connection without any loss of data integrity. Additionally, in some other cases the originating message can be reproduced meaning that a loss of data has little impact on the capability. For example, some agents query the current state of the system and then forward the results to a fleet manager. If the results are somehow lost during transit it is possible to issue the same query and try again. However, other data sources such as network packet captures are much less forgiving. Systems that capture ephemeral network traffic are especially impacted by data lost in transit. A midserver can mitigate this risk by providing traffic buffering in the event that the backhaul connection goes down. When the connection is reestablished, the buffers will empty and continue forwarding as usual.

[035] The midserver architecture may be designed to operate as a bastion host that runs a collection of containerized services. It is assumed that midservers are cyber security targets and are likely to be compromised at some point. Ideally, therefore, the midserver should be designed to reduce data loss and further access to the enterprise network to which it is attached. Midservers should not be a primary data store, and should only buffer data when connections are lost. Midservers should have only the minimum software necessary to operate, and least privilege should be enforced for access. Midservers may be configured as a single server instance or as a clusters of redundant servers to provide additional resiliency.

[036] The midserver runs a plurality of containerized services that serve to collect, aggregate, analyze, transform, and securely transmit data. The containerized service run by the midserver can be roughly categorized in four ways: traffic processors, sensors, management services, and utilities.

[037] Containers acting as traffic processors are primarily used to receive forwarded traffic from a customer network, transform the traffic if necessary, and then forward the traffic upstream over the primary connection. Several examples of traffic processing containerized services are: reverse

proxy containers, system log containers, and messaging containers. An example of a reverse proxy containerized service is Nginx. The Nginx proxy (nginx-pxy) provides reverse proxy capabilities that allows customer traffic to send approved data through the midserver. Data and log sources that support the proxy protocol will connect to this service. The service also provides traffic transform capabilities such as http to https forwarding and others as supported by Nginx. In a system log containerized service, the service provides log consolidation and forwarding capabilities for logs sent using the system log protocol. The service also provides message shaping and enrichment such as adding additional contextual fields to log sources if needed. An example of a messaging containerized service is RabbitMQ. The RabbitMQ service acts as a proxy for advanced messaging queueing protocol (AMQP) messages using the Shovel plugin. The service is primarily used for queuing and forwarding of traffic generated by messaging agents, and can support any AMQP traffic as needed. Another traffic processing containerized service example is Consul, which provides service discovery and is may be used to support RabbitMQ configurations in a midserver cluster.

[038] Containers acting as sensors can monitor and generate data rather than just process data from other sensors or data sources.

[039] Management containers are used for providing management consoles or services for midserver administrators. Examples of management containers include the Nginx management proxy and Portainer. The Nginx management proxy (nginx-mgt) is responsible for managing connections to management interfaces on containers. This containerized service acts a firewall to only allow traffic to management pages and services originating from approved address spaces. Portainer provides a lightweight management UI which allows adminstrators to easily manage and monitor the other container services on the midserver.

[040] Utility containers are special purpose tools used to aid in configuration or deployment of a midserver.

[041] Consolidating these containerized services at the midserver allows for large-scale, reliable ingestion (i.e., one or more of collection, aggregating, analysis (pre-processing), transformation (pre-processing), and secure transmission) of data into a cloud-based service from an external

network. This improves data consistency, reliability, efficiency of bandwidth usage, and security. Using the midserver as a gateway to the cloud-based service dramatically reduces the number of connections at the business enterprise's network edge, greatly reducing the number of avenues of attack and improving network security.

Definitions

[050] "Bastion host" as used herein means a computer that is deliberately exposed on a public network as the primary or only node or the network exposed to the outside world. A bastion host processes and filters all incoming traffic and prevents malicious traffic from entering the network.

[051] "Ingestion" as used herein means the transfer of data into a cloud-based service.

[052] "Midserver" as used herein means a server that functions as an interface between an external network and a cloud-based service, and which runs one or more containerized services that perform one or more of: collecting, aggregating, analyzing, filtering, transforming, and securely transmitting data. A midserver may also be configured as a bastion host.

Conceptual Architecture

[053] **Fig. 1** is a diagram of an exemplary midserver system architecture. A network **110** exists connecting a cloud service **130**, through a firewall or security layer **112**, as well as an on-site security layer or firewall **111** with some organization which may wish to connect over a network **110** to a cloud service **130**. A demilitarized zone ("DMZ," also known as a perimeter network or screened subnet) **120** is present which may present the forward-facing network connections and functionality of an organization's network or services, which may be forwarded data or interface further with on-site servers **150** and user endpoints **160**, or data log sources **140**. On-site servers **150** may include a midserver **151** for collecting, aggregating, analyzing, filtering, transforming, and securely transmitting data data transfers and interactions with a cloud service **130**, typically

co-located with the enterprise domain controller (or Active Directory (AD) server) 152 for exploration of network-enabled directories and to control access to and authenticate security requests on the network for other connected servers 150. A midserver 151 in this implementation may be used for streamlined communications with a cloud service 130 including a single point of connectivity with the service, a ticket form of security adding further security to such a connected system, and a batch method of data transfer, allowing numerous other servers 150 or endpoints 160 or log sources 140 to communicate with the midserver which then collates data for transfer to a cloud server 130, which may further collate data received from the cloud service 130, for ease of analysis and which allows for other forms of network optimization to take place which are not present in systems where numerous endpoints and servers maintain individual connections to a cloud service 130, also allowing for new data sources including servers 150 and endpoints 160 to be added swiftly and integrated into the system for connection to the cloud service 130 rapidly and easily due to the midserver 151 acting as an interface between the service 130 and the other possible endpoint 160 or server 150.

[054] **Fig. 2** is a diagram of an exemplary midserver architecture showing data input to a midserver and the ingestion of forwarded data from a midserver through a proxy to a cloud service. Cloud sources 211 of customer monitoring agents 210 may provide input to a proxy server 240 behind a firewall 230 which filters data going in and out of an organization's network. These sources of customer network monitoring agents 210 may include data that is gathered from online tools such as social media crawlers or any other source of customer network monitoring from a cloud service or network 211. On-site data monitoring tools and processes include endpoint responses 211, network traffic data 212, events and metrics 213 which may include metadata about devices, users, or other connected assets, active directory 214 usage, and process monitoring 215 which may monitor active processes on connected assets such as operations performed on a connected network endpoint such as a computer workstation. Data from these sources is sent to a midserver 220 which may be on-site or connected to via a Virtual Private Network (VPN), before the data is sent to through an organizations firewall 230 to a proxy server 240, to be forwarded to a cloud service's data ingestion pipeline 250. Such a data ingestion pipeline 250 may include the use of a load balancer 251 to aid in processing of

received data loads from differing sources, system log servers 252 which may record the reception and content of data or any other metadata about the connection to a proxy server 240 and the activity of the load balancer 251, before forwarding data to a distributed messaging system 253 which may separate received data and data streams into related "topics" which may be defined by the sender's identity, metadata about the streams or batches of data, or some other qualifier. Ingestion pipelines 254 may process data by filtering, mapping, parsing, and sanitizing data received, before adding it to a temporal knowledge graph 255 representing a graph of assets, people, events, processes, services, and "tickets" of concerns, as well as data about the edges connecting such nodes in the graph such as their relationship, over time.

[055] Fig. 3 is a diagram of an exemplary midserver architecture between multiple office locations. A cloud service 310 exists which connects to a may connect to a main office 340 but not a satellite office 330 over a network such as the Internet, with a VPN 320 connected between the networks of the offices. A satellite office 330 contains numerous assets including log sources 331, user endpoints 332, and a server or servers 333 which include the functionality of an Active Directory (AD) server 334 and domain controller 335. Also operating on a satellite office 330 is firewall 336, in addition to firewall on a main office's network 347, which provides basic security to a satellite office's network 330 and a main office's network 340. Connected via a VPN 320 with a satellite office 330 is a main office 340, which comprises many of the same components, including log sources 341, at least one user endpoint 342, and a group of servers 343 including at least an AD server 345 and domain controller 346, as well as a midserver 344, which may communicate with a satellite office 330 to provide access to midserver functionality without using the satellite office's 330 bandwidth to external networks. Midservers 344 may be deployed as a single instance, or as a cluster depending on the traffic volume leaving the office 340 premise to support high availability operational requirements. These servers may be co-located with the domain controllers 346 and other servers 343, but may be placed anywhere on the network. The exact number and configuration of midservers 344 may be tailored to the organizational environment and the specific overall network architecture. It is possible to place a midserver 344 (or cluster of such) at the main office 340 only, as shown in Fig. 3. In this configuration, the agents (or log source 331) installed at the satellite office 330 will forward all traffic across the

VPN connection 320 to the Midserver 344 at the Main Office 340, which will then forward the traffic to the cloud infrastructure 310 via the gateway at that location.

[056] **Fig. 4** is diagram of another exemplary midserver architecture between multiple office locations. An alternative configuration compared to **Fig. 3** is shown, placing one or more midservers at the satellite office and allowing traffic to egress the network locally instead of through a VPN connection to other locations. A cloud service 410 exists which connects directly to a main office 430 and a satellite office 420 over a network such as the Internet. A satellite office 420 contains numerous assets including log sources 421, user endpoints 422, and a server or servers 423 which include the functionality of a midserver 424, an Active Directory (AD) server 425, and a domain controller 426. Also operating on a satellite office 420 is firewall 427, in addition to firewall on a main office's network 437, which provides basic security to a satellite office's network 420 and main office network 430. Connected also with a cloud service 410 is a main office network 430, which comprises many of the same components, including log sources 431, at least one user endpoint 432, and a group of servers 433 including at least an AD server 435 and domain controller 436, as well as a midserver 434, allowing for both office networks 420, 430 to have midserver functionality without requiring a direct or virtual connection.

[057] **Fig. 5A** is a partial diagram of an exemplary advanced cyber-decision platform utilizing midserver architecture. A plurality of software agents may monitor an organization's network usage, including but not limited to a Kerberos messaging capture (PcapKrb) agent 501 continuous monitoring (Application Performance Monitoring) agents 502, Osquery agents 503, active directory monitoring (ADMon) agents 504, and other agents 505 which may include, for example, data received from system log (syslog) data stores. The plurality of network monitoring agents may feed into a midserver or midservers 510 that may contain message and data processing containerized services, for example: a RabbitMQ container 511, an NGINX container 512, a system log container 513, a continuous monitoring module 514, an Osquery engine 515. The midserver 510 The midserver 510 may communicate through a network firewall 520, to a reverse proxy 531 which may mask the external-facing properties of an internal server 532 of a cloud service. A reverse proxy 531 may forward relevant data, or all data, received from a

midserver 510, to an internal server 532, which utilizes a load balancer 533 to process data efficiently and effectively despite possibly asymmetrical or massive network loads, or dynamically changing loads.

[058] **Fig. 5B** is a partial diagram of an exemplary advanced cyber-decision platform utilizing midserver architecture. An observed system 540 is a system that is monitored by an exemplary advanced cyber-decision platform that may communicate with a midserver 510, and may contain at least a message digestion and management service such as RabbitMQ 541, a log listener 542 which communicates with a system log server 543 for the purpose of managing, monitoring, and storing system logs. An observed system may also include an Observer Reporting Server (ORS) 544, which may communicate with an Osquery Agent Handler 545, allowing management, recording, and monitoring of users and systems who use Osquery or a similar system to query a device or server similarly to a database, as is the purpose of Osquery. Also present is a ConMon Agent Handler 546 which my operate as an interface to continuous monitoring connected systems, acting as an interface for a ConMon service 547, which receives further input from systems illustrated in **Fig. 5C** and may communicate with a statistics aggregator 548.

[059] **Fig. 5C** is a partial diagram of an exemplary advanced cyber-decision platform utilizing midserver architecture. Data flows from an observed system 540 into a directed computational graph (DCG) 554, and a Multivariate Time-Series Database (MDTSDB) 556. Data from a DCG 554 may move to an enrichment service 553, connected to a plurality of differently structured databases such as MySQL 552 and Redis 551, an enrichment service being able to store and record relevant graph data in these databases 552, 551 and also forward related stored data to a DCG 554, for the purpose of increased accuracy with data processing. A DCG 554 also may send data to a multi-dimensional time series database (MDTSDB) service 556 which relates all received data and records the temporal metadata, resulting in a multidimensional temporal graph with which to relate data, as generated with the help of a graphstack service 555. A graphstack service manages data received from a MDTSDB service 556 and produces the final graph results, with both the results and operation of the MDTSDB 556 and graphstack service 555 being viewable from a cloud service's front end 561, which may also communicate with a

plurality of datastores 557, 559, 560. A graphstack service 555 may also forward data to an enrichment service 553 for storage in the connected databases 551, 552, allowing for a constant stream of graph data to be maintained. Lastly, an incident service 558 may be used to receive incident or error data from a directed computational graph 554, recording these incidents in a plurality of databases 559, 560.

[060] Fig. 6 is a diagram showing an exemplary architecture and methodology 600 for midserver deployment, automated onboarding of data, and endpoint transparent data transport. Midserver deployment comprises establishment of a secure connection between the midserver side 610 and the cloud-based service side 620. After a midserver 611 is physically installed, an automated package called a midserver Open Virtual Appliance (OVA) is installed and run on the midserver 611. The OVA in this example is a virtual image pre-installed with only the minimal software on configurations required to initate the deployment process. The OVA will initiate a bootstrap process to establish a secure Peer-to-Peer (P2P) connection to the cloud-based service side. Using ZeroTier as an example of a P2P connection, the OVA will initiate a ZeroTier Controller 612, which is responsible for admitting members to the VPN, issuing certificates, and issuing default configuration information. ZeroTier establishes a secure P2P connection over a virtually extensible local area network (VXLAN) called the Reachback Network. Once the initial connection is requested, a representative of the cloud-based service, either onsite 613a or offsite 613b, will verify and approve the connection using a secret key. After a secure connection is established between the midserver and the cloud-based service side at an Ansible server 621, an Ansible playbook is automatically initiated. First, the playbook downloads the most recent configuration template from a configuration controller 622. Next it connects to a deployment vault 623 instance to retrieve the customer specific configurations including any secrets (e.g. passwords, keys, etc) which will have been previously established by a representative of the cloud-based service 613b. A ZeroTier network application programming interface (API) acts as an adhoc Ansible inventory and a single source of truth for which systems have previously connected to the P2P network. Then, the playbook then begins configurating the midserver 611 via an ssh connection tunnel, establishing a primary backhaul virtual private network (VPN) connection to the cloud-based service. Once this connection is made the

midserver tears down the Reachback Network and all communcation is done over the VPN through a firewall **616** on the customer network edge. The VPN created using this methodology then allows containerized services **614** to forward data using transport layer security (TLS) **615** to the cloud-based service, allowing for longhaul transportation of data that is transparent to the network endpoint. Some implementations may use external web serving, reverse proxying, caching, and load balancing such as external Nginx **624**, data center load balancing and caching such as DCOS Nginx **625**, and microservices and container orchestration such as Nginx Plus **626**.

[061] **Fig. 7** is an exemplary method **700** for deploying a midserver where the business enterprise network is located on, or utilizes, a cloud computing service such as Amazon Web Services (AWS) or Microsoft's Azure. In cloud computing services, all or part of the business enterprise's network is run on the servers of the cloud computing service. Use of midserver architecture where the business enterprise utilizes cloud computing services poses difficulties because the cloud computing service infrastructure is not controlled by the business enterprise, and thus the business enterprise may not be able to authorize the installation of 3rd party software (e.g., Kerberos agents, and other software agents that monitor network traffic) on all or a part of its network. The solution to this problem is to utilize the cloud computing service's functions that allow continuous streaming of virtual machine network traffic to a network packet collector or analytics tool. Using Microsoft's Azure Active Directory service and its virtual network terminal access point (vTAP) as an example, the Azure Active Directory (Azure AD) is a cloud-based identity and access management service that allows employees of a business enterprise to access both external and internal resources. The vTAP function allows continuous streaming of cloud computing service network traffic to a network packet collector or analytics tool, and operates in a manner roughly equivalent to traditional port mirroring. Where the business enterprise manages its own network of virtual machines on the cloud computing service, it may still be possible to install software agents, although use of a continuous streaming function may be more efficient. Where the business enterprise uses the cloud computing service for managed domain services, however, the business enterprise does not have authorization to install agents, and the continuous streaming (port mirroring) function will need to be used to deploy a midserver

architecture. In this example, a customer (business enterprise) virtual network **720** is established within the cloud computing service **710**. The customer virtual network comprises a number of virtual machines **721a-n**, operated on one or more of the cloud computing service **710** servers **722**. Separately, a cloud-based service network is established on the cloud computing service **710** and is controlled by the cloud-based service **740** to which data is to be forwarded. Using the continuous streaming function available on the cloud computing service **710**, for example vTAP for the Azure Active Directory service, a virtual machine on the cloud-based service network **730** is established as a virtual network peer VM **731** to the customer virtual network **720**, and all data from the customer virtual network **720** is continuously streamed from the cloud computing service server(s) **722** to the virtual network peer VM **731**, which forwards the data to the cloud-based service **740**.

[062] **Fig. 8** is another exemplary method **800** for deploying a midserver where the business enterprise network is located on, or utilizes, a cloud computing service such as Amazon Web Services (AWS) or Microsoft's Azure. In this example, a customer (business enterprise) virtual network **820** is established within the cloud computing service **810**. The customer virtual network comprises a number of virtual machines **821a-n**, operated on one or more of the cloud computing service **810** servers **822**. The customer also operates on the customer virtual network **820** a virtual network peer VM **823** that is configured to aggregate and forward data to the cloud-based service **830**, using the continuous streaming function available on the cloud computing service **810**, for example vTAP for the Azure Active Directory service. In this manner, all data from the customer virtual network **820** is continuously streamed from the cloud computing service server(s) **822** to the virtual network peer VM **823**, which forwards the data to the cloud-based service **830**.

[063] **Fig. 9** is a diagram showing an overview of the methodology of two of several known Kerberos attacks. In the so-called "golden ticket" attack **900**, after a client computer **901** has been compromised, a forged ticket is sent to the domain controller **902**, which grants access to all servers in the network, and the host server **903** is accessed using the granted access. In the so-called "silver ticket" attack **910**, after a client computer **911** has been compromised, a forged

ticket granting service (TGS) ticket is sent directly to the host server **913** to be attacked. The host server receiving the forged TGS ticket grants access to the client computer **911** to grant access tickets, which are then used to access the host server **913**. Unlike in the golden ticket attack, in the silver ticket attack, the domain controller **912** is not involved in granting access.

[064] **Fig. 10** is a diagram showing an overview of the use of a ledger of Kerberos requests and responses to provide security against Kerberos attacks **1000**. In a typical Kerberos authentication interaction, several requests and responses are sent between a user computer **1001**, a domain controller, **1002**, and a Kerberos-enabled service **1003**. Maintaining a ledger **1004** of these requests and responses effectively transforms the Kerberos protocol from a stateless to a stateful one, allowing confirmation of the validity of traffic and providing additional protection against Kerberos attacks.

[065] **Fig. 11A** is a partial diagram of a security analytic workflow validating an exemplary Kerberos ticket-based security protocol for use in an observed system in order to detect common attacks against the Kerberos protocol including those known by the industry as Golden Ticket, Silver Ticket, DCSync, and DCShadow. A messaging source **1101**, such as RabbitMQ or NGINX, forwards received data messages to a FPRS split stage **1102**, where specific message states are determined and separated to identify high priority tickets, and sent through appropriate processing pipelines. An "OTHER" stage **1103** represents unknown ticket priority and is forwarded to a JSON field extractor **1104** which extracts relevant data fields in Javascript Object Notation (JSON), which is a common data format for object representation in data analytics. A stage where no message is present **1105** represents a ticket with missing information, therefore being sent for an enrichment stage **1106** before being sent to a similar JSON field extractor **1104**. An error stage **1107** may also be reached, resulting in the ticket being sent to an Abstract Syntax Notation One (ASN1) decoder **1108**, ASN1 being a standard interface description language for defining data structures. If an otherwise normal message is present for a ticket stage **1109**, it is sent directly for JSON field extraction **1104**.

[066] **Fig. 11B** is a partial diagram of a security analytic workflow validating an exemplary Kerberos ticket-based security protocol for use in an observed system in order to detect common

attacks against the Kerberos protocol including those known by the industry as Golden Ticket, Silver Ticket, DCSync, and DCShadow. JSON field data that is extracted **1104** is then forwarded for being placed into a MDTSDB **1111**, resulting in it being stored for later use in a temporal knowledge graph. After an error message is ASN1 decoded **1108**, it is sent for JSON field extraction **1112**, before also being recorded in a MDTSDB **1113**. Once a no-message stage has been enriched **1106**, it is sent to a secondary FPRS split stage **1114**, where the enriched ticket is now determined to possess either an unknown or "OTHER" stage message **1115** and not stored anywhere **1116**, or it has a DC_SYNC **1117** or DC_SHADOW **1120** message. In either of the latter two cases a the message is converted into an exemplary advanced malware protection (AMP) alert **1118, 1121** and stored in an MDTSDB **1119**.

Hardware Architecture

[067] Generally, the techniques disclosed herein may be implemented on hardware or a combination of software and hardware. For example, they may be implemented in an operating system kernel, in a separate user process, in a library package bound into network applications, on a specially constructed machine, on an application-specific integrated circuit ("ASIC"), or on a network interface card.

[068] Software/hardware hybrid implementations of at least some of the aspects disclosed herein may be implemented on a programmable network-resident machine (which should be understood to include intermittently connected network-aware machines) selectively activated or reconfigured by a computer program stored in memory. Such network devices may have multiple network interfaces that may be configured or designed to utilize different types of network communication protocols. A general architecture for some of these machines may be described herein in order to illustrate one or more exemplary means by which a given unit of functionality may be implemented. According to specific aspects, at least some of the features or functionalities of the various aspects disclosed herein may be implemented on one or more general-purpose computers associated with one or more networks, such as for example an end-user computer system, a client computer, a network server or other server system, a mobile computing device (e.g., tablet computing device, mobile phone, smartphone, laptop, or other

appropriate computing device), a consumer electronic device, a music player, or any other suitable electronic device, router, switch, or other suitable device, or any combination thereof. In at least some aspects, at least some of the features or functionalities of the various aspects disclosed herein may be implemented in one or more virtualized computing environments (e.g., network computing clouds, virtual machines hosted on one or more physical computing machines, or other appropriate virtual environments).

[069] Referring now to **Fig. 12**, there is shown a block diagram depicting an exemplary computing device **10** suitable for implementing at least a portion of the features or functionalities disclosed herein. Computing device **10** may be, for example, any one of the computing machines listed in the previous paragraph, or indeed any other electronic device capable of executing software- or hardware-based instructions according to one or more programs stored in memory. Computing device **10** may be configured to communicate with a plurality of other computing devices, such as clients or servers, over communications networks such as a wide area network a metropolitan area network, a local area network, a wireless network, the Internet, or any other network, using known protocols for such communication, whether wireless or wired.

[070] In one embodiment, computing device **10** includes one or more central processing units (CPU) **12**, one or more interfaces **15**, and one or more busses **14** (such as a peripheral component interconnect (PCI) bus). When acting under the control of appropriate software or firmware, CPU **12** may be responsible for implementing specific functions associated with the functions of a specifically configured computing device or machine. For example, in at least one embodiment, a computing device **10** may be configured or designed to function as a server system utilizing CPU **12**, local memory **11** and/or remote memory **16**, and interface(s) **15**. In at least one embodiment, CPU **12** may be caused to perform one or more of the different types of functions and/or operations under the control of software modules or components, which for example, may include an operating system and any appropriate applications software, drivers, and the like.

[071] CPU **12** may include one or more processors **13** such as, for example, a processor from one of the Intel, ARM, Qualcomm, and AMD families of microprocessors. In some

embodiments, processors 13 may include specially designed hardware such as application-specific integrated circuits (ASICs), electrically erasable programmable read-only memories (EEPROMs), field-programmable gate arrays (FPGAs), and so forth, for controlling operations of computing device 10. In a specific embodiment, a local memory 11 (such as non-volatile random access memory (RAM) and/or read-only memory (ROM), including for example one or more levels of cached memory) may also form part of CPU 12. However, there are many different ways in which memory may be coupled to system 10. Memory 11 may be used for a variety of purposes such as, for example, caching and/or storing data, programming instructions, and the like. It should be further appreciated that CPU 12 may be one of a variety of system-on-a-chip (SOC) type hardware that may include additional hardware such as memory or graphics processing chips, such as a QUALCOMM SNAPDRAGON™ or SAMSUNG EXYNOS™ CPU as are becoming increasingly common in the art, such as for use in mobile devices or integrated devices.

[072] As used herein, the term "processor" is not limited merely to those integrated circuits referred to in the art as a processor, a mobile processor, or a microprocessor, but broadly refers to a microcontroller, a microcomputer, a programmable logic controller, an application-specific integrated circuit, and any other programmable circuit.

[073] In one embodiment, interfaces 15 are provided as network interface cards (NICs). Generally, NICs control the sending and receiving of data packets over a computer network; other types of interfaces 15 may for example support other peripherals used with computing device 10. Among the interfaces that may be provided are Ethernet interfaces, frame relay interfaces, cable interfaces, DSL interfaces, token ring interfaces, graphics interfaces, and the like. In addition, various types of interfaces may be provided such as, for example, universal serial bus (USB), Serial, Ethernet, FIREWIRE™, THUNDERBOLT™, PCI, parallel, radio frequency (RF), BLUETOOTH™, near-field communications (e.g., using near-field magnetics), 802.11 (WiFi), frame relay, TCP/IP, ISDN, fast Ethernet interfaces, Gigabit Ethernet interfaces, Serial ATA (SATA) or external SATA (ESATA) interfaces, high-definition multimedia interface (HDMI), digital visual interface (DVI), analog or digital audio interfaces, asynchronous transfer

mode (ATM) interfaces, high-speed serial interface (HSSI) interfaces, Point of Sale (POS) interfaces, fiber data distributed interfaces (FDDIs), and the like. Generally, such interfaces 15 may include physical ports appropriate for communication with appropriate media. In some cases, they may also include an independent processor (such as a dedicated audio or video processor, as is common in the art for high-fidelity A/V hardware interfaces) and, in some instances, volatile and/or non-volatile memory (e.g., RAM).

[074] Although the system shown in **Fig. 12** illustrates one specific architecture for a computing device 10 for implementing one or more of the inventions described herein, it is by no means the only device architecture on which at least a portion of the features and techniques described herein may be implemented. For example, architectures having one or any number of processors 13 may be used, and such processors 13 may be present in a single device or distributed among any number of devices. In one embodiment, a single processor 13 handles communications as well as routing computations, while in other embodiments a separate dedicated communications processor may be provided. In various embodiments, different types of features or functionalities may be implemented in a system according to the invention that includes a client device (such as a tablet device or smartphone running client software) and server systems (such as a server system described in more detail below).

[075] Regardless of network device configuration, the system of the present invention may employ one or more memories or memory modules (such as, for example, remote memory block 16 and local memory 11) configured to store data, program instructions for the general-purpose network operations, or other information relating to the functionality of the embodiments described herein (or any combinations of the above). Program instructions may control execution of or comprise an operating system and/or one or more applications, for example. Memory 16 or memories 11, 16 may also be configured to store data structures, configuration data, encryption data, historical system operations information, or any other specific or generic non-program information described herein.

[076] Because such information and program instructions may be employed to implement one or more systems or methods described herein, at least some network device embodiments may

include nontransitory machine-readable storage media, which, for example, may be configured or designed to store program instructions, state information, and the like for performing various operations described herein. Examples of such nontransitory machine- readable storage media include, but are not limited to, magnetic media such as hard disks, floppy disks, and magnetic tape; optical media such as CD- ROM disks; magneto-optical media such as optical disks, and hardware devices that are specially configured to store and perform program instructions, such as read-only memory devices (ROM), flash memory (as is common in mobile devices and integrated systems), solid state drives (SSD) and "hybrid SSD" storage drives that may combine physical components of solid state and hard disk drives in a single hardware device (as are becoming increasingly common in the art with regard to personal computers), memristor memory, random access memory (RAM), and the like. It should be appreciated that such storage means may be integral and non-removable (such as RAM hardware modules that may be soldered onto a motherboard or otherwise integrated into an electronic device), or they may be removable such as swappable flash memory modules (such as "thumb drives" or other removable media designed for rapidly exchanging physical storage devices), "hot-swappable" hard disk drives or solid state drives, removable optical storage discs, or other such removable media, and that such integral and removable storage media may be utilized interchangeably. Examples of program instructions include both object code, such as may be produced by a compiler, machine code, such as may be produced by an assembler or a linker, byte code, such as may be generated by for example a JAVA™ compiler and may be executed using a Java virtual machine or equivalent, or files containing higher level code that may be executed by the computer using an interpreter (for example, scripts written in Python, Perl, Ruby, Groovy, or any other scripting language).

[077] In some embodiments, systems according to the present invention may be implemented on a standalone computing system. Referring now to **Fig. 13**, there is shown a block diagram depicting a typical exemplary architecture of one or more embodiments or components thereof on a standalone computing system. Computing device **20** includes processors **21** that may run software that carry out one or more functions or applications of embodiments of the invention, such as for example a client application **24**. Processors **21** may carry out computing instructions

under control of an operating system **22** such as, for example, a version of MICROSOFT WINDOWS™ operating system, APPLE OSX™ or iOS™ operating systems, some variety of the Linux operating system, ANDROID™ operating system, or the like. In many cases, one or more shared services **23** may be operable in system **20**, and may be useful for providing common services to client applications **24**. Services **23** may for example be WINDOWS™ services, user-space common services in a Linux environment, or any other type of common service architecture used with operating system **21**. Input devices **28** may be of any type suitable for receiving user input, including for example a keyboard, touchscreen, microphone (for example, for voice input), mouse, touchpad, trackball, or any combination thereof. Output devices **27** may be of any type suitable for providing output to one or more users, whether remote or local to system **20**, and may include for example one or more screens for visual output, speakers, printers, or any combination thereof. Memory **25** may be random-access memory having any structure and architecture known in the art, for use by processors **21**, for example to run software. Storage devices **26** may be any magnetic, optical, mechanical, memristor, or electrical storage device for storage of data in digital form (such as those described above, referring to **Fig. 12**). Examples of storage devices **26** include flash memory, magnetic hard drive, CD-ROM, and/or the like.

[078] In some embodiments, systems of the present invention may be implemented on a distributed computing network, such as one having any number of clients and/or servers. Referring now to **Fig. 14**, there is shown a block diagram depicting an exemplary architecture **30** for implementing at least a portion of a system according to an embodiment of the invention on a distributed computing network. According to the embodiment, any number of clients **33** may be provided. Each client **33** may run software for implementing client-side portions of the present invention; clients may comprise a system **20** such as that illustrated in **Fig. 13**. In addition, any number of servers **32** may be provided for handling requests received from one or more clients **33**. Clients **33** and servers **32** may communicate with one another via one or more electronic networks **31**, which may be in various embodiments any of the Internet, a wide area network, a mobile telephony network (such as CDMA or GSM cellular networks), a wireless network (such as WiFi, WiMAX, LTE, and so forth), or a local area network (or indeed any network topology

known in the art; the invention does not prefer any one network topology over any other). Networks 31 may be implemented using any known network protocols, including for example wired and/or wireless protocols.

[079] In addition, in some embodiments, servers 32 may call external services 37 when needed to obtain additional information, or to refer to additional data concerning a particular call. Communications with external services 37 may take place, for example, via one or more networks 31. In various embodiments, external services 37 may comprise web-enabled services or functionality related to or installed on the hardware device itself. For example, in an embodiment where client applications 24 are implemented on a smartphone or other electronic device, client applications 24 may obtain information stored in a server system 32 in the cloud or on an external service 37 deployed on one or more of a particular enterprise's or user's premises.

[080] In some embodiments of the invention, clients 33 or servers 32 (or both) may make use of one or more specialized services or appliances that may be deployed locally or remotely across one or more networks 31. For example, one or more databases 34 may be used or referred to by one or more embodiments of the invention. It should be understood by one having ordinary skill in the art that databases 34 may be arranged in a wide variety of architectures and using a wide variety of data access and manipulation means. For example, in various embodiments one or more databases 34 may comprise a relational database system using a structured query language (SQL), while others may comprise an alternative data storage technology such as those referred to in the art as "NoSQL" (for example, HADOOP CASSANDRA™, GOOGLE BIGTABLE™, and so forth). In some embodiments, variant database architectures such as column-oriented databases, in-memory databases, clustered databases, distributed databases, or even flat file data repositories may be used according to the invention. It will be appreciated by one having ordinary skill in the art that any combination of known or future database technologies may be used as appropriate, unless a specific database technology or a specific arrangement of components is specified for a particular embodiment herein. Moreover, it should be appreciated that the term "database" as used herein may refer to a physical database machine, a cluster of machines acting as a single database system, or a

logical database within an overall database management system. Unless a specific meaning is specified for a given use of the term "database", it should be construed to mean any of these senses of the word, all of which are understood as a plain meaning of the term "database" by those having ordinary skill in the art.

[081] Similarly, most embodiments of the invention may make use of one or more security systems 36 and configuration systems 35. Security and configuration management are common information technology (IT) and web functions, and some amount of each are generally associated with any IT or web systems. It should be understood by one having ordinary skill in the art that any configuration or security subsystems known in the art now or in the future may be used in conjunction with embodiments of the invention without limitation, unless a specific security 36 or configuration system 35 or approach is specifically required by the description of any specific embodiment.

[082] Fig. 15 shows an exemplary overview of a computer system 40 as may be used in any of the various locations throughout the system. It is exemplary of any computer that may execute code to process data. Various modifications and changes may be made to computer system 40 without departing from the broader scope of the system and method disclosed herein. Central processor unit (CPU) 41 is connected to bus 42, to which bus is also connected memory 43, nonvolatile memory 44, display 47, input/output (I/O) unit 48, and network interface card (NIC) 53. I/O unit 48 may, typically, be connected to keyboard 49, pointing device 50, hard disk 52, and real-time clock 51. NIC 53 connects to network 54, which may be the Internet or a local network, which local network may or may not have connections to the Internet. Also shown as part of system 40 is power supply unit 45 connected, in this example, to a main alternating current (AC) supply 46. Not shown are batteries that could be present, and many other devices and modifications that are well known but are not applicable to the specific novel functions of the current system and method disclosed herein. It should be appreciated that some or all components illustrated may be combined, such as in various integrated applications, for example Qualcomm or Samsung system-on-a-chip (SOC) devices, or whenever it may be appropriate to combine multiple capabilities or functions into a single hardware device (for instance, in mobile

devices such as smartphones, video game consoles, in-vehicle computer systems such as navigation or multimedia systems in automobiles, or other integrated hardware devices).

[083] In various embodiments, functionality for implementing systems or methods of the present invention may be distributed among any number of client and/or server components. For example, various software modules may be implemented for performing various functions in connection with the present invention, and such modules may be variously implemented to run on server and/or client components.

[084] The skilled person will be aware of a range of possible modifications of the various embodiments described above. Accordingly, the present invention is defined by the claims and their equivalents.

PROTECTING YOUR INVENTION OUTSIDE THE UNITED STATES

Since the rights granted by a U.S. patent extend only throughout the territory of the United States and have no effect in a foreign country, an inventor who wishes patent protection in another country must apply for a patent in a specific country or in regional patent offices. Applicants may wish to consider the filing of an international application under the Patent Cooperation Treaty (PCT). An international (PCT) application generally has the same effect as a regular national patent application in each PCT-member country. The PCT process **simplifies** the filing of patent applications on the same invention in member countries, but **does not result** in a grant of "an international patent" and does not eliminate the need of applicants to file additional documents and fees in countries where patent protection is desired.

Almost every country has its own patent law, and a person desiring a patent in a particular country must make an application for patent in that country in accordance with its particular laws. Since the laws of many countries differ in various respects from the patent law of the United States, applicants are advised to seek guidance from specific foreign countries to ensure that patent rights are not lost prematurely.

Applicants also are advised that in the case of inventions made in the United States, the Director of the USPTO must issue a license before applicants can apply for a patent in a foreign country. The filing of a U.S. patent application serves as a request for a foreign filing license. The application's filing receipt contains further information and guidance as to the status of applicant's license for foreign filing.

Applicants may wish to consult the USPTO booklet, "General Information Concerning Patents" (specifically, the section entitled "Treaties and Foreign Patents") for more information on timeframes and deadlines for filing foreign patent applications. The guide is available either by contacting the USPTO Contact Center at 800-786-9199, or it can be viewed on the USPTO website at http://www.uspto.gov/web/offices/pac/doc/general/index.html.

For information on preventing theft of your intellectual property (patents, trademarks and copyrights), you may wish to consult the U.S. Government website, http://www.stopfakes.gov. Part of a Department of Commerce initiative, this website includes self-help "toolkits" giving innovators guidance on how to protect intellectual property in specific

countries such as China, Korea and Mexico. For questions regarding patent enforcement issues, applicants may call the U.S. Government hotline at 1-866-999-HALT (1-866-999-4258).

LICENSE FOR FOREIGN FILING UNDER

Title 35, United States Code, Section 184

Title 37, Code of Federal Regulations, 5.11 & 5.15

GRANTED

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Bureau of Industry and Security, Department of Commerce (15 CFR parts 730-774); the Office of Foreign AssetsControl, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

NOT GRANTED

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).

一种构造系统模型的可视建模编辑器

技术领域

[0001] 本发明涉及软件工程技术领域，具体是一种构造系统模型的可视建模编辑器。

背景技术

[0002] 系统建模是人们根据客观事物的规律和特征构造系统模型的活动或过程。系统建模已广泛地存在于科研、工程、军事、生产等各种社会实践活动之中。在信息技术特别是软件技术高度发展的今天，软件已经成为人们进行系统建模的基本工具。这些辅助系统建模的软件工具称为建模编辑器。相对于以文字、公式、形式语言等手段形式的建模编辑器，采用图形方式的建模编辑器以其可视性成为人们的最爱。这类以图形为基本方式的建模编辑器称为可视建模编辑器。

[0003] 随着UML(统一建模语言，Unified Modeling Language)成为主流的面向对象可视化建模语言工业标准，基于UML的CASE(计算机辅助软件工程工具，Computer-AssistedSoftware Engineering)工具自然成为主流的可视建模编辑器，其中的典型代表是Rational Rose，Enterprise Architect等等。由于以UML为基础，这些建模工具天然具有UML带来的缺陷：第一，缺乏建模方法支持：这些工具并不提供建模方法和规则，只提供一些符号表示工具；这些工具是面向程序开发人员使用的，定位于软件开发过程建模，实际上侧重于基于面向对象方法的程序实现模型的描述，并不适用于超越软件开发的通用性系统建模编辑器。第二，非运算性：利用这些工具构造的系统模型不具备足够的完整性和一致性，无法采用自动代码技术将其转化成计算机可运行的软件。这些工具仅能用于产生一些代码片段，要获得完整的可以由计算机运行的软件必须最终由人工进行编辑；第三，难于使用：这些工具是面向程序人员所设计，其复杂和混乱不仅程序员很难掌握，领域人员更无法理解，远不能满足建模实践的需要。上述评论同样适用于基于sysML的面向工程领域系统建模的可视编辑器，其中的典型代表是Rhapsody。

[0004] 基于预制构件进行模型装配的可视建模编辑器，已广泛地应用于各种领域的模型构建，其中的典型代表是Simlink。这类基于预制构件的装配式可视化建模编辑器有两大基本缺陷：必须基于预制构件进行装配，系统模型的构造严重受制于预制构件；预制构件的接口是固定的，由于不支持任意接口的构件集成，这类可视化建模编辑器通常被应用于基于领域构件库进行特定的领域建模，从而并不适合于通用性的系统建模；第二，构件的装配和运行原则也很简单，基于上是由数据的传递关系决定构件的工作协同，同时，随着构件的增多，数据传递的复杂性使得视图可读性急剧变差，因此，这类编辑器虽然声称是进行系统建模，但实际上是用于对简单明确的算法进行建模，不适合进行大型复杂的系统建模；

[0005] 总的看来，目前还缺乏一种容易被普通领域人员理解和掌握的构造系统模型的可视建模编辑器，基于通用性的系统建模规范，支持各种领域建模活动，以构造具有可运算性的系统模型。

发明内容

[0006] 鉴于现有技术的以上缺点，本发明的目的是提供一种通过基于系统元视图的系统视图的可视建模编辑器，使之能够克服现有技术的以上缺点。

[0007] 本发明基于一个含有计算机可读程序代码的计算机可读存储介质，所述计算机可读程序代码包含一组可以被计算机的处理器所执行的指令，通过基于系统元视图的系统视图对一个由系统元模型定义的记录系统模型的数据进行处理，来实现构造系统模型的通用可视建模方法，其所用的可视建模编辑器包含如下组元：

[0011] 流程编辑器：采用MVC结构，以流程模型为数据部件，以流程面板为显示部件，以流程处理器为处理部件，来实现对流程视图及流程模型的编辑；所述流程面板以流程视图对流程模型进行可视显示；

[1001] 流程编辑器接收并响应从实际系统建模环境送来的操作信息，将第一相同比较活动符设置为所涉活动符；传输符编辑器以所涉活动符为对象构造传输视图，形成第一相同

比较传输视图；

[1002] 传输符编辑器接收并响应从实际系统建模环境送来的操作信息，建立一个从B27滑油压力表构件类型符的读数属性符向第一相同比较活动符的被比较属性符传值符；

[1003] 传输符编辑器接收并响应从实际系统建模环境送来的操作信息，建立一个从B27滑油压力表构件类型符的常数零属性符向第一相同比较活动符的比较属性符传值符；

[1004] 传输符编辑器接收并响应从实际系统建模环境送来的操作信息，建立一个从第一相同比较活动符的结果属性符向B27滑油压力表构件类型符的读数为零吗属性符传值符；

[1005] 至此，第一相同比较传输视图及传输模型编辑完成。

[1006] 第一条件传输编辑

[1007] 图121为完成后的第一条件传输视图，其构造过程如下：

[1008] 流程编辑器接收并响应从实际系统建模环境送来的操作信息，将第一条件活动符设置为所涉活动符；传输符编辑器以所涉活动符为对象构造传输视图，形成第一条件传输视图；

[1009] 传输符编辑器接收并响应从实际系统建模环境送来的操作信息，建立一个从B27滑油压力表构件类型符的读数为零吗属性符向第一条件活动符的状态属性符传值符；

[1010] 至此，第一条件传输视图及传输模型编辑完成。

[1045] 至此，本实施例中由软件层级视图、软件接口视图、软件交互视图、软件算法视图、软件流程视图和软件传输视图及相应模型构成的业务管理YWGL软件视图及软件模型编辑完毕。

[1046] 本实施例演示了一个不掌握现有复杂系统建模语言、不掌握计算机程序语言的普通航空训练人员，无须依赖专业建模人员和程序开发人员，如何独立地将自己关于座舱训练的构想，在相对短的时间内利用本发明编辑出一个具有运算性的座舱训练系统视图及相应的系统模型。不但编辑过程清晰，编辑方法简单，而且，视图质量明显较高，花费的时间明显较少。

[1047] 与该同一个航空训练人员与专业建模人员或程序开发人员的协同开发座舱训练系统视图及系统模型的模式相比，该航空训练人员利用本发明独立开发座舱训练系统视图及系统模型，取得了如下的明显效果：

[1048] (1)质量高：编辑完成的系统视图及系统模型是该航空训练人员心目中所需要的，避免了专业建模人员或程序开发人员与该航空训练人员对座舱训练系统视图及系统模型的理解偏差；

[1049] (2)时间短：由于节省了航空训练人员与专业建模人员或程序开发人员之间的繁杂沟通，整个建模花费的时间周期缩短到原来的1/5，大大地节约了时间、精力和经费。

Abstract of CN105302532 (A)

The invention discloses a system meta-model based visual modeling editor for constructing a system model. The editing of the system model and a system view is finished by taking a hierarchical model, an interface model, an algorithm model, a process model, a transmission model and a corresponding view as editing objects through a hierarchical editor, an interface editor, an algorithm editor, a process editor and a transmission editor. A visual system modeling tool with the advantages of computability, universality and usability is provided for various fields. The system model and the system view constructed by the editor are explicit in structure, adjustable in hierarchy and controllable in modeling granularity, and have computable full consistency. Methods are unified, so that top-down analysis design and bottom-up integration are convenient, and the editor is suitable for modeling various systems including software systems and information systems in various application environments. The modeling method is simple and complete in visual modeling, so that even personnel in general fields can independently and easily edit the system model and the system view.

PROTECTING YOUR INVENTION OUTSIDE THE UNITED STATES

Since the rights granted by a U.S. patent extend only throughout the territory of the United States and have no effect in a foreign country, an inventor who wishes patent protection in another country must apply for a patent in a specific country or in regional patent offices. Applicants may wish to consider the filing of an international application under the Patent Cooperation Treaty (PCT). An international (PCT) application generally has the same effect as a regular national patent application in each PCT-member country. The PCT process **simplifies** the filing of patent applications on the same invention in member countries, but **does not result** in a grant of "an international patent" and does not eliminate the need of applicants to file additional documents and fees in countries where patent protection is desired.

Almost every country has its own patent law, and a person desiring a patent in a particular country must make an application for patent in that country in accordance with its particular laws. Since the laws of many countries differ in various respects from the patent law of the United States, applicants are advised to seek guidance from specific foreign countries to ensure that patent rights are not lost prematurely.

Applicants also are advised that in the case of inventions made in the United States, the Director of the USPTO must issue a license before applicants can apply for a patent in a foreign country. The filing of a U.S. patent application serves as a request for a foreign filing license. The application's filing receipt contains further information and guidance as to the status of applicant's license for foreign filing.

Applicants may wish to consult the USPTO booklet, "General Information Concerning Patents" (specifically, the section entitled "Treaties and Foreign Patents") for more information on timeframes and deadlines for filing foreign patent applications. The guide is available either by contacting the USPTO Contact Center at 800-786-9199, or it can be viewed on the USPTO website at http://www.uspto.gov/web/offices/pac/doc/general/index.html.

For information on preventing theft of your intellectual property (patents, trademarks and copyrights), you may wish to consult the U.S. Government website, http://www.stopfakes.gov. Part of a Department of Commerce initiative, this website includes self-help "toolkits" giving innovators guidance on how to protect intellectual property in specific

countries such as China, Korea and Mexico. For questions regarding patent enforcement issues, applicants may call the U.S. Government hotline at 1-866-999-HALT (1-866-999-4258).

LICENSE FOR FOREIGN FILING UNDER

Title 35, United States Code, Section 184

Title 37, Code of Federal Regulations, 5.11 & 5.15

GRANTED

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Bureau of Industry and Security, Department of Commerce (15 CFR parts 730-774); the Office of Foreign AssetsControl, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

NOT GRANTED

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).

Application Serial No. 16/412,340; Correction of Filing Receipt

Dear Commissioner:

Please find enclosed the originally filed Application Data Sheet (ADS) together with the filing receipt mailed on June 3, 2019. Applicant notes that the Filing Receipt needs correction as it erroneously indicates that application 16/412,340 is a CIP of 16/248,893. Page 5, 7 and 8 of the ADS filed on May 14, 2019 states that the above-referenced application is in fact a CIP of 16/267,893.

Applicant hereby request that the USPTO correct the filing receipt that was mailed on June 3, 2019 to reflect the correct continuity information.

Thank you,

/BRIAN R. GALVIN/

Foreign Priority Information:

This section allows for the applicant to claim priority to a foreign application. Providing this information in the application data sheet constitutes the claim for priority as required by 35 U.S.C. 119(b) and 37 CFR 1.55. When priority is claimed to a foreign application that is eligible for retrieval under the priority document exchange program (PDX)[i] the information will be used by the Office to automatically attempt retrieval pursuant to 37 CFR 1.55(i)(1) and (2). Under the PDX program, applicant bears the ultimate responsibility for ensuring that a copy of the foreign application is received by the Office from the participating foreign intellectual property office, or a certified copy of the foreign priority application is filed, within the time period specified in 37 CFR 1.55(g)(1).

Authorization or Opt-Out of Authorization to Permit Access:

When this Application Data Sheet is properly signed and filed with the application, applicant has provided written authority to permit a participating foreign intellectual property (IP) office access to the instant application-as-filed (see paragraph A in subsection 1 below) and the European Patent Office (EPO) access to any search results from the instant application (see paragraph B in subsection 1 below).

Should applicant choose not to provide an authorization identified in subsection 1 below, applicant **must opt-out** of the authorization by checking the corresponding box A or B or both in subsection 2 below.

NOTE: This section of the Application Data Sheet is **ONLY** reviewed and processed with the **INITIAL** filing of an application. After the initial filing of an application, an Application Data Sheet cannot be used to provide or rescind authorization for access by a foreign IP office(s). Instead, Form PTO/SB/39 or PTO/SB/69 must be used as appropriate.

1. Authorization to Permit Access by a Foreign Intellectual Property Office(s)

A. Priority Document Exchange (PDX) - Unless box A in subsection 2 (opt-out of authorization) is checked, the undersigned hereby **grants the USPTO authority** to provide the European Patent Office (EPO), the Japan Patent Office (JPO), the Korean Intellectual Property Office (KIPO), the State Intellectual Property Office of the People's Republic of China (SIPO), the World Intellectual Property Organization (WIPO), and any other foreign intellectual property office participating with the USPTO in a bilateral or multilateral priority document exchange agreement in which a foreign application claiming priority to the instant patent application is filed, access to: (1) the instant patent application-as-filed and its related bibliographic data, (2) any foreign or domestic application to which priority or benefit is claimed by the instant application and its related bibliographic data, and (3) the date of filing of this Authorization. See 37 CFR 1.14(h)(1).

B. Search Results from U.S. Application to EPO - Unless box B in subsection 2 (opt-out of authorization) is checked, the undersigned hereby **grants the USPTO authority** to provide the EPO access to the bibliographic data and search results from the instant patent application when a European patent application claiming priority to the instant patent application is filed. See 37 CFR 1.14(h)(2).

The applicant is reminded that the EPO's Rule 141(1) EPC (European Patent Convention) requires applicants to submit a copy of search results from the instant application without delay in a European patent application that claims priority to the instant application.

2. Opt-Out of Authorizations to Permit Access by a Foreign Intellectual Property Office(s)

☐ A. Applicant **DOES NOT** authorize the USPTO to permit a participating foreign IP office access to the instant application-as-filed. If this box is checked, the USPTO will not be providing a participating foreign IP office with any documents and information identified in subsection 1A above.

☐ B. Applicant **DOES NOT** authorize the USPTO to transmit to the EPO any search results from the instant patent application. If this box is checked, the USPTO will not be providing the EPO with search results from the instant application.

NOTE: Once the application has published or is otherwise publicly available, the USPTO may provide access to the application in accordance with 37 CFR 1.14.

PROTECTING YOUR INVENTION OUTSIDE THE UNITED STATES

Since the rights granted by a U.S. patent extend only throughout the territory of the United States and have no effect in a foreign country, an inventor who wishes patent protection in another country must apply for a patent in a specific country or in regional patent offices. Applicants may wish to consider the filing of an international application under the Patent Cooperation Treaty (PCT). An international (PCT) application generally has the same effect as a regular national patent application in each PCT-member country. The PCT process **simplifies** the filing of patent applications on the same invention in member countries, but **does not result** in a grant of "an international patent" and does not eliminate the need of applicants to file additional documents and fees in countries where patent protection is desired.

Almost every country has its own patent law, and a person desiring a patent in a particular country must make an application for patent in that country in accordance with its particular laws. Since the laws of many countries differ in various respects from the patent law of the United States, applicants are advised to seek guidance from specific foreign countries to ensure that patent rights are not lost prematurely.

Applicants also are advised that in the case of inventions made in the United States, the Director of the USPTO must issue a license before applicants can apply for a patent in a foreign country. The filing of a U.S. patent application serves as a request for a foreign filing license. The application's filing receipt contains further information and guidance as to the status of applicant's license for foreign filing.

Applicants may wish to consult the USPTO booklet, "General Information Concerning Patents" (specifically, the section entitled "Treaties and Foreign Patents") for more information on timeframes and deadlines for filing foreign patent applications. The guide is available either by contacting the USPTO Contact Center at 800-786-9199, or it can be viewed on the USPTO website at http://www.uspto.gov/web/offices/pac/doc/general/index.html.

For information on preventing theft of your intellectual property (patents, trademarks and copyrights), you may wish to consult the U.S. Government website, http://www.stopfakes.gov. Part of a Department of Commerce initiative, this website includes self-help "toolkits" giving innovators guidance on how to protect intellectual property in specific

countries such as China, Korea and Mexico. For questions regarding patent enforcement issues, applicants may call the U.S. Government hotline at 1-866-999-HALT (1-866-999-4258).

LICENSE FOR FOREIGN FILING UNDER

Title 35, United States Code, Section 184

Title 37, Code of Federal Regulations, 5.11 & 5.15

GRANTED

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Bureau of Industry and Security, Department of Commerce (15 CFR parts 730-774); the Office of Foreign AssetsControl, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

NOT GRANTED

Statement under 37 CFR 1.55 or 1.78 for AIA (First Inventor to File) Transition Applications: No

PROTECTING YOUR INVENTION OUTSIDE THE UNITED STATES

Since the rights granted by a U.S. patent extend only throughout the territory of the United States and have no effect in a foreign country, an inventor who wishes patent protection in another country must apply for a patent in a specific country or in regional patent offices. Applicants may wish to consider the filing of an international application under the Patent Cooperation Treaty (PCT). An international (PCT) application generally has the same effect as a regular national patent application in each PCT-member country. The PCT process **simplifies** the filing of patent applications on the same invention in member countries, but **does not result** in a grant of "an international patent" and does not eliminate the need of applicants to file additional documents and fees in countries where patent protection is desired.

Almost every country has its own patent law, and a person desiring a patent in a particular country must make an application for patent in that country in accordance with its particular laws. Since the laws of many countries differ in various respects from the patent law of the United States, applicants are advised to seek guidance from specific foreign countries to ensure that patent rights are not lost prematurely.

Applicants also are advised that in the case of inventions made in the United States, the Director of the USPTO must issue a license before applicants can apply for a patent in a foreign country. The filing of a U.S. patent application serves as a request for a foreign filing license. The application's filing receipt contains further information and guidance as to the status of applicant's license for foreign filing.

Applicants may wish to consult the USPTO booklet, "General Information Concerning Patents" (specifically, the section entitled "Treaties and Foreign Patents") for more information on timeframes and deadlines for filing foreign patent applications. The guide is available either by contacting the USPTO Contact Center at 800-786-9199, or it can be viewed on the USPTO website at http://www.uspto.gov/web/offices/pac/doc/general/index.html.

For information on preventing theft of your intellectual property (patents, trademarks and copyrights), you may wish to consult the U.S. Government website, http://www.stopfakes.gov. Part of a Department of Commerce initiative, this website includes self-help "toolkits" giving innovators guidance on how to protect intellectual property in specific

countries such as China, Korea and Mexico. For questions regarding patent enforcement issues, applicants may call the U.S. Government hotline at 1-866-999-HALT (1-866-999-4258).

LICENSE FOR FOREIGN FILING UNDER

Title 35, United States Code, Section 184

Title 37, Code of Federal Regulations, 5.11 & 5.15

GRANTED

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Bureau of Industry and Security, Department of Commerce (15 CFR parts 730-774); the Office of Foreign AssetsControl, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

NOT GRANTED

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).

PROTECTING YOUR INVENTION OUTSIDE THE UNITED STATES

Since the rights granted by a U.S. patent extend only throughout the territory of the United States and have no effect in a foreign country, an inventor who wishes patent protection in another country must apply for a patent in a specific country or in regional patent offices. Applicants may wish to consider the filing of an international application under the Patent Cooperation Treaty (PCT). An international (PCT) application generally has the same effect as a regular national patent application in each PCT-member country. The PCT process **simplifies** the filing of patent applications on the same invention in member countries, but **does not result** in a grant of "an international patent" and does not eliminate the need of applicants to file additional documents and fees in countries where patent protection is desired.

Almost every country has its own patent law, and a person desiring a patent in a particular country must make an application for patent in that country in accordance with its particular laws. Since the laws of many countries differ in various respects from the patent law of the United States, applicants are advised to seek guidance from specific foreign countries to ensure that patent rights are not lost prematurely.

Applicants also are advised that in the case of inventions made in the United States, the Director of the USPTO must issue a license before applicants can apply for a patent in a foreign country. The filing of a U.S. patent application serves as a request for a foreign filing license. The application's filing receipt contains further information and guidance as to the status of applicant's license for foreign filing.

Applicants may wish to consult the USPTO booklet, "General Information Concerning Patents" (specifically, the section entitled "Treaties and Foreign Patents") for more information on timeframes and deadlines for filing foreign patent applications. The guide is available either by contacting the USPTO Contact Center at 800-786-9199, or it can be viewed on the USPTO website at http://www.uspto.gov/web/offices/pac/doc/general/index.html.

For information on preventing theft of your intellectual property (patents, trademarks and copyrights), you may wish to consult the U.S. Government website, http://www.stopfakes.gov. Part of a Department of Commerce initiative, this website includes self-help "toolkits" giving innovators guidance on how to protect intellectual property in specific

countries such as China, Korea and Mexico. For questions regarding patent enforcement issues, applicants may call the U.S. Government hotline at 1-866-999-HALT (1-866-999-4258).

LICENSE FOR FOREIGN FILING UNDER

Title 35, United States Code, Section 184

Title 37, Code of Federal Regulations, 5.11 & 5.15

GRANTED

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Bureau of Industry and Security, Department of Commerce (15 CFR parts 730-774); the Office of Foreign AssetsControl, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

NOT GRANTED

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).

Foreign Priority Information:

This section allows for the applicant to claim priority to a foreign application. Providing this information in the application data sheet constitutes the claim for priority as required by 35 U.S.C. 119(b) and 37 CFR 1.55. Authorization or Opt-Out of Authorization to Permit Access:

When this Application Data Sheet is properly signed and filed with the application, applicant has provided written authority to permit a participating foreign intellectual property (IP) office access to the instant application-as-filed (see paragraph A in subsection 1 below) and the European Patent Office (EPO) access to any search results from the instant application (see paragraph B in subsection 1 below).

Should applicant choose not to provide an authorization identified in subsection 1 below, applicant **must opt-out** of the authorization by checking the corresponding box A or B or both in subsection 2 below.

NOTE: This section of the Application Data Sheet is **ONLY** reviewed and processed with the **INITIAL** filing of an application. After the initial filing of an application, an Application Data Sheet cannot be used to provide or rescind authorization for access by a foreign IP office(s). Instead, Form PTO/SB/39 or PTO/SB/69 must be used as appropriate.

1. Authorization to Permit Access by a Foreign Intellectual Property Office(s)

A. Priority Document Exchange (PDX) - Unless box A in subsection 2 (opt-out of authorization) is checked, the undersigned hereby **grants the USPTO authority** to provide the European Patent Office (EPO), the Japan Patent Office (JPO), the Korean Intellectual Property Office (KIPO), the State Intellectual Property Office of the People's Republic of China (SIPO), the World Intellectual Property Organization (WIPO), and any other foreign intellectual property office participating with the USPTO in a bilateral or multilateral priority document exchange agreement in which a foreign application claiming priority to the instant patent application is filed, access to: (1) the instant patent application-as-filed and its related bibliographic data, (2) any foreign or domestic application to which priority or benefit is claimed by the instant application and its related bibliographic data, and (3) the date of filing of this Authorization. See 37 CFR 1.14(h)(1).

B. Search Results from U.S. Application to EPO - Unless box B in subsection 2 (opt-out of authorization) is checked, the undersigned hereby **grants the USPTO authority** to provide the EPO access to the bibliographic data and search results from the instant patent application when a European patent application claiming priority to the instant patent application is filed. See 37 CFR 1.14(h)(2).

The applicant is reminded that the EPO's Rule 141(1) EPC (European Patent Convention) requires applicants to submit a copy of search results from the instant application without delay in a European patent application that claims priority to the instant application.

2. Opt-Out of Authorizations to Permit Access by a Foreign Intellectual Property Office(s)

☐ A. Applicant **DOES NOT** authorize the USPTO to permit a participating foreign IP office access to the instant application-as-filed. If this box is checked, the USPTO will not be providing a participating foreign IP office with any documents and information identified in subsection 1A above.

☐ B. Applicant **DOES NOT** authorize the USPTO to transmit to the EPO any search results from the instant patent application. If this box is checked, the USPTO will not be providing the EPO with search results from the instant application.

NOTE: Once the application has published or is otherwise publicly available, the USPTO may provide access to the application in accordance with 37 CFR 1.14.

Re: Miscellaneous Communication to Applicant – No Action Count
Application Serial No. 16/412,340
Attorney Docket. 15026

Dear Commissioner:

In compliance with 37 CFR 1.48, please find enclosed a revised Application Data Sheet correcting the name of inventor Richard Kelley. Mr. Kelley's given name was inadvertently truncated as Rich Kelley on the originally-filed Application Data Sheet filed on May 14, 2019. Applicant is also enclosing the required petition fee of $70 and hereby requests that the USPTO accept the inventor declaration signed by Richard Kelley (as inventor) that was filed on May 14, 2019 as the inventor information on the ADS now matches the inventor declaration.

Unless notified by the USPTO, Applicant now considers this matter to be satisfactorily resolved.

Warm Regards,

/Brian S. Boon/

PROTECTING YOUR INVENTION OUTSIDE THE UNITED STATES

Since the rights granted by a U.S. patent extend only throughout the territory of the United States and have no effect in a foreign country, an inventor who wishes patent protection in another country must apply for a patent in a specific country or in regional patent offices. Applicants may wish to consider the filing of an international application under the Patent Cooperation Treaty (PCT). An international (PCT) application generally has the same effect as a regular national patent application in each PCT-member country. The PCT process **simplifies** the filing of patent applications on the same invention in member countries, but **does not result** in a grant of "an international patent" and does not eliminate the need of applicants to file additional documents and fees in countries where patent protection is desired.

Almost every country has its own patent law, and a person desiring a patent in a particular country must make an application for patent in that country in accordance with its particular laws. Since the laws of many countries differ in various respects from the patent law of the United States, applicants are advised to seek guidance from specific foreign countries to ensure that patent rights are not lost prematurely.

Applicants also are advised that in the case of inventions made in the United States, the Director of the USPTO must issue a license before applicants can apply for a patent in a foreign country. The filing of a U.S. patent application serves as a request for a foreign filing license. The application's filing receipt contains further information and guidance as to the status of applicant's license for foreign filing.

Applicants may wish to consult the USPTO booklet, "General Information Concerning Patents" (specifically, the section entitled "Treaties and Foreign Patents") for more information on timeframes and deadlines for filing foreign patent applications. The guide is available either by contacting the USPTO Contact Center at 800-786-9199, or it can be viewed on the USPTO website at http://www.uspto.gov/web/offices/pac/doc/general/index.html.

For information on preventing theft of your intellectual property (patents, trademarks and copyrights), you may wish to consult the U.S. Government website, http://www.stopfakes.gov. Part of a Department of Commerce initiative, this website includes self-help "toolkits" giving innovators guidance on how to protect intellectual property in specific countries such as China, Korea and Mexico. For questions regarding patent enforcement issues, applicants may call the U.S. Government hotline at 1-866-999-HALT (1-866-999-4258).

LICENSE FOR FOREIGN FILING UNDER

Title 35, United States Code, Section 184

Title 37, Code of Federal Regulations, 5.11 & 5.15

GRANTED

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Bureau of Industry and Security, Department of Commerce (15 CFR parts 730-774); the Office of Foreign AssetsControl, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

NOT GRANTED

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).

Foreign Priority Information:

This section allows for the applicant to claim priority to a foreign application. Providing this information in the application data sheet constitutes the claim for priority as required by 35 U.S.C. 119(b) and 37 CFR 1.55. When priority is claimed to a foreign application that is eligible for retrieval under the priority document exchange program (PDX)[i] the information will be used by the Office to automatically attempt retrieval pursuant to 37 CFR 1.55(i)(1) and (2). Under the PDX program, applicant bears the ultimate responsibility for ensuring that a copy of the foreign application is received by the Office from the participating foreign intellectual property office, or a certified copy of the foreign priority application is filed, within the time period specified in 37 CFR 1.55(g)(1).

Authorization or Opt-Out of Authorization to Permit Access:

When this Application Data Sheet is properly signed and filed with the application, applicant has provided written authority to permit a participating foreign intellectual property (IP) office access to the instant application-as-filed (see paragraph A in subsection 1 below) and the European Patent Office (EPO) access to any search results from the instant application (see paragraph B in subsection 1 below).

Should applicant choose not to provide an authorization identified in subsection 1 below, applicant **must opt-out** of the authorization by checking the corresponding box A or B or both in subsection 2 below.

NOTE: This section of the Application Data Sheet is **ONLY** reviewed and processed with the **INITIAL** filing of an application. After the initial filing of an application, an Application Data Sheet cannot be used to provide or rescind authorization for access by a foreign IP office(s). Instead, Form PTO/SB/39 or PTO/SB/69 must be used as appropriate.

1. Authorization to Permit Access by a Foreign Intellectual Property Office(s)

A. Priority Document Exchange (PDX) - Unless box A in subsection 2 (opt-out of authorization) is checked, the undersigned hereby **grants the USPTO authority** to provide the European Patent Office (EPO), the Japan Patent Office (JPO), the Korean Intellectual Property Office (KIPO), the State Intellectual Property Office of the People's Republic of China (SIPO), the World Intellectual Property Organization (WIPO), and any other foreign intellectual property office participating with the USPTO in a bilateral or multilateral priority document exchange agreement in which a foreign application claiming priority to the instant patent application is filed, access to: (1) the instant patent application-as-filed and its related bibliographic data, (2) any foreign or domestic application to which priority or benefit is claimed by the instant application and its related bibliographic data, and (3) the date of filing of this Authorization. See 37 CFR 1.14(h)(1).

B. Search Results from U.S. Application to EPO - Unless box B in subsection 2 (opt-out of authorization) is checked, the undersigned hereby **grants the USPTO authority** to provide the EPO access to the bibliographic data and search results from the instant patent application when a European patent application claiming priority to the instant patent application is filed. See 37 CFR 1.14(h)(2).

The applicant is reminded that the EPO's Rule 141(1) EPC (European Patent Convention) requires applicants to submit a copy of search results from the instant application without delay in a European patent application that claims priority to the instant application.

2. Opt-Out of Authorizations to Permit Access by a Foreign Intellectual Property Office(s)

☐ A. Applicant **DOES NOT** authorize the USPTO to permit a participating foreign IP office access to the instant application-as-filed. If this box is checked, the USPTO will not be providing a participating foreign IP office with any documents and information identified in subsection 1A above.

☐ B. Applicant **DOES NOT** authorize the USPTO to transmit to the EPO any search results from the instant patent application. If this box is checked, the USPTO will not be providing the EPO with search results from the instant application.

NOTE: Once the application has published or is otherwise publicly available, the USPTO may provide access to the application in accordance with 37 CFR 1.14.

Notice of Pre-AIA or AIA Status

The present application, filed on or after March 16, 2013, is being examined under the first inventor to file provisions of the AIA. In the event the determination of the status of the application as subject to AIA 35 U.S.C. 102 and 103 (or as subject to pre-AIA 35 U.S.C. 102 and 103) is incorrect, any correction of the statutory basis for the rejection will not be considered a new ground of rejection if the prior art relied upon, and the rationale supporting the rejection, would be the same under either status.

Priority

Applicant's claim for the benefit of a prior-filed application under 35 U.S.C. 119(e) or under 35 U.S.C. 120, 121, or 365(c) is acknowledged. Applicant has not complied with one or more conditions for receiving the benefit of an earlier filing date under 35 U.S.C. 119(e) as follows:

The later-filed application must be an application for a patent for an invention which is also disclosed in the prior application (the parent or original nonprovisional application or provisional application). The disclosure of the invention in the parent application and in the later-filed application must be sufficient to comply with the requirements of 35 U.S.C. 112(a) or the first paragraph of pre-AIA 35 U.S.C. 112, except for the best mode requirement. See *Transco Products, Inc. v. Performance Contracting, Inc.*, 38 F.3d 551, 32 USPQ2d 1077 (Fed. Cir. 1994)

The disclosure of the prior-filed applications No. 14/095919 and/or 12/963411, fails to provide adequate support or enablement in the manner provided by 35 U.S.C. 112(a) or pre-AIA 35 U.S.C. 112, first paragraph for one or more claims of this application. Specifically, independent claims recite terms "midserver", "Ansible server", and "Kerberos" as limitations, however no such terms were disclosed in parent applications. Therefore Claims 1-10 do not receive benefit of an earlier filing date.

Claim Objections

Claims 5 and 6 are objected to because of the following informalities: claimed "system of claim 4" should be the "method of claim 4".

Claim 10 is objected because of missing space in "steps of:receiving".

Appropriate correction is required.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

> A person shall be entitled to a patent unless –
>
> (a)(1) the claimed invention was patented, described in a printed publication, or in public use, on sale or otherwise available to the public before the effective filing date of the claimed invention.

Claim 40 is rejected under 35 U.S.C. 102(a)(2) as being unpatentable over Bonomi et al. (US 2018/0115519, Pub. Date: Apr. 26, 2018, priority Oct. 21, 2016.), hereinafter referred to as Bonomi.

As per claim 1, Bonomi teaches a system for ingestion of data into a cloud-based service from an external network (The system architecture 100 supports security technology methods and algorithms that enable co-location of the IT /OT devices and other infrastructure components on the fognode 124 that enable operation of the IT and OT software components without

interfering with other software components. It also enables a secure middleware infrastructure and communication bus for secure data exchange, as well as prevents inadvertent interference and Denial of Service (DOS) effects on the system components due to failures and defects in one set of software components that are co-located. In some embodiments the system architecture 100 prevents malicious Denial of Service (DOS) effects in the system architecture 100 components if vulnerabilities are present in a set of software components that are co-located with one another. Bonomi, [0056]), comprising:

a midserver configured to function as an interface between an external network and a cloud-based service comprising at least a processor, a memory, and a plurality of programming instructions stored in the memory and operating on the processor (the present disclosure is directed to a system, comprising: (a) a forwarder that provides one-way data publishing connectivity to a cloud; and (b) a data bus that provides domain-to-domain secure messaging between a plurality of domains, Bonomi, [0004]):

receive data from a plurality of computing devices on the external network (The system architecture 100 enables different monitoring and auditing components that support various logging and alarm collection and forwarding to cloud controller (NSM 128). Bonomi, [0057]);

run one or more containerized services to process the received data (The system architecture 100 enables container/isolation technology at the foglet 122 that enables rapid integration of IT/OT device management software without compromising security. This feature is advantageous as the IT/OT device types are large across varied vendors, each type requiring different software components across different

operating systems. Bonomi, [0054]); and

securely transmit the processed data to a cloud-based service (The system architecture 100 also implements mechanisms for secure application hosting. Rich application deployment at the edge of a network/domain is an important premise in fog computing. Application hosting is primarily implemented for performing real time computation on critical data at locations closer to its source, protect the data from theft and associated loss of intellectual property, reduce the data movement to cloud, and provide for rapid deployment of richer applications from the cloud and in edge analytics applications that refine analytics models in the cloud and on the foglet 122. Application hosting performed from the cloud 106 supports various security constructs. Bonomi, [0058]).

As per claim 2, Bonomi teaches the system of claim 1, wherein the containerized services include one or more of the following types of containerized services: traffic processors, sensors, management services, and utilities (The system architecture 100 also provides for robust application isolation security. In some embodiments, the fognode 124 and its foglet 122 implement mechanisms for isolating applications from each other for variety of reason like OT network security, application protection, multi-tenancy, and data protection-just to name a few. Strict isolation of OT applications and services, such as applications executed within the OT virtual machines 110A-B, is also advantageous to prevent inadvertent interference, Denial of Service (DOS), and malicious DOS from a compromised application. Bonomi, [0055]).

As per claim 3, Bonomi teaches the system of claim 1, wherein the midserver is installed at the same location from which some part of the external network is operated (Typically, the IT infrastructure is co-located in an operations center along with the OT infrastructure (for example in the same manufacturing facility location). Bonomi, [0011]).

Method claims 4-6 are drawn to the method of using the corresponding apparatus claimed in claims 1-3. Therefore method claims 4-6 correspond to apparatus claims 1-3 and are rejected for the same reasons of anticipation as used above.

Claims 8 and 9 has limitations similar to those treated in the above rejection, and are met by the references as discussed above, and are rejected for the same reasons of anticipation as used above. For "establishing a virtual machine within the virtual network" see "Initiating virtual machines for a plurality of domains" (Bonomi, FIG. 3).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103 which forms the basis for all obviousness rejections set forth in this Office action:

> A patent for a claimed invention may not be obtained, notwithstanding that the claimed invention is not identically disclosed as set forth in section 102, if the differences between the claimed invention and the prior art are such that the claimed invention as a whole would have been obvious before the effective filing date of the claimed invention to a person having ordinary skill in the art to which the claimed invention pertains. Patentability shall not be negated by the manner in which the invention was made.

Claim 7 is rejected under 35 U.S.C. 103 as being unpatentable over Bonomi et al. (US 2018/0115519, Pub. Date: Apr. 26, 2018, priority Oct. 21, 2016.), in view of Himes (Using Ansible to generate complex configs, May 31, 2018, 5 pages), in view of MatthiasLohr (Provide a method Peer.close(), Mar 27, 2013, 5 pages), hereinafter referred to as Bonomi, Himes, and MatthiasLohr.

As per claim 7, Bonomi teaches a method for deployment of a midserver for ingestion of data into a cloud-based service from an external network (*The system architecture 100 supports security technology methods and algorithms that enable co-location of the IT/OT devices and other infrastructure components on the fognode 124 that enable operation of the IT and OT software components without interfering with other software components. It also enables a*

secure middleware infrastructure and communication bus for secure data exchange, as well as prevents inadvertent interference and Denial of Service (DOS) effects on the system components due to failures and defects in one set of software components that are co-located. In some embodiments the system architecture 100 prevents malicious Denial of Service (DOS) effects in the system architecture 100 components if vulnerabilities are present in a set of software components that are co-located with one another. Bonomi, [0056]), comprising the steps of:

installing a midserver on an external network (*FIG. 4 is a diagrammatic representation of an example machine in the form of a computer system 1, within which a set of instructions for causing the machine to perform any one or more of the methodologies discussed herein may be executed. In various example embodiments, the machine operates as a standalone device or may be connected (e.g., networked) to other machines. In a networked deployment, the machine may operate in the capacity of a server or a client machine in a server-client network environment, or as a peer machine in a peer-to-peer (or distributed) network environment. Bonomi, [0085]*);

establishing a secure peer-to-peer connection from the midserver (*In a networked deployment, the machine may operate in the capacity of a server or a client machine in a server-client network environment, or as a peer machine in a peer-to-peer (or distributed) network environment. Bonomi, [0085]*) to an ~~Ansible~~ server at the cloud-based service (*A forwarder 108 present in the forwarder VM 142 represents a set of docker containers that is used for forwarding messages received from the data bus 109 to appropriate cloud layer in a secure manner. Bonomi, [0076]*);

Although Bonomi teaches a peer-to-peer network environment, as cited above, he does **not** teach Ansible server, Himes however teaches an Ansible server (*Using Ansible to generate complex configs. Himes, page 1*).

> Bonomi in view of Himes are analogous art to the claimed invention, because they are from a similar field of endeavor of systems, components and methodologies for providing secure communication between computer systems. It would have been obvious to a person of ordinary skill in the art before the effective filing date of the claimed invention to modify Bonomi in view of Himes. This would have been desirable for a good way to generate router/switch configs easily and quickly. Most of the tools I have seen are either not flexible enough or homebrew and difficult to maintain. Ansible gives something I can use to build configs for secure areas, non-secure areas, different geographical locations, different purposes, etc without storing the same data (ACLs, IOSs etc) in many different locations. (Himes, page 1).

initiating an Ansible playbook, which downloads a configuration template (*We are going to start by calling the playbook with "ansible playbook templates.yaml". Himes, page 1*), retrieves security information for the external network at which the midserver is installed (*to build configs for secure areas, non-secure areas, Himes, page 1*), and configures the midserver to establish a primary backhaul virtual private network between the midserver and the cloud-based service (*if you wanted to you could easily have it build smaller config sections: Build a new VRF section for each of your backhaul routers. VXLAN for your data-center routers, etc. Himes, page 1*);

Bonomi in view of Himes does **not** teach closing the peer-to-peer connection, MatthiasLohr however teaches closing the peer-to-peer connection (*it would be nice if the connection to the key servercan be closed after a p2p connection has been established. MatthiasLohr, page 1*).

> Bonomi in view of Himes in view of MatthiasLohr are analogous art to the claimed invention, because they are from a similar field of endeavor of systems, components and methodologies for providing secure communication between computer systems. It would have been obvious to a person of ordinary skill in the art before the effective filing date of the claimed invention to modify Bonomi in view of Himes in view of MatthiasLohr. This would have been useful if there is Peer.close() method (MatthiasLohr, page 1).

Claim 10 is rejected under 35 U.S.C. 103 as being unpatentable over Microsoft (What's New in Kerberos Authentication, 08/31/2016, 22 pages), in view of Bonomi et al.

(US 2018/0115519, Pub. Date: Apr. 26, 2018, priority Oct. 21, 2016.), hereinafter referred to as Bonomi, Himes, and Matthias Lohr.

As per **claim 10**, Bonomi teaches a method for preventing Kerberos-based cyberattacks (*any front-end service that can delegate to a resource service represents a potential attack point. Microsoft, page 14*) ~~using a midserver for ingestion of data into a cloud based service from an external network~~, comprising the steps of:

receiving Kerberos-based messaging between user computers, domain controllers, and Kerberos-based services (*Kerberos authentication can be leveraged to address lack of connectivity to the domain controller from outside the corporate firewall. To do so, it proxies Kerberos authentication and password change messages for users who are requesting domain access through Direct Access or Remote Desktop Services, Microsoft, page 2*);

maintaining a ledger of the monitored messages (*The new KDC operational log is located in Application and Services/Microsoft/Windows/Kerberos-Key-Distribution-Center/Operational. It provides information that can help you determine the cause of a certificate logon failure or when the KDC service was stopped or started... The new Kerberos operational log is located in Application and Services/Microsoft/Windows/Security-Kerberos/Operational . It provides information that can help you determine the cause of a failure without collecting a trace and contacting Microsoft Product Support. Microsoft, page 18*);

comparing the ledger against expected messages for Kerberos authentications to confirm the validity of the Kerberos authentication traffic (*102: Error: Certificate based authentication failure due to KDC certificate validation failure; 103: Error: Certificate based authentication failure due to client certificate validation failure; 106: Error: Certificate based authentication failure due to KDC certificate validation failure due to KDC EKU missing; 107: Error:*

Certificate based authentication failure due to KDC certificate validation failure due to wrong domain name. Microsoft, page 19).

Microsoft does **not** teach using a midserver for ingestion of data into a cloud-based service from an external network, Bonomi however teaches using a midserver for ingestion of data into a cloud-based service from an external network (*Bonomi, FIG.2*)

> Microsoft in view of Bonomi are analogous art to the claimed invention, because they are from a similar field of endeavor of systems, components and methodologies for providing secure communication between computer systems. It would have been obvious to a person of ordinary skill in the art before the effective filing date of the claimed invention to modify Microsoft in view of Bonomi. This would have been desirable because the system architecture 100 supports security technology methods and algorithms that enable co-location of the IT /OT devices and other infrastructure components on the fognode 124 that enable operation of the IT and OT software components without interfering with other software components. It also enables a secure middleware infrastructure and communication bus for secure data exchange, as well as prevents inadvertent interference and Denial of Service (DOS) effects on the system components due to failures and defects in one set of software components that are co-located. In some embodiments the system architecture 100 prevents malicious Denial of Service (DOS) effects in the system architecture 100 components if vulnerabilities are present in a set of software components that are co-located with one another. (Bonomi, [0056]).

REMARKS

This communication is responsive to the office action pertaining to the instant invention that was mailed on May 4, 2022.

From the Action:

The disclosure of the prior-filed applications No. 14/095919 and/or 12/963411, fails to provide adequate support or enablement in the manner provided by 35 U.S.C. 112(a) or pre-AIA 35 U.S.C. 112, first paragraph for one or more claims of this application. Specifically, independent claims recite terms "midserver", "Ansible server", and "Kerberos" as limitations, however no such terms were disclosed in parent applications. Therefore Claims 1-10 do not receive benefit of an earlier filing date.

Applicant's Response:

The two applications cited, numbers 14/095,919 and 12/963,411, were not claimed as priority documents in the Application Data Sheet and are not in any way related to the instant application. It appears this was a typographical error, but the error prevents applicant from meaningfully responding to the priority issue cited by the examiner. Nevertheless, applicant concedes that Bonomi's effective filing date precedes the effective filing date of all claims, and Bonomi is therefore conceded to be prior art.

From the Action:

Claims 5 and 6 are objected to because of the following informalities: claimed "system of claim 4" should be the "method of claim 4".

Claim 10 is objected because of missing space in "steps of:receiving".

Appropriate correction is required.

Applicant's Response:

The appropriate corrections have been made.

From the Action:

Claim 40 is rejected under 35 U.S.C. §102(a)(2) as being unpatentable over Bonomi et al. (US 2018/0115519, Pub. Date: Apr. 26, 2018, priority Oct. 21, 2016.), hereinafter referred to as Bonomi.

Applicant's Response:

Applicant assumes the examiner's §102 rejection is directed to Claim 1 and argues accordingly.

The relevant claims have been amended to more particularly point out and distinctly claim the subject matter which the applicant regards as the invention. Claim 1 has been amended to more clearly teach the functions of the midserver. Support for the amendments may be found in at least ¶¶[032-041] and ¶[060] of the disclosure; no new matter has been added.

The amendments now clearly teach the operation of the midserver, which automatically deploys a virtual appliance software application, which loads configuration parameters and then receives streaming data from multiple hosts on an internal network to retransmit to an external network as a single data stream. The received data may be transformed such as to encrypt data that is received in an insecure state before transmitting over the secure connection, and multiple data streams are in effect unified for easier processing at the destination. These operations are described in detail in at least the noted supporting portions of the disclosure. This midserver operations clearly distinguishes over the reference of Bonomi (and the additional references cited below in further rejections), as Bonomi merely teaches a form of firewall that selectively receives and blocks connections between local and external networks (Bonomi, Abstract and at least ¶[0030]). Bonomi does not provide an automatically-deployed virtual appliance software application that receives *and transforms* multiple data streams for retransmission over a single, secured data stream to an external host.

Thus, for reasons argued above, Bonomi does not teach each and every limitation of claim 1, as amended. Claim 1 is therefore clearly patentable over the reference, and all dependent claims are therefore similarly patentable at least as they depend from a patentable base claim. Applicant requests the §102 rejection of claim 1 be withdrawn, accordingly.

From the Action:

Claim 7 is rejected under 35 U.S.C. §103 as being unpatentable over Bonomi et al. (US 2018/0115519, Pub. Date: Apr. 26, 2018, priority Oct. 21, 2016.), in view of Himes (Using Ansible to generate complex configs, May 31, 2018, 5 pages), in view of MatthiasLohr (Provide a method Peer.close(), Mar 27, 2013, 5 pages), hereinafter referred to as Bonomi, Himes, and MatthiasLohr.

Applicant's Response:

Claims 7 and 10 have been canceled.

From the Action:

Claim 10 is rejected under 35 U.S.C. §103 as being unpatentable over Microsoft (What's New in Kerberos Authentication, 08/31/2016, 22 pages), in view of Bonomi et al. (US 2018/0115519, Pub. Date: Apr. 26, 2018, priority Oct. 21, 2016.), hereinafter referred to as Bonomi, Himes, and MatthiasLohr.

Applicant's Response:

Claims 7 and 10 have been canceled.

SUMMARY

As all of the claims (as amended) are believed to be, and to have been shown to be, patentable over the references cited, applicant respectfully requests that the case be passed quickly to issue. If any time extension is needed beyond any extension requested with this amendment, such extension is hereby requested.

Respectfully Submitted,

Mike Chasman

DETAILED ACTION

Response to Amendment

This action is in response to amendment filed May 31, 2022 for the application # 16/412,340 filed on May 14, 2019. Claims 1-6, 8, and 9 are pending and are directed toward SYSTEM AND METHOD FOR MIDSERVER FACILITATION OF LONG-HAUL TRANSPORT OF TELEMETRY FOR CLOUD-BASED SERVICES.

Any claim objection/rejection not repeated below is withdrawn due to Applicant's amendment.

Notice of Pre-AIA or AIA Status

The present application, filed on or after March 16, 2013, is being examined under the first inventor to file provisions of the AIA. In the event the determination of the status of the application as subject to AIA 35 U.S.C. 102 and 103 (or as subject to pre-AIA 35 U.S.C. 102 and 103) is incorrect, any correction of the statutory basis for the rejection will not be considered a new ground of rejection if the prior art relied upon, and the rationale supporting the rejection, would be the same under either status.

Response to Arguments

Applicant's arguments with regards to claims 1-6, 8, and 9 have been fully considered, they are persuasive in view of amended claims 1-6. No amendments and/or arguments were made in regards to claims 8 and 9, therefore Examiner maintains rejections of claims 8 and 9.

Priority

Applicant's claim for the benefit of a prior-filed application under 35 U.S.C. 119(e) or under 35 U.S.C. 120, 121, or 365(c) is acknowledged. Applicant concedes that Bonomi's

effective filing date precedes the effective filing date of all claims, and Bonomi is therefore conceded to be prior art (REMARKS, page 5).

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

> A person shall be entitled to a patent unless –
>
> (a)(1) the claimed invention was patented, described in a printed publication, or in public use, on sale or otherwise available to the public before the effective filing date of the claimed invention.

Claims 8 and 9 are rejected under 35 U.S.C. 102(a)(2) as being unpatentable over Bonomi et al. (US 2018/0115519, Pub. Date: Apr. 26, 2018, priority Oct. 21, 2016.), hereinafter referred to as Bonomi.

As per **claim 8**, Bonomi teaches a method for deployment of a midserver for ingestion of data into a cloud-based service from an external network (*The system architecture 100 supports security technology methods and algorithms that enable co-location of the IT/OT devices and other infrastructure components on the fognode 124 that enable operation of the IT and OT software components without interfering with other software components. It also enables a secure middleware infrastructure and communication bus for secure data exchange, as well as prevents inadvertent interference and Denial of Service (DOS) effects on the system components due to failures and defects in one set of software components that are co-located. In some embodiments the system architecture 100 prevents malicious Denial of Service (DOS) effects in the system architecture 100 components if vulnerabilities are present in a set of software components that are co-located with one another. Bonomi, [0056]*) wherein the external network

comprises a virtual network operated on a cloud computing service (*310- Executing virtual network functions within the virtual machines, Bonomi, FIG. 3*), comprising the steps of:

establishing on the cloud computing service a virtual network controlled by the cloud-based service (*FIG. 4 is a diagrammatic representation of an example machine in the form of a computer system 1, within which a set of instructions for causing the machine to perform any one or more of the methodologies discussed herein may be executed. In various example embodiments, the machine operates as a standalone device or may be connected (e.g., networked) to other machines. In a networked deployment, the machine may operate in the capacity of a server or a client machine in a server-client network environment or as a peer machine in a peer-to-peer (or distributed) network environment. Bonomi, [0085]*);

establishing a virtual machine on the virtual network controlled by the cloud-based service (*Initiating virtual machines for a plurality of domains, Bonomi, FIG. 3*);

configuring the virtual machine on the virtual network controlled by the cloud-based service as a virtual network peer of the external network (*A virtual local area network (VLAN) mechanism enables the connected devices D3 and D5 (or other group of devices in the OT and/or IT domains) to be accessible and managed only by a soft real-time function enabled virtual machine. VLANs are identifiers or tags present in a packet that enables any of the IT/OT switches to forward them to ports that are configured to accept only packets with the specified tag. This VLAN tagging ensures that only configured VMs receive packets with the associated tags. In one embodiment, multiple domains/networks are connected to a physical or virtual switch (such as IT switch C) and each network comprises its own VLAN. Bonomi, [0044]*);

streaming data from the external network to the virtual machine configured as a virtual network peer of the external network (*Policies for separating a device flow (I/0 of each device)*

into multiple streams of control, management, critical data and non-critical data flows is enabled through ovs-flows and policies. Bonomi, [0052]); and

forwarding the streamed data from the virtual network peer to the cloud-based service (*A forwarder 108 present in the forwarder VM 142 represents a set of docker containers that is used for forwarding messages received from the data bus 109 to appropriate cloud layer in a secure manner. Bonomi, [0076],* see also *Bonomi, [0084]*).

Claim 9 has limitations similar to those treated in the above rejection, and are met by the references as discussed above, and are rejected for the same reasons of anticipation as used above.

Allowable Subject Matter

Claims 1-6 are allowed.

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Dear Commissioner:

Response B

In the Claims

All of the claims standing for examination are reproduced below with appropriate status indication.

1. (Previously presented) A system for ingestion of data into a cloud-based service from an external network, comprising:

a midserver comprising at least a processor, a memory, and a plurality of programming instructions stored in the memory and operating on the processor, wherein the plurality of programming instructions, when operating on the processor, cause the processor to:

automatically install a virtual appliance software application, the virtual appliance software application configured to automatically load a plurality of stored configurations on the midserver;

establish a secure network connection to an external network;

receive data over a local network from a plurality of computing devices;

apply a plurality of transformations to at least a portion of the received data; and

retransmit the received data over the secure connection as a single data stream.

2. (Original) The system of claim 1, wherein the containerized services include one or more of the following types of containerized services: traffic processors, sensors, management services, and utilities.

3. (Original) The system of claim 1, wherein the midserver is installed at the same location from which some part of the external network is operated.

4. (Previously presented) A method for ingestion of data into a cloud-based service from an external network, comprising the steps of:

installing a midserver comprising at least a processor, a memory, and a plurality of programming instructions stored in the memory and operating on the processor;

automatically installing, using the midserver, a virtual appliance software application, the virtual appliance software application configured to automatically load a plurality of stored configurations on the midserver;

establishing a secure network connection from the midserver to an external network;

receiving data over a local network from a plurality of computing devices;

applying a plurality of transformations to at least a portion of the received data; and

retransmitting the received data over the secure connection as a single data stream.

5. (Previously presented) The method of claim 4, further comprising the step of including one or more of the following types of containerized services: traffic processors, sensors, management services, and utilities.

6. (Previously presented) The method of claim 4, further comprising the step of installing the midserver at the same location from which some part of the external network is operated.

Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)
(Applications filed on or after May 29, 2000)

The Office has discontinued providing a Patent Term Adjustment (PTA) calculation with the Notice of Allowance.

Section 1(h)(2) of the AIA Technical Corrections Act amended 35 U.S.C. 154(b)(3)(B)(i) to eliminate the requirement that the Office provide a patent term adjustment determination with the notice of allowance. See Revisions to Patent Term Adjustment, 78 Fed. Reg. 19416, 19417 (Apr. 1, 2013). Therefore, the Office is no longer providing an initial patent term adjustment determination with the notice of allowance. The Office will continue to provide a patent term adjustment determination with the Issue Notification Letter that is mailed to applicant approximately three weeks prior to the issue date of the patent, and will include the patent term adjustment on the patent. Any request for reconsideration of the patent term adjustment determination (or reinstatement of patent term adjustment) should follow the process outlined in 37 CFR 1.705.

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at 1-(888)-786-0101 or (571)-272-4200.

OMB Clearance and PRA Burden Statement for PTOL-85 Part B

The Paperwork Reduction Act (PRA) of 1995 requires Federal agencies to obtain Office of Management and Budget approval before requesting most types of information from the public. When OMB approves an agency request to collect information from the public, OMB (i) provides a valid OMB Control Number and expiration date for the agency to display on the instrument that will be used to collect the information and (ii) requires the agency to inform the public about the OMB Control Number's legal significance in accordance with 5 CFR 1320.5(b).

The information collected by PTOL-85 Part B is required by 37 CFR 1.311. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 30 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, Virginia 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, Virginia 22313-1450. Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

	Application Number	16/412,340
Title of Invention	SYSTEM AND METHOD FOR MIDSERVER FACILITATION OF LONG-HAUL TRANSPORT OF TELEMETRY FOR CLOUD-BASED SERVICES	

Authorization or Opt-Out of Authorization to Permit Access:

When this Application Data Sheet is properly signed and filed with the application, applicant has provided written authority to permit a participating foreign intellectual property (IP) office access to the instant application-as-filed (see paragraph A in subsection 1 below) and the European Patent Office (EPO) access to any search results from the instant application (see paragraph B in subsection 1 below).

Should applicant choose not to provide an authorization identified in subsection 1 below, applicant **must opt-out** of the authorization by checking the corresponding box A or B or both in subsection 2 below.

NOTE: This section of the Application Data Sheet is **ONLY** reviewed and processed with the **INITIAL** filing of an application. After the initial filing of an application, an Application Data Sheet cannot be used to provide or rescind authorization for access by a foreign IP office(s). Instead, Form PTO/SB/39 or PTO/SB/69 must be used as appropriate.

1. Authorization to Permit Access by a Foreign Intellectual Property Office(s)

A. Priority Document Exchange (PDX) - Unless box A in subsection 2 (opt-out of authorization) is checked, the undersigned hereby **grants the USPTO authority** to provide the European Patent Office (EPO), the Japan Patent Office (JPO), the Korean Intellectual Property Office (KIPO), the State Intellectual Property Office of the People's Republic of China (SIPO), the World Intellectual Property Organization (WIPO), and any other foreign intellectual property office participating with the USPTO in a bilateral or multilateral priority document exchange agreement in which a foreign application claiming priority to the instant patent application is filed, access to: (1) the instant patent application-as-filed and its related bibliographic data, (2) any foreign or domestic application to which priority or benefit is claimed by the instant application and its related bibliographic data, and (3) the date of filing of this Authorization. See 37 CFR 1.14(h)(1).

B. Search Results from U.S. Application to EPO - Unless box B in subsection 2 (opt-out of authorization) is checked, the undersigned hereby **grants the USPTO authority** to provide the EPO access to the bibliographic data and search results from the instant patent application when a European patent application claiming priority to the instant patent application is filed. See 37 CFR 1.14(h)(2).

The applicant is reminded that the EPO's Rule 141(1) EPC (European Patent Convention) requires applicants to submit a copy of search results from the instant application without delay in a European patent application that claims priority to the instant application.

2. Opt-Out of Authorizations to Permit Access by a Foreign Intellectual Property Office(s)

☐ A. Applicant **DOES NOT** authorize the USPTO to permit a participating foreign IP office access to the instant application-as-filed. If this box is checked, the USPTO will not be providing a participating foreign IP office with any documents and information identified in subsection 1A above.

☐ B. Applicant **DOES NOT** authorize the USPTO to transmit to the EPO any search results from the instant patent application. If this box is checked, the USPTO will not be providing the EPO with search results from the instant application.

NOTE: Once the application has published or is otherwise publicly available, the USPTO may provide access to the application in accordance with 37 CFR 1.14.

PROTECTING YOUR INVENTION OUTSIDE THE UNITED STATES

Since the rights granted by a U.S. patent extend only throughout the territory of the United States and have no effect in a foreign country, an inventor who wishes patent protection in another country must apply for a patent in a specific country or in regional patent offices. Applicants may wish to consider the filing of an international application under the Patent Cooperation Treaty (PCT). An international (PCT) application generally has the same effect as a regular national patent application in each PCT-member country. The PCT process **simplifies** the filing of patent applications on the same invention in member countries, but **does not result** in a grant of "an international patent" and does not eliminate the need of applicants to file additional documents and fees in countries where patent protection is desired.

Almost every country has its own patent law, and a person desiring a patent in a particular country must make an application for patent in that country in accordance with its particular laws. Since the laws of many countries differ in various respects from the patent law of the United States, applicants are advised to seek guidance from specific foreign countries to ensure that patent rights are not lost prematurely.

Applicants also are advised that in the case of inventions made in the United States, the Director of the USPTO must issue a license before applicants can apply for a patent in a foreign country. The filing of a U.S. patent application serves as a request for a foreign filing license. The application's filing receipt contains further information and guidance as to the status of applicant's license for foreign filing.

Applicants may wish to consult the USPTO booklet, "General Information Concerning Patents" (specifically, the section entitled "Treaties and Foreign Patents") for more information on timeframes and deadlines for filing foreign patent applications. The guide is available either by contacting the USPTO Contact Center at 800-786-9199, or it can be viewed on the USPTO website at http://www.uspto.gov/web/offices/pac/doc/general/index.html.

For information on preventing theft of your intellectual property (patents, trademarks and copyrights), you may wish to consult the U.S. Government website, http://www.stopfakes.gov. Part of a Department of Commerce initiative, this website includes self-help "toolkits" giving innovators guidance on how to protect intellectual property in specific countries such as China, Korea and Mexico. For questions regarding patent enforcement issues, applicants may call the U.S. Government hotline at 1-866-999-HALT (1-866-999-4258).

LICENSE FOR FOREIGN FILING UNDER

Title 35, United States Code, Section 184

Title 37, Code of Federal Regulations, 5.11 & 5.15

GRANTED

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Bureau of Industry and Security, Department of Commerce (15 CFR parts 730-774); the Office of Foreign AssetsControl, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

NOT GRANTED

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).
