A computer implemented method, and a carrier medium carrying computer code to implement the method to generate a customized "link collection" of topics and items attached to the topics related to a subject of interest to a group of people. The link collection includes items of information, provided, in one embodiment, in the form of URLs. A member of the link collection requires only a computer connected to a server system via a network such as the Internet. In one embodiment, access to the link collection is provided by a Web browser application running on the computer. The collection of attachments can be viewed and searched by a corresponding group of at least one user. The topics do not necessarily have a hierarchy, and a dynamic hierarchy may be defined in the process of a multi-step search.

AUTHORING AND MANAGING PERSONALIZED SEARCHABLE LINK COLLECTIONS

RELATED PATENT APPLICATIONS

[0001] The present invention claims priority of U.S. Provisional Patent Application Ser. No. 60/688,433 to inventors Smadja, et al., filed Jun. 7, 2005, and titled **AUTHORING AND MANAGING PERSONALIZED SEARCHABLE LINK COLLECTIONS**, filed with attorney/agent docket no. TOPIX105-P. Such U.S. Provisional Patent Application Ser. No. 60/688,433 is incorporated herein by reference in its entirety.

[0002] The present invention also claims priority of U.S. Provisional Patent Application Ser. No. 60/609,215 to inventors Palmon, et al., filed Sep. 10, 2004, and titled **USER CREATING AND RATING OF ATTACHMENTS FOR CONDUCTING A SEARCH DIRECTED BY A HIERARCHY-FREE SET OF TOPICS, AND A USER INTERFACE THEREOF**, filed with attorney/agent docket no. TOPIX101-P. Such U.S. Provisional Patent Application Ser. No. 60/609,215 is incorporated herein by reference in its entirety, and is referred to herein as the First Parent Application.

[0003] The present invention also claims priority of U.S. Provisional Patent Application Ser. No. 60/621,290 to inventors Palmon, et al. filed Oct. 22, 2004, and titled: **CREATING AND SHARING COLLECTIONS OF LINKS FOR CONDUCTING A SEARCH DIRECTED BY A HIERARCHY-FREE SET OF TOPICS, AND A USER INTERFACE THEREFOR**, filed with attorney/agent docket no. TOPIX104-P. Such U.S. Provisional Patent Application Ser. No. 60/621,290 is incorporated herein by reference in its entirety, and is referred to herein as the Second Parent Application.

BACKGROUND

[0004] The present invention is related to searching for information, for example, searching for information on the Internet. In particular, the present invention is related to searching for information guided by a set of topics such as keywords, wherein the set of topics is not necessarily hierarchical, and wherein during any particular search, any search hierarchy of topics is created on the fly.

[0005] As background, the reader is assumed to have read the First Patent Application and the Second Patent Application, both of which are incorporated herein by reference, and are attached hereto as Appendix A and Appendix B, respectively.

[0006] A Brief introduction to these related applications is now presented.

Overview of the System Described in the First Parent Application

[0007] The First Parent Application describes a system for a user to create and rate attachments for conducting a search. The search is directed by a hierarchy-free set of topics. The First Parent Application also describes a user application thereof. An implementation of a system incorporating the aspects described in the First Parent Application is called "Topixa" herein. By "Improved Topixa" is meant a Topixa system incorporating one or more aspects of the Second Parent Application and/or of the present invention.

[0008] One aspect of the Topixa system described in the First Parent Application is the providing of a set of topics useful for guiding a search, each topic having attachments to one or more items of information, e.g., Web pages that are appropriate for the topic. The set of topics is not necessarily hierarchically arranged. Rather, for a particular search starting with an initial topic or a search phrase, a hierarchy of topics for the particular search is determined on the fly. Each step of the hierarchical search includes selecting a topic or providing a search phrase, and results in a set of suggested topics for furthering the search. At any stage, results for the search so far, e.g., URLs of the information items, are also provided. The set of suggested topics is generated by an analysis of the attachments of the search results under the initial search or the search topic. One aspect of the invention is that the suggested topics include one or more refinement topics determined from the plurality of topics according to a refinement topic criterion.

[0009] In one embodiment of Topixa, an initial search page provides for a user to input a search phrase and also to sign-in, in the case that a user is not signed in. Thus, initially, a searcher inputs a search phrase and is presented with a set of suggested topics, including refinement topics, and selected information items that result in searching for the input search phrase. The searcher may now select a topic from the suggested topics, or a search phrase.

[0010] In another embodiment of Topixa, an initial set of topics is pre-defined, and this is the initial set of topics used to determine an initial set of suggested topics.

[0011] One aspect of the Topixa system described in the First Parent Application is that it provides users, e.g., searchers who have registered by providing registration information, with the ability to create topics. In one version, in which an initial set of topics is pre-defined, users are thus provided with the ability to add to the initial set of topics. Another aspect of the invention is providing the capability for such users to create attachments between information items and topics. Another aspect of the invention is providing for such users the ability to rate attachments. In one embodiment, users are provided with the mechanism to rate an attachment between a topic and an information item using a binary rating system that has a first value ("positive," positively rating") and a second value ("negative," negatively rating") less favorable than the first value. Another aspect of the invention is a method of calculating an overall attachment quality for each attachment based on the rating of the attachment by users.

[0012] Another aspect of the Topixa system described in the First Parent Application is that a registered user may select one or more topics to be "preferred" or "favorites" for that user. That user is presented with a view of the search results that differs from what is presented to another searcher. In one embodiment, the suggested topics for furthering a search are presented in an order in which topics that have been selected to be favorites appear before other topics.

[0013] Another aspect of the Topixa system described in the First Parent Application is that suggested topics, e.g., refinement topics for furthering a search are presented in an order determined according to a refinement topic ranking method. In one embodiment, the ranking method depends on how registered users of the system have rated attachments to

the search results for each potential refinement topic, in particular, according to the calculated overall attachment quality of the attachments between a potential refinement topic and the information items of the search results.

[0014] Yet another aspect of the Topixa system described in the First Parent Application is a carrier medium, e.g., a storage mechanism, for storing a data structure that includes a user data structure to store the set of topics, a topic data structure configured to store the set of topics that are not necessarily hierarchically structured, an attachment data structure configured to store the attachments between topics and information items, e.g., Web pages. The data structures are part of a main data structure. In one embodiment the main data structure is in the form of a set of tables of a relational database, and the topic data structure, the user data structure, and the attachment data structure are each a table of the database.

Overview of the system described in the Second Parent Application and Extensions Thereof

[0015] In one embodiment of the Topixa system described in the First Parent Application, all topic classifications are shared by every user. This feature of the system allows the operator of a service based on the system to create the critical mass of aggregated use knowledge. There is however a need for groups of users to view attachments that are created only by a specific user or only by a specific group of users. Such a need is illustrated by the following examples:

[0016] 1. Suppose the operator of a Web site called Bay Area Hiker classifies his own site into topics in order to improve searching within his site. The user would like to share these classifications and URLs linked to these topics with some other users of the Improved Topixa system to provide for such other users the ability of searching within these topics, i.e., only in his site.

[0017] 2. A group of people called the Wild California hiking group maintains a list of adventurous hikes in the area. Members of this group would like to view how other members have classified hikes into topics because members know that other members of this group are better at classifying hikes than some unknown person. That is, it is desired to provide for members of the group the ability of seeing search results only within the attachments belonging to other members of the group.

[0018] 3. John is a user, and is classifying sushi restaurants in Senegal. John would like to share his classifications, i.e., his topics and attachment ratings with a selected set of friends, e.g., with his friend Brett who John knows is going to Senegal. John would also like to share his Sushi-savvy with Issy. There is a need to share John's attachments with a small group of friends.

[0019] One aspect of the Second Parent Application and of the present invention, called "Topixa groups," is to allow sharing attachments between URLs and topics among a pre-defined group of people. Example 2 above illustrates this need. Such sharing of attachments also creates sharing of search results.

Introducing the Link Collection

[0020] FIG. 3A is the same as FIG. 7 of the First Parent Application (incorporated herein by reference Provisional

Patent Application Ser. No. 60/609,215) and describes a user interface display 700 that shows, for a search example, how the results of a search at some stage of a search may be shown in two forms: a main display area 750 and a user-specific explorer bar (or other additional window) 760. The presented user interface display 700 includes an indication 719 of the current user, in this example as a Welcome message with a username selected by the user during registration. Provision is also provided for the user to indicate, e.g., by signing in, if the username shown is of a different user. Sign-out provision 729 also is provided, in this example in the explorer bar 760, for the user to sign out.

[0021] The main window 750 of the presented user interface display includes a user specific manner of presenting results. For example, the main window 750 includes an indication of the search topic path 703, in this case again "Half Moon Bay>Things to do>Hiking>Trails." In one embodiment, a provision to add the current search topic path to a stored set of the user's favorite search topic paths is included, in this embodiment as a clickable object 717 labeled "Add to My Topixa" or similar designation, where in this example, "My Topixa" is a user's user specific information, such as the user's favorite topics, positively rated attachments, and other user specific information. In one embodiment, the main window 750 also includes a message area 745, which in the example shown contains the message "This topic path has been added to My Topixa." Such a message would result, for example, after the user clicks on the clickable object 717 to make the current search topic path 703 a favorite.

[0022] In one embodiment, the main display window 750 of the presented third user interface display 700 further includes the URL results 701, in this embodiment, in three different presentations. The first includes the positively rated, e.g., "favorite" results, that is, those URLs that have attachments to the topic(s) of the search topic path that the user has "selected" to be included as the user's "Favorite" attachments. The second list 743 is of the overall results.

[0023] In one embodiment, the main window 750 of the presented user interface display 700 includes in the favorites results 707 a provision to "junk" one or more of the results, e.g., in the form of a check window 721 and a "junk" button 723 appropriately marked with "Delete link from My Topixa," where "My Topixa" is the list of favorite attachments under the search topic path. Checking any result(s) and clicking on a provided button 723 negatively rates the attachments of the marked URLs to the search topic path.

[0024] The main window 750 of the presented user interface display 700 also includes a set of suggested topics in the form of a set of refinement topics 705. In one embodiment, the number of URLs under each of the suggested topics also is displayed. One embodiment of the presented user interface display window 750 further includes a mechanism for the searcher to provide an additional search phrase to search for within the search topic path. In FIG. 3A, this mechanism is in the form of a text window 711 within which the user can enter the search phrase, and a button 715 to initiate the next step in the search.

[0025] In one embodiment, the set of refinement topics is presented with an indication of which of the suggested topics are the user's favorite topics. In FIG. 3A, a star is shown in the list 705 to indicate the favorite suggested

topics. Furthermore, the ordering is such that the favorite suggested topics are presented before the other suggested topics. In the example shown in **FIG. 3A**, three of the suggested refinement topics: “family trails,” “long trails,” and “nature hikes” are favorites, e.g., have previously been selected as favorites by this user.

[0026] In one embodiment, and of relevance to aspects of the present invention, the user interface display **700** includes a user-specific explorer bar **760** (or similar panel) that provides user specific information. In one embodiment, the present search topic path is displayed **731** if such a search topic path was made favorite. In an alternate embodiment, the present search topic path is displayed **731** even if such a search topic path was not made favorite. A clickable object is provided for displaying and managing all favorite search topic paths, and a clickable object, here labeled “New . . .” **727** is provided for adding a new search topic path as a favorite search topic path.

[0027] In one embodiment, the explorer bar (or similar panel) **760** includes a list **741** of the user’s favorite attachments for the present search topic path. The explorer bar (or similar panel) **760** further includes a clickable object **739**, labeled in **FIG. 3A** as “Add current page” for adding an attachment between the currently displayed search topic path, and the Web page displayed in the main window **750**. Thus, a user selects a Web page by clicking on one of the results **701**. This causes that URL to be served and displayed in the main window **750**. A user now clicking on the clickable object **739** causes information to be sent to the server that adds attachments between the URL displayed in the main window and each topic in the currently displayed search topic path **731**.

[0028] Thus, a mechanism is provided for the user to rate the quality of any attachment between a displayed search result and the search topic path.

[0029] In one embodiment, the explorer bar (or similar panel) **760** of the user interface display **700** includes provision for the user to add a topic or subtopic. In the version shown, the provision is in the form of a clickable object **737** that when invoked, causes the server to serve a popup page for adding a new topic, or a subtopic to the presently displayed search topic path, e.g., to the last topic in the search topic path. Each new topic or subtopic becomes a favorite for the particular user.

[0030] A particular user’s user-specific information (called “My Topixa” in this drawing) includes the user’s favorite topics, the user’s positively rated attachments, and other user specific information. The results shown in the “My Topixa” window **760** are only the positively rated, e.g., “favorite” results, that is, those URLs that have attachments to the topic(s) of the search topic path that the user has “selected” to be included as the user’s “Favorite” attachments.

[0031] One might say that user specific results (window **760**) are those results from searching within a first “collection” called My Topixa for that user. The searching within the first collection accessible to a first group, e.g., the group consisting of only that user. The other window, window **750** in user interface **700**, can be thought of as the results of searching within a second “collection” which includes the whole system. Searching within the second collection is

accessible to a second group that in this case includes all the users of Topixa, and in one embodiment, non-user searchers too, i.e., searcher’s who have not registered with the system.

[0032] An aspect of the invention described in the Second Parent Application, and herein, is generalizing the concepts to provide for defining collections, with each collection accessible to a corresponding group of users defined for the collection. By a “link collection” is meant a set—a virtual “area”—of links, i.e., attachments that can be viewed and searched separately by a group of one or more users, as described herein by way of examples. As a first example, suppose that a user Mary wishes to form a collection of attachments such that she and any other member of a group of mothers she knows in Menlo Park, Calif. can use them. Mary can form a link collection for the group of users. The collection has a name, e.g., the “Menlo Park Moms group” link collection. Mary lets each member of the group know of the existence of this collection, e.g., by letting them know of the name of the collections, and e.g., forming a password and letting the members know of the password. Some members of the group can be provided the privilege of defining links to be within that collection. Other members who do not have this privilege then only have viewing and searching privileges. This provides a member of the group the capability of carrying out a search as described in the First Parent Application, and further, to view the results of such a search that are within the collection, e.g., only classified into topics that are part of the collection, with suggested topics that are only part of the collection, and of URLs that have links to the collection.

[0033] As described above, the First Parent Application already describes two types of link collections.

[0034] Personal (private) link collections. For a particular user, these are the links, topics, search topic paths, etc., that have been added, i.e., positively rated by the particular user. See, e.g., “My Topixa” in **FIG. 3A** (the same as **FIG. 7** of the First Parent Application) and the description thereof. These are the My Topixa topics, links, etc. The group of users for a personal collection consists of the particular user. When conducting a search, the particular user can view the search results separately, e.g., in a separate window, that is part of that user’s personal collection.

[0035] The overall collection for the system. This is the “All Topixa” window of results shown in **FIG. 3A**. Any user sees these results. Thus, the group of users who can view the results of the overall-link collection is the overall set of users. In one embodiment, non-users, e.g., searchers who have not registered with the system also can view such results. This overall link collection is called the system’s link collection herein.

[0036] The Second Parent Application generalizes this to have one or more collections that corresponding groups of particular users can see and search within. Each link collection is associated with a user—called the link collection’s creator—who defined the collection. Each link collection further has a name—the link collection name—by which the collection may be identified, and a group of people—the link collection group—to whom the collection is accessible, with each member of the group called indeed called a “member” of the link collection group. Alternatively, rather than a group of pre-defined users, each link collection has an

associated set of at least one password. A person who knows the password may access and use the link collection. In one version there are two passwords, one to provide editing privilege (see below), and another to provide viewing privilege so that the user may search within the collection. Thus, any member can view results of a search with the collection. Furthermore, in one embodiment, the member's of a collection's group, i.e., the group of people associated with a collection includes a subset of one or more members, including at least the creator, who have editing privilege in that such a member may define topics and search topic paths to be part of the link collection, and with such defining of a topic or search topic path, automatically define all the links that he attached to this topic or search topic path. Thus, any member has viewing privileges to view search results within the group, and some member(s) have editing privileges. In one embodiment, when a member views the name of a link collection, the collection's creator's username is concatenated, in the possessive form, with the collection's name. For example, if Mary created the collection called "Menlo Park Moms group," then members of the group can search and view search results within this collection, and the collection's name appears as "Mary's Menlo Park Moms group" in the system and for such users. Of course in other embodiments, the creator may be identified differently.

[0037] FIG. 3B is the same as FIG. 3B of the Second Parent Application, and shows an alternate version of the main window labeled 750 in FIG. 3A (FIG. 7 of the First Parent Application). The term "topic" in FIG. 3B refers to what was called a "search topic path" in the First Parent Application and in the text part of this description. "My Topixa" is an example of a private collection, and the results there under are the results within that private collection. Assume the user has a username Eran. When one or more aspects of the present invention are incorporated, this private collection is called "Eran's links" The main window shown in FIG. 3B further shows the system's link collection called "All Topixa" The viewer can see results that are part of the system's link collection.

[0038] FIG. 4 is the same as FIG. 3 of the Second Parent Application, and shows a version of the explorer bar, also called the left pane herein, that, after a user logs into the system, shows user specific information. In FIG. 3A (FIG. 7 of the First Parent Application), this is called the explorer bar 760. FIG. 4 includes the user's private link collection called "Eran's links" and subtopics therein.

BACKGROUND OF THE PRESENT INVENTION

[0039] The present invention is related to and extends many of the aspects first introduced in the Second Patent Application. In particular, aspects of the present invention include a method, a carrier medium carrying computer-readable code, and an apparatus that provides for users the ability to collect, define topics and search topic paths for, publish and exchange searchable "link collections." Furthermore, the link collections may be personalized in that they may have a customized appearance, and other personalized aspects. A link collection represents the common and accumulated knowledge of a group of users, e.g., the link collection members who have editing privilege on a specific topic or search topic path.

[0040] Aspects of the present invention include:

[0041] 1) Providing a link collection for users to search through. In a link collection, a Topixa group is easily searchable.

[0042] 2) Providing a method and software product and an apparatus for authoring information within one or more link collections, and for managing information within one or more link collections.

[0043] In one embodiment, a link collection is a named object that includes a set of attachments to items of information, e.g., in the form of URLs to the items of information. The items via attachments are selected and categorized into topics by a user.

[0044] In one embodiment, a link collection is stored in a data structure. Each element of a link collection structure includes the creator, a list of users and their respective privileges, e.g., editing privileges, viewing privileges, and so forth, customization information such as the look and feel of a Web page for using and searching through the link collection, and the list of attachments that belong to the link collection. In one embodiment, each entry in the list of such attachments includes the user who created the attachment, the timestamp, rating, and so forth. The entry for a link collection further includes the list of topics that belong to the collection. In one embodiment, each entry in the list of such attachments includes the user who created the attachment, the timestamp, and so forth.

[0045] The links in a link collection are searchable along one or both of two dimensions: topics and content such as a search phrase. See the First Parent Application for a more detailed description of searching along such two dimensions.

[0046] Personalized portals like "my.Yahoo!" (Yahoo, Inc., Sunnyvale, Calif.) are known, in which a user can define a personal Web page and select from a limited set of predefined feeds and services to display in that page, such as the weather, stock symbols and their latest prices, news feeds, and so forth. As described in the Second Parent Application, a link collection is associated not simply with a user but with also with a subject. For example, the first Parent Application defined a Private (Personal) Link Collection. For a particular user, these are the links, topics, search topic paths, etc., that have been added, i.e., positively rated by the particular user. See, e.g., "My Topixa" in FIG. 3A (same as FIG. 7 of the First Parent Application) and the description thereof. These are the My Topixa topics, search topic paths, links, etc. The group of users for a personal link collection consists of the particular user. When conducting a search, the particular user can view the search results separately, e.g., in a separate window, that is part of that user's personal collection.

[0047] The Second Parent Application defined another type of link collection, that like the personal link collection, is identified by the user name and a subject matter, but that now is available to a group of users. As an example, suppose that a user Mary wishes to form a collection of attachments such that she and any other member of a group of mothers she knows in Menlo Park, Calif. can use that relate to issues of interest to the group of mothers. Mary can be a creator of a link collection for the group of users. The collection has a name, e.g., the "Menlo Park Moms group" link collection.

Mary lets each member of the group know of the existence of this collection, e.g., by letting them know of the name of the collections, and e.g., forming a password and letting the members know of the password. The link collection is identified in the Topixa system by its name, and also by the identity of the creator (Mary).

[0048] Note that a link collection differs from totally open spaces such as the ones offered by Yahoo!GeoCities (Yahoo! Inc., Sunnyvale, Calif.) as it comes with some predefined structure specifically suited to the personalized exchange of information around a given subject. Such information around a given subject includes items of information, e.g., as URLs, and also topics or search topic paths that the items of information are attached to. Furthermore, a link collection is different from social bookmarking services such as provided under the name ("MyWeb") by Yahoo, Inc, Sunnyvale, Calif., and also SearchFox by SearchFox Inc., San Francisco, Calif., Del.icio.us by Joshua Schachter (an individual) at <http://del.icio.us>, and other similar services. The main difference between these services and a link collection is that a link collection is centered around a group of users-a community. The community is such that the link collection provides for members of the group to focus on a specific subject that the link collection elates to, e.g., Menlo Park mothers' issues. Furthermore, a link collection provides for the sharing of the information amongst members, and further, for at least some members that have the appropriate privileges, the ability to form associations between topics and items of information e.g., URLs, and to add items of information, and to add topics.

[0049] As described herein, creating a link collection includes defining of the members of the group, optionally assigning editing privileges to some members of the group, and to the customization of the link collection, including it's look, feel, and other user interface aspects.

[0050] One key aspect described herein is how link collections can be easily created, maintained and exchanged. One aspect of the methods described herein is that the creating, maintaining and and/or exchanging of the link collections and information contained therein may be carried out remotely, e.g., on a client system, and further, that such activities require no client software other than a common Internet browser that can access a remote system via a network, e.g., via the Internet. In one embodiment, aspects of the Topixa system reside in a server remote from the clients that hosts services for managing link collections.

SUMMARY

[0051] One aspect of the invention is a computer implemented method to generate a customized "link collection" related to a subject of interest to a group of people. The link collection includes items of information, provided, in one embodiment, in the form of URLs. Another aspect is a carrier medium carrying code to instruct one or more processors of a processing system to implement the method.

[0052] According to one aspect of the invention, a member of the link collection requires only a computer connected to a server system via a network such as the Internet. In one embodiment, access to the link collection is provided by a Web browser application running on the computer.

[0053] Specifically, one embodiment of the invention is a computer implemented method that includes defining a

collection of attachments that can be viewed and searched by a corresponding group of at least one user, a user being a searcher who has provided registration information. Each attachment in the collection is between a topic or search topic path of a defined set of topics and one or more information items of a plurality of information items, e.g., URLs, such that the collection is defined by the topics and information items of the attachments, and by the corresponding group for the collection.

[0054] In one embodiment, the defining of the collection includes accepting from a user who is the collection creator a name for the collection, and accepting from the collection creator, or from a designate thereof, one or more searchers to be potential members of the corresponding group. The defining further includes inviting the one or, more searchers to become members of the corresponding group.

[0055] Each topic is defined by a user for attachment to one or more information items of the plurality of information items. The defining of the topics includes accepting from at least one user at least one topic; and adding the topic to the set of topics. The topics do not necessarily have a hierarchical structure.

[0056] The topics that are attached to at least one information item are for searching by a particular searcher for one or more information items of the plurality of information items according to search request information provided by the particular searcher, search request information including at least one topic of the set of topics, or a search topic path, the searching including identifying at least one information item that has attachments to the at least one topic of the search request information.

[0057] Thus, one aspect of the invention, is a computer implemented method to create the link collection. The creating method includes a user who is a creator providing a name to the link collections. In one embodiment, a subject of interest also is provided with the link collection name. The name and subject of interest are, according to one implementation, in the form of unconstrained free text.

[0058] One embodiment of the creating method further includes the creator or a designate of the creator inviting one or more searchers to be searchers on the link. In one implementation, any invited searcher needs to register with the Topixa system, and thus become a user of the system as part of becoming a member of the link collection.

[0059] Thus, one aspect of the invention is a computer implemented method to define a link collection. The defining method includes a member selecting at least one item of information, e.g., in the form of a URL to a Web page. In one version, a set of topics is defined. For at least some of the items of information selected for inclusion in the link collection, at least one association is created between the item of information, e.g., the URL, and at least one topic, such that each of these at least one item of information has at least one associated topic.

[0060] For a search result that includes one or more items of information, and a search topic path for the one or more items of information such that there is an association between each item of information and each topic in the search topic path. One aspect of the invention is that a collection creator can include such a search result in the link collection, resulting in the associations between the item of

information and each topic in the search topic path being included in the link collection.

[0061] Another aspect of the invention is that each item of information, e.g., a URL may be annotated with notes and/or comments, e.g., in the form of free text.

[0062] One version of the computer implemented creating method includes assigning an item of information, e.g., in the form of a URL to the link collection. The URL is static, so that it may be viewed from any Web browser coupled to the server containing the information, e.g., to the Internet which is in turn coupled to a Web server containing the information of the URL.

[0063] In one embodiment, the URL has a simple, short, and mnemonic name which may be, at least in part, decided by the creator of the link collection.

[0064] In one embodiment, descriptive text is be assigned to the link collection. The descriptive text can be in the form of free text.

[0065] One version of the computer implemented creating method further includes creating a look and feel to the link collection. The look and feel can include one or more features such as specific colors, fonts, margins; logo and images; and type of information displayed.

[0066] One embodiment of the invention is in the form of a computer implemented method to create a link collection. The creating method of this embodiment includes selecting items of information, e.g., as URLs; optionally forming attachments between at least one of the items of information, e.g., the URLs of the link collection and at least one topic or search topic path of a set of topics, the set of topics not necessarily forming a hierarchy; and optionally annotating or commenting on at least one of the items of information, e.g., the URLs of the link collection.

[0067] In one version, the topics do have a hierarchy, and the topic hierarchy can be edited freely by members who are provided with editing privileges. Such editing of topics includes, but is not limited to, one or more of renaming topics, naming or renaming search topic paths, copying topics, copying search topic paths, placing the copied topics under another topic in the hierarchy, and deleting topics or search topic paths.

[0068] Members of the link collection that are provided with inviting privileges may invite others to become members.

[0069] One aspect of the invention is a computer implemented method to share a link collection amongst a set of members. The sharing method includes one or more of: providing a mechanism for the link collection to be viewed by a group of members; providing the members of the link collection a mechanism to perform a search through the link collection, e.g., for any word or words appearing on any of the URLs in the link collection; and providing the members of the link collection with a mechanism to perform a search through the link collection for any topic or search topic path, comment or classification information entered by the members who have privileges to add such information.

[0070] Another aspect of the invention is that the search results are returned to the member in a way that shows

results on the URLs as well as on the topic classification information entered by the members who have privileges to add such information.

[0071] Some or all of the members have privileges to add information to the link collection. The adding of information includes but is not limited to one or more of rating information and associations between topics and items of information; adding free text comments, annotations and opinions; forming associations between items of information and one or more topics, or between items of information and a search topic path; adding one or more topics, and associations thereto; adding one or more search topic paths, and associations thereto; and adding one or more items of information, and associations therefrom to one or more topics or search topic paths.

[0072] Other aspects and features will be clear from the description and the claims provided herein.

BRIEF DESCRIPTION OF THE DRAWINGS

[0073] **FIG. 1** illustrates an exemplary client-server environment that includes an embodiment of the present invention.

[0074] **FIG. 2** illustrates one method embodiment of the invention, and in particular shows what occurs at the client side and the server side.

[0075] **FIG. 3A** is the same as **FIG. 7** of the First Parent Application and describes a user interface display that shows, for a search example, how the results of a search at some stage of a search may be shown in two forms.

[0076] **FIG. 3B** is the same as **FIG. 2** of the second Parent Application, and shows an alternate version of the main window of **FIG. 3A**, according to an embodiment of the invention.

[0077] **FIG. 4** is the same as **FIG. 3** of the second Parent Application, and shows a version of the explorer bar that, after a user logs into the system, shows user specific information, according to an embodiment of the invention.

[0078] **FIG. 5** shows a user interface in the form of a Web page that is used in one embodiment to specify the look and feel of a link collection.

[0079] **FIG. 6** shows one embodiment of a link collection page with results.

DETAILED DESCRIPTION OF THE PRESENT INVENTION

Client-Server Computer Network

[0080] The present invention is preferably, but not necessarily, implemented in a client-server computer network, i.e. on a distributed computer system. An exemplary client-server environment that includes an embodiment of the present invention is illustrated in **FIG. 1**. Three exemplary clients **109-1**, **109-2**, and **109-3** are connected to an exemplary Web server **103** via a network **105**, and to a search server via the network **105**. For illustrative purposes, the network **105** is the Internet. However, network **105** may be a private network (an intranet), an internetwork, an extranet or any other known mechanism for providing a network connection. While only one Web server **103** is shown, the Web server **103** is one of a plurality of servers which are

accessible by clients, such as the one illustrated as client **101**. The Web server is also accessible by a search server, shown as search server **151**.

[0081] Note that only one client **101** is shown at any level of detail as an example. An exemplary client machine such as client **101** typically includes a processing system of at least one processor **107**, a memory subsystem **117**, a display subsystem **119**, a keyboard **115**, a pointing and selecting device **123** such as a mouse or another input device, all such input devices collectively shown as **123**, local storage **109**, and a network interface (NIC) **113** coupling the processor system to the network **105**. The elements of the processing system of the client are coupled via a bus subsystem **111** that is shown for the sake of simplicity as a single bus. The client may include more or fewer components as is known.

[0082] An exemplary search server such as search server **151** includes a processing system of at least one processor **157**, a memory subsystem **167**, a display subsystem **169**, a keyboard **165**, local storage **159**, and a NIC **162** coupling the processor system to the network **105**. The elements of the processing system of the server **151** are coupled via a bus subsystem **161** that is shown for the sake of simplicity as a single bus. The search server may include more or fewer components as is known.

[0083] An exemplary Web server such as Web server **103** also includes a processing system not shown in detail in **FIG. 1**. The Web server stores Web pages that are each identified by a URL, as is well known. One such Web page is shown as page **131**.

[0084] The client **101** includes a browser application **121** shown in **FIG. 1** as being in memory **117**, although those in the art will understand that not all instructions of the browser may be in the memory at the same time, even when the browser is in operation. The user interface assumed in this description is implemented as pages that are displayed on the client's display **119** using a browser application **121**.

[0085] For the purpose of this example, the user using the client **101** is a "link collection manager" that manages aspects of the link collection. The manager may be, for example, the link collection creator, as defined in the Second Parent Application, or a member who has editing privileges.

[0086] The other clients **109-1**, **109-2**, and **109-3** may have similar or different architectures than client **101**. For the purpose of this example, these clients each include a Web browser application that in each case is used by a searcher using the system of the invention.

[0087] The search server **151** includes a search engine application **163** shown in **FIG. 1** as being in memory **167**. The search engine includes aspects of the present invention, that is, a set of instructions implementing an embodiment of the invention, although those in the art will understand that not all instructions of the search engine **163** may be in the memory at the same time. The search server **151** also includes one or more other programs shown as **181** for Link collection management, and one or more other programs, shown as **183**, for Link collection authoring. The search server **151** may also include one or more other programs shown as **185** in **FIG. 1**.

[0088] Furthermore, while **FIG. 1** shows the search engine **163** operating in the search server **151**, other embodiments

of the invention need not operate, and in many cases will not operate on one server, but may operate on some other processor coupled to the shown search server, e.g., coupled to the server **151** via the Internet, or coupled to the server **151** via a local area network. It may also be that several method embodiments of the invention may operate at several locations all coupled via the Internet or a local network. Furthermore, a search engine in a processor on the internet may assign at least one task to various processors such that some aspects of the invention may operate remotely on at least one computer system, even in parallel on the computer system(s). How to modify the description herein to be implemented in a distributed manner would be clear to those in the art.

[0089] It may also be that several method embodiments of the invention may operate at several locations all coupled via the Internet or a local network. Furthermore, a search engine in a processor on the Internet may assign at least one task to various processors such that some aspects of the invention may operate remotely on at least one computer system, even in parallel on the computer systems. How to modify the description herein to be implemented in a distributed manner would be clear to those in the art.

[0090] A set of users, i.e., registered searchers is maintained by the search server **151** and shown as a user data structure **179** in the storage **159** of the search server **151**. Each element in the data structure **179** represents a user.

[0091] In one embodiment, the user data structure is part of a main data structure **177** residing in the storage **159** of search server **151**. In a particular embodiment, the main data structure **177** is in the form of a relational database that includes a set of tables. In such an embodiment, the user data structure **179** is a table of the main data structure **177**.

[0092] The method uses a set of topics, shown in **FIG. 1** as a topic data structure **173** of the main data structure **177** residing in the storage **159** of search server **151**. Each topic is an element in the topic data structure **173**. The topics are not necessarily hierarchically structured, and one inventive aspect of the invention is carrying out a search guided by a non-hierarchically-structured set of topics. Each topic is attached to at least one URL of a set of URLs that form the universe of searchable items. Thus, by an attachment is meant an association between a URL and a topic. Each attachment is defined by at least the <URL,topic>doublet. As described further below, a user may create an attachment, and in such a case, each attachment is described by at least the triplet <UserID,<URL,topic>>, where UserID is the user identifier. In the embodiment in which the data structure **177** is in the form of a set of tables of a relational database, the topic data structure is a table **173**. The attachments are shown in **FIG. 1** as an attachment data structure **175** that is part of the data structure **177**. In the embodiment in which the main data structure includes a set of tables of a relational database, the attachment data structure is an attachment table **175**.

[0093] While the topics are not hierarchically structured in the table **173**, one aspect of the invention is that a hierarchy for a particular search is generated on the fly as a result of a searcher selecting topics and/or search terms. For any search, such a hierarchy is called a search topic path. Another aspect of the invention is that some of the topics may initially be arranged hierarchically.

[0094] In one embodiment, a link collection also is stored in a data structure **187** that is part of structure **177**. Each element of link collection structure includes the creator, a list of users and their respective privileged, e.g., editing privileges, viewing privileges, and so forth, customization information such as the look and feel of a Web page for using and searching through the link collection, the list of attachments that belong to the link collection. In one embodiment, each entry in the list of such attachments includes the user who created the attachment, the timestamp, rating, and so forth. The entry for a link collection further includes the list of topics and, in one embodiment, search topic paths that belong to the collection. In one embodiment, each entry in the list of such attachments includes the user who created the attachment, the timestamp, and so forth.

Client-Side and Server Side Operation

[0095] A method embodiment for operation by a searcher at the client side conducting a search is now presented. The search operates on the search server side.

[0096] **FIG. 2**, which is the same as **FIG. 2** of the First Parent Application, shows one method embodiment **200** of the invention, shown in what occurs at the client side and the server side. At the client side, a searcher in **201** invokes the browser and requests a search page from the search server **151** for display on the display **119** of the client **101**. This is done, for example, by indicating to the client a Website that causes the Search server **151** to serve a start page for the searcher. On the search server side, in **203**, the search engine **163** serves an initial search page that includes provision for the searcher to enter a search phrase.

[0097] In one embodiment, provision is also provided on the initial page displayed in **205** for a searcher who is a user, i.e., who has provided registration information, to log into the system by providing, in **207**, a username and password. In such an embodiment, provision is also presented for a non-user searcher to register with the system to become a user, by providing registration information to the system, or to choose to continue as a non-user.

[0098] In a variation, the initial search page also includes an initial subset of the set of topics presented to the searcher, with provision for the searcher to select any of the presented topics. In one embodiment, the initial subset is pre-defined as an initial subset of topics to present to any searcher. In another embodiment, the initial subset is user specific. For example, in one version, the user-specific initial set is pre-defined according to properties, e.g., properties entered during registration of a user. In one version, alternatively or in addition, a particular user can modify the pre-defined initial subset to form a personalized user-specific subset for initial display. A user of the set of users may add to a general initial subset of topics or a user-specific initial subset by defining new topics and/or new attachments between topics and information items. Alternatively, in addition, the user-specific initial set is calculated according to previous activity by the user. In one embodiment, the user table **179** thus includes information on the personalized subset of topics for each user. In another embodiment, the topics table **173** includes for each topic the names of each user that claims "ownership."

[0099] On the client side, the client **101** receives the initial page, and the Web browser displays the initial page on the

display **119**. The user may input proper user name and password (collectively "user ID") in **207**.

[0100] If the user has successfully inputted a proper user name and password (see branch **208**), the client in **209** sends the user ID to the server **151**. The search engine **163** in **211** receives the information, looks up the user ID (denoted UserID herein) in the set of users in table **179** to authorize the user, and assuming successful authorization, in **211** serves a new initial page. In one embodiment, the initial page includes an initial subset of the topics personalized, e.g., selected by or for the user.

[0101] At the client side, in **213**, the new initial page with the personalized subset of topics is presented to the user on the display **119** with provision for the user to select one of the topics, e.g., by clicking on the display of a topic, or by the user entering a search phrase and causing a search, e.g., by pressing a button labeled search on the initial page.

[0102] In the remainder of the discussion, the searcher may be a user or, as a result of branch **208**, a non-registered searcher.

[0103] Thus, in the case that topics are provided for the user, the client **101** at **215** waits for the searcher to select a topic or input a search phrase. The selected topic and any search phrase input is referred to herein as the "search request information." Once the search request information is provided, then, in **217**, the client sends the search request information to the search server **151**.

[0104] At the search server **151**, in **219**, the search request information is received, and the search engine in **219** generates results based on the search request information. As will be described in more detail below, one aspect of the invention is that the search results generated in **219** include one or more URLs that meet the search request information according to one or more search criteria (see below), and further includes one or more sets of suggested topics that the searcher may select such that the searcher's electing any of the suggested topics will further direct the search. The generating of the suggested topics is described in more detail below.

[0105] Continuing at the search server, **219** further includes generating and serving a new page containing the search results, including the suggested topics, and further including any topics selected so far.

[0106] At the client **101**, in **221**, the served page is received and displayed to the searcher. The searcher may now continue the search. The client side process thus returns to **215** wherein the client **101** waits for the searcher to select a topic, e.g., one of the suggested topics as an additional topic, or a previously selected topic, or for the searcher to enter a new search phrase, or for the searcher to select one of the displayed URLs for further display.

[0107] Note that the flow chart of **FIG. 2** does not include such details as the searcher ending the process, a user logging off, a non-registered searcher registering, and so forth. That such features may be included would be clear to those in the art, and further, how to expand the flow chart to include such features would be clear to those in the art. Furthermore, the flowchart of **FIG. 2** does not include details on how to receive Web pages, how to generate Web pages, and other aspects that would also be known to those in the art.

[0108] A hierarchical search may thus be continued by continuing with 215, 217, 219, and 221 that include requesting and providing search request information on the client side, then generating results for the search request information and a Web page containing the results in the search server side, then displaying the results in back in the client side. Each such loop furthers the search in a hierarchical manner.

[0109] Note that when URLs are displayed, e.g., as results of a search for search request information, each of the URLs may be displayed in various forms, including a digest of the contents, as is common today in search engines such as those operated by Google, Inc., of Mountain View, Calif. Clicking on the URL provides a display of the web page to the searcher or user.

[0110] In one embodiment, the results page served in 219 and displayed to the searcher in 221 includes:

[0111] Each topic so far selected and each search phrase so far entered, in order.

[0112] A set of suggested topics.

[0113] The search phrase or the present phrase and previous included phrases.

[0114] The URLs of the search phrase under the topics so far selected.

[0115] One embodiment provides for a user, i.e., a registered searcher, to define a set of favorite topics. In such an embodiment, the results page served in 219 and displayed to the searcher in 221 further includes the set of the user's favorite topics.

[0116] Described herein are further improvements that provide for link collections.

OPERATION OF AN ASPECT OF THE INVENTION

[0117] As used herein, a "Link Collection Creator" is a user that creates at least one link collection, e.g., using a Web browser such as that of client system 101. The link collection creator decides on the look and feel of how the link collection appears to members of the group, and also on who of the group members has which privileges, e.g., can undertake which operations on the link collection created by the creator. For example, some members, including but not necessarily restricted to the creator, may edit a link collection, while other members may only view and search.

[0118] Note that a link collection creator is a user of the overall Topixa system, so, for example, such a link collection creator is a user with only search privileges for some other link collection for which that user only has search privileges.

[0119] A user can search through any created link collections to which he or she is a member.

[0120] In some embodiments, searching link collections is not restricted only to members of the group. That is, some link collections may include members who are not users of the system in that they have not registered with the Topixa system.

[0121] Aspects of the present invention include the object which we call the "link collection" shown stored in structure

187, and the methods that enable users to author, to manage, to exchange, and to search such link collections, depending on the privileges such a member of the link collection has with respect to the particular link collection. In one embodiment, a user performs each of these tasks with the simple use of an Internet browser.

Using Link Collections in a Search

[0122] One aspect of the invention is that the system provides for searching within a plurality of link collections. In one embodiment, the default search collections for a user of the system are the system's link collection ("All-Topixa") and any collections that the user created. If the user has not yet created any collections other than the user's default collection, then the user's private link collection is the only collection used, e.g., for a user Eran, the private collection called "Eran's links" in FIG. 4, and called "My Topixa" in FIG. 3A (FIG. 7 of the Parent Application), is the only link collection.

[0123] When searching, one aspect of the user interface is that a user can select which collections the user wants to view in a search. For example, in one embodiment a user can "minimize" any link collection such that only the title of the link collection is shown, to save space on the display screen, or a user can "maximize" (or leave maximized) any link collection such that information about the link collection, such as topics, search topic paths, and so forth are visible. In one embodiment, searching, e.g., under a topic of a search topic path, or using a search phrase, provides search results only for those link collections that are maximized.

[0124] A user can add a link collection to any search the user carries out if the user knows the link collection's name and a password. In one embodiment, a password with view-only privilege is all that is required for adding a link collection to a search pane.

[0125] One embodiment provides the capability of adding a parameter to the URL of the system that defines which link collection(s) to show. For example, using such parameters when invoking the system on a browser, a user can have displayed on the user's client browser window only the requested link collection. For example, suppose there is a link collection created by a user of username Bay Area Hiker and such a user shared this with members of a group by sending the name and the password. Such a group member can call up a window that displays only the collection called Bay Area Hiker's links.

Functions Added to the Left Pane

[0126] By way of example, not meant to be limiting, the following is a set of commands that can be used on the left pane—the explorer 760 of FIG. 3A (FIG. 7 of the Parent Application) and the pane shown in FIG. 4. This example is provided to illustrate the functionality that can be provided in different embodiments of the invention:

[0127] Display the link collection at the beginning of the path, but in a way that it is clear that this is not a search topic path, but something else.

[0128] Near the link collection, one embodiment includes the commands: Add collection; Change Collection; See All; Edit.

[0129] The command See All is included, and is an abbreviation for getting back to the user's private collection, e.g., "Eran's links" for use of the username Eran.

[0130] The command Change Collection is included to provide a user with the ability to choose from other collections of that user, to put this collection at the beginning of the search topic path, and to show only this collections search topic paths

[0131] The command Add Collection will prompt a screen that enables the user to add a collection. The user can define a new collection, or “import” a collection by, for example, writing the creator/name/edit-password of the collection.

[0132] The command Edit collection enables changing the passwords of a collection.

[0133] Near the search topic path, one embodiment displays a command Add to collection which prompts the user to select from the list of the user’s collections

[0134] The command E-mail collection provides for sending an e-mail to another user that will give a link for the user to either add this collection to such other user’s left pane for editing or to view his collection in a search pane.

[0135] Other embodiments add other commands and capabilities for manipulating link collections.

EXAMPLE USE 1

[0136] Suppose company “XYZ Bicycles” is a small bicycle store that has a Website with the URL <http://www.XYZ-Bicycles.com>. This Website includes a section called “Best links” that contains many, e.g., hundreds of links to Web locations related to bicycling. Using an embodiment of the present invention, the owner or a designate of “XYZ Bicycles” is provided with the mechanism to build a link collection related to bicycles, and to share information about this link collections to a set of members, e.g., customers and potential customers of “XYZ Bicycles” who have signed up for this information. The link collection, lets call it the “XYZ Bicycles link collection” provides these XYZ Bicycles’ members the ability to easily find information they might desire by running a topic-guided search through the link collection. See the First Patent Application on the advantages of running such a topic-guided search. Note that the creation of the link collection is carried out entirely using a Web browser, e.g., running one of XYZ Bicycles’s computers connected to the Topixa server via, e.g., the Internet.

EXAMPLE USE 2

[0137] Jean is a wine enthusiast; she enjoys and owns a large collection of wines of multiple type and origins. She is well known as a wine expert in her neighborhood and at her workplace, and she is often asked wine related questions by neighbors and/or colleagues. Jean also has a file on her computer that she uses, for her purposes, that includes a list of wine-related Websites. Some contain reviews, some have educational material, others describe specific wineries sites, some provide FAQs, and so forth. In the past, when Jean was asked a wine related questions, she used to email this file of URLs to the questioner.

[0138] Using aspects of the present invention, Jean can become a creator of a link collection called “Jean’s Wine Related Link Collection”. The URLs in her file can be easily

moved to a Website for the link collection using only her computer and a Web browser. Jean, as creator, can further form attachments between some of the URLs of items of information, and suitable topics, such as type of wine, wine region, type of information, and so forth. Jean can then tell her friends how to access this link collection, e.g., by providing the friends with a user password that provides search privileges. To some people, e.g., fellow wine enthusiasts, Jean may provide them with a different password that allows them to add URLs of interesting wine-related Websites, and to provide attachments from URLs to the one or more topics that Jean may have pre-defined for her link collection.

EXAMPLE USE 3

[0139] Patrick is a sailing instructor at the XYZ Sailing club. The club members are used to corresponding via email in which people send and receive information and opinions related to sailing. Patrick is the main contributor. Often his emails contain one or more URLs of Websites related to sailing equipment, his opinions on these, information on races, and so forth. Patrick also enjoys receiving emails replies, e.g., with comments on Websites mentioned in his emails. Using aspects of the present invention, instead of sending links to Websites via email, Patrick can instead build his own sailing related link collection, called “Patrick’s Sailing Related Link Collection”. Patrick can design the look and feel of a Website that is used for searching through this Link Collection. Patrick’s links to interesting Websites can be added by Patrick, and further categorized by form attachments between some or all of the URLs of items of information, and suitable topics. Patrick can now let people know how to reach his Link Collection, e.g., by providing a password that allows viewing and searching privileges. To some people, e.g., fellow instructors, Patrick can provide the privilege of adding links and attachments to topics. Thus, Patrick can have the sailing club members interact with him and among each other on the link collection. By allowing more and more people editing privileges, the link collection will collect other members’ comments and potentially allow others to contribute to the link collection.

Creating the Link Collection.

[0140] One aspect of the invention is providing a user with the capabilities of: creating one or more new link collections, attaching one or more search topic paths to an already created link collection, viewing all search topic paths of a created link collection, and sharing any created link topic collection with others. Which of these capabilities a particular user has depends on the privilege provided to such a user within the group of any particular link collection.

[0141] As defined above, a user who creates a link collection is the collection’s creator. The full name of a link collection is the concatenation of the username of the creator and the collection name created by the creator. In one embodiment, the concatenation uses the possessive form. For example if a user with a username Eran creates a link collection and names it “Oregon Trip,” then the full name of the link collection in Improved Topixa is “Eran’s Oregon Trip”. So, the Pseudo search topic path “Eran’s links” is just a default link collection called “links” for everything a user having a username Eran creates. Note that the underlying assumption is that usernames are unique in the system

[0142] Using a standard Internet Browser, e.g., Browser 121 of client 101 (See FIG. 1), a creator can specify a simple set of topics that help categorize the items of information of the link collection. One aspect is that these topics need not be hierarchically arranged, but of course may be. Thus, the topics can be organized and grouped based on the user's desire. For example, a link creator building a bicycling link collection, might choose to have the following topics: bike rides, bike shops, equipment, and so forth. Some of the topics may be organized hierarchically, so that the creator could have a topic: "San Francisco Bay Area" under which he could put "South Bay" and "East Bay." Once the topic set is built, still using a standard browser, the user can point and select items of information, e.g., as links such as URLs that the user wants to associate with any of the defined tags. These define associations. All the URLs thus associated with topics are automatically gathered by our system with the topics and attachments included. They are stored in storage 159 of a Topixa server 151 as information on Users (179), Topics (173) and Attachments (175).

Managing the Look and Feel of the Link Collection, and Access Privileges.

[0143] A creator also has the ability to customize the look and feel of the Link Collection, again using only a Web browser such as browser 121 of client 101. The creator can customize graphics, colors, positioning, etc.

[0144] FIG. 5 shows a user interface in the form of a Web page 500 that is used in one embodiment to specify the look and feel of a link collection. The user interface 500 includes an area 503 to describe the link collection, including a URL for where the link collection is published. The user interface 500 also includes an area 505 to describe how results are to be displayed on a results page for the link collection (a link collection results page). The user interface 500 also includes an area 507 to describe any logo that is to be included with the link collection's Web page how results are to be displayed on a results page. Note that in the user interface 500, a "tag" refers to a topic, and tagging refers to making an association for an information item to a new or existing topic (here called tag). Note also that rather than TOPIX, the service is called "RawSugar" herein.

[0145] In the user interface 500 of FIG. 5, the URL of the collection is shown as www.rawsugar.com/collections/dovr, where dovr is the username. The collection being edited is the personal collection for the user dovr.

[0146] FIG. 6 shows one embodiment of a link collection page 600 with results. The search topic path 609 is "paloaltobikes>paloaltobike." As can be seen, the look and feel of the Webpage for this collection is defined by the collection creator using a user interface such as that of FIG. 5. The search results URLs 603 and the suggested topics 605 form the overall search results.

[0147] Another aspect of the invention is the ability of the Link Collection creator to determine and assign different access privileges to different members of the link collection. The Second Parent Application described mostly two main types of privileges: editing, and viewing (searching).

[0148] Thus, a user can share a link collection with a group of at least one other person. Such other person need not be a user, but any searcher. However, for such other person to search within the link collection, e.g. to view

search results within that search collection, in open embodiment, the searcher would need to know about the collection name and possibly password. Furthermore, in one embodiment, the searcher need not be a user, i.e., register with the Improved Topixa system to access the collection. In the description herein, users are assumed.

[0149] In one embodiment described in the Second Parent Application, each share with a particular user can provide such user with editing privileges, or with view only privileges. In one embodiment, every link collection has two associated passwords, a first with edit privileges and one for view only. Thus, in such an embodiment, editing privileges may be provided by a user using the password used for editing privilege. The providing of the editing or viewing privilege is by letting the other user know the appropriate password. Thus, sharing a collection is as easy as sending someone the collection name and the password for the appropriate privilege.

[0150] Any viewer can also view the results in the collection in the search pane—the main search window (e.g., FIG. 3B). By having the password with edit privilege to a collection, a viewer also can "import" a collection to a left-pane (FIG. 4)—what we also call an explorer bar—for edit.

[0151] One aspect of the present invention is that many more categories other than editing and viewing/searching may be defined. For example, some members may be given the privilege of adding items of information and attachments to topics for these added items. Others may be also provided the privilege of being able to create new topics, and form attachments between existing and new items of information, and the added (or existing topics). Others may be able to exercise a voting privilege to rate attachments. Rating Attachments is described in detail in the First Parent Application.

Publishing and Exchanging Information On and In the Link Collection.

[0152] To publish a created Link collection, the creator informs the members of the link collection group on how to access the link collection. This may be by publishing a URL, or, using the URL of the Topixa system, and but by letting users know passwords that provide access to particular link collections. As already described above, some passwords may be associated with special privileges.

[0153] Thus, a method has been described for defining and using link collections.

[0154] Note that while the description herein has assumed that only users of the systems are able to be members of a link collection (a user is a searcher who has registered with the Topixa system), some implementations may not require members of a link collection to be a user of the Topixa system. For example, some link collections may be made available to the general public.

[0155] The methodologies described herein are, in one embodiment, performable by a machine which includes a one or more processors that accept code segments containing instructions. For any of the methods described herein, when the instructions are executed by the machine, the machine performs the method. Any machine capable of executing a set of instructions (sequential or otherwise) that

specify actions to be taken by that machine are included. Thus, a typical machine may be exemplified by a typical processing system that includes one or more processors. Each processor may include one or more of a CPU, a graphics processing unit, and a programmable DSP unit. The processing system further may include a memory subsystem including main RAM and/or a static RAM, and/or ROM. A bus subsystem may be included for communicating between the components. If the processing system requires a display, such a display may be included, e.g., a liquid crystal display (LCD) or a cathode ray tube (CRT) display. If manual data entry is required, the processing system also includes an input device such as one or more of an alphanumeric input unit such as a keyboard, a pointing control device such as a mouse, and so forth. The term memory unit as used herein also encompasses a storage system such as a disk drive unit. The processing system in some configurations may include a sounds output device, and a network interface device. The memory subsystem thus includes a carrier medium that carries machine readable code segments (e.g., software) including instructions for performing, when executed by the processing system, one of more of the methods described herein. The software may reside in the hard disk, or may also reside, completely or at least partially, within the RAM and/or within the processor during execution thereof by the computer system. Thus, the memory and the processor also constitute carrier medium carrying machine readable code.

[0156] In alternative embodiments, the machine operates as a standalone device or may be connected, e.g., networked to other machines, in a networked deployment, the machine may operate in the capacity of a server or a client machine in server-client network environment, or as a peer machine in a peer-to-peer or distributed network environment. The machine may be a personal computer (PC), a tablet PC, a set-top box (STB), a Personal Digital Assistant (PDA), a cellular telephone, a web appliance, a network router, switch or bridge, or any machine capable of executing a set of instructions (sequential or otherwise) that specify actions to be taken by that machine.

[0157] Note that while some diagram(s) only show(s) a single processor and a single memory that carries the code, those in the art will understand that many of the components described above are included, but not explicitly shown or described in order not to obscure the inventive aspect. For example, while only a single machine is illustrated, the term "machine" shall also be taken to include any collection of machines that individually or jointly execute a set (or multiple sets) of instructions to perform any one or more of the methodologies discussed herein.

[0158] Thus, one embodiment of each of the methods described herein is in the form of a computer program that executes on a processing system, e.g., a one or more processors that are part of the Topixa server. Thus, as will be appreciated by those skilled in the art, embodiments of the present invention may be embodied as a method, an apparatus such as a special purpose apparatus, an apparatus such as a data processing system, or a carrier medium, e.g., a computer program product. The carrier medium carries one or more computer readable code segments for controlling a processing system to implement a method. Accordingly, aspects of the present invention may take the form of a method, an entirely hardware embodiment, an entirely software embodiment or an embodiment combining software

and hardware aspects. Furthermore, the present invention may take the form of carrier medium (e.g., a computer program product on a computer-readable storage medium) carrying computer-readable program code segments embodied in the medium.

[0159] The software may further be transmitted or received over a network via the network interface device. While the carrier medium is shown in an exemplary embodiment to be a single medium, the term "carrier medium" should be taken to include a single medium or multiple media (e.g., a centralized or distributed database, and/or associated caches and servers) that store the one or more sets of instructions. The term "carrier medium" shall also be taken to include any medium that is capable of storing, encoding or carrying a set of instructions for execution by the machine and that cause the machine to perform any one or more of the methodologies of the present invention. A carrier medium may take many forms, including but not limited to, non-volatile media, volatile media, and transmission media. Non-volatile media includes, for example, optical, magnetic disks, and magneto-optical disks. Volatile media includes dynamic memory, such as main memory. Transmission media includes coaxial cables, copper wire and fiber optics, including the wires that comprise a bus subsystem. Transmission media may also take the form of acoustic or light waves, such as those generated during radio wave and infrared data communications. For example, the term "carrier medium" shall accordingly be taken to include, but not be limited to, solid-state memories, optical and magnetic media, and carrier wave signals.

[0160] It will be understood that the steps of methods discussed are performed in one embodiment by an appropriate processor (or processors) of a processing (i.e., computer) system executing instructions (code segments) stored in storage. It will also be understood that the invention is not limited to any particular implementation or programming technique and that the invention may be implemented using any appropriate techniques for implementing the functionality described herein. The invention is not limited to any particular programming language or operating system.

[0161] Reference throughout this specification to "one embodiment" or "an embodiment" means that a particular feature, structure or characteristic described in connection with the embodiment is included in at least one embodiment of the present invention. Thus, appearances of the phrases "in one embodiment" or "in an embodiment" in various places throughout this specification are not necessarily all referring to the same embodiment. Furthermore, the particular features, structures or characteristics may be combined in any suitable manner, as would be apparent to one of ordinary skill in the art from this disclosure, in one or more embodiments.

[0162] Similarly, it should be appreciated that in the above description of exemplary embodiments of the invention, various features of the invention are sometimes grouped together in a single embodiment, figure, or description thereof for the purpose of streamlining the disclosure and aiding in the understanding of one or more of the various inventive aspects. This method of disclosure, however, is not to be interpreted as reflecting an intention that the claimed invention requires more features than are expressly recited in each claim. Rather, as the following claims reflect,

inventive aspects lie in less than all features of a single foregoing disclosed embodiment. Thus, the claims following the Detailed Description are hereby expressly incorporated into this Detailed Description, with each claim standing on its own as a separate embodiment of this invention.

[0163] Furthermore, while some embodiments described herein include some but not other features included in other embodiments, combinations of features of different embodiments are meant to be within the scope of the invention, and form different embodiments, as would be understood by those in the art. For example, in the following claims, any of the claimed embodiments can be used in any combination.

[0164] Furthermore, some of the embodiments are described herein as a method or combination of elements of a method that can be implemented by a processor of a computer system or by other means of carrying out the function. Thus, a processor with the necessary instructions for carrying out such a method or element of a method forms a means for carrying out the method or element of a method. Furthermore, an element described herein of an apparatus embodiment is an example of a means for carrying out the function performed by the element for the purpose of carrying out the invention.

[0165] All publications, patents, and patent applications cited herein are hereby incorporated by reference.

[0166] In the claims below and the description herein, any one of the terms comprising, comprised of or which comprises is an open term that means including at least the elements/features that follow, but not excluding others. Thus, the term comprising, when used in the claims, should not be interpreted as being limitative to the means or elements or steps listed thereafter. For example, the scope of the expression a device comprising A and B should not be limited to devices consisting only of elements A and B. Any one of the terms including or which includes or that includes as used herein is also an open term that also means including at least the elements/features that follow the term, but not excluding others. Thus, including is synonymous with and means comprising.

[0167] Similarly, it is to be noticed that the term coupled, when used in the claims, should not be interpreted as being limitative to direct connections only. Thus, the scope of the expression a device A coupled to a device B should not be limited to devices or systems wherein an output of device A is directly connected to an input of device B. It means that there exists a path between an output of A and an input of B which may be a path including other devices or means.

[0168] Thus, while there has been described what are believed to be the preferred embodiments of the invention, those skilled in the art will recognize that other and further

modifications may be made thereto without departing from the spirit of the invention, and it is intended to claim all such changes and modifications as fall within the scope of the invention. For example, any formulas given above are merely representative of procedures that may be used. Functionality may be added or deleted from the block diagrams and operations may be interchanged among functional blocks. Steps may be added or deleted to methods described within the scope of the present invention.

We claim

1. A computer implemented method comprising:

defining a collection of attachments that can be viewed and searched by a corresponding group of at least one user, a user being a searcher who has provided registration information, the corresponding group defined for the collection, each attachment in the collection being between a topic of a defined set of topics and one or more information items of a plurality of information items, such that the collection is defined by the topics and information items of the attachments, and by the corresponding group,

the defining of the collection including:

accepting from a collection creator a name for the collection, the collection creator being a user,

accepting from the collection creator, or from a designate thereof, one or more searchers to be potential members of the corresponding group; and

inviting the one or more searchers to become members of the corresponding group,

wherein each topic is defined by a user for attachment to one or more information items of the plurality of information items, the defining the topics including:

accepting from at least one user at least one topic; and

adding the topic to the set of topics,

wherein the topics do not necessarily have a hierarchical structure, and

wherein the topics that are attached to at least one information item are for searching by a particular searcher for one or more information items of the plurality of information items according to search request information provided by the particular searcher, search request information including at least one topic of the set of topics, the searching including identifying at least one information item that has attachments to the at least one topic of the search request information.
