

**IN THE UNITED STATES DISTRICT COURT
FOR THE EASTERN DISTRICT OF TEXAS
MARSHALL DIVISION**

TOPWIRE LLC

Plaintiff,

v.

SAMSUNG ELECTRONICS CO., LTD.
AND SAMSUNG ELECTRONICS
AMERICA, INC.,

Defendants.

Civil Action No. 2:25-cv-01183

JURY TRIAL DEMANDED

DEFENDANTS' INITIAL INVALIDITY CONTENTIONS

APPENDICES

Appendices A-1 through A-54

Invalidity claim charts for U.S. 9,859,202

I. INTRODUCTION

Pursuant to the Court’s Docket Control Order (Dkt. No. 21) and Patent Local Rules 3-3 and 3-4, Defendants Samsung Electronics Co., Ltd., and Samsung Electronics America, Inc. (collectively, “Samsung” or “Defendants”) provide these initial invalidity contentions (“Invalidity Contentions”) to Plaintiff TopWire LLC (“TopWire” or “Plaintiff”) for Claims 1–4, 6, and 9 (collectively, “Asserted Claims”) of U.S. Patent No. 9,859,202 (“the ’202 patent” or “Asserted Patent”). These Invalidity Contentions are based on Samsung’s current knowledge of the Asserted Patent and prior art, along with its understanding of TopWire’s infringement allegations set forth in its Disclosure of Asserted Claims and Infringement Contentions (“Infringement Contentions”), served on March 12, 2026. Samsung’s investigation of the prior art and other grounds of invalidity is ongoing, and Samsung expressly reserves the right to supplement these Invalidity Contentions as the case proceeds.

Samsung filed a Petition for *inter partes* review proceeding (“IPR”) at the Patent Trial and Appeal Board (“PTAB”), challenging the validity of each claim of the ’202 patent, which includes all Asserted Claims set forth in TopWire’s Infringement Contentions. *See* IPR2026-00324 (hereinafter “the ’202 IPR”), Paper 1 (March 31, 2026). Samsung hereby incorporates by reference the Petition in the ’202 IPR, including the exhibits thereto, as if set forth fully in these Invalidity Contentions. To the extent the ’202 IPR is instituted, Samsung will abide by the stipulation attached to the Petition. ’202 IPR, Paper 1, EX1031.

Nothing in these Invalidity Contentions is intended, nor should be construed, as a waiver of any claim construction argument or noninfringement position. Samsung’s statements herein (including the accompanying claim charts) reflect in certain places Samsung’s present understanding of the purported potential scope of the claims that TopWire appears to be advocating by way of its Infringement Contentions and are not to be seen as any acquiescence to TopWire’s

interpretation of any claims. To the extent that TopWire's Infringement Contentions imply or define a scope or construction of the Asserted Claims, Samsung disagrees that any such claim scope or construction is proper. To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases at this time. The Court established separate deadlines for the parties' proposed claim constructions, and Samsung will disclose its proposed constructions accordingly. For purposes of these Invalidity Contentions, Samsung may adopt alternative claim construction positions. Samsung reserves the right to supplement, modify, or otherwise amend these Invalidity Contentions, particularly to the extent that TopWire is allowed to assert any additional Asserted Claims or theories or to amend its contentions or otherwise attempt to correct the deficiencies in its Infringement Contentions or supplement them in any way.

Nothing herein shall be interpreted as an admission that: (1) the Asserted Claims are infringed by any of Samsung's products or instrumentalities, (2) any particular feature or aspect of any of the accused instrumentalities practices any limitation of the Asserted Claims, (3) there is 35 U.S.C. § 112 support for any limitation of the Asserted Claims, or (4) any of TopWire's proposed or implied constructions are supportable or proper.

Consistent with the Local Patent Rules and the Federal Rules of Civil Procedure, Samsung reserves the right to amend these Invalidity Contentions. The information and documents that Samsung produced with these Invalidity Contentions are provisional and subject to further revision as follows. Samsung expressly reserves the right to amend its disclosures and document production referenced herein should TopWire provide any information that it failed to provide in its Local Patent Rule 3-1 and 3-2 disclosures or should TopWire amend its disclosures in any way, whether

explicitly (*i.e.*, via moving for leave to amend or supplement) or implicitly. Further, because discovery has only recently begun, Samsung reserves the right to amend the information provided herein. Such amendments include, for example, identifying and relying on additional references, should Samsung's further analysis yield additional information or references, consistent with the Patent Rules or the Federal Rules of Civil Procedure. Samsung reserves the right to supplement these contentions in light of any additional prior art of which TopWire is aware and did not disclose to Samsung in discovery. Also, because third-party discovery is not yet complete, Samsung reserves the right to supplement these contentions in light of any newly discovered information or documentation produced by any third-parties with relevant information from whom Samsung may seek discovery via subpoenas. For example, Samsung expects to issue subpoenas to, and receive information from, third-parties believed to have knowledge, documentation, and/or corroborating evidence concerning some of the prior art listed below and/or additional prior art. These third-parties include, without limitation, the authors, inventors, vendors, or assignees of the references listed in these disclosures.

Samsung also reserves the right to revise its ultimate contentions concerning the invalidity of the Asserted Claims based upon the Court's construction of the claim terms, any findings as to the priority dates of the Asserted Claims, and/or positions that TopWire, Samsung, or any expert witness may take concerning claim interpretation, infringement, and/or invalidity issues.

Prior art not included in this disclosure, whether known or not known to Samsung, may become relevant. In particular, Samsung is currently unaware of the extent, if any, to which TopWire will contend that limitations of the Asserted Claims are not disclosed in the prior art identified by Samsung. To the extent that such an issue arises, Samsung reserves the right to identify other references that would have made the addition of the allegedly missing limitation to

the disclosed device obvious or show that the allegedly missing limitation would have been known or readily apparent to a POSITA at the time of the invention in light of the disclosure of the prior art at issue.

For prior art patents and prior art publications identified in these Invalidity Contentions, Samsung reserves the right to rely on the public use, offer for sale, sale, and/or actual products embodying the methods and systems described therein uncovered during discovery. Samsung also reserves the right to rely upon any related patents and patent applications, foreign patent counterparts and foreign patent applications of U.S. patents identified in these Invalidity Contentions, and U.S. counterparts of foreign patents and foreign patent applications identified in these Invalidity Contentions.

Samsung's claim charts in Appendices A-1 through A-54 cite to or reference particular teachings and disclosures of the prior art as applied to features of the Asserted Claims, but a POSITA in the art generally may view an item of prior art in the context of other publications, literature, products, and understanding. As such, the cited portions are only examples, and Samsung reserves the right to rely on uncited portions of the prior art references and on other publications and expert testimony as aids in understanding and interpreting the cited portions, as providing context thereto, and as additional evidence that the prior art discloses a claim limitation. Samsung further reserves the right to rely on uncited portions of the prior art references, other publications, and testimony to establish reasons for combining certain cited references that render the Asserted Claims obvious. Where Samsung cites to a particular figure in a reference, the citation should be understood to encompass the caption and description of the figure and any text relating to the figure. Conversely, where Samsung cites to particular text referring to a figure, the citation should be understood to include the figure as well.

The references discussed in the claim charts in Appendices A-1 through A-54 may disclose the elements of the Asserted Claims explicitly and/or inherently, and/or they may be relied upon to show the State of the Art in the relevant time frame or the foreseeability from a technical perspective of a POSITA at the time of the alleged invention and/or marketing and/or natural and expected evolution of the art. The suggested obviousness combinations are provided in the alternative to Samsung’s anticipation contentions and are not to be construed to suggest that any reference included in the combinations is not by itself anticipatory.

II. ’202 PATENT AND ASSERTED CLAIMS

In its Infringement Contentions, TopWire asserts Claims 1–4, 6, and 9 (*i.e.*, “Asserted Claims”) of the ’202 patent (*i.e.*, “Asserted Patent”). Among the Asserted Claims, Claim 1 is an independent claim.

For the purposes of these contentions, Samsung only addresses those claims specifically asserted by TopWire in its March 12, 2026 Infringement Contentions. Samsung reserves the right to amend or supplement this disclosure as needed in light of any changes or amendments made, for any reason, to TopWire’s infringement theories, Infringement Contentions, or Asserted Claims.

III. PERSON OF ORDINARY SKILL IN THE ART

These Invalidity Contentions use the acronym “POSITA” to refer to a person of ordinary skill in the art at the time of the Asserted Patent.

Samsung contends that a POSITA in this case would have had either (i) a Master of Science in Electrical Engineering, Materials Science, Mechanical Engineering, or an equivalent field, or (ii) a Bachelor of Science in Electrical Engineering, Materials Science, Mechanical Engineering, or an equivalent field and two years of experience in the field of semiconductor packaging.

Samsung reserves the right to modify and/or supplement this contention as the case proceeds, including during expert discovery and/or after receiving TopWire’s contentions on this issue.

IV. PRIORITY DATE

The Plaintiff bears the burden of establishing the priority date to which each claim of the Asserted Patents is entitled. *See, e.g., In re NTP, Inc.*, 654 F.3d 1268, 1276 (Fed. Cir. 2011) (“[F]or a patent’s claim to be entitled to an earlier priority date, the patentee must *demonstrate* that the claims meet the requirements of 35 U.S.C. § 120.”); *Natural Alternatives Int’l, Inc. v. Iancu*, 904 F.3d 1375, 1380 (Fed. Cir. 2018) (“Accordingly, claims in a patent or patent application are not entitled to priority under § 120 at least until the patent owner *proves* entitlement to the PTO, the Board, or a federal court.”).

The ’202 patent claims priority on its face to U.S. Provisional Patent Application No. 62/184,034, filed on June 24, 2015.

TopWire’s Infringement Contentions allege that “the Asserted Claims of the Asserted Patent are entitled to a priority date of June 24, 2015.” *See* Infringement Contentions at 7. For the purposes of these Invalidity Contentions, Samsung assumes that post-AIA patent statutes apply based on TopWire’s claimed priority date of June 24, 2015, for all Asserted Claims. *Id.* This is in no way a concession that TopWire is entitled to that priority date.

Samsung specifically does not concede that the June 24, 2015 priority date is accurate. TopWire has not provided sufficient evidence to support its contention that the Asserted Claims of the ’202 patent are entitled to the priority dates of the provisional application.

In the event that TopWire seeks leave to amend its priority date or conception/reduction to practice contentions, Samsung reserves the right to supplement these Invalidity Contentions in light of those amendments. To the extent TopWire alleges that any prior art relied on in these

Invalidity Contentions does not actually qualify as prior art to the Asserted Patent, Samsung reserves the right to rebut those allegations (*e.g.*, by demonstrating an earlier critical date for the challenged prior art and/or a later priority date for the Asserted Patent and/or Asserted Claims) with additional evidence.

V. IDENTIFICATION OF PRIOR ART

Subject to Samsung's reservations of rights, Samsung identifies each item of prior art that anticipates or renders obvious one or more of the Asserted Claims, either expressly or inherently as understood by a POSITA, or based on TopWire's apparent interpretation of the claims. Samsung may also use the prior art identified to form the basis of the knowledge of a POSITA, in the sections that follow and/or in the claim chart appendices to these Invalidity Contentions. To the extent any references identified below and/or in the claim charts is not identified as an item of prior art that anticipates or renders obvious an Asserted Claim, Samsung intends to rely on such references as background and evidence of the state of the art at the time of the alleged inventions of the Asserted Patent. Samsung reserves the right to rely on additional prior art that may be uncovered during its continuing investigation and discovery.

In addition, many of the prior art references have related patent applications, publications, or issued patents that contain the same or materially the same subject matter (*e.g.*, published U.S. patent applications and publications, issued U.S. patents, and foreign applications or issued patents). Any citation to or quotation from any of these applications, publications, or patents, therefore, should be understood as encompassing any parallel citation to the same subject matter in other related or corresponding patent applications, publications, or issued patents. Moreover, Samsung relies on machine translations for various foreign prior art identified herein. Samsung reserves the right to update or amend these translations at a later time.

Also, to the extent not expressly stated herein, Samsung incorporates by reference any and all prior art contained or identified in documents produced thus far by TopWire in this case, each reference identified in all Appendices to these Invalidity Contentions, and any and all materials regarding invalidity that should have been timely produced by TopWire previously.

A. Prior Art Patents and Publications

The table below identifies patents and patent publications now known to Samsung that qualify as prior art to the Asserted Patent under at least 35 U.S.C. §§ 102(a)(1) and/or 102(a)(2). Invalidity claim charts for these references are attached as Appendices A-1 through A-54. Each listed reference became prior art at least as early as the dates provided on the face of the document, as indicated in the chart below, and/or as indicated in the corresponding Appendix. Samsung reserves the right to rely upon earlier dates of publication or public availability to the extent such information is uncovered during discovery. Samsung also reserves the right to rely on fact or expert witness testimony to establish the publication and/or public availability of any publications described below.

Table 1: Prior Art Patents and Published Patent Applications				
Patent Number	Title	Date(s)	Short Name	Appendix
US 2008/0155820	Wiring Substrate, Manufacturing Method Thereof, and Semiconductor Device	Pub: July 3, 2008	Arai	A-1

Samsung's investigation into prior art patent and publication references remains ongoing, and Samsung reserves the right to identify and rely upon additional patent or publication references.

B. Prior Art Non-Patent Publications

The table below identifies non-patent printed publications now known to Samsung that qualify as prior art to the Asserted Patent under at least 35 U.S.C. §§ 102(a)(1) and/or 102(a)(2). Each listed reference became prior art at least as early as the dates provided on the face of the document, as indicated in the chart below, and/or as indicated in the corresponding Appendix.

Samsung reserves the right to rely upon earlier dates of publication or public availability to the extent such information is uncovered during discovery. Samsung also reserves the right to rely on fact or expert witness testimony to establish the publication and/or public availability of any publications described below.

Table 2: Prior Art Printed Publications			
Title	Author/Publisher	Date	Appendix
Polymer Adhesives and Encapsulants for Microelectronic Applications	Richard C. Benson, et al.	January 1, 2008	A-38
Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration	Rabindra N. Das, et al. 25th International Symposium on Microelectronics	Sept. 13, 2012	A-39
Copper Pillar Bumping Technology	Christopher Henderson InfoTracks Semitracks Monthly Newsletter	June 27, 2012	A-40
Embedded Glass Interposer for Heterogeneous Multi-Chip Integration	Dyi-Chung Hu, et al. Institute of Electrical and Electronics Engineers (IEEE)	May 29, 2015	A-41
The Requirement of Future Substrate - Maker Point of View -	Dyi-Chung Hu Unimicron	April 22, 2014	A-42
IPC-4761 Design Guide for Protection of Printed Board Via Structures	Associate Connecting Electronics Industries (IPC)	May 7, 2008	A-43
Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module	Christian Kriedl	December 31, 2011	A-44
All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices	Tyler N. Osborn	April 2, 2009	A-45
Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects	Aibin Yu, et al. Institute of Electrical and Electronics Engineers (IEEE)	July 18, 2011	A-46

Samsung's investigation into non-patent printed publications remains ongoing, and Samsung reserves the right to identify and rely upon additional non-patent printed publications.

C. Prior Art Systems on Sale and/or Publicly Used

The table below identifies systems and products that were publicly available and/or used, offered for sale, or sold and qualify as prior art to the Asserted Patent under 35 U.S.C. §§ 102(a)(1) and/or 102(a)(2). Some or all of the supporting references for these systems, as cited below and in the corresponding Appendices, may also qualify as prior art publications under 35 U.S.C. §§ 102, such as manuals, patents, and other information intended to cover these products and systems, and may be used as invalidating prior art under 35 U.S.C. §§ 102 and 103. In addition, Samsung incorporates by reference the individuals identified in its initial disclosures, and Samsung also continues to investigate the systems and products and reserves the right to supplement the contentions and accompanying claim charts after further discovery and investigation. Samsung also reserves the right to rely on fact or expert witness testimony to establish the public knowledge, use, availability, sale, or offer for sale of any systems described below. Although additional information and prior art systems may be obtained through discovery, such prior art systems include at least the following:

Table 3: Prior Art Systems			
System/Item	Date(s)	Person/Entity	Appendix
Teensy Board	Dec. 21, 2014	PJRC, LLC	A-47
Seeed Board	Dec. 14, 2014	Seeed Technology Limited	A-48
SainSmart Board	Feb. 9, 2014	SainSmart	A-49
Apple iPhone 1	2007	Apple Inc.	A-50
Through Mold Via (TMV) PoP	2011	Amkor Technology, Inc.	A-51

MCeP	2013	Shinko Electric Industries Co., Ltd.	A-52
Apple iPhone 4–6	2014	Apple Inc.	A-53
EIT Package-Interposer-Package (PIP) Test Vehicle	Sept. 2012	Endicott Interconnect Technologies, Inc.	A-54
Preci-Dip PCB Connectors	2014 ¹	Preci-Dip SA	N/A
Mill-Max PCB Connectors	2013 ²	Mill-Max Mfg. Corp	N/A

Samsung’s investigation into prior art systems is ongoing and discovery is only in its early stages. Samsung will amend or supplement its disclosures of these systems, as its investigation and discovery continue, including third-party discovery. Samsung also reserves the right to rely on fact or expert witness testimony to establish the public knowledge, use, availability, sale, or offer for sale of any systems described above and in the accompanying claim charts.

D. Admitted Prior Art

Statements made by the Applicant in the specification and/or during prosecution of the Asserted Patent and any related patents/applications, such as in the “Background of the Invention” section that describes the related art known to the Applicant, are admissions that can be relied upon for both anticipation and obviousness determinations, regardless of whether the admitted prior art would otherwise qualify as prior art under the statutory categories set forth in 35 U.S.C. § 102. *See* MPEP §§ 2129 and 608.01(c). To the extent TopWire contends that the Asserted Claims are not invalid as anticipated by and/or obvious in view of the prior art under 35 U.S.C. §§ 102 and 103,

¹ *See, e.g.*, <https://web.archive.org/web/20140722155507/http://www.precidip.com/en/Products/PCB-Connectors/PCB-Connectors.html>

² *See, e.g.*, <https://web.archive.org/web/20130827161228/http://www.mill-max.com/>

Samsung reserves the right to rely on Applicant's "Admitted Prior Art" to demonstrate the invalidity of the Asserted Claims.

For example, the Asserted Patent and/or the alleged inventor(s) thereof admit that all of the following was prior art. Samsung reserves the right to supplement the list of admitted prior art to refer to additional admissions:

- Spacer connectors deposited between a top and bottom package substrate. *See, e.g.*, '202 patent at 1:12–15 ("Technical Field The present invention relates to a fabricating process for making a *spacer connector*, especially using a conductive carrier in an initial step of the fabrication process.").
- Metal pillars on a substrate, such as "a plurality of bottom metal pillars" on "a top package substrate" and "a plurality of top metal pillars" on "a bottom package substrate. *See, e.g.*, '202 patent at 1:16–18 ("One of the traditional processes for fabricating metal circuitry, a seed layer is often applied before *electric plating*," which was a well-known process to form metal pillars/posts on a substrate); Hu '083 (A-13) at [0008] ("[M]etal posts are formed by electroplating.").

VI. GROUNDS FOR INVALIDITY UNDER 35 U.S.C. §§ 102, 103

Samsung contends that all Asserted Claims of the Asserted Patent are invalid under 35 U.S.C. §§ 102, 103, and/or 112. The Appendices to these Invalidity Contentions contain claim charts for prior art references selected by Samsung. Specifically, the claim chart Appendices to these Invalidity Contentions set forth how the prior art identified by Samsung anticipates either expressly or inherently, or renders obvious, each Asserted Claim. Samsung cites exemplary relevant portions of the identified prior art references to provide notice of its theories of invalidity. However, other portions of the identified reference may additionally anticipate, either expressly or inherently, or render obvious one or more of the Asserted Claims. In addition, a POSITA generally would view each prior art reference in the context of other publications, literature, products, systems, and understanding. As such, the cited portions are merely exemplary, and Samsung

reserves the right to rely on uncited portions of the prior art references and on other publications, expert testimony, and other evidence as aids in understanding and interpreting the cited portions, as providing context thereto, and as additional evidence that the prior art discloses a claim limitation or any of the Asserted Claims as whole. Samsung further reserves the right to rely on uncited portions of the prior art references, other publications, and testimony, including expert testimony, to establish bases for combinations of certain cited references that render the Asserted Claims obvious. Further, as a general matter, all portions of each prior art reference are relied upon to support the disclosure of each patent claim limitation, as all portions provide general support. Supporting citations are still provided, but do not necessarily represent every location where a particular claim limitation may be found in the prior art reference.

Where Samsung cites a particular drawing or figure in the accompanying charts, the citation encompasses the description of the drawing or figure, as well as any text associated with the drawing or figure (even if the associated text is not itself expressly cited). Similarly, where Samsung cites particular text concerning a drawing or figure in the accompanying charts, the citation encompasses that drawing or figure as well (even if the associated drawing or figure is not expressly cited). Samsung further incorporates by reference the prior art references cited during prosecution of the Asserted Patent, any patents or patent applications related to the Asserted Patent, and any patent or patent application sharing a common inventor with the Asserted Patent. This includes without limitation those identified in any other proceeding involving the Asserted Patent or related U.S. or foreign patents. Samsung additionally incorporates by reference all prior art produced or otherwise known to Plaintiff and all prior art known to the named inventors, any past or current owner, or any individual substantively involved in the prosecution of the Asserted Patent.

Samsung contends that at least some of the systems and products disclosed in one or more of the prior art references identified here or in the attached Appendices are prior art under 35 U.S.C. §§ 102(a)(1) and/or 102(a)(2), and/or 103. Samsung's reference to any particular component, device, machine, or other product herein should also be interpreted as a reference to the product itself and any corresponding patents, publications, or product literature cited here or in the attached Appendices that relate to the cited component, device, machine, or other product. Samsung's reliance on each prior art reference identified throughout these Invalidity Contentions includes the reference itself, anything incorporated by the reference or described as relevant technology by the reference, any system embodying the reference, and any testimony by those with knowledge of the reference, such as named authors and inventors. All such documents and information shall be considered one prior art reference to the extent they describe a single prior art system, technology or solution. Moreover, while some prior art may be charted separately, Samsung reserves the right to show that combinations of individual charts describe a portion of single prior art system or solution.

Samsung does not yet have complete information regarding the dates by which some of the cited products were publicly disclosed, used, sold, or offered for sale, the circumstances under which the research, design, and development activities were conducted, and the identities of the particular individuals involved in such activities through publicly available patents, publications, and product literature. Samsung reserves the right to amend these Invalidity Contentions upon obtaining further information related to the cited products herein, including information obtained relating to any Samsung products or third-party products obtained through subpoenas as this case progresses through discovery.

It is understood that a POSITA reads a prior art reference as a whole and in the context of

other publications, literature, and general knowledge in the field. To understand and interpret any specific statement or disclosure in a prior art reference, a POSITA also relies upon other information including other publications and general scientific, engineering or other relevant knowledge. Samsung reserves the right to rely upon the general scientific, engineering or other relevant knowledge in the field in interpreting the disclosure of the prior art references. In addition, Samsung reserves the right to rely upon other publications and on expert testimony to provide context and to aid in the understanding of the prior art references. Samsung also reserves the right to rely upon other portions of the prior art references, other publications, and the testimony of experts to establish that the alleged inventions would have been obvious to a POSITA, including the basis for modifying or combining the prior art references. Furthermore, Samsung reserves the right to rely upon any admissions relating to prior art found in the intrinsic evidence for the Asserted Patent.

Certain pieces of identified prior art inherently disclose features of the Asserted Claims. Samsung may rely on inherency to demonstrate the invalidity of the Asserted Claims. Moreover, certain prior art references and solutions may inherently anticipate certain features of the Asserted Claims as construed by Plaintiff. Samsung may rely on other portions of the prior art, other documents, and expert testimony to establish the inherency of certain features of the prior art to invalidate the Asserted Claims. Samsung also may rely on any reference identified in these invalidity contentions or any other reference to prove that the references are enabled or to explain the meaning of a term used in the solutions or any reference.

Whether a prior art reference anticipates or renders obvious the Asserted Claims may depend on claim construction. To the extent any limitation is deemed not to be met exactly by an item of prior art, Samsung contends that the difference would have been obvious to a POSITA and

within the knowledge of one skilled in the art at the time of the alleged invention, such that the claimed invention would have been obvious both in light of the single reference alone and/or in light of combined references.

To the extent that prior art cited for a particular limitation discloses functionality that is the same or similar in some respect to the alleged functionality in the accused products as set forth in TopWire's Infringement Contentions (notwithstanding the deficiencies therein), Samsung does not concede that those limitations are in fact met by those accused functionalities.

Further, in the attached Appendices to these Invalidity Contentions, Samsung has identified where the prior art references disclose subject matter recited in the preambles of the Asserted Claims, without regard to whether the preambles are properly considered to be limitations of the Asserted Claims.

Samsung's proposed obviousness combinations of the prior art references are separately identified throughout these Invalidity Contentions (including in § VI.B, below).

Samsung reserves the right to further streamline and reduce the number of anticipation and/or obviousness references relied on with respect to a given Asserted Claim and to exchange or otherwise modify the specific references relied upon for anticipation and within each obviousness combination for each asserted claim. Discovery is at an early stage, and TopWire has not provided sufficient contentions or documentation with respect to any pre-filing invention dates or with respect to claim limitations that are allegedly lacking or not obvious in the prior art.

A. Anticipation

Samsung contends that the Asserted Claims of the '202 patent are anticipated by the prior art, or are obvious in view of the prior art, as set forth in the table below. Samsung provides Appendices A-1 through A-54, which contain claim charts demonstrating the invalidity of the Asserted Claims of the '202 patent.

Each Asserted Claim is anticipated or rendered obvious by the following prior art, either alone or in combination with the knowledge of a POSITA, the state of the art, admitted prior art, or in combination one or more other prior art references as described below in § VI.B:

- Arai (A-1)
- Berry (A-2)
- Chen '402 (A-3)
- Chen '484 (A-4)
- Daizo (A-5)
- Dunne (A-6)
- Furuta '669 (A-7)
- Furuta '415 (A-8)
- Ganesan (A-9)
- Hsu '142 (A-10)
- Hsu '559 (A-11)
- Hu '687 (A-12)
- Hu '083 (A-13)
- Hu '659 (A-14)

- Apple iPhone 4-6 (A-53)
- EIT Package-Interposer-Package (PIP) Test Vehicle (A-54)

B. Obviousness

A massive body of relevant, analogous prior art existed as of the earliest filing dates of the

Asserted Claims, as identified, for example, in § V, *supra*. Taken together, this prior art discloses each and every limitation of every asserted claim. Example combinations of specific prior art references that Samsung may rely on at trial to demonstrate obviousness of the Asserted Claims are set forth below. Such obviousness combinations are provided in the alternative to Samsung's anticipation contentions and are not to be construed to suggest that any references included in the combinations is not by itself anticipatory or that any particular limitation is missing from a particular reference.

Given the scope and content of these prior art references, the lack of any substantial differences between these references and the Asserted Claims, and the knowledge of a POSITA at the time of the alleged inventions, it would have been obvious to combine the specified references. *See KSR Int'l Co. v. Teleflex Inc.*, 550 U.S. 398 (2007). Moreover, a POSITA had a motivation to combine these references because—at a minimum—they all pertain to the subject of spacer connectors.

One or more combinations of the prior art references identified above would have been obvious because those references would have been combined using: known methods to yield predictable results; known techniques in the same way; a simple substitution of one known, equivalent element for another to obtain predictable results; and/or teaching, suggestion, or motivation in the prior art generally. In addition, it would have been obvious to try combining the prior art references identified above because there were only a finite number of predictable solutions with a reasonable expectation of success and/or because known work in one field of endeavor prompted variations based on predictable design incentives and/or market forces either in the same field or a different one. In addition, the combination of the prior art references identified above would have been obvious because the combination represents the known potential

options with a reasonable expectation of success.

These rationales would have motivated a POSITA to combine the identified prior art items and teachings. As the Supreme Court held in *KSR Int'l Co. v. Teleflex, Inc.*, “[t]he combination of familiar elements according to known methods is likely to be obvious when it does no more than yield predictable results.” 550 U.S. 398, 416 (2007). The Supreme Court further held that “[w]hen a work is available in one field of endeavor, design incentives and other market forces can prompt variations of it, either in the same field or a different one. If a person of ordinary skill in the art can implement a predictable variation, § 103 likely bars its patentability. For the same reason, if a technique has been used to improve one device, and a person of ordinary skill in the art would recognize that it would improve similar devices in the same way, using the technique is obvious unless its actual application is beyond his or her skill.” *Id.* at 418.

“[I]n many cases a person of ordinary skill will be able to fit the teachings of multiple patents together like pieces of a puzzle.” *Id.* at 420. For example, the Supreme Court held that it is sufficient that a combination of elements was “obvious to try,” recognizing that “[w]hen there is a design need or market pressure to solve a problem and there are a finite number of identified, predictable solutions, a person of ordinary skill has good reason to pursue the known options within his or her technical grasp. If this leads to the anticipated success, it is likely the product not of innovation but of ordinary skill and common sense.” *Id.*

Patents like the Asserted Patent here are invalid, the Supreme Court explained, because “[g]ranting patent protection to advances that would occur in the ordinary course without real innovation retards progress and may, in the case of patents combining previously known elements, deprive prior inventions of their value or utility.” *Id.* at 402. Here, each of the prior art items identified above is directed to the same field of endeavor as the Asserted Patent at least under

TopWire’s apparent interpretation³. Further, each prior art item was directed to the same problem or problems that the Asserted Patent purportedly addressed. The Asserted Claims therefore represent, at the most, mere “ordinary skill and common sense,” not innovation. In other words, the alleged inventions of the Asserted Patent are, at most, obvious combinations or adaptations of well-known technology used in predictable ways.

Additional evidence that there would have been a motivation to combine the prior art references identified above includes the interrelated teachings of multiple prior art references; the effects of demands known to the design community or present in the marketplace; the existence of a known problem for which there was an obvious solution encompassed by the Asserted Claims; the existence of a known need or problem in the field of the endeavor at the time of the invention(s); and the background knowledge that would have been possessed by a POSITA.

Thus, the motivation to combine the teachings of the prior art references disclosed herein is found in the references themselves and: (1) the nature of the problem being solved; (2) the express, implied and inherent teachings of the prior art; (3) the knowledge of POSITAs; (4) the predictable results obtained in combining the different elements of the prior art; (5) the predictable results obtained in simple substitution of one known element for another; (6) the use of a known

³ As reflected in TopWire’s Infringement Contentions, TopWire broadly interprets the field of endeavor to include not only semiconductor packaging technology but also printed circuit board assembly technology. TopWire’s Infringement Contentions at 3, 5–6. In addition, TopWire appears to have also taken broad interpretations regarding certain terms. *See e.g.*, TopWire’s Infringement Contentions, Ex. A, at 8–9 (interpreting “bottom package substrate” and “top package substrate” to cover printed circuit boards), 18 (interpreting “metal pillars protrudes downwardly from a bottom surface of the core substrate” to cover metal pillars that are flush with the bottom surface of a core substrate), 19–20 (interpreting “bottom metal pillars” and “top metal pillars” to cover solder connections); Samsung’s Petition, IPR2026-00324 at 5–8 (discussing TopWire’s apparent claim constructions). For the purpose of this Invalidity Contentions only, Samsung adopts TopWire’s apparent interpretation for all relevant terms until further resolution of the disputes during the claim construction as set forth in the Court’s Docket Control Order. For avoidance of doubt, Samsung does not concede TopWire’s interpretations are correct.

technique to improve similar devices, methods, or products in the same way; (7) the predictable results obtained in applying a known technique to a known device, method, or product ready for improvement; (8) the finite number of identified predictable solutions that had a reasonable expectation of success; and (9) known work in various technological fields that could be applied to the same or different technological fields based on design incentives or other market forces.

Any reference or combination of references that anticipates or makes obvious an asserted independent claim also makes obvious any asserted claim dependent on that independent claim because every element of each dependent claim was known by a POSITA at the time of the alleged invention, and it would have been obvious to combine those known elements with the independent claims at least as a matter of common sense and routine innovation. Accordingly, Samsung contends that each Asserted Claim would have been obvious not only by the combinations explicitly defined in these contentions, but also by any combination of references that renders obvious an Asserted Claim.

In addition to the exemplary prior art references, systems, and teachings identified herein and in the accompanying Appendices, the common knowledge of POSITAs also constitutes prior art, and may be relied on by Samsung through testimony or declarations in combination with the identified prior art. The knowledge of a POSITA at the time of the alleged invention would also include, for example, the known advantages and disadvantages of each of the limitations recited in the Asserted Claims. It would have been obvious to combine the references and teachings identified herein with one another based on the nature of the problem to be solved, the general knowledge of a person of ordinary skill in the art, the teachings of other art in existence at that time, and the recognition of similarities between the art and the claimed features. On these bases,

each identified prior art item can be combined with others if a particular prior art item lacks or does not exactly disclose a limitation or feature of an Asserted Claim.

Samsung hereby expressly incorporates by reference any statements and reasons set forth by the Examiner during prosecution of the Asserted Patent and any relevant family patents, including the First Reissue, the Parent Patent, and any continuation patents that may issue from the Asserted Patent, particularly as to why it would have been obvious to modify or combine references to achieve the limitations of the Asserted Claims. Numerous prior art references, including those identified above, reflect common knowledge and the state of the prior art before the priority date claimed on the face of each asserted patent.

For at least the reasons described above and below in the examples provided as well as in the claim chart Appendices, it would have been obvious to a POSITA to combine any of a number of prior art references, including any combination of those identified in Appendices A-1 through A-54, to meet the limitations of the Asserted Claims. Samsung provides additional motivations to combine as to specific exemplary combinations and elements, as discussed in the sections that follow. As such, Samsung's inclusion of exemplary combinations does not preclude Samsung from identifying other invalidating combinations as appropriate.

1. Top Package Substrate Stacked on Top of a Bottom Package Substrate

Claim 1 of the '202 patent recites "a top package substrate stacked on top of the bottom package substrate." *See, e.g.*, '202 patent, Claim 1. Claims 2–4, 6, and 9 each depend from Claim 1, and therefore incorporate this limitation.

Nothing about the claimed, generic "top package substrate stacked on top of the bottom package substrate," as recited in the above referenced claim, adds anything non-obvious over the prior art. The structure of "a top package substrate stacked on top of the bottom package substrate"

was well known in the art before the alleged invention of the '202 patent. To the extent any of the structural elements reciting a stacked “top package substrate” and “bottom package substrate” is not explicitly or inherently disclosed in a charted reference, such elements are disclosed and/or taught by each of the prior art references identified in the non-exhaustive list below and the corresponding Appendices, such that references in combination, in addition to the relevant teachings identified herein and/or charted, render the claim obvious.

- EIT Package-Interposer-Package (PIP) Test Vehicle (A-54)

A POSITA at the time of the alleged invention would have been motivated to combine the teachings of these references with the charted references for the reasons stated above. For example, a POSITA seeking to interconnect mounted components would have recognized that a top package substrate could be stacked on top of a bottom package substrate. Such a configuration was a well-known design choice in the semiconductor packaging art, as it allowed manufacturers to improve electrical performance, reduce the size of a semiconductor package, and decrease the interconnect length between mounted components.

The motivation to vertically stack a top package substrate and bottom package substrate to improve electrical performance, reduce the size of a semiconductor package, and decrease the interconnect length was known in the prior art at the time. *See, e.g.*, Chen '484 (A-4) at [0004] (“To improve electrical performances and save spaces, a plurality of packages can be vertically stacked on one another so as to form a package on package (PoP) structure.”); Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration (A-39)

at 5 (a “packaged die stack provides better electrical performance by reducing the interconnect length between the parts”); Waite (A-33) at [7:1-7:6] (“cavity 260 provides room for RF tuning components 406 and/or other components to be located immediately below the DUT 214, either on the bottom side 408 of daughter board 202 or on the top side of the motherboard 200 allowing for relatively short connections between the tuning elements 406 and the DUT 214.”). Moreover, the references listed above, as demonstrated in the corresponding Appendices, disclose top package substrates stacked on top of bottom package substrates. *See, e.g.*, Chen ’402 (A-3) at [0019] (disclosing the “bonding of top package component 62 to bottom package 60”); Sun (A-31) at [0048] (disclosing an upper PoP module stacked on a first module 110, with a second substrate 300 interposed therebetween, wherein a “plurality of second connectors 310 are provided on the second (upper surface) of the second substrate 300. The first and second connectors preferably take the form of metal pillars, for example copper pillars. The first connectors may be electrically connected to the electrical contacts of the first substrate 110 by solder bonding or intermetallic bonding) 140.... For example an upper PoP module may be mounted on top of the first module 110 and make electrical contact via the second connectors 311.”).

As these exemplary teachings demonstrate, improving existing semiconductor packaging designs that are ready for improvement by stacking a top package substrate on top of a bottom package substrate was known in the art and would yield predictable results. Such improvement would be a combination of prior art references according to known methods to yield predictable results. A POSITA would have had a reasonable expectation of success in making such modifications or combinations. Known techniques of semiconductor packaging design and manufacturing, such as those set forth in the prior art references cited above, would have been within the knowledge of a POSITA and would have sufficed to allow a POSITA to implement any

such combination and where, as here, such combinations of references listed above involve well-established principles of semiconductor packaging in predictable, well-developed fields, thus the results of making the combinations would be predictable. Moreover, as all such systems are within the same field of endeavor, the combination would have been obvious to a POSITA because it is simply the use of a known technique to improve similar devices or systems in the same way. Moreover, such a combination would be predictable because each system and its components continue to function in the combination as it did separately.

In addition, a POSITA would have been motivated to combine or adapt known or familiar methods in the art, especially where market forces prompt such variations. For example, to the extent that market forces demanded decreased interconnection length, more compact form factors, improved reliability, or streamlined manufacturing processes, as discussed above, a POSITA would have thought to combine or modify references that described known techniques for achieving these objectives because such techniques offered known improvements to existing semiconductor packaging structures. Further, as described above and in the corresponding Appendices, each of the references listed above describes techniques that were known to offer such improvements, and accordingly, a POSITA would have been motivated to combine the references. The teaching, suggestion, or motivation to modify or combine the references in the manner claimed can be found in the explicit and/or implicit teachings of the references listed above, as identified in the corresponding Appendices, and the prior art as a whole, the general knowledge of POSITAs, including the knowledge of trends in the field toward faster, smaller, more versatile, and more reliable semiconductor packaging structures, and knowledge that the art of decreasing interconnector length, improving reliability at high temperatures, and reducing solder bridging is of special interest or importance in the field. *See, e.g.,* Chen '484 (A-4) at [0004] ("To improve

electrical performances and save spaces, a plurality of packages can be vertically stacked on one another so as to form a package on package (PoP) structure.”); Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration (A-39) at 5 (a “packaged die stack provides better electrical performance by reducing the interconnect length between the parts.”); Waite (A-33) at [7:1-7:6] (“cavity 260 provides room for RF tuning components 406 and/or other components to be located immediately below the DUT 214, either on the bottom side 408 of daughter board 202 or on the top side of the motherboard 200 allowing for relatively short connections between the tuning elements 406 and the DUT 214.”).

2. Spacer Connector Between Package Substrates

Claim 1 of the ’202 patent recites “at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate.” *See, e.g.,* ’202 patent, Claim 1. Claims 2–4, 6, and 9 each depend from Claim 1, and therefore incorporate this limitation.

Nothing about the claimed, generic “spacer connector,” as recited in the above referenced claim, adds anything non-obvious over the prior art. The structure of a “spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate” was well known in the art before the alleged invention of the ’202 patent. To the extent any of the structural elements reciting a “spacer connector” is not explicitly or inherently disclosed in a charted reference, such elements are disclosed and/or taught by each of the prior art references identified in the non-exhaustive list below and the corresponding Appendices, such that references in combination, in addition to the relevant teachings identified herein and/or charted, render the claim obvious.

A POSITA at the time of the alleged invention would have been motivated to combine the teachings of these references with the charted references for the reasons stated above. For example, a POSITA seeking to interconnect a top package substrate and a bottom package substrate would have recognized that such a goal could be accomplished with a spacer connector. Such a

configuration was a well-known design choice in the semiconductor packaging art, as it allowed manufacturers to interconnect stacked package substrates while providing room for mounted components and improving rigidity of the overall structure.

The motivation to interpose a vertically stacked top package substrate and bottom package substrate with a spacer connector to interconnect stacked package substrates while providing room for mounted components and improving rigidity of the overall structure was known in the prior art at the time. *See, e.g.*, Sun (A-31) at [0048] (“A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chip 200”). Moreover, the references listed above, as demonstrated in the corresponding Appendices, disclose spacer connectors interposed between a top package substrate and a bottom package substrate. *See, e.g.*, Chen ’402 (A-3) at [0021] (“the connection between top package component 62 and bottom package 60 is through TAV modules 28”); Sun (A-31) at [0048] (disclosing an upper PoP module stacked on a first module 110, with a second substrate 300 interposed therebetween, wherein a “plurality of second connectors 310 are provided on the second (upper surface) of the second substrate 300. The first and second connectors preferably take the form of metal pillars, for example copper pillars. The first connectors may be electrically connected to the electrical contacts of the first substrate 110 by solder bonding or intermetallic bonding) 140.... For example an upper PoP module may be mounted on top of the first module 110 and make electrical contact via the second connectors 311.”); Hsu ’142 (A-10), at [0029] (“The presence of reinforcement layer 128 provides rigidity and stiffness for better handling of substrate 112 in the absence of carrier 100.”).

As these exemplary teachings demonstrate, improving existing semiconductor packaging designs that are ready for improvement by interposing a spacer connector between a vertically stacked top package substrate and a bottom package substrate was known in the art and would

yield predictable results. Such improvement would be a combination of prior art references according to known methods to yield predictable results. A POSITA would have had a reasonable expectation of success in making such modifications or combinations. Known techniques of semiconductor packaging design and manufacturing, such as those set forth in the prior art references cited above, would have been within the knowledge of a POSITA and would have sufficed to allow a POSITA to implement any such combination and where, as here, such combinations of references listed above involve well-established principles of semiconductor packaging in predictable, well-developed fields, thus the results of making the combinations would be predictable. Moreover, as all such systems are within the same field of endeavor, the combination would have been obvious to a POSITA because it is simply the use of a known technique to improve similar devices or systems in the same way. Moreover, such a combination would be predictable because each system and its components continue to function in the combination as it did separately.

In addition, a POSITA would have been motivated to combine or adapt known or familiar methods in the art, especially where market forces prompt such variations. For example, to the extent that market forces demanded more compact form factors, improved reliability, or streamlined manufacturing processes, as discussed above, a POSITA would have thought to combine or modify references that described known techniques for achieving these objectives because such techniques offered improvements to existing semiconductor packaging structures. Further, as described above and in the corresponding Appendices, each of the references listed above describes techniques that were known to offer such improvements, and accordingly, a POSITA would have been motivated to combine the references. The teaching, suggestion, or motivation to modify or combine the references in the manner claimed can be found in the explicit

and/or implicit teachings of the references listed above, as identified in the corresponding Appendices, and the prior art as a whole, the general knowledge of POSITAs, including the knowledge of trends in the field toward faster, smaller, more versatile, and more reliable semiconductor packaging structures, and knowledge that the art of interconnecting package substrates is of special interest or importance in the field. *See, e.g.*, Sun (A-31) at [0048] (“A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chip 200”).

3. Metal Pillars

Claim 1 of the '202 patent recites “a plurality of metal pillars, each passing through the core substrate.” *See, e.g.*, '202 patent, Claim 1. Claims 2–4, 6, and 9 each depend from Claim 1, and therefore incorporate these limitations.

Nothing about the claimed, generic “metal pillars,” as recited in the above referenced claim, adds anything non-obvious over the prior art. The structure of a “metal pillar,” which appears to refer to a copper pillar structure in the specification, was well known in the art before the alleged invention of the '202 patent. To the extent any of the structural elements reciting a “metal pillar” is not explicitly or inherently disclosed in a charted reference, such elements are disclosed and/or taught by each of the prior art references identified in the non-exhaustive list below and the corresponding Appendices, such that references in combination, in addition to the relevant teachings identified herein and/or charted, render the claim obvious.

A POSITA at the time of the alleged invention would have been motivated to combine the teachings of these references with the charted references for the reasons stated above. For example, a POSITA seeking to interconnect stacked package substrates would have recognized that such package substrates could be interconnected through metal pillars, such as metal vias, implemented in a spacer connector. Such a configuration was a well-known design choice in the semiconductor

packaging art, as it allowed manufacturers to improve electrical performance, reduce the size of a semiconductor package, decrease the interconnect length between mounted components, improve reliability at high temperatures, and reduce solder bridging.

The motivation to vertically stack a top package substrate and bottom package substrate using metal pillars, to achieve these benefits was known in the prior art at the time. *See, e.g.*, Sun (A-31) at [0015] (“Metal pillars allow for fine pitch and maintain their shape at high processing temperatures (e.g. 260° C), compared to solder joints which melt and break down at such temperatures”), [0066] (“for a given stand off height, metal pillars provide a superior solution to solder balls for connecting the upper and lower surfaces of the second substrate to respective other substrates. The metal pillars allow finer pitch and thus denser electrical connections.”); Chen ’484 (A-4) at [0004] (“To improve electrical performances and save spaces, a plurality of packages can be vertically stacked on one another so as to form a package on package (PoP) structure.”); [0005] (“as the packages tend to have smaller sizes and fine pitches, solder bridging easily occurs between the solder balls of the PoP structure, thus adversely affecting the product yield. Accordingly, copper pillars are formed to achieve a stand-off effect so as to prevent solder bridging.”); Hu ’083 (A-13) at [0004] (“it is difficult to control deviation of the volume of the solder balls, thereby easily resulting in a tilted stack structure and poor coplanarity, and even causing position deviation of solder joints between the packages.... Furthermore, an increase in the volume of the solder balls can easily cause a solder bridge between the solder balls.”); Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration (A-39) at 5 (a “packaged die stack provides better electrical performance by reducing the interconnect length between the parts”). Moreover, the references listed above, as demonstrated in the corresponding Appendices, disclose package substrates interconnected using metal pillars implemented in a spacer connector.

See, e.g., Chen '402 (A-3) at (“Through-substrate vias 32 are formed in substrate 34 for inter-coupling the conductive features on opposite sides of substrate 34. Through-substrate vias 32 are formed of a conductive material, which may include copper, aluminum, tungsten, and/or the like.”); Sun (A-31) at [0048], [0062], FIG. 13 (disclosing an upper PoP module stacked on a first module 110, with a second substrate 300 interposed therebetween, where the second substrate 300 includes “vias 390 extending through the second substrate 300”); Waite (A-33) at [10:2-10:5] (“Conductive ground vias 428 and signal vias 402, 432 can run substantially perpendicular to the ground planes 422. Each via is connected to contact pads (308, 312) affixed to it at each PCB surface.”); IPC-4761 Design Guide for Protection of Printed Board Via Structures (A-43) at 9 (disclosing a “via with a secondary metallized coating covering the via”).

As these exemplary teachings demonstrate, improving existing semiconductor packaging designs that are ready for improvement by interconnecting package substrates using metal pillars in a spacer connector was known in the art and would yield predictable results. Such improvement would be a combination of prior art references according to known methods to yield predictable results. A POSITA would have had a reasonable expectation of success in making such modifications or combinations. Known techniques of semiconductor packaging design and manufacturing, such as those set forth in the prior art references cited above, would have been within the knowledge of a POSITA and would have sufficed to allow a POSITA to implement any such combination and where, as here, such combinations of references listed above involve well-established principles of semiconductor packaging in predictable, well-developed fields, thus the results of making the combinations would be predictable. Moreover, as all such systems are within the same field of endeavor, the combination would have been obvious to a POSITA because it is simply the use of a known technique to improve similar devices or systems in the same way.

Moreover, such a combination would be predictable because each system and its components continue to function in the combination as it did separately.

In addition, a POSITA would have been motivated to combine or adapt known or familiar methods in the art, especially where market forces prompt such variations. For example, to the extent that market forces demanded decreased interconnection length, more compact form factors, improved reliability, or streamlined manufacturing processes, as discussed above, a POSITA would have thought to combine or modify references that described known techniques for achieving these objectives because such techniques offered improvements to existing semiconductor packaging structures. Further, as described above and in the corresponding Appendices, each of the references listed above describes techniques that were known to offer such improvements, and accordingly, a POSITA would have been motivated to combine the references. The teaching, suggestion, or motivation to modify or combine the references in the manner claimed can be found in the explicit and/or implicit teachings of the references listed above, as identified in the corresponding Appendices, and the prior art as a whole, the general knowledge of POSITAs, including the knowledge of trends in the field toward faster, smaller, more versatile, and more reliable semiconductor packaging structures, and knowledge that the art of decreasing interconnector length, improving reliability at high temperatures, and reducing solder bridging is of special interest or importance in the field. *See, e.g.*, Sun (A-31) at [0015] (“Metal pillars allow for fine pitch and maintain their shape at high processing temperatures (e.g. 260° C), compared to solder joints which melt and break down at such temperatures”), [0066] (“for a given stand off height, metal pillars provide a superior solution to solder balls for connecting the upper and lower surfaces of the second substrate to respective other substrates. The metal pillars allow finer pitch and thus denser electrical connections.”); Chen ’484 (A-4) at [0004] (“To improve electrical

performances and save spaces, a plurality of packages can be vertically stacked on one another so as to form a package on package (PoP) structure.”); [0005] (“as the packages tend to have smaller sizes and fine pitches, solder bridging easily occurs between the solder balls of the PoP structure, thus adversely affecting the product yield. Accordingly, copper pillars are formed to achieve a stand-off effect so as to prevent solder bridging.”); Hu ’083 (A-13) at [0004] (“it is difficult to control deviation of the volume of the solder balls, thereby easily resulting in a tilted stack structure and poor coplanarity, and even causing position deviation of solder joints between the packages.... Furthermore, an increase in the volume of the solder balls can easily cause a solder bridge between the solder balls.”); Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration (A-39) at 5 (a “packaged die stack provides better electrical performance by reducing the interconnect length between the parts”).

4. Metal Pads

Claim 1 of the ’202 patent recites “a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.” *See, e.g.*, ’202 patent, Claim 1. Claims 2–4, 6, and 9 each depend from Claim 1, and therefore incorporate these limitations. Claim 9 of the ’202 patent recites “a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars.” *See, e.g.*, ’202 patent, Claim 9.

Nothing about the claimed, generic “top metal pads” or “bottom metal pads” as recited in the above referenced claim, adds anything non-obvious over the prior art. The structure of a “metal pad” was well known in the art before the alleged invention of the ’202 patent. To the extent any of the structural elements reciting a “top metal pad” or “bottom metal pad” is not explicitly or inherently disclosed in a charted reference, such elements are disclosed and/or taught by each of the prior art references identified in the non-exhaustive list below and the corresponding

Appendices, such that references in combination, in addition to the relevant teachings identified herein and/or charted, render the claim obvious.

A POSITA at the time of the alleged invention would have been motivated to combine the teachings of these references with the charted references for the reasons stated above. For example, a POSITA seeking to implement a metal pillar would have known that top and/or bottom metal

pads could be applied to such a metal pillar. Such a configuration was a well-known design choice in the semiconductor packaging art, as it allowed manufacturers to facilitate a reliable electrical connection between metal pillars, reduce misalignment tolerances during manufacturing, and prevent contaminants from damaging metal pillars.

The motivation to apply top metal pads to metal pillars to facilitate a reliable electrical connection between the metal pillars and bottom metal pillars and top metal pillars, reduce misalignment tolerances during manufacturing, and prevent contaminants from damaging metal pillars was known in the prior art at the time. *See, e.g.*, Love (A-24) at 13:17–37 (“interconnect columns may be somewhat offset from an exact opposing relationship... Such an offset may occur during the construction of interconnect column 15d... base pad 20 of each interconnect columns 15a–15d is approximately 40 microns wide and the bottom end 17 is approximately 10 microns in diameter, thereby allowing a 15 micron misalignment error for each of interconnect columns 15a and 15b.”); IPC-4761 Design Guide for Protection of Printed Board Via Structures (A-43) at Table 5-1 (“Filled and Capped” vias provide the benefits of “[k]eeping chemistry or solder from passing through the via,” and “[p]revent[ing] migration of solder, adhesives, or encapsulants into vias”). Moreover, the references listed above, as demonstrated in the corresponding Appendices, disclose top metal pads. *See, e.g.*, Chen ’402 (A-3) at [0011] (“TAV modules 28 may include redistribution layer(s) that include redistribution lines and metal pads on the top sides of TAV modules 28.”); Love (A-24) at [7:32-7:36] (disclosing a “base pad 20); Sun (A-31) at [0066] (“A small amount of solder or bonding pads may used to connect the metal pillars to the respective other substrates.”); Waite (A-33) at 4:20–21 (disclosing “upper contact pads 308 of the first spacer-connector 204”) IPC-4761 Design Guide for Protection of Printed Board Via Structures (A-43) at 9 (disclosing “Filled and Capped” vias).

As these exemplary teachings demonstrate, improving existing semiconductor packaging designs that are ready for improvement by applying top metal pads and/or bottom metal pads to metal pillars was known in the art and would yield predictable results. Such improvement would be a combination of prior art references according to known methods to yield predictable results. A POSITA would have had a reasonable expectation of success in making such modifications or combinations. Known techniques of semiconductor packaging design and manufacturing, such as those set forth in the prior art references cited above, would have been within the knowledge of a POSITA and would have sufficed to allow a POSITA to implement any such combination and where, as here, such combinations of references listed above involve well-established principles of semiconductor packaging in predictable, well-developed fields, thus the results of making the combinations would be predictable. Moreover, as all such systems are within the same field of endeavor, the combination would have been obvious to a POSITA because it is simply the use of a known technique to improve similar devices or systems in the same way. Moreover, such a combination would be predictable because each system and its components continue to function in the combination as it did separately.

In addition, a POSITA would have been motivated to combine or adapt known or familiar methods in the art, especially where market forces prompt such variations. For example, to the extent that market forces demanded improved reliability or streamlined manufacturing processes, as discussed above, a POSITA would have thought to combine or modify references that described known techniques for achieving these objectives because such techniques offered improvements to existing semiconductor packaging structures. Further, as described above and in the corresponding Appendices, each of the references listed above describes techniques that were known to offer such improvements, and accordingly, a POSITA would have been motivated to

combine the references. The teaching, suggestion, or motivation to modify or combine the references in the manner claimed can be found in the explicit and/or implicit teachings of the references listed above, as identified in the corresponding Appendices, and the prior art as a whole, the general knowledge of POSITAs, including the knowledge of trends in the field toward faster, smaller, more versatile, and more reliable semiconductor packaging structures, and knowledge that the art of metal pillar interconnections is of special interest or importance in the field. *See, e.g.*, Love (A-24) at 13:17–37 (“interconnect columns may be somewhat offset from an exact opposing relationship... Such an offset may occur during the construction of interconnect column 15d... base pad 20 of each interconnect columns 15a–15d is approximately 40 microns wide and the bottom end 17 is approximately 10 microns in diameter, thereby allowing a 15 micron misalignment error for each of interconnect columns 15a and 15b.”); IPC-4761 Design Guide for Protection of Printed Board Via Structures (A-43) at Table 5-1 (“Filled and Capped” vias provide the benefits of “[k]eeping chemistry or solder from passing through the via,” and “[p]revent[ing] migration of solder, adhesives, or encapsulants into vias”).

5. Metal Pillars Protrude Downwardly from Core Substrate

Claim 1 of the '202 patent recites “wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate.” *See, e.g.*, '202 patent, Claim 1. Claims 2–4, 6, and 9 each depend from Claim 1, and therefore incorporate these limitations.

Nothing about the claimed, generic “metal pillars,” as recited in the above referenced claim, adds anything non-obvious over the prior art. The structure of a “metal pillar” which “protrudes downwardly from a bottom surface of the core substrate” was well known in the art before the alleged invention of the '202 patent. To the extent any of the structural elements reciting a “metal pillar” which “protrudes downwardly from a bottom surface of the core substrate” is not

explicitly or inherently disclosed in a charted reference, such elements are disclosed and/or taught by each of the prior art references identified in the non-exhaustive list below and the corresponding Appendices, such that references in combination, in addition to the relevant teachings identified herein and/or charted, render the claim obvious.

A POSITA at the time of the alleged invention would have been motivated to combine the teachings of these references with the charted references for the reasons stated above. For example,

a POSITA seeking to interconnect stacked package substrates would have recognized that such package substrates could be interconnected using metal pillars implemented in a spacer connector, which would protrude below the bottom surface of a core substrate of the spacer connector, such that they make contact with top metal pillars of a bottom substrate. Such a configuration was a well-known design choice in the semiconductor packaging art, as it allowed manufacturers to improve electrical performance, reduce the size of a semiconductor package, decrease the interconnect length between mounted components, and facilitate the connection between the metal pillars and the bottom substrate.

The motivation to vertically stack a top package substrate and bottom package substrate to improve electrical performance, reduce the size of a semiconductor package, decrease the interconnect length between mounted components, and facilitate the connection between the metal pillars and the bottom substrate was known in the prior art at the time. *See, e.g.*, Chen '484 (A-4) at [0004] (“To improve electrical performances and save spaces, a plurality of packages can be vertically stacked on one another so as to form a package on package (PoP) structure.”); Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration (A-39) at 5 (a “packaged die stack provides better electrical performance by reducing the interconnect length between the parts”). Moreover, the references listed above, as demonstrated in the corresponding Appendices, disclose package substrates interconnected using metal pillars implemented in a spacer connector. *See, e.g.*, Chen '402 (A-3) at (“through-substrate vias 32 protrude above the back surface of substrate 34”); Sun (A-31) at [0048], [0062], FIGs. 13, 15 (disclosing an upper PoP module stacked on a first module 110, with a second substrate 300 interposed therebetween, where the second substrate 300 includes “vias 390 extending through the second substrate 300” and protruding below a bottom surface of a core substrate).

As these exemplary teachings demonstrate, improving existing semiconductor packaging designs that are ready for improvement by interconnecting package substrates using metal pillars implemented in a spacer connector, which protrude below the bottom surface of a core substrate, was known in the art and would yield predictable results. Such improvement would be a combination of prior art references according to known methods to yield predictable results. A POSITA would have had a reasonable expectation of success in making such modifications or combinations. Known techniques of semiconductor packaging design and manufacturing, such as those set forth in the prior art references cited above, would have been within the knowledge of a POSITA and would have sufficed to allow a POSITA to implement any such combination and where, as here, such combinations of references listed above involve well-established principles of semiconductor packaging in predictable, well-developed fields, thus the results of making the combinations would be predictable. Moreover, as all such systems are within the same field of endeavor, the combination would have been obvious to a POSITA because it is simply the use of a known technique to improve similar devices or systems in the same way. Moreover, such a combination would be predictable because each system and its components continue to function in the combination as it did separately.

In addition, a POSITA would have been motivated to combine or adapt known or familiar methods in the art, especially where market forces prompt such variations. For example, to the extent that market forces demanded decreased interconnection length, more compact form factors, improved reliability, or streamlined manufacturing processes, as discussed above, a POSITA would have thought to combine or modify references that described known techniques for achieving these objectives because such techniques offered improvements to existing semiconductor packaging structures. Further, as described above and in the corresponding

Appendices, each of the references listed above describes techniques that were known to offer such improvements, and accordingly, a POSITA would have been motivated to combine the references. The teaching, suggestion, or motivation to modify or combine the references in the manner claimed can be found in the explicit and/or implicit teachings of the references listed above, as identified in the corresponding Appendices, and the prior art as a whole, the general knowledge of POSITAs, including the knowledge of trends in the field toward faster, smaller, more versatile, and more reliable semiconductor packaging structures, and knowledge that the art of decreasing interconnector length is of special interest or importance in the field. *See, e.g.*, Chen '484 (A-4) at [0004] (“To improve electrical performances and save spaces, a plurality of packages can be vertically stacked on one another so as to form a package on package (PoP) structure.”); Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration (A-39) at 5 (a “packaged die stack provides better electrical performance by reducing the interconnect length between the parts”).

6. Bottom Metal Pillars and Top Metal Pillars

Claim 1 of the '202 patent recites “the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector,” and “the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.” *See, e.g.*, '202 patent, Claim 1. Claims 2–4, 6, and 9 each depend from Claim 1, and therefore incorporate these limitations.

Nothing about the claimed, generic “bottom metal pillars” or “top metal pillars,” as recited in the above referenced claim, adds anything non-obvious over the prior art. The structure of “bottom metal pillars” and “top metal pillars” was well known in the art before the alleged invention of the '202 patent. To the extent any of the structural elements reciting “bottom metal

pillars” or “top metal pillars” is not explicitly or inherently disclosed in a charted reference, such elements are disclosed and/or taught by each of the prior art references identified in the non-exhaustive list below and the corresponding Appendices, such that references in combination, in addition to the relevant teachings identified herein and/or charted, render the claim obvious.

A POSITA at the time of the alleged invention would have been motivated to combine the teachings of these references with the charted references for the reasons stated above. For example, a POSITA seeking to interconnect a top package substrate and bottom package substrate would

have recognized that metal pillars could be applied to the top package substrate and bottom package substrate, to facilitate such an interconnection. Such a configuration was a well-known design choice in the semiconductor packaging art, as it allowed for reduced pitch between electrical connectors, improved reliability at high temperatures, and reduced solder bridging.

The motivation to apply bottom metal pillars and top metal pillars to achieve these benefits was known in the prior art at the time. *See, e.g.*, Sun (A-31) at [0015] (“Metal pillars allow for fine pitch and maintain their shape at high processing temperatures (e.g. 260° C), compared to solder joints which melt and break down at such temperatures”), [0066] (“for a given stand off height, metal pillars provide a superior solution to solder balls for connecting the upper and lower surfaces of the second substrate to respective other substrates. The metal pillars allow finer pitch and thus denser electrical connections.”); Chen ’484 (A-4) at [0005] (“as the packages tend to have smaller sizes and fine pitches, solder bridging easily occurs between the solder balls of the PoP structure, thus adversely affecting the product yield. Accordingly, copper pillars are formed to achieve a stand-off effect so as to prevent solder bridging.”); Hu ’083 (A-13) at [0004] (“it is difficult to control deviation of the volume of the solder balls, thereby easily resulting in a tilted stack structure and poor coplanarity, and even causing position deviation of solder joints between the packages.... Furthermore, an increase in the volume of the solder balls can easily cause a solder bridge between the solder balls.”).

Moreover, the references listed above, as demonstrated in the corresponding Appendices, disclose bottom metal pillars and top metal pillars. *See, e.g.*, Hu ’083 (A-13) at [0037] (“package 3 is bonded to the first and second external connection structures 27 a, 27 b”); Love (A-24) at 6:63–66 (“Structure 10 comprises substrate 12 and an interconnect column 15, which includes an electrically conductive post 14 disposed on a first surface 13 of substrate 12.”); Sun (A-31) at

[0059], [0066], FIG. 14(a) (disclosing “second metal connectors 310” and “first metal connectors 320”); Waite (A-33) at [4:19-4:26] (disclosing “multiple conductive elements 302 of the first conductive elastomer 206”).

As these exemplary teachings demonstrate, improving existing semiconductor packaging designs that are ready for improvement by implementing bottom metal pillars and top metal pillars was known in the art and would yield predictable results. Such improvement would be a combination of prior art references according to known methods to yield predictable results. A POSITA would have had a reasonable expectation of success in making such modifications or combinations. Known techniques of semiconductor packaging design and manufacturing, such as those set forth in the prior art references cited above, would have been within the knowledge of a POSITA and would have sufficed to allow a POSITA to implement any such combination and where, as here, such combinations of references listed above involve well-established principles of semiconductor packaging in predictable, well-developed fields, thus the results of making the combinations would be predictable. Moreover, as all such systems are within the same field of endeavor, the combination would have been obvious to a POSITA because it is simply the use of a known technique to improve similar devices or systems in the same way. Moreover, such a combination would be predictable because each system and its components continue to function in the combination as it did separately.

In addition, a POSITA would have been motivated to combine or adapt known or familiar methods in the art, especially where market forces prompt such variations. For example, to the extent that market forces demanded decreased interconnection length, more compact form factors, improved reliability, or streamlined manufacturing processes, as discussed above, a POSITA would have thought to combine or modify references that described known techniques for

achieving these objectives because such techniques offered improvements to existing semiconductor packaging structures. Further, as described above and in the corresponding Appendices, each of the references listed above describes techniques that were known to offer such improvements, and accordingly, a POSITA would have been motivated to combine the references. The teaching, suggestion, or motivation to modify or combine the references in the manner claimed can be found in the explicit and/or implicit teachings of the references listed above, as identified in the corresponding Appendices, and the prior art as a whole, the general knowledge of POSITAs, including the knowledge of trends in the field toward faster, smaller, more versatile, and more reliable semiconductor packaging structures, and knowledge that the art of metal pillar interconnects is of special interest or importance in the field. *See, e.g.*, Sun (A-31) at [0015] (“Metal pillars allow for fine pitch and maintain their shape at high processing temperatures (e.g. 260° C), compared to solder joints which melt and break down at such temperatures”), [0066] (“for a given stand off height, metal pillars provide a superior solution to solder balls for connecting the upper and lower surfaces of the second substrate to respective other substrates. The metal pillars allow finer pitch and thus denser electrical connections.”); Chen ’484 (A-4) at [0005] (“as the packages tend to have smaller sizes and fine pitches, solder bridging easily occurs between the solder balls of the PoP structure, thus adversely affecting the product yield. Accordingly, copper pillars are formed to achieve a stand-off effect so as to prevent solder bridging.”); Hu ’083 (A-13) at [0004] (“it is difficult to control deviation of the volume of the solder balls, thereby easily resulting in a tilted stack structure and poor coplanarity, and even causing position deviation of solder joints between the packages.... Furthermore, an increase in the volume of the solder balls can easily cause a solder bridge between the solder balls.”).

7. Bottom Chip

Claim 1 of the '202 patent recites “a bottom chip arranged in the space between the bottom package substrate and the top package substrate” and “the bottom chip is mounted to the top surface of the bottom package substrate.” *See, e.g.*, '202 patent, Claim 1. Claims 2–4, 6, and 9 each depend from Claim 1, and therefore incorporate these limitations.

Nothing about the claimed, generic “bottom chip” as recited in the above referenced claim, adds anything non-obvious over the prior art. The structure of “a bottom chip arranged in the space between the bottom package substrate and the top package substrate,” where “the bottom chip is mounted to the top surface of the bottom package substrate” was well known in the art before the alleged invention of the '202 patent. To the extent any of the structural elements reciting such a “bottom chip” is not explicitly or inherently disclosed in a charted reference, such elements are disclosed and/or taught by each of the prior art references identified in the non-exhaustive list below and the corresponding Appendices, such that references in combination, in addition to the relevant teachings identified herein and/or charted, render the claim obvious.

- EIT Package-Interposer-Package (PIP) Test Vehicle (A-54)

A POSITA at the time of the alleged invention would have been motivated to combine the teachings of these references with the charted references for the reasons stated above. For example, a POSITA seeking to interconnect mounted components would have recognized that a bottom chip could be mounted on a bottom package substrate and connected to a top chip mounted on a top package substrate, which is stacked on top of the bottom package substrate (i.e., the package substrates are vertically stacked). Such a configuration was a well-known design choice in the semiconductor packaging art, as it allowed manufacturers to improve electrical performance, reduce the size of a semiconductor package, and decrease the interconnect length between mounted components.

The motivation to mount a bottom chip on the bottom package substrate, such that the bottom chip is arranged in the space between the bottom package substrate and the top package substrate, to improve electrical performance, reduce the size of a semiconductor package and

decrease the interconnect length between the bottom chip and components mounted on the top package substrate (i.e., top chips) was known in the prior art at the time. *See, e.g.*, Chen '484 (A-4) at [0004] (“To improve electrical performances and save spaces, a plurality of packages can be vertically stacked on one another so as to form a package on package (PoP) structure.”); Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration (A-39) at 5 (a “packaged die stack provides better electrical performance by reducing the interconnect length between the parts”); Waite (A-33) at [7:1-7:6] (“cavity 260 provides room for RF tuning components 406 and/or other components to be located immediately below the DUT 214, either on the bottom side 408 of daughter board 202 or on the top side of the motherboard 200 allowing for relatively short connections between the tuning elements 406 and the DUT 214.”). Moreover, the references listed above, as demonstrated in the corresponding Appendices, disclose such a configuration. *See, e.g.*, Chen (A-3) at [0009] (disclosing a “package component 24”); Hu '083 (A-13) at [0035]–[0037] (disclosing a “semiconductor chip 28”); Sun (A-31) at [0048] (“A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chip 200”); Waite (A-33) at [7:1-7:6] (“cavity 260 provides room for RF tuning components 406 and/or other components to be located immediately below the DUT 214, either on the bottom side 408 of daughter board 202 or on the top side of the motherboard 200 allowing for relatively short connections between the tuning elements 406 and the DUT 214.”).

As these exemplary teachings demonstrate, mounting a bottom chip on the bottom package substrate was known in the art and would yield predictable results. Such improvement would be a combination of prior art references according to known methods to yield predictable results. A POSITA would have had a reasonable expectation of success in making such modifications or

combinations. Known techniques of semiconductor packaging design and manufacturing, such as those set forth in the prior art references cited above, would have been within the knowledge of a POSITA and would have sufficed to allow a POSITA to implement any such combination and where, as here, such combinations of references listed above involve well-established principles of semiconductor packaging in predictable, well-developed fields, thus the results of making the combinations would be predictable. Moreover, as all such systems are within the same field of endeavor, the combination would have been obvious to a POSITA because it is simply the use of a known technique to improve similar devices or systems in the same way. Moreover, such a combination would be predictable because each system and its components continue to function in the combination as it did separately.

In addition, a POSITA would have been motivated to combine or adapt known or familiar methods in the art, especially where market forces prompt such variations. For example, to the extent that market forces demanded decreased interconnection length, more compact form factors, improved reliability, or streamlined manufacturing processes, as discussed above, a POSITA would have thought to combine or modify references that described known techniques for achieving these objectives because such techniques offered improvements to existing semiconductor packaging structures. Further, as described above and in the corresponding Appendices, each of the references listed above describes techniques that were known to offer such improvements, and accordingly, a POSITA would have been motivated to combine the references. The teaching, suggestion, or motivation to modify or combine the references in the manner claimed can be found in the explicit and/or implicit teachings of the references listed above, as identified in the corresponding Appendices, and the prior art as a whole, the general knowledge of POSITAs, including the knowledge of trends in the field toward faster, smaller, more versatile,

and more reliable semiconductor packaging structures, and knowledge that the art of decreasing interconnection length is of special interest or importance in the field. *See, e.g.*, Chen '484 (A-4) at [0004] (“To improve electrical performances and save spaces, a plurality of packages can be vertically stacked on one another so as to form a package on package (PoP) structure.”); Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration (A-39) at 5 (a “packaged die stack provides better electrical performance by reducing the interconnect length between the parts”); Waite (A-33) at [7:1-7:6] (“cavity 260 provides room for RF tuning components 406 and/or other components to be located immediately below the DUT 214, either on the bottom side 408 of daughter board 202 or on the top side of the motherboard 200 allowing for relatively short connections between the tuning elements 406 and the DUT 214.”).

8. Two Spacer Connectors Arranged on Opposite Sides of the Bottom Chip

Claim 1 of the '202 patent recites “the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.” *See, e.g.*, '202 patent, Claim 1. Claims 2–4, 6, and 9 each depend from Claim 1, and therefore incorporate this limitation.

Nothing about the claimed, generic “two spacer connectors arranged on opposite sides of the bottom chip,” as recited in the above referenced claim, adds anything non-obvious over the prior art. The structure of “two spacer connectors arranged on opposite sides of the bottom chip” was well known in the art before the alleged invention of the '202 patent. To the extent any of the structural elements reciting “two spacer connectors arranged on opposite sides of the bottom chip” is not explicitly or inherently disclosed in a charted reference, such elements are disclosed and/or taught by each of the prior art references identified in the non-exhaustive list below and the

corresponding Appendices, such that references in combination, in addition to the relevant teachings identified herein and/or charted, render the claim obvious.

A POSITA at the time of the alleged invention would have been motivated to combine the teachings of these references with the charted references for the reasons stated above. For example, a POSITA seeking to interconnect a top package substrate and a bottom package substrate would

have recognized that such a goal could be accomplished with two spacer connectors arranged on opposite sides of a bottom chip. Such a configuration was a well-known design choice in the semiconductor packaging art, as it allowed manufacturers to interconnect stacked package substrates while providing room for mounted components.

The motivation to interpose a vertically stacked top package substrate and bottom package substrate with two spacer connectors arranged on opposite sides of a bottom chip to interconnect stacked package substrates while providing room for mounted components was known in the prior art at the time. *See, e.g.*, Berry (A-2) at 13:56–61 (“the electronic component(s) 122 is/are oriented in respective voids or openings 331 of the interposer strip 330, each such opening 331 extending between the first and second segments 130a, 130b of a respective one of the interposers 130 within the interposer strip 330”); Ganesan (A-9) at 3:3–5 (“Planar interconnect stiffener 330 includes substrate 220 defining a recess 330 adapted to house die 170 of bottom device package 150.”); Sun (A-31) at [0048] (“A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chip 200”).

As these exemplary teachings demonstrate, improving existing semiconductor packaging designs that are ready for improvement by arranging two spacer connectors on opposite sides of a bottom chip was known in the art and would yield predictable results. Such improvement would be a combination of prior art references according to known methods to yield predictable results. A POSITA would have had a reasonable expectation of success in making such modifications or combinations. Known techniques of semiconductor packaging design and manufacturing, such as those set forth in the prior art references cited above, would have been within the knowledge of a POSITA and would have sufficed to allow a POSITA to implement any such combination and where, as here, such combinations of references listed above involve well-established principles

of semiconductor packaging in predictable, well-developed fields, thus the results of making the combinations would be predictable. Moreover, as all such systems are within the same field of endeavor, the combination would have been obvious to a POSITA because it is simply the use of a known technique to improve similar devices or systems in the same way. Moreover, such a combination would be predictable because each system and its components continue to function in the combination as it did separately.

In addition, a POSITA would have been motivated to combine or adapt known or familiar methods in the art, especially where market forces prompt such variations. For example, to the extent that market forces demanded more compact form factors, improved reliability, or streamlined manufacturing processes, as discussed above, a POSITA would have thought to combine or modify references that described known techniques for achieving these objectives because such techniques offered improvements to existing semiconductor packaging structures. Further, as described above and in the corresponding Appendices, each of the references listed above describes techniques that were known to offer such improvements, and accordingly, a POSITA would have been motivated to combine the references. The teaching, suggestion, or motivation to modify or combine the references in the manner claimed can be found in the explicit and/or implicit teachings of the references listed above, as identified in the corresponding Appendices, and the prior art as a whole, the general knowledge of POSITAs, including the knowledge of trends in the field toward faster, smaller, more versatile, and more reliable semiconductor packaging structures, and knowledge that the art of interconnecting package substrates is of special interest or importance in the field. *See, e.g.,* Berry (A-2) at 13:56–61 (“the electronic component(s) 122 is/are oriented in respective voids or openings 331 of the interposer strip 330, each such opening 331 extending between the first and second segments 130a, 130b of

a respective one of the interposers 130 within the interposer strip 330”); Ganesan (A-9) at 3:3–5 (“Planar interconnect stiffener 330 includes substrate 220 defining a recess 330 adapted to house die 170 of bottom device package 150.”); Sun (A-31) at [0048] (“A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chip 200”).

9. Top Chip Overlaps Bottom Chip and Spacer Connectors

Claim 3 of the ’202 patent recites “a top chip mounted to the top surface of the top package substrate” and “in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.” *See, e.g.*, ’202 patent, Claim 3.

Nothing about the claimed, generic “top chip” as recited in the above referenced claim, adds anything non-obvious over the prior art. The structure of “a top chip mounted to the top surface of the top package substrate” where “in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors” was well known in the art before the alleged invention of the ’202 patent. To the extent any of the structural elements reciting such a “top chip” is not explicitly or inherently disclosed in a charted reference, such elements are disclosed and/or taught by each of the prior art references identified in the non-exhaustive list below and the corresponding Appendices, such that references in combination, in addition to the relevant teachings identified herein and/or charted, render the claim obvious.

- Furuta ’669 (A-7) at, *e.g.*, 9:40-9:45, FIG. 12
- Furuta ’415 (A-8) at, *e.g.*, [0040], FIG. 6

- Ganesan (A-9) at, *e.g.*, 1:35-1:41, FIG. 2
- Hsu '142 (A-10) at, *e.g.*, [0048], FIG. 9
- Hsu '559 (A-11) at, *e.g.*, [2:50-2:63], FIG. 1
- Kurashima (A-18) at, *e.g.*, [0108-0115], FIG. 11
- Lin (A-21) at, *e.g.*, [42:46-42:52], FIG. 12
- Muthukumar (A-25) at, *e.g.*, FIG. 1E
- Sun (A-31) at, *e.g.*, [0058-0059], FIG. 12
- SainSmart Board (A-49)

A POSITA at the time of the alleged invention would have been motivated to combine the teachings of these references with the charted references for the reasons stated above. For example, a POSITA seeking to shorten the interconnect length between mounted components would have recognized that a top chip could be mounted on a top package substrate and connected to a bottom chip mounted on a bottom package substrate, which is stacked below the top package substrate (i.e., the package substrates are vertically stacked). Such a configuration was a well-known design choice in the semiconductor packaging art, as it allowed manufacturers to improve electrical performance, reduce the size of a semiconductor package, and decrease the interconnect length between mounted components. Further, a POSITA would have recognized that a top chip could overlap a bottom chip and each of two spacer connectors. Such a configuration was a well-known design choice in the semiconductor packaging art, as larger chips can more easily be mounted on the top substrate of a semiconductor package, which has more available mounting area than the bottom substrate.

The motivation to mount a top chip on the top package substrate, such that the top chip is arranged above the bottom chip, to improve electrical performance, reduce the size of a semiconductor package, and decrease the interconnect length between the top chip and the bottom chip was known in the prior art at the time. *See, e.g.*, Chen '484 (A-4) at [0004] (“To improve

electrical performances and save spaces, a plurality of packages can be vertically stacked on one another so as to form a package on package (PoP) structure.”); Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration (A-39) at 5 (a “packaged die stack provides better electrical performance by reducing the interconnect length between the parts”); Waite (A-33) at [7:1-7:6] (“cavity 260 provides room for RF tuning components 406 and/or other components to be located immediately below the DUT 214, either on the bottom side 408 of daughter board 202 or on the top side of the motherboard 200 allowing for relatively short connections between the tuning elements 406 and the DUT 214.”). Further, the motivation to mount a large top chip on a top package substrate having sufficient mounting area, such that it overlaps a bottom chip and each of two spacer connectors on a bottom package substrate was known in the prior art at the time. *See e.g.*, Chen ’484 (A-4) at FIGs. 9, 12. Moreover, the references listed above, as demonstrated in the corresponding Appendices, disclose such a configuration. *See, e.g.*, Chen ’402 (A-3) at [0019], FIG. 9 (disclosing a “package component 62”); Sun (A-31) at [0048] (“an upper PoP module may be mounted on top of the first module 110 and make electrical contact via the second connectors 311.”); FIG. 12.

As these exemplary teachings demonstrate, mounting a top chip on the top package substrate and a bottom chip on the bottom package substrate was known in the art and would yield predictable results. Such improvement would be a combination of prior art references according to known methods to yield predictable results. A POSITA would have had a reasonable expectation of success in making such modifications or combinations. Known techniques of semiconductor packaging design and manufacturing, such as those set forth in the prior art references cited above, would have been within the knowledge of a POSITA and would have sufficed to allow a POSITA to implement any such combination and where, as here, such combinations of references listed

above involve well-established principles of semiconductor packaging in predictable, well-developed fields, thus the results of making the combinations would be predictable. Moreover, as all such systems are within the same field of endeavor, the combination would have been obvious to a POSITA because it is simply the use of a known technique to improve similar devices or systems in the same way. Moreover, such a combination would be predictable because each system and its components continue to function in the combination as it did separately.

In addition, a POSITA would have been motivated to combine or adapt known or familiar methods in the art, especially where market forces prompt such variations. For example, to the extent that market forces demanded decreased interconnection length, more compact form factors, improved reliability, or streamlined manufacturing processes, as discussed above, a POSITA would have thought to combine or modify references that described known techniques for achieving these objectives because such techniques offered improvements to existing semiconductor packaging structures. Further, as described above and in the corresponding Appendices, each of the references listed above describes techniques that were known to offer such improvements, and accordingly, a POSITA would have been motivated to combine the references. The teaching, suggestion, or motivation to modify or combine the references in the manner claimed can be found in the explicit and/or implicit teachings of the references listed above, as identified in the corresponding Appendices, and the prior art as a whole, the general knowledge of POSITAs, including the knowledge of trends in the field toward faster, smaller, more versatile, and more reliable semiconductor packaging structures, and knowledge that the art of decreasing interconnection length is of special interest or importance in the field. *See, e.g.*, Chen '484 (A-4) at [0004] ("To improve electrical performances and save spaces, a plurality of packages can be vertically stacked on one another so as to form a package on package (PoP) structure."); Package-

Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration (A-39) at 5 (a “packaged die stack provides better electrical performance by reducing the interconnect length between the parts”); Waite (A-33) at [7:1-7:6] (“cavity 260 provides room for RF tuning components 406 and/or other components to be located immediately below the DUT 214, either on the bottom side 408 of daughter board 202 or on the top side of the motherboard 200 allowing for relatively short connections between the tuning elements 406 and the DUT 214.”).

10. Metal Pillars are Connected to Top Metal Pillars in an End-to-End Manner

Claim 6 of the '202 patent recites “the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate.” *See, e.g.*, '202 patent, Claim 6.

Nothing about the claimed, generic “metal pillars” or “top metal pillars” as recited in the above referenced claim, adds anything non-obvious over the prior art. The structure of a “metal pillar” being connected to a “top metal pillar” in an “end-to-end manner” was well known in the art before the alleged invention of the '202 patent. To the extent any of the structural elements reciting such a structure is not explicitly or inherently disclosed in a charted reference, such elements are disclosed and/or taught by each of the prior art references identified in the non-exhaustive list below and the corresponding Appendices, such that references in combination, in addition to the relevant teachings identified herein and/or charted, render the claim obvious.

- Furuta '669 (A-7) at, *e.g.*, [9:1-9:15], FIG. 12
- Furuta '415 (A-8) at, *e.g.*, [0038], FIG. 6
- Hu '687 (A-12) at, *e.g.*, [0038-0039], FIG. 2E
- Hu '083 (A-13) at, *e.g.*, [0037], FIG. 3

- Sun (A-31) at, *e.g.*, [0062-0064], FIG. 13
- Waite (A-33) at, *e.g.*, [4:12-4:25], FIGs. 3, 4A
- All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices (A-45) at, *e.g.*, 53, FIG. 3.1
- Teensy Board (A-47)
- Seeed Board (A-48)
- SainSmart Board (A-49)

A POSITA at the time of the alleged invention would have been motivated to combine the teachings of these references with the charted references for the reasons stated above. For example, a POSITA seeking to interconnect stacked package substrates would have recognized that such package substrates could be interconnected using metal pillars implemented in a spacer connector and top metal pillars implemented on a bottom package substrate in an end-to-end manner. Such a configuration was a well-known design choice in the semiconductor packaging art, as it allowed manufacturers to improve electrical performance, reduce the size of a semiconductor package, decrease the interconnect length between mounted components, and reduce solder bridging.

The motivation to vertically stack a top package substrate and bottom package substrate using metal pillars to achieve these benefits was known in the prior art at the time. *See, e.g.*, Sun (A-31) at [0015] (“Metal pillars allow for fine pitch and maintain their shape at high processing temperatures (*e.g.* 260° C), compared to solder joints which melt and break down at such temperatures”), [0066] (“for a given stand off height, metal pillars provide a superior solution to solder balls for connecting the upper and lower surfaces of the second substrate to respective other substrates. The metal pillars allow finer pitch and thus denser electrical connections.”); Chen ’484 (A-4) at [0004] (“To improve electrical performances and save spaces, a plurality of packages can be vertically stacked on one another so as to form a package on package (PoP) structure.”); [0005]

(“as the packages tend to have smaller sizes and fine pitches, solder bridging easily occurs between the solder balls of the PoP structure, thus adversely affecting the product yield. Accordingly, copper pillars are formed to achieve a stand-off effect so as to prevent solder bridging.”); Hu ’083 (A-13) at [0004] (“it is difficult to control deviation of the volume of the solder balls, thereby easily resulting in a tilted stack structure and poor coplanarity, and even causing position deviation of solder joints between the packages.... Furthermore, an increase in the volume of the solder balls can easily cause a solder bridge between the solder balls.”); Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration (A-39) at 5 (a “packaged die stack provides better electrical performance by reducing the interconnect length between the parts”). Moreover, the references listed above, as demonstrated in the corresponding Appendices, disclose package substrates interconnected using metal pillars implemented in a spacer connector and top metal pillars on a bottom package substrate, wherein the metal pillars and top metal pillars are connected in an end-to-end manner. *See, e.g.*, Chen ’402 (A-3) at [0014] (“connectors 44 are formed to connect to metal posts 26 and 30”); Hu ’083 (A-13) at [0037] (“external connection structures 30 are aligned and bonded to the first and second external connection structures 27 a, 27 b”); Sun (A-31) at [0062], FIG. 13 (“[v]ias 390 electrically connect each second metal connector 310 with a corresponding first metal connector 320”); Waite (A-33) at [4:12–4:25] (“upper contact pads 310 of the motherboard 200 are coupled to lower spacer contact pads 312 of the first connector 204 through the conductive elements 302 of the second conductive elastomer 208”).

As these exemplary teachings demonstrate, improving existing semiconductor packaging designs that are ready for improvement by interconnecting package substrates using metal pillars in a spacer connector and top metal pillars on a bottom package substrate, in an end-to-end manner,

was known in the art and would yield predictable results. Such improvement would be a combination of prior art references according to known methods to yield predictable results. A POSITA would have had a reasonable expectation of success in making such modifications or combinations. Known techniques of semiconductor packaging design and manufacturing, such as those set forth in the prior art references cited above, would have been within the knowledge of a POSITA and would have sufficed to allow a POSITA to implement any such combination and where, as here, such combinations of references listed above involve well-established principles of semiconductor packaging in predictable, well-developed fields, thus the results of making the combinations would be predictable. Moreover, as all such systems are within the same field of endeavor, the combination would have been obvious to a POSITA because it is simply the use of a known technique to improve similar devices or systems in the same way. Moreover, such a combination would be predictable because each system and its components continue to function in the combination as it did separately.

In addition, a POSITA would have been motivated to combine or adapt known or familiar methods in the art, especially where market forces prompt such variations. For example, to the extent that market forces demanded decreased interconnection length, more compact form factors, improved reliability, or streamlined manufacturing processes, as discussed above, a POSITA would have thought to combine or modify references that described known techniques for achieving these objectives because such techniques offered improvements to existing semiconductor packaging structures. Further, as described above and in the corresponding Appendices, each of the references listed above describes techniques that were known to offer such improvements, and accordingly, a POSITA would have been motivated to combine the references. The teaching, suggestion, or motivation to modify or combine the references in the

manner claimed can be found in the explicit and/or implicit teachings of the references listed above, as identified in the corresponding Appendices, and the prior art as a whole, the general knowledge of POSITAs, including the knowledge of trends in the field toward faster, smaller, more versatile, and more reliable semiconductor packaging structures, and knowledge that the art of decreasing interconnector length, improving reliability at high temperatures, and reducing solder bridging is of special interest or importance in the field. *See, e.g.*, Sun (A-31) at [0015] (“Metal pillars allow for fine pitch and maintain their shape at high processing temperatures (e.g. 260° C), compared to solder joints which melt and break down at such temperatures”), [0066] (“for a given stand off height, metal pillars provide a superior solution to solder balls for connecting the upper and lower surfaces of the second substrate to respective other substrates. The metal pillars allow finer pitch and thus denser electrical connections.”); Chen ’484 (A-4) at [0004] (“To improve electrical performances and save spaces, a plurality of packages can be vertically stacked on one another so as to form a package on package (PoP) structure.”); [0005] (“as the packages tend to have smaller sizes and fine pitches, solder bridging easily occurs between the solder balls of the PoP structure, thus adversely affecting the product yield. Accordingly, copper pillars are formed to achieve a stand-off effect so as to prevent solder bridging.”); Hu ’083 (A-13) at [0004] (“it is difficult to control deviation of the volume of the solder balls, thereby easily resulting in a tilted stack structure and poor coplanarity, and even causing position deviation of solder joints between the packages.... Furthermore, an increase in the volume of the solder balls can easily cause a solder bridge between the solder balls.”); Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration (A-39) at 5 (a “packaged die stack provides better electrical performance by reducing the interconnect length between the parts”).

11. Other Structural and Electrical Elements

In addition to the claim elements analyzed above, the Asserted Claims of the '202 patent further recite various generic structural and electrical limitations of the claimed socket structure, as summarized in the table below. Some Asserted Claims may have slight variations in claim language, which are not exhaustively listed below and do not change the analysis of the prior art.

Claim Language	Summary of Element	Asserted Claims
“A structure”	Structural – Structure	1
“the spacer connector comprises a core substrate”	Structural – Core substrate	1
“the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of top metal pillars of the bottom package substrate”	Structural – Metal pillar connection	1
“the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip”	Structural – Spacer connector	1
“a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate”	Structural – Space between bottom chip and top package substrate	2
“each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate”	Structural – Metal pillar alignment	4
“bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector”	Structural – Metal pillar connection	6, 9
“the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package	Structural – Metal pillar connection	9

substrate via the corresponding bottom metal pads of the spacer connector”		
--	--	--

Nothing about these generic structural limitations that commonly exist in many existing semiconductor package structures at the time of the alleged invention of the '202 patent add anything non-obvious over the prior art. The basic structural configuration of package substrate interconnection using metal pillars was well-known in the field, well before the alleged inventions of the '202 patent. For example, Sun (A-31) discloses, among others things:

- “A structure” element – *see, e.g.*, Sun (A-31) at [0058] (“PoP assembly 1 comprising a second module 5 mounted on a first module 10”).
- “the spacer connector comprises a core substrate” element – *see, e.g.*, Sun (A-31) at [0016] (“the second substrate may comprise a core insulator layer and conducting layers on either side of the core layer. There may be insulating layers (e.g. solder resists) outward on either side of the conducting layers.”).
- “the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of top metal pillars of the bottom package substrate” element – *see, e.g.*, Sun (A-31) at [0012]–[0013] (“the first substrate being electrically connected to the second substrate by at least one first electrical connector; and at least one second electrical connector extending from the second substrate through the overmold and having an exposed end for electrical connection to an external module.”); [0015] (“[p]referably there are a plurality of first electrical connectors and a plurality of second electrical connectors. For example, there may be four or more first electrical connectors on the underside of the second

- substrate and four or more second electrical connectors on the top side of the second substrate”); [0061] (“[t]he second substrate 300 has a plurality of first connectors 320 for connecting the substrate electrically with the first substrate 110”); [0063] (“[v]ias 390 electrically connect each second metal connector 310 with a corresponding first metal connector 320”); [0074] (“electrical contacts (e.g. bonding pads or lands) present on the second (lower) side of the third substrate are placed in contact with the exposed ends of the second electrical connectors 310 of the first module 10”).
- “the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip” element – *see, e.g.*, Sun (A-31) at [0061] (“[t]he second substrate 300 has an opening therein for accommodating the chips 200, 200a”); [0055] (“second substrate 300 is rectangular and has a rectangular opening 340 in the middle.... Each side has a gap 350. The gaps 350 are of different shapes and join the central opening 340.”); [0014] (“the opening in the second substrate makes room for one or more chips mounted to the first substrate.”).
 - “a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate” element – *see, e.g.*, Sun (A-31) at [0010] (“[i]t would be desirable to increase the vertical separation (stand off height) in order to make room for more and larger chips and enable stacking of chips on the lower substrate.”); [0014] (“[a]s the lower module has a second substrate with electrical connectors on either side, the stand off height may be increased. Further, the opening in the second substrate makes room for one or more chips mounted to the first substrate.”).
 - “each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of

- metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate” element – *see, e.g.*, Sun (A-31) at [0062] (“[t]he second metal connectors 310 are aligned with corresponding [first metal connectors 320] on the opposite side of the substrate 300.”); [0063] (“[v]ias 390 electrically connect each second metal connector 310 with a corresponding first metal connector 320.”).
- “bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector” element – *see, e.g.*, Sun (A-31) at FIG. 14(a).
 - “the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector” element – *see, e.g.*, Sun (A-31) at FIG. 13.

To the extent any of the structural elements recited in the Asserted Claims are not explicitly or inherently disclosed in a charted reference, such elements are disclosed and/or taught by each of the prior art references identified in the non-exhaustive list below and the corresponding Appendices, such that references in combination, in addition to the relevant teachings identified herein and/or charted, render the claim obvious.

A person of ordinary skill in the art at the time of the alleged invention would have been motivated to combine the teachings of these references with the charted references because they arise from the same field of semiconductor packaging design and address closely related structural and functional problems. Each reference discloses improvements to known semiconductor

packaging interconnect structures—such as modifications to interconnect types and arrangements—aimed at improving connection pitch, reliability, or performance. Combining these teachings would have involved no more than the predictable use of known elements according to their established functions, resulting in a semiconductor package stack that operates in the same expected manner as its constituent parts. Thus, a POSITA would have found such combinations of available prior art to be a straightforward integration of already available design choices at the time within a mature and well-developed technical field, yielding expected and predictable results.

C. Knowledge of POSITA

To the extent that TopWire contends that any particular feature or element of the Asserted Claims is a novel aspect of the claimed subject matter, Samsung reserves the right to illustrate that the particular feature was widely known, understood, and implemented by POSITAs at the time of the alleged invention, and that it would have been obvious to combine and/or modify the prior art identified throughout these Invalidity Contentions with the knowledge of a POSITA. Samsung reserves the right to illustrate the knowledge of a POSITA using any of the prior art references identified throughout these Invalidity Contentions, expert testimony, learned treatises, and/or testimony of prior art fact witnesses.

D. No Secondary Considerations

As of the date these Invalidity Contentions were served, TopWire has not identified any secondary considerations of non-obviousness. Samsung reserves all rights to respond to any secondary considerations of non-obviousness raised by TopWire, including by updating, modifying, and/or adding to these Invalidity Contentions.

Samsung contends that there are no secondary considerations of non-obviousness evidencing the validity of any of the Asserted Claims. Secondary considerations of non-obviousness, also referred to as objective indicia of non-obviousness, “can include copying, long

felt but unsolved need, failure of others, commercial success, unexpected results created by the claimed invention, unexpected properties of the claimed invention, licenses showing industry respect for the invention, awards or other industry praise for the invention, and skepticism of skilled artisans before the invention.” *Power Integrations, Inc. v. Fairchild Semiconductor Int’l, Inc.*, 711 F.3d 1348, 1368 (Fed. Cir. 2013). “A nexus between the merits of the claimed invention and evidence of secondary considerations is required in order for the evidence to be given substantial weight in an obviousness decision.” *Ruiz v. A.B. Chance Co.*, 234 F.3d 654, 668 (Fed. Cir. 2000). Even when a nexus is found to exist, secondary considerations of non-obviousness “simply cannot overcome [a] strong prima facie showing of obviousness.” *Sundance, Inc. v. DeMonte Fabricating Ltd.*, 550 F.3d 1356, 1368 (Fed. Cir. 2008).

TopWire has not identified or proven any objective indicia or secondary considerations of non-obviousness supporting the validity of any Asserted Claim. TopWire also has not established a nexus between any of the Asserted Claims and any alleged objective indicia or secondary considerations. Samsung reserves the right to supplement these invalidity contentions to respond to any such evidence should TopWire be permitted to raise them in the future. Further, while discovery in this case is ongoing and Samsung’s investigation continues (including via fact and expert discovery), to the extent TopWire alleges that one or more Asserted Claims are not obvious based on secondary considerations, Samsung contends such allegations are without merit.

Samsung also reserves the right to identify any of the art herein as evidence of simultaneous invention, which shows the obviousness of the Asserted Claims.

VII. GROUNDS FOR INVALIDITY UNDER 35 U.S.C. § 112

Samsung alleges that the Asserted Claims are invalid under 35 U.S.C. § 112 for failing to satisfy the written description and enablement requirements (§ 112, ¶ 1). Samsung reserves all rights to amend its Invalidity Contentions under 35 U.S.C. § 112, including after the Asserted

Claims are ultimately construed by the Court, in response to any interpretation of the Asserted Claims embodied in TopWire’s infringement positions, and/or to account for any changes in the law concerning invalidity under 35 U.S.C. § 112. Samsung also reserves the right to provide additional explanation and/or argument for its Invalidity Contentions under § 112, including, for example, based on expert testimony.

These contentions shall not be construed as an admission that any claim construction advanced by Samsung in this case is in any way inconsistent, flawed or erroneous. Nor should these contentions prevent Samsung from advancing claim construction and/or non-infringement positions in lieu of, or in addition to, invalidity positions. Further, these contentions shall not be construed as an admission of or acquiescence to TopWire’s purported construction of the claim language or of other positions advanced by TopWire during the course of this litigation.

Samsung provides below its preliminary invalidity contentions under § 112.

1. Legal Standard

35 U.S.C. § 112 includes an enablement requirement: “The specification shall contain a written description . . . of the manner and process of making and using [the invention] in such full, clear, concise and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same.” 35 U.S.C. § 112, ¶ 1.

To satisfy the enablement requirement, the disclosure “must teach those skilled in the art how to make and use the full scope of the claimed invention without ‘undue experimentation.’” *Genentech, Inc. v. Novo Nordisk A/S*, 108 F.3d 1361, 1366 (Fed. Cir. 1997); *MagSil Corp. v. Hitachi Glob. Storage Techs., Inc.*, 687 F.3d 1377, 1381 (Fed. Cir. 2012); *Sitrick v. Dreamworks, LLC*, 516 F.3d 993, 999 (Fed. Cir. 2008). Moreover, “[i]t is the specification, not the knowledge of one skilled in the art, that must supply the novel aspects of an invention in order to constitute adequate enablement.” *Genentech, Inc.*, 108 F.3d at 1366. “If, by following the steps set forth in

the specification, one of ordinary skill in the art is not able to replicate the claimed invention without undue experimentation, the claim has not been enabled as required by 112, paragraph 1.” *National Recovery Tech., Inc. v. Magnetic Separation Syst., Inc.*, 166 F.3d 1190, 1196 (Fed. Cir. 1990). Similarly, if a specification teaches away from a substantial portion of the claim, or otherwise does not enable the full scope of the claim, there is no enablement. *AK Steel Corp. v. Sollac*, 344 F.3d 1234 (Fed. Cir. 2003); *see also MagSil Corp.*, 687 F.3d at 1383-84 (Fed. Cir. 2012).

35 U.S.C. § 112 further includes a written description requirement: “The specification shall contain a written description of the invention” 35 U.S.C. § 112, ¶ 1. “To satisfy the written description requirement, a patent applicant must convey with reasonable clarity to those skilled in the art that, as of the filing date sought, he or she was in possession of the invention.” *ICU Medical, Inc. v. Alaris Medical Systems, Inc.*, 558 F.3d 1368, 1377 (Fed. Cir. 2009) (internal quotation marks and citations omitted); *see also Synthes USA, LLC v. Spinal Kinetics, Inc.*, 734 F.3d 1332, 1340 (Fed. Cir. 2013). “The test [for written description support] requires an objective inquiry into the four corners of the specification from the perspective of a person of ordinary skill in the art. Based on that inquiry, the specification must describe an invention understandable to that skilled artisan and show that the inventor actually invented the invention claimed.” *Ariad Pharmaceuticals, Inc. v. Eli Lilly & Co.*, 598 F.3d 1336, 1351 (Fed. Cir. 2010) (en banc).

The specification must describe the claimed invention in sufficient detail so that a POSITA can recognize what is claimed. “The appearance of mere indistinct words in a specification or a claim, even an original claim, does not necessarily satisfy that requirement.” *University of Rochester v. G.D. Searle & Co.*, 358 F.3d 916, 923 (Fed. Cir. 2004) (internal quotation marks and citations omitted).

2. Invalidity Argument

The identified grounds noted below both individually and collectively render the Asserted Claims of the '202 patent invalid under the statutory requirements of § 112. By identifying certain claim language below, Samsung does not imply that such language is entitled to any patentable weight when comparing the claim as a whole to the prior art.

a. Lack of Written Description

The Asserted Claims of the '202 patent are invalid for failure to comply with the written description requirement under § 112, ¶ 1. For example, the '202 patent does not contain written description support at least for the following claim terms, either individually or collectively, particularly as TopWire is asserting the claims for purposes of infringement, rendering the Asserted Claims in which they appear (and any claims depending therefrom) invalid for lack of written description:

Claim Terms	Asserted Claims
“end-to-end manner”	6
“top metal pillar”	1, 4, 6, 9
“bottom metal pillar”	1, 4, 6, 9
“top package substrate”	1–4, 6, 9
“bottom package substrate”	1, 3–4, 6, 9
“bottom metal pillars of the top package substrate”	1, 4, 6, 9
“top metal pillars of the bottom package substrate”	1, 4, 6, 9

At least under TopWire’s apparent interpretation and application of the Asserted Claims, the '202 patent does not provide sufficient written description support for the above claim terms. For example, at least under TopWire’s apparent interpretation and application of the Asserted Claims, the specification does not adequately describe a “top metal pillar” or “bottom metal pillar”

to demonstrate the inventor’s possession of the full scope of the claim. Indeed, nothing in the specification supports or suggests that the claimed metal pillars could encompass a solder structure. Similarly, the specification does not adequately describe a “bottom package substrate” or “top package substrate” to demonstrate the inventor’s possession of the full scope of the claim, at least under TopWire’s apparent interpretation, which encompass a printed circuit board assembly.

Accordingly, Asserted Claims 1, 3–4, 6, and 9 are invalid for lack of written description.

b. Lack of Enablement

The Asserted Claims of the ’202 patent are also invalid for failure to comply with the enablement requirement under § 112, ¶ 1. For example, the ’202 patent fails to provide an enabling disclosure with respect to the following claim terms, either individually or collectively, particularly as TopWire is asserting the claims for purposes of infringement, rendering the Asserted Claims in which they appear (and any claims depending therefrom) invalid for lack of enablement:

Claim Terms	Asserted Claims
“metal pillar”	1, 4, 6, 9
“top package substrate”	1–4, 6, 9
“bottom package substrate”	1, 3–4, 6, 9
“bottom metal pillars of the top package substrate”	1, 4, 6, 9
“top metal pillars of the bottom package substrate”	1, 4, 6, 9
“end-to-end manner”	6

At least under TopWire’s apparent interpretation and application of the Asserted Claims, the ’202 patent does not enable the above claim terms. For example, at least under TopWire’s apparent interpretation and application of the Asserted Claims, the specification does not adequately enable a POSITA to construct a “metal pillar,” “top package substrate,” “bottom

package substrate,” “bottom metal pillar of the top package substrate,” or “top metal pillar of the bottom package substrate.” Moreover, the specification does not provide enablement for the full scope of the claims to the extent the scope of the claims is interpreted to cover the accused embodiments, which are not described or enabled in the specification.

Accordingly, all Asserted Claims are invalid for lack of enablement.

VIII. ADDITIONAL INVALIDITY CONTENTIONS

Samsung has identified other invalidity defenses, which are outside the scope of Patent Rule 3-3, and are set forth in Samsung’s initial disclosures. Samsung will identify all bases upon which the Asserted Claims are invalid and/or unenforceable, as discovery proceeds. Samsung reserves the right to amend or supplement these Invalidity Contentions to address any additional invalidity arguments that become apparent in view of any relevant facts and information revealed during the course of discovery. Samsung expressly reserves the right to assert that the Asserted Patent is invalid under 35 U.S.C. § 102(f) in the event Samsung obtains evidence that the named inventor of the Asserted Patent did not invent the subject matter claimed in the Asserted Patent, or alternatively other inventor(s) contributed to the subject matter claimed in the Asserted Patent but were not included as named inventors of the Asserted Patent.

IX. DOCUMENT PRODUCTION AND ACCOMPANYING INVALIDITY CONTENTIONS

Documents required to be produced under the Docket Control Order (Dkt. No. 21) and Patent Local Rule 3-4 are being produced to TopWire under a separate letter or will be made available for inspection. By way of example, Samsung has separately produced documents or produces concurrently with service of these Invalidity Contentions prior art references and materials at SAMS.TopWire.003871–SAMS.TopWire.0005477. Samsung reserves the right to produce and rely on additional documents relating to their products in view of additional discovery.

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

U.S. Patent Publication No. 20080155820 (“Arai”) is titled Wiring Substrate, Manufacturing Method Thereof, and Semiconductor Device and lists Tadashi Arai and Toshio Kobayashi as inventors. Arai is assigned to Shinko Electric Industries Co., Ltd. Arai anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Arai is a U.S. patent publication that was filed November 13, 2007 and published July 3, 2008. Arai is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Arai, or otherwise rendered obvious by disclosures and teachings of Arai, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Arai does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Arai with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Arai, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Arai “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Arai or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Arai set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Arai discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“The present invention relates to a wiring substrate which includes a base wiring board constructed by stacking a plurality of unit wiring boards each having wiring patterns which enable an electrical connection between upper and lower sides, in a state that the plurality of unit wiring boards are connected to each other via a connection terminal, a silicon interposer which is stacked on the base wiring board, and having wiring patterns which enable an electrical connection between upper and lower sides, and connected to the wiring patterns of the base wiring board via a connection terminal, and a resin portion which is filled in a gap</p>

	<p>between the plurality of unit wiring boards as well as a gap between the base wiring board and the silicon interposer, and which integrates the base wiring board and the silicon interposer.” Arai, [0014].</p> <p>“As shown in FIG. 7, in the interposer built-in wiring substrate 7 according to this embodiment, the second unit wiring board 20 is stacked to be connected to the first unit wiring board 10 in the thickness direction to construct the base wiring board 5. In the first unit wiring board 10, the wiring patterns 16 are formed on both surface sides of the insulating layer 12, and the wiring patterns 16 are connected to each other via the through-hole-conductive layers 14 filled in the through-holes 12 x of the insulating layer 12. Furthermore, the solder resists 18 having the openings on the connection parts of the wiring patterns 16 are respectively provided on both surface sides of the insulating layer 12. In the second unit wiring board 20, similarly to the first unit wiring board 10, the wiring patterns 16 are formed, on both surface sides of the insulating layer 12, to be connected to each other via the through-hole-conductive layers 14. The solder resists 18 having the openings on the connection parts of the wiring patterns 16 are respectively provided on both surface sides of the insulating layer 12. In addition, the capacitor components 17 are mounted to be connected to the wiring pattern 16 on the upper surface of the second unit wiring board 20. Furthermore, the connection terminals 20 a are disposed on the connection parts of the wiring patterns 16 on the lower surface side of the insulating layer 12. Subsequently, the connection terminals 20 a of the second unit wiring board 20 are joined to be electrically connected to the connection parts of the wiring patterns 16 of the first unit wiring board 10.” Arai, [0057-0060].</p>
--	---

FIG. 11

Arai, FIG. 11

“Moreover, as in an interposer built-in substrate 7 a shown in FIG. 8, solder balls or the like may be mounted on the connection parts C of the wiring patterns 16 on the lower surface side of the interposer built-in wiring substrate 7 of FIG. 7 to provide external connection terminals 5 a, whereby the interposer built-in substrate 7 may be used as a BGA (Ball Grid Array) type.” Arai, [0072].

“FIG. 9 shows an interposer built-in wiring substrate 7 b according to a modification of this embodiment. In the interposer built-in wiring substrate 7 b according to the modification, bumps 60 of a semiconductor chip 60 (LSI chip) are connected by flip-chip bonding to the connection parts of the wiring patterns 16 on the upper surface of the first unit wiring board 10 of the interposer built-in wiring substrate 7 a of FIG. 8. The semiconductor chip 60 is embedded in the resin portion 50. A gap between the first unit wiring board 10 and the semiconductor chip 60 is also filled with the resin portion 50. The semiconductor chip 60 is housed in a space which is formed to have a height corresponding to that of the connection

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>terminal 20 a of the second unit wiring board 20. The semiconductor chip 60 is sealed with the resin portion 50.” Arai, [0073-0074].</p> <p>“FIG. 10 shows a semiconductor device 8 according to this embodiment. The semiconductor device 8 is constructed in a way that bumps 70 a of a semiconductor chip 70 (LSI chip) are mounted to be connected by flip-chip bonding to the connection parts of the wiring patterns 36 (FIG. 4) on the upper surface of the silicon interposer 30 of the interposer built-in wiring substrate 7 a of FIG. 8. The capacitor components 17 mounted on the base wiring board 5 are connected between a power line and a ground line of the semiconductor chip 70, and serves as decoupling capacitors.” Arai, [0075].</p> <p>“FIG. 11 shows a semiconductor device 8 a according to a modification of the embodiment of the present invention. As shown in FIG. 11, the semiconductor device 8 a according to the modification is constructed in such a way that the bumps 70 a of the semiconductor chip 70 are connected by flip-chip bonding to the interposer 30 of the interposer built-in wiring substrate 7 b of FIG. 9.” Arai, [0078-0079].</p>
[1.A] a bottom package substrate;	<p>Arai discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“In the first unit wiring board 10, through-holes 12 x are formed in an insulating layer 12 which is made of, for example, an epoxy resin (prepreg), or the like, containing glass fabrics. Each through-hole 12 x is filled with a through-hole-conductive layer 14 which is made of copper or the like. Furthermore, on both surface sides of the insulating layer 12, wiring patterns 16 made of copper or the like are formed. The wiring patterns 16 on both surface</p>

	<p>sides are connected to each other via the through-hole-conductive layer 14. In addition, solder resists 18 having openings are formed on both surface sides of the insulating layer 12, and the openings are provided on the connection parts of the wiring patterns 16.” Arai, [0037-0038].</p> <p>FIG. 11</p> <p>Arai, FIG. 11</p> <p>“Subsequently, as shown in FIG. 2, the second unit wiring board 20 is disposed on the first unit wiring board 10 so that the connection terminals 20 a of the second unit wiring board 20 can match the connection parts of the wiring patterns 16 of the upper side of the first unit wiring board 10. In addition, a heat treatment is performed thereto at a temperature of 180° C. to 220° C., so that the connection terminals 20 a of the second unit wiring board 20 are joined to the connection parts of the wiring patterns 16 on the upper surface of the first unit wiring board 10.” Arai, [0043].</p>
--	--

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>“Consequently, as shown FIG. 3, the first and second unit wiring boards 10 and 20, each having the wiring patterns 16 of two layers, are stacked and connected in a three dimensional manner in the thickness direction, and thus a base wiring board 5 is constructed. The base wiring board 5 is constructed to have the wiring patterns 16 of four layers, which are connected to each other with the through-hole-conductive layers 14 and the connection terminals 20 a interposed therebetween, and the capacitor components 17 are mounted on the uppermost wiring patterns 16.” Arai, [0044].</p> <p>“As shown in FIG. 7, in the interposer built-in wiring substrate 7 according to this embodiment, the second unit wiring board 20 is stacked to be connected to the first unit wiring board 10 in the thickness direction to construct the base wiring board 5. In the first unit wiring board 10, the wiring patterns 16 are formed on both surface sides of the insulating layer 12, and the wiring patterns 16 are connected to each other via the through-hole-conductive layers 14 filled in the through-holes 12 x of the insulating layer 12. Furthermore, the solder resists 18 having the openings on the connection parts of the wiring patterns 16 are respectively provided on both surface sides of the insulating layer 12.” Arai, [0057-0058].</p> <p>“FIG. 7 shows an example of an external connection type used as LGA (Land Grid Array) type, and connection parts C of the wiring patterns 16 on the lower surface of the base wiring board 5 are used as lands.” Arai, [0064].</p> <p>“FIG. 9 shows an interposer built-in wiring substrate 7 b according to a modification of this embodiment. In the interposer built-in wiring substrate 7 b according to the modification, bumps 60 of a semiconductor chip 60 (LSI chip) are connected by flip-chip bonding to the connection parts of the wiring patterns 16 on the upper surface of the first unit wiring board 10 of the interposer built-in wiring substrate 7 a of FIG. 8. The semiconductor chip 60 is embedded in the resin portion 50.” Arai, [0073].</p>
--	--

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Arai discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“In the wiring substrate according to the present invention, connection electrodes with a narrow pitch of the high-performance semiconductor chip is connected to the silicon interposer having fine wirings, and the pitch is converted from the silicon interposer to the base wiring board.” Arai, [0017].</p> <p>“Subsequently, as shown in FIG. 2, the second unit wiring board 20 is disposed on the first unit wiring board 10 so that the connection terminals 20 a of the second unit wiring board 20 can match the connection parts of the wiring patterns 16 of the upper side of the first unit wiring board 10. In addition, a heat treatment is performed thereto at a temperature of 180° C. to 220° C., so that the connection terminals 20 a of the second unit wiring board 20 are joined to the connection parts of the wiring patterns 16 on the upper surface of the first unit wiring board 10.” Arai, [0043].</p> <p>“Consequently, as shown FIG. 3, the first and second unit wiring boards 10 and 20, each having the wiring patterns 16 of two layers, are stacked and connected in a three dimensional</p>

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>manner in the thickness direction, and thus a base wiring board 5 is constructed.” Arai, [0044].</p> <p>“Subsequently, the silicon interposer 30 is disposed on the base wiring board 5 so that the connection terminals 30 a of the silicon interposer 30 match the solder materials 22 on the base wiring board 5. Furthermore, a heat treatment is performed at a temperature of 180° C. to 220° C., so that the connection terminals 30 a of the interposer 30 are joined to the solder materials 22 provided on the base wiring board 5, and thereby electrically connected to the wiring patterns 16 of the base wiring board 5. Thus, as shown in FIG. 5, the silicon interposer 30 is stacked to be connected onto the base wiring board 5 in a three dimensional manner, whereby an interposer-attached wiring substrate 6 is obtained.” Arai, [0047-0048].</p> <p>“In the second unit wiring board 20, similarly to the first unit wiring board 10, the wiring patterns 16 are formed, on both surface sides of the insulating layer 12, to be connected to each other via the through-hole-conductive layers 14. The solder resists 18 having the openings on the connection parts of the wiring patterns 16 are respectively provided on both surface sides of the insulating layer 12. In addition, the capacitor components 17 are mounted to be connected to the wiring pattern 16 on the upper surface of the second unit wiring board 20. Furthermore, the connection terminals 20 a are disposed on the connection parts of the wiring patterns 16 on the lower surface side of the insulating layer 12. Subsequently, the connection terminals 20 a of the second unit wiring board 20 are joined to be electrically connected to the connection parts of the wiring patterns 16 of the first unit wiring board 10.” Arai, [0059-0060].</p> <p>“Furthermore, the silicon interposer 30 is stacked to be connected onto the base wiring board 5 in the thickness direction. In the silicon interposer 30, as described above referring to FIG. 4, the wiring patterns 36 are formed on the on both surface sides of the silicon substrate 32,</p>
--	--

so that the wiring patterns 36 are connected to each other via the through-hole-conductive layer 34." Arai, [0061].

FIG. 11

Arai, FIG. 11

To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein

Arai discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.

See, e.g.:

	<p>“Subsequently, as shown in FIG. 2, the second unit wiring board 20 is disposed on the first unit wiring board 10 so that the connection terminals 20 a of the second unit wiring board 20 can match the connection parts of the wiring patterns 16 of the upper side of the first unit wiring board 10. In addition, a heat treatment is performed thereto at a temperature of 180° C. to 220° C., so that the connection terminals 20 a of the second unit wiring board 20 are joined to the connection parts of the wiring patterns 16 on the upper surface of the first unit wiring board 10. When the connection terminals 20 a of the second unit wiring board 20 are formed of gold bumps, gold layers are formed on the connection parts of the wiring patterns 16 of the first unit wiring board 10, and connected thereto by means of ultrasonic bonding. Consequently, as shown FIG. 3, the first and second unit wiring boards 10 and 20, each having the wiring patterns 16 of two layers, are stacked and connected in a three dimensional manner in the thickness direction, and thus a base wiring board 5 is constructed. The base wiring board 5 is constructed to have the wiring patterns 16 of four layers, which are connected to each other with the through-hole-conductive layers 14 and the connection terminals 20 a interposed therebetween, and the capacitor components 17 are mounted on the uppermost wiring patterns 16. Incidentally, instead of providing the connection terminals 20 a on the second unit wiring board 20, the connection terminals may be provided on the wiring patterns 16 on the upper surface of the first unit wiring board 10. Next, as shown in FIG. 4, a silicon interposer 30 having wiring patterns 36 which enable the electrical connection between the upper and lower sides is prepared.” Arai, [0043-0045].</p>
--	---

FIG. 11

Arai, FIG. 11

“At this time, between the first unit wiring board 10 and the second unit wiring board 20, as well as between the second unit wiring board 20 and the silicon interposer 30, there exist gaps which correspond to a thickness of the connection terminal 20 a of the second unit wiring board 20, and to a thickness of the connection terminal 30 a of the silicon interposer 30, respectively.” Arai, [0048].

“Next, as also shown in FIG. 6, a molten resin is introduced into the space A constructed by the mold die 40 through the resin-introducing part R. At this time, the resin is introduced in a state where the space A is depressurized (or vacuumized) by exhausting the air. Thus, the resin is introduced into the space A in the mold die 40 through the resin-introducing part R, so that the resin is filled in the gap A 1 between the first unit wiring board 10 and the second unit wiring board 20, the gap A 2 between the second unit wiring board 20 and the silicon interposer 30, and the like.” Arai, [0052-0053].

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>“Still furthermore, the gap A 1 between the first unit wiring board 10 and the second unit wiring board 20 as well as the gap A 2 between the second unit wiring board 20 and the silicon interposer 30 are filled with the resin portion 50. The resin portion 50 is integrally formed to be connected from these gaps A 1, A 2 to the sides of the base wiring board 5 and the silicon interposer 30.” Arai, [0056].</p> <p>“In the second unit wiring board 20, similarly to the first unit wiring board 10, the wiring patterns 16 are formed, on both surface sides of the insulating layer 12, to be connected to each other via the through-hole-conductive layers 14. The solder resists 18 having the openings on the connection parts of the wiring patterns 16 are respectively provided on both surface sides of the insulating layer 12. In addition, the capacitor components 17 are mounted to be connected to the wiring pattern 16 on the upper surface of the second unit wiring board 20. Furthermore, the connection terminals 20 a are disposed on the connection parts of the wiring patterns 16 on the lower surface side of the insulating layer 12. Subsequently, the connection terminals 20 a of the second unit wiring board 20 are joined to be electrically connected to the connection parts of the wiring patterns 16 of the first unit wiring board 10.” Arai, [0059-0060].</p> <p>“The height of the connection terminal 20 a of the second unit wiring board 20 is adjusted such that semiconductor chip 60 can be housed between the first unit wiring board 10 and the second unit wiring board 20 according to the thickness of the semiconductor chip 60.” Arai, [0074].</p> <p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

<p>[1.D] the spacer connector comprises a core substrate;</p>	<p>Arai discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Firstly, in the method of manufacturing a wiring substrate according to this embodiment, as shown in FIG. 1, a sheet-like first unit wiring board 10 and a sheet-like second unit wiring board 20 which respectively have wiring patterns 16 which enable electrical connection between the upper and lower sides are prepared. In the first unit wiring board 10, through-holes 12 x are formed in an insulating layer 12 which is made of, for example, an epoxy resin (prepreg), or the like, containing glass fabrics. Each through-hole 12 x is filled with a through-hole-conductive layer 14 which is made of copper or the like. Furthermore, on both surface sides of the insulating layer 12, wiring patterns 16 made of copper or the like are formed.” Arai, [0037-0038].</p> <p>“In the second unit wiring board 20, similarly to the first unit wiring board 10, the wiring patterns 16 are formed and connected to each other via a through-hole-conductive layer 14 in a through-hole 12 x on both surface sides of an insulating layer 12. In addition, similarly to the first unit wiring board 10, solder resists 18 having openings are formed on both surface sides of the insulating layer 12, and the openings are provided on the connection parts of the wiring patterns 16. Moreover, a capacitor component 17 is mounted to be connected to the wiring pattern 16 on the upper surface side of the second unit wiring board 20. Note that, besides the capacitor 17, a passive component such as a resistance component or an inductor component may be mounted thereon. In addition, in the second unit wiring board 20, a connection terminal 20 a is provided to the connection part of the wiring pattern 16 on the lower surface side of the insulating layer 12.” Arai, [0039-0040].</p>
--	--

Arai, FIG. 11

“Subsequently, as shown in FIG. 2, the second unit wiring board 20 is disposed on the first unit wiring board 10 so that the connection terminals 20 a of the second unit wiring board 20 can match the connection parts of the wiring patterns 16 of the upper side of the first unit wiring board 10. In addition, a heat treatment is performed thereto at a temperature of 180° C. to 220° C., so that the connection terminals 20 a of the second unit wiring board 20 are joined to the connection parts of the wiring patterns 16 on the upper surface of the first unit wiring board 10.” Arai, [0043].

“Consequently, as shown FIG. 3, the first and second unit wiring boards 10 and 20, each having the wiring patterns 16 of two layers, are stacked and connected in a three dimensional manner in the thickness direction, and thus a base wiring board 5 is constructed. The base wiring board 5 is constructed to have the wiring patterns 16 of four layers, which are connected to each other with the through-hole-conductive layers 14 and the connection

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>terminals 20 a interposed therebetween, and the capacitor components 17 are mounted on the uppermost wiring patterns 16.” Arai, [0044].</p> <p>“In the first unit wiring board 10, the wiring patterns 16 are formed on both surface sides of the insulating layer 12, and the wiring patterns 16 are connected to each other via the through-hole-conductive layers 14 filled in the through-holes 12 x of the insulating layer 12. Furthermore, the solder resists 18 having the openings on the connection parts of the wiring patterns 16 are respectively provided on both surface sides of the insulating layer 12.” Arai, [0058].</p> <p>“In the second unit wiring board 20, similarly to the first unit wiring board 10, the wiring patterns 16 are formed, on both surface sides of the insulating layer 12, to be connected to each other via the through-hole-conductive layers 14. The solder resists 18 having the openings on the connection parts of the wiring patterns 16 are respectively provided on both surface sides of the insulating layer 12. In addition, the capacitor components 17 are mounted to be connected to the wiring pattern 16 on the upper surface of the second unit wiring board 20. Furthermore, the connection terminals 20 a are disposed on the connection parts of the wiring patterns 16 on the lower surface side of the insulating layer 12.” Arai, [0059].</p> <p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Arai discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p>

	<p>See, e.g.:</p> <p>“In the first unit wiring board 10, through-holes 12 x are formed in an insulating layer 12 which is made of, for example, an epoxy resin (prepreg), or the like, containing glass fabrics. Each through-hole 12 x is filled with a through-hole-conductive layer 14 which is made of copper or the like.” Arai, [0037].</p> <p>FIG. 11</p>  <p>Arai, FIG. 11</p> <p>“In the silicon interposer 30, through-holes 32 x are provided in a silicon substrate 32, and insulating layers 33 are formed on both surfaces of the silicon substrate 32 as well as on the inner surfaces of the through-holes 32 x. The through-hole 32 x is filled with a through-hole-conductive layer 34 formed of copper or the like.” Arai, [0037].</p>
--	--

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>“In the second unit wiring board 20, similarly to the first unit wiring board 10, the wiring patterns 16 are formed and connected to each other via a through-hole-conductive layer 14 in a through-hole 12 x on both surface sides of an insulating layer 12.” Arai, [0039].</p> <p>“In the first unit wiring board 10, the wiring patterns 16 are formed on both surface sides of the insulating layer 12, and the wiring patterns 16 are connected to each other via the through-hole-conductive layers 14 filled in the through-holes 12 x of the insulating layer 12.” Arai, [0058].</p> <p>“In the second unit wiring board 20, similarly to the first unit wiring board 10, the wiring patterns 16 are formed, on both surface sides of the insulating layer 12, to be connected to each other via the through-hole-conductive layers 14.” Arai, [0059].</p> <p>“In the silicon interposer 30, as described above referring to FIG. 4, the wiring patterns 36 are formed on the on both surface sides of the silicon substrate 32, so that the wiring patterns 36 are connected to each other via the through-hole-conductive layer 34.” Arai, [0061].</p> <p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.F] a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars;</p>	<p>Arai discloses, either expressly or inherently, a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.</p> <p><i>See, e.g.:</i></p>

	<p>“In addition, solder resists 18 having openings are formed on both surface sides of the insulating layer 12, and the openings are provided on the connection parts of the wiring patterns 16. In the second unit wiring board 20, similarly to the first unit wiring board 10, the wiring patterns 16 are formed and connected to each other via a through-hole-conductive layer 14 in a through-hole 12 x on both surface sides of an insulating layer 12.” Arai, [0038-0039].</p> <p style="text-align: center;">FIG. 11</p>
--	--

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>“In addition, in the second unit wiring board 20, a connection terminal 20 a is provided to the connection part of the wiring pattern 16 on the lower surface side of the insulating layer 12.” Arai, [0039-0040].</p> <p>“In the silicon interposer 30, through-holes 32 x are provided in a silicon substrate 32, and insulating layers 33 are formed on both surfaces of the silicon substrate 32 as well as on the inner surfaces of the through-holes 32 x. The through-hole 32 x is filled with a through-hole-conductive layer 34 formed of copper or the like. Furthermore, on both surface sides of the silicon substrate 32, the wiring patterns 36 made of copper or the like are formed. The wiring patterns 36 are connected to each other via the through-hole-conductive layer 34.” Arai, [0045].</p> <p>“In addition, connection terminals 30 a each made of a gold bump or the like and which has a height of 30 μm to 100 μm are formed onto the wiring pattern 36 of the lower surface of the silicon interposer 30.” Arai, [0046].</p> <p>“Furthermore, the connection terminals 20 a are disposed on the connection parts of the wiring patterns 16 on the lower surface side of the insulating layer 12.” Arai, [0059].</p> <p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.G] wherein a bottom end of each metal pillar among the plurality of metal pillars</p>	<p>Arai discloses, either expressly or inherently, wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate.</p>

<p>protrudes downwardly from a bottom surface of the core substrate,</p>	<p>See, <i>e.g.</i>:</p> <p>“In the second unit wiring board 20, similarly to the first unit wiring board 10, the wiring patterns 16 are formed and connected to each other via a through-hole-conductive layer 14 in a through-hole 12 x on both surface sides of an insulating layer 12. In addition, similarly to the first unit wiring board 10, solder resists 18 having openings are formed on both surface sides of the insulating layer 12, and the openings are provided on the connection parts of the wiring patterns 16. Moreover, a capacitor component 17 is mounted to be connected to the wiring pattern 16 on the upper surface side of the second unit wiring board 20. --	--

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>“Each wiring pattern 16 of the first unit wiring board 10 and the second unit wiring board 20 are formed by below method. Firstly, the through-hole 12 x is formed in the insulating layer 12. Subsequently, a metal layer which is connected to both surfaces of the insulating layer 12 from the inside of the through-hole 12 x, is formed by means of a plating method. Thereafter, the metal layer is patterned by photolithography and etching. Alternatively, the wiring pattern may be formed on both surface sides on the bases of processing a copper-clad laminate. Each wiring pattern 16 of the first unit wiring board 10 and the second unit wiring board 20 is set to have a minimum width of, for example, 30 μm to 50 μm.” Arai, [0041].</p> <p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.H] the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector,</p>	<p>Arai discloses, either expressly or inherently, the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p>See, <i>e.g.</i>:</p> <p>“Next, as shown in FIG. 4, a silicon interposer 30 having wiring patterns 36 which enable the electrical connection between the upper and lower sides is prepared. In the silicon interposer 30, through-holes 32 x are provided in a silicon substrate 32, and insulating layers 33 are formed on both surfaces of the silicon substrate 32 as well as on the inner surfaces of the through-holes 32 x. The through-hole 32 x is filled with a through-hole-conductive layer 34 formed of copper or the like. Furthermore, on both surface sides of the silicon substrate 32,</p>

the wiring patterns 36 made of copper or the like are formed. The wiring patterns 36 are connected to each other via the through-hole-conductive layer 34." Arai, [0045].

Arai, FIG. 11

“Since the silicon interposer 30 is manufactured by manufacturing processes of a semiconductor integrated circuit, the silicon interposer 30 is formed at a finer pitch rather than the case of the wiring pattern 16 of the above-described base wiring board 5 and, and the minimum width thereof is formed to be in the range of, for example, 3 μm to 5 μm . In addition, connection terminals 30 a each made of a gold bump or the like and which has a height of 30 μm to 100 μm are formed onto the wiring pattern 36 of the lower surface of the silicon interposer 30. Note that, the wiring patterns 36 of the silicon interposer 30 may be stacked on both surface sides of the silicon substrate 32 in an arbitrary number of layers.” Arai, [0046].

	<p>“As shown also in FIG. 4, solder materials 22 are formed on connection parts for the interposer, which are on the uppermost wiring patterns 16 of the base wiring board 5. The solder materials 22 are formed of a solder ball or a solder paste. Subsequently, the silicon interposer 30 is disposed on the base wiring board 5 so that the connection terminals 30 a of the silicon interposer 30 match the solder materials 22 on the base wiring board 5. Furthermore, a heat treatment is performed at a temperature of 180° C. to 220° C., so that the connection terminals 30 a of the interposer 30 are joined to the solder materials 22 provided on the base wiring board 5, and thereby electrically connected to the wiring patterns 16 of the base wiring board 5.” Arai, [0047].</p> <p>“Furthermore, the silicon interposer 30 is stacked to be connected onto the base wiring board 5 in the thickness direction. In the silicon interposer 30, as described above referring to FIG. 4, the wiring patterns 36 are formed on the on both surface sides of the silicon substrate 32, so that the wiring patterns 36 are connected to each other via the through-hole-conductive layer 34. The connection terminals 30 a formed of the gold bump or the like are provided on the connection parts of the wiring patterns 36 on the lower surface of the silicon substrate 32. The connection terminals 30 a of the silicon interposer 30 are joined to the connection parts of the wiring patterns 16 of the base wiring board 5 by use of the solder materials 22.” Arai, [0061].</p> <p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

<p>[1.I] the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and</p>	<p>Arai discloses, either expressly or inherently, the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“In addition, in the second unit wiring board 20, a connection terminal 20a is provided to the connection part of the wiring pattern 16 on the lower surface side of the insulating layer 12. The connection terminal 20 a is formed of a silver (Ag) paste, a solder paste, a solder ball, a copper ball covered with solder on the outer surface, a gold bump, or the like, and the height is set to 30 μm to 100 μm.” Arai, [0040].</p> <p>“As shown also in FIG. 4, solder materials 22 are formed on connection parts for the interposer, which are on the uppermost wiring patterns 16 of the base wiring board 5. The solder materials 22 are formed of a solder ball or a solder paste. Subsequently, the silicon interposer 30 is disposed on the base wiring board 5 so that the connection terminals 30 a of the silicon interposer 30 match the solder materials 22 on the base wiring board 5. Furthermore, a heat treatment is performed at a temperature of 180° C. to 220° C., so that the connection terminals 30 a of the interposer 30 are joined to the solder materials 22 provided on the base wiring board 5, and thereby electrically connected to the wiring patterns 16 of the base wiring board 5.” Arai, [0047].</p> <p>“In the first unit wiring board 10, the wiring patterns 16 are formed on both surface sides of the insulating layer 12, and the wiring patterns 16 are connected to each other via the through-hole-conductive layers 14 filled in the through-holes 12 x of the insulating layer 12. Furthermore, the solder resists 18 having the openings on the connection parts of the wiring</p>
---	---

patterns 16 are respectively provided on both surface sides of the insulating layer 12." Arai, [0058].

FIG. 11

Arai, FIG. 11

To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Arai discloses, either expressly or inherently, the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of top metal pillars of the bottom package substrate.

See, e.g.:

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

top metal pillars of the bottom package substrate; and	<p>“In addition, in the second unit wiring board 20, a connection terminal 20a is provided to the connection part of the wiring pattern 16 on the lower surface side of the insulating layer 12. The connection terminal 20a is formed of a silver (Ag) paste, a solder paste, a solder ball, a copper ball covered with solder on the outer surface, a gold bump, or the like, and the height is set to 30 μm to 100 μm.” Arai, [0040].</p> <p>“the wiring patterns 16 are connected to each other via the through-hole-conductive layers 14 filled in the through-holes 12 x of the insulating layer 12.” Arai, [0045-0046].</p> <p>“As shown also in FIG. 4, solder materials 22 are formed on connection parts for the interposer, which are on the uppermost wiring patterns 16 of the base wiring board 5. The solder materials 22 are formed of a solder ball or a solder paste. Subsequently, the silicon interposer 30 is disposed on the base wiring board 5 so that the connection terminals 30a of the silicon interposer 30 match the solder materials 22 on the base wiring board 5. Furthermore, a heat treatment is performed at a temperature of 180° C. to 220° C., so that the connection terminals 30a of the interposer 30 are joined to the solder materials 22 provided on the base wiring board 5, and thereby electrically connected to the wiring patterns 16 of the base wiring board 5.” Arai, [0047].</p> <p>“the second unit wiring board 20 is stacked to be connected to the first unit wiring board 10 in the thickness direction to construct the base wiring board 5.” Arai, [0057].</p>
--	---

	<p>FIG. 11</p>  <p>Arai, FIG. 11</p> <p>“the wiring patterns 16 are formed, on both surface sides of the insulating layer 12, to be connected to each other via the through-hole-conductive layers 14” Arai, [0059].</p> <p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.K] a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein</p>	<p>Arai discloses, either expressly or inherently, a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein.</p> <p>See, e.g.:</p> <p>“FIG. 9 shows an interposer built-in wiring substrate 7 b according to a modification of this embodiment. In the interposer built-in wiring substrate 7 b according to the modification,</p>

bumps 60 of a semiconductor chip 60 (LSI chip) are connected by flip-chip bonding to the connection parts of the wiring patterns 16 on the upper surface of the first unit wiring board 10 of the interposer built-in wiring substrate 7 a of FIG. 8. The semiconductor chip 60 is embedded in the resin portion 50. A gap between the first unit wiring board 10 and the semiconductor chip 60 is also filled with the resin portion 50.” Arai, [0073].

“The semiconductor chip 60 is housed in a space which is formed to have a height corresponding to that of the connection terminal 20 a of the second unit wiring board 20. The semiconductor chip 60 is sealed with the resin portion 50. The height of the connection terminal 20 a of the second unit wiring board 20 is adjusted such that semiconductor chip 60 can be housed between the first unit wiring board 10 and the second unit wiring board 20 according to the thickness of the semiconductor chip 60. In the interposer built-in wiring substrate 7 b according to the modified example also, the resin portion 50 is filled by the above-described vacuum transfer molding.” Arai, [0074].

Arai, FIG. 11

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>“FIG. 11 shows a semiconductor device 8 a according to a modification of the embodiment of the present invention. As shown in FIG. 11, the semiconductor device 8 a according to the modification is constructed in such a way that the bumps 70 a of the semiconductor chip 70 are connected by flip-chip bonding to the interposer 30 of the interposer built-in wiring substrate 7 b of FIG. 9.” Arai, [0078-0079].</p> <p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.L] the bottom chip is mounted to the top surface of the bottom package substrate, and</p>	<p>Arai discloses, either expressly or inherently, the bottom chip is mounted to the top surface of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Moreover, in a method filling a gap with a liquid resin by means of capillarity, it is generally extremely difficult to fill a narrow gap with a resin containing a large amount of fillers. In this embodiment, even when the gap A 1 between the first unit wiring board 10 and the second unit wiring board 20 as well as the gap A 2 between the second unit wiring board 20 and the silicon interposer 30 are quite narrow (for example, 30 μm), because the filling with resin is performed by means of vacuum transfer molding, it is possible to fill a narrow gap with a resin containing a large amount of fillers with high reliability.” Arai, [0056-0057].</p> <p>“As shown in FIG. 7, in the interposer built-in wiring substrate 7 according to this embodiment, the second unit wiring board 20 is stacked to be connected to the first unit</p>

	<p>wiring board 10 in the thickness direction to construct the base wiring board 5. In the first unit wiring board 10, the wiring patterns 16 are formed on both surface sides of the insulating layer 12, and the wiring patterns 16 are connected to each other via the through-hole-conductive layers 14 filled in the through-holes 12 x of the insulating layer 12.” Arai, [0057-0058].</p> <p>“In the first unit wiring board 10, the wiring patterns 16 are formed on both surface sides of the insulating layer 12, and the wiring patterns 16 are connected to each other via the through-hole-conductive layers 14 filled in the through-holes 12 x of the insulating layer 12. Furthermore, the solder resists 18 having the openings on the connection parts of the wiring patterns 16 are respectively provided on both surface sides of the insulating layer 12. In the second unit wiring board 20, similarly to the first unit wiring board 10, the wiring patterns 16 are formed, on both surface sides of the insulating layer 12, to be connected to each other via the through-hole-conductive layers 14. The solder resists 18 having the openings on the connection parts of the wiring patterns 16 are respectively provided on both surface sides of the insulating layer 12.” Arai, [0058-0059].</p> <p>“The semiconductor chip 60 is housed in a space which is formed to have a height corresponding to that of the connection terminal 20 a of the second unit wiring board 20. The semiconductor chip 60 is sealed with the resin portion 50. The height of the connection terminal 20 a of the second unit wiring board 20 is adjusted such that semiconductor chip 60 can be housed between the first unit wiring board 10 and the second unit wiring board 20 according to the thickness of the semiconductor chip 60.” Arai, [0073-0074].</p>
--	--

FIG. 11

Arai, FIG. 11

“FIG. 10 shows a semiconductor device 8 according to this embodiment. The semiconductor device 8 is constructed in a way that bumps 70 of a semiconductor chip 70 (LSI chip) are mounted to be connected by flip-chip bonding to the connection parts of the wiring patterns 36 (FIG. 4) on the upper surface of the silicon interposer 30 of the interposer built-in wiring substrate 7 of FIG. 8.” Arai, [0075].

“FIG. 11 shows a semiconductor device 8 a according to a modification of the embodiment of the present invention. As shown in FIG. 11, the semiconductor device 8 a according to the modification is constructed in such a way that the bumps 70 a of the semiconductor chip 70 are connected by flip-chip bonding to the interposer 30 of the interposer built-in wiring substrate 7 b of FIG. 9.” Arai, [0078-0079].

To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general

	knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.
<p>[1.M] the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.</p>	<p>Arai discloses, either expressly or inherently, the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.</p> <p>See, e.g.:</p> <p>“a sheet-like first wiring board 10 and a sheet-like second unit wiring board 20 which respectively have wiring patterns 16 which enable electrical connection between the upper and lower sides are prepared. In the first unit wiring board 10, through-holes 12 x are formed in an insulating layer 12 which is made of, for example, an epoxy resin (prepreg), or the like, containing glass fabrics. Each through-hole 12 x is filled with a through-hole-conductive layer 14 which is made of copper or the like.” Arai, [0044-0045].</p> <p>FIG. 11</p> <p>Arai, FIG. 11</p>

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>“In addition, the capacitor components 17 are mounted to be connected to the wiring pattern 16 on the upper surface of the second unit wiring board 20. Furthermore, the connection terminals 20 a are disposed on the connection parts of the wiring patterns 16 on the lower surface side of the insulating layer 12.” Arai, [0059].</p> <p>“The capacitor components 17 mounted on the base wiring board 5 are connected between a power line and a ground line of the semiconductor chip 70, and serves as decoupling capacitors.” Arai, [0075].</p> <p>“Another embodiment may be constructed as follows. Firstly, two units are prepared, each having a structure in which the silicon interposer 30 is mounted on the base wiring board 5. The units are symmetrically connected to each other with a connection terminal.” Arai, [0078].</p> <p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

FIG. 11

Arai, FIG. 11

To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.	

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

<p>package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p><i>See, e.g.:</i></p> <p>“FIG. 9 shows an interposer built-in wiring substrate 7 b according to a modification of this embodiment. In the interposer built-in wiring substrate 7 b according to the modification, bumps 60 of a semiconductor chip 60 (LSI chip) are connected by flip-chip bonding to the connection parts of the wiring patterns 16 on the upper surface of the first unit wiring board 10 of the interposer built-in wiring substrate 7 a of FIG. 8. The semiconductor chip 60 is embedded in the resin portion 50. A gap between the first unit wiring board 10 and the semiconductor chip 60 is also filled with the resin portion 50. The semiconductor chip 60 is housed in a space which is formed to have a height corresponding to that of the connection terminal 20 a of the second unit wiring board 20.” Arai, [0073-0074].</p> <p>“The semiconductor device 8 is constructed in a way that bumps 70 a of a semiconductor chip 70 (LSI chip) are mounted to be connected by flip-chip bonding to the connection parts of the wiring patterns 36 (FIG. 4) on the upper surface of the silicon interposer 30 of the interposer built-in wiring substrate 7 a of FIG. 8. The capacitor components 17 mounted on the base wiring board 5 are connected between a power line and a ground line of the semiconductor chip 70, and serves as decoupling capacitors.” Arai, [0075].</p>
--	--

FIG. 11

Arai, FIG. 11

“FIG. 11 shows a semiconductor device 8 a according to a modification of the embodiment of the present invention. As shown in FIG. 11, the semiconductor device 8 a according to the modification is constructed in such a way that the bumps 70 a of the semiconductor chip 70 are connected by flip-chip bonding to the interposer 30 of the interposer built-in wiring substrate 7 b of FIG. 9.” Arai, [0078-0079].

“In the semiconductor device 8, 8 a of this embodiment, even when a high-performance semiconductor device 70 having connection electrodes with narrow pitch is mounted, the semiconductor chip 70 can be electrically connected to the base wiring board 5 while converting the pitch of the connection electrodes thereof, by mounting the semiconductor chip 70 on the silicon interposer 30 having the wiring pattern corresponding the connection electrode of the semiconductor chip 70.” Arai, [0080].

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 4, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p>	<p>Arai discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Subsequently, as shown in FIG. 2, the second unit wiring board 20 is disposed on the first unit wiring board 10 so that the connection terminals 20 a of the second unit wiring board 20 can match the connection parts of the wiring patterns 16 of the upper side of the first unit wiring board 10. In addition, a heat treatment is performed thereto at a temperature of 180° C. to 220° C., so that the connection terminals 20 a of the second unit wiring board 20 are joined to the connection parts of the wiring patterns 16 on the upper surface of the first unit wiring board 10.” Arai, [0043].</p> <p>“As shown also in FIG. 4, solder materials 22 are formed on connection parts for the interposer, which are on the uppermost wiring patterns 16 of the base wiring board 5. The</p>

solder materials 22 are formed of a solder ball or a solder paste. Subsequently, the silicon interposer 30 is disposed on the base wiring board 5 so that the connection terminals 30 a of the silicon interposer 30 match the solder materials 22 on the base wiring board 5. Furthermore, a heat treatment is performed at a temperature of 180° C. to 220° C., so that the connection terminals 30 a of the interposer 30 are joined to the solder materials 22 provided on the base wiring board 5, and thereby electrically connected to the wiring patterns 16 of the base wiring board 5.” Arai, [0047].

Arai, FIG. 4

“In the first unit wiring board 10, the wiring patterns 16 are formed on both surface sides of the insulating layer 12, and the wiring patterns 16 are connected to each other via the through-hole-conductive layers 14 filled in the through-holes 12 x of the insulating layer 12.” Arai, [0058].

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>“In the second unit wiring board 20, similarly to the first unit wiring board 10, the wiring patterns 16 are formed, on both surface sides of the insulating layer 12, to be connected to each other via the through-hole-conductive layers 14.” Arai, [0059].</p> <p>“Subsequently, the connection terminals 20 a of the second unit wiring board 20 are joined to be electrically connected to the connection parts of the wiring patterns 16 of the first unit wiring board 10.” Arai, [0060].</p> <p>“The connection terminals 30 a formed of the gold bump or the like are provided on the connection parts of the wiring patterns 36 on the lower surface of the silicon substrate 32. The connection terminals 30 a of the silicon interposer 30 are joined to the connection parts of the wiring patterns 16 of the base wiring board 5 by use of the solder materials 22.” Arai, [0061].</p> <p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the pillars protruding downwardly from the	Arai discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

<p>bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“In the first unit wiring board 10, through-holes 12 x are formed in an insulating layer 12 which is made of, for example, an epoxy resin (prepreg), or the like, containing glass fabrics. Each through-hole 12 x is filled with a through-hole-conductive layer 14 which is made of copper or the like. Furthermore, on both surface sides of the insulating layer 12, wiring patterns 16 made of copper or the like are formed. The wiring patterns 16 on both surface sides are connected to each other via the through-hole-conductive layer 14.” Arai, [0037-0038].</p> <p>“Subsequently, as shown in FIG. 2, the second unit wiring board 20 is disposed on the first unit wiring board 10 so that the connection terminals 20 a of the second unit wiring board 20 can match the connection parts of the wiring patterns 16 of the upper side of the first unit wiring board 10. In addition, a heat treatment is performed thereto at a temperature of 180° C. to 220° C., so that the connection terminals 20 a of the second unit wiring board 20 are joined to the connection parts of the wiring patterns 16 on the upper surface of the first unit wiring board 10.” Arai, [0043].</p> <p>“Consequently, as shown FIG. 3, the first and second unit wiring boards 10 and 20, each having the wiring patterns 16 of two layers, are stacked and connected in a three dimensional manner in the thickness direction, and thus a base wiring board 5 is constructed. The base wiring board 5 is constructed to have the wiring patterns 16 of four layers, which are connected to each other with the through-hole-conductive layers 14 and the connection</p>
--	---

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>terminals 20 a interposed therebetween, and the capacitor components 17 are mounted on the uppermost wiring patterns 16.” Arai, [0044].</p> <p>“In addition, connection terminals 30 a each made of a gold bump or the like and which has a height of 30 μm to 100 μm are formed onto the wiring pattern 36 of the lower surface of the silicon interposer 30. Note that, the wiring patterns 36 of the silicon interposer 30 may be stacked on both surface sides of the silicon substrate 32 in an arbitrary number of layers. As shown also in FIG. 4, solder materials 22 are formed on connection parts for the interposer, which are on the uppermost wiring patterns 16 of the base wiring board 5. The solder materials 22 are formed of a solder ball or a solder paste. Subsequently, the silicon interposer 30 is disposed on the base wiring board 5 so that the connection terminals 30 a of the silicon interposer 30 match the solder materials 22 on the base wiring board 5. Furthermore, a heat treatment is performed at a temperature of 180° C. to 220° C., so that the connection terminals 30 a of the interposer 30 are joined to the solder materials 22 provided on the base wiring board 5, and thereby electrically connected to the wiring patterns 16 of the base wiring board 5.” Arai, [0046-0047].</p>
--	--

Arai, FIG. 4

“Furthermore, the connection terminals 20 a are disposed on the connection parts of the wiring patterns 16 on the lower surface side of the insulating layer 12. Subsequently, the connection terminals 20 a of the second unit wiring board 20 are joined to be electrically connected to the connection parts of the wiring patterns 16 of the first unit wiring board 10.” Arai, [0059-0060].

“The connection terminals 30 a formed of the gold bump or the like are provided on the connection parts of the wiring patterns 36 on the lower surface of the silicon substrate 32. The connection terminals 30 a of the silicon interposer 30 are joined to the connection parts of the wiring patterns 16 of the base wiring board 5 by use of the solder materials 22.” Arai, [0061].

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to the bottom ends of the plurality of metal pillars of the bottom package substrate via the plurality of metal pillars, and bottom ends of the plurality of bottom metal pillars are connected to corresponding top ends of the plurality of metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Arai discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“In the first unit wiring board 10, through-holes 12 x are formed in an insulating layer 12 which is made of, for example, an epoxy resin (prepreg), or the like, containing glass fabrics. Each through-hole 12 x is filled with a through-hole-conductive layer 14 which is made of copper or the like. Furthermore, on both surface sides of the insulating layer 12, wiring patterns 16 made of copper or the like are formed. The wiring patterns 16 on both surface sides are connected to each other via the through-hole-conductive layer 14. In addition, solder resists 18 having openings are formed on both surface sides of the insulating layer 12, and</p>

	<p>the openings are provided on the connection parts of the wiring patterns 16.” Arai, [0037-0038].</p> <p>“In the second unit wiring board 20, similarly to the first unit wiring board 10, the wiring patterns 16 are formed and connected to each other via a through-hole-conductive layer 14 in a through-hole 12 x on both surface sides of an insulating layer 12. In addition, similarly to the first unit wiring board 10, solder resists 18 having openings are formed on both surface sides of the insulating layer 12, and the openings are provided on the connection parts of the wiring patterns 16. Moreover, a capacitor component 17 is mounted to be connected to the wiring pattern 16 on the upper surface side of the second unit wiring board 20. Note that, besides the capacitor 17, a passive component such as a resistance component or an inductor component may be mounted thereon. In addition, in the second unit wiring board 20, a connection terminal 20 a is provided to the connection part of the wiring pattern 16 on the lower surface side of the insulating layer 12. The connection terminal 20 a is formed of a silver (Ag) paste, a solder paste, a solder ball, a copper ball covered with solder on the outer surface, a gold bump, or the like, and the height is set to 30 μm to 100 μm. Each wiring pattern 16 of the first unit wiring board 10 and the second unit wiring board 20 are formed by below method. Firstly, the through-hole 12 x is formed in the insulating layer 12. Subsequently, a metal layer which is connected to both surfaces of the insulating layer 12 from the inside of the through-hole 12 x, is formed by means of a plating method.” Arai, [0039-0041].</p>

FIG. 11

Arai, FIG. 11

“Subsequently, as shown in FIG. 2, the second unit wiring board 20 is disposed on the first unit wiring board 10 so that the connection terminals 20 a of the second unit wiring board 20 can match the connection parts of the wiring patterns 16 of the upper side of the first unit wiring board 10. In addition, a heat treatment is performed thereto at a temperature of 180° C. to 220° C., so that the connection terminals 20 a of the second unit wiring board 20 are joined to the connection parts of the wiring patterns 16 on the upper surface of the first unit wiring board 10.” Arai, [0043].

“In the silicon interposer 30, through-holes 32 x are provided in a silicon substrate 32, and insulating layers 33 are formed on both surfaces of the silicon substrate 32 as well as on the inner surfaces of the through-holes 32 x. The through-hole 32 x is filled with a through-hole-conductive layer 34 formed of copper or the like. Furthermore, on both surface sides of the silicon substrate 32, the wiring patterns 36 made of copper or the like are formed. The wiring patterns 36 are connected to each other via the through-hole-conductive layer 34. Since the

Appendix A-1 - Invalidity of U.S. Patent No. 9859202 in view of Arai - U.S. Patent Publication No. 20080155820

	<p>silicon interposer 30 is manufactured by manufacturing processes of a semiconductor integrated circuit, the silicon interposer 30 is formed at a finer pitch rather than the case of the wiring pattern 16 of the above-described base wiring board 5 and, and the minimum width thereof is formed to be in the range of, for example, 3 μm to 5 μm. In addition, connection terminals 30 a each made of a gold bump or the like and which has a height of 30 μm to 100 μm are formed onto the wiring pattern 36 of the lower surface of the silicon interposer 30.” Arai, [0045-0046].</p> <p>“Subsequently, the silicon interposer 30 is disposed on the base wiring board 5 so that the connection terminals 30 a of the silicon interposer 30 match the solder materials 22 on the base wiring board 5. Furthermore, a heat treatment is performed at a temperature of 180° C. to 220° C., so that the connection terminals 30 a of the interposer 30 are joined to the solder materials 22 provided on the base wiring board 5, and thereby electrically connected to the wiring patterns 16 of the base wiring board 5.” Arai, [0047].</p> <p>“The connection terminals 30 a formed of the gold bump or the like are provided on the connection parts of the wiring patterns 36 on the lower surface of the silicon substrate 32. The connection terminals 30 a of the silicon interposer 30 are joined to the connection parts of the wiring patterns 16 of the base wiring board 5 by use of the solder materials 22.” Arai, [0061].</p> <p>To the extent Plaintiff contends that Arai fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

U.S. Patent No. 7687899 (“Berry”) is titled Dual Laminate Package Structure with Embedded Elements and lists Christopher J. Berry as the inventor. Berry is assigned to Amkor Technology, Inc. Berry anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Berry is a U.S. patent that was filed August 7, 2007 and issued March 30, 2010. Berry is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Berry, or otherwise rendered obvious by disclosures and teachings of Berry, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Berry does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Berry with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Berry, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

Where the chart below states that Berry “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Berry or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Berry set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Berry discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“Referring now to the drawings wherein the showings are for purposes of illustrating various embodiments of the present invention only, and not for purposes of limiting the same, FIG. 1 depicts a semiconductor package 10 constructed in accordance with a first embodiment of the present invention. The semiconductor package 10 comprises a laminate bottom substrate 12 which has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the bottom substrate 12 defines a generally planar top surface 14 and an opposed, generally planar bottom surface 16.” Berry, [3:15-3:24].</p>

Berry, FIG. 1

“The semiconductor package 10 of the first embodiment further comprises a laminate top substrate 48 which is mechanically and electrically connected to the interposer 30 in a manner which will be described in more detail below. The top substrate 48 also has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the top substrate 48 defines a generally planar top surface 50 and an opposed, generally planar bottom surface 52.” Berry, [4:55-4:62].

“Referring now to FIG. 2, there is depicted a semiconductor package 100 constructed in accordance with a second embodiment of the present invention. The semiconductor package 100 comprises a laminate bottom substrate 112 which has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the bottom substrate 112 defines a generally planar top surface 114 and an opposed, generally planar bottom surface 116.” Berry, [6:20-6:27].

FIG. 2

Berry, FIG. 2

“Referring now to FIG. 3, there is depicted a semiconductor package 200 constructed in accordance with a third embodiment of the present invention. The semiconductor package 200 comprises a laminate bottom substrate 212 which has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the bottom substrate 212 defines a generally planar top surface 214 and an opposed, generally planar bottom surface 216.” Berry, [6:20-6:27].

FIG. 3

Berry, FIG. 3

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

	<p>“The semiconductor package 100 of the first embodiment further comprises a laminate top substrate 148 which is mechanically and electrically connected to the interposer 130 in a manner which will be described in more detail below. The top substrate 148 also has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the top substrate 148 defines a generally planar top surface 150 and an opposed, generally planar bottom surface 152.” Berry, [7:54-7:61].</p> <p>“The semiconductor package 200 of the third embodiment further comprises a laminate top substrate 248 which is mechanically and electrically connected to the interposer 230 in a manner which will be described in more detail below. The top substrate 248 also has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the top substrate 248 defines a generally planar top surface 250 and an opposed, generally planar bottom surface 252.” Berry, [11:3-11:10].</p>
[1.A] a bottom package substrate;	<p>Berry discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The semiconductor package 10 comprises a laminate bottom substrate 12 which has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the bottom substrate 12 defines a generally planar top surface 14 and an opposed, generally planar bottom surface 16. Disposed on the top surface 14 is a plurality of top contacts 18 of the bottom substrate 12. In the bottom substrate 12, the top contacts 18 are segregated into two sets, with the top contacts 18 of each set extending along and in spaced relation to a respective one of an opposed pair of the peripheral edge segments defined by the bottom substrate 12. Formed on the bottom surface 16 of the bottom substrate 12 is a plurality of</p>

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

	<p>bottom contacts 20. Though not shown in FIG. 1, the top and bottom contacts 18, 20 are electrically connected to each other in a prescribed pattern or arrangement by conductive vias which extend through the bottom substrate 12.” Berry, [3:20-3:35].</p> <p>“Formed on each of the bottom contacts 20 of the bottom substrate 12 is a solder bump or solder ball 46.” Berry, [4:52-4:54].</p> <p>“The semiconductor package 100 comprises a laminate bottom substrate 112 which has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the bottom substrate 112 defines a generally planar top surface 114 and an opposed, generally planar bottom surface 116. Disposed on the top surface 114 is a plurality of top contacts 118 of the bottom substrate 112. In the bottom substrate 112, the top contacts 118 are segregated into two sets, with the top contacts 118 of each set extending along and in spaced relation to a respective one of an opposed pair of the peripheral edge segments defined by the bottom substrate 112. Formed on the bottom surface 116 of the bottom substrate 112 is a plurality of bottom contacts 120. Though not shown in FIG. 2, the top and bottom contacts 118, 120 are electrically connected to each other in a prescribed pattern or arrangement by conductive vias which extend through the bottom substrate 112.” Berry, [6:22-6:38].</p>
--	--

FIG. 2

Berry, FIG. 2

“Formed on each of the bottom contacts 120 of the bottom substrate 112 is a solder bump or solder ball 146.” Berry, [7:51-7:53].

“The semiconductor package 200 comprises a laminate bottom substrate 212 which has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the bottom substrate 212 defines a generally planar top surface 214 and an opposed, generally planar bottom surface 216. Disposed on the top surface 214 is a plurality of top contacts 218 of the bottom substrate 212. In the bottom substrate 212, the top contacts 218 are segregated into at least three sets, with the top contacts 218 of two of these sets extending along and in spaced relation to a respective one of an opposed pair of the peripheral edge segments defined by the bottom substrate 212. The top contacts 218 of the third set extend between and in generally parallel relation to the top contacts 218 of the other two sets thereof. Formed on the bottom surface 216 of the bottom substrate 212 is a plurality of bottom contacts 220. Though not shown in FIG. 3, the top and bottom contacts 218, 220 are electrically connected to each other in a prescribed pattern or arrangement by conductive vias which extend through the bottom substrate 212.” Berry, [9:40-9:59].

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

	<p>“In the next step of the fabrication process, a bottom substrate strip 312 is provided, such bottom substrate strip 312 including multiple bottom substrates 112 which are integrally connected to each other. In this respect, disposed on the top surface of the bottom substrate strip 312 is a plurality of the top contacts 118 which are oriented such that each of the bottom substrates 112 included in the bottom substrate strip 312 is provided with an assortment of the top contacts 118 arranged in the same pattern described above in relation to the bottom substrate 112 of the semiconductor package 100 shown in FIG. 2.” Berry, [13:62-14:4].</p> <p>To the extent Plaintiff contends that Berry fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.B] a top package substrate stacked on top of the bottom package substrate;	<p>Berry discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The semiconductor package 10 of the first embodiment further comprises a laminate top substrate 48 which is mechanically and electrically connected to the interposer 30 in a manner which will be described in more detail below. The top substrate 48 also has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the top substrate 48 defines a generally planar top surface 50 and an opposed, generally planar bottom surface 52. Disposed in the approximate center of the top surface 50 of the top substrate 48 is a plurality of top contacts 54 of the top substrate 48. Additionally, formed on the bottom surface 52 of the top substrate 48 is a plurality of bottom contacts 56 thereof. In</p>

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

	<p>the top substrate 48, the bottom contacts 56 are segregated into two sets, with the bottom contacts 56 of each set extending along and in spaced relation to a respective one of an opposed pair of the peripheral edge segments defined by the top substrate 48. Though not shown, the top and bottom contacts 54, 56 are electrically connected to each other by conductive vias which extend through the top substrate 48. Those of ordinary skill in the art will recognize that each top contact 54 may be electrically connected to one or more bottom contacts 56 in any pattern or arrangement through the use of such conductive vias. The top and bottom contacts 54, 56 are also each preferably identically configured to each other, and fabricated from a suitable conductive material, as is any conductive via extending there between.” Berry, [4:55-5:13].</p> <p>“When the top substrate 48 is electrically and mechanically connected to the interposer 30 in the above-described manner, the die stack 22 as well as the conductive wires 28 are effectively positioned between the bottom and top substrates 12, 48, and more particularly the top surface 14 of the bottom substrate 12 and the bottom surface 52 of the top substrate 48.” Berry, [5:31-5:37].</p> <p>“The semiconductor package 200 of the third embodiment further comprises a laminate top substrate 248 which is mechanically and electrically connected to the interposer 230 in a manner which will be described in more detail below. The top substrate 248 also has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the top substrate 248 defines a generally planar top surface 250 and an opposed, generally planar bottom surface 252. Disposed on the top surface 250 of the top substrate 248 is a plurality of top contacts 254 of the top substrate 248. Additionally, formed on the bottom surface 252 of the top substrate 248 is a plurality of bottom contacts 256 thereof.” Berry, [7:54-7:65].</p>
--	--

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

	<p>“When the top substrate 148 is electrically and mechanically connected to the interposer 130 in the above-described manner, the electronic components 122, 124 as well as the conductive wires 128 are effectively positioned between the bottom and top substrates 112, 148, and more particularly the top surface 114 of the bottom substrate 112 and the bottom surface 152 of the top substrate 148.” Berry, [8:47-8:53].</p> <p>“The semiconductor package 100 of the first embodiment further comprises a laminate top substrate 148 which is mechanically and electrically connected to the interposer 130 in a manner which will be described in more detail below. The top substrate 148 also has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the top substrate 148 defines a generally planar top surface 150 and an opposed, generally planar bottom surface 152. Disposed in the approximate center of the top surface 150 of the top substrate 148 is a plurality of top contacts 154 of the top substrate 148. Additionally, formed on the bottom surface 152 of the top substrate 148 is a plurality of bottom contacts 156 thereof. In the top substrate 148, some of the bottom contacts 156 are segregated into two sets, with the bottom contacts 156 of each such set extending along and in spaced relation to a respective one of an opposed pair of the peripheral edge segments defined by the top substrate 148. Though not shown, the top and bottom contacts 154, 156 are electrically connected to each other by conductive vias which extend through the top substrate 148. Those of ordinary skill in the art will recognize that each top contact 154 may be electrically connected to one or more bottom contacts 156 in any pattern or arrangement through the use of such conductive vias. The top and bottom contacts 154, 156 are also each preferably identically configured to each other, and fabricated from a suitable conductive material, as is any conductive via extending there between. Attached to a central area of the bottom surface 152 of the top substrate 148 is at least one, and preferably multiple electronic components 124.” Berry, [11:3-11:30].</p>
--	---

	 <p>FIG. 2</p> <p>Berry, FIG. 2</p> <p>“When the top substrate 248 is electrically and mechanically connected to the interposer 230 in the above-described manner, the electronic components 222, 224 as well as the conductive wires 228 are effectively positioned between the bottom and top substrates 212, 248, and more particularly the top surface 214 of the bottom substrate 212 and the bottom surface 252 of the top substrate 248.” Berry, [11:64-12:3].</p> <p>To the extent Plaintiff contends that Berry fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom</p>	<p>Berry discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p>See, e.g.:</p>

package substrate and the top package substrate, wherein	<p>“In the semiconductor package 100, each bottom pad 140 in each of the first and second segments 130 a, 130 b is electrically connected to a respective one of the top contacts 118 of a corresponding set thereof by a solder ball 144. However, those of ordinary skill in the art will recognize that solder paste, conductive adhesive, or other suitable materials may be employed as an alternative to the use of the solder balls 144. As seen in FIG. 2, such attachment is preferably facilitated such that one of the longitudinal side surfaces 137 of each of the first and second segments 130 a, 130 b extends in generally co-planar relation to a respective one of the sides or peripheral edge segments defined by the bottom substrate 112. Formed on each of the bottom contacts 120 of the bottom substrate 112 is a solder bump or solder ball 146. The semiconductor package 100 of the first embodiment further comprises a laminate top substrate 148 which is mechanically and electrically connected to the interposer 130 in a manner which will be described in more detail below.” Berry, [7:40-7:57].</p>  <p>FIG. 2</p> <p>Berry, FIG. 2</p> <p>“In the semiconductor package 100, each top pad 138 of each of the first and second segments 130 a, 130 b of the interposer 130 is electrically connected to a respective one of the bottom</p>
--	--

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

	<p>contacts 156 of a corresponding set thereof by a solder ball 158. However, those of ordinary skill in the art will recognize that solder paste, conductive adhesive, or other suitable materials may be employed as an alternative to the use of the solder balls 158. As is also seen in FIG. 2, such attachment is preferably facilitated such that one of the longitudinal side surfaces 137 of each of the first and second segments 130 a, 130 b extends in generally co-planar relation to a respective one of the sides or peripheral edge segments defined by the top substrate 148. Thus, in addition to extending in generally co-planar relation to respective longitudinal side surfaces 137 of the first and second segments 130 a, 130 b, the peripheral edge segments defined by the top substrate 148 also extend in generally co-planar relation to respective ones of the peripheral edge segments defined by the bottom substrate 112. When the top substrate 148 is electrically and mechanically connected to the interposer 130 in the above-described manner, the electronic components 122, 124 as well as the conductive wires 128 are effectively positioned between the bottom and top substrates 112, 148, and more particularly the top surface 114 of the bottom substrate 112 and the bottom surface 152 of the top substrate 148.” Berry, [8:29-8:53].</p> <p>“The semiconductor package 200 further comprises an interposer 230 which is mounted and electrically connected to the top contacts 218 of the bottom substrate 212. It is contemplated that the interposer 230 may comprise separate first, second and third segments 230 a, 230 b, 230 c which are electrically connected to each of the top contacts 218 of respective ones of the three sets thereof. The first, second and third segments 230 a, 230 b, 230 c of the interposer 230 are identically configured to each other and, in the completed semiconductor package 200, extend in spaced, generally parallel relation to each other.” Berry, [10:17-10:27].</p> <p>“In the semiconductor package 200, each top pad 238 of each of the first, second and third segments 230 a, 230 b, 230 c of the interposer 230 is electrically connected to a respective</p>
--	---

one of the bottom contacts 256 of a corresponding set thereof by a solder ball 258. However, those of ordinary skill in the art will recognize that solder paste, conductive adhesive, or other suitable materials may be employed as an alternative to the use of the solder balls 258. As is also seen in FIG. 3, such attachment is preferably facilitated such that one of the longitudinal side surfaces 237 of each of the first and second segments 230 a, 230 b extends in generally co-planar relation to a respective one of the sides or peripheral edge segments defined by the top substrate 248. Thus, in addition to extending in generally co-planar relation to respective longitudinal side surfaces 237 of the first and second segments 230 a, 230 b, the peripheral edge segments defined by the top substrate 248 also extend in generally co-planar relation to respective ones of the peripheral edge segments defined by the bottom substrate 212. When the top substrate 248 is electrically and mechanically connected to the interposer 230 in the above-described manner, the electronic components 222, 224 as well as the conductive wires 228 are effectively positioned between the bottom and top substrates 212, 248, and more particularly the top surface 214 of the bottom substrate 212 and the bottom surface 252 of the top substrate 248.” Berry, [11:46-12:3].

Berry, FIG. 3

“In the next step of the fabrication process shown in FIG. 4C, each of the top substrates 148 shown in FIG. 4A is mated and electrically connected to a respective one of the interposers

130 within the interposer strip 330. The mounting and electrical connection of each top substrate 148 to a respective interposer 130 is accomplished in the same manner described above in relation to the electrical connection of the top substrate 148 to the interposer 130 in the semiconductor package 100 shown in FIG. 2. In this regard, each of the solder balls 158 formed on respective ones of the bottom contacts 156 on each of the top substrates 148 is brought into direct contact with a respective one of the top pads 138 included in each of the interposers 130 of the interposer strip 330. Thereafter, a reflow process is completed as effectively electrically connects each of the top substrates 148 to a corresponding one of the interposers 130 within the interposer strip 330. Subsequent to the mounting and electrical connection of each of the top substrates 148 to respective ones of the interposers 130 within the interposer strip 330, a suitable encapsulant material or mold compound is injected between the top surface of the bottom substrate strip 312 and the bottom surface 152 of each of the top substrates 148 mounted and electrically connected to the interposer strip 330.” Berry, [13:62-14:17].

FIG. 4C

Berry, FIG. 4C

To the extent Plaintiff contends that Berry fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

	knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.
[1.D] the spacer connector comprises a core substrate;	<p>Berry discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“The semiconductor package 10 further comprises an interposer 30 which is mounted and electrically connected to the top contacts 18 of the bottom substrate 12. It is contemplated that the interposer 30 may comprise a first segment 30 a which is electrically connected to each of the top contacts 18 of one of the sets thereof, and a separate second segment 30 b which is electrically connected to each of the top contacts 18 of the remaining set thereof.” Berry, [4:1-4:9].</p> <p>“Each of the interposer segments 30 a, 30 b of the interposer 30 comprises an interposer body 32 having a top surface 34, a bottom surface 36, an opposed pair of longitudinal side surfaces 37, and an opposed pair of lateral side surfaces.” Berry, [4:15-4:18].</p> <p>“The semiconductor package 100 further comprises an interposer 130 which is mounted and electrically connected to the top contacts 118 of the bottom substrate 112. It is contemplated that the interposer 130 may comprise a first segment 130 a which is electrically connected to each of the top contacts 118 of one of the sets thereof, and a separate second segment 130 b which is electrically connected to each of the top contacts 118 of the remaining set thereof.” Berry, [7:1-7:8].</p> <p>“The semiconductor package 200 further comprises an interposer 230 which is mounted and electrically connected to the top contacts 218 of the bottom substrate 212. It is contemplated</p>

that the interposer 230 may comprise separate first, second and third segments 230 a, 230 b, 230 c which are electrically connected to each of the top contacts 218 of respective ones of the three sets thereof.” Berry, [10:17-10:23].

“Each of the interposer segments 130 a, 130 b of the interposer 130 comprises an interposer body 132 having a top surface 134, a bottom surface 136, an opposed pair of longitudinal side surfaces 137, and an opposed pair of lateral side surfaces.” Berry, [10:28-10:32].

FIG. 2

Berry, FIG. 2

“Each of the interposer segments 230 a, 230 b, 230 c of the interposer 230 comprises an interposer body 232 having a top surface 234, a bottom surface 236, an opposed pair of longitudinal side surfaces 237, and an opposed pair of lateral side surfaces.” Berry, [10:28-10:31].

To the extent Plaintiff contends that Berry fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

	knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.
[1.E] a plurality of metal pillars, each passing through the core substrate; and	<p>Berry discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Each of the interposer segments 30 a, 30 b of the interposer 30 comprises an interposer body 32 having a top surface 34, a bottom surface 36, an opposed pair of longitudinal side surfaces 37, and an opposed pair of lateral side surfaces. Disposed on the top surface 34 of the interposer body 32 of each of the first and second segments 30 a, 30 b is a plurality of top pads 38. Similarly, disposed on the bottom surface 36 of each of the first and second segments 30 a, 30 b is a plurality of bottom pads 40. The top and bottom pads 38, 40 disposed on the interposer body 32 of each of the first and second segments 30 a, 30 b are segregated into multiple pairs, with the top pad 38 of each pair being disposed in spaced, substantial vertical alignment with the bottom pad 40 of the same pair. The top and bottom pads 38, 40 of each pair within each of the first and second segments 30 a, 30 b are electrically connected to each other by one or more conductive vias 42 which extend through the interposer body 32 substantially perpendicularly between the top and bottom pads 38, 40 of the corresponding pair.” Berry, [4:15-4:32].</p>

FIG. 1

Berry, FIG. 1

“The top and bottom pads 138, 140 disposed on the interposer body 132 of each of the first and second segments 130 a, 130 b are segregated into multiple pairs, with the top pad 138 of each pair being disposed in spaced, substantial vertical alignment with the bottom pad 140 of the same pair. The top and bottom pads 138, 140 of each pair within each of the first and second segments 130 a, 130 b are electrically connected to each other by one or more conductive vias 142 which extend through the interposer body 132 substantially perpendicularly between the top and bottom pads 138, 140 of the corresponding pair. The top and bottom pads 138, 140 of each pair are preferably identically configured to each other, and fabricated from a suitable conductive material, as is the conductive via(s) 142 extending therebetween. Those of ordinary skill in the art will recognize that the top and bottom pads 138, 140 of each pair need not necessarily be in exact vertical alignment, and that some degree of juxtaposition therebetween is contemplated to fall within the scope of the present invention.” Berry, [7:21-7:39].

“Each of the interposer segments 130 a, 130 b of the interposer 130 comprises an interposer body 132 having a top surface 134, a bottom surface 136, an opposed pair of longitudinal

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Berry discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“The semiconductor package 10 of the first embodiment further comprises a laminate top substrate 48 which is mechanically and electrically connected to the interposer 30 in a manner which will be described in more detail below. The top substrate 48 also has a generally quadrangular configuration defining four (4) peripheral edge segments. In addition, the top substrate 48 defines a generally planar top surface 50 and an opposed, generally planar bottom surface 52. Disposed in the approximate center of the top surface 50 of the top substrate 48 is a plurality of top contacts 54 of the top substrate 48.” Berry, [4:55-4:65].</p>

FIG. 1

Berry, FIG. 1

“Those of ordinary skill in the art will recognize that each top contact 54 may be electrically connected to one or more bottom contacts 56 in any pattern or arrangement through the use of such conductive vias.” Berry, [5:7-5:10].

“The top contacts 54 of the top substrate 48 provide top side routing also known as a ‘lands-over-top’ feature in the completed semiconductor package 10.” Berry, [6:17-6:20].

To the extent Plaintiff contends that Berry fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

Claim Limitation	Disclosure
<p>[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p>	<p>Berry discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The top and bottom pads 138, 140 disposed on the interposer body 132 of each of the first and second segments 130 a, 130 b are segregated into multiple pairs, with the top pad 138 of each pair being disposed in spaced, substantial vertical alignment with the bottom pad 140 of the same pair. The top and bottom pads 138, 140 of each pair within each of the first and second segments 130 a, 130 b are electrically connected to each other by one or more conductive vias 142 which extend through the interposer body 132 substantially perpendicularly between the top and bottom pads 138, 140 of the corresponding pair.” Berry, [7:21-7:31].</p> <p align="center">FIG. 2</p>

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

	<p>Berry, FIG. 2</p> <p>“The top and bottom pads 138, 140 of each pair are preferably identically configured to each other, and fabricated from a suitable conductive material, as is the conductive via(s) 142 extending therebetween. Those of ordinary skill in the art will recognize that the top and bottom pads 138, 140 of each pair need not necessarily be in exact vertical alignment, and that some degree of juxtaposition therebetween is contemplated to fall within the scope of the present invention.” Berry, [7:32-7:39].</p> <p>“As seen in FIG. 2, such attachment is preferably facilitated such that one of the longitudinal side surfaces 137 of each of the first and second segments 130 a, 130 b extends in generally co-planar relation to a respective one of the sides or peripheral edge segments defined by the bottom substrate 112.” Berry, [7:47-7:51].</p> <p>“In the semiconductor package 100, each top pad 138 of each of the first and second segments 130 a, 130 b of the interposer 130 is electrically connected to a respective one of the bottom contacts 156 of a corresponding set thereof by a solder ball 158. However, those of ordinary skill in the art will recognize that solder paste, conductive adhesive, or other suitable materials may be employed as an alternative to the use of the solder balls 158.” Berry, [8:29-8:36].</p> <p>“As is also seen in FIG. 2, such attachment is preferably facilitated such that one of the longitudinal side surfaces 137 of each of the first and second segments 130 a, 130 b extends in generally co-planar relation to a respective one of the sides or peripheral edge segments defined by the top substrate 148. Thus, in addition to extending in generally co-planar relation to respective longitudinal side surfaces 137 of the first and second segments 130 a, 130 b, the peripheral edge segments defined by the top substrate 148 also extend in generally co-planar</p>

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the bottom ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	<p>Berry discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p>

spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

“Similarly, disposed on the bottom surface 36 of each of the first and second segments 30 a, 30 b is a plurality of bottom pads 40. The top and bottom pads 38, 40 disposed on the interposer body 32 of each of the first and second segments 30 a, 30 b are segregated into multiple pairs, with the top pad 38 of each pair being disposed in spaced, substantial vertical alignment with the bottom pad 40 of the same pair. The top and bottom pads 38, 40 of each pair within each of the first and second segments 30 a, 30 b are electrically connected to each other by one or more conductive vias 42 which extend through the interposer body 32 substantially perpendicularly between the top and bottom pads 38, 40 of the corresponding pair. The top and bottom pads 38, 40 of each pair are preferably identically configured to each other, and fabricated from a suitable conductive material, as is the conductive via(s) 42 extending therebetween. Those of ordinary skill in the art will recognize that the top and bottom pads 38, 40 of each pair need not necessarily be in exact vertical alignment, and that some degree of juxtaposition therebetween is contemplated to fall within the scope of the present invention. In the semiconductor package 10, each bottom pad 40 in each of the first and second segments 30 a, 30 b is electrically connected to a respective one of the top contacts 18 of a corresponding set thereof by a solder ball 44.” Berry, [4:21-4:44].

FIG. 2

Berry, FIG. 2

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

	<p>“In the semiconductor package 10, each top pad 38 of each of the first and second segments 30 a, 30 b of the interposer 30 is electrically connected to a respective one of the bottom contacts 56 of a corresponding set thereof by a solder ball 58.” Berry, [5:14-5:17].</p> <p>“Similarly, disposed on the bottom surface 136 of each of the first and second segments 130 a, 130 b is a plurality of bottom pads 140. The top and bottom pads 138, 140 disposed on the interposer body 132 of each of the first and second segments 130 a, 130 b are segregated into multiple pairs, with the top pad 138 of each pair being disposed in spaced, substantial vertical alignment with the bottom pad 140 of the same pair. The top and bottom pads 138, 140 of each pair within each of the first and second segments 130 a, 130 b are electrically connected to each other by one or more conductive vias 142 which extend through the interposer body 132 substantially perpendicularly between the top and bottom pads 138, 140 of the corresponding pair. The top and bottom pads 138, 140 of each pair are preferably identically configured to each other, and fabricated from a suitable conductive material, as is the conductive via(s) 142 extending therebetween. Those of ordinary skill in the art will recognize that the top and bottom pads 138, 140 of each pair need not necessarily be in exact vertical alignment, and that some degree of juxtaposition therebetween is contemplated to fall within the scope of the present invention. In the semiconductor package 100, each bottom pad 140 in each of the first and second segments 130 a, 130 b is electrically connected to a respective one of the top contacts 118 of a corresponding set thereof by a solder ball 144.” Berry, [7:19-7:43].</p> <p>“In the semiconductor package 100, each top pad 138 of each of the first and second segments 130 a, 130 b of the interposer 130 is electrically connected to a respective one of the bottom contacts 156 of a corresponding set thereof by a solder ball 158.” Berry, [8:29-8:33].</p>
--	---

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

	<p>“Similarly, disposed on the bottom surface 236 of each of the first, second and third segments 230 a, 230 b, 230 c is a plurality of bottom pads 240. The top and bottom pads 238, 240 disposed on the interposer body 232 of each of the first, second and third segments 230 a, 230 b, 230 c are segregated into multiple pairs, with the top pad 238 of each pair being disposed in spaced, substantial vertical alignment with the bottom pad 240 of the same pair. The top and bottom pads 238, 240 of each pair within each of the first and second segments 230 a, 230 b are electrically connected to each other by one or more conductive vias 242 which extend through the interposer body 232 substantially perpendicularly between the top and bottom pads 238, 240 of the corresponding pair. The top and bottom pads 238, 240 of each pair are preferably identically configured to each other, and fabricated from a suitable conductive material, as is the conductive via(s) 242 extending therebetween. Those of ordinary skill in the art will recognize that the top and bottom pads 238, 240 of each pair need not necessarily be in exact vertical alignment, and that some degree of juxtaposition therebetween is contemplated to fall within the scope of the present invention. In the semiconductor package 200, each bottom pad 240 in each of the first, second and third segments 230 a, 230 b, 230 c is electrically connected to a respective one of the top contacts 218 of a corresponding set thereof by a solder ball 244.” Berry, [10:34-10:59].</p> <p>“In the semiconductor package 200, each top pad 238 of each of the first, second and third segments 230 a, 230 b, 230 c of the interposer 230 is electrically connected to a respective one of the bottom contacts 256 of a corresponding set thereof by a solder ball 258.” Berry, [11:46-11:50].</p> <p>To the extent Plaintiff contends that Berry fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-2 - Invalidity of U.S. Patent No. 9859202 in view of Berry - U.S. Patent No. 7687899

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

U.S. Patent Publication No. 20130182402 (“Chen '402”) is titled PoP Structures Including Through-Assembly Via Modules and lists Chih-Hua Chen, Chen-Shien Chen, and Ching-Wen Hsiao as inventors. Chen '402 is assigned to Taiwan Semiconductor Manufacturing Company, Ltd. Chen '402 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the '202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff's apparent infringement theory.² Chen '402 is a U.S. patent publication that was filed January 18, 2012 and published July 18, 2013. Chen '402 is therefore prior art to the '202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Chen '402, or otherwise rendered obvious by disclosures and teachings of Chen '402, including under TopWire's apparent interpretation of the Asserted Claims as Samsung understands them from TopWire's Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Chen '402 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Chen '402 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung's other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung's Invalidity Contentions with respect to the '202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Chen '402, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire's March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court's order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire's apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung's interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Chen '402 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Chen '402 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Chen '402 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Chen '402 discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“A Package-on-Package (PoP) structure and the methods of forming the same are provided in accordance with various exemplary embodiments.” Chen '402, [0008].</p> <p>“FIGS. 1 through 9 are cross-sectional views and a top view of intermediate stages in the manufacturing of a Package-on-Package (PoP) structure in accordance with some exemplary embodiments. FIG. 1 illustrates carrier 20 and release layer 22 on carrier 20. Carrier 20 may</p>

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

	<p>be a glass carrier, a ceramic carrier, or the like. Release layer 22 may be formed of an adhesive such as an Ultra-Violet (UV) glue. Package component 24 and Through-Assembly Via (TAV) modules 28 are then placed on release layer 22. The bottom surfaces of package component 24 and TAV modules 28 are in contact with the top surface of release layer 22, and are level with each other. The position of package component 24 and TAV modules 28 are accurately aligned to desirable locations, so that the subsequent formed redistribution lines may electrically couple to metal posts 26 and 30. In some embodiments, package component 24 includes one or a plurality of device dies. For example, package component 24 may include a Central Computing Unit (CPU) die or another type of logic die having logic circuits. In alternative embodiments, package component 24 includes a plurality of memory dies stacked together (please refer to FIG. 11). In the embodiments wherein package component 24 is a device die, package component 24 may include semiconductor substrate 25 and active devices (such as transistors) 27 at a top surface of semiconductor substrate 25. The bottom surface of semiconductor substrate 25 is thus in contact with release layer 22. Semiconductor substrate 25 may be free from through-substrate vias formed therein, although through-substrate vias may also be formed to penetrate through semiconductor substrate 25. Package component 24 may also be a package that includes device die(s), interposer(s), package substrate(s) (not shown), and/or the like. Metal posts 26 (such as copper posts) are formed as a top portion of package component 24.” Chen ’402, [0009].</p>
--	--

FIG. 1

Chen '402, Fig. 1

“TAV modules 28 are integrated modules that are pre-formed before being placed on release layer 22. TAV modules 28 include substrate 34, which may be a semiconductor substrate such as a silicon substrate. Alternatively, substrate 34 is a dielectric substrate such as a glass substrate. Through-substrate vias 32 are formed in substrate 34 for inter-coupling the conductive features on opposite sides of substrate 34. Through-substrate vias 32 are formed of a conductive material, which may include copper, aluminum, tungsten, and/or the like. In some embodiments, bottom ends 32A of through-substrate vias 32 are level with the bottom surface 34A of substrate 34. Accordingly, bottom ends 32A of through-substrate vias 32 may be in contact with release layer 22. TAV modules 28 may also include metal posts 30 (such as copper posts) formed as top portions of TAV modules 28. The top surfaces of metal post 26 and 30 are substantially level with each other.” Chen '402, [0010].

“FIG. 2 illustrates a top view of the structure in FIG. 1. In accordance with some embodiments, TAV modules 28 are disposed on opposite sides of package component 24.

Although two TAV modules 28 are illustrated, there may be one or more than two TAV modules 28. TAV modules 28 may have an identical structure. Alternatively, TAV modules 28 may have different structures with different counts of metal posts 30, different layouts of metal posts 30, different sizes, and/or different materials. The plurality of TAV modules 28 may be laid out on release layer 22 with any layout.” Chen ’402, [0012].

FIG. 2

Chen ’402, Fig. 2

“Next, referring to FIG. 4, Redistribution Lines (RDLs) 42 and connectors 44 are formed to connect to metal posts 26 and 30. As indicated by dashed lines, RDLs 42 may also

interconnect metal posts 26 and 30. RDLs 42 may be formed by depositing a metal layer, and then patterning the metal layer. In some exemplary embodiments, the formation of connectors 44 includes placing solder balls on the exposed portions of RDLs 42, and then reflowing the solder balls. In alternative embodiments, the formation of connectors 44 includes performing a plating step to form solder regions on RDLs 42, and then reflowing the solder regions. Connectors 44 may also include metal pillars, or metal pillars and solder caps, which may also be formed through plating. Throughout the description, the structure including package component 24, TAV modules 28, and polymer 40 is referred to as package 46.” Chen ’402, [0014].

FIG. 4

Chen '402, Fig. 4

“FIG. 9 illustrates the bonding of top package component 62 to bottom package 60. In some embodiments, top package component 62 is a device die. Alternatively, package component 62 is a package that includes a device die (not shown) bonded to a package substrate (not shown), an interposer (not shown), or the like. In the resulting package, TAV modules 28 are

used to electrically couple the circuit devices in package component 62 to package component 56.” Chen ’402, [0019].

FIG. 9

Chen ’402, Fig. 9

“FIG. 10 illustrates an exemplary embodiment wherein package component 62 includes a plurality of stacked dies 64. In some embodiments, stacked dies 64 are memory dies. Stacked dies 64 may be bonded to RDLs 54 that are over and aligned to package component 24, which are further connected to the RDLs 54 over and aligned to TAV modules 28. In these embodiments, package component 24 may be electrically coupled to stacked dies 64, for example, through RDLs 54, TAV modules 28, RDLs 42, and/or package component 56. FIG. 11 illustrates alternative embodiments, wherein the positions of stacked dies 64 and package component 24 are swapped as compared to FIG. 10.” Chen ’402, [0020].

	 <p>FIG. 10</p> <p>Chen '402, Fig. 10</p>
[1.A] a bottom package substrate;	<p>Chen '402 discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 8, package 46 is bonded to package component 56 to form bottom package 60. Package component 56 may be a package substrate, an interposer, a device die, a Printed Circuit Board (PCB), or the like. Polymer 58 is dispensed between package 46 and package component 56.” Chen '402, [0018].</p>

FIG. 8

Chen '402, Fig. 8

“Package component 56 may be a package substrate, an interposer, a device die, a Printed Circuit Board (PCB), or the like.” Chen '402, [0018].

“FIG. 9 illustrates the bonding of top package component 62 to bottom package 60. In some embodiments, top package component 62 is a device die. Alternatively, package component 62 is a package that includes a device die (not shown) bonded to a package substrate (not shown), an interposer (not shown), or the like.” Chen '402, [0019].

FIG. 9

Chen '402, Fig. 9

“FIG. 10 illustrates an exemplary embodiment wherein package component 62 includes a plurality of stacked dies 64. In some embodiments, stacked dies 64 are memory dies. Stacked dies 64 may be bonded to RDLs 54 that are over and aligned to package component 24, which are further connected to the RDLs 54 over and aligned to TAV modules 28. In these embodiments, package component 24 may be electrically coupled to stacked dies 64, for example, through RDLs 54, TAV modules 28, RDLs 42, and/or package component 56. FIG. 11 illustrates alternative embodiments, wherein the positions of stacked dies 64 and package component 24 are swapped as compared to FIG. 10.” Chen ’402, [0020].

Chen '402, Fig. 10

“In accordance with other embodiments, a device includes a bottom package, and a top package component bonded to the bottom package. The bottom package includes a package substrate, a plurality of connectors over the package substrate, and a package.” Chen '402, [0024].

“A plurality of RDLs is under the molding compound and electrically coupled to the device die and the plurality of through-vias in the TAV module. The plurality of RDLs is bonded to the package substrate through the plurality of connectors.” Chen '402, [0024].

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

	<p>“The polymer is ground to expose metal posts of the device die and metal posts of the TAV module. A first plurality of RDLs is formed over the polymer and connected to the metal posts of the device die and the metal posts of the TAV module, wherein the device die, the TAV module, and the first plurality of RDLs form a package. The package is mounted on a second carrier, wherein the first and the second carriers are on opposite sides of the package.” Chen '402, [0025].</p> <p>To the extent Plaintiff contends that Chen '402 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Chen '402 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 8, package 46 is bonded to package component 56 to form bottom package 60. Package component 56 may be a package substrate, an interposer, a device die, a Printed Circuit Board (PCB), or the like.” Chen '402, [0018].</p>

	<div data-bbox="324 420 633 1344"></div> <div data-bbox="649 840 673 924"><p>FIG. 8</p></div> <div data-bbox="706 1155 738 1386"><p>Chen '402, Fig. 8</p></div> <div data-bbox="787 178 868 1302"><p>“Alternatively, package 60 may be molded, for example, using compress molding, and RDLs 54 are exposed through the respective molding compound (not shown).” Chen '402, [0018].</p></div> <div data-bbox="901 178 1063 1302"><p>“FIG. 9 illustrates the bonding of top package component 62 to bottom package 60. In some embodiments, top package component 62 is a device die. Alternatively, package component 62 is a package that includes a device die (not shown) bonded to a package substrate (not shown), an interposer (not shown), or the like.” Chen '402, [0019].</p></div>
--	--

FIG. 9

Chen '402, Fig. 9

“FIG. 10 illustrates an exemplary embodiment wherein package component 62 includes a plurality of stacked dies 64. In some embodiments, stacked dies 64 are memory dies. Stacked dies 64 may be bonded to RDLs 54 that are over and aligned to package component 24, which are further connected to the RDLs 54 over and aligned to TAV modules 28. In these embodiments, package component 24 may be electrically coupled to stacked dies 64, for example, through RDLs 54, TAV modules 28, RDLs 42, and/or package component 56.”
Chen '402, [0020].

FIG. 11

Chen '402, Fig. 11

“In accordance with other embodiments, a device includes a bottom package, and a top package component bonded to the bottom package. The bottom package includes a package substrate, a plurality of connectors over the package substrate, and a package. The package includes a device die, and a TAV Module substantially level with the device die. The TAV module is free from active devices therein, and includes a substrate and a plurality of through-vias penetrating through the substrate. A molding compound contacts a bottom surface of the device die, a bottom surface of the TAV module, and sidewalls of the device die and the TAV module. A plurality of RDLs is under the molding compound and electrically coupled to the device die and the plurality of through-vias in the TAV module. The plurality of RDLs is bonded to the package substrate through the plurality of connectors.” Chen '402, [0023-0024].

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

	<p>To the extent Plaintiff contends that Chen '402 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Chen '402 discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 illustrates carrier 20 and release layer 22 on carrier 20. Carrier 20 may be a glass carrier, a ceramic carrier, or the like. Release layer 22 may be formed of an adhesive such as an Ultra-Violet (UV) glue. Package component 24 and Through-Assembly Via (TAV) modules 28 are then placed on release layer 22. The bottom surfaces of package component 24 and TAV modules 28 are in contact with the top surface of release layer 22, and are level with each other.” Chen '402, [0009].</p>

FIG. 1

Chen '402, Fig. 1

“In some embodiments, package component 24 includes one or a plurality of device dies.”
Chen '402, [0009].

Chen '402, [0009].

“TAV modules 28 are integrated modules that are pre-formed before being placed on release layer 22. TAV modules 28 include substrate 34, which may be a semiconductor substrate such as a silicon substrate. Alternatively, substrate 34 is a dielectric substrate such as a glass substrate. Through-substrate vias 32 are formed in substrate 34 for inter-coupling the conductive features on opposite sides of substrate 34. Through-substrate vias 32 are formed of a conductive material, which may include copper, aluminum, tungsten, and/or the like. In some embodiments, bottom ends 32A of through-substrate vias 32 are level with the bottom surface 34A of substrate 34. Accordingly, bottom ends 32A of through-substrate vias 32 may be in contact with release layer 22. TAV modules 28 may also include metal posts 30 (such as copper posts) formed as top portions of TAV modules 28. The top surfaces of metal posts 26 and 30 are substantially level with each other.” Chen ’402, [0010].

“FIG. 2 illustrates a top view of the structure in FIG. 1. In accordance with some embodiments, TAV modules 28 are disposed on opposite sides of package component 24. Although two TAV modules 28 are illustrated, there may be one or more than two TAV modules 28. TAV modules 28 may have an identical structure. Alternatively, TAV modules 28 may have different structures with different counts of metal posts 30, different layouts of metal posts 30, different sizes, and/or different materials. The plurality of TAV modules 28 may be laid out on release layer 22 with any layout.” Chen '402, [0012].

FIG. 2

Chen '402, Fig. 2

“Referring to FIG. 3, polymer 40 is molded on package component 24 and TAV modules 28. Polymer 40 fills the gaps between package component 24 and TAV modules 28, and may be in contact with release layer 22. Furthermore, polymer 40 is filled into the gaps between

metal posts 26, and into the gaps between metal posts 30. Polymer 40 may include a molding compound, a molding underfill, or a kind of epoxy. The top surface of polymer 40 may be level with or higher than the top surfaces of metal posts 26 and 30.” Chen ’402, [0013].

FIG. 3

Chen '402, Fig. 3

“Throughout the description, the structure including package component 24, TAV modules 28, and polymer 40 is referred to as package 46. Referring to FIG. 5, a carrier switch is performed. In the carrier switch process, carrier 48 is first attached to package 46, wherein carriers 20 and 48 are on the opposite sides of package 46.” Chen ’402, [0014-0015].

Chen '402, Fig. 5

“Referring to FIG. 8, package 46 is bonded to package component 56 to form bottom package 60. Package component 56 may be a package substrate, an interposer, a device die, a Printed Circuit Board (PCB), or the like. Polymer 58 is dispensed between package 46 and package component 56. Polymer 58 may be an underfill or a molding underfill. Alternatively, package 60 may be molded, for example, using compress molding, and RDLs 54 are exposed through the respective molding compound (not shown). FIG. 9 illustrates the bonding of top package component 62 to bottom package 60. In some embodiments, top package component 62 is a device die. Alternatively, package component 62 is a package that includes a device die (not shown) bonded to a package substrate (not shown), an interposer (not shown), or the like. In the resulting package, TAV modules 28 are used to electrically couple the circuit devices in package component 62 to package component 56.” Chen '402, [0018-0019].

FIG. 8

Chen '402, Fig. 8

“FIG. 10 illustrates an exemplary embodiment wherein package component 62 includes a plurality of stacked dies 64. In some embodiments, stacked dies 64 are memory dies. Stacked dies 64 may be bonded to RDLs 54 that are over and aligned to package component 24, which are further connected to the RDLs 54 over and aligned to TAV modules 28. In these embodiments, package component 24 may be electrically coupled to stacked dies 64, for example, through RDLs 54, TAV modules 28, RDLs 42, and/or package component 56.”
Chen '402, [0020].

FIG. 10

Chen '402, Fig. 10

“In the embodiments, the connection between top package component 62 and bottom package 60 is through TAV modules 28, rather than large solder balls. Since TAV modules 28 may be formed using lithography processes and/or other processes that are used on silicon substrates, the pitches and the sizes of through-substrate vias 32 may be very small. Accordingly, the number of connections between top package component 62 and bottom package 60 is increased. The throughput of the packaging process is also high.” Chen '402, [0021].

To the extent Plaintiff contends that Chen '402 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

<p>[1.D] the spacer connector comprises a core substrate;</p>	<p>Chen '402 discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p>See, e.g.:</p> <p>“FIG. 1 illustrates carrier 20 and release layer 22 on carrier 20. Carrier 20 may be a glass carrier, a ceramic carrier, or the like. Release layer 22 may be formed of an adhesive such as an Ultra-Violet (UV) glue. Package component 24 and Through-Assembly Via (TAV) modules 28 are then placed on release layer 22.” Chen '402, [0009].</p>  <p>FIG. 1</p> <p>Chen '402, Fig. 1</p> <p>“TAV modules 28 are integrated modules that are pre-formed before being placed on release layer 22. TAV modules 28 include substrate 34, which may be a semiconductor substrate such as a silicon substrate. Alternatively, substrate 34 is a dielectric substrate such as a glass substrate.” Chen '402, [0010].</p>
---	---

FIG. 9

Chen '402, Fig. 9

“Through-substrate vias 32 are formed in substrate 34 for inter-coupling the conductive features on opposite sides of substrate 34. Through-substrate vias 32 are formed of a conductive material, which may include copper, aluminum, tungsten, and/or the like.” Chen et al., 2002, [0010].

“TAV modules 28 may also include metal posts 30 (such as copper posts) formed as top portions of TAV modules 28. The top surfaces of metal post 26 and 30 are substantially level with each other. No active devices such as transistors are formed in TAV modules 28.” Chen, 402, [0010-0011].

“Next, referring to FIG. 4, Redistribution Lines (RDLs) 42 and connectors 44 are formed to connect to metal posts 26 and 30. As indicated by dashed lines, RDLs 42 may also

interconnect metal posts 26 and 30. RDLs 42 may be formed by depositing a metal layer, and then patterning the metal layer. In some exemplary embodiments, the formation of connectors 44 includes placing solder balls on the exposed portions of RDLs 42, and then reflowing the solder balls. In alternative embodiments, the formation of connectors 44 includes performing a plating step to form solder regions on RDLs 42, and then reflowing the solder regions. Connectors 44 may also include metal pillars, or metal pillars and solder caps, which may also be formed through plating. Throughout the description, the structure including package component 24, TAV modules 28, and polymer 40 is referred to as package 46.” Chen '402, [0014].

“Referring to FIG. 6, after the carrier switch, the back surface of TAV modules 28 is exposed, and through-substrate vias 32 in TAV modules 28 are exposed. In some embodiments, a grinding is performed to lightly grind the back surface of package component 24 and TAV modules 28, so that through-substrate vias 32 protrude above the back surface of substrate 34.” Chen '402, [0016].

FIG. 6

Chen '402, Fig. 6

“As shown in FIG. 7, dielectric layer 52 is formed on the illustrated top surface of package 46. In some embodiments, dielectric layer 52 includes a polymer, which may be polyimide, benzocyclobutene (BCB), or the like. Dielectric layer 52 may also be formed of a light-sensitive material, which may be exposed in a lithography step, and then patterned. Alternatively, dielectric layer 52 may be formed of other materials such as oxides, nitrides, combination thereof, and multilayers thereof. RDLs 54 are then formed on dielectric layer 52 and connected to RDLs 54. RDLs 54 may extend to over and aligned to package component 24. Accordingly, RDLs 54 have a fan-in structure. The RDLs 54 that are over and aligned to package component 24 may be connected to the RDLs over and aligned to TAV modules 28. The dashed portions of RDLs 54 illustrate the connecting portions of RDLs 54. Next, carrier 48 (FIG. 6) is demounted from package 46. The formation of package 46 is thus finished.” Chen '402, [0017].

FIG. 7

Chen '402, Fig. 7

“In the embodiments, the connection between top package component 62 and bottom package 60 is through TAV modules 28, rather than large solder balls. Since TAV modules 28 may be formed using lithography processes and/or other processes that are used on silicon

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

	<p>substrates, the pitches and the sizes of through-substrate vias 32 may be very small. Accordingly, the number of connections between top package component 62 and bottom package 60 is increased. The throughput of the packaging process is also high.” Chen ’402, [0021].</p> <p>“In accordance with embodiments, a device includes a TAV Module, which includes a substrate, a plurality of through-vias penetrating through the substrate, and a second plurality of metal posts at a bottom surface of the TAV module and electrically coupled to the plurality of through-vias.” Chen ’402, [0023].</p> <p>To the extent Plaintiff contends that Chen ’402 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Chen ’402 discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Through-substrate vias 32 are formed in substrate 34 for inter-coupling the conductive features on opposite sides of substrate 34. Through-substrate vias 32 are formed of a conductive material, which may include copper, aluminum, tungsten, and/or the like.” Chen ’402, [0010].</p>

FIG. 9

Chen '402, Fig. 9

“TAV modules 28 may also include metal posts 30 (such as copper posts) formed as top portions of TAV modules 28. The top surfaces of metal post 26 and 30 are substantially level with each other.” Chen '402, [0010].

“No active devices such as transistors are formed in TAV modules 28. In accordance with some embodiments, TAV modules 28 do not include passive devices such as capacitors, inductors, resistors, and/or the like. In alternative embodiments, TAV modules 28 may include the passive devices therein. Exemplary capacitor 36 is illustrated in FIG. 12, which capacitor 36 includes two or more parallel metal strips 66 that penetrate through substrate 34 to form the capacitor plates of capacitor 36. TAV modules 28 may include redistribution layer(s) that include redistribution lines and metal pads on the top sides of TAV modules 28. Alternatively, no redistribution layer is formed on either side of one or each of TAV modules

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

	28, and metal posts 30 are connected to, and are aligned to, through-substrate vias 32, with no redistribution lines between metal posts and through-substrate vias 32.” Chen ’402, [0011].
--	---

Chen '402, Fig. 12

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

	<p>“FIG. 12 illustrates a top view of the structure in FIG. 1 in accordance with alternative embodiments. In TAV modules 28, besides through-substrate vias 32, which are used for electrically connecting the features on opposite sides of TAV modules 28, strip-shaped vias 66 may also be formed. In accordance with some embodiments, strip-shaped vias 66 are used for dissipating the heat generated in package component 24 as in FIGS. 9 through 11. Accordingly, strip-shaped vias 66 (such as 66C) may be electrically floating when TAV modules 28 are used in the package structure in FIGS. 9 through 11. In these embodiments, since strip-shaped vias 66C are formed of metals that have good thermal conductivity, the heat dissipating ability is improved over that of molding compound. In alternative embodiments, strip-shaped vias 66 may be interconnected to form a capacitor. For example, in FIG. 12, strip-shaped vias 66 include strip-shaped vias 66A that are interconnected to form one of the capacitor plates, and strip-shaped vias 66B that are interconnected to form the other capacitor plate. Strip-shaped vias 66A and strip-shaped vias 66B are laid out in an alternating pattern to increase the capacitance.” Chen '402, [0022].</p> <p>To the extent Plaintiff contends that Chen '402 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.F] a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars;</p>	<p>Chen '402 discloses, either expressly or inherently, a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.</p> <p>See, e.g.:</p> <p>“Metal posts 26 (such as copper posts) are formed as a top portion of package component 24.” Chen '402, [0009].</p>

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

	<p>“Package component 24 and Through-Assembly Via (TAV) modules 28 are then placed on release layer 22. The bottom surfaces of package component 24 and TAV modules 28 are in contact with the top surface of release layer 22, and are level with each other. The position of package component 24 and TAV modules 28 are accurately aligned to desirable locations, so that the subsequent formed redistribution lines may electrically couple to metal posts 26 and 30.” Chen '402, [0009].</p> <p>“TAV modules 28 may also include metal posts 30 (such as copper posts) formed as top portions of TAV modules 28. The top surfaces of metal post 26 and 30 are substantially level with each other.” Chen '402, [0010].</p> <p>“No active devices such as transistors are formed in TAV modules 28. In accordance with some embodiments, TAV modules 28 do not include passive devices such as capacitors, inductors, resistors, and/or the like. In alternative embodiments, TAV modules 28 may include the passive devices therein. 	<p>FIG. 9</p>
	<p>Chen '402, Fig. 9</p> <p>To the extent Plaintiff contends that Chen '402 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.G] wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate,</p>	<p>Chen '402 discloses, either expressly or inherently, wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate.</p> <p>See, <i>e.g.</i>:</p> <p>“FIGS. 1 through 9 are cross-sectional views and a top view of intermediate stages in the manufacturing of a Package-on-Package (PoP) structure in accordance with some exemplary</p>

	<p>embodiments. FIG. 1 illustrates carrier 20 and release layer 22 on carrier 20. Carrier 20 may be a glass carrier, a ceramic carrier, or the like. Release layer 22 may be formed of an adhesive such as an Ultra-Violet (UV) glue. Package component 24 and Through-Assembly Via (TAV) modules 28 are then placed on release layer 22. The bottom surfaces of package component 24 and TAV modules 28 are in contact with the top surface of release layer 22, and are level with each other. The position of package component 24 and TAV modules 28 are accurately aligned to desirable locations, so that the subsequent formed redistribution lines may electrically couple to metal posts 26 and 30. In some embodiments, package component 24 includes one or a plurality of device dies. For example, package component 24 may include a Central Computing Unit (CPU) die or another type of logic die having logic circuits. In alternative embodiments, package component 24 includes a plurality of memory dies stacked together (please refer to FIG. 11). In the embodiments wherein package component 24 is a device die, package component 24 may include semiconductor substrate 25 and active devices (such as transistors) 27 at a top surface of semiconductor substrate 25. The bottom surface of semiconductor substrate 25 is thus in contact with release layer 22. Semiconductor substrate 25 may be free from through-substrate vias formed therein, although through-substrate vias may also be formed to penetrate through semiconductor substrate 25. Package component 24 may also be a package that includes device die(s), interposer(s), package substrate(s) (not shown), and/or the like. Metal posts 26 (such as copper posts) are formed as a top portion of package component 24.” Chen ’402, [0009].</p>
--	--

FIG. 9

Chen '402, Fig. 9

“TAV modules 28 may also include metal posts 30 (such as copper posts) formed as top portions of TAV modules 28. The top surfaces of metal post 26 and 30 are substantially level with each other.” Chen '402, [0010].

FIG. 1

Chen '402, Fig. 1

“metal posts 30 are connected to, and are aligned to, through-substrate vias 32, with no redistribution lines between metal posts and through-substrate vias 32.” Chen ’402, [0011].

“Next, referring to FIG. 4, Redistribution Lines (RDLs) 42 and connectors 44 are formed to connect to metal posts 26 and 30. As indicated by dashed lines, RDLs 42 may also interconnect metal posts 26 and 30. RDLs 42 may be formed by depositing a metal layer, and then patterning the metal layer.” Chen '402, [0014].

FIG. 4

Chen '402, Fig. 4

“Referring to FIG. 6, after the carrier switch, the back surface of TAV modules 28 is exposed, and through-substrate vias 32 in TAV modules 28 are exposed. In some embodiments, a grinding is performed to lightly grind the back surface of package component 24 and TAV modules 28, so that through-substrate vias 32 protrude above the back surface of substrate 34. Alternatively, the grinding step is skipped. When no grinding is performed, surfaces 32A of through-substrate vias 32 are level with back surface 34A of substrate 34.” Chen ‘402, [0016].

	<p>FIG. 6</p> <p>Chen '402, Fig. 6</p> <p>To the extent Plaintiff contends that Chen '402 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.H] the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector,</p>	<p>Chen '402 discloses, either expressly or inherently, the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p>See, <i>e.g.</i>:</p> <p>“In an existing PoP process, the bottom package is formed first, which includes a device die bonded to a package substrate. A molding compound is then molded on the package substrate, wherein the device die is molded in the molding compound. The package substrate further includes solder balls formed thereon, wherein the solder balls and the device die are on a</p>

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

	<p>same side of the package substrate. The solder balls are used for connecting the top package to the bottom package. Accordingly, the heights of the solder balls need to be greater than the thickness of the device die, so that the top portions of the solder balls may protrude above the top surface of the device die, and above the top surface of the molding compound. Accordingly, the lateral sizes of the solder balls are also large, and the amount of the solder balls that can be used in a PoP structure is limited.” Chen ’402, [0002].</p> <p>“Next, referring to FIG. 4, Redistribution Lines (RDLs) 42 and connectors 44 are formed to connect to metal posts 26 and 30. 	<p>“FIG. 9 illustrates the bonding of top package component 62 to bottom package 60. In some embodiments, top package component 62 is a device die. Alternatively, package component 62 is a package that includes a device die (not shown) bonded to a package substrate (not shown), an interposer (not shown), or the like. In the resulting package, TAV modules 28 are used to electrically couple the circuit devices in package component 62 to package component 56.” Chen '402, [0019].</p> <div data-bbox="613 426 954 1350"></div> <p>FIG. 9</p> <p>Chen '402, Fig. 9</p> <p>“In these embodiments, package component 24 may be electrically coupled to stacked dies 64, for example, through RDLs 54, TAV modules 28, RDLs 42, and/or package component 56.” Chen '402, [0020].</p> <p>“In the embodiments, the connection between top package component 62 and bottom package 60 is through TAV modules 28, rather than large solder balls. Since TAV modules</p>
--	--

	<p>28 may be formed using lithography processes and/or other processes that are used on silicon substrates, the pitches and the sizes of through-substrate vias 32 may be very small. Accordingly, the number of connections between top package component 62 and bottom package 60 is increased.” Chen ’402, [0021].</p> <p>“FIG. 12 illustrates a top view of the structure in FIG. 1 in accordance with alternative embodiments. In TAV modules 28, besides through-substrate vias 32, which are used for electrically connecting the features on opposite sides of TAV modules 28, strip-shaped vias 66 may also be formed. In accordance with some embodiments, strip-shaped vias 66 are used for dissipating the heat generated in package component 24 as in FIGS. 9 through 11. Accordingly, strip-shaped vias 66 (such as 66C) may be electrically floating when TAV modules 28 are used in the package structure in FIGS. 9 through 11. In these embodiments, since strip-shaped vias 66C are formed of metals that have good thermal conductivity, the heat dissipating ability is improved over that of molding compound. In alternative embodiments, strip-shaped vias 66 may be interconnected to form a capacitor. For example, in FIG. 12, strip-shaped vias 66 include strip-shaped vias 66A that are interconnected to form one of the capacitor plates, and strip-shaped vias 66B that are interconnected to form the other capacitor plate. Strip-shaped vias 66A and strip-shaped vias 66B are laid out in an alternating pattern to increase the capacitance.” Chen ’402, [0022].</p>

Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.	<p>Chen ’402 discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p> <p><i>See, e.g.:</i></p> <p>“RDLs 54 are then formed on dielectric layer 52 and connected to RDLs 54. RDLs 54 may extend to over and aligned to package component 24. Accordingly, RDLs 54 have a fan-in structure. The RDLs 54 that are over and aligned to package component 24 may be connected to the RDLs over and aligned to TAV modules 28.” Chen ’402, [0017].</p>

“Referring to FIG. 8, package 46 is bonded to package component 56 to form bottom package 60. Package component 56 may be a package substrate, an interposer, a device die, a Printed Circuit Board (PCB), or the like. Polymer 58 is dispensed between package 46 and package component 56. Polymer 58 may be an underfill or a molding underfill. Alternatively, package 60 may be molded, for example, using compress molding, and RDLs 54 are exposed through the respective molding compound (not shown). FIG. 9 illustrates the bonding of top package component 62 to bottom package 60.” Chen '402, [0018-0019].

FIG. 8

Chen '402, Fig. 8

“FIG. 9 illustrates the bonding of top package component 62 to bottom package 60. In some embodiments, top package component 62 is a device die. Alternatively, package component 62 is a package that includes a device die (not shown) bonded to a package substrate (not shown), an interposer (not shown), or the like. In the resulting package, TAV modules 28 are

used to electrically couple the circuit devices in package component 62 to package component 56.” Chen ’402, [0019].

FIG. 9

Chen '402, Fig. 9

“FIG. 10 illustrates an exemplary embodiment wherein package component 62 includes a plurality of stacked dies 64. In some embodiments, stacked dies 64 are memory dies. Stacked dies 64 may be bonded to RDLs 54 that are over and aligned to package component 24, which are further connected to the RDLs 54 over and aligned to TAV modules 28. In these embodiments, package component 24 may be electrically coupled to stacked dies 64, for example, through RDLs 54, TAV modules 28, RDLs 42, and/or package component 56.”
Chen '402, [0020].

FIG. 10

Chen '402, Fig. 10

“In accordance with other embodiments, a device includes a bottom package, and a top package component bonded to the bottom package. The bottom package includes a package substrate, a plurality of connectors over the package substrate, and a package. The package includes a device die, and a TAV Module substantially level with the device die. The TAV module is free from active devices therein, and includes a substrate and a plurality of through-vias penetrating through the substrate. A molding compound contacts a bottom surface of the device die, a bottom surface of the TAV module, and sidewalls of the device die and the TAV module. A plurality of RDLs is under the molding compound and electrically coupled to the device die and the plurality of through-vias in the TAV module. The plurality of RDLs is

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

	<p>bonded to the package substrate through the plurality of connectors.” Chen ’402, [0023-0024].</p> <p>To the extent Plaintiff contends that Chen ’402 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Chen ’402 discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“FIGS. 1 through 9 are cross-sectional views and a top view of intermediate stages in the manufacturing of a Package-on-Package (PoP) structure in accordance with some exemplary embodiments. FIG. 1 illustrates carrier 20 and release layer 22 on carrier 20. Carrier 20 may be a glass carrier, a ceramic carrier, or the like. Release layer 22 may be formed of an adhesive such as an Ultra-Violet (UV) glue. Package component 24 and Through-Assembly Via (TAV) modules 28 are then placed on release layer 22. The bottom surfaces of package component 24 and TAV modules 28 are in contact with the top surface of release layer 22,</p>

	<p>and are level with each other. The position of package component 24 and TAV modules 28 are accurately aligned to desirable locations, so that the subsequent formed redistribution lines may electrically couple to metal posts 26 and 30. In some embodiments, package component 24 includes one or a plurality of device dies. For example, package component 24 may include a Central Computing Unit (CPU) die or another type of logic die having logic circuits. In alternative embodiments, package component 24 includes a plurality of memory dies stacked together (please refer to FIG. 11). In the embodiments wherein package component 24 is a device die, package component 24 may include semiconductor substrate 25 and active devices (such as transistors) 27 at a top surface of semiconductor substrate 25. The bottom surface of semiconductor substrate 25 is thus in contact with release layer 22. Semiconductor substrate 25 may be free from through-substrate vias formed therein, although through-substrate vias may also be formed to penetrate through semiconductor substrate 25. Package component 24 may also be a package that includes device die(s), interposer(s), package substrate(s) (not shown), and/or the like. Metal posts 26 (such as copper posts) are formed as a top portion of package component 24.” Chen ’402, [0009].</p> <p>“FIG. 9 illustrates the bonding of top package component 62 to bottom package 60. In some embodiments, top package component 62 is a device die. Alternatively, package component 62 is a package that includes a device die (not shown) bonded to a package substrate (not shown), an interposer (not shown), or the like. In the resulting package, TAV modules 28 are used to electrically couple the circuit devices in package component 62 to package component 56.” Chen ’402, [0019].</p> <p>“FIG. 10 illustrates an exemplary embodiment wherein package component 62 includes a plurality of stacked dies 64. In some embodiments, stacked dies 64 are memory dies. Stacked dies 64 may be bonded to RDLs 54 that are over and aligned to package component 24, which are further connected to the RDLs 54 over and aligned to TAV modules 28. In these</p>
--	--

	<p>embodiments, package component 24 may be electrically coupled to stacked dies 64, for example, through RDLs 54, TAV modules 28, RDLs 42, and/or package component 56.” Chen '402, [0020].</p>  <p>Chen '402, Fig. 9</p> <p>To the extent Plaintiff contends that Chen '402 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

Claim Limitation	Disclosure
<p>[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of metal pillars of the bottom package substrate.</p>	<p>Chen '402 discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“No active devices such as transistors are formed in TAV modules 28. In accordance with some embodiments, TAV modules 28 do not include passive devices such as capacitors, inductors, resistors, and/or the like. In alternative embodiments, TAV modules 28 may include the passive devices therein. Exemplary capacitor 36 is illustrated in FIG. 12, which capacitor 36 includes two or more parallel metal strips 66 that penetrate through substrate 34 to form the capacitor plates of capacitor 36. TAV modules 28 may include redistribution layer(s) that include redistribution lines and metal pads on the top sides of TAV modules 28. Alternatively, no redistribution layer is formed on either side of one or each of TAV modules 28, and metal posts 30 are connected to, and are aligned to, through-substrate vias 32, with no redistribution lines between metal posts and through-substrate vias 32.” Chen '402, [0011].</p> <p>“Next, referring to FIG. 4, Redistribution Lines (RDLs) 42 and connectors 44 are formed to connect to metal posts 26 and 30. As indicated by dashed lines, RDLs 42 may also interconnect metal posts 26 and 30. RDLs 42 may be formed by depositing a metal layer, and then patterning the metal layer. In some exemplary embodiments, the formation of connectors 44 includes placing solder balls on the exposed portions of RDLs 42, and then reflowing the solder balls. In alternative embodiments, the formation of connectors 44 includes performing</p>

	<p>a plating step to form solder regions on RDLs 42, and then reflowing the solder regions. Connectors 44 may also include metal pillars, or metal pillars and solder caps, which may also be formed through plating. Throughout the description, the structure including package component 24, TAV modules 28, and polymer 40 is referred to as package 46.” Chen ’402, [0014].</p> <div data-bbox="581 430 873 1354"></div> <p>FIG. 4</p> <p>Chen ’402, Fig. 4</p> <p>“FIG. 9 illustrates the bonding of top package component 62 to bottom package 60. In some embodiments, top package component 62 is a device die. Alternatively, package component 62 is a package that includes a device die (not shown) bonded to a package substrate (not shown), an interposer (not shown), or the like. In the resulting package, TAV modules 28 are used to electrically couple the circuit devices in package component 62 to package component 5” Chen ’402, [0019].</p>
--	---

FIG. 9

Chen '402, Fig. 9

“In the embodiments, the connection between top package component 62 and bottom package 60 is through TAV modules 28, rather than large solder balls” Chen '402, [0021].

“FIG. 12 illustrates a top view of the structure in FIG. 1 in accordance with alternative embodiments. In TAV modules 28, besides through-substrate vias 32, which are used for electrically connecting the features on opposite sides of TAV modules 28, strip-shaped vias 66 may also be formed. In accordance with some embodiments, strip-shaped vias 66 are used for dissipating the heat generated in package component 24 as in FIGS. 9 through 11. Accordingly, strip-shaped vias 66 (such as 66C) may be electrically floating when TAV modules 28 are used in the package structure in FIGS. 9 through 11. In these embodiments, since strip-shaped vias 66C are formed of metals that have good thermal conductivity, the heat dissipating ability is improved over that of molding compound. In alternative embodiments, strip-shaped vias 66 may be interconnected to form a capacitor. For example, in FIG. 12, strip-shaped vias 66 include strip-shaped vias 66A that are interconnected to form

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

	one of the capacitor plates, and strip-shaped vias 66B that are interconnected to form the other capacitor plate. Strip-shaped vias 66A and strip-shaped vias 66B are laid out in an alternating pattern to increase the capacitance.” Chen ’402, [0022].

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Chen '402 discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“Metal posts 26 (such as copper posts) are formed as a top portion of package component 24. TAV modules 28 are integrated modules that are pre-formed before being placed on release layer 22. TAV modules 28 include substrate 34, which may be a semiconductor substrate such as a silicon substrate. Alternatively, substrate 34 is a dielectric substrate such as a glass substrate. Through-substrate vias 32 are formed in substrate 34 for inter-coupling the conductive features on opposite sides of substrate 34.” Chen '402, [0009-0010].</p>

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

	<p>“In some embodiments, bottom ends 32 A of through-substrate vias 32 are level with the bottom surface 34 A of substrate 34. Accordingly, bottom ends 32 A of through-substrate vias 32 may be in contact with release layer 22. TAV modules 28 may also include metal posts 30 (such as copper posts) formed as top portions of TAV modules 28. The top surfaces of metal post 26 and 30 are substantially level with each other.” Chen ’402, [0010].</p> <p>“TAV modules 28 may include redistribution layer(s) that include redistribution lines and metal pads on the top sides of TAV modules 28. Alternatively, no redistribution layer is formed on either side of one or each of TAV modules 28, and metal posts 30 are connected to, and are aligned to, through-substrate vias 32, with no redistribution lines between metal posts and through-substrate vias 32.” Chen ’402, [0011].</p> <p>“A grinding step may be performed to grind polymer 40, until metal posts 26 and 30 are exposed. Line 39 marks an exemplary position of the top surface of polymer 40 after the grinding. Next, referring to FIG. 4, Redistribution Lines (RDLs) 42 and connectors 44 are formed to connect to metal posts 26 and 30.” Chen ’402, [0013-0014].</p> <p>“Next, referring to FIG. 4, Redistribution Lines (RDLs) 42 and connectors 44 are formed to connect to metal posts 26 and 30. As indicated by dashed lines, RDLs 42 may also interconnect metal posts 26 and 30. RDLs 42 may be formed by depositing a metal layer, and then patterning the metal layer.” Chen ’402, [0014].</p> <p>“Referring to FIG. 6, after the carrier switch, the back surface of TAV modules 28 is exposed, and through-substrate vias 32 in TAV modules 28 are exposed. In some embodiments, a grinding is performed to lightly grind the back surface of package component 24 and TAV modules 28, so that through-substrate vias 32 protrude above the back surface of substrate</p>
--	---

	<p>34. Alternatively, the grinding step is skipped. When no grinding is performed, surfaces 32 A of through-substrate vias 32 are level with back surface 34 A of substrate 34. As shown in FIG. 7, dielectric layer 52 is formed on the illustrated top surface of package 46. In some embodiments, dielectric layer 52 includes a polymer, which may be polyimide, benzocyclobutene (BCB), or the like. Dielectric layer 52 may also be formed of a light-sensitive material, which may be exposed in a lithography step, and then patterned. Alternatively, dielectric layer 52 may be formed of other materials such as oxides, nitrides, combination thereof, and multilayers thereof. RDLs 54 are then formed on dielectric layer 52 and connected to RDLs 54. RDLs 54 may extend to over and aligned to package component 24. Accordingly, RDLs 54 have a fan-in structure. The RDLs 54 that are over and aligned to package component 24 may be connected to the RDLs over and aligned to TAV modules 28. The dashed portions of RDLs 54 illustrate the connecting portions of RDLs 54. Next, carrier 48 (FIG. 6) is demounted from package 46. The formation of package 46 is thus finished. Referring to FIG. 8, package 46 is bonded to package component 56 to form bottom package 60.” Chen '402, [0016-0018].</p>

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to	Chen '402 discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

<p>the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“TAV modules 28 include substrate 34, which may be a semiconductor substrate such as a silicon substrate. Alternatively, substrate 34 is a dielectric substrate such as a glass substrate. Through-substrate vias 32 are formed in substrate 34 for inter-coupling the conductive features on opposite sides of substrate 34. Through-substrate vias 32 are formed of a conductive material, which may include copper, aluminum, tungsten, and/or the like. In some embodiments, bottom ends 32 A of through-substrate vias 32 are level with the bottom surface 34 A of substrate 34. Accordingly, bottom ends 32 A of through-substrate vias 32 may be in contact with release layer 22. TAV modules 28 may also include metal posts 30 (such as copper posts) formed as top portions of TAV modules 28. The top surfaces of metal post 26 and 30 are substantially level with each other. No active devices such as transistors are formed in TAV modules 28. In accordance with some embodiments, TAV modules 28 do not include passive devices such as capacitors, inductors, resistors, and/or the like. In alternative embodiments, TAV modules 28 may include the passive devices therein. Exemplary capacitor 36 is illustrated in FIG. 12, which capacitor 36 includes two or more parallel metal strips 66 that penetrate through substrate 34 to form the capacitor plates of capacitor 36. TAV modules 28 may include redistribution layer(s) that include redistribution lines and metal pads on the top sides of TAV modules 28.” Chen '402, [0010-0011].</p>
--	---

Chen '402, Fig. 9

“Redistribution Lines (RDLs) 42 and connectors 44 are formed to connect to metal posts 26 and 30. As indicated by dashed lines, RDLs 42 may also interconnect metal posts 26 and 30. RDLs 42 may be formed by depositing a metal layer, and then patterning the metal layer. In some exemplary embodiments, the formation of connectors 44 includes placing solder balls on the exposed portions of RDLs 42, and then reflowing the solder balls. In alternative embodiments, the formation of connectors 44 includes performing a plating step to form solder regions on RDLs 42, and then reflowing the solder regions. Connectors 44 may also include metal pillars, or metal pillars and solder caps, which may also be formed through plating. Throughout the description, the structure including package component 24, TAV modules 28, and polymer 40 is referred to as package 46.” Chen '402, [0014].

Appendix A-3 - Invalidity of U.S. Patent No. 9859202 in view of Chen '402 - U.S. Patent Publication No. 20130182402

	<p>To the extent Plaintiff contends that Chen '402 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-4 - Invalidity of U.S. Patent No. 9859202 in view of Chen 2 - U.S. Patent Publication No. 20150102484

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Chen '484 - U.S. Patent Publication No. 20150102484

U.S. Patent Publication No. 20150102484 (“Chen ’484”) is titled Package Structure and Fabrication Method Thereof and lists Chia-Cheng Chen, Ming-Chen Sun, Tzu-Chieh Shen, Liang-yi Hung, Wei-chung Hsiao, Yu-cheng Pai, Shih-Chao Chiu, Don-Son Jiang, Yi-Feng Chang, and Lung-Yuan Wang as inventors. Chen ’484 is assigned to Siliconware Precision Industries Co., Ltd. Chen ’484 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Chen ’484 is a U.S. patent publication that was filed December 20, 2013 and published April 16, 2015. Chen ’484 claims priority to TW 102137271 filed on October 16, 2013. Chen ’484 is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Chen ’484, or otherwise rendered obvious by disclosures and teachings of Chen ’484, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Chen ’484 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Chen ’484 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Chen ’484, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-4 - Invalidity of U.S. Patent No. 9859202 in view of Chen 2 - U.S. Patent Publication No. 20150102484

To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Chen '484 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Chen '484 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Chen '484 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Chen '484 discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“In view of the above-described drawbacks, the present invention provides a package structure, which comprises: a first substrate; a build-up layer formed on and electrically connected to the first substrate and having a cavity; at least an electronic element disposed in the cavity and electrically connected to the first substrate; a stack member disposed on the build-up layer so as to be stacked on the first substrate; and an encapsulant formed between the build-up layer and the stack member.” Chen '484, [0011].</p>

“FIGS. 2A to 2F are schematic cross-sectional views showing a method for fabricating a package structure 2 according to the present invention.” Chen ’484, [0031].

Chen ’484, FIGS. 2A, 2B, 2C, 2C’

“FIGS. 3 and 4 are schematic cross-sectional views showing other embodiments of the package structure of the present invention.” Chen ’484, [0032].

FIG.3

Chen ’484, FIG. 3

“The present invention further provides a package structure 2, 3, 4, which has: a first substrate 21 ; a build-up layer 28, 48 formed on and electrically connected to the first substrate 21 ; an electronic element 26, 26’ disposed on and electrically connected to the first substrate 21 ; a stack member 22, 32 stacked on the build-up layer 28, 48 so as to be stacked on the first substrate 21 ; and an encapsulant 26, 26’ formed between the build-up layer 28, 48 (or the insulating layer 24) and the stack member 22, 32.” Chen ’484, [0052-0054].

Appendix A-4 - Invalidity of U.S. Patent No. 9859202 in view of Chen 2 - U.S. Patent Publication No. 20150102484

	<p>“Therefore, the present invention forms on the first substrate 21 the build-up layer 28 having the conductive members 230 embedded in the dielectric layer 20 and stacks the stack member 22, 32 on the build-up layer 28, thus achieving a stand-off effect on the conductive members 230 and preventing solder bridging from occurring therebetween.” Chen ’484, [0057].</p> <p>“In the present embodiment, the build-up layer 28, 48 has: at least a dielectric layer 20 formed on the first substrate 21, a circuit layer 23 formed on the dielectric layer 20, and a plurality of conductive members 230 formed in and exposed from the dielectric layer 20.” Chen ’484, [0062].</p>
[1.A] a bottom package substrate;	<p>Chen ’484 discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“In the above-described package structure and method, the first substrate can be a circuit board.” Chen ’484, [0021].</p> <p>“Referring to FIG. 2A, a first substrate 21 having a first surface 21 a and a second surface 21 b opposite to the first surface 21 a is provided. In the present embodiment, the first substrate 21 is a circuit board having a core layer 21 ’ and a plurality of circuits 213 formed on upper and lower sides of the core layer 21 ’. Further, the first surface 21 a of the first substrate 21 has a plurality of first bonding pads 210 and a plurality of second bonding pads 211, and the second surface 21 b of the first substrate 21 has a plurality of third bonding pads 212.” Chen ’484, [0036-0037].</p>

FIG. 2A

Chen '484, FIG. 2A

“Referring to FIG. 2E, a stack member 22 is disposed on the conductive members 230 so as to be stacked on the build-up layer 28 and cover the electronic element 25. In the present embodiment, the stack member 22 is a second substrate, such as a circuit board. The stack member 22 is bonded to the conductive members 230 through a plurality of conductive elements 27.” Chen ’484, [0050-0051].

FIG.2E

Chen '484, FIG. 2E

“Referring to FIG. 2F, an encapsulant 26 is formed between the first surface 21 a of the first substrate 21 and the stack member 22. In the present embodiment, the encapsulant 26 is formed between the dielectric layer 20 (or the insulating layer 24) and the stack member 22, but is not formed in the cavity 200.” Chen ’484, [0053-0054].

FIG.2F

Chen ’484, FIG. 2F

“In another embodiment, referring to FIG. 3, the width d of the stack member 32 is less than the width r of the first substrate 21 so as for the encapsulant 26 ’ to encapsulate both side and upper surfaces 32 c, 32 a of the stack member 32.” Chen ’484, [0055].

FIG.3

Chen '484, FIG. 3

“The present invention further provides a package structure 2, 3, 4, which has: a first substrate 21 ; a build-up layer 28, 48 formed on and electrically connected to the first substrate 21 ; an electronic element 25 disposed on and electrically connected to the first substrate 21 ; a stack member 22, 32 stacked on the build-up layer 28, 48 so as to be stacked on the first substrate 21 ; and an encapsulant 26, 26 ' formed between the build-up layer 28, 48 (or the insulating layer 24) and the stack member 22, 32. The first substrate 21 is a circuit board, which has opposite first and second surfaces 21 a, 21 b.” Chen '484, [0059-0060].

To the extent Plaintiff contends that Chen '484 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the

Appendix A-4 - Invalidity of U.S. Patent No. 9859202 in view of Chen 2 - U.S. Patent Publication No. 20150102484

	<p>general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Chen '484 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 2E, a stack member 22 is disposed on the conductive members 230 so as to be stacked on the build-up layer 28 and cover the electronic element 25. In the present embodiment, the stack member 22 is a second substrate, such as a circuit board. The stack member 22 is bonded to the conductive members 230 through a plurality of conductive elements 27. For example, a plurality of conductive elements 27 made of such as a solder material are formed on a lower surface 22 b of the stack member 22 and electrically connected to the conductive members 230 so as to stack the stack member 22 on the build-up layer 28.”</p> <p>Chen '484, [0050-0051].</p> <div data-bbox="974 630 1218 1365"> </div> <p style="text-align: center;">FIG. 2E</p> <p>Chen '484, FIG. 2E</p>

“Further, referring to FIG. 3, the stack member 32 can be a package, which has: a substrate 22', an electronic element 35 disposed on an upper surface 22 a of the substrate 22', and an encapsulant 36 formed on the upper surface 22 a of the substrate 22' for encapsulating the electronic element 35. The electronic element 35 is electrically connected to the substrate 22' in a flip-chip manner or through wire bonding.” Chen '484, [0052].

FIG. 3

Chen '484, FIG. 3

“Referring to FIG. 2F, an encapsulant 26 is formed between the first surface 21 a of the first substrate 21 and the stack member 22. In the present embodiment, the encapsulant 26 is formed between the dielectric layer 20 (or the insulating layer 24) and the stack member 22, but is not formed in the cavity 200.” Chen ’484, [0053-0054].

FIG.2F

Chen '484, FIG. 2F

“In another embodiment, referring to FIG. 3, the width d of the stack member 32 is less than the width r of the first substrate 21 so as for the encapsulant 26 to encapsulate both side and upper surfaces 32 c, 32 a of the stack member 32.” Chen '484, [0055].

“The present invention further provides a package structure 2, 3, 4, which has: a first substrate 21; a build-up layer 28, 48 formed on and electrically connected to the first substrate 21; an electronic element 25 disposed on and electrically connected to the first substrate 21; a stack member 22, 32 stacked on the build-up layer 28, 48 so as to be stacked on the first substrate 21; and an encapsulant 26, 26' formed between the build-up layer 28, 48 (or the insulating layer 24) and the stack member 22, 32. The first substrate 21 is a circuit board, which has opposite first and second surfaces 21 a, 21 b.” Chen '484, [0059-0060].

“The stack member 22, 32 is disposed on the build-up layer 28, 48. In particular, the stack member 22, 32 is bonded to the conductive members 230, 230' through a plurality of conductive elements 27 so as to be stacked on the first substrate 21.” Chen '484, [0065-0066].

Appendix A-4 - Invalidity of U.S. Patent No. 9859202 in view of Chen 2 - U.S. Patent Publication No. 20150102484

<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>To the extent Plaintiff contends that Chen '484 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p> <p>Chen '484 discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“Therefore, by forming the build-up layer on the first substrate so as to stack the stack member on the build-up layer, the present invention achieves a stand-off effect and prevents solder bridging. Further, the size of the conductive members can be controlled through the openings of the dielectric layer so as to cause the conductive members to have a uniform height.” Chen '484, [0028-0029].</p> <p>“Referring to FIG. 2B, a dielectric layer 20 is formed on the first surface 21 a of the first substrate 21. The dielectric layer 20 has a cavity 200 for exposing the first bonding pads 210 and a portion of the first surface 21 a around peripheries of the first bonding pads 210, and a plurality of openings 201 for exposing the second bonding pads 211. In the present embodiment, the dielectric layer 20 is laminated on the first surface 21 a of the first substrate 21 first and then the cavity 200 and the openings 201 are formed in the dielectric layer 20 by laser drilling. In other embodiments, the cavity 200 and the openings 201 are formed in the dielectric layer 20 first and then the dielectric layer 20 having the cavity 200 and the openings 201 is laminated on the first surface 21 a of the first substrate 21. The dielectric layer 20 can</p>
---	--

be made of prepreg (PP). Referring to FIG. 2C, a circuit layer 23 is formed on the dielectric layer 20 and a plurality of conductive members 230 are formed in the openings 201 of the dielectric layer 20. As such, the dielectric layer 20, the circuit layer 23 and the conductive members 230 together form a build-up layer 28. The conductive members 230 electrically connect the circuit layer 23 to the second bonding pads 211 and the circuits 213 of the first substrate 21. In the present embodiment, an insulating layer 24, such as a solder mask layer, is formed on the dielectric layer 20 and the circuit layer 23, and a plurality of openings 240 are formed in the insulating layer 24 for exposing the conductive members 230.” Chen ’484, [0040-0044].

FIG.2B

Chen ’484, FIG. 2B

“Referring to FIG. 2E, a stack member 22 is disposed on the conductive members 230 so as to be stacked on the build-up layer 28 and cover the electronic element 25. In the present embodiment, the stack member 22 is a second substrate, such as a circuit board. The stack member 22 is bonded to the conductive members 230 through a plurality of conductive elements 27. For example, a plurality of conductive elements 27 made of such as a solder material are formed on a lower surface 22 b of the stack member 22 and electrically connected to the conductive members 230 so as to stack the stack member 22 on the build-up layer 28.” Chen ’484, [0050-0051].

FIG. 2E

Chen '484, FIG. 2E

“Referring to FIG. 2F, an encapsulant 26 is formed between the first surface 21 a of the first substrate 21 and the stack member 22. In the present embodiment, the encapsulant 26 is formed between the dielectric layer 20 (or the insulating layer 24) and the stack member 22, but is not formed in the cavity 200. Therefore, the conductive elements 27 are encapsulated by the encapsulant 26, but the electronic element 25 is not encapsulated by the encapsulant 26.” Chen '484, [0053-0054].

FIG. 2F

Chen '484, FIG. 2F

Appendix A-4 - Invalidity of U.S. Patent No. 9859202 in view of Chen 2 - U.S. Patent Publication No. 20150102484

	<p>“Therefore, the present invention forms on the first substrate 21 the build-up layer 28 having the conductive members 230 embedded in the dielectric layer 20 and stacks the stack members 22, 32 on the build-up layer 28, thus achieving a stand-off effect on the conductive members 230 and preventing solder bridging from occurring therebetween.” Chen ’484, [0057].</p> <p>“The present invention further provides a package structure 2, 3, 4, which has: a first substrate 21 ; a build-up layer 28, 48 formed on and electrically connected to the first substrate 21 ; an electronic element 25 disposed on and electrically connected to the first substrate 21 ; a stack member 22, 32 stacked on the build-up layer 28, 48 so as to be stacked on the first substrate 21 ; and an encapsulant 26, 26 ’ formed between the build-up layer 28, 48 (or the insulating layer 24) and the stack member 22, 32.” Chen ’484, [0059].</p> <p>To the extent Plaintiff contends that Chen ’484 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.D] the spacer connector comprises a core substrate;	<p>Chen ’484 discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“The dielectric layer 20 can be made of prepreg (PP).” Chen ’484, [0016].</p> <p>“In the present embodiment, the first substrate 21 is a circuit board having a core layer 21 ’ and a plurality of circuits 213 formed on upper and lower sides of the core layer 21 ’.” Chen ’484, [0037].</p>

“In the present embodiment, the dielectric layer 20 is laminated on the first surface 21 a of the first substrate 21 first and then the cavity 200 and the openings 201 are formed in the dielectric layer 20 by laser drilling. In other embodiments, the cavity 200 and the openings 201 are formed in the dielectric layer 20 first and then the dielectric layer 20 having the cavity 200 and the openings 201 is laminated on the first surface 21 a of the first substrate 21. The dielectric layer 20 can be made of prepreg (PP). Referring to FIG. 2C, a circuit layer 23 is formed on the dielectric layer 20 and a plurality of conductive members 230 are formed in the openings 201 of the dielectric layer 20. As such, the dielectric layer 20, the circuit layer 23 and the conductive members 230 together form a build-up layer 28.” Chen ’484, [0041-0043].

“In another embodiment, referring to FIG. 4, the build-up layer 48 of the package structure 4 has a plurality of dielectric layers 20 and a plurality of circuit layers 23.” Chen ‘484, [0056].

FIG. 4

Appendix A-4 - Invalidity of U.S. Patent No. 9859202 in view of Chen 2 - U.S. Patent Publication No. 20150102484

	<p>Chen '484, FIG. 4</p> <p>“The present invention further provides a package structure 2, 3, 4, which has: a first substrate 21 ; a build-up layer 28, 48 formed on and electrically connected to the first substrate 21 ; an electronic element 25 disposed on and electrically connected to the first substrate 21 ; a stack member 22, 32 stacked on the build-up layer 28, 48 so as to be stacked on the first substrate 21 ; and an encapsulant 26, 26 ' formed between the build-up layer 28, 48 (or the insulating layer 24) and the stack member 22, 32.” Chen '484, [0059].</p> <p>“In the present embodiment, the build-up layer 28, 48 has: at least a dielectric layer 20 formed on the first substrate 21, a circuit layer 23 formed on the dielectric layer 20, and a plurality of conductive members 230 formed in and exposed from the dielectric layer 20.” Chen '484, [0062].</p> <p>To the extent Plaintiff contends that Chen '484 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Chen '484 discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 2B, a dielectric layer 20 is formed on the first surface 21 a of the first substrate 21. The dielectric layer 20 has a cavity 200 for exposing the first bonding pads 210 and a portion of the first surface 21 a around peripheries of the first bonding pads 210, and a</p>

plurality of openings 201 for exposing the second bonding pads 211. In the present embodiment, the dielectric layer 20 is laminated on the first surface 21 a of the first substrate 21 first and then the cavity 200 and the openings 201 are formed in the dielectric layer 20 by laser drilling." Chen '484, [0040-0041].

FIG. 2B

Chen '484, FIG. 2B

“Referring to FIG. 2C, a circuit layer 23 is formed on the dielectric layer 20 and a plurality of conductive members 230 are formed in the openings 201 of the dielectric layer 20. As such, the dielectric layer 20, the circuit layer 23 and the conductive members 230 together form a build-up layer 28. The conductive members 230 electrically connect the circuit layer 23 to the second bonding pads 211 and the circuits 213 of the first substrate 21. In the present embodiment, an insulating layer 24, such as a solder mask layer, is formed on the dielectric layer 20 and the circuit layer 23, and a plurality of openings 240 are formed in the insulating layer 24 for exposing the conductive members 230. Further, the conductive members 230 are made of a metal material, such as copper, and the conductive members 230 are of a pillar shape.” Chen ’484, [0043-0045].

Chen '484, FIGS. 2C, 2C'

“In another embodiment, referring to FIG. 2 C’, the conductive members 230 ’ can be of a groove shape.” Chen ’484, [0046].

“In the present embodiment, the build-up layer 28, 48 has: at least a dielectric layer 20 formed on the first substrate 21, a circuit layer 23 formed on the dielectric layer 20, and a plurality of conductive members 230 formed in and exposed from the dielectric layer 20. In particular, the cavity 200 penetrates the dielectric layer 20. The dielectric layer 20 further has a plurality of openings 201. The dielectric layer 20 can be made of prepreg. The conductive members 230, 230 ’ are formed in the openings 201 of the dielectric layer 20 for electrically connecting

Appendix A-4 - Invalidity of U.S. Patent No. 9859202 in view of Chen 2 - U.S. Patent Publication No. 20150102484

	<p>the circuit layer 23 and the first substrate 21. The conductive members 230, 230 ' are made of metal and of a pillar shape or a groove shape." Chen '484, [0062-0063].</p> <p>To the extent Plaintiff contends that Chen '484 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.F] a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars;</p>	<p>Chen '484 discloses, either expressly or inherently, a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.</p> <p><i>See, e.g.:</i></p> <p>"Further, the first surface 21 a of the first substrate 21 has a plurality of first bonding pads 210 and a plurality of second bonding pads 211, and the second surface 21 b of the first substrate 21 has a plurality of third bonding pads 212." Chen '484, [0037].</p> <p>"Referring to FIG. 2C, a circuit layer 23 is formed on the dielectric layer 20 and a plurality of conductive members 230 are formed in the openings 201 of the dielectric layer 20. As such, the dielectric layer 20, the circuit layer 23 and the conductive members 230 together form a build-up layer 28. The conductive members 230 electrically connect the circuit layer 23 to the second bonding pads 211 and the circuits 213 of the first substrate 21. In the present embodiment, an insulating layer 24, such as a solder mask layer, is formed on the dielectric layer 20 and the circuit layer 23, and a plurality of openings 240 are formed in the insulating layer 24 for exposing the conductive members 230." Chen '484, [0043-0044].</p>

	<p>“Referring to FIG. 2D, an electronic element 25 is disposed on the first bonding pads 210 in the cavity 200 through a plurality of solder bumps 250 and an underfill 251 is formed between the first substrate 21 and the electronic element 25 for encapsulating the solder bumps 250.” Chen ’484, [0047].</p> <div data-bbox="516 651 714 1375"></div> <p style="text-align: center;">FIG.2D</p> <p>Chen ’484, FIG. 2D</p> <p>“Referring to FIG. 2E, a stack member 22 is disposed on the conductive members 230 so as to be stacked on the build-up layer 28 and cover the electronic element 25. In the present embodiment, the stack member 22 is a second substrate, such as a circuit board. The stack member 22 is bonded to the conductive members 230 through a plurality of conductive elements 27. For example, a plurality of conductive elements 27 made of such as a solder material are formed on a lower surface 22 b of the stack member 22 and electrically connected to the conductive members 230 so as to stack the stack member 22 on the build-up layer 28. Alternatively, a plurality of conductive elements 27 each consisting of a metal pillar 270 (such as a copper pillar) and a solder material 271 formed on the metal pillar 270 can be formed between the conductive members 230 and the stack member 22 so as to stack the stack member 22 on the build-up layer 28.” Chen ’484, [0050-0051].</p>

FIG. 3

Chen '484, FIG. 3

To the extent Plaintiff contends that Chen '484 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Chen '484 discloses, either expressly or inherently, the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.

See, e.g.:

Appendix A-4 - Invalidity of U.S. Patent No. 9859202 in view of Chen 2 - U.S. Patent Publication No. 20150102484

	<p>“In the above-described package structure and method, the stack member can be bonded to the build-up layer through a plurality of conductive elements.” Chen ’484, [0024].</p> <p>“Referring to FIG. 2C, a circuit layer 23 is formed on the dielectric layer 20 and a plurality of conductive members 230 are formed in the openings 201 of the dielectric layer 20. As such, the dielectric layer 20, the circuit layer 23 and the conductive members 230 together form a build-up layer 28. The conductive members 230 electrically connect the circuit layer 23 to the second bonding pads 211 and the circuits 213 of the first substrate 21. In the present embodiment, an insulating layer 24, such as a solder mask layer, is formed on the dielectric layer 20 and the circuit layer 23, and a plurality of openings 240 are formed in the insulating layer 24 for exposing the conductive members 230. Further, the conductive members 230 are made of a metal material, such as copper, and the conductive members 230 are of a pillar shape.” Chen ’484, [0043-0045].</p> <p>“Referring to FIG. 2E, a stack member 22 is disposed on the conductive members 230 so as to be stacked on the build-up layer 28 and cover the electronic element 25. In the present embodiment, the stack member 22 is a second substrate, such as a circuit board. The stack member 22 is bonded to the conductive members 230 through a plurality of conductive elements 27. For example, a plurality of conductive elements 27 made of such as a solder material are formed on a lower surface 22 b of the stack member 22 and electrically connected to the conductive members 230 so as to stack the stack member 22 on the build-up layer 28. Alternatively, a plurality of conductive elements 27 each consisting of a metal pillar 270 (such as a copper pillar) and a solder material 271 formed on the metal pillar 270 can be formed between the conductive members 230 and the stack member 22 so as to stack the stack member 22 on the build-up layer 28.” Chen ’484, [0050-0051].</p>
--	--

FIG. 2E

Chen '484, FIG. 2E

“Further, referring to FIG. 3, the stack member 32 can be a package, which has: a substrate 22', an electronic element 35 disposed on an upper surface 22 a of the substrate 22', and an encapsulant 36 formed on the upper surface 22 a of the substrate 22' for encapsulating the electronic element 35. The electronic element 35 is electrically connected to the substrate 22' in a flip-chip manner or through wire bonding.” Chen '484, [0052].

FIG. 3

Chen '484, FIG. 3

“The present invention further provides a package structure 2, 3, 4, which has: a first substrate 21; a build-up layer 28, 48 formed on and electrically connected to the first substrate 21; an electronic element 25 disposed on and electrically connected to the first substrate 21; a stack member 22, 32 stacked on the build-up layer 28, 48 so as to be stacked on the first substrate 21; and an encapsulant 26, 26' formed between the build-up layer 28, 48 (or the insulating layer 24) and the stack member 22, 32. The first substrate 21 is a circuit board, which has opposite first and second surfaces 21 a, 21 b. The build-up layer 28, 48 has a cavity 200 exposing a portion of the first surface 21 a of the first substrate 21. In the present embodiment, the build-up layer 28, 48 has: at least a dielectric layer 20 formed on the first substrate 21, a circuit layer 23 formed on the dielectric layer 20, and a plurality of conductive members 230 formed in and exposed from the dielectric layer 20. In particular, the cavity 200 penetrates the dielectric layer 20. The dielectric layer 20 further has a plurality of openings 201. The

Appendix A-4 - Invalidity of U.S. Patent No. 9859202 in view of Chen 2 - U.S. Patent Publication No. 20150102484

	<p>dielectric layer 20 can be made of prepreg. The conductive members 230, 230 ' are formed in the openings 201 of the dielectric layer 20 for electrically connecting the circuit layer 23 and the first substrate 21. The conductive members 230, 230 ' are made of metal and of a pillar shape or a groove shape. The package structure 2, 3, 4 can further have an insulating layer 24 formed on the build-up layer 28, 48 and exposing the conductive members 230, 230 '. The electronic element 25 is an active component or a passive component. The electronic element 25 is disposed on the first surface 21 a of the first substrate 21 in the cavity 200. The stack member 22, 32 is disposed on the build-up layer 28, 48. In particular, the stack member 22, 32 is bonded to the conductive members 230, 230 ' through a plurality of conductive elements 27 so as to be stacked on the first substrate 21.' Chen '484, [0059-0064].</p> <p>To the extent Plaintiff contends that Chen '484 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.	Chen '484 discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.

downwardly from the bottom surface of the top package substrate.

See, e.g.:

“Referring to FIG. 2E, a stack member 22 is disposed on the conductive members 230 so as to be stacked on the build-up layer 28 and cover the electronic element 25.” Chen ‘484, [0050].

FIG. 2E

Chen '484, FIG. 2E

“Referring to FIG. 2F, an encapsulant 26 is formed between the first surface 21 a of the first substrate 21 and the stack member 22. In the present embodiment, the encapsulant 26 is formed between the dielectric layer 20 (or the insulating layer 24) and the stack member 22, but is not formed in the cavity 200. Therefore, the conductive elements 27 are encapsulated by the encapsulant 26, but the electronic element 25 is not encapsulated by the encapsulant 26.” Chen ’484, [0053-0054].

FIG. 2F

Chen '484, FIG. 2F

“In other embodiments, the encapsulant 26 can be filled between the first surface 21 a of the first substrate 21 and the stack member 22 so as to encapsulate the conductive elements 27 and the electronic element 25.” Chen '484, [0054].

“The present invention further provides a package structure 2, 3, 4, which has: a first substrate 21 ; a build-up layer 28, 48 formed on and electrically connected to the first substrate 21 ; an electronic element 25 disposed on and electrically connected to the first substrate 21 ; a stack member 22, 32 stacked on the build-up layer 28, 48 so as to be stacked on the first substrate 21 ; and an encapsulant 26, 26 ' formed between the build-up layer 28, 48 (or the insulating layer 24) and the stack member 22, 32.” Chen '484, [0059].

“The stack member 22, 32 is disposed on the build-up layer 28, 48. In particular, the stack member 22, 32 is bonded to the conductive members 230, 230 ' through a plurality of conductive elements 27 so as to be stacked on the first substrate 21.” Chen '484, [0065-0066].

Appendix A-4 - Invalidity of U.S. Patent No. 9859202 in view of Chen 2 - U.S. Patent Publication No. 20150102484

	<p>“In an embodiment, the encapsulant 26’ is further formed between the first substrate 21 and the stack member 32.” Chen ’484, [0066].</p> <p>To the extent Plaintiff contends that Chen ’484 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Chen ’484 discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“As such, the electronic element 25 is disposed on the first surface 21 a of the first substrate 21 to form a package, and the electronic element 25 is electrically connected to the circuits 213 and the first bonding pads 210 of the first substrate 21 in a flip-chip manner. In the present embodiment, the electronic element 25 is an active component, such as a chip, and/or a passive component, such as a resistor, a capacitor or an inductor. In other embodiments, the electronic element 25 can be electrically connected to the first substrate 21 through wire bonding. Referring to FIG. 2E, a stack member 22 is disposed on the conductive members</p>

230 so as to be stacked on the build-up layer 28 and cover the electronic element 25." Chen '484, [0047-0050].

“Further, referring to FIG. 3, the stack member 32 can be a package, which has: a substrate 22', an electronic element 35 disposed on an upper surface 22 a of the substrate 22', and an encapsulant 36 formed on the upper surface 22 a of the substrate 22' for encapsulating the electronic element 35. The electronic element 35 is electrically connected to the substrate 22' in a flip-chip manner or through wire bonding.” Chen '484, [0052].

FIG. 3

Chen '484, FIG. 3

“In another embodiment, referring to FIG. 3, the width d of the stack member 32 is less than the width r of the first substrate 21 so as for the encapsulant 26 ' to encapsulate both side and upper surfaces 32 c, 32 a of the stack member 32.” Chen '484, [0055].

Appendix A-4 - Invalidity of U.S. Patent No. 9859202 in view of Chen 2 - U.S. Patent Publication No. 20150102484

	<p>“The present invention further provides a package structure 2, 3, 4, which has: a first substrate 21 ; a build-up layer 28, 48 formed on and electrically connected to the first substrate 21 ; an electronic element 25 disposed on and electrically connected to the first substrate 21 ; a stack member 22, 32 stacked on the build-up layer 28, 48 so as to be stacked on the first substrate 21 ; and an encapsulant 26, 26 ' formed between the build-up layer 28, 48 (or the insulating layer 24) and the stack member 22, 32.” Chen '484, [0059].</p> <p>“In an embodiment, the stack member 22 is a second substrate such as a circuit board. In another embodiment, the stack member 32 is a package. In an embodiment, the width d of the stack member 32 is less than the width r of the first substrate 21 so as for the encapsulant 26 ' to encapsulate the stack member 32.” Chen '484, [0067-0068].</p> <p>To the extent Plaintiff contends that Chen '484 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

	<p>structure 2, 3, 4 can further have an insulating layer 24 formed on the build-up layer 28, 48 and exposing the conductive members 230, 230 '." Chen '484, [0063-0064].</p> <p>"The stack member 22, 32 is disposed on the build-up layer 28, 48. In particular, the stack member 22, 32 is bonded to the conductive members 230, 230 ' through a plurality of conductive elements 27 so as to be stacked on the first substrate 21." Chen '484, [0065-0066].</p> <p>To the extent Plaintiff contends that Chen '484 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of metal pillars of the top package substrate via the corresponding bottom metal pads of the bottom package substrate via the corresponding top metal pads of the spacer connector.	<p>Chen '484 discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p>

spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

“In the above-described method, forming the build-up layer can comprise: forming at least a dielectric layer on the first substrate and forming the cavity and a plurality of openings in the dielectric layer; and forming in the openings of the dielectric layer a plurality of conductive members electrically connected to the first substrate.” Chen ’484, [0015].

“In the above-described package structure and method, the stack member can be bonded to the build-up layer through a plurality of conductive elements. In the above-described package structure and method, the stack member can be a second substrate or a package. The second substrate can be a circuit board.” Chen ’484, [0024-0025].

“Referring to FIG. 2B, a dielectric layer 20 is formed on the first surface 21 a of the first substrate 21. The dielectric layer 20 has a cavity 200 for exposing the first bonding pads 210 and a portion of the first surface 21 a around peripheries of the first bonding pads 210, and a plurality of openings 201 for exposing the second bonding pads 211.” Chen ’484, [0040].

FIG.2B

Chen ’484, FIG. 2B

	<p>“Referring to FIG. 2C, a circuit layer 23 is formed on the dielectric layer 20 and a plurality of conductive members 230 are formed in the openings 201 of the dielectric layer 20. As such, the dielectric layer 20, the circuit layer 23 and the conductive members 230 together form a build-up layer 28. The conductive members 230 electrically connect the circuit layer 23 to the second bonding pads 211 and the circuits 213 of the first substrate 21. In the present embodiment, an insulating layer 24, such as a solder mask layer, is formed on the dielectric layer 20 and the circuit layer 23, and a plurality of openings 240 are formed in the insulating layer 24 for exposing the conductive members 230. Further, the conductive members 230 are made of a metal material, such as copper, and the conductive members 230 are of a pillar shape.” Chen ’484, [0043-0045].</p> <div data-bbox="792 420 1042 1348"></div> <p style="text-align: center;">FIG.2C</p> <p>Chen ’484, FIG. 2C</p> <p>“Referring to FIG. 2E, a stack member 22 is disposed on the conductive members 230 so as to be stacked on the build-up layer 28 and cover the electronic element 25. In the present</p>
--	--

embodiment, the stack member 22 is a second substrate, such as a circuit board. The stack member 22 is bonded to the conductive members 230 through a plurality of conductive elements 27. For example, a plurality of conductive elements 27 made of such as a solder material are formed on a lower surface 22 b of the stack member 22 and electrically connected to the conductive members 230 so as to stack the stack member 22 on the build-up layer 28. Alternatively, a plurality of conductive elements 27 each consisting of a metal pillar 270 (such as a copper pillar) and a solder material 271 formed on the metal pillar 270 can be formed between the conductive members 230 and the stack member 22 so as to stack the stack member 22 on the build-up layer 28.” Chen ’484, [0050-0051].

FIG. 2E

Chen '484, FIG. 2E

“The present invention further provides a package structure 2, 3, 4, which has: a first substrate 21; a build-up layer 28, 48 formed on and electrically connected to the first substrate 21; an

	<p>electronic element 25 disposed on and electrically connected to the first substrate 21 ; a stack member 22, 32 stacked on the build-up layer 28, 48 so as to be stacked on the first substrate 21 ; and an encapsulant 26, 26 ' formed between the build-up layer 28, 48 (or the insulating layer 24) and the stack member 22, 32. The first substrate 21 is a circuit board, which has opposite first and second surfaces 21 a, 21 b. The build-up layer 28, 48 has a cavity 200 exposing a portion of the first surface 21 a of the first substrate 21. In the present embodiment, the build-up layer 28, 48 has: at least a dielectric layer 20 formed on the first substrate 21, a circuit layer 23 formed on the dielectric layer 20, and a plurality of conductive members 230 formed in and exposed from the dielectric layer 20. In particular, the cavity 200 penetrates the dielectric layer 20. The dielectric layer 20 further has a plurality of openings 201. The dielectric layer 20 can be made of prepreg. The conductive members 230, 230 ' are formed in the openings 201 of the dielectric layer 20 for electrically connecting the circuit layer 23 and the first substrate 21. The conductive members 230, 230 ' are made of metal and of a pillar shape or a groove shape. The package structure 2, 3, 4 can further have an insulating layer 24 formed on the build-up layer 28, 48 and exposing the conductive members 230, 230 '. The electronic element 25 is an active component or a passive component. The electronic element 25 is disposed on the first surface 21 a of the first substrate 21 in the cavity 200. The stack member 22, 32 is disposed on the build-up layer 28, 48. In particular, the stack member 22, 32 is bonded to the conductive members 230, 230 ' through a plurality of conductive elements 27 so as to be stacked on the first substrate 21." Chen '484, [0059-0064].</p> <p>To the extent Plaintiff contends that Chen '484 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

U.S. Patent No.9401320 (“Daizo”) is titled Combined Substrate and lists Tomoya Daizo, Takema Adachi, Takeshi Furusawa, Wataru Nakamura, Yuki Ito, Yuki Yoshikawa, and Tomoyoshi Hirabayashi as inventors. Daizo is assigned to Ilden Co., Ltd. Daizo anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Daizo is a U.S. patent that was filed March 4, 2015 and published September 10, 2015. Daizo claims priority to JP 2014-044520 filed on March 7, 2014. Daizo is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(2).

The chart below provides representative examples of where each element of each Asserted Claim is found within Daizo, or otherwise rendered obvious by disclosures and teachings of Daizo, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Daizo does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Daizo with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Daizo, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Daizo “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Daizo or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Daizo set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Daizo discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“According to one aspect of the present invention, a combined substrate includes a first substrate having multiple first metal posts, a second substrate having multiple second metal posts such that the second metal posts are positioned to oppose the first metal posts, respectively, and multiple solder structures interposed between the first metal posts and the second metal posts, respectively.” Daizo, [1:26-1:32].</p>

Daizo, FIG. 1

“A combined substrate 10 of the present embodiment is formed by superposing a second substrate 30 on a first substrate 11. A so-called PoP structure (package-on-package structure) in which a third substrate 20 is superposed on the combined substrate 10 is illustrated in FIG. 2. Daizo, [2:3-2:8].

“The first substrate 11 is, for example, a CPU substrate in which a CPU 12 is mounted on a substrate body (11 H). The substrate body (11 H) forms a multilayer structure with a built-in circuit (not illustrated in the drawings).” Daizo, [2:11-2:14].

“The third substrate 20 is, for example, a memory substrate in which a memory chip 21 is mounted on a substrate body (20 H). The substrate body (20 H), for example, has a planar

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>shape that is substantially the same as the substrate body (11 H) of the first substrate 11.” Daizo, [2:44-2:48].</p> <p>“The second substrate 30, for example, has a planar shape that is substantially the same as the substrate bodies (11 H, 20 H) of the first substrate 11 and the third substrate 20. Similar to the above-described substrate bodies (11 H, 20 H), the second substrate 30 also forms a multilayer structure with a built-in circuit (not illustrated in the drawings).” Daizo, [2:59-2:64].</p> <p>“In a combined substrate which has metal posts protruding from one substrate and soldered to solder bumps of another substrate, there is a conceivable problem that an internal stress occurs between the metal posts and the solder bumps due to thermal deformation of the substrates and thus reliability of electrical connection between the substrates decreases.” Daizo, [5:64-6:2].</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.A] a bottom package substrate;	<p>Daizo discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“A combined substrate 10 of the present embodiment is formed by superposing a second substrate 30 on a first substrate 11. A so-called PoP structure (package-on-package structure) in which a third substrate 20 is superposed on the combined substrate 10 is illustrated in FIG.</p>

	<p>1. In the PoP structure, the second substrate 30 becomes an interposer for connecting the third substrate 20 to the first substrate 11.” Daizo, [2:3-2:10].</p> <p>“The first substrate 11 is, for example, a CPU substrate in which a CPU 12 is mounted on a substrate body (11 H). The substrate body (11 H) forms a multilayer structure with a built-in circuit (not illustrated in the drawings). An F surface (11 F), which is a mounting surface, and a B surface (11 B), which is a back surface of the substrate body (11 H), are covered by solder resist layers (11 S, 11 S). Further, for example, multiple circular pad openings (11 K) are formed in the front and back solder resist layers (11 S, 11 S).” Daizo, [2:11-2:19].</p> <p style="text-align: center;">FIG. 1</p> <p style="text-align: right;">Daizo, FIG. 1</p>
--	--

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>“Further, the group of the pads 14 of the B surface (11 B) of the substrate body (11 H) is bump-connected to another substrate (not illustrated in the drawings).” Daizo, [2:40-2:42].</p> <p>“In order to manufacture the combined substrate 10, the third substrate 20 is prepared in advance in which the memory chip 21 is mounted on the F surface (20 F) of the substrate body (20 H) that is provided with the solder bumps 25. Further, the first substrate 11 is manufactured in which the CPU 12 is mounted on the F surface (11 F) of the substrate body (11 H).” Daizo, [4:17-4:23].</p> <p>“Next, the first substrate 11 and the second substrate 30 are heated at a temperature lower than the melting point of the solder balls 15 of the CPU 12 to reflow the solders 53 and to crush the solders 53 between the front-end surfaces (51 B, 52 B) of the first and second metal posts (51, 52). Then, the solders 53 are solidified to formed a combined body in which the second substrate 30 is fixed on the first substrate 11.” Daizo, [4:29-4:36].</p> <p>“In addition, as described above, the first substrate 11 is thicker than the second substrate 30 and thus is unlikely to thermally deform. In the present embodiment, as described above, the first metal post 51 of the first substrate 11 that is unlikely to thermally deform is formed longer.” Daizo, [5:3-5:8].</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Daizo discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p>

See, e.g.:

“A combined substrate 10 of the present embodiment is formed by superposing a second substrate 30 on a first substrate 11. A so-called PoP structure (package-on-package structure) in which a third substrate 20 is superposed on the combined substrate 10 is illustrated in FIG. 1. In the PoP structure, the second substrate 30 becomes an interposer for connecting the third substrate 20 to the first substrate 11.” Daizo, [2:3-2:11].

FIG. 1

Daizo, FIG. 1

“The solder bumps 25 of the third substrate 20 are soldered to the group of the pads 33 of the F surface (30 F) of the second substrate 30.” Daizo, [3:10-3:12].

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>“Then, the second substrate 30 is mounted on the first substrate 11.” Daizo, [4:23-4:24].</p> <p>“Next, the first substrate 11 and the second substrate 30 are heated at a temperature lower than the melting point of the solder balls 15 of the CPU 12 to reflow the solders 53 and to crush the solders 53 between the front-end surfaces (51 B, 52 B) of the first and second metal posts (51, 52). Then, the solders 53 are solidified to formed a combined body in which the second substrate 30 is fixed on the first substrate 11.” Daizo, [4:29-4:36].</p> <p>“Thereafter, the third substrate 20 is superposed on the second substrate 30 of the combined body and is heated at a temperature lower than the melting point of the solders 53 to reflow the solder bumps 25 of the third substrate 20 and thereby solder the third substrate 20 to the second substrate 30.” Daizo, [4:36-4:41].</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Daizo discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“In the PoP structure, the second substrate 30 becomes an interposer for connecting the third substrate 20 to the first substrate 11.” Daizo, [2:8-2:10].</p>

Daizo, FIG. 1

“The second substrate 30, for example, has a planar shape that is substantially the same as the substrate bodies (11 H, 20 H) of the first substrate 11 and the third substrate 20. Similar to the above-described substrate bodies (11 H, 20 H), the second substrate 30 also forms a multilayer structure with a built-in circuit (not illustrated in the drawings). An F surface (30 F) and a B surface (30 B) are covered by solder resist layers (30 S, 30 S).” Daizo, [2:59-2:66].

	<div data-bbox="292 1291 349 1375"><p>30</p></div> <div data-bbox="324 1060 357 1144"><p>FIG. 3</p></div> <div data-bbox="406 766 1023 1354"></div> <div data-bbox="1031 1218 1063 1386"><p>Daizo, FIG. 3</p></div> <div data-bbox="1112 178 1266 1302"><p>“Further, as compared to the substrate bodies (11 H, 20 H) in which the CPU 12 or the memory chip 21 is mounted, in the second substrate 30, strength required is low and a circuit structure is also simple. Therefore, the second substrate 30 is thinner than the first substrate 11 and the third substrate 20.” Daizo, [3:5-3:9].</p></div>
--	---

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>“The solder bumps 25 of the third substrate 20 are soldered to the group of the pads 33 of the F surface (30 F) of the second substrate 30. On the other hand, multiple second metal posts 52 corresponding to the first metal posts 51 of the first substrate 11 protrude from the group of the pads 34 of the B surface (30 B) of the second substrate 30.” Daizo, [3:10-3:15].</p> <p>“Thereafter, the third substrate 20 is superposed on the second substrate 30 of the combined body and is heated at a temperature lower than the melting point of the solders 53 to reflow the solder bumps 25 of the third substrate 20 and thereby solder the third substrate 20 to the second substrate 30.” Daizo, [4:36-4:41].</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.D] the spacer connector comprises a core substrate;	<p>Daizo discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“In the following, a first embodiment of the present invention is described based on FIG. 1-5. 	second substrate 30. The group of the second metal posts 52 and the group of the first metal posts 51 are fixed by solders 53 in a state in which the second metal posts 52 and the first metal posts 51 respectively butt against each other.” Daizo, [3:12-3:19].
--	---

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>“The first and second metal posts (51, 52) are formed, for example, by subjecting the substrate body (11H) of the first substrate 11 and the second substrate 30 to copper plating processing. Specifically, the substrate body (11H) is covered by an insulating film (not illustrated in the drawings). A circular hole is formed in a part of the insulating film to expose the pad (13 b) of the substrate body (11H). In this state, the substrate body (11H) is subjected to copper plating processing and thereby the first metal post 51 is formed. As illustrated in FIG. 5, for example, the first metal post 51 forms a columnar shape having an outer diameter larger than that of the circular opening (11K) for the pad (13 b) in the solder resist layer (11S), and is in close contact with an opening edge and an inner surface of the pad opening (11K) and the pad (13 b) in the pad opening (11K). The second metal post 52 is also similarly formed by plating processing, forms a columnar shape having an outer diameter larger than that of the pad opening (30K) of the solder resist layer (30S), and is in close contact with an opening edge and an inner surface of the pad opening (30K) and the pad 34.” Daizo, [3:20-3:39].</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.I] the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and</p>	<p>Daizo discloses, either expressly or inherently, the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p>See, <i>e.g.</i>:</p>

Daizo, FIG. 1

“On the other hand, multiple second metal posts 52 corresponding to the first metal posts 51 of the first substrate 11 protrude from the group of the pads 34 of the B surface (30B) of the second substrate 30. The group of the second metal posts 52 and the group of the first metal posts 51 are fixed by solders 53 in a state in which the second metal posts 52 and the first metal posts 51 respectively butt against each other.” Daizo, [3:12-3:19].

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>“The first and second metal posts (51, 52) are formed, for example, by subjecting the substrate body (11H) of the first substrate 11 and the second substrate 30 to copper plating processing. Specifically, the substrate body (11H) is covered by an insulating film (not illustrated in the drawings). A circular hole is formed in a part of the insulating film to expose the pad (13 b) of the substrate body (11H). In this state, the substrate body (11H) is subjected to copper plating processing and thereby the first metal post 51 is formed. As illustrated in FIG. 5, for example, the first metal post 51 forms a columnar shape having an outer diameter larger than that of the circular opening (11K) for the pad (13 b) in the solder resist layer (11S), and is in close contact with an opening edge and an inner surface of the pad opening (11K) and the pad (13 b) in the pad opening (11K). The second metal post 52 is also similarly formed by plating processing, forms a columnar shape having an outer diameter larger than that of the pad opening (30K) of the solder resist layer (30S), and is in close contact with an opening edge and an inner surface of the pad opening (30K) and the pad 34.” Daizo, [3:20-3:39].</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.J] the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of the bottom package substrate.</p> <p>See, <i>e.g.</i>:</p>	<p>Daizo discloses, either expressly or inherently, the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of top metal pillars of the bottom package substrate.</p>

top metal pillars of the bottom package substrate; and	
[1.K] a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein	<p>Daizo, FIG. 1</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p> <p>Daizo discloses, either expressly or inherently, a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein.</p> <p>See, e.g.:</p>

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>“A combined substrate 10 of the present embodiment is formed by superposing a second substrate 30 on a first substrate 11. A so-called PoP structure (package-on-package structure) in which a third substrate 20 is superposed on the combined substrate 10 is illustrated in FIG. 1. In the PoP structure, the second substrate 30 becomes an interposer for connecting the third substrate 20 to the first substrate 11. The first substrate 11 is, for example, a CPU substrate in which a CPU 12 is mounted on a substrate body (11 H).” Daizo, [2:3-2:12].</p> <p>“The above-described CPU 12 is bump-connected (this is also referred to as a “flip-chip connection”) to the group of the pads (13 a) by solder balls 15, and first metal posts 51 (to be described in detail later) protrude from the group of the pads (13 b). The substrate body (11 H) may be a multilayer substrate having a core substrate, for example, as described in Japanese Patent Laid-Open Publication No. 2007-227512, or may be a so-called coreless substrate that does not have a core substrate as described in Japanese Patent Laid-Open Publication No. 2005-236244. The entire contents of Japanese Patent Laid-Open Publication No. 2007-227512 are incorporated herein by reference. Further, the group of the pads 14 of the B surface (11 B) of the substrate body (11 H) is bump-connected to another substrate (not illustrated in the drawings). The third substrate 20 is, for example, a memory substrate in which a memory chip 21 is mounted on a substrate body (20 H). The substrate body (20 H), for example, has a planar shape that is substantially the same as the substrate body (11 H) of the first substrate 11.” Daizo, [2:29-2:49].</p>
--	---

FIG. 1

Daizo, FIG. 1

“The above-described memory chip 21 is fixed at a center of the F surface (20 F) and is wire-bonded to a group of pads 23 surrounding the memory chip 21. Further, solder bumps 25 connected to a group of pads (not illustrated in the drawings) are provided on substantially the entire B surface (20 B) of the substrate body (20 H). The second substrate 30, for example, has a planar shape that is substantially the same as the substrate bodies (11 H, 20 H) of the first substrate 11 and the third substrate 20.” Daizo, [2:53-2:61].

“The solder bumps 25 of the third substrate 20 are soldered to the group of the pads 33 of the F surface (30 F) of the second substrate 30. On the other hand, multiple second metal posts 52 corresponding to the first metal posts 51 of the first substrate 11 protrude from the group of the pads 34 of the B surface (30 B) of the second substrate 30. The group of the second

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>metal posts 52 and the group of the first metal posts 51 are fixed by solders 53 in a state in which the second metal posts 52 and the first metal posts 51 respectively butt against each other.” Daizo, [3:10-3:19].</p> <p>“It is also possible that, after the first substrate 11 and the second substrate 30 are connected, the third substrate 20 is mounted after mold resin is poured in to fix the CPU 12 and the substrate.” Daizo, [4:42-4:45].</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.L] the bottom chip is mounted to the top surface of the bottom package substrate, and</p>	<p>Daizo discloses, either expressly or inherently, the bottom chip is mounted to the top surface of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The first substrate 11 is, for example, a CPU substrate in which a CPU 12 is mounted on a substrate body (11 H). The substrate body (11 H) forms a multilayer structure with a built-in circuit (not illustrated in the drawings). An F surface (11 F), which is a mounting surface, and a B surface (11 B), which is a back surface of the substrate body (11 H), are covered by solder resist layers (11 S, 11 S).” Daizo, [2:11-2:17].</p>

Daizo, FIG. 1

“A plan view of the F surface (11 F) of the first substrate 11 is illustrated in FIG. 2. A group of the pads (13 a) for connecting to the above-described CPU 12 is arranged in a matrix shape in a central portion of the F surface (11 F).” Daizo, [2:22-2:26].

“The above-described CPU 12 is bump-connected (this is also referred to as a “flip-chip connection”) to the group of the pads (13 a) by solder balls 15, and first metal posts 51 (to be described in detail later) protrude from the group of the pads (13 b).” Daizo, [2:29-2:33].

“The third substrate 20 is, for example, a memory substrate in which a memory chip 21 is mounted on a substrate body (20 H). The substrate body (20 H), for example, has a planar

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>shape that is substantially the same as the substrate body (11 H) of the first substrate 11.” Daizo, [2:44-2:48].</p> <p>“The above-described memory chip 21 is fixed at a center of the F surface (20 F) and is wire-bonded to a group of pads 23 surrounding the memory chip 21.” Daizo, [2:53-2:56].</p> <p>“In order to manufacture the combined substrate 10, the third substrate 20 is prepared in advance in which the memory chip 21 is mounted on the F surface (20 F) of the substrate body (20 H) that is provided with the solder bumps 25. Further, the first substrate 11 is manufactured in which the CPU 12 is mounted on the F surface (11 F) of the substrate body (11 H).” Daizo, [4:17-4:23].</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.M] the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.</p>	<p>Daizo discloses, either expressly or inherently, the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.</p> <p><i>See, e.g.:</i></p> <p>“In the PoP structure, the second substrate 30 becomes an interposer for connecting the third substrate 20 to the first substrate 11.” Daizo, [2:8-2:10].</p>

Daizo, FIG. 1

“The second substrate 30, for example, has a planar shape that is substantially the same as the substrate bodies (11H, 20H) of the first substrate 11 and the third substrate 20. Similar to the above-described substrate bodies (11H, 20H), the second substrate 30 also forms a multilayer structure with a built-in circuit (not illustrated in the drawings). An F surface (30F) and a B surface (30B) are covered by solder resist layers (30S, 30S). Pads 33, 34 are provided on deep sides of pad openings (30K) of the solder resist layers (30S, 30S). A plan view of the B surface (30B) of the second substrate 30 is illustrated in FIG. 3. The group of the pads 34 is arranged opposing the group of the pads (13 b) arranged on the F surface (11F) of the first substrate 11 illustrated in FIG. 2. Further, as compared to the substrate bodies (11H, 20H) in which the CPU 12 or the memory chip 21 is mounted, in the second substrate 30, strength required is low and a circuit structure is also simple. Therefore, the second substrate

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>30 is thinner than the first substrate 11 and the third substrate 20. The solder bumps 25 of the third substrate 20 are soldered to the group of the pads 33 of the F surface (30F) of the second substrate 30. On the other hand, multiple second metal posts 52 corresponding to the first metal posts 51 of the first substrate 11 protrude from the group of the pads 34 of the B surface (30B) of the second substrate 30.” Daizo, [2:59-3:15].</p> <p>“Thereafter, the third substrate 20 is superposed on the second substrate 30 of the combined body and is heated at a temperature lower than the melting point of the solders 53 to reflow the solder bumps 25 of the third substrate 20 and thereby solder the third substrate 20 to the second substrate 30.” Daizo, [4:36-4:41].</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.	<p>Daizo discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p> <p><i>See, e.g.:</i></p>

“The first substrate 11 is, for example, a CPU substrate in which a CPU 12 is mounted on a substrate body (11 H). The substrate body (11 H) forms a multilayer structure with a built-in circuit (not illustrated in the drawings). An F surface (11 F), which is a mounting surface, and a B surface (11 B), which is a back surface of the substrate body (11 H), are covered by solder resist layers (11 S, 11 S).” Daizo, [2:11-2:17].

Daizo, FIG. 1

“The above-described CPU 12 is bump-connected (this is also referred to as a “flip-chip connection”) to the group of the pads (13 a) by solder balls 15, and first metal posts 51 (to be described in detail later) protrude from the group of the pads (13 b).” Daizo, [2:29-2:33].

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>“The group of the second metal posts 52 and the group of the first metal posts 51 are fixed by solders 53 in a state in which the second metal posts 52 and the first metal posts 51 respectively butt against each other.” Daizo, [3:15-3:19].</p> <p>“The first metal post 51 is thinner and longer than the second metal post 52. Specifically, the first metal post 51 has an outer diameter of 70-170 μm and a total length of 30-160 μm, and the second metal post 52 has an outer diameter of 70-140 μm and a total length of 15-90 μm.” Daizo, [3:40-3:44].</p> <p>“The total length of a metal post means a height from a surface of an uppermost layer (the solder resist layers (11 S, 30 S)) of the substrate to a highest part of the metal post.” Daizo, [3:52-3:55].</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Daizo discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

<p>package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p><i>See, e.g.:</i></p> <p>“A so-called PoP structure (package-on-package structure) in which a third substrate 20 is superposed on the combined substrate 10 is illustrated in FIG. 1. In the PoP structure, the second substrate 30 becomes an interposer for connecting the third substrate 20 to the first substrate 11. The first substrate 11 is, for example, a CPU substrate in which a CPU 12 is mounted on a substrate body (11 H).” Daizo, [2:5-2:12].</p> <p>“A plan view of the F surface (11 F) of the first substrate 11 is illustrated in FIG. 2. A group of the pads (13 a) for connecting to the above-described CPU 12 is arranged in a matrix shape in a central portion of the F surface (11 F). A group of the pads (32 b), which are larger than the pads (13 a), is arranged in a matrix shape in a frame-shaped region surrounding the pads (13 a).” Daizo, [2:22-2:29].</p> <p>“Further, the group of the pads 14 of the B surface (11 B) of the substrate body (11 H) is bump-connected to another substrate (not illustrated in the drawings). The third substrate 20 is, for example, a memory substrate in which a memory chip 21 is mounted on a substrate body (20 H). The substrate body (20 H), for example, has a planar shape that is substantially the same as the substrate body (11 H) of the first substrate 11. Further, although not illustrated in the drawings, the substrate body (20 H) also forms a multilayer structure with a built-in circuit, similar to the substrate body (11 H) of the first substrate 11. Multiple pads that are connected to the internal circuit are provided on an F surface (20 F) and a B surface (20 B).” Daizo, [2:40-2:53].</p>
--	---

Daizo, FIG. 1

“The above-described memory chip 21 is fixed at a center of the F surface (20 F) and is wire-bonded to a group of pads 23 surrounding the memory chip 21. Further, solder bumps 25 connected to a group of pads (not illustrated in the drawings) are provided on substantially the entire B surface (20 B) of the substrate body (20 H).” Daizo, [2:53-2:58].

“A plan view of the B surface (30 B) of the second substrate 30 is illustrated in FIG. 3. The group of the pads 34 is arranged opposing the group of the pads (13 b) arranged on the F surface (11 F) of the first substrate 11 illustrated in FIG. 2.” Daizo, [3:1-3:5].

“Therefore, the second substrate 30 is thinner than the first substrate 11 and the third substrate 20. The solder bumps 25 of the third substrate 20 are soldered to the group of the pads 33 of

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>the F surface (30 F) of the second substrate 30. On the other hand, multiple second metal posts 52 corresponding to the first metal posts 51 of the first substrate 11 protrude from the group of the pads 34 of the B surface (30 B) of the second substrate 30.” Daizo, [3:8-3:15].</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 4, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.	<p>Daizo discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The group of the pads 34 is arranged opposing the group of the pads (13 b) arranged on the F surface (11 F) of the first substrate 11 illustrated in FIG. 2.” Daizo, [3:2-3:5].</p> <p>“On the other hand, multiple second metal posts 52 corresponding to the first metal posts 51 of the first substrate 11 protrude from the group of the pads 34 of the B surface (30 B) of the second substrate 30.” Daizo, [3:12-3:15].</p>

“The group of the second metal posts 52 and the group of the first metal posts 51 are fixed by solders 53 in a state in which the second metal posts 52 and the first metal posts 51 respectively butt against each other.” Daizo, [3:15-3:19].

FIG. 1

Daizo, FIG. 1

“Specifically, the second substrate 30 is superposed on the F surface (11 F) of the first substrate 11, and the solders 53 of the group of the second metal posts 52 and the front-end surfaces (51 B) of the group of the first metal posts 51 are put in a state of being in contact with each other.” Daizo, [4:25-4:29].

Appendix A-5 - Invalidity of U.S. Patent No. 9859202 in view of Daizo - U.S. Patent No. 9401320

	<p>“Next, the first substrate 11 and the second substrate 30 are heated at a temperature lower than the melting point of the solder balls 15 of the CPU 12 to reflow the solders 53 and to crush the solders 53 between the front-end surfaces (51 B, 52 B) of the first and second metal posts (51, 52).” Daizo, [4:29-4:34].</p> <p>“Further, the outer diameter of the first metal post 51 is larger than the outer diameter of the second metal post 52. Therefore, positional displacement of the front-end surface (52 B) of the second metal post 52 can be allowed within the front-end surface (51 B) of the first metal post 51.” Daizo, [4:64-5:1].</p>
--	---

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	<p>Daizo discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p>

spacer connector via the corresponding top metal pads of the spacer connector.

Daizo, FIG. 1

“Similar to the above-described substrate bodies (11H, 20H), the second substrate 30 also forms a multilayer structure with a built-in circuit (not illustrated in the drawings). An F surface (30F) and a B surface (30B) are covered by solder resist layers (30S, 30S). Pads 33, 34 are provided on deep sides of pad openings (30K) of the solder resist layers (30S, 30S). A plan view of the B surface (30B) of the second substrate 30 is illustrated in FIG. 3. The group of the pads 34 is arranged opposing the group of the pads (13 b) arranged on the F surface (11F) of the first substrate 11 illustrated in FIG. 2.” Daizo, [2:62-3:5].

“The solder bumps 25 of the third substrate 20 are soldered to the group of the pads 33 of the F surface (30F) of the second substrate 30. On the other hand, multiple second metal posts 52 corresponding to the first metal posts 51 of the first substrate 11 protrude from the group

	<p>of the pads 34 of the B surface (30B) of the second substrate 30. The group of the second metal posts 52 and the group of the first metal posts 51 are fixed by solders 53 in a state in which the second metal posts 52 and the first metal posts 51 respectively butt against each other.” Daizo, [3:10-3:19].</p> <p style="text-align: center;">FIG. 6</p>  <p style="text-align: right;">Daizo, FIG. 6</p> <p>To the extent Plaintiff contends that Daizo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general</p>

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

U.S. Patent No. 8436475 (“Dunne”) is titled IC Device Having Low Resistance TSV Comprising Ground Connection and lists Rajiv Dunne, Gary P. Morrison, Satyendra S. Chauham, Masood Murtuza, Thomas D. Bonifield as inventors. Dunne is assigned to Texas Instruments Incorporated. Dunne anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Dunne is a U.S. patent that was filed April 11, 2012 and published August 2, 2012. Dunne claims priority to a provisional application filed on May 12, 2008. Dunne is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Dunne, or otherwise rendered obvious by disclosures and teachings of Dunne, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Dunne does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Dunne with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Dunne, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Dunne “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Dunne or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Dunne set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Dunne discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 1A, a cross sectional depiction of an IC die 100 is shown comprising a substrate 105 including a top semiconductor comprising surface 106 and a bottom surface 107 on an opposite side of the IC die 100. Although described as an IC die 100, the substrate 105 can comprise a wafer having a plurality of IC die 100. The TSV 110 comprises a first electrically conductive filler material 124 (e.g., Cu or a Cu alloy) having an optional liner 125. TSV 110 includes a protruding integral tip 104 comprising sidewalls 103 that comprises the first electrically conductive filler material 124.” Dunne, [4:12-4:21].</p>

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

	<p>“Referring again to FIG. 1A, a metal comprising layer 112 is shown on both the bottom surface 107 of the IC die 100 and the sidewalls 103 and the distal end 111 of the tip 104 including over the liner 125. Metal layer 112 is shown comprising a continuous (i.e. blanket) metal layer that extends over an entire area of the bottom surface 107 of the IC die 100. The metal layer 112 comprises a second electrically conductive metal comprising composition that is different from the first electrically conductive filler material 124. In one embodiment, the metal layer 112 can comprise a solder or solder alloy. Generally, a barrier layer (not shown), then a seed layer (not shown) are under the metal layer 112.” Dunne, [6:47-6:58].</p> <p>“Now referring to FIG. 1B, an IC die 150 is shown that further comprises an electrically conductive adhesive layer 163 comprising a third electrically conductive composition on the metal layer 112. Electrically conductive adhesive layer 163 performs a ground enhancement function, by lowering the resistance from TSV 110 to a ground connection proximate to the bottom surface 107 of the IC die 150, such as the die pad of a lead frame (not shown). The third electrically conductive composition is compositionally different from the first electrically conductive filler material 124 and the second electrically conductive composition of the metal layer 112.” Dunne, [7:3-7:14].</p> <p>“Referring now to FIG. 2, a cross sectional depiction of semiconductor device 200 comprising first IC die 210 comprising of substrate (e.g., wafer or die) 211 including active top semiconductor surface 212 and a bottom surface 213, according to an embodiment of the invention, is shown. Device 200 comprises a package substrate with leadframe 205 comprising a die paddle 206, wherein the die paddle 206 has a top metal comprising surface 207. Packaging material, such as plastic encapsulant, is not shown. Bond wires 234 and 236 are shown providing a connection between an I/O or power supply node for integrated circuitry formed on active semiconductor surface 212 to lead fingers 208 and 218. First IC</p>
--	---

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

	<p>die 210 is shown mounted face up on the top metal comprising surface 207. A plurality of TSVs 110 comprising a first electrically conductive filler material 124 extends from the top semiconductor comprising surface 212 to protruding integral tips 216 and 217 that extend beyond the bottom surface 213 and provide an electrical contact between die paddle 206 and a ground pad (i.e. connected to ground pins of the IC 210) 243 on the top semiconductor surface 212.” Dunne, [7:46-7:65].</p> <p>“FIG. 3 shows a cross sectional depiction of a semiconductor device 300 that comprises IC die 260 joined to die pad 206 of lead-frame 205, according to another embodiment of the invention. The IC die 260 includes a thin metal layer 221 and an electrically conductive die attach adhesive layer 222 comprising a third electrically conductive composition, such as a solder filled polymer, wherein the solder can be arranged in an electrically interconnected network, positioned between the metal layer 221 and the die pad 206 of the package substrate 205. As shown in FIG. 3, the metal layer 221 capped protruding integral tips 216, 217 extend into the electrically conductive die attach adhesive layer 222 which functions as a ground connection enhancement region.” Dunne, [8:41-8:53].</p> <p>“FIG. 4 shows a cross sectional depiction of a stacked die comprising semiconductor device 400 according to another embodiment of the invention. Stacked die comprising semiconductor device 400 comprises a second IC die 410 flip chip joined to the semiconductor device 300 shown in FIG. 3. Pads 411 of second IC die 410 are bonded to the tops of TSVs 110 by bond pads 243 which can comprise materials such as solder, Au or other suitable bond pad materials. Low resistance ground connections are thus provided to IC 410 via TSVs 110 to die paddle 206 via protruding integral tips 216, 217, backside finish layer 221 and ground connection enhancement region 222. Although not shown, second IC die 410 can also comprise TSVs and thus be stacked face-up on IC die 260, and can include additional TSV comprising die (not shown) stacked thereon.” Dunne, [9:18-9:32].</p>
--	--

<p>[1.A] a bottom package substrate;</p>	<p>Dunne discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The package substrate can comprise a printed circuit board (PCB), BT substrate, lead frame, or tape. The lead frame can be part of generally any wire-bond (WB) package type, such as QFN or QFP, for example.” Dunne, [3:1-3:4].</p> <p>“Referring now to FIG. 2, a cross sectional depiction of semiconductor device 200 comprising first IC die 210 comprising of substrate (e.g., wafer or die) 211 including active</p>

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

	<p>top semiconductor surface 212 and a bottom surface 213, according to an embodiment of the invention, is shown. Device 200 comprises a package substrate with leadframe 205 comprising a die paddle 206, wherein the die paddle 206 has a top metal comprising surface 207. Packaging material, such as plastic encapsulant, is not shown. Bond wires 234 and 236 are shown providing a connection between an I/O or power supply node for integrated circuitry formed on active semiconductor surface 212 to lead fingers 208 and 218. First IC die 210 is shown mounted face up on the top metal comprising surface 207.” Dunne, [7:45-7:58].</p>  <p style="text-align: center;">FIG. 2</p> <p>Dunne, FIG. 2</p> <p>“Referring now to FIG. 2, a cross sectional depiction of semiconductor device 200 comprising first IC die 210 comprising of substrate (e.g., wafer or die) 211 including active top semiconductor surface 212 and a bottom surface 213, according to an embodiment of the</p>

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

	<p>invention, is shown. Device 200 comprises a package substrate with leadframe 205 comprising a die paddle 206, wherein the die paddle 206 has a top metal comprising surface 207.” Dunne, [7:46-7:53].</p> <p>“Device 200 comprises a package substrate with leadframe 205 comprising a die paddle 206, wherein the die paddle 206 has a top metal comprising surface 207. Packaging material, such as plastic encapsulant, is not shown.” Dunne, [7:51-7:54].</p> <p>“FIG. 3 shows a cross sectional depiction of a semiconductor device 300 that comprises IC die 260 joined to die pad 206 of lead-frame 205, according to another embodiment of the invention.” Dunne, [8:41-8:44].</p> <p>“Stacked die comprising semiconductor device 400 comprises a second IC die 410 flip chip joined to the semiconductor device 300 shown in FIG. 3. Pads 411 of second IC die 410 are bonded to the tops of TSVs 110 by bond pads 243 which can comprise materials such as solder, Au or other suitable bond pad materials. Low resistance ground connections are thus provided to IC 410 via TSVs 110 to die paddle 206 via protruding integral tips 216, 217, backside finish layer 221 and ground connection enhancement region 222.” Dunne, [9:21-9:30].</p> <p>To the extent Plaintiff contends that Dunne fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.B] a top package substrate stacked on top of the bottom package substrate;	Dunne discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.

See, e.g.:

“Embodiments of the present invention describe IC die comprising a substrate having a semiconductor surface (and wafers having a plurality of such IC die) having at least one, and generally a plurality of TSVs.” Dunne, [2:38-2:41].

“FIG. 4 shows a cross sectional depiction of a stacked die comprising semiconductor device 400 according to another embodiment of the invention. Stacked die comprising semiconductor device 400 comprises a second IC die 410 flip chip joined to the semiconductor device 300 shown in FIG. 3. Pads 411 of second IC die 410 are bonded to the tops of TSVs 110 by bond pads 243 which can comprise materials such as solder, Au or other suitable bond pad materials.” Dunne, [9:18-9:25].

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

	<p>Dunne, FIG. 4</p> <p>“Although not shown, second IC die 410 can also comprise TSVs and thus be stacked face-up on IC die 260, and can include additional TSV comprising die (not shown) stacked thereon.” Dunne, [9:30-9:34].</p> <p>To the extent Plaintiff contends that Dunne fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Dunne discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p>See, e.g.:</p> <p>“Referring now to FIG. 2, a cross sectional depiction of semiconductor device 200 comprising first IC die 210 comprising of substrate (e.g., wafer or die) 211 including active top semiconductor surface 212 and a bottom surface 213, according to an embodiment of the invention, is shown. Device 200 comprises a package substrate with leadframe 205 comprising a die paddle 206, wherein the die paddle 206 has a top metal comprising surface 207. First IC die 210 is shown mounted face up on the top metal comprising surface 207. A plurality of TSVs 110 comprising a first electrically conductive filler material 124 extends from the top</p>

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

	<p>semiconductor comprising surface 212 to protruding integral tips 216 and 217 that extend beyond the bottom surface 213 and provide an electrical contact between die paddle 206 and a ground pad (i.e. connected to ground pins of the IC 210) 243 on the top semiconductor surface 212.” Dunne, [7:46-7:65].</p> <p>“FIG. 3 shows a cross sectional depiction of a semiconductor device 300 that comprises IC die 260 joined to die pad 206 of lead-frame 205, according to another embodiment of the invention. The IC die 260 includes a thin metal layer 221 and an electrically conductive die attach adhesive layer 222 comprising a third electrically conductive composition, such as a solder filled polymer, wherein the solder can be arranged in an electrically interconnected network, positioned between the metal layer 221 and the die pad 206 of the package substrate 205. As shown in FIG. 3, the metal layer 221 capped protruding integral tips 216, 217 extend into the electrically conductive die attach adhesive layer 222 which functions as a ground connection enhancement region.” Dunne, [8:41-8:53].</p> <p>“FIG. 4 shows a cross sectional depiction of a stacked die comprising semiconductor device 400 according to another embodiment of the invention. Stacked die comprising semiconductor device 400 comprises a second IC die 410 flip chip joined to the semiconductor device 300 shown in FIG. 3. Pads 411 of second IC die 410 are bonded to the tops of TSVs 110 by bond pads 243 which can comprise materials such as solder, Au or other suitable bond pad materials. Low resistance ground connections are thus provided to IC 410 via TSVs 110 to die paddle 206 via protruding integral tips 216, 217, backside finish layer 221 and ground connection enhancement region 222. Although not shown, second IC die 410 can also comprise TSVs and thus be stacked face-up on IC die 260, and can include additional TSV comprising die (not shown) stacked thereon.” Dunne, [9:18-9:32].</p>
--	--

Dunne, FIG. 4

To the extent Plaintiff contends that Dunne fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Dunne discloses, either expressly or inherently, the spacer connector comprises a core substrate.

See, e.g.:

“Referring now to FIG. 2, a cross sectional depiction of semiconductor device 200 comprising first IC die 210 comprising of substrate (e.g., wafer or die) 211 including active top semiconductor surface 212 and a bottom surface 213, according to an embodiment of the

	<p>invention, is shown. Device 200 comprises a package substrate with leadframe 205 comprising a die paddle 206, wherein the die paddle 206 has a top metal comprising surface 207. Packaging material, such as plastic encapsulant, is not shown. Bond wires 234 and 236 are shown providing a connection between an I/O or power supply node for integrated circuitry formed on active semiconductor surface 212 to lead fingers 208 and 218. First IC die 210 is shown mounted face up on the top metal comprising surface 207. A plurality of TSVs 110 comprising a first electrically conductive filler material 124 extends from the top semiconductor comprising surface 212 to protruding integral tips 216 and 217 that extend beyond the bottom surface 213 and provide an electrical contact between die paddle 206 and a ground pad (i.e. connected to ground pins of the IC 210) 243 on the top semiconductor surface 212. Although not shown, TSVs 110 generally include a barrier layer and seed layer in the case of conventional Cu TSVs.” Dunne, [7:46-7:67].</p>  <p style="text-align: center;">FIG. 2</p> <p>Dunne, FIG. 2</p>
--	---

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

	<p>“FIG. 4 shows a cross sectional depiction of a stacked die comprising semiconductor device 400 according to another embodiment of the invention. Stacked die comprising semiconductor device 400 comprises a second IC die 410 flip chip joined to the semiconductor device 300 shown in FIG. 3. Pads 411 of second IC die 410 are bonded to the tops of TSVs 110 by bond pads 243 which can comprise materials such as solder, Au or other suitable bond pad materials. Low resistance ground connections are thus provided to IC 410 via TSVs 110 to die paddle 206 via protruding integral tips 216, 217, backside finish layer 221 and ground connection enhancement region 222. Although not shown, second IC die 410 can also comprise TSVs and thus be stacked face-up on IC die 260, and can include additional TSV comprising die (not shown) stacked thereon.” Dunne, [9:19-9:34].</p> <p>To the extent Plaintiff contends that Dunne fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.E] a plurality of metal pillars, each passing through the core substrate; and	<p>Dunne discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“As known in the art, TSVs which are also referred to as through-wafer vias (TWVs), are vertical electrical connections that pass from the frontside surface of a wafer or IC die (e.g., contact level or one of the metal levels) completely through to the backside surface.” Dunne, [1:23-1:27].</p>

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

	<p>“The TSV 110 comprises a first electrically conductive filler material 124 (e.g., Cu or a Cu alloy) having an optional liner 125. TSV 110 includes a protruding integral tip 104 comprising sidewalls 103 that comprises the first electrically conductive filler material 124.” Dunne, [4:17-4:21].</p> <p>“Liner 125 is shown extending from the top semiconductor surface 106 to the bottom surface 107 and include a tip liner portion that extends past the bottom surface 107 a distance equal to at least 1% of tip height.” Dunne, [4:24-4:27].</p> <p>“Embedded via-first TSVs are conventionally formed by topside via etching (e.g., by RIE) to a depth less than the thickness of the substrate/wafer, framing the via by forming a dielectric liner in the via, followed by filling the via with an electrically conductive filler material.” Dunne, [4:49-4:53].</p> <p>“A plurality of TSVs 110 comprising a first electrically conductive filler material 124 extends from the top semiconductor comprising surface 212 to protruding integral tips 216 and 217 that extend beyond the bottom surface 213 and provide an electrical contact between die paddle 206 and a ground pad (i.e. connected to ground pins of the IC 210) 243 on the top semiconductor surface 212. Although not shown, TSVs 110 generally include a barrier layer and seed layer in the case of conventional Cu TSVs. As shown in FIG. 2, the protruding integral tips 216, 217 protrude from the bottom surface 213 of the substrate 211 a tip height that is generally 1 to 50 μm, and is typically between 2 and 20 μm. A metal layer 220 is on both the bottom surface 213 of the substrate 211 and on the protruding integral tips 216, 217. The metal layer 220 comprises a second electrically conductive metal comprising composition that is different from the first electrically conductive filler material 124 of the TSV 110, and the top metal comprising surface 207 of the die paddle 206.” Dunne, [7:58-8:10].</p>
--	--

FIG. 4

Dunne, FIG. 4

“The IC die 260 includes a thin metal layer 221 and an electrically conductive die attach adhesive layer 222 comprising a third electrically conductive composition, such as a solder filled polymer, wherein the solder can be arranged in an electrically interconnected network, positioned between the metal layer 221 and the die pad 206 of the package substrate 205. As shown in FIG. 3, the metal layer 221 capped protruding integral tips 216, 217 extend into the electrically conductive die attach adhesive layer 222 which functions as a ground connection enhancement region.” Dunne, [8:44-8:53].

To the extent Plaintiff contends that Dunne fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

	general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.
[1.F] a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars;	<p>Dunne discloses, either expressly or inherently, a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.</p> <p><i>See, e.g.:</i></p> <p>“The TSV 110 comprises a first electrically conductive filler material 124 (e.g., Cu or a Cu alloy) having an optional liner 125. 	general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.
Claim 2, U.S. Patent No. 9859202	
Claim Limitation	Disclosure
[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.	<p>Dunne discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p> <p>See, e.g.:</p> <p>Dunne, FIG. 4</p>

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

	<p>To the extent Plaintiff contends that Dunne fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Dunne discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“Referring now to FIG. 2, a cross sectional depiction of semiconductor device 200 comprising first IC die 210 comprising of substrate (e.g., wafer or die) 211 including active top semiconductor surface 212 and a bottom surface 213, according to an embodiment of the invention, is shown. Device 200 comprises a package substrate with leadframe 205 comprising a die paddle 206, wherein the die paddle 206 has a top metal comprising surface 207. Packaging material, such as plastic encapsulant, is not shown. Bond wires 234 and 236 are shown providing a connection between an I/O or power supply node for integrated circuitry formed on active semiconductor surface 212 to lead fingers 208 and 218. First IC die 210 is shown mounted face up on the top metal comprising surface 207.” Dunne, [7:46-7:59].</p>

Appendix A-6 - Invalidity of U.S. Patent No. 9859202 in view of Dunne - U.S. Patent No. 8436475

	<p>“FIG. 3 shows a cross sectional depiction of a semiconductor device 300 that comprises IC die 260 joined to die pad 206 of lead-frame 205, according to another embodiment of the invention. The IC die 260 includes a thin metal layer 221 and an electrically conductive die attach adhesive layer 222 comprising a third electrically conductive composition, such as a solder filled polymer, wherein the solder can be arranged in an electrically interconnected network, positioned between the metal layer 221 and the die pad 206 of the package substrate 205.” Dunne, [8:41-8:50].</p> <p>“FIG. 4 shows a cross sectional depiction of a stacked die comprising semiconductor device 400 according to another embodiment of the invention. Stacked die comprising semiconductor device 400 comprises a second IC die 410 flip chip joined to the semiconductor device 300 shown in FIG. 3. Pads 411 of second IC die 410 are bonded to the tops of TSVs 110 by bond pads 243 which can comprise materials such as solder, Au or other suitable bond pad materials. Low resistance ground connections are thus provided to IC 410 via TSVs 110 to die paddle 206 via protruding integral tips 216, 217, backside finish layer 221 and ground connection enhancement region 222. Although not shown, second IC die 410 can also comprise TSVs and thus be stacked face-up on IC die 260, and can include additional TSV comprising die (not shown) stacked thereon.” Dunne, [9:19-9:34].</p>
--	--

FIG. 4

Dunne, FIG. 4

“Although not shown, second IC die 410 can also comprise TSVs and thus be stacked face-up on IC die 260, and can include additional TSV comprising die (not shown) stacked thereon.” Dunne, [9:30-9:34].

To the extent Plaintiff contends that Dunne fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

--	---

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to the plurality of metal pillars of the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of metal pillars of the bottom package substrate via the plurality of metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p>	<p>Dunne discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p>

the corresponding top metal pads of the spacer connector.

FIG. 4

Dunne, FIG. 4

To the extent Plaintiff contends that Dunne fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-7 - Invalidity of U.S. Patent No. 9859202 in view of Furuta '669 - U.S. Patent No. 8618669

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Furuta '669 - U.S. Patent No. 8618669

U.S. Patent No. 8618669 (“Furuta '669”) is titled Combination Substrate and lists Toru Furuta as inventor. Furuta '669 is assigned to Ibidon Co., Ltd. Furuta '669 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the '202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff's apparent infringement theory.² Furuta '669 is a U.S. patent that was filed July 16, 2008 and published July 9, 2009. Furuta '669 claims priority to a provisional application filed on January 9, 2008. Furuta '669 is therefore prior art to the '202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Furuta '669, or otherwise rendered obvious by disclosures and teachings of Furuta '669, including under TopWire's apparent interpretation of the Asserted Claims as Samsung understands them from TopWire's Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Furuta '669 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Furuta '669 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung's other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung's Invalidity Contentions with respect to the '202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Furuta '669, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire's March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court's order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire's apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung's interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-7 - Invalidity of U.S. Patent No. 9859202 in view of Furuta '669 - U.S. Patent No. 8618669

a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Furuta '669 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Furuta '669 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Furuta '669 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Furuta '669 discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 4(A) illustrates a sectional view of a combination substrate 10 in accordance with Example 1. The combination substrate 10 comprises an upper substrate 12 U and a lower substrate 12 L. On the upper substrate 12 U there are disposed a pad group of pads for package substrate connection 42 P on the center portion of the upper substrate 12 U, as illustrated in the plan view of FIG. 6(A) corresponding to the a arrow directional view in FIG. 4(A). On the lower substrate 12 L there is likewise formed a pad group for external connection such as</p>

Appendix A-7 - Invalidity of U.S. Patent No. 9859202 in view of Furuta '669 - U.S. Patent No. 8618669

	<p>the BGA of pads 42 D for connecting to another printed wiring board. On the upper face of the lower substrate 12 L there is mounted an IC chip 50. As to the lower substrate 12 L, conductor circuits 42 b on the lower face and conductor circuits 42 a on the upper face are connected via vias 44, and the IC chip 50 and the conductor circuits 42 a on the upper face are connected via solder bumps 52. In this case, the IC chip 50 may be mounted by other mounting configurations (wire bonding mounting, for example). A plurality of IC chips may be mounted. In the opening portions 48 a in a solder resist 8 of the conductor circuits 42 a on the upper face side of the lower substrate 12 L there is formed a pad group of pads 42 G for upper substrate connection. In the opening portions 48 a in a solder resist 48 of the conductor circuits 42 on the lower face side there is formed a pad group constituting pads 42 D for printed wiring board connection. Likewise, as to the upper substrate 12 U, the conductor circuits 42 a on the lower face side and the conductor circuits 42 b on the upper face side are connected via vias 44. In the opening portions 42 a in the solder resist 48 of the conductor circuits 42 a on the lower face side of the upper substrate 12 U there is formed a pad group of pads 42 F for lower substrate connection, and in the opening portions 48 a in the solder resist 48 of the conductor circuits 42 b on the upper face side there is formed a pad group of pads 42 P for package substrate connection. Between the lower substrate 12 L and the IC chip 50 there is filled an insulating resin such as an underfill 60 such as an epoxy resin, and between the upper substrate 12 U and the lower substrate 12 L there is filled an insulating resin being a resin filler agent (underfill) 62. The underfill 60 and the resin filler agent 62 are preferably composed of a thermosetting resin and an inorganic filler. The pads 42 F on the lower face side of the upper substrate 12 U and the pads 42 G on the upper face side of the lower substrate 12 L are electrically connected via cylindrical metal posts 46, 46.” Furuta ’669, [2:58-3:34].</p> <p>“FIG. 7 illustrates a combination substrate pertaining to Revised Example 1 of Example 1. With Example 1, an IC chip 50 was mounted on the upper face of the lower substrate 12 L</p>
--	---

Appendix A-7 - Invalidity of U.S. Patent No. 9859202 in view of Furuta '669 - U.S. Patent No. 8618669

	<p>as illustrated in FIG. 5(B). In lieu of this, an IC chip may also be mounted on the lower face of the upper substrate 12 U, as illustrated in FIG. 7." Furuta '669, [6:66-7:4].</p> <p>"FIG. 12(A) illustrates a sectional view of the combination substrate 10 in accordance with Example 2. The combination substrate 10 comprises an upper substrate 12 U, an interposer 12 M being an intermediate material, and a lower substrate 12 L. On the upper substrate 12 U, a pad group of pads 42 P for package substrate connection is disposed in the center region of the upper substrate 12 U, as illustrated in the plan view of FIG. 14(A) corresponding to the arrow directional view in FIG. 12(A). On the lower substrate 12 L there is likewise formed a pad group of pads 42 D to connect to a printed wiring board. On the upper face of the lower substrate 12 L there is mounted an IC chip 50. As to the lower substrate 12 L conductor circuits 42 b on the lower face side and conductor circuits 42 a on the upper face side are connected vias 44, and the IC chip 50 and the conductor circuits 42 b on the upper face side are connected via solder bumps 52. In openings 48 a in a solder resist 48 on the conductor circuits 42 a on the upper face side of the lower substrate 12 L there are formed pads 42 G for the upper substrate connection, and in openings 48 a in a solder resist 48 on conductor circuits 42 b on the lower face side there are formed a pad group of pads 42 D for printed wiring substrate connection. Likewise, as to the lower substrate 12 L the conductor circuits 42 a on the lower face side and the conductor circuits 42 b on the upper face side are connected vias 44. In openings 48 a in the solder resist 48 on the conductor circuits 42 a on the lower face side of the upper substrate 12 U there are formed pads 42 F for the lower substrate connection, and in openings 48 a in the solder resist 48 on the conductor circuits 42 b on the upper face side there are formed pads 42 P for package substrate connection. Between the lower substrate 12 L and the IC chip 50 there is filled underfill 60 being an insulating resin, and between the upper substrate 12 U and the lower substrate 12 L there is filled a resin filler (underfill) 62. The pads 42 F on the lower face side of the upper substrate</p>
--	---

	<p>12 U and the pads 42 G on the upper face side of the lower substrate 12 L are electrically connected with cylindrical metal posts 86 of the interposer 12 M.” Furuta ’669, [7:16-7:56].</p> <p>FIG. 12</p> <p>Furuta, FIG. 12</p> <p>“FIG. 15 illustrates a combination substrate pertaining to Revised Example 1 of Example 2. With Example 2, an IC chip 50 was mounted on the upper face of the lower substrate 12 L as illustrated in FIG. 13(A). In lieu of this, an IC chip may also be mounted on the lower face of the upper substrate 12 U, as illustrated in FIG. 15.” Furuta ’669, [10:14-10:19].</p> <p>“According to the foregoing embodiments, a combination substrate includes a lower substrate having the first main face and the second main face opposite the previously-described first main face; connection pads formed on the first face of the previously-described lower</p>

	<p>substrate; mounting pads formed on the second main face of the previously-described lower substrate and for connecting with a printed wiring board; an upper substrate having the first main face and the second main face opposite the previously-described first main face; mounting pads formed on the first main face of the previously-described upper substrate and for loading a package substrate; component loading pads formed on the second main face of the previously-described upper substrate or on the first main face of the previously-described lower substrate and for loading an electronic component; and connection pads formed on the second main face of the previously-described upper substrate and for electrically connecting with the connection pads of the previously-described lower substrate.” Furuta ’669, [10:27-10:44].</p> <p>To the extent Plaintiff contends that Furuta ’669 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Furuta ’669 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The combination substrate 10 comprises an upper substrate 12 U and a lower substrate 12 L. On the upper substrate 12 U there are disposed a pad group of pads for package substrate connection 42 P on the center portion of the upper substrate 12 U, as illustrated in the plan view of FIG. 6(A) corresponding to the a arrow directional view in FIG. 4(A). On the lower substrate 12 L there is likewise formed a pad group for external connection such as the BGA of pads 42 D for connecting to another printed wiring board.” Furuta ’669, [2:59-3:1].</p>

FIG. 12

Furuta, FIG. 12

“The pads 42 F on the lower face side of the upper substrate 12 U and the pads 42 G on the upper face side of the lower substrate 12 L are electrically connected via cylindrical metal posts 46, 46. On the pads 42 D on the lower face side of the combination substrate 10 there are provided external connection terminals 64 L such as BGA and solder bumps, and by their being connected to pads 76 of another printed wiring board 74 as illustrated in FIG. 5(B) said combination substrate 10 is loaded onto the printed wiring board 74. In the combination substrate 10 in Example 1, on account of the underfill 62 having been filled between the upper substrate 12 U and the lower substrate 12 L, it now becomes possible to control the warpage and separation of the upper substrate 12 U and the lower substrate 12 L and to ease stresses on account of the underfill 62 even when the upper substrate 12 U and the lower

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	Furuta '669 discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

Appendix A-7 - Invalidity of U.S. Patent No. 9859202 in view of Furuta '669 - U.S. Patent No. 8618669

<p>the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p><i>See, e.g.:</i></p> <p>“FIG. 12(A) illustrates a sectional view of the combination substrate 10 in accordance with Example 2. The combination substrate 10 comprises an upper substrate 12 U, an interposer 12 M being an intermediate material, and a lower substrate 12 L. On the upper substrate 12 U, a pad group of pads 42 P for package substrate connection is disposed in the center region of the upper substrate 12 U, as illustrated in the plan view of FIG. 14(A) corresponding to the arrow directional view in FIG. 12(A). On the lower substrate 12 L there is likewise formed a pad group of pads 42 D to connect to a printed wiring board. On the upper face of the lower substrate 12 L there is mounted an IC chip 50. As to the lower substrate 12 L conductor circuits 42 b on the lower face side and conductor circuits 42 a on the upper face side are connected vias 44, and the IC chip 50 and the conductor circuits 42 b on the upper face side are connected via solder bumps 52. In openings 48 a in a solder resist 48 on the conductor circuits 42 a on the upper face side of the lower substrate 12 L there are formed pads 42 G for the upper substrate connection, and in openings 48 a in a solder resist 48 on conductor circuits 42 b on the lower face side there are formed a pad group of pads 42 D for printed wiring substrate connection. Likewise, as to the lower substrate 12 L the conductor circuits 42 a on the lower face side and the conductor circuits 42 b on the upper face side are connected vias 44. In openings 48 a in the solder resist 48 on the conductor circuits 42 a on the lower face side of the upper substrate 12 U there are formed pads 42 F for the lower substrate connection, and in openings 48 a in the solder resist 48 on the conductor circuits 42 b on the upper face side there are formed pads 42 P for package substrate connection. Between the lower substrate 12 L and the IC chip 50 there is filled underfill 60 being an insulating resin, and between the upper substrate 12 U and the lower substrate 12 L there is filled a resin filler (underfill) 62. The pads 42 F on the lower face side of the upper substrate 12 U and the pads 42 G on the upper face side of the lower substrate 12 L are electrically connected with cylindrical metal posts 86 of the interposer 12 M.” Furuta '669, [7:17-7:56].</p>
--	---

“Formation of an Interposer An insulating material 80 is prepared (FIG. 11(A)). Openings 82 penetrating the insulating material 80 are formed (FIG. 11 (B)), and a conductor layer 84 is formed in said openings 82 (FIG. 11(C)). The conductor layer 84 is formed by the through-hole, via, and post such as implant. For a conductor layer, a metal such as Cu, Ni, and a precious metal may be used. As an example therefor, a method of filling a post with an implant is available. An insulating substrate having on both faces a conductor layer formed with a copper foil, plating, etc., is prepared. Openings for penetration are provided in the insulating substrate with drilling or laser. Then, a resist layer is provided on the entirety of the face of the conductor layer, and a mask with the wiring pattern drawn thereon is placed. Following that, a pattern for the interposer is formed through an etching treatment after having undergone exposure and development. Then, a solder resist layer may be formed or the external shape may be treated (single-piece treatment of interposer), as necessary. This results in the preparation of an insulating substrate having openings for implant. Implant material to constitute posts for implant is prepared. The thickness (height) thereof is preferably greater than that of the insulating substrate. A lower jig for the implant step is placed in advance underneath the implant material. At that time, an upper jig having a protrusion shape and for punching is placed over the implant material. The upper jig is punched part way down the implant material. The punched-out implant material is inserted and tapped into the openings 82 of the insulating substrate 80 which had been prepared such that the conductor layer (posts) 86 penetrating the insulating substrate is formed (FIG. 11(D)). Then, they are severed from the implant material and the height of a plurality of posts 86 protruding from the insulating substrate 80 is evened out. This allows the insulating substrate 80 being the interposer 12 M to make an electrical connection between the front and the back and to have conductor layer (posts) 86 being nearly the same in height of the protrusions off the insulating substrate 80.” Furuta ’669, [8:19-8:58].

Appendix A-7 - Invalidity of U.S. Patent No. 9859202 in view of Furuta '669 - U.S. Patent No. 8618669

	<p>“At that time, an adhesive 88 may be applied, etc., as necessary, to affix the posts 86 being the conductor layer (FIG. 11(E)). And, the tip portions of the conductor layer may undergo steps for improving anti-oxidation and the connection of the substrate with the conductor layer (roughened face formation, mirror surface treatment, etc.)” Furuta ’669, [8:58-8:64].</p> <p>“Formation of Laminate Substrate 1. Alignment of Lower Substrate and Upper Substrate The circuits (pads) 42 G of the lower substrate 12 L, posts 86 of the interposer 12 M, and the circuits (pads) 42 F of the upper substrate 12 U are aligned (FIG. 12(A)). At that time, the circuit portions 42 G of the lower substrate 12 L and the conductor layers 86 of the interposer 12 M are brought in mutual contact. The circuit portions 42 F of the upper substrate 12 U and the conductor layers 86 of the interposer 12 M are brought in mutual contact. That allows the upper substrate 12 U and the lower substrate 12 L to be electrically connected via the interposer 12 M. The conductor layers 86 and the conductor layers 42 G, 42 F of each of the substrates may be connected with the use of solder, etc., as a conductive adhesive 88.” Furuta ’669, [9:1-9:15].</p>
--	---

	<p>FIG. 12</p>  <p>Furuta, FIG. 12</p> <p>To the extent Plaintiff contends that Furuta '669 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-8 - Invalidity of U.S. Patent No. 9859202 in view of Furuta '415 - U.S. Patent Publication No. 20090140415

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Furuta '415 - U.S. Patent Publication No. 20090140415

U.S. Patent Publication No. 20090140415 (“Furuta '415”) is titled Combination Substrate and lists Toru Furuta as inventor. Furuta '415 is assigned to Iriden Co., Ltd. Furuta '415 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the '202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff's apparent infringement theory.² Furuta '415 is a U.S. patent publication that was filed June 27, 2008 and published June 27, 2008. Furuta '415 claims priority to a provisional application filed on November 29, 2007. Furuta '415 is therefore prior art to the '202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Furuta '415, or otherwise rendered obvious by disclosures and teachings of Furuta '415, including under TopWire's apparent interpretation of the Asserted Claims as Samsung understands them from TopWire's Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Furuta '415 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Furuta '415 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung's other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung's Invalidity Contentions with respect to the '202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Furuta '415, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire's March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court's order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire's apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung's interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-8 - Invalidity of U.S. Patent No. 9859202 in view of Furuta '415 - U.S. Patent Publication No. 20090140415

a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Furuta '415 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Furuta '415 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Furuta '415 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Furuta '415 discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 6(A) shows a cross-sectional view of combination substrate 10 according to Example 1. Combination substrate 10 is structured with upper substrate (12 U), interposer (12 M) as an intermediate and lower substrate (12 L). On upper substrate (12 U), as shown in the plan view in FIG. 7(A) equivalent to a fragmentary view taken from the direction (a) in FIG. 6(A), a group of pads (42 P) for connection to a package substrate is arranged in the center portion of upper substrate (12 U). Likewise, on lower substrate (12 L), a group of pads (42 D) for</p>

	<p>connection to a printed wiring board is formed. On the top surface of lower substrate (12 L), IC chip 50 is mounted. At lower substrate (12 L), conductive circuit (42 b) on the bottom surface and conductive circuit (42 a) on the top surface are connected through vias 44, and IC chip 50 and conductive circuit (42 b) on the top surface are connected through solder bumps 52. In openings (48 a) of solder resist 48 for conductive circuit (42 a) on the top surface of lower substrate (12 L), pads (42 G) for connection to the upper substrate are formed; and in openings (48 a) of solder resist 48 for conductive circuit (42 b) on the bottom surface, a group of pads (42 D) for connection to a printed wiring board substrate is formed. In the same manner, at upper substrate (12 U), conductive circuit (42 a) on the bottom surface and conductive circuit (42 b) on the top surface are connected through vias 44. In openings (48 a) of solder resist 48 for conductive circuit (42 a) on the bottom surface of upper substrate (12 U), pads (42 F) for connection to the lower substrate are formed; and in openings (48 a) of solder resist 48 for conductive circuit (42 b) on the top surface, pads (42 P) for connection to a package substrate are formed. Between lower substrate (12 L) and IC chip 50, insulative resin underfill 60 is filled; and between upper substrate (12 U) and lower substrate (12 L), resin filling agent 62 is filled. Pads (42 F) on the bottom surface of upper substrate (12 U) and pads (42 G) on the top surface of lower substrate (12 L) are electrically connected by cylindrical metal posts 86 in interposer (12 M).” Furuta ’415, [0020-0021].</p>
--	--

FIG. 6

(A)

Furuta '415, FIG. 6

“FIG. 8 shows a combination substrate according to Modification 1 to Example 1. In Example 1, as shown in FIG. 6(A), IC chip 50 was mounted on the top surface of lower substrate (12 L). Instead, as shown in FIG. 8, IC chip 50 may also be mounted on the bottom surface of upper substrate (12 U).” Furuta '415, [0047].

Furuta '415, FIG. 8

“FIG. 9 shows a combination substrate according to Modification 2 to Example 1. In Example 1, upper substrate (12 U) and lower substrate (12 L) are arranged in a mirror image structure. Instead, as shown in FIG. 9, vias 66 and circuit (42 b) of lower substrate (12 L) may be arranged so as to spread toward the periphery (fan out).” Furuta ‘415, [0048].

Furuta '415, FIG. 9

“FIG. 10 show a combination substrate according to Example 2. In Example 1, interiors of open holes (80 a) of interposer (12 M) are filled with underfill 62 or resin 90. In contrast, as shown in FIG. 10(C), Example 2 has a structure so as not to fill the interiors of open holes (80 a) of interposer (12 M) with resin 90. Here, since the interiors of open holes (80 a) of interposer (12 M) are not filled with resin 90, occurrence of cracks at the interface (especially at the corners of the IC chip) between lower substrate (12 L) and mounted IC chip 50 may be suppressed.” Furuta '415, [0049].

Furuta '415, FIG. 10

“FIG. 11 show a combination substrate according to Modification 1 to Example 1 to Example 2. Example 2, as described above with reference to FIG. 10(C), was structured so as not to fill the interiors

of open holes (80 a) of interposer (12 M) with underfill 90. In contrast, according to Modification 1 to Example 2, the interiors of open holes (80 a) are filled with resin 91 which is less elastic than the underfill." Furuta '415, [0051].

Furuta '415, FIG. 11

“According to the foregoing embodiments of the present invention, a combination substrate is structured with a lower substrate which is to be installed on a printed wiring board, and an upper substrate which is to be installed on the upper surface of the lower substrate and on

Appendix A-8 - Invalidity of U.S. Patent No. 9859202 in view of Furuta '415 - U.S. Patent Publication No. 20090140415

	<p>which to mount a package substrate; and on the surface of the lower substrate facing the upper substrate, or on the surface of the upper substrate facing the lower substrate, a die is mounted.” Furuta ’415, [0053].</p>
<p>[1.A] a bottom package substrate;</p>	<p>Furuta ’415 discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“At lower substrate (12 L), conductive circuit (42 b) on the bottom surface and conductive circuit (42 a) on the top surface are connected through vias 44, and IC chip 50 and conductive circuit (42 b) on the top surface are connected through solder bumps 52. In openings (48 a) of solder resist 48 for conductive circuit (42 a) on the top surface of lower substrate (12 L), pads (42 G) for connection to the upper substrate are formed; and in openings (48 a) of solder resist 48 for conductive circuit (42 b) on the bottom surface, a group of pads (42 D) for connection to a printed wiring board substrate is formed.” Furuta ’415, [0020].</p>

FIG. 6

(A)

Furuta '415, FIG. 6

“In the same manner, at upper substrate (12 U), conductive circuit (42 a) on the bottom surface and conductive circuit (42 b) on the top surface are connected through vias 44. In openings (48 a) of solder resist 48 for conductive circuit (42 a) on the bottom surface of upper substrate (12 U), pads (42 F) for connection to the lower substrate are formed; and in openings (48 a) of solder resist 48 for conductive circuit (42 b) on the top surface, pads (42 P) for connection to a package substrate are formed.” Furuta '415, [0021].

	<p>“B. Forming the Lower Substrate Steps 1-5 are the same as in the steps for the upper substrate (FIG. 3(A)). 6. Mounting an IC Chip Solder bumps 52 are formed on IC chip-mounting pads (42 E) of lower substrate (12 L). IC chip 50 is mounted by flip-chip mounting through a reflow process on solder bumps 52 (FIG. 3(C)). Then, in the gap between IC chip 50 and lower substrate (12 L), underfill 60 is filled (FIG. 3(C)). In doing so, a mounting substrate with mounted IC chip 50 (lower substrate (12 L)) is formed.” Furuta ’415, [0031-0033].</p>
--	---

Furuta '415, FIG. 3

“Then, through solder bumps 64 formed on a group of pads (42 L) of lower substrate (12 L) or a BGA, combination substrate 10 is connected to printed wiring board 74 by connecting it to pads 76 of printed wiring board 74 (FIG. 6(B)).” Furuta '415, [0040].

Appendix A-8 - Invalidity of U.S. Patent No. 9859202 in view of Furuta '415 - U.S. Patent Publication No. 20090140415

	<p>“According to requirements, solder bumps (64 L) may be formed on pads (42 D) of lower substrate (12 L) (FIG. 5(C)). On a group of pads (42 P) on the top portion of upper substrate (12 U), package substrate 70 with built-in or mounted IC chip 71 may be mounted (FIG. 6(A)). By doing so, a laminated structure of a package substrate having two or more IC chips (50, 71) is obtained.” Furuta '415, [0040].</p> <p>“The lower substrate has connection pads for electrical connection to the upper substrate on the surface facing the upper substrate, and mounting pads for installation on the printed wiring board on the surface opposite the surface facing the upper substrate; the upper substrate has connection pads for electrical connection to the lower substrate on the surface facing the lower substrate, and mounting pads for installation of a package substrate on the surface opposite the surface facing the lower substrate; and a middle substrate positioned between the upper substrate and the lower substrate has conductive members electrically connecting the connection pads on the lower substrate and the connection pads on the upper substrate.” Furuta '415, [0053].</p> <p>To the extent Plaintiff contends that Furuta '415 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.B] a top package substrate stacked on top of the bottom package substrate;	<p>Furuta '415 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p>

Appendix A-8 - Invalidity of U.S. Patent No. 9859202 in view of Furuta '415 - U.S. Patent Publication No. 20090140415

	<p>“Combination substrate 10 is structured with upper substrate (12 U), interposer (12 M) as an intermediate and lower substrate (12 L).” Furuta ’415, [0020].</p> <p>“In the following, the steps for manufacturing a combination substrate according to Example 1 with reference to FIGS. 6(A) and 6(B) will be described by referring to FIGS. 1-5. A. Forming the Upper Substrate 1.” Furuta ’415, [0026].</p> <p>“Circuit (pads) (42 G) of lower substrate (12 L), posts 86 of interposer (12 M) and circuit (pads) (42 F) of upper substrate (12 U) are aligned (FIG. 5(A)).” Furuta ’415, [0038].</p> <p>“By such, upper substrate (12 U) and lower substrate (12 L) are electrically connected through interposer (12 M).” Furuta ’415, [0038].</p> <p>“On a group of pads (42 P) on the top portion of upper substrate (12 U), package substrate 70 with built-in or mounted IC chip 71 may be mounted (FIG. 6(A)). FIG. 6

(A)

Furuta '415, FIG. 6

“Then, through solder bumps 64 formed on a group of pads (42 L) of lower substrate (12 L) or a BGA, combination substrate 10 is connected to printed wiring board 74 by connecting it to pads 76 of printed wiring board 74 (FIG. 6(B)).” Furuta '415, [0040].

To the extent Plaintiff contends that Furuta '415 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the

Appendix A-8 - Invalidity of U.S. Patent No. 9859202 in view of Furuta '415 - U.S. Patent Publication No. 20090140415

	<p>general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Furuta '415 discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“Between lower substrate (12 L) and IC chip 50, insulative resin underfill 60 is filled; and between upper substrate (12 U) and lower substrate (12 L), resin filling agent 62 is filled. Pads (42 F) on the bottom surface of upper substrate (12 U) and pads (42 G) on the top surface of lower substrate (12 L) are electrically connected by cylindrical metal posts 86 in interposer (12 M). Metal posts 86 are formed, for example, of copper or copper alloy. As shown in FIG. 6(B), on pads (42 D) on the bottom surface of combination substrate 10, solder bumps (64 L) or a BGA is arranged, then connected to a group of pads 76 on printed wiring board 74 so that combination substrate 10 is loaded onto printed wiring board 74. In combination substrate 10 according to Example 1, through posts 86 fitted into through-holes 82 in interposer (12 M), connection pads (42 G) on lower substrate (12 L) and connection pads (42 F) on upper substrate (12 U) are electrically connected. Accordingly, it is possible to obtain connection through posts 86 with a smaller diameter than solder bumps, and thus wiring may be arranged with a fine pitch. Also, since uniformly manufactured posts 86 are used, unlike solder bumps of varying sizes, heat is generated uniformly, thus high temperatures in spots may seldom be generated. Moreover, since interposer (12M) lies in between, the height between upper substrate (12U) and lower substrate (12L) may be adjusted, making it easier to secure electrical connectivity and reliability. “ Furuta '415, [0021-0023].</p>

FIG. 6

(A)

Furuta '415, FIG. 6

“In combination substrate 10 according to Example 1, through posts 86 fitted into through-holes 82 in interposer (12 M), connection pads (42 G) on lower substrate (12 L) and connection pads (42 F) on upper substrate (12 U) are electrically connected. Accordingly, it is possible to obtain connection through posts 86 with a smaller diameter than solder bumps, and thus wiring may be arranged with a fine pitch. Also, since uniformly manufactured posts 86 are used, unlike solder bumps of varying sizes, heat is generated

	<p>uniformly, thus high temperatures in spots may seldom be generated. Moreover, since interposer (12 M) lies in between, the height between upper substrate (12 U) and lower substrate (12 L) may be adjusted, making it easier to secure electrical connectivity and reliability.” Furuta ’415, [0023-0024].</p> <p>“C. Forming an Interposer Insulative material 80 is prepared (FIG. 4(A)). Openings 82 penetrating insulative material 80 are formed (FIG. 4(B)) and conductive layers 84 are formed in openings 82 (FIG. 4(C)). Conductive layers 84 are formed by through-holes, vias and post-implants. For the conductive layers, metals such as copper, nickel or noble metals may be used. As an example, there is a method to fill posts with implants. An insulative substrate having conductive layers formed by copper foil, plating or the like on both surfaces is prepared. Openings for through-holes are bored in the insulative substrate using a drill or a laser. Then, resist layers are provided on the entire surfaces of the conductive layers, and masks with a drawn wiring pattern are placed. After that, through exposure to light and development, then through an etching treatment, patterns for an interposer are formed. Then, if necessary, solder-resist layers may be formed or external configuration processing (unit processing for the interposer) may be conducted. By such, an insulative substrate having openings for implants is prepared. Implant material to form implant posts is prepared. The thickness (height) is preferred to be thicker than the insulative substrate. Beneath the implant material, a lower jig for implant processing is placed in advance. Here, on the implant material, an upper jig with projections for piercing is placed. The upper jig pierces to the midway point of the implant material. The pierced implant material is inserted in openings 82 of insulative substrate 80 prepared above, then pounded in. Accordingly, conductive members (metal posts) 86 penetrating the insulative substrate are formed (FIG. 4(D)). Then, the implant material is separated and the height of posts 86 protruding beyond insulative substrate 80 is aligned. In doing so, insulative substrate 80, which is interposer (12 M), obtains conductive members (posts) 86, which enable electrical connection between the top</p>

Appendix A-9 - Invalidity of U.S. Patent No. 9859202 in view of Ganesan - U.S. Patent No. 8513792

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Ganesan - U.S. Patent No. 8513792

U.S. Patent No.8513792 (“Ganesan”) is titled Package-On-Package Interconnect Stiffener and lists Sanka Ganesan, Yosuke Kanaoka, Ram S. Viswanath, Rajasekaran Swaminathan, Robert M. Nickerson, Leonel R. Arana, John S. Guzek, and Yoshihiro Tomita as inventors. Ganesan is assigned to Intel Corporation. Ganesan anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Ganesan is a U.S. patent that was filed April 10, 2009 and published October 14, 2010. Ganesan is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Ganesan, or otherwise rendered obvious by disclosures and teachings of Ganesan, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Ganesan does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Ganesan with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Ganesan, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-9 - Invalidity of U.S. Patent No. 9859202 in view of Ganesan - U.S. Patent No. 8513792

To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Ganesan “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Ganesan or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Ganesan set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Ganesan discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 5 is a perspective view of an assembled PoP assembly having a top device package and a bottom device package attached to an interconnect stiffener according to an embodiment. Top device package 100 is connected to stiffener 220 via interconnects such as micro balls 140 disposed on planar contact pads 210 on the top side of stiffener 220. FIG. 5 shows an embodiment of assembled PoP with the width and length dimensions of top device</p>

Appendix A-9 - Invalidity of U.S. Patent No. 9859202 in view of Ganesan - U.S. Patent No. 8513792

	<p>package 100 substantially the same with the respective dimensions of stiffener 220.” Ganesan, [2:12-2:26].</p> <p>“Embodiments of the invention include a first semiconductor package having a plurality of inter-package contact pads and a plurality of second level interconnect (SLI) pads; a second semiconductor package having a plurality of SLI pads on the bottom side of the package; and a planar stiffener having a first plurality of planar contact pads on the top side of the stiffener electrically connected to the SLI pads of the second package, and a second plurality of planar contact pads electrically connected to the inter-package contact pads of the first package.” Ganesan, [2:33-2:41].</p> <p>“FIG. 2 is a cross-sectional view of a package-on-package (PoP) assembly having an interconnect stiffener according to an embodiment. The PoP assembly is attachable to a motherboard (not shown) via second level interconnect pads 190 disposed on the bottom side of bottom device package 150. The PoP assembly includes bottom device package 150 interconnected to planar interconnect stiffener 200. Bottom device package 150 may be any semiconductor package depending on the application. For example, bottom device package 150 may be a semiconductor logic package, an application processor, or a memory package with an integrated circuit in die 170. Planar stiffener 200 includes a plurality of planar contact pads 210 disposed on the top side of stiffener 200. Planar contact pads 210 are configured to be electrically connected to top device package 100, for example, by way of micro balls 140. Top device package 100 may be a memory package or cache unit or any other device package suited for connection with the type of device of bottom device package 150. Planar stiffener 200 also includes a plurality of planar contact pads 240 disposed on the bottom side of stiffener 200. In the PoP assembly, planar contact pads 240 are electrically connected to bottom device package 150, for example, by way of micro balls 180.” Ganesan, [2:45-2:66].</p>
--	--

FIG. 2

Ganesan, FIG. 2

“FIG. 3 is an exploded perspective view of a PoP assembly having an interconnect stiffener according to an embodiment. Planar interconnect stiffener 220 includes substrate 220 defining a through recess 330 adapted to house die 170 of bottom device package 150. Stiffener 200 also includes small through openings through which planar contact pads 210 and 240 are formed. Planar contact pads 210 and 240 formed on substrate 220 each includes a solder-wettable surface finish so that during reflow, the solder materials of micro balls 140 and 180 can melt, wet and form permanent conductive connection between stiffener 200 and the top and bottom packages 100, 150.” Ganesan, [3:1-3:12].

Appendix A-9 - Invalidity of U.S. Patent No. 9859202 in view of Ganesan - U.S. Patent No. 8513792

	<p>“FIG. 4 is an exploded perspective view of a top device package and a bottom device package having an interconnect stiffener attached to the top side of the bottom device package according to an embodiment. Stiffener 220 is attached to bottom device package 150 via respective contact pads 155 and 240. Planar contact pads 240 disposed on the bottom side of stiffener 220 are connected to inter-package contact pads 155 of bottom device package 150 by way of conductive micro balls 180. Stiffener 220 may be attached to bottom device package 150 before attaching top device package 100 to the top side of stiffener 220.” Ganesan, [3:17-3:27].</p> <p>“FIG. 6 is a cross-sectional view of a PoP interconnect stiffener according to an embodiment. Stiffener 200 includes substrate 220 to provide structural support and upon which contact pads 210, 240 are fabricated. Stiffener 200 includes solder resist layer 620 disposed on the top surface and bottom surface of core layer 630. For an embodiment, core layer 630 is a cored substrate fabricated from known polymeric materials such as bismaleimide triazine (BT), polyimide, and liquid crystalline (LC) polymer. However, other materials suitable for core layer 630 are not precluded in other embodiments of the invention. Substrate 220 may include a coefficient of thermal expansion (CTE) of approximately between 15 and 25 ppm. Substrate 220 may also include a flexural modulus of approximately between 15 and 30 GPa. The properties of stiffener 200 will be designed to provide acceptable end-of-line warpage of the assembly of top device package 100 and stiffener 200 and/or the reliability of the interconnections between top device package 100 and stiffener 200. Stiffener 200 also includes conductive traces 600 fabricated in substrate 220 to electrically interconnect planar contact pads 210 on the top side of stiffener 220 with planar contact pads 240 on the bottom side of stiffener 220. FIG. 6 illustrates a via-in-pad design in which plug material 610 is disposed between core layer 630 and between planar contact pads 210, 240.” Ganesan, [3:46-4:3].</p>
--	--

Appendix A-9 - Invalidity of U.S. Patent No. 9859202 in view of Ganesan - U.S. Patent No. 8513792

<p>[1.A] a bottom package substrate;</p>	<p>Ganesan discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 is a cross-sectional view of a known package-on-package (PoP) assembly. Bottom device package 150 may be a core chip such as a microprocessor unit and includes die 170, substrate 160, inter-package contact pads 155 on the top side of bottom package 150, micro balls 180 attached to inter-package contact pads 155, and second level interconnect pads 190 attachable to a motherboard (not shown).” Ganesan, [2:1-2:9].</p> <p>“Embodiments of the invention include a first semiconductor package having a plurality of inter-package contact pads and a plurality of second level interconnect (SLI) pads; a second semiconductor package having a plurality of SLI pads on the bottom side of the package; and a planar stiffener having a first plurality of planar contact pads on the top side of the stiffener electrically connected to the SLI pads of the second package, and a second plurality of planar contact pads electrically connected to the inter-package contact pads of the first package.” Ganesan, [2:33-2:41].</p> <p>“The PoP assembly is attachable to a motherboard (not shown) via second level interconnect pads 190 disposed on the bottom side of bottom device package 150.” Ganesan, [2:47-2:49].</p> <p>“The PoP assembly includes bottom device package 150 interconnected to planar interconnect stiffener 200. Bottom device package 150 may be any semiconductor package depending on the application. For example, bottom device package 150 may be a semiconductor logic package, an application processor, or a memory package with an integrated circuit in die 170. Planar stiffener 200 includes a plurality of planar contact pads 210 disposed on the top side of stiffener 200.” Ganesan, [2:50-2:57].</p>
---	---

FIG. 2

Ganesan, FIG. 2

“FIG. 4 is an exploded perspective view of a top device package and a bottom device package having an interconnect stiffener attached to the top side of the bottom device package according to an embodiment. Stiffener 220 is attached to bottom device package 150 via respective contact pads 155 and 240. Planar contact pads 240 disposed on the bottom side of stiffener 220 are connected to inter-package contact pads 155 of bottom device package 150 by way of conductive micro balls 180.” Ganesan, [3:17-3:25].

Appendix A-9 - Invalidity of U.S. Patent No. 9859202 in view of Ganesan - U.S. Patent No. 8513792

	<p>“Bottom device package 150 having inter-package contact pads 155 on the top side of the package and second level interconnect (SLI) pads 190 on the bottom side of the package is provided. Bottom device package 150 may be in the form of individual package or multiple packages connected in a panel form.” Ganesan, [4:13-4:18].</p> <p>To the extent Plaintiff contends that Ganesan fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.B] a top package substrate stacked on top of the bottom package substrate;	<p>Ganesan discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Top device package 100 is stacked onto bottom package 150 to form an electrical connection therebetween. Top device package 100 may be a peripheral chip such as a memory or cache unit, and may include die 120 interconnected to substrate 110 via wire bond 130 and encapsulated by molding 125.” Ganesan, [1:33-1:38].</p>

FIG. 2

Ganesan, FIG. 2

“FIG. 5 is a perspective view of an assembled PoP assembly having a top device package and a bottom device package attached to an interconnect stiffener according to an embodiment. Top device package 100 is connected to stiffener 220 via interconnects such as micro balls 140 disposed on planar contact pads 210 on the top side of stiffener 220.” Ganesan, [2:12-2:19].

“FIG. 2 is a cross-sectional view of a package-on-package (PoP) assembly having an interconnect stiffener according to an embodiment. The PoP assembly is attachable to a motherboard (not shown) via second level interconnect pads 190 disposed on the bottom side

Appendix A-9 - Invalidity of U.S. Patent No. 9859202 in view of Ganesan - U.S. Patent No. 8513792

	<p>of bottom device package 150. The PoP assembly includes bottom device package 150 interconnected to planar interconnect stiffener 200. Bottom device package 150 may be any semiconductor package depending on the application. For example, bottom device package 150 may be a semiconductor logic package, an application processor, or a memory package with an integrated circuit in die 170. FIG. 2

Ganesan, FIG. 2

“FIG. 6 is a cross-sectional view of a PoP interconnect stiffener according to an embodiment. Stiffener 200 includes substrate 220 to provide structural support and upon which contact pads 210, 240 are fabricated. Stiffener 200 includes solder resist layer 620 disposed on the top surface and bottom surface of core layer 630. For an embodiment, core layer 630 is a cored substrate fabricated from known polymeric materials such as bismaleimide triazine (BT), polyimide, and liquid crystalline (LC) polymer.” Ganesan, [3:46-3:54].

	 <p>Ganesan, FIG. 6</p> <p>To the extent Plaintiff contends that Ganesan fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.D] the spacer connector comprises a core substrate;</p>	<p>Ganesan discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Planar interconnect stiffener 200 includes substrate 220 defining a through recess 330 adapted to house die 170 of bottom device package 150. Stiffener 200 also includes small</p>

--	---

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Ganesan discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 5 is a perspective view of an assembled PoP assembly having a top device package and a bottom device package attached to an interconnect stiffener according to an embodiment. Top device package 100 is connected to stiffener 220 via interconnects such as micro balls 140 disposed on planar contact pads 210 on the top side of stiffener 220.” Ganesan, [2:12-2:19].</p> <p>“FIG. 2 is a cross-sectional view of a package-on-package (PoP) assembly having an interconnect stiffener according to an embodiment. The PoP assembly is attachable to a</p>

Appendix A-9 - Invalidity of U.S. Patent No. 9859202 in view of Ganesan - U.S. Patent No. 8513792

	<p>motherboard (not shown) via second level interconnect pads 190 disposed on the bottom side of bottom device package 150. The PoP assembly includes bottom device package 150 interconnected to planar interconnect stiffener 200. Bottom device package 150 may be any semiconductor package depending on the application. For example, bottom device package 150 may be a semiconductor logic package, an application processor, or a memory package with an integrated circuit in die 170. Planar stiffener 200 includes a plurality of planar contact pads 210 disposed on the top side of stiffener 200. Planar contact pads 210 are configured to be electrically connected to top device package 100, for example, by way of micro balls 140. Top device package 100 may be a memory package or cache unit or any other device package suited for connection with the type of device of bottom device package 150.” Ganesan, [2:45-2:62].</p> <p>“Planar stiffener 200 also includes a plurality of planar contact pads 240 disposed on the bottom side of stiffener 200. In the PoP assembly, planar contact pads 240 are electrically connected to bottom device package 150, for example, by way of micro balls 180. FIG. 3 is an exploded perspective view of a PoP assembly having an interconnect stiffener according to an embodiment. Planar interconnect stiffener 200 includes substrate 220 defining a through recess 330 adapted to house die 170 of bottom device package 150. Stiffener 200 also includes small through openings through which planar contact pads 210 and 240 are formed. Planar contact pads 210 and 240 formed on substrate 220 each includes a solder-wettable surface finish so that during reflow, the solder materials of micro balls 140 and 180 can melt, wet and form permanent conductive connection between stiffener 200 and the top and bottom packages 100, 150. Various types of solder-wettable surface finish known in the art such as Electroless Nickel/Immersion Gold (ENIG), ENIG+Electroless Gold (ENIG+EG) and Nickel-Palladium-Gold (NiPdAu) are suitable for planar contact pads 210 and 240. FIG. 4 is an exploded perspective view of a top device package and a bottom device package having an interconnect stiffener attached to the top side of the bottom device package according to</p>
--	---

	<p>an embodiment. Stiffener 220 is attached to bottom device package 150 via respective contact pads 155 and 240. Planar contact pads 240 disposed on the bottom side of stiffener 220 are connected to inter-package contact pads 155 of bottom device package 150 by way of conductive micro balls 180.” Ganesan, [2:62-3:25].</p> <p style="text-align: center;">FIG. 2</p> <p>Ganesan, FIG. 2</p> <p>“Known process to fabricate package substrate may be used to form stiffener 200 and the key process steps may include: drilling through-holes in core layer 630 ; plating the sidewalls of through-holes; disposing plug material 610 in the through-holes; forming electrically conductive planar contact pads 210 and 240 ; forming a solder-wettable finish on planar</p>
--	--

Appendix A-9 - Invalidity of U.S. Patent No. 9859202 in view of Ganesan - U.S. Patent No. 8513792

	<p>contact pads 210 and 240 ; and forming recess 330 in stiffener 200. In operation 720 (FIG. 8), planar stiffener 200 is mounted on the top side of bottom device package 150. Planar contact pads 240 on the bottom side of stiffener 200 are aligned and attached to micro balls 180 connected to inter-package contact pads 155 of bottom device package 150. The assembly of stiffener 200 and bottom device package 150 are reflowed to form permanent interconnection. After reflow, die 170 is attached to bottom device package 150 attached to stiffener 200. The assembly of bottom device package 150 and stiffener 200 (in panel form) may then be singulated to yield individual assemblies of bottom device package 150 with stiffener 200 attached thereto.” Ganesan, [3:12-3:31].</p> <p>“FIG. 6 is a cross-sectional view of a PoP interconnect stiffener according to an embodiment. Stiffener 200 includes substrate 220 to provide structural support and upon which contact pads 210, 240 are fabricated. Stiffener 200 includes solder resist layer 620 disposed on the top surface and bottom surface of core layer 630. For an embodiment, core layer 630 is a cored substrate fabricated from known polymeric materials such as bismaleimide triazine (BT), polyimide, and liquid crystalline (LC) polymer. However, other materials suitable for core layer 630 are not precluded in other embodiments of the invention. Substrate 220 may include a coefficient of thermal expansion (CTE) of approximately between 15 and 25 ppm. Substrate 220 may also include a flexural modulus of approximately between 15 and 30 GPa. The properties of stiffener 200 will be designed to provide acceptable end-of-line warpage of the assembly of top device package 100 and stiffener 200 and/or the reliability of the interconnections between top device package 100 and stiffener 200. Stiffener 200 also includes conductive traces 600 fabricated in substrate 220 to electrically interconnect planar contact pads 210 on the top side of stiffener 220 with planar contact pads 240 on the bottom side of stiffener 220. FIG. 6 illustrates a via-in-pad design in which plug material 610 is disposed between core layer 630 and between planar contact pads 210, 240. Plug material 610 forms part of the material for substrate 220 to provide structural rigidity and foundation</p>

Appendix A-10 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '142 - U.S. Patent Publication No. 20150061142

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Hsu '142 - U.S. Patent Publication No. 20150061142

U.S. Patent Publication No. 20150061142 (“Hsu '142”) is titled Ultra Fine Pitch PoP Coreless Package and lists Jun Chung Hsu and Jun Zhai as inventors. Hsu '142 is assigned to Apple Inc. Hsu '142 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the '202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff's apparent infringement theory.² Hsu '142 is a U.S. patent publication that was filed November 25, 2013 and published March 5, 2015. Hsu '142 claims priority to a provisional application filed on August 30, 2013. Hsu '142 is therefore prior art to the '202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Hsu '142, or otherwise rendered obvious by disclosures and teachings of Hsu '142, including under TopWire's apparent interpretation of the Asserted Claims as Samsung understands them from TopWire's Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Hsu '142 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Hsu '142 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung's other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung's Invalidity Contentions with respect to the '202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Hsu '142, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire's March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court's order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire's apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung's interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-10 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '142 - U.S. Patent Publication No. 20150061142

To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Hsu '142 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Hsu '142 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Hsu '142 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Hsu '142 discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIGS. 1A-K depict cross-sectional representations of an embodiment of a process flow for forming a bottom package of a PoP package. FIG. 1A depicts a cross-sectional representation of an embodiment of carrier 100. Carrier 100 may be any carrier suitable for supporting and carrying a coreless substrate or similar thin substrate. Carrier 100 may be, for example, a temporary substrate for a coreless substrate or other thin substrate.” Hsu '142, [0023].</p>

	<p>“FIGS. 2A-K depict cross-sectional representations of an alternative embodiment of a process flow for forming a bottom package of a PoP package. FIG. 2A depicts a cross-sectional representation of an embodiment of core material 102 with metal layer 108 filling vias 106 through the core material. Vias 106 may be formed, for example, by laser drilling in core material 102. Metal layer 108 may be formed, for example, by paste hole (PTH) filling of vias 106. Metal layer 108 may be copper or another suitable conductive metal. Metal layer 108 may also cover portions of the surface of core material 102. In some embodiments, portions of metal layer 108 on the surface of core material 102 is patterned or otherwise defined to provide metal features on the surface of the core material. In certain embodiments, barrier layer 110 is formed on core material 102.” Hsu '142, [0038].</p> <p>“Bottom package 126 may be coupled to a top package (e.g., a memory package) to form a PoP package. FIG. 4 depicts an embodiment of bottom package 126 (shown in FIG. 1K) coupled to top package 132 to form PoP package 134. FIG. 5 depicts an embodiment of bottom package 126' (shown in FIG. 2K) coupled to top package 132 to form PoP package 134'. Top package 132 may include, for example, a memory die or a multilayer printed circuit board (MLB). As shown in FIGS. 4 and 5, top package 132 may be coupled to reinforcement layer 128 (or 128') in bottom package 126 (or 126') by coupling terminals 136 on the top package to terminals 130 on the bottom package. Terminals 136 may be, for example, solder balls.” Hsu '142, [0046].</p> <p>“FIG. 9 depicts another embodiment of bottom package 126' (shown in FIG. 2K) coupled to PCB 140 and memory die 142. PCB 140 may be coupled to bottom package 126 (or 126') by coupling terminals 136 on the PCB to terminals 130 on the bottom package. In certain embodiments, memory die 142 is coupled to substrate 112 on the non-PCB side (now top) of bottom package 126 (or 126') using terminals 124. Memory die 142 may be, for example, a</p>
--	---

	<p>memory die stack with two memory die stacked on top of each other. In some embodiments, memory die 142 is a fan-out memory die stack.” Hsu ’142, [0048].</p>  <p style="text-align: center;"><i>FIG. 9</i></p> <p>Hsu ’142, FIG. 9</p> <p>“In some embodiments, a bottom package as described herein (e.g., bottom package 126 or bottom package 126’) is flipped over and the reinforcement layer is coupled to a printed circuit board (PCB)(e.g., the top package is a PCB but the entire assembly is flipped over so that the PCB is below the bottom package). A memory die may then be coupled to the opposite side of the bottom package from the printed circuit board. FIG. 8 depicts an embodiment of bottom package 126 (shown in FIG. 1K) coupled to printed circuit board (PCB) 140 and memory die 142.” Hsu ’142, [0048].</p>
--	--

<p>[1.A] a bottom package substrate;</p>	<p>Hsu '142 discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 3 depicts a top view of an embodiment of bottom package 126. Bottom package 126 may be made using either of the processes depicted in FIGS. 1A-1K and/or FIGS. 2A-2K. As shown in FIG. 3, die 120 is located on substrate 112 and substantially surrounded by reinforcement layer 128 and terminals 130 in a fan-out wafer level package (FOWLP) arrangement. While the FOWLP arrangement is shown, it is to be understood that other wafer package arrangements may also be contemplated using the processes depicted in FIGS. 1A-1K and/or FIGS. 2A-2K. Terminals 130 may correspond to locations of metal layer 108 filled vias 106 (shown in FIGS. 1K and 2K).” Hsu '142, [0045].</p> <p>“Bottom package 126 may be coupled to a top package (e.g., a memory package) to form a PoP package. FIG. 4 depicts an embodiment of bottom package 126 (shown in FIG. 1K) coupled to top package 132 to form PoP package 134. FIG. 5 depicts an embodiment of bottom package 126' (shown in FIG. 2K) coupled to top package 132 to form PoP package 134'. Top package 132 may include, for example, a memory die or a multilayer printed circuit board (MLB). As shown in FIGS. 4 and 5, top package 132 may be coupled to reinforcement layer 128 (or 128') in bottom package 126 (or 126') by coupling terminals 136 on the top package to terminals 130 on the bottom package. Terminals 136 may be, for example, solder balls.” Hsu '142, [0046].</p> <p>“In some embodiments, a bottom package as described herein (e.g., bottom package 126 or bottom package 126') is flipped over and the reinforcement layer is coupled to a printed circuit board (PCB)(e.g., the top package is a PCB but the entire assembly is flipped over so that the PCB is below the bottom package). A memory die may then be coupled to the</p>
--	--

opposite side of the bottom package from the printed circuit board. FIG. 8 depicts an embodiment of bottom package 126 (shown in FIG. 1K) coupled to printed circuit board (PCB) 140 and memory die 142. FIG. 9 depicts another embodiment of bottom package 126' (shown in FIG. 2K) coupled to PCB 140 and memory die 142. PCB 140 may be coupled to bottom package 126 (or 126') by coupling terminals 136 on the PCB to terminals 112 on the bottom package. In certain embodiments, memory die 142 is coupled to substrate 112 on the non-PCB side (now top) of bottom package 126 (or 126') using terminals 124. Memory die 142 may be, for example, a memory die stack with two memory die stacked on top of each other. In some embodiments, memory die 142 is a fan-out memory die stack." Hsu '142, [0048].

Hsu '142, FIG. 9

Appendix A-10 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '142 - U.S. Patent Publication No. 20150061142

	<p>To the extent Plaintiff contends that Hsu '142 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Hsu '142 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 5 depicts an embodiment of bottom package 126' (shown in FIG. 2K) coupled to top package 132 to form PoP package 134'. Top package 132 may include, for example, a memory die or a multilayer printed circuit board (MLB). As shown in FIGS. 4 and 5, top package 132 may be coupled to reinforcement layer 128 (or 128') in bottom package 126 (or 126') by coupling terminals 136 on the top package to terminals 130 on the bottom package. Terminals 136 may be, for example, solder balls.” Hsu '142, [0046].</p> <p>“FIG. 9 depicts another embodiment of bottom package 126' (shown in FIG. 2K) coupled to PCB 140 and memory die 142. PCB 140 may be coupled to bottom package 126 (or 126') by coupling terminals 136 on the PCB to terminals 130 on the bottom package. In certain embodiments, memory die 142 is coupled to substrate 112 on the non-PCB side (now top) of bottom package 126 (or 126') using terminals 124. Memory die 142 may be, for example, a memory die stack with two memory die stacked on top of each other. In some embodiments, memory die 142 is a fan-out memory die stack.” Hsu '142, [0048].</p>

--	--

FIG. 9

Hsu '142, FIG. 9

“In some embodiments, a bottom package as described herein (e.g., bottom package 126 or bottom package 126′) is flipped over and the reinforcement layer is coupled to a printed circuit board (PCB)(e.g., the top package is a PCB but the entire assembly is flipped over so that the PCB is below the bottom package). A memory die may then be coupled to the opposite side of the bottom package from the printed circuit board. FIG. 8 depicts an embodiment of bottom package 126 (shown in FIG. 1K) coupled to printed circuit board (PCB) 140 and memory die 142. FIG. 9 depicts another embodiment of bottom package 126′ (shown in FIG. 2K) coupled to PCB 140 and memory die 142. PCB 140 may be coupled to bottom package 126 (or 126′) by coupling terminals 136 on the PCB to terminals 130 on the bottom package. In certain embodiments, memory die 142 is coupled to substrate 112 on the

Appendix A-10 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '142 - U.S. Patent Publication No. 20150061142

	<p>non-PCB side (now top) of bottom package 126 (or 126') using terminals 124. Memory die 142 may be, for example, a memory die stack with two memory die stacked on top of each other. In some embodiments, memory die 142 is a fan-out memory die stack.” Hsu ’142, [0048].</p> <p>To the extent Plaintiff contends that Hsu ’142 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.D] the spacer connector comprises a core substrate;	<p>Hsu ’142 discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Core material 102 may be any suitable material known in the art for use as a core material in integrated circuit packages. For example, core material 102 may be a dielectric material such as, but not limited to, a ceramic or resin material.” Hsu ’142, [0024].</p> <p>“In certain embodiments, after coupling core material 102 to carrier 100, vias 106 (e.g., through holes) are formed in the core material and at least partially filled with metal layer 108, as shown in FIG. 1C. Vias 106 may be formed, for example, by laser drilling in core material 102. After vias 106 are formed, additional metal layer 108 (e.g., copper) may be deposited in the vias. In some embodiments, metal layer 108 only partially fills vias 106. In some embodiments, portions of metal layer 108 on the surface of core material 102 is patterned or otherwise defined to provide metal features on the surface of the core material.” Hsu ’142, [0026].</p>

Appendix A-10 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '142 - U.S. Patent Publication No. 20150061142

	<p>“As shown in FIG. 1D, core material 102, laminate layer 104, and metal layer 108 form reinforcement layer 128. Reinforcement layer 128 provides reinforcement for substrate 112. For example, reinforcement layer 128 may support substrate 112 and stiffen the substrate (e.g., make the substrate more rigid). Stiffening substrate 112 may allow for better handling of the substrate and provide more stiffness to a bottom package made using the substrate.” Hsu '142, [0029].</p> <p>“After carrier 100 is removed, a cavity or opening may be formed to allow connection of a die to substrate 112 through core material 102 (e.g., the cavity or opening is formed to provide a terminal (bump) pad area for a die coupled to the package). FIGS. 1G-1J depict an embodiment of a process for forming the cavity or opening providing the terminal pad area for the die. As shown in FIG. 1G, core material 102 may be removed to form opening 116. Opening 116 may be formed in the area defined by the dotted lines depicted in FIGS. 1C-F. Core material 102 may be removed, for example, by laser ablation of the core material. In certain embodiments, the core material removal process (e.g., the laser ablation process) is stopped by the presence of metal layer 108.” Hsu '142, [0031].</p>
--	---

Hsu '142, FIG. 1G

To the extent Plaintiff contends that Hsu '142 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Hsu '142 discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.

See, e.g.:

“In certain embodiments, after coupling core material 102 to carrier 100, vias 106 (e.g., through holes) are formed in the core material and at least partially filled with metal layer 108, as shown in FIG. 1C. Vias 106 may be formed, for example, by laser drilling in core material 102. After vias 106 are formed, additional metal layer 108 (e.g., copper) may be deposited in the vias.” Hsu ’142, [0026].

FIG. 1C

Hsu '142, FIG. 1C

“As shown in FIG. 1D, core material 102, laminate layer 104, and metal layer 108 form reinforcement layer 128. Reinforcement layer 128 provides reinforcement for substrate 112.” Hsu '142, [0029].

“FIG. 2A depicts a cross-sectional representation of an embodiment of core material 102 with metal layer 108 filling vias 106 through the core material. Vias 106 may be formed, for example, by laser drilling in core material 102. Metal layer 108 may be formed, for example, by paste hole (PTH) filling of vias 106. Metal layer 108 may be copper or another suitable conductive metal.” Hsu '142, [0038].

Appendix A-10 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '142 - U.S. Patent Publication No. 20150061142

	<p>“Core material 102, laminate layer 104, and metal layer 108 form reinforcement layer 128’. Reinforcement layer 128’, shown in FIG. 2D, is substantially similar to reinforcement layer 128, shown in FIG. 1D, with a difference being the substantially complete filling of vias 106 in core material 102 with metal layer 108 (e.g., the metal layer substantially fills the vias in the core material due to the paste hole filling of the vias).” Hsu ’142, [0040].</p> <p>“Terminals 130 may correspond to locations of metal layer 108 filled vias 106 (shown in FIGS. 1K and 2K).” Hsu ’142, [0045].</p> <p>“In certain embodiments, the pitch between terminals 130 is relatively fine, as shown in FIG. 3. The fine pitch may be possible because of the use of metal layer 108 in vias 106 to define terminals 130 on bottom package 126 or 126’. Using metal layer 108 in vias 106 to define terminals 130 provides the terminals as post-like structures that can have small spacing between the terminals.” Hsu ’142, [0049].</p> <p>To the extent Plaintiff contends that Hsu ’142 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.F] a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars;	<p>Hsu ’142 discloses, either expressly or inherently, a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 3 depicts a top view of an embodiment of bottom package 126. Bottom package 126 may be made using either of the processes depicted in FIGS. 1A-1K and/or FIGS. 2A-2K.</p>

As shown in FIG. 3, die 120 is located on substrate 112 and substantially surrounded by reinforcement layer 128 and terminals 130 in a fan-out wafer level package (FOWLP) arrangement. While the FOWLP arrangement is shown, it is to be understood that other wafer package arrangements may also be contemplated using the processes depicted in FIGS. 1A-1K and/or FIGS. 2A-2K. Terminals 130 may correspond to locations of metal layer 108 filled vias 106 (shown in FIGS. 1K and 2K).” Hsu ’142, [0045].

“FIG. 9 depicts another embodiment of bottom package 126’ (shown in FIG. 2K) coupled to PCB 140 and memory die 142. PCB 140 may be coupled to bottom package 126 (or 126’) by coupling terminals 136 on the PCB to terminals 130 on the bottom package.” Hsu ’142, [0048].

FIG. 9

	<p>Hsu '142, FIG. 9</p> <p>“Using metal layer 108 in vias 106 to define terminals 130 provides the terminals as post-like structures that can have small spacing between the terminals. Thus, terminals 136 on top package 132, shown in FIGS. 4 and 5, may be relatively small solder balls to avoid bridging between adjacent solder balls when the top package is coupled to bottom package 126 or 126’.” Hsu '142, [0049].</p> <p>To the extent Plaintiff contends that Hsu '142 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.G] wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate,</p>	<p>Hsu '142 discloses, either expressly or inherently, wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 3 depicts a top view of an embodiment of bottom package 126. Bottom package 126 may be made using either of the processes depicted in FIGS. 1A-1K and/or FIGS. 2A-2K. As shown in FIG. 3, die 120 is located on substrate 112 and substantially surrounded by reinforcement layer 128 and terminals 130 in a fan-out wafer level package (FOWLP) arrangement. While the FOWLP arrangement is shown, it is to be understood that other wafer package arrangements may also be contemplated using the processes depicted in FIGS. 1A-1K and/or FIGS. 2A-2K. Terminals 130 may correspond to locations of metal layer 108 filled vias 106 (shown in FIGS. 1K and 2K).” Hsu '142, [0045].</p>

FIG. 9

Hsu '142, FIG. 9

“FIG. 9 depicts another embodiment of bottom package 126' (shown in FIG. 2K) coupled to PCB 140 and memory die 142. PCB 140 may be coupled to bottom package 126 (or 126') by coupling terminals 136 on the PCB to terminals 130 on the bottom package.” Hsu '142, [0048].

“Using metal layer 108 in vias 106 to define terminals 130 provides the terminals as post-like structures that can have small spacing between the terminals. Thus, terminals 136 on top package 132, shown in FIGS. 4 and 5, may be relatively small solder balls to avoid bridging between adjacent solder balls when the top package is coupled to bottom package 126 or 126’.” Hsu ’142, [0049].

	general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.
--	---

Claim 4, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of metal pillars of the bottom package substrate.	<p>Hsu '142 discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“After core material 102 and carrier 100 are coupled using laminate layer 104, bottom package substrate 112 may be formed on core material 102, as shown in FIG. 2D. Core material 102, laminate layer 104, and metal layer 108 form reinforcement layer 128'. Reinforcement layer 128', shown in FIG. 2D, is substantially similar to reinforcement layer 128, shown in FIG. 1D, with a difference being the substantially complete filling of vias 106 in core material 102 with metal layer 108 (e.g., the metal layer substantially fills the vias in the core material due to the paste hole filling of the vias). Subsequent processing of carrier 100, core material 102, laminate layer 104, barrier layer 110, and substrate 112 in FIGS. 2E-2K is also substantially similar to the processing described in FIGS. 1E-1K. Thus, package 126' with reinforcement layer 128', shown in FIG. 2K, has a substantially similar structure to package 126 with reinforcement layer 128, shown in FIG. 1K.” Hsu '142, [0040].</p>

	<p>“In the process embodiments depicted in FIGS. 1A-1K and FIGS. 2A-2K, it should be understood that core material 102 may, in some embodiments, be coupled to both sides of carrier 100 (e.g., the core material is coupled to both the top and bottom of the carrier) and subsequent processing may form identical bottom packages (126 or 126') using core material on both the top and bottom of the carrier. For example, core material 102 on either side of carrier 100 may be detached from the carrier and subsequently processed individually. In addition, more than one bottom package may be formed on either side of carrier 100 from a single layer of core material 102 (e.g., core material 102 may be used as a base layer for multiple packages on either side of the carrier).” Hsu '142, [0044].</p> <p>“FIG. 9 depicts another embodiment of bottom package 126' (shown in FIG. 2K) coupled to PCB 140 and memory die 142. PCB 140 may be coupled to bottom package 126 (or 126') by coupling terminals 136 on the PCB to terminals 130 on the bottom package. In certain embodiments, memory die 142 is coupled to substrate 112 on the non-PCB side (now top) of bottom package 126 (or 126') using terminals 124. Memory die 142 may be, for example, a memory die stack with two memory die stacked on top of each other. In some embodiments, memory die 142 is a fan-out memory die stack.” Hsu '142, [0048].</p>
--	---

FIG. 9

Hsu '142, FIG. 9

3. The fine pitch may be possible because of the use of metal layer 108 in vias 106 to define terminals 130 on bottom package 126 or 126'. Using metal layer 108 in vias 106 to define terminals 130 provides the terminals as post-like structures that can have small spacing between the terminals. Thus, terminals 136 on top package 132, shown in FIGS. 4 and 5, may be relatively small solder balls to avoid bridging between adjacent solder balls when the top package is coupled to bottom package 126 or 126'." Hsu '142, [0049].

To the extent Plaintiff contends that Hsu '142 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the

--	---

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	<p>Hsu '142 discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“Barrier layer 110 may be formed over core material 102 in an area (defined by the dotted lines in FIG. 1C) that is later used as a terminal (bump) pad area for a die coupled to the package. After core material 102 is patterned and vias 106 are filled with metal layer 108, bottom package substrate 112 may be formed on core material 102, as shown in FIG. 1D.” Hsu '142, [0027-0028].</p> <p>“Die 120 may be coupled to substrate terminal pad 118 using one or more terminals 122. For example, terminals 122 may be solder balls coupled to solder pads on terminal pad 118.” Hsu '142, [0035].</p>

	<p>“In certain embodiments, terminals 127 are formed on or from exposed surfaces of metal layer 108 on top of bottom package 126. Terminals 127 may be used to couple bottom package 126 to a top package in a PoP package.” Hsu '142, [0037].</p> <p>“After core material 102 is patterned and metal layer 108 is formed, core material 102 may be coupled to carrier 100 (shown in FIG. 2B). FIG. 2C depicts core material 102 and carrier 100 coupled using laminate layer 104.” Hsu '142, [0039].</p> <p>“After core material 102 and carrier 100 are coupled using laminate layer 104, bottom package substrate 112 may be formed on core material 102, as shown in FIG. 2D. Core material 102, laminate layer 104, and metal layer 108 form reinforcement layer 128'. Reinforcement layer 128', shown in FIG. 2D, is substantially similar to reinforcement layer 128, shown in FIG. 1D, with a difference being the substantially complete filling of vias 106 in core material 102 with metal layer 108 (e.g., the metal layer substantially fills the vias in the core material due to the paste hole filling of the vias). Subsequent processing of carrier 100, core material 102, laminate layer 104, barrier layer 110, and substrate 112 in FIGS. 2E-2K is also substantially similar to the processing described in FIGS. 1E-1K. Thus, package 126' with reinforcement layer 128', shown in FIG. 2K, has a substantially similar structure to package 126 with reinforcement layer 128, shown in FIG. 1K.” Hsu '142, [0040].</p> <p>“In the process embodiments depicted in FIGS. 1A-1K and FIGS. 2A-2K, it should be understood that core material 102 may, in some embodiments, be coupled to both sides of carrier 100 (e.g., the core material is coupled to both the top and bottom of the carrier) and subsequent processing may form identical bottom packages (126 or 126') using core material on both the top and bottom of the carrier. For example, core material 102 on either side of carrier 100 may be detached from the carrier and subsequently processed individually. In</p>
--	--

addition, more than one bottom package may be formed on either side of carrier 100 from a single layer of core material 102 (e.g., core material 102 may be used as a base layer for multiple packages on either side of the carrier).” Hsu ’142, [0044].

“As shown in FIGS. 4 and 5, top package 132 may be coupled to reinforcement layer 128 (or 128 ') in bottom package 126 (or 126 ') by coupling terminals 136 on the top package to terminals 130 on the bottom package. Terminals 136 may be, for example, solder balls.” Hsu '142, [0046].

FIG. 9

Hsu '142, FIG. 9

	<p>“PCB 140 may be coupled to bottom package 126 (or 126 ') by coupling terminals 136 on the PCB to terminals 130 on the bottom package. In certain embodiments, memory die 142 is coupled to substrate 112 on the non-PCB side (now top) of bottom package 126 (or 126 ') using terminals 124.” Hsu '142, [0048].</p> <p>“FIG. 9 depicts another embodiment of bottom package 126' (shown in FIG. 2K) coupled to PCB 140 and memory die 142. PCB 140 may be coupled to bottom package 126 (or 126') by coupling terminals 136 on the PCB to terminals 130 on the bottom package. In certain embodiments, memory die 142 is coupled to substrate 112 on the non-PCB side (now top) of bottom package 126 (or 126') using terminals 124. Memory die 142 may be, for example, a memory die stack with two memory die stacked on top of each other. In some embodiments, memory die 142 is a fan-out memory die stack.” Hsu '142, [0048].</p> <p>“In certain embodiments, the pitch between terminals 130 is relatively fine, as shown in FIG. 3. The fine pitch may be possible because of the use of metal layer 108 in vias 106 to define terminals 130 on bottom package 126 or 126'. Using metal layer 108 in vias 106 to define terminals 130 provides the terminals as post-like structures that can have small spacing between the terminals. Thus, terminals 136 on top package 132, shown in FIGS. 4 and 5, may be relatively small solder balls to avoid bridging between adjacent solder balls when the top package is coupled to bottom package 126 or 126'.” Hsu '142, [0049].</p> <p>To the extent Plaintiff contends that Hsu '142 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

U.S. Patent No. 8981559 (“Hsu ’559”) is titled Package on Package Devices and Methods of Packaging Semiconductor Dies and lists Chun-Lei Hsu, Chung-Shi Liu, De-Yuan Lu, Ming-Che Ho, and Yu-Feng Chen as inventors. Hsu ’559 is assigned to Taiwan Semiconductor Manufacturing Company, Ltd. Hsu ’559 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Hsu ’559 is a U.S. patent that was filed June 25, 2012 and published December 26, 2013. Hsu ’559 is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Hsu ’559, or otherwise rendered obvious by disclosures and teachings of Hsu ’559, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Hsu ’559 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Hsu ’559 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Hsu ’559, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Hsu '559 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Hsu '559 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Hsu '559 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Hsu '559 discloses, either expressly or inherently, a structure.</p> <p>See, e.g.:</p> <p>“FIG. 1 illustrates a cross-sectional view of a method of attaching a second (or top) packaged die 140 to a first (or bottom) packaged die 120 having a plurality of metal pillars 102 disposed thereon in accordance with an embodiment of the present disclosure. A first die 110 is packaged to form the first packaged die 120, and at least one second die 128 is packaged to form a second packaged die 140. The second packaged die 140 is then packaged with the first packaged die 120 by attaching solder balls 132 on the bottom surface 124 of the second</p>

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

	<p>packaged die 140 to the metal pillars 102 on the top surface 101 of the first packaged die 120, forming a PoP device 142, as shown in FIG. 2, which is a cross-sectional view of a PoP device 142 packaged in accordance with the method shown in FIG. 1.” Hsu ’559, [2:50-2:63].</p> <p>“FIG. 2. The molding compound 152 may be formed after the first packaged die and the second packaged die 140 are attached. Alternatively, the molding compound 152 may be applied at least between the metal pillars 102 before the first packaged die 120 and the second packaged die 140 are attached, to be described herein with reference to FIGS. 8, 18, and 19. The molding compound 152 may comprise similar materials described for the underfill material 150, for example. Alternatively, the molding material 152 may comprise other materials. The underfill material 150 may comprise a first molding compound that is formed over sidewalls of the first die 110, and the molding compound 152 may comprise a second molding compound that is formed over the first molding compound 150 and the first die 110, in some embodiments, for example. A plurality of solder balls 148 may optionally be formed on the bottom surface of the first substrate 100, as shown in FIG. 2. The solder balls 148 are attached to the bond pads 146 on the bottom of the first substrate 100, before or after singulating the individual packaged dies 120, for example.” Hsu ’559, [6:6-6:25].</p>
--	--

Hsu '559, Fig. 2.

“FIG. 3, which shows a cross-sectional view of a PoP device 142 packaged in accordance with another embodiment. Solder balls 132 (not shown in FIG. 3 ; see solder ball 132 in FIG. 1 and solder joint 132 ' in FIG. 3 after a reflow process of a solder ball 132) are formed on a second packaged die 140 that comprises a bottom packaged die. Each of the plurality of metal pillars 102 on the bottom surface of the first substrate 100 (e.g., comprising a top substrate) is coupled to a solder ball 132 on the top surface of the second substrate 122 (e.g., comprising a bottom substrate). The solder balls 132 become solder joints 132 ' after a solder reflow process to attach the first and second packaged dies 120 and 140 together.” Hsu '559, [6:35-6:46].

“FIG. 4 is a cross-sectional view of a PoP device 142 packaged in accordance with another embodiment, wherein metal pillars 102 a and 102 b are disposed on both the first and second packaged dies 120 and 140, respectively. Metal pillars 102 a are also referred to herein as

	<p>first metal pillars 102 a, and metal pillars 102 b are also referred to herein as second metal pillars 102 b. A solder ball 132 (not shown in FIG. 4; see solder ball 132 in FIG. 1 and solder joint 132 " in FIG. 4 after a reflow process of a solder ball 132) is formed on each of the plurality of first metal pillars 102 a or on each of the plurality of second metal pillars 102 b. A solder ball 132 may alternatively be formed on each of the plurality of first metal pillars 102 a and on each of the plurality of second metal pillars 102 b, for example. Each of the plurality of first metal pillars 102 a is coupled to one of the plurality of second metal pillars 102 b using a solder ball 132 formed on one of the plurality of first metal pillars 102 a and/or a solder ball 132 formed on one of the plurality of second metal pillars 102 b, and a solder reflow process is performed, forming the solder joints 132 " shown in FIG. 4." Hsu '559, [6:48-6:67].</p> <p>"FIG. 5 illustrates a cross-sectional view of a PoP device 142 packaged in accordance with an embodiment wherein the metal pillars 102 comprise a cone or ladder shape. The metal pillars 102 are wider at the bottom than at the top. The sidewalls of the metal pillars 102 may be substantially straight, forming a cone shape, as shown in FIG. 5. Alternatively, the sidewalls of the metal pillars 102 may be stair-stepped and have a ladder shape, as shown in FIG. 6, which is a more detailed view of a metal pillar 102 shown in FIG. 5." Hsu '559, [7:8-7:17].</p> <p>"FIG. 8 is a cross-sectional view of a PoP device packaged in accordance with yet another embodiment, wherein the metal pillars 102 comprise the shape of the letter "I". The I shape of the metal pillars 102 also has a second portion 106 with a narrower top region that facilitates adhering with a solder ball 132. Portions of the solder joint 132 ' form around edges of the narrower top region of the second portion 106 of the metal pillars 102. The solder ball 132 can be printed from a solder film or may comprise a smaller-sized ball than in other embodiments described herein, as examples. If the metal pillar 102 critical dimension (CD)</p>
--	--

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

	<p>is substantially the same as the solder ball 132 diameter or solder film width, the metal pillars can form an “I” shape, for example. FIG. 8 also illustrates an optional protective material 154 (see also FIGS. 16 through 18, to be described further herein) that may be formed over top surfaces and sidewalls of the metal pillars 102 before coupling together the first and second packages dies 120 and 140.” Hsu ’559, [7:26-7:43].</p>
[1.A] a bottom package substrate;	<p>Hsu ’559 discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 illustrates a cross-sectional view of a method of attaching a second (or top) packaged die 140 to a first (or bottom) packaged die 120 having a plurality of metal pillars 102 disposed thereon in accordance with an embodiment of the present disclosure. A first die 110 is packaged to form the first packaged die 120, and at least one second die 128 is packaged to form a second packaged die 140. The second packaged die 140 is then packaged with the first packaged die 120 by attaching solder balls 132 on the bottom surface 124 of the second packaged die 140 to the metal pillars 102 on the top surface 101 of the first packaged die 120, forming a PoP device 142, as shown in FIG. 2, which is a cross-sectional view of a PoP device 142 packaged in accordance with the method shown in FIG. 1. Referring to FIG. 1, to package the first die 110, the first die 110 is attached to a substrate 100. First, a first substrate 100 is provided. Only one first substrate 100 is shown in the drawings; however, several first substrates 100 are processed on a workpiece comprising a plurality of first substrates 100, and the workpiece is later singulated, after packaging first dies 110 on the first substrates 100. The first substrate 100 comprises an interposer comprised of an insulating material or glass in some embodiments. In other embodiments, the first substrate 100 comprises a semiconductive material such as a semiconductor wafer.” Hsu ’559, [2:50-3:6].</p>

Fi. 50

Hsu '559, Fig. 1.

“The first substrate 100 is then singulated from other first substrates 100 on the workpiece, forming a first packaged die 120. The first packaged die 120 is also referred to herein in some embodiments as a bottom packaged die, for example. In some embodiments, the bottom packaged die 120 includes a plurality of solder balls 148 formed on bond pads 146 on the bottom surface 144 thereof, as shown in FIG. 2. Each of the plurality of metal pillars 102 is bonded to a bond pad and/or trace 103 on the top surface 101 of the bottom packaged die 120.” Hsu ’559, [5:3-5:12].

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

	<p>“Each of the plurality of metal pillars 102 on the top surface 101 of the first substrate 100 (e.g., comprising a bottom substrate) is coupled to a solder ball 132 on the bottom surface 124 of the second substrate 122 (e.g., comprising a top substrate).” Hsu '559, [5:38-5:42].</p> <p>“The solder balls 148 are attached to the bond pads 146 on the bottom of the first substrate 100, before or after singulating the individual packaged dies 120, for example.” Hsu '559, [6:23-6:25].</p> <p>“In the embodiment shown in FIG. 2, the metal pillars 102 are formed on a first packaged die 120 that comprises a bottom packaged die, and solder balls 132 are formed on a second packaged die 140 that comprises a top packaged die.” Hsu '559, [6:29-6:32].</p> <p>“Alternatively, the metal pillars 102 may be formed on a first packaged die 120 that comprises a top packaged die, as shown in FIG. 3, which shows a cross-sectional view of a PoP device 142 packaged in accordance with another embodiment. 	<p>To the extent Plaintiff contends that Hsu '559 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.D] the spacer connector comprises a core substrate;</p>	<p>Hsu '559 discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 illustrates a cross-sectional view of a method of attaching a second (or top) packaged die 140 to a first (or bottom) packaged die 120 having a plurality of metal pillars 102 disposed thereon in accordance with an embodiment of the present disclosure. A first die 110 is packaged to form the first packaged die 120, and at least one second die 128 is packaged to form a second packaged die 140. The second packaged die 140 is then packaged with the first packaged die 120 by attaching solder balls 132 on the bottom surface 124 of the second packaged die 140 to the metal pillars 102 on the top surface 101 of the first packaged die 120, forming a PoP device 142, as shown in FIG. 2, which is a cross-sectional view of a PoP device 142 packaged in accordance with the method shown in FIG. 1.” Hsu '559, [2:50-2:63].</p>

Hsu '559, Fig. 2.

“In the embodiment shown in FIG. 2, the metal pillars 102 are formed on a first packaged die 120 that comprises a bottom packaged die, and solder balls 132 are formed on a second packaged die 140 that comprises a top packaged die. Alternatively, the metal pillars 102 may be formed on a first packaged die 120 that comprises a top packaged die, as shown in FIG. 3, which shows a cross-sectional view of a PoP device 142 packaged in accordance with another embodiment. Solder balls 132 (not shown in FIG. 3; see solder ball 132 in FIG. 1 and solder joint 132' in FIG. 3 after a reflow process of a solder ball 132) are formed on a second packaged die 140 that comprises a bottom packaged die. Each of the plurality of metal pillars 102 on the bottom surface of the first substrate 100 (e.g., comprising a top substrate) is coupled to a solder ball 132 on the top surface of the second substrate 122 (e.g., comprising a bottom substrate). The solder balls 132 become solder joints 132' after a solder reflow process to attach the first and second packaged dies 120 and 140 together.” Hsu '559, [6:29-6:46].

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

	<p>“A molding compound 152 may also optionally be formed between the first packaged die 120 and the second packaged die 140, also shown in phantom in FIG. 2. The molding compound 152 may be formed after the first packaged die and the second packaged die 140 are attached. Alternatively, the molding compound 152 may be applied at least between the metal pillars 102 before the first packaged die 120 and the second packaged die 140 are attached, to be described herein with reference to FIGS. 8, 18, and 19. The molding compound 152 may comprise similar materials described for the underfill material 150, for example. Alternatively, the molding material 152 may comprise other materials. The underfill material 150 may comprise a first molding compound that is formed over sidewalls of the first die 110, and the molding compound 152 may comprise a second molding compound that is formed over the first molding compound 150 and the first die 110, in some embodiments, for example.” Hsu '559, [6:4-6:20].</p> <p>To the extent Plaintiff contends that Hsu '559 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Hsu '559 discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 illustrates a cross-sectional view of a method of attaching a second (or top) packaged die 140 to a first (or bottom) packaged die 120 having a plurality of metal pillars 102 disposed thereon in accordance with an embodiment of the present disclosure. A first die 110 is</p>

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

	<p>packaged to form the first packaged die 120, and at least one second die 128 is packaged to form a second packaged die 140. The second packaged die 140 is then packaged with the first packaged die 120 by attaching solder balls 132 on the bottom surface 124 of the second packaged die 140 to the metal pillars 102 on the top surface 101 of the first packaged die 120, forming a PoP device 142, as shown in FIG. 2, which is a cross-sectional view of a PoP device 142 packaged in accordance with the method shown in FIG. 1.” Hsu ’559, [2:50-2:63].</p> <p>“The first substrate 100 includes wiring 156 (see FIG. 9) formed within one or more insulating material layers. The wiring 156 provides horizontal electrical connections (e.g., x-axis connections in the view shown in FIG. 1) in some embodiments, for example. The wiring 156 may include fan-out regions that include traces of conductive material for expanding the footprint of the first die 110 to a footprint of the bottom side 144 of the first substrate 100, e.g., of the bond pads 146. The wiring 156 of the first substrate 100 may include one or more redistribution layers (RDLs). The RDLs may comprise one or more insulating layers and wiring layers. The RDLs may include inter-level dielectrics (ILDs) with wiring in metallization layers disposed or formed therein. The wiring 156 may comprise one or more vias and/or conductive lines, for example. The wiring 156 and the TSVs may be formed in the first substrate 100 using one or more subtractive etch processes, single damascene techniques, and/or dual damascene techniques, as examples.” Hsu ’559, [3:40-3:57].</p> <p>“Referring again to FIG. 1, in accordance with embodiments of the present disclosure, a plurality of metal pillars 102 is attached to the bond pads and/or traces 103 on the top surface of the first substrate 100. The plurality of metal pillars 102 is formed using a two-step plating process, to be described further herein. The metal pillars 102 include a first portion 104 and a second portion 106 coupled to the first portion 104. The height of the first portion 104 in a vertical direction is thinner than the height of the second portion 106. The first portion 104</p>
--	---

is disposed directly over the bond pads and/or traces 103. The second portion 106 is coupled to and disposed directly over the first portion 104 of each metal pillar 102.” Hsu ’559, [3:65-4:10].

Fi

Hsu '559, Fig. 1.

“In the embodiment shown in FIG. 2, the metal pillars 102 are formed on a first packaged die 120 that comprises a bottom packaged die, and solder balls 132 are formed on a second packaged die 140 that comprises a top packaged die. Alternatively, the metal pillars 102 may be formed on a first packaged die 120 that comprises a top packaged die, as shown in FIG. 3, which shows a cross-sectional view of a PoP device 142 packaged in accordance with another embodiment. Solder balls 132 (not shown in FIG. 3; see solder ball 132 in FIG. 1 and solder joint 132' in FIG. 3 after a reflow process of a solder ball 132) are formed on a

	<p>comprising silicon or other semiconductor materials and may be covered by an insulating layer, for example. The first die 110 may include one or more components and/or circuits formed in and/or over the workpiece, not shown. The first die 110 may include conductive layers and/or semiconductor elements, e.g., transistors, diodes, capacitors, etc., also not shown. The first die 110 may comprise logic circuitry, memory devices, or other types of circuits, as examples. The first die 110 may include a plurality of contacts (not shown) formed on a bottom surface thereof. A plurality of bumps 114 may be formed on the bottom surface of the first die 110, e.g., on the plurality of contacts on the bottom surface of the first die 110. The bumps 114 may comprise microbumps and the bumps 114 may each include a solder cap 116 formed thereon, as examples. The bumps 114 are also referred to herein as conductive bumps. The bumps 114 on the first die 110 are then attached to the bond pads and/or traces 112 on the top surface of the first substrate 100, as shown in FIG. 1.” Hsu ’559, [4:34-4:58].</p>
--	---

150

Hsu '559, Fig. 1.

“The first die 110 comprises an integrated circuit or chip that will be packaged with a second die 128 a and optionally also a third die 128 b (not shown in FIG. 1 ; see FIG. 27) in a single PoP device 142.” Hsu ’559, [4:36-4:39].

“A solder reflow process is used to reflow the solder caps 116 on the solder bumps 114 and attach the first die 110 to the first substrate 100, electrically and mechanically attaching the bumps 114 to the bond pads and/or traces 112 of the first substrate 100, for example.” Hsu ’559, [4:59-4:63].

“In some embodiments, the first die 110 is attached to the first substrate 100 using a flip-chip bond-on-trace (BOT) attachment technique.” Hsu ’559, [4:65-4:67].

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

	<p>“FIG. 8 further illustrates a plurality of contacts 155 formed on the first substrate 100 that are formed in a central region of the first substrate 100. The contacts 155 may optionally be formed simultaneously with the formation of first portions 104 of the metal pillars 102 in a first plating process accordance with some embodiments (to be described further herein with reference to FIGS. 9 through 13). The solder caps 116 on the first die 110 are coupled to the contacts 155 of the first substrate 100 in these embodiments, as shown. Each of the plurality of conductive bumps 114 is coupled to one of the plurality of contacts 155 in the central region of the substrate 100 by a solder cap 116.” Hsu '559, [7:60-8:4].</p> <p>“In step 191, a first die 110 is coupled to a first substrate 100.” Hsu '559, [14:20-14:21].</p> <p>To the extent Plaintiff contends that Hsu '559 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.M] the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.</p>	<p>Hsu '559 discloses, either expressly or inherently, the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 1, to package the first die 110, the first die 110 is attached to a substrate 100. First, a first substrate 100 is provided. Only one first substrate 100 is shown in the drawings; however, several first substrates 100 are processed on a workpiece comprising a plurality of first substrates 100, and the workpiece is later singulated, after packaging first dies 110 on the first substrates 100. The first substrate 100 comprises an interposer comprised</p>

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

	<p>of an insulating material or glass in some embodiments. In other embodiments, the first substrate 100 comprises a semiconductive material such as a semiconductor wafer. The first substrate 100 may include electronic components and elements formed thereon in some embodiments, or alternatively, the first substrate 100 may be free of electronic components and elements.” Hsu ’559, [2:64-3:10].</p> <p>“The first substrate 100 may optionally include a plurality of through-substrate vias (TSVs) (not shown) formed therein in some embodiments. The TSVs comprise a conductive or semiconductive material that extends completely through the first substrate 100 may optionally be lined with an insulating material. The TSVs provide vertical electrical connections (e.g., y-axis connections in the view shown in FIG. 1) from a bottom surface to a top surface of the first substrate 100.” Hsu ’559, [3:32-3:39].</p> <p>“Referring again to FIG. 1, in accordance with embodiments of the present disclosure, a plurality of metal pillars 102 is attached to the bond pads and/or traces 103 on the top surface of the first substrate 100. The plurality of metal pillars 102 is formed using a two-step plating process, to be described further herein. The metal pillars 102 include a first portion 104 and a second portion 106 coupled to the first portion 104. The height of the first portion 104 in a vertical direction is thinner than the height of the second portion 106. The first portion 104 is disposed directly over the bond pads and/or traces 103. The second portion 106 is coupled to and disposed directly over the first portion 104 of each metal pillar 102. The metal pillars 102 comprise a height comprising dimension d1 of about 200 μm or less in some embodiments. In other embodiments, dimension d1 may comprise about 90 to 190 μm, as another example. The metal pillars 102 comprise a width comprising dimension d2 of about 10 to 250 μm in some embodiments. Alternatively, dimensions d1 and d2 may comprise other values.” Hsu ’559, [3:65-4:17].</p>
--	--

“In the embodiment shown in FIG. 2, the metal pillars 102 are formed on a first packaged die 120 that comprises a bottom packaged die, and solder balls 132 are formed on a second packaged die 140 that comprises a top packaged die. Alternatively, the metal pillars 102 may be formed on a first packaged die 120 that comprises a top packaged die, as shown in FIG. 3, which shows a cross-sectional view of a PoP device 142 packaged in accordance with another embodiment. Solder balls 132 (not shown in FIG. 3; see solder ball 132 in FIG. 1 and solder joint 132' in FIG. 3 after a reflow process of a solder ball 132) are formed on a second packaged die 140 that comprises a bottom packaged die. Each of the plurality of metal pillars 102 on the bottom surface of the first substrate 100 (e.g., comprising a top substrate) is coupled to a solder ball 132 on the top surface of the second substrate 122 (e.g., comprising a bottom substrate). The solder balls 132 become solder joints 132' after a solder reflow process to attach the first and second packaged dies 120 and 140 together.” Hsu '559, [6:29-6:46].

Fig. 2

Hsu '559, Fig. 2.

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

	<p>To the extent Plaintiff contends that Hsu '559 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p>	<p>Hsu '559 discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 illustrates a cross-sectional view of a method of attaching a second (or top) packaged die 140 to a first (or bottom) packaged die 120 having a plurality of metal pillars 102 disposed thereon in accordance with an embodiment of the present disclosure. A first die 110 is packaged to form the first packaged die 120, and at least one second die 128 is packaged to form a second packaged die 140. The second packaged die 140 is then packaged with the first packaged die 120 by attaching solder balls 132 on the bottom surface 124 of the second packaged die 140 to the metal pillars 102 on the top surface 101 of the first packaged die 120, forming a PoP device 142, as shown in FIG. 2, which is a cross-sectional view of a PoP device 142 packaged in accordance with the method shown in FIG. 1.” Hsu '559, [2:50-2:63].</p>

Hsu '559, Fig. 1.

“The plurality of metal pillars 102 is disposed between the first packaged die 120 and the second packaged die 140, as shown. The solder joints 132 ' electrically couple together the bond pads and/or traces 103 of the first packaged die 120 and the contacts 134 of the second packaged die 120, and also mechanically couple together the first and second packaged dies 120 and 140.” Hsu '559, [5:54-5:60].

“A molding compound 152 may also optionally be formed between the first packaged die 120 and the second packaged die 140, also shown in phantom in FIG. 2. The molding compound 152 may be formed after the first packaged die and the second packaged die 140 are attached.” Hsu '559, [6:4-6:8].

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

	<p>“The CMP process or grinding process can be used to remove a portion of the molding compound 152 and form an air exit space between the first die 110 and the second packaged die 140 in some embodiments, for example.” Hsu ’559, [12:53-12:57].</p> <p>To the extent Plaintiff contends that Hsu ’559 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Hsu ’559 discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 illustrates a cross-sectional view of a method of attaching a second (or top) packaged die 140 to a first (or bottom) packaged die 120 having a plurality of metal pillars 102 disposed thereon in accordance with an embodiment of the present disclosure. A first die 110 is packaged to form the first packaged die 120, and at least one second die 128 is packaged to form a second packaged die 140. The second packaged die 140 is then packaged with the first packaged die 120 by attaching solder balls 132 on the bottom surface 124 of the second</p>

packaged die 140 to the metal pillars 102 on the top surface 101 of the first packaged die 120, forming a PoP device 142, as shown in FIG. 2, which is a cross-sectional view of a PoP device 142 packaged in accordance with the method shown in FIG. 1." Hsu '559, [2:50-2:63].

Hsu '559, Fig. 1.

To the extent Plaintiff contends that Hsu '559 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

Claim Limitation	Disclosure
<p>[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of metal pillars of the bottom package substrate.</p>	<p>Hsu '559 discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The first substrate 100 is then singulated from other first substrates 100 on the workpiece, forming a first packaged die 120. The first packaged die 120 is also referred to herein in some embodiments as a bottom packaged die, for example. In some embodiments, the bottom packaged die 120 includes a plurality of solder balls 148 formed on bond pads 146 on the bottom surface 144 thereof, as shown in FIG. 2. Each of the plurality of metal pillars 102 is bonded to a bond pad and/or trace 103 on the top surface 101 of the bottom packaged die 120. Final tests are then performed on the first packaged die 120.” Hsu '559, [5:3-5:13].</p>

Hsu '559, Fig. 2.

“In the embodiment shown in FIG. 2, the metal pillars 102 are formed on a first packaged die 120 that comprises a bottom packaged die, and solder balls 132 are formed on a second packaged die 140 that comprises a top packaged die. Alternatively, the metal pillars 102 may be formed on a first packaged die 120 that comprises a top packaged die, as shown in FIG. 3, which shows a cross-sectional view of a PoP device 142 packaged in accordance with another embodiment. Solder balls 132 (not shown in FIG. 3; see solder ball 132 in FIG. 1 and solder joint 132' in FIG. 3 after a reflow process of a solder ball 132) are formed on a second packaged die 140 that comprises a bottom packaged die. Each of the plurality of metal pillars 102 on the bottom surface of the first substrate 100 (e.g., comprising a top substrate) is coupled to a solder ball 132 on the top surface of the second substrate 122 (e.g., comprising a bottom substrate). The solder balls 132 become solder joints 132' after a solder reflow process to attach the first and second packaged dies 120 and 140 together.” Hsu '559, [6:29-6:46].

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

	<p>To the extent Plaintiff contends that Hsu '559 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Hsu '559 discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 illustrates a cross-sectional view of a method of attaching a second (or top) packaged die 140 to a first (or bottom) packaged die 120 having a plurality of metal pillars 102 disposed thereon in accordance with an embodiment of the present disclosure. A first die 110 is packaged to form the first packaged die 120, and at least one second die 128 is packaged to form a second packaged die 140. The second packaged die 140 is then packaged with the first packaged die 120 by attaching solder balls 132 on the bottom surface 124 of the second packaged die 140 to the metal pillars 102 on the top surface 101 of the first packaged die 120,</p>

	<p>forming a PoP device 142, as shown in FIG. 2, which is a cross-sectional view of a PoP device 142 packaged in accordance with the method shown in FIG. 1.” Hsu ’559, [2:50-2:63].</p> <p>“Bond pads and/or traces 103 comprising openings in wiring of the first substrate 110 are formed on the top surface of the first substrate 100 in a peripheral region of the first substrate 100 in a top view. Bond pads and/or traces 112 comprising openings in wiring are formed on the top surface of the first substrate 100 in a central region of the first substrate 100 in a top view. Bond pads and/or traces 103 and are shown in a more detailed view in FIG. 9. Bond pads 146 (not shown in FIG. 1; see FIG. 2) are formed on the bottom surface 144 of the first substrate 100. The bond pads 146 may be arranged in an array or in rows or columns on the bottom surface 144 of the first substrate 100, not shown. The bond pads 146 may fully populate the bottom surface 144 or may be arranged in various patterns, such as patterns used in ball grid array (BGA) or land grid array (LGA) package devices, as examples. The bond pads and/or traces 103 and 112 and bond pads 146 comprise a conductive material such as Al, Cu, Au, alloys thereof, other materials, or combinations and/or multiple layers thereof, as examples. Alternatively, the bond pads and/or traces 103 and 112, and bond pads 146 may comprise other materials.” Hsu ’559, [3:11-3:31].</p> <p>“The first substrate 100 may optionally include a plurality of through-substrate vias (TSVs) (not shown) formed therein in some embodiments. The TSVs comprise a conductive or semiconductive material that extends completely through the first substrate 100 may optionally be lined with an insulating material. The TSVs provide vertical electrical connections (e.g., y-axis connections in the view shown in FIG. 1) from a bottom surface to a top surface of the first substrate 100.” Hsu ’559, [3:32-3:39].</p> <p>“In the embodiment shown in FIG. 2, the metal pillars 102 are formed on a first packaged die 120 that comprises a bottom packaged die, and solder balls 132 are formed on a second</p>
--	--

packaged die 140 that comprises a top packaged die. Alternatively, the metal pillars 102 may be formed on a first packaged die 120 that comprises a top packaged die, as shown in FIG. 3, which shows a cross-sectional view of a PoP device 142 packaged in accordance with another embodiment. Solder balls 132 (not shown in FIG. 3; see solder ball 132 in FIG. 1 and solder joint 132' in FIG. 3 after a reflow process of a solder ball 132) are formed on a second packaged die 140 that comprises a bottom packaged die. Each of the plurality of metal pillars 102 on the bottom surface of the first substrate 100 (e.g., comprising a top substrate) is coupled to a solder ball 132 on the top surface of the second substrate 122 (e.g., comprising a bottom substrate). The solder balls 132 become solder joints 132' after a solder reflow process to attach the first and second packaged dies 120 and 140 together." Hsu '559, [6:29-6:46].

Hsu '559, Fig. 2.

Appendix A-11 - Invalidity of U.S. Patent No. 9859202 in view of Hsu '559 - U.S. Patent No. 8981559

	<p>To the extent Plaintiff contends that Hsu '559 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to the bottom ends of the plurality of metal pillars of the bottom package substrate via the plurality of metal pillars of the bottom package substrate, and bottom ends of the plurality of metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Hsu '559 discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 illustrates a cross-sectional view of a method of attaching a second (or top) packaged die 140 to a first (or bottom) packaged die 120 having a plurality of metal pillars 102 disposed thereon in accordance with an embodiment of the present disclosure. A first die 110 is packaged to form the first packaged die 120, and at least one second die 128 is packaged to form a second packaged die 140. The second packaged die 140 is then packaged with the first packaged die 120 by attaching solder balls 132 on the bottom surface 124 of the second packaged die 140 to the metal pillars 102 on the top surface 101 of the first packaged die 120,</p>

	<p>forming a PoP device 142, as shown in FIG. 2, which is a cross-sectional view of a PoP device 142 packaged in accordance with the method shown in FIG. 1. Referring to FIG. 1, to package the first die 110, the first die 110 is attached to a substrate 100. First, a first substrate 100 is provided. Only one first substrate 100 is shown in the drawings; however, several first substrates 100 are processed on a workpiece comprising a plurality of first substrates 100, and the workpiece is later singulated, after packaging first dies 110 on the first substrates 100. The first substrate 100 comprises an interposer comprised of an insulating material or glass in some embodiments. In other embodiments, the first substrate 100 comprises a semiconductive material such as a semiconductor wafer. The first substrate 100 may include electronic components and elements formed thereon in some embodiments, or alternatively, the first substrate 100 may be free of electronic components and elements.” Hsu '559, [2:50-3:10].</p> <p>“Bond pads and/or traces 103 comprising openings in wiring of the first substrate 110 are formed on the top surface of the first substrate 100 in a peripheral region of the first substrate 100 in a top view. Bond pads and/or traces 112 comprising openings in wiring are formed on the top surface of the first substrate 100 in a central region of the first substrate 100 in a top view. Bond pads and/or traces 103 and are shown in a more detailed view in FIG. 9. Bond pads 146 (not shown in FIG. 1; see FIG. 2) are formed on the bottom surface 144 of the first substrate 100. The bond pads 146 may be arranged in an array or in rows or columns on the bottom surface 144 of the first substrate 100, not shown. The bond pads 146 may fully populate the bottom surface 144 or may be arranged in various patterns, such as patterns used in ball grid array (BGA) or land grid array (LGA) package devices, as examples. The bond pads and/or traces 103 and 112 and bond pads 146 comprise a conductive material such as Al, Cu, Au, alloys thereof, other materials, or combinations and/or multiple layers thereof, as examples. Alternatively, the bond pads and/or traces 103 and 112, and bond pads 146 may comprise other materials.” Hsu '559, [3:11-3:31].</p>
--	---

“In the embodiment shown in FIG. 2, the metal pillars 102 are formed on a first packaged die 120 that comprises a bottom packaged die, and solder balls 132 are formed on a second packaged die 140 that comprises a top packaged die. Alternatively, the metal pillars 102 may be formed on a first packaged die 120 that comprises a top packaged die, as shown in FIG. 3, which shows a cross-sectional view of a PoP device 142 packaged in accordance with another embodiment. Solder balls 132 (not shown in FIG. 3; see solder ball 132 in FIG. 1 and solder joint 132' in FIG. 3 after a reflow process of a solder ball 132) are formed on a second packaged die 140 that comprises a bottom packaged die. Each of the plurality of metal pillars 102 on the bottom surface of the first substrate 100 (e.g., comprising a top substrate) is coupled to a solder ball 132 on the top surface of the second substrate 122 (e.g., comprising a bottom substrate). The solder balls 132 become solder joints 132' after a solder reflow process to attach the first and second packaged dies 120 and 140 together.” Hsu '559, [6:29-6:46].

Appendix A-12 - Invalidity of U.S. Patent No. 9859202 in view of Hu '687 - U.S. Patent Publication No. 20130175687

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Hu '687 - U.S. Patent Publication No. 20130175687

U.S. Patent Publication No. 20130175687 (“Hu '687”) is titled Package Stack Device and Fabrication Method Thereof and lists Dyi-Chung Hu as inventor. Hu '687 is assigned to Unimicron Technology Corporation. Hu '687 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the '202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff's apparent infringement theory.² Hu '687 is a U.S. patent publication that was filed June 22, 2012 and published July 11, 2013. Hu '687 claims priority to a TW 101100716 filed on January 6, 2012. Hu '687 is therefore prior art to the '202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Hu '687, or otherwise rendered obvious by disclosures and teachings of Hu '687, including under TopWire's apparent interpretation of the Asserted Claims as Samsung understands them from TopWire's Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Hu '687 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Hu '687 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung's other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung's Invalidity Contentions with respect to the '202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Hu '687, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire's March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court's order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire's apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung's interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-12 - Invalidity of U.S. Patent No. 9859202 in view of Hu '687 - U.S. Patent Publication No. 20130175687

To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Hu '687 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Hu '687 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Hu '687 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Hu '687 discloses, either expressly or inherently, a structure.</p> <p>See, e.g.:</p> <p>“Accordingly, the present invention provides a package stack device, which comprises: a first package structure, comprising: a first substrate having a first surface with a plurality of first metal posts formed thereon and a second surface opposite to the first surface; and a first electronic element disposed on the first surface of the first substrate and electrically connected to the first substrate; a second package structure, comprising: a second substrate having a third surface and a fourth surface opposite to the third surface, wherein the fourth</p>

surface has a plurality of second metal posts which are connected to the first metal posts, respectively, so as for the second package structure to be stacked on the first package structure, and the height of the second metal posts is greater than, equal to or less than that of the first metal posts; and a second electronic element disposed on the third surface of the second substrate and electrically connected to the second substrate; and an encapsulant formed between the first surface of the first substrate and the fourth surface of the second substrate to encapsulate the first electronic element.” Hu '687, [0012].

FIG. 2F

Hu '687, FIG. 2F.

“The present invention further provides a fabrication method of a package stack device, which comprises the steps of: providing a first substrate having a first surface with a plurality

	<p>of first metal posts formed thereon and a second surface opposite to the first surface, disposing a first electronic element on the first surface of the first substrate and electrically connecting the first electronic element and the first substrate so as to form a first package structure, providing a second substrate having a third surface and a fourth surface opposite to the third surface, and disposing a second electronic element on the third surface of the second substrate and electrically connecting the second electronic element and the second substrate so as to form a second package structure, wherein the fourth surface of the second substrate has a plurality of second metal posts and the height of the second metal posts is greater than, equal to or less than that of the first metal posts; connecting the second metal posts to the first metal posts, respectively, so as to stack the second package structure on the first package structure; and forming an encapsulant between the first surface of the first substrate and the fourth surface of the second substrate for encapsulating the first electronic element. The present invention further provides a package stack device, which comprises: a first package structure, comprising: a first substrate having a first surface with a plurality of first metal posts formed thereon and a second surface opposite to the first surface; a first electronic element disposed on the first surface of the first substrate and electrically connected to the first substrate in a flip-chip manner; and an underfill formed between the first electronic element and the first surface of the first substrate; a second package structure, comprising: a second substrate having a third surface and a fourth surface opposite to the third surface, wherein the fourth surface has a plurality of second metal posts which are connected to the first metal posts, respectively, so as for the second package structure to be stacked on the first package structure, and the height of the second metal posts is greater than, equal to or less than that of the first metal posts; and a second electronic element disposed on the third surface of the second substrate and electrically connected to the second substrate; and an encapsulant formed between the first surface of the first substrate and the fourth surface of the second substrate to encapsulate the first electronic element and the underfill.” Hu '687, [0013-0014].</p>
--	--

Appendix A-12 - Invalidity of U.S. Patent No. 9859202 in view of Hu '687 - U.S. Patent Publication No. 20130175687

	<p>“The present invention further provides a package stack device, which has: a first package structure 2 a, a second package structure 2 b stacked on the first package structure 2 a, and an encapsulant 23 disposed between the first and second package structures 2 a, 2 b. The first package structure 2 a has a first substrate 21 having a first surface 21 a and a second surface 21 b opposite to the first surface 21 a, and a first electronic element 20, 20' disposed on the first surface 21 a and electrically connected to the first substrate 21. The first surface 21 a of the first substrate 21 has a plurality of first metal posts 210, 310, 310', 310'', 410, and the second surface 21 b of the first substrate 21 has a plurality of ball pads 212 for mounting solder balls 24.” Hu '687, [0052-0053].</p> <p>“The present invention further provides a package stack device, which has: a first package structure 2 a, a second package structure 2 b stacked on the first package structure 2 a, and an encapsulant 23 disposed between the first and second package structures 2 a, 2 b. The first package structure 2 a has: a first substrate 21 having a first surface 21 a and a second surface 21 b opposite to the first surface 21 a, a first electronic element 20 disposed on the first surface 21 a and electrically connected to the first substrate 21 in a flip-chip manner, and an underfill 550 disposed between the first electronic element 20 and the first surface 21 a of the first substrate 21.” Hu '687, [0063-0064].</p>
[1.A] a bottom package substrate;	<p>Hu '687 discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 2A, a first substrate 21 having a first surface 21 a and a second surface 21 b opposite to the first surface 21 a is provided. The first surface 21 a of the first substrate 21</p>

has a plurality of bonding pads 211 a and a plurality of contact pads 211 b. The second surface 21 b of the first substrate 21 has a plurality of ball pads 212.” Hu '687, [0031].

“The first package structure 2 a has a first substrate 21 having a first surface 21 a and a second surface 21 b opposite to the first surface 21 a, and a first electronic element 20, 20' disposed on the first surface 21 a and electrically connected to the first substrate 21. The first surface 21 a of the first substrate 21 has a plurality of first metal posts 210, 310, 310', 310'', 410, and the second surface 21 b of the first substrate 21 has a plurality of ball pads 212 for mounting solder balls 24.” Hu '687, [0053].

FIG. 2F

Hu '687, FIG. 2F.

Appendix A-12 - Invalidity of U.S. Patent No. 9859202 in view of Hu '687 - U.S. Patent Publication No. 20130175687

	<p>To the extent Plaintiff contends that Hu '687 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Hu '687 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 2A, a first substrate 21 having a first surface 21 a and a second surface 21 b opposite to the first surface 21 a is provided. The first surface 21 a of the first substrate 21 has a plurality of bonding pads 211 a and a plurality of contact pads 211 b. The second surface 21 b of the first substrate 21 has a plurality of ball pads 212.” Hu '687, [0031].</p> <p>“Referring to FIG. 2E, the second metal posts 220 are connected to the first metal posts 210 (or the solder material 211 on the first metal posts 210), respectively, to thereby stack the second package structure 2 b on the first package structure 2 a.” Hu '687, [0038].</p>

Fig. 2.

Hu '687, FIG. 2E.

“Referring to FIG. 2F, an encapsulant 23 is formed between the insulating protection layer 213 on the first surface 21 a of the first substrate 21 and the insulating protection layer 223 on the fourth surface 22 b of the second substrate 22 to encapsulate the first electronic element 20.” Hu ’687, [0041].

	<p style="text-align: center;">FIG. 2F</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Hu '687, FIG. 2F.</p> <p>To the extent Plaintiff contends that Hu '687 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p> <p>Hu '687 discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p>See, e.g.:</p>

Appendix A-12 - Invalidity of U.S. Patent No. 9859202 in view of Hu '687 - U.S. Patent Publication No. 20130175687

	<p>“Referring to FIG. 2E, the second metal posts 220 are connected to the first metal posts 210 (or the solder material 211 on the first metal posts 210), respectively, to thereby stack the second package structure 2 b on the first package structure 2 a. In the present embodiment, the width d (or maximum diameter) of the end surfaces 210 a (surfaces bonding with the second metal posts 220) of the first metal posts 210 is greater than the width r of the end surfaces 220 a of the second metal posts 220. Such a difference in width facilitates alignment of the first and second package structures so as to avoid the risk of joint deviation. Further, increase in the heights of the first and second metal posts 210, 220 will not lead to an increase in the diameters of the first and second metal posts 210, 220. Therefore, a compact-sized and low-profiled device can be achieved. Furthermore, an increased number of the first and second metal posts 210, 220 can be provided in a predetermined region so as to facilitate the alignment of the first and second package structures 2 a, 2 b. Referring to FIG. 2F, an encapsulant 23 is formed between the insulating protection layer 213 on the first surface 21 a of the first substrate 21 and the insulating protection layer 223 on the fourth surface 22 b of the second substrate 22 to encapsulate the first electronic element 20.” Hu '687, [0037-0041].</p>

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Hu '687 discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 2D, a plurality of second metal posts 220 such as copper posts are formed on the exposed surfaces of the contact pads 221 b of the second substrate 22 by electroplating. The height h of the second metal posts 220 is less than the height t of the first metal posts 210 or less than the sum of the height of the first metal posts 210 and the height of the solder material 211. Further, a plurality of second electronic elements 25 a, 25 b are mounted on the exposed surfaces of the bonding pads 221 a of the second substrate 22 through solder bumps</p>

	<p>250 a. As such, a second package structure is obtained. The electrode pads 250 of the second electronic elements 25 a, 25 b are electrically connected to the second substrate 22 in a flip-chip manner.” Hu '687, [0036].</p>  <p style="text-align: center;">FIG. 2D</p> <p>Hu '687, FIG. 2D.</p> <p>“Referring to FIG. 2E, the second metal posts 220 are connected to the first metal posts 210 (or the solder material 211 on the first metal posts 210), respectively, to thereby stack the second package structure 2 b on the first package structure 2 a. In the present embodiment, the width d (or maximum diameter) of the end surfaces 210 a (surfaces bonding with the second metal posts 220) of the first metal posts 210 is greater than the width r of the end surfaces 220 a of the second metal posts 220.” Hu '687, [0038-0039].</p> <p>“Referring to FIG. 2F, an encapsulant 23 is formed between the insulating protection layer 213 on the first surface 21 a of the first substrate 21 and the insulating protection layer 223</p>
--	--

Appendix A-12 - Invalidity of U.S. Patent No. 9859202 in view of Hu '687 - U.S. Patent Publication No. 20130175687

	<p>on the fourth surface 22 b of the second substrate 22 to encapsulate the first electronic element 20.” Hu ’687, [0041].</p> <p>“Referring to FIG. 3, in another embodiment, the height h’ of the second metal posts 320 can be greater than the height t’ of the first metal posts 310, and the width d (such as diameter) of the end surfaces 310 a of the first metal posts 310 can be greater than the width r (such as diameter) of the end surfaces 320 a of the second metal posts 320. In the present embodiment, only one second electronic element 25 a such as an active component is disposed on the second substrate 22.” Hu ’687, [0045].</p> <p>“Referring to FIG. 4, in another embodiment, the height h” of the second metal posts 420 can be equal to the height t” of the first metal posts 410, and the first and second electronic elements 20 ’, 25 a ’ are electrically connected to the first and second substrates 21, 22, respectively, through wire bonding.” Hu ’687, [0047].</p> <p>“The second package structure 2 b has a second substrate 22 having a third surface 22 a and a fourth surface 22 b opposite to the third surface 22 a, and at least a second electronic element 25 a, 25 b, 25 ’ disposed on the third surface 22 a and electrically connected to the second substrate 22. The fourth surface 22 b of the second substrate 22 has a plurality of second metal posts 220, 320, 320 ’, 320 ”, 420 which are connected to the first metal posts 210, 310, 310 ’, 310 ”, 410, respectively, so as for the second package structure 2 b to be stacked on the first package structure 2 a.” Hu ’687, [0054].</p> <p>To the extent Plaintiff contends that Hu ’687 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 4, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of metal pillars of the bottom package substrate.</p>	<p>Hu '687 discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 2E, the second metal posts 220 are connected to the first metal posts 210 (or the solder material 211 on the first metal posts 210), respectively, to thereby stack the second package structure 2 b on the first package structure 2 a. In the present embodiment, the width d (or maximum diameter) of the end surfaces 210 a (surfaces bonding with the second metal posts 220) of the first metal posts 210 is greater than the width r of the end surfaces 220 a of the second metal posts 220. Such a difference in width facilitates alignment of the first and second package structures so as to avoid the risk of joint deviation.” Hu '687, [0038-0039].</p>

25

Hu '687, FIG. 2E.

“Further, increase in the heights of the first and second metal posts 210, 220 will not lead to an increase in the diameters of the first and second metal posts 210, 220.” Hu ’687, [0039-0040].

“Referring to FIG. 2 G', the width d' (such as diameter) of the end surfaces 210 b of the first metal posts 210' can be equal to the width r' (such as diameter) of the end surfaces 220 b of the second metal posts 220'. Although the end surfaces 210 b, 220 b of the metal posts 210', 220' have the same width, since variation in the size of the metal posts are easy to control, the use of the metal posts facilitates vertical stacking of the package structures and helps to reduce the risk of joint deviation as compared with the prior art.” Hu '687, [0042-0043].

Appendix A-12 - Invalidity of U.S. Patent No. 9859202 in view of Hu '687 - U.S. Patent Publication No. 20130175687

	<p>“Referring to FIG. 3, in another embodiment, the height h’ of the second metal posts 320 can be greater than the height t’ of the first metal posts 310, and the width d (such as diameter) of the end surfaces 310 a of the first metal posts 310 can be greater than the width r (such as diameter) of the end surfaces 320 a of the second metal posts 320.” Hu ’687, [0045].</p> <p>“The second package structure 2 b has a second substrate 22 having a third surface 22 a and a fourth surface 22 b opposite to the third surface 22 a, and at least a second electronic element 25 a, 25 b, 25 ’ disposed on the third surface 22 a and electrically connected to the second substrate 22. The fourth surface 22 b of the second substrate 22 has a plurality of second metal posts 220, 320, 320 ’, 320 ’’, 420 which are connected to the first metal posts 210, 310, 310 ’, 310 ’’, 410, respectively, so as for the second package structure 2 b to be stacked on the first package structure 2 a.” Hu ’687, [0054].</p> <p>“Furthermore, the width d, d’, d’’ of the end surfaces 210 a, 210 b, 210 c, 310 a, 310 b, 310 c of the first metal posts 210, 310, 310 ’, 310 ’’ is greater than, equal to or less than the width r, r’, r’’ of the end surfaces 220 a, 220 b, 220 c, 320 a, 320 b, 320 c of the second metal posts 220, 320, 320 ’, 320 ’’.” Hu ’687, [0058].</p> <p>To the extent Plaintiff contends that Hu ’687 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-13 - Invalidity of U.S. Patent No. 9859202 in view of Hu '083 - U.S. Patent Publication No. 20130249083

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Hu '083 - U.S. Patent Publication No. 20130249083

U.S. Patent Publication No. 20130249083 (“Hu '083”) is titled Packaging Substrate and lists Dyi-chung Hu, Ying-Chih Chan, and Chun-Ting Lin as inventors. Hu '083 is assigned to Unimicron Technology Corporation. Hu '083 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the '202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff's apparent infringement theory.² Hu '083 is a U.S. patent publication that was filed January 30, 2013 and published January 30, 2013. Hu '083 claims priority to TW 101205295 filed on March 23, 2012. Hu '083 is therefore prior art to the '202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Hu '083, or otherwise rendered obvious by disclosures and teachings of Hu '083, including under TopWire's apparent interpretation of the Asserted Claims as Samsung understands them from TopWire's Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Hu '083 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Hu '083 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung's other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung's Invalidity Contentions with respect to the '202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Hu '083, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire's March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court's order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire's apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung's interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-13 - Invalidity of U.S. Patent No. 9859202 in view of Hu '083 - U.S. Patent Publication No. 20130249083

To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Hu '083 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Hu '083 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Hu '083 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Hu '083 discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 1, a conventional packaging substrate 1 has a substrate body 10 having an upper surface 10 a with a circuit layer 11 a and a lower surface 10 b with a circuit layer 11 b. The circuit layer 11 a has a plurality of bonding pads 111 a, a plurality of first conductive pads 110 a and a plurality of second conductive pads 110 b, and the circuit layer 11 b has a plurality of bonding pads 111 b.” Hu '083, [0005].</p>

	<p>“In view of the above-described drawbacks, the present invention provides a packaging substrate, which comprises: a substrate body having two opposite surfaces respectively provided with a circuit layer, wherein the circuit layer on at least one of the surfaces of the substrate body has a plurality of first conductive pads and a plurality of second conductive pads; an insulating protective layer formed on the substrate body and the circuit layer and having a plurality of openings for exposing the first and second conductive pads; a plurality of first conductive posts respectively formed on the first conductive pads in the openings; a plurality of second conductive posts respectively formed on the second conductive pads in the openings and having a height greater than that of the first conductive posts; a first conductive bonding layer formed on each of the first conductive posts so as for the first conductive posts and the first conductive bonding layer to form first external connection structures; and a second conductive bonding layer formed on each of the second conductive posts so as for the second conductive posts and the second conductive bonding layer to form second external connection structures, wherein the first external connection structures have a height equal to that of the second external connection structures.” Hu ’083, [0010].</p> <p>“Referring to FIG. 2A, a substrate body 20 having an upper surface 20 a and a lower surface 20 b is provided. A circuit layer 21 a is formed on the upper surface 20 a and has a plurality of bonding pads 211 a, a plurality of first conductive pads 210 a and a plurality of second conductive pads 210 b. A circuit layer 21 b is formed on the lower surface 20 b and has a plurality of bonding pads 211 b. An insulating protective layer 22 a is formed on the upper surface 20 a, and the circuit layer 21 a and has a plurality of openings 220 a for exposing the bonding pads 211 a and the first and second conductive pads 210 a, 210 b. An insulating protective layer 22 b is formed on the lower surface 20 b and the circuit layer 21 b and has a plurality of openings 220 b for exposing the bonding pads 211 b.” Hu ’083, [0020-0021].</p>
--	---

	<p>“FIG. 3 is a schematic cross-sectional view showing the use of the packaging substrate 2 in subsequent packaging and stacking processes. Referring to FIG. 3, a semiconductor chip 28 is bonded to the bonding pads 211 a through the conductive bumps 212 in a flip-chip manner, and a plurality of solder balls 29 are mounted on the bonding pads 211 b for electrically connecting an electronic device such as a circuit board, so as to form a semiconductor package 2'. Then, a package 3 is bonded to the first and second external connection structures 27 a, 27 b.” Hu '083, [0035-0037].</p> <p>“The present invention further provides a packaging substrate 2, which has a substrate body 20 having an upper surface 20 a with a circuit layer 21 a and a lower surface 20 b with a circuit layer 21 b, wherein the circuit layers 21 a, 21 b have a plurality of bonding pads 211 a, 211 b, respectively, and the circuit layer 21 a further has a plurality of first conductive pads 210 a and a plurality of second conductive pads 210 b; an insulating protective layer 22 a formed on the upper surface 20 a and the circuit layer 21 a and an insulating protective layer 22 b formed on the lower surface 20 b and the circuit layer 21 b, wherein the insulating protective layer 22 a has a plurality of openings 220 a for exposing the first and second conductive pads 210 a, 210 b, respectively; a plurality of first conductive posts 23 a respectively formed on the first conductive pads 210 a; a plurality of second conductive posts 23 b respectively formed on the second conductive pads 210 b and having a height greater than that of the first conductive posts 23 a; a first conductive bonding layer 26 a formed on each of the first conductive posts 23 a so as for the first conductive posts 23 a and the first conductive bonding layer 26 a to form first external connection structures 27 a; and a second conductive bonding layer 26 b formed on each of the second conductive posts 23 b so as for the second conductive posts 23 b and the second conductive bonding layer 26 b to form second external connection structures 27 b, wherein the first external connection structures 27 a have a height equal to that of the second external connection structures 27 b.” Hu '083, [0039].</p>
--	---

	 <p data-bbox="1112 850 1161 976">FIG.3</p>
[1.A] a bottom package substrate;	Hu '083, FIG. 3. Hu '083 discloses, either expressly or inherently, a bottom package substrate.

	<p><i>See, e.g.:</i></p> <p>“Referring to FIG. 2A, a substrate body 20 having an upper surface 20 a and a lower surface 20 b is provided. A circuit layer 21 a is formed on the upper surface 20 a and has a plurality of bonding pads 211 a, a plurality of first conductive pads 210 a and a plurality of second conductive pads 210 b. A circuit layer 21 b is formed on the lower surface 20 b and has a plurality of bonding pads 211 b.” Hu ’083, [0020].</p> <p>“In an embodiment, the substrate body 20 further has a core layer 200, a plurality of internal circuits 201 formed on opposite surfaces of the core layer 200, a dielectric layer 202 formed on the core layer 200 and the internal circuits 201, a plurality of conductive vias 203 formed in the dielectric layer 202 for electrically connecting the circuit layers 21 a, 21 b and the internal circuits 201, and a plurality of conductive through holes 204 penetrating the core layer 200 for electrically connecting the internal circuits 201 on the opposite surfaces of the core layer 200. As such, the circuit layers 21 a, 21 b are the outermost circuit layer of the substrate body 20.” Hu ’083, [0022].</p> <p>“The present invention further provides a packaging substrate 2, which has a substrate body 20 having an upper surface 20 a with a circuit layer 21 a and a lower surface 20 b with a circuit layer 21 b, wherein the circuit layers 21 a, 21 b have a plurality of bonding pads 211 a, 211 b, respectively, and the circuit layer 21 a further has a plurality of first conductive pads 210 a and a plurality of second conductive pads 210 b; an insulating protective layer 22 a formed on the upper surface 20 a and the circuit layer 21 a and an insulating protective layer 22 b formed on the lower surface 20 b and the circuit layer 21 b, wherein the insulating protective layer 22 a has a plurality of openings 220 a for exposing the first and second conductive pads 210 a, 210 b, respectively; a plurality of first conductive posts 23 a</p>

Appendix A-13 - Invalidity of U.S. Patent No. 9859202 in view of Hu '083 - U.S. Patent Publication No. 20130249083

	<p>general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Hu '083 discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“According to the present invention, the conductive posts together with the conductive bonding layer formed thereon form a plurality of external connection structures with the same height so as prevent tilted stack structures and poor coplanarity in a subsequent stacking process, and tHu '083s to improve the product reliability.” Hu '083, [0013].</p> <p>“Referring to FIG. 2C, by using the conductive layer 24 as a current conductive path, an electroplating process is performed such that a plurality of first conductive posts 23 a are respectively formed on the first conductive pads 210 a and a plurality of second conductive posts 23 b are respectively formed on the second conductive pads 210 b. The height h of the second conductive posts 23 b is greater than the height t of the first conductive posts 23 a. In an embodiment, the first and second conductive posts 23 a, 23 b are metal posts such as copper posts.” Hu '083, [0028-0029].</p> <p>“In an embodiment, the first and second conductive posts 23 a, 23 b are metal posts, such as copper posts.” Hu '083, [0029].</p> <p>“Referring to FIG. 2D, a first conductive bonding layer 26 a is formed on each of the first conductive posts 23 a by printing or coating such that the first conductive posts 23 a and the first conductive bonding layer 26 a form a plurality of first external connection structures 27</p>

	<p>a; and a second conductive bonding layer 26 b is formed on each of the second conductive posts 23 b by printing or coating such that the second conductive posts 23 b and the second conductive bonding layer 26 b form a plurality of second external connection structures 27 b. The height d of the first external connection structures 27 a is equal to the height d of the second external connection structures 27 b.” Hu ’083, [0030].</p> <p>“In an embodiment, the first and second conductive bonding layers 26 a, 26 b are made of a conductive paste such as a copper paste. Referring to FIG. 2E, the resist layer 25 and the conductive layer 24 under the resist layer 25 are removed. In another embodiment, referring to FIG. 2E’, a plurality of third and fourth external connection structures 27 c, 27 d are further formed on the lower surface 20 b of a substrate body 20’. That is, external connection structures are formed on both the upper and lower surfaces 20 a, 20 b of the substrate body 20’. Since a post made of a copper paste or made of electroplated copper in combination with a copper paste generally has a porous structure, water can easily accumulate in the porous structure during a subsequent wet process, thereby adversely affecting the quality of the structure. Therefore, referring to FIG. 2F, a surface finish layer 270 is formed on each of the first and second external connection structures 27 a, 27 b for facilitating a subsequent solder joint or electrical connection process. In an embodiment, the surface finish layer 270 is made of electroplated nickel/gold, ENIG (Electroless Nickel Immersion Gold) or ENEPIG (Electroless Nickel Electroless Palladium Immersion Gold). In another embodiment, referring to FIG. 2F’, an electroless plated copper layer 270 a is formed on the first and second external connection structures 27 a, 27 b and then an electroplated copper layer 270 b is formed on the electroless plated copper layer 270 such that the electroless plated copper layer 270 a and the electroplated copper layer 270 b constitute a surface finish layer 270’. Preferably, the surface finish layer 270, 270’ has a thickness greater than 3 um. FIG. 3 is a schematic cross-sectional view showing the use of the packaging substrate 2 in subsequent packaging and stacking processes.” Hu ’083, [0031-0035].</p>
--	--

	<p>“Then, a package 3 is bonded to the first and second external connection structures 27 a, 27 b. The package 3 has a packaging substrate 30, a semiconductor chip 31 disposed on the packaging substrate 30 and a plurality of external connection structures 300 formed on the packaging substrate 30. The external connection structures 30 are aligned and bonded to the first and second external connection structures 27 a, 27 b, respectively, so as for the package 3 to be stacked on the semiconductor package 2', thereby forming a package stack structure. In an embodiment, the packaging substrate 30 is similar to the packaging substrate 2, and the external connection structures 30 are similar to the first and second external connection structures 27 a, 27 b.” Hu '083, [0037].</p>
--	--

	<div data-bbox="316 472 998 1291"></div> <div data-bbox="1071 850 1120 976"><p>FIG.3</p></div> <div data-bbox="1177 1186 1209 1386"><p>Hu '083, FIG. 3.</p></div> <div data-bbox="1258 178 1339 1291"><p>“In the packaging substrate 2, the first and second conductive posts 23 a, 23 b together with the first and second conductive bonding layers 26 a, 26 b respectively formed thereon</p></div>

	<p>general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.H] the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector,</p>	<p>Hu '083 discloses, either expressly or inherently, the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“According to the present invention, the conductive posts together with the conductive bonding layer formed thereon form a plurality of external connection structures with the same height so as prevent tilted stack structures and poor coplanarity in a subsequent stacking process, and tHu '083s to improve the product reliability.” Hu '083, [0013].</p> <p>“Referring to FIG. 2C, by using the conductive layer 24 as a current conductive path, an electroplating process is performed such that a plurality of first conductive posts 23 a are respectively formed on the first conductive pads 210 a and a plurality of second conductive posts 23 b are respectively formed on the second conductive pads 210 b. The height h of the second conductive posts 23 b is greater than the height t of the first conductive posts 23 a. In an embodiment, the first and second conductive posts 23 a, 23 b are metal posts such as copper posts.” Hu '083, [0028-0029].</p> <p>“Referring to FIG. 2D, a first conductive bonding layer 26 a is formed on each of the first conductive posts 23 a by printing or coating such that the first conductive posts 23 a and the first conductive bonding layer 26 a form a plurality of first external connection structures 27 a; and a second conductive bonding layer 26 b is formed on each of the second conductive posts 23 b by printing or coating such that the second conductive posts 23 b and the second</p>

	<p>conductive bonding layer 26 b form a plurality of second external connection structures 27 b. The height d of the first external connection structures 27 a is equal to the height d of the second external connection structures 27 b.” Hu ’083, [0030].</p> <p>“In an embodiment, the first and second conductive bonding layers 26 a, 26 b are made of a conductive paste such as a copper paste. Referring to FIG. 2E, the resist layer 25 and the conductive layer 24 under the resist layer 25 are removed. In another embodiment, referring to FIG. 2E’, a plurality of third and fourth external connection structures 27 c, 27 d are further formed on the lower surface 20 b of a substrate body 20’. That is, external connection structures are formed on both the upper and lower surfaces 20 a, 20 b of the substrate body 20’. Since a post made of a copper paste or made of electroplated copper in combination with a copper paste generally has a porous structure, water can easily accumulate in the porous structure during a subsequent wet process, thereby adversely affecting the quality of the structure. Therefore, referring to FIG. 2F, a surface finish layer 270 is formed on each of the first and second external connection structures 27 a, 27 b for facilitating a subsequent solder joint or electrical connection process. In an embodiment, the surface finish layer 270 is made of electroplated nickel/gold, ENIG (Electroless Nickel Immersion Gold) or ENEPIG (Electroless Nickel Electroless Palladium Immersion Gold). In another embodiment, referring to FIG. 2F’, an electroless plated copper layer 270 a is formed on the first and second external connection structures 27 a, 27 b and then an electroplated copper layer 270 b is formed on the electroless plated copper layer 270 such that the electroless plated copper layer 270 a and the electroplated copper layer 270 b constitute a surface finish layer 270’. Preferably, the surface finish layer 270, 270’ has a thickness greater than 3 um. FIG. 3 is a schematic cross-sectional view showing the use of the packaging substrate 2 in subsequent packaging and stacking processes.” Hu ’083, [0031-0035].</p>
--	---

	<p>“Then, a package 3 is bonded to the first and second external connection structures 27 a, 27 b. The package 3 has a packaging substrate 30, a semiconductor chip 31 disposed on the packaging substrate 30 and a plurality of external connection structures 300 formed on the packaging substrate 30. The external connection structures 30 are aligned and bonded to the first and second external connection structures 27 a, 27 b, respectively, so as for the package 3 to be stacked on the semiconductor package 2', thereby forming a package stack structure. In an embodiment, the packaging substrate 30 is similar to the packaging substrate 2, and the external connection structures 30 are similar to the first and second external connection structures 27 a, 27 b.” Hu '083, [0037].</p>
--	--

FIG.3

Hu '083, FIG. 3.

“In the packaging substrate 2, the first and second conductive posts 23 a, 23 b together with the first and second conductive bonding layers 26 a, 26 b respectively formed thereon

	<p>constitute a plurality of first and second external connection structures 27 a, 27 b having the same height d, thereby preventing tilt of the packaging substrate 30 during a subsequent stacking process, improving the coplanarity and consequently effectively improving the product reliability.” Hu ’083, [0038].</p> <p>“The present invention further provides a packaging substrate 2, which has a substrate body 20 having an upper surface 20 a with a circuit layer 21 a and a lower surface 20 b with a circuit layer 21 b, wherein the circuit layers 21 a, 21 b have a plurality of bonding pads 211 a, 211 b, respectively, and the circuit layer 21 a further has a plurality of first conductive pads 210 a and a plurality of second conductive pads 210 b; an insulating protective layer 22 a formed on the upper surface 20 a and the circuit layer 21 a and an insulating protective layer 22 b formed on the lower surface 20 b and the circuit layer 21 b, wherein the insulating protective layer 22 a has a plurality of openings 220 a for exposing the first and second conductive pads 210 a, 210 b, respectively; a plurality of first conductive posts 23 a respectively formed on the first conductive pads 210 a; a plurality of second conductive posts 23 b respectively formed on the second conductive pads 210 b and having a height greater than that of the first conductive posts 23 a; a first conductive bonding layer 26 a formed on each of the first conductive posts 23 a so as for the first conductive posts 23 a and the first conductive bonding layer 26 a to form first external connection structures 27 a; and a second conductive bonding layer 26 b formed on each of the second conductive posts 23 b so as for the second conductive posts 23 b and the second conductive bonding layer 26 b to form second external connection structures 27 b, wherein the first external connection structures 27 a have a height equal to that of the second external connection structures 27 b.” Hu ’083, [0039].</p> <p>To the extent Plaintiff contends that Hu ’083 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the</p>

Appendix A-14 - Invalidity of U.S. Patent No. 9859202 in view of Hu '659 - U.S. Patent No. 9357659

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Hu '659 - U.S. Patent No. 9357659

U.S. Patent No. 9357659 (“Hu ’659”) is titled Packaging Substrate Having Embedded Through-Via Interposer and lists Dyi-Chung Hu, and Tzyy-Jang Tseng as inventors. Hu ’659 is assigned to Unimicron Technology Corporation. Hu ’659 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Hu ’659 is a U.S. patent that was filed January 22, 2015 and published May 14, 2015. Hu ’659 claims priority to TW 100139667 filed on October 31, 2011. Hu ’659 is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Hu ’659, or otherwise rendered obvious by disclosures and teachings of Hu ’659, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Hu ’659 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Hu ’659 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Hu ’659, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-14 - Invalidity of U.S. Patent No. 9859202 in view of Hu '659 - U.S. Patent No. 9357659

To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Hu '659 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Hu '659 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Hu '659 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Hu '659 discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 2I, a multi-layer circuit structure may be formed according to practical needs. In an embodiment, the built-up structure 23 has at least a dielectric layer 230, a circuit layer 231 embedded in the dielectric layer 230, and a plurality of conductive vias 232 formed in the dielectric layer 230 and electrically connected with the circuit layer 231. Portions of the conductive vias 232' electrically connect with the second end surfaces 200 b of the conductive through-vias 200.” Hu '659, [6:18-6:26].</p>

FIG. 2I'

Hu '659, FIG. 2I'.

“Referring to FIGS. 2J, 2J' and 2J'', the structure of FIG. 2I, 2I' or 2I'' is singulated along imaginary scribing lines L of FIG. 2I so as to obtain a plurality of packaging substrates 2, 2' or 2'' having an embedded through-via interposer 20.” Hu '659, [6:44-6:47].

“The present invention further provides a packaging substrate 2, 2', 2'' having an embedded through-via interposer 20. The packaging substrate 2, 2', 2'' comprises an encapsulant layer 22 having a first surface 22 a, 22 a', 22 a'' and an opposite second surface 22 b; a through-via interposer 20 embedded in the encapsulant layer 22, a redistribution layer 21 embedded in the encapsulant layer 22 and formed on the through-via interposer 20, a built-up structure 23 formed on the second surface 22 b of the encapsulant layer 22, and an insulating protective layer 24 formed on the built-up structure 23. The through-via interposer 20 has opposite first surface 20 a and second side 20 b, and a plurality of conductive through-vias 200 in communication with the first side 20 a and the second side 20 b. Each of the conductive through-vias 200 has a first end surface 200 a on the first side 20 a of the through-via

Appendix A-14 - Invalidity of U.S. Patent No. 9859202 in view of Hu '659 - U.S. Patent No. 9357659

	<p>interposer 20, and a second end surface 200 b on the second side 20 b of the through-via interposer 20, and an insulating layer 201 is formed on the sidewall of the conductive through-via 200. The second side 20 b of the through-via interposer 20 and the second end surfaces 200 b of the conductive through-vias 200 are flush with the second surface 22 b of the encapsulant layer 22.” Hu '659, [6:56-7:10].</p>
<p>[1.A] a bottom package substrate;</p>	<p>Hu '659 discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIGS. 2G to 2I, a built-up structure 23 is formed on the second surface 22 b of the encapsulant layer 22, the second sides 20 b of the interposers 20, and the second end surfaces 200 b of the conductive through-vias 200.” Hu '659, [5:52-5:55].</p> <div data-bbox="868 462 1104 1333" data-label="Image"> </div> <p style="text-align: center;">FIG. 2I'</p> <p>Hu '659, FIG. 2I'.</p>

Appendix A-14 - Invalidity of U.S. Patent No. 9859202 in view of Hu '659 - U.S. Patent No. 9357659

	<p>“Referring to FIGS. 2J, 2J’ and 2 J”, the structure of FIG. 2I, 2I’ or 2 I” is singulated along imaginary scribing lines L of FIG. 2I so as to obtain a plurality of packaging substrates 2, 2’ or 2” having an embedded through-via interposer 20. Before or after the singulation process, a plurality of solder balls 25 can be mounted on the conductive pads 233 for other electronic devices such as printed circuit boards or semiconductor packages to be mounted thereon.” Hu ’659, [6:44-6:51].</p> <p>“Before or after the singulation process, a plurality of solder balls 25 can be mounted on the conductive pads 233 for other electronic devices such as printed circuit boards or semiconductor packages to be mounted thereon.” Hu ’659, [6:48-6:51].</p> <p>“Referring to FIGS. 3E, 3E’ and 3 E”, the structures 3 D, 3 D’ and 3 D” are singulated along the imaginary scribing lines L of FIG. 3D so as to obtain a plurality of packaging substrates 3, 3’ and 3” having an embedded through-via interposer 30. Before or after the singulation process, a plurality of solder balls 25 can be mounted on the conductive pads 233 for electrically connecting to other electronic devices such as printed circuit boards or packages.” Hu ’659, [8:40-8:47].</p> <p>To the extent Plaintiff contends that Hu ’659 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.B] a top package substrate stacked on top of the bottom package substrate;	<p>Hu ’659 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p>

	 <p style="text-align: center;">FIG. 2I'</p> <p>Hu '659, FIG. 2I'.</p> <p>To the extent Plaintiff contends that Hu '659 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Hu '659 discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 2I, a multi-layer circuit structure may be formed according to practical needs. In an embodiment, the built-up structure 23 has at least a dielectric layer 230, a circuit layer 231 embedded in the dielectric layer 230, and a plurality of conductive vias 232 formed in the dielectric layer 230 and electrically connected with the circuit layer 231. Portions of</p>

the conductive vias 232' electrically connect with the second end surfaces 200 b of the conductive through-vias 200." Hu '659, [6:18-6:26].

FIG. 2I'

Hu '659, FIG. 2I'.

"The present invention further provides a packaging substrate 2, 2', 2'' having an embedded through-via interposer 20. The packaging substrate 2, 2', 2'' comprises an encapsulant layer 22 having a first surface 22 a, 22 a', 22 a'' and an opposite second surface 22 b; a through-via interposer 20 embedded in the encapsulant layer 22, a redistribution layer 21 embedded in the encapsulant layer 22 and formed on the through-via interposer 20, a built-up structure 23 formed on the second surface 22 b of the encapsulant layer 22, and an insulating protective layer 24 formed on the built-up structure 23. The through-via interposer 20 has opposite first surface 20 a and second side 20 b, and a plurality of conductive through-vias 200 in communication with the first side 20 a and the second side 20 b. Each of the conductive through-vias 200 has a first end surface 200 a on the first side 20 a of the through-via interposer 20, and a second end surface 200 b on the second side 20 b of the through-via

Appendix A-14 - Invalidity of U.S. Patent No. 9859202 in view of Hu '659 - U.S. Patent No. 9357659

	<p>interposer 20, and an insulating layer 201 is formed on the sidewall of the conductive through-via 200. The second side 20 b of the through-via interposer 20 and the second end surfaces 200 b of the conductive through-vias 200 are flush with the second surface 22 b of the encapsulant layer 22.” Hu ’659, [6:56-7:10].</p> <p>To the extent Plaintiff contends that Hu ’659 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.D] the spacer connector comprises a core substrate;</p>	<p>Hu ’659 discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIGS. 2G to 2I, a built-up structure 23 is formed on the second surface 22 b of the encapsulant layer 22, the second sides 20 b of the interposers 20, and the second end surfaces 200 b of the conductive through-vias 200.” Hu ’659, [5:52-5:55].</p> <p>“Referring to FIG. 2I, a multi-layer circuit structure may be formed according to practical needs. In an embodiment, the built-up structure 23 has at least a dielectric layer 230, a circuit layer 231 embedded in the dielectric layer 230, and a plurality of conductive vias 232 formed in the dielectric layer 230 and electrically connected with the circuit layer 231. Portions of the conductive vias 232’ electrically connect with the second end surfaces 200 b of the conductive through-vias 200.” Hu ’659, [6:18-6:26].</p>

FIG. 2I'

Hu '659, FIG. 2I'.

“The present invention further provides a packaging substrate 2, 2', 2'' having an embedded through-via interposer 20. The packaging substrate 2, 2', 2'' comprises an encapsulant layer 22 having a first surface 22 a, 22 a', 22 a'' and an opposite second surface 22 b; a through-via interposer 20 embedded in the encapsulant layer 22, a redistribution layer 21 embedded in the encapsulant layer 22 and formed on the through-via interposer 20, and an insulating protective layer 24 formed on the built-up structure 23. The through-via interposer 20 has opposite first surface 20 a and second side 20 b, and a plurality of conductive through-vias 200 in communication with the first side 20 a and the second side 20 b. Each of the conductive through-vias 200 has a first end surface 200 a on the first side 20 a of the through-via interposer 20, and a second end surface 200 b on the second side 20 b of the through-via interposer 20, and an insulating layer 201 is formed on the sidewall of the conductive through-via 200. The second side 20 b of the through-via interposer 20 and the second end

Appendix A-14 - Invalidity of U.S. Patent No. 9859202 in view of Hu '659 - U.S. Patent No. 9357659

	<p>surfaces 200 b of the conductive through-vias 200 are flush with the second surface 22 b of the encapsulant layer 22.” Hu ’659, [6:56-7:10].</p> <p>To the extent Plaintiff contends that Hu ’659 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Hu ’659 discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Accordingly, the present invention provides a packaging substrate having an embedded through-via interposer, comprising: an encapsulant layer having opposite first and second surfaces; a through-via interposer embedded in the encapsulant layer and having opposite first and second sides and a plurality of conductive through-vias in communication with the first and second sides, wherein each of the conductive through-vias has a first end surface on the first side of the through-via interposer and a second end surface on the second side of the through-via interposer, and the second side of the through-via interposer is flush with the second end surfaces of the conductive through-vias and the second surface of the encapsulant layer; a redistribution layer embedded in the encapsulant layer and formed on the first side of the through-via interposer and the first end surfaces of the conductive through-vias so as to electrically connect with the first end surfaces of the conductive through-vias, wherein the outermost layer of the redistribution layer has electrode pads; and a built-up structure formed on the second surface of the encapsulant layer, the second side of the through-via interposer and the second end surfaces of the conductive through-vias, and having at least a dielectric</p>

Appendix A-14 - Invalidity of U.S. Patent No. 9859202 in view of Hu '659 - U.S. Patent No. 9357659

	<p>layer, a circuit layer embedded in the dielectric layer and a plurality of conductive vias formed in the dielectric layer for electrically connecting with the circuit layer, wherein portions of the conductive vias electrically connect with the second end surfaces of the conductive through-vias, respectively.” Hu ’659, [1:64-2:23].</p> <p>“The present invention further provides a method of fabricating a packaging substrate having an embedded through-via interposer, comprising: providing a through-via interposer having opposite first and second sides and a plurality of conductive through-vias in communication with the first and second sides, wherein each of the conductive through-vias has a first end surface on the first side of the through-via interposer and a second end surface on the second side of the through-via interposer, and the second end surfaces of the conductive through-vias are flush with the second side of the through-via interposer; forming a redistribution layer on the first side of the through-via interposer and the first end surfaces of the conductive through-vias such that the redistribution layer electrically connects with the first end surfaces of the conductive through-vias, wherein the outermost layer of the redistribution layer has electrode pads; forming an encapsulant layer to encapsulate and embed the through-via interposer, wherein the encapsulant layer has opposite first and second surfaces, and the second side of the through-via interposer and the second end surfaces of the conductive through-vias are flush with the second surface of the encapsulant layer, and the encapsulant layer covers the redistribution layer and the electrode pads; and forming a built-up structure on the second surface of the encapsulant layer, the second side of the through-via interposer and the second end surfaces of the conductive through-vias, wherein the built-up structure has at least a dielectric layer, a circuit layer embedded in the dielectric layer and a plurality of conductive vias formed in the dielectric layer for electrically connecting with the circuit layer, wherein portions of the conductive vias electrically connect with the second end surfaces of the conductive through-vias, respectively.” Hu ’659, [2:52-3:15].</p>
--	--

Appendix A-14 - Invalidity of U.S. Patent No. 9859202 in view of Hu '659 - U.S. Patent No. 9357659

	<p>“The present invention further provides another method of fabricating a packaging substrate having an embedded through-via interposer, comprising: providing a through-via interposer having opposite first and second sides and a plurality of conductive through-vias in communication with the first and second sides, wherein each of the conductive through-vias has a first end surface on the first side of the through-via interposer and a second end surface on the second side of the through-via interposer, and the second end surfaces of the conductive through-vias protrude above the second side of the through-via interposer to serve as conductive bumps; forming a redistribution layer on the first side of the through-via interposer and the first end surfaces of the conductive through-vias such that the redistribution layer electrically connects with the first end surfaces of the conductive through-vias, wherein the outermost layer of the redistribution layer has electrode pads; forming an encapsulant layer to encapsulate and embed the through-via interposer, wherein the encapsulant layer has opposite first and second surfaces, the second side of the through-via interposer is exposed from the second surface of the encapsulant layer, the conductive bumps protrude above the second surface of the encapsulant layer, and the encapsulant layer covers the redistribution layer and the electrode pads; and forming a built-up structure on the second surface of the encapsulant layer, the second side of the through-via interposer and the conductive bumps, wherein the built-up structure has at least a dielectric layer, a circuit layer formed on the dielectric layer and a plurality of conductive vias formed in the dielectric layer for electrically connecting with the circuit layer, wherein portions of the conductive vias electrically connect with the conductive bumps, respectively.” Hu '659, [3:17-3:48].</p> <p>“Referring to FIG. 2I, a multi-layer circuit structure may be formed according to practical needs. In an embodiment, the built-up structure 23 has at least a dielectric layer 230, a circuit layer 231 embedded in the dielectric layer 230, and a plurality of conductive vias 232 formed in the dielectric layer 230 and electrically connected with the circuit layer 231. Portions of</p>

Appendix A-14 - Invalidity of U.S. Patent No. 9859202 in view of Hu '659 - U.S. Patent No. 9357659

	<p>“Before or after the singulation process, a plurality of solder balls 25 can be mounted on the conductive pads 233 for other electronic devices such as printed circuit boards or semiconductor packages to be mounted thereon.” Hu ’659, [6:48-6:51].</p> <p>“The present invention further provides a packaging substrate 2, 2’, 2” having an embedded through-via interposer 20. The packaging substrate 2, 2’, 2” comprises an encapsulant layer 22 having a first surface 22 a, 22 a’, 22 a” and an opposite second surface 22 b; a through-via interposer 20 embedded in the encapsulant layer 22, a redistribution layer 21 embedded in the encapsulant layer 22 and formed on the through-via interposer 20, a built-up structure 23 formed on the second surface 22 b of the encapsulant layer 22, and an insulating protective layer 24 formed on the built-up structure 23. The through-via interposer 20 has opposite first surface 20 a and second side 20 b, and a plurality of conductive through-vias 200 in communication with the first side 20 a and the second side 20 b. Each of the conductive through-vias 200 has a first end surface 200 a on the first side 20 a of the through-via interposer 20, and a second end surface 200 b on the second side 20 b of the through-via interposer 20, and an insulating layer 201 is formed on the sidewall of the conductive through-via 200. The second side 20 b of the through-via interposer 20 and the second end surfaces 200 b of the conductive through-vias 200 are flush with the second surface 22 b of the encapsulant layer 22.” Hu ’659, [6:56-7:10].</p> <p>“The redistribution layer 21 is disposed on the first side 20 a of the through-via interposer 20 and the first end surfaces 200 a of the conductive through-vias 200 and electrically connects with the first end surfaces 200 a of the conductive through-vias 200. The outermost layer of the redistribution layer 21 has a plurality of electrode pads 210.” Hu ’659, [7:11-7:16].</p>
--	--

Appendix A-14 - Invalidity of U.S. Patent No. 9859202 in view of Hu '659 - U.S. Patent No. 9357659

	<p>To the extent Plaintiff contends that Hu '659 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.G] wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate,</p>	<p>Hu '659 discloses, either expressly or inherently, wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 2B, an insulating layer 201 is formed on sidewalls and bottom portions of the through-vias 200 ', and a copper material is applied to fill the through-vias 200 ' so as to form a plurality of conductive through-vias 200. Each of the conductive through-vias 200 has a first end surface 200 a and a second end surface 200 b corresponding to the first side 20 a and the second side 20 b ' of the interposer 20 ', respectively.” Hu '659, [4:52-4:58].</p> <p>“Referring to FIG. 2D, the first side 20 a of the interposer 20 ' and the redistribution layer 21 are attached to a carrier (not shown), and the second side 20 b of the interposer 20 ' is polished, such that the second end surfaces 200 b of the conductive through-vias 200 are exposed from the second side 20 b of the interposer 20 '.” Hu '659, [5:11-5:16].</p> <p>“Referring to FIG. 2I, a multi-layer circuit structure may be formed according to practical needs. In an embodiment, the built-up structure 23 has at least a dielectric layer 230, a circuit layer 231 embedded in the dielectric layer 230, and a plurality of conductive vias 232 formed in the dielectric layer 230 and electrically connected with the circuit layer 231. Portions of the conductive vias 232' electrically connect with the second end surfaces 200 b of the conductive through-vias 200.” Hu '659, [6:18-6:26].</p>

Hu '659, FIG. 2I'.

“The present invention further provides a packaging substrate 2, 2', 2'' having an embedded through-via interposer 20. The packaging substrate 2, 2', 2'' comprises an encapsulant layer 22 having a first surface 22 a, 22 a', 22 a'' and an opposite second surface 22 b; a through-via interposer 20 embedded in the encapsulant layer 22, a redistribution layer 21 embedded in the encapsulant layer 22 and formed on the through-via interposer 20, a built-up structure 23 formed on the second surface 22 b of the encapsulant layer 22, and an insulating protective layer 24 formed on the built-up structure 23. The through-via interposer 20 has opposite first surface 20 a and second side 20 b, and a plurality of conductive through-vias 200 in communication with the first side 20 a and the second side 20 b. Each of the conductive through-vias 200 has a first end surface 200 a on the first side 20 a of the through-via interposer 20, and a second end surface 200 b on the second side 20 b of the through-via interposer 20, and an insulating layer 201 is formed on the sidewall of the conductive through-via 200. The second side 20 b of the through-via interposer 20 and the second end

Appendix A-14 - Invalidity of U.S. Patent No. 9859202 in view of Hu '659 - U.S. Patent No. 9357659

	<p>surfaces 200 b of the conductive through-vias 200 are flush with the second surface 22 b of the encapsulant layer 22.” Hu ’659, [6:56-7:10].</p> <p>“Referring to FIG. 3C, the structure is singulated along imaginary scribing lines K of FIG. 3B to obtain a plurality of through-via interposers 30. Then, an encapsulate layer 22 having opposite first side 22 a and second surface 22 b is formed to encapsulate and embed the through-via interposers 30. The second sides 30 b of the through-via interposers 30 are exposed from the second surface 22 b of the encapsulant layer 22, and the conductive bumps 301 protrude from the second surface 22 b of the encapsulant layer 22.” Hu ’659, [8:5-8:15].</p> <p>“According to the present embodiment, the second end surfaces 300 b of the conductive through-vias 300 protrude above the second sides 30 b of the through-via interposers 30 to serve as conductive bumps 301. When the circuit intaglios 230 a are formed in the built-up structure 23 via a laser technique, high temperature and pressure generated due the application of the laser technique can be absorbed by the conductive bumps 301 made of a hard material, thereby avoiding damage of the through-via interposers 30 made of a brittle material.” Hu ’659, [8:48-8:56].</p> <p>“Each of the conductive through-vias 300 has a first end surface 300 a on the first side 30 a of the through-via interposer 30 and a second end surface 300 b on the second side 30 b of the through-via interposer 30, and an insulating layer 201 is formed on the sidewall of the conductive through-via 300. The second side 30 b of the through-via interposer 30 is exposed from the second surface 22 b of the encapsulant layer 22. The second end surfaces 300 b of the conductive through-vias 300 protrude above the second side 30 b of the through-via interposer 30 and the second surface 22 b of the encapsulant layer 22 so as to serve as conductive bumps 301.” Hu ’659, [9:35-9:45].</p>

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

U.S. Patent No.8017436 (“Huemoeller”) is titled Thin Substrate Fabrication Method and Structure and lists Ronald Patrick Huemoeller, Sukianto Rusli, Bob Shih-Wei Kuo, Jon Gregory Aday, Lee John Smith, and Robert F. Darveau as inventors. Huemoeller is assigned to Amkor Technology, Inc. Huemoeller anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Huemoeller is a U.S. patent that was filed December 10, 2007. Huemoeller is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Huemoeller, or otherwise rendered obvious by disclosures and teachings of Huemoeller, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Huemoeller does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Huemoeller with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Huemoeller, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Huemoeller “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Huemoeller or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Huemoeller set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Huemoeller discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 28 is a copper pillar flip chip in substrate formation method 2800 in accordance with one embodiment of the present invention. FIG. 29 is a cross-sectional view of a package 2900 during fabrication in accordance with one embodiment. FIGS. 30, 31, 32, 33, 34, 35, 36 are cross-sectional views of package 2900 of FIG. 29 at various stages during fabrication in accordance with various embodiments of the present invention. Referring now to FIGS. 28 and 29 together, in a form circuit pattern on carrier operation 2802, a circuit pattern 2902 is</p>

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>formed on a carrier 2904. Carrier 2904 is similar to top carrier 204 of FIG. 2 and so is not discussed in detail. Further, circuit pattern 2902 is similar to circuit pattern 202 of FIG. 2 and formed in a similar manner and so is not discussed in detail. In accordance with this embodiment, circuit pattern 2902 includes patterned etch stop layer 2906 and patterned conductor layer 2908. Patterned etch stop layer 2906 is formed on carrier 2904. Patterned conductor layer 2908 is formed on patterned etch stop layer 2906. Patterned etch stop layer 2906 and patterned conductor layer 2908 are similar to patterned etch stop layer 206 and patterned conductor layer 208 of FIG. 2 and formed in a similar manner, respectively, and so are not discussed in detail.” Huemoeller, [11:39-11:62].</p> <p>“FIG. 37 is a cross-sectional view of a package 2900 A in accordance with another embodiment. Package 2900 A of FIG. 37 is an example of an exposed chip in substrate (CIS) package. Package 2900 A of FIG. 37 is similar to package 2900 of FIG. 36 and only the significant differences between the packages are discussed below. Referring now to FIG. 37, in accordance with this embodiment, package body 3324 partially encapsulates die 836 such that inactive surface 842 of die 836 is exposed. In this manner, heat transfer from die 836 to the ambient environment is maximized. In another example, a heat sink is attached to exposed inactive surface 842 of die 836.” Huemoeller, [14:18-14:29].</p> <p>“FIG. 38 is a cross-sectional view of a package 2900 B in accordance with another embodiment. Package 2900 B of FIG. 38 is an example of a chip in substrate (CIS) plus shielding package. Package 2900 B of FIG. 38 is similar to package 2900 of FIG. 36 and only the significant differences between the packages are discussed below. Referring now to FIG. 38, in accordance with this embodiment, an electrically conductive shielding layer 3832, e.g., copper or other electrically conductive material, is formed on an upper, e.g., first, surface 3324 U of package body 3324. In accordance with this embodiment, shielding layer 3832 extends around sides 2900 S of package 2900 B. Sides 2900 S are defined by coplanar sides</p>
--	--

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>3324 S of package body 3324, sides 3010 S of dielectric material 3010, and sides 3526 S of upper and lower buildup dielectric materials 3526, 3526 A. However, in another embodiment, shielding layer 3832 is formed only on upper surface 3324 U of package body 3324.” Huemoeller, [14:30-14:46].</p> <p>“FIG. 39 is a cross-sectional view of a package 2900 C in accordance with another embodiment. Package 2900 C of FIG. 39 is an example of a chip in substrate (CIS) plus soldered top interposer package. Package 2900 C of FIG. 39 is similar to package 2900 of FIG. 36 and only the significant differences between the packages are discussed below. Referring now to FIGS. 28 and 39 together, from form interconnection balls operation 2824 (or directly from fill artifacts with electrically conductive material operation 2822 if form interconnection balls operation 2824 is not performed), flow moves to a form laser-ablated artifacts operation 2826. In form laser-ablated artifacts operation 2826, package body 3324 and dielectric material 3010 are laser-ablated resulting in the formation of laser-ablated artifacts extending through package body 3324 and dielectric material 3010 and to circuit pattern 2902. More particularly, portions of circuit pattern 2902 are exposed through the laser-ablated artifacts. The laser-ablated artifacts are formed using a laser-ablation process in a manner similar to that described above regarding form artifacts in additional dielectric operation 112 of FIG. 1 and so is only briefly repeated here. During this laser-ablation process, a laser beam is directed at package body 3324 and moved. The laser beam laser-ablates at least partially, and in some places through, package body 3324 and dielectric material 3010. Accordingly, the laser-ablated artifacts are formed at least partially, and in some places through, package body 3324. Further, the laser-ablated artifacts are formed through dielectric material 3010 to expose portions of circuit pattern 2902. The laser-ablated artifacts include laser-ablated channels, laser-ablated land openings, and/or laser-ablated via apertures. The laser-ablated via apertures extend through both package body 3324 and dielectric material 3010 to expose portions of circuit pattern 2902. From form laser-ablated</p>
--	--

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>artifacts 2826, flow moves to a fill laser-ablated artifacts operation 2830. In fill laser-ablated artifacts operation 2830, the laser-ablated artifacts are filled with an electrically conductive filler material, e.g., copper, to form redistribution circuit pattern 3934 as illustrated in FIG. 39. The laser-ablated artifacts are filled with an electrically conductive filler material in a manner similar to that described above regarding fill artifacts with electrically conductive material operation 114 of FIG. 1 and so is only briefly discussed here. As shown in FIG. 39, redistribution circuit pattern 3934 is embedded within package body 3324 and dielectric material 3010. Redistribution circuit pattern 3934 includes electrically conductive traces, lands, and/or vias. In accordance with this embodiment, redistribution circuit pattern 3934 includes electrically conductive vias 3936 electrically connected to circuit pattern 2902. The upper exposed surfaces of vias 3936 form lands 3937 of redistribution circuit pattern 3934. From fill laser-ablated artifacts operation 2830, flow moves to a mount additional structures operation 2832. In mount additional structures operation 2832, additional structures such as an interposer 3938 are mounted to package body 3324 and/or redistribution circuit pattern 3934. Interposer 3938 is electrically connected, e.g., soldered, to redistribution circuit pattern 3934. In one embodiment, interposer 3938 is a structure, e.g., a printed circuit board, to which other structures such as an integrated circuit die are mounted. Interposer 3938 redistributes the pattern of redistribution circuit pattern 3934 to match the footprint of the structure mounted to interposer 3938.” Huemoeller, [14:53-15:51].</p> <p>“FIG. 40 is a cross-sectional view of a package 2900 D in accordance with another embodiment. Package 2900 D of FIG. 40 is an example of a chip in substrate (CIS) plus flip chip (FC) package. In another embodiment, package 2900 D of FIG. 40 is an example of a chip in substrate (CIS) plus full array LOT for system on package. Package 2900 D of FIG. 40 is similar to package 2900 C of FIG. 39 and only the significant differences between the packages are discussed below. Referring now to FIGS. 28 and 40 together, performance of form laser-ablated artifacts operation 2826 and fill laser-ablated artifacts operation 2830</p>
--	--

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>forms redistribution circuit pattern 3934 A electrically connected to circuit pattern 2902. In accordance with this embodiment, redistribution circuit pattern 3934 A includes a plurality of lands 3937 A, e.g., distributed as a fully array of lands on upper surface 3324 U of package body 3324. In mount additional structures operation 2832, an electronic structure 4040 is mounted to redistribution circuit pattern 3934 A by electrically conductive bumps 4042. In one embodiment, electronic structure 4040 is die, e.g., an integrated circuit die, having a lower, e.g., first, surface 4044 (e.g., an active surface in this embodiment) with terminals 4046 (e.g., bond pads in this embodiment) formed thereon. Terminals 4046 are physically and electrically flip chip connected to lands 3937 A of redistribution circuit pattern 3934 A by bumps 4042, e.g., flip chip bumps. In another embodiment, electronic structure 4040 is electronic component package, e.g., that includes a die, in a package on package (PoP) configuration. In accordance with this embodiment, terminals 4046 are physically and electrically connected to lands 3937 A of redistribution circuit pattern 3934 A by bumps 4042, e.g., interconnection balls such as ball grid array solder balls.” Huemoeller, [15:52-16:18].</p> <p>“FIG. 41 is a cross-sectional view of a package 2900 E in accordance with another embodiment. Package 2900 E of FIG. 41 is an example of a chip in substrate (CIS) plus flip chip (FC) plus package on package (PoP) package. Package 2900 E of FIG. 41 is similar to package 2900 D of FIG. 40 and only the significant differences between the packages are discussed below. Referring now to FIGS. 28 and 41 together, in mount additional structures operation 2832, inner and outer, e.g., first and second, electronic structures 4148, 4150 are mounted to redistribution circuit pattern 3934 A by inner and outer, e.g., first and second, electrically conductive bumps 4152, 4154. In one embodiment, inner electronic structure 4148 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Inner electronic structure 4148 includes a lower, e.g., first, surface 4156 with terminals 4158 formed thereon. Inner electronic structure 4148 further includes an</p>
--	--

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>upper, e.g., second, surface 4160 opposite lower surface 4156. Terminals 4158 are physically and electrically connected to lands 3937 A of redistribution circuit pattern 3934 A by inner electrically conductive bumps 4152. Outer electronic structure 4150 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Outer electronic structure 4150 includes a lower, e.g., first, surface 4162 with terminals 4164 formed thereon. Outer electronic structure 4150 further includes an upper, e.g., second, surface 4166 opposite lower surface 4162. Terminals 4164 are physically and electrically connected to lands 3937 A of redistribution circuit pattern 3934 A by outer electrically conductive bumps 4154. More particularly, outer electrically conductive bumps 4154 space outer electronic structure 4150 above inner electronic structure 4148 as illustrated in FIG. 41 such that lower surface 4162 of outer electronic structure 4150 is above upper surface 4160 of inner electronic structure 4148.” Huemoeller, [16:18-16:53].</p>
--	--

Huemoeller, FIG. 41.

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

<p>[1.A] a bottom package substrate;</p>	<p>Huemoeller discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“From embed circuit pattern in dielectric operation 106, flow moves to a remove top carrier operation 108. In remove top carrier operation 108, top carrier 204 is removed, e.g., using a selective etch as discussed above, resulting in the structure as illustrated in FIG. 3. From remove top carrier operation 108, flow moves, optionally, to a form blind vias operation 109. In form blind vias operation 109, at least one electrically conductive blind via 314 is formed. Blind vias 314 extend through dielectric material 212 between upper surface 212 U and lower surface 212 L. Blind vias 314 electrically connect circuit pattern 202 to bottom carrier 210 through dielectric material 212.” Huemoeller, [4:1-4:12].</p> <p>“Referring now to FIGS. 1, 4 and 5 together, from fill artifacts with electrically conductive material operation 114, flow moves to a pattern bottom carrier into stiffener operation 116. In pattern bottom carrier into stiffener operation 116, bottom carrier 210 is patterned into a stiffener 502. In one embodiment, bottom carrier 210 is etched to remove a portion of bottom carrier 210, and the remaining portion of bottom carrier 210 forms stiffener 502. Bottom carrier 210 is patterned using a photoimageable dielectric or resist in one embodiment. As stiffener 502 is formed from bottom carrier 210, i.e., is built into package 200, package 200 is formed with stiffener 502 without use of an adhesive to mount stiffener 502.” Huemoeller, [5:49-5:61].</p> <p>“Referring now to FIGS. 15 and 16 together, in a form circuit patterns on top and bottom carriers operation 1502, a top, e.g., first, circuit pattern 1602 is formed on a first, e.g., top,</p>
---	---

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>carrier 1604 and a bottom, e.g., second, circuit pattern 1602 A is formed on a second, e.g., bottom, carrier 1604 A, sometimes called a removable carrier. Carriers 1604, 1604 A are similar to top carrier 204 and bottom carrier 210 of FIG. 2 and so are not discussed in detail. Bottom carrier 1604 A acts as a stiffener during thin coreless package formation method 1500.” Huemoeller, [8:59-9:1].</p> <p>“Referring now to FIGS. 15, 23 and 24 together, from encapsulate operation 1520 (or directly from wirebond operation 1518 if encapsulate operation 1520 is not performed), flow moves to a remove bottom carrier operation 1522. In remove bottom carrier operation 1522, bottom carrier 1604 A is removed, e.g., using a selective etch process as discussed above. By retaining bottom carrier 1604 A in the operations leading up to remove bottom carrier operation 1522, bottom carrier 1604 A acts a stiffener during the manufacture of package 1600.” Huemoeller, [10:38-10:47].</p> <p>“Referring now to FIGS. 28 and 29 together, in a form circuit pattern on carrier operation 2802, a circuit pattern 2902 is formed on a carrier 2904. Carrier 2904 is similar to top carrier 204 of FIG. 2 and so is not discussed in detail. Further, circuit pattern 2902 is similar to circuit pattern 202 of FIG. 2 and formed in a similar manner and so is not discussed in detail.” Huemoeller, [11:47-11:53].</p> <p>“FIG. 41 is a cross-sectional view of a package 2900E in accordance with another embodiment. Package 2900E of FIG. 41 is an example of a chip in substrate (CIS) plus flip chip (FC) plus package on package (PoP) package. Package 2900E of FIG. 41 is similar to package 2900D of FIG. 40 and only the significant differences between the packages are discussed below. Referring now to FIGS. 28 and 41 together, in mount additional structures operation 2832, inner and outer, e.g., first and second, electronic structures 4148, 4150 are mounted to redistribution circuit pattern 3934A by inner and outer, e.g., first and second,</p>
--	--

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>electrically conductive bumps 4152, 4154. In one embodiment, inner electronic structure 4148 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Inner electronic structure 4148 includes a lower, e.g., first, surface 4156 with terminals 4158 formed thereon. Inner electronic structure 4148 further includes an upper, e.g., second, surface 4160 opposite lower surface 4156. Terminals 4158 are physically and electrically connected to lands 3937A of redistribution circuit pattern 3934A by inner electrically conductive bumps 4152. Outer electronic structure 4150 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Outer electronic structure 4150 includes a lower, e.g., first, surface 4162 with terminals 4164 formed thereon. Outer electronic structure 4150 further includes an upper, e.g., second, surface 4166 opposite lower surface 4162. Terminals 4164 are physically and electrically connected to lands 3937A of redistribution circuit pattern 3934A by outer electrically conductive bumps 4154. More particularly, outer electrically conductive bumps 4154 space outer electronic structure 4150 above inner electronic structure 4148 as illustrated in FIG. 41 such that lower surface 4162 of outer electronic structure 4150 is above upper surface 4160 of inner electronic structure 4148.” Huemoeller, [16:19-16:55].</p>
--	---

Huemoeller, FIG. 41.

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>To the extent Plaintiff contends that Huemoeller fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Huemoeller discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring now to FIGS. 15, 16 and 17 together, from form circuit patterns on top and bottom carriers operation 1502, flow moves to an embed circuit patterns in dielectric operation 1504. In embed circuit patterns in dielectric operation 1504, circuit pattern 1602, 1602 A are embedded within a dielectric material 1610 in a manner similar to that discussed above in relation to embed circuit pattern in dielectric operation 106 of FIG. 1 and so is not discussed in detail. More particularly, as shown in FIG. 17, circuit pattern 1602 is embedded into an upper, e.g., first, surface 1610 U of dielectric material 1610. Similarly, circuit pattern 1602 A is embedded into a lower, e.g., second, surface 1610 L of dielectric material 1610. Dielectric material 1610 remains between circuit patterns 1602, 1602 A thereby electrically isolating circuit pattern 1602, 1602 A from each other.” Huemoeller, [9:15-9:29].</p> <p>“Referring now to FIGS. 15 and 20 together, from fill blind via apertures with electrically conductive material operation 1510, flow moves, optionally, to a form resist over bond fingers operation 1512. In form resist over bond fingers operation 1512, photoresist 2016 is selectively formed over bond fingers 2018, sometimes called lands, of top circuit pattern 1602. In one embodiment, the exposed top surface of a blind via 1914 forms a bond fingers 2018. Photoresist 2016 is formed using any one of a number of techniques and the particular</p>

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>technique used is not essential to this embodiment. Referring now to FIGS. 15 and 21 together, from form resist over bond fingers operation 1512 (or directly from fill blind via apertures with electrically conductive material operation 1510 if form resist over bond fingers operation 1512 is not performed), flow moves to a die attach operation 1514. In die attach operation 1514, die 836 is die attached to upper surface 1610 U of dielectric material 1610. In the embodiment illustrated in FIG. 21, in addition to being attached to upper surface 1610 U of dielectric material 1610, die 836 is also die attached directly to top circuit pattern 1602 and the exposed top surface of a blind via 1914.” Huemoeller, [9:55-10:8].</p> <p>“Referring now to FIGS. 28 and 35 together, from remove carrier operation 2816, flow moves to a mount additional dielectric operation 2818. In mount additional dielectric operation 2818, an upper, e.g., first, buildup dielectric material 3526 is mounted to dielectric material 3010 and circuit pattern 2902. More particularly, an upper, e.g., first, surface 3526 U of upper buildup dielectric material 3526 is mounted to lower surface 3010 L of dielectric material 3010. Upper buildup dielectric material 3526 further includes a lower, e.g., second, surface 3526 L opposite upper surface 3526 U. From mount additional dielectric operation 2818, flow moves to a form artifacts in additional dielectric operation 2820. In form artifacts in additional dielectric operation 2820, upper buildup dielectric material 3526 is laser-ablated resulting in the formation of laser-ablated artifacts in upper buildup dielectric material 3526.” Huemoeller, [13:6-13:22].</p> <p>“As indicated by the dashed arrow in FIG. 28, operations 2818, 2820, and 2822 can be repeated any one of a number of times to form additional buildup circuit patterns in additional buildup dielectric materials. In accordance with the embodiment illustrated in FIG. 35, operations 2818, 2820, and 2822 are repeated a second time to form a lower, e.g., second, buildup circuit pattern 3528 A in a lower, e.g., second, buildup dielectric material 3526 A.</p>

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>Lower buildup circuit pattern 3528 A redistributes the pattern of upper buildup circuit pattern 3528 to the pattern of lower buildup circuit pattern 3528 A.” Huemoeller, [13:55-13:65].</p> <p>“Referring now to FIGS. 28 and 39 together, from form interconnection balls operation 2824 (or directly from fill artifacts with electrically conductive material operation 2822 if form interconnection balls operation 2824 is not performed), flow moves to a form laser-ablated artifacts operation 2826. In form laser-ablated artifacts operation 2826, package body 3324 and dielectric material 3010 are laser-ablated resulting in the formation of laser-ablated artifacts extending through package body 3324 and dielectric material 3010 and to circuit pattern 2902. More particularly, portions of circuit pattern 2902 are exposed through the laser-ablated artifacts. The laser-ablated artifacts are formed using a laser-ablation process in a manner similar to that described above regarding form artifacts in additional dielectric operation 112 of FIG. 1 and so is only briefly repeated here. During this laser-ablation process, a laser beam is directed at package body 3324 and moved. The laser beam laser-ablates at least partially, and in some places through, package body 3324 and dielectric material 3010. Accordingly, the laser-ablated artifacts are formed at least partially, and in some places through, package body 3324. Further, the laser-ablated artifacts are formed through dielectric material 3010 to expose portions of circuit pattern 2902. The laser-ablated artifacts include laser-ablated channels, laser-ablated land openings, and/or laser-ablated via apertures. The laser-ablated via apertures extend through both package body 3324 and dielectric material 3010 to expose portions of circuit pattern 2902. From form laser-ablated artifacts 2826, flow moves to a fill laser-ablated artifacts operation 2830. In fill laser-ablated artifacts operation 2830, the laser-ablated artifacts are filled with an electrically conductive filler material, e.g., copper, to form redistribution circuit pattern 3934 as illustrated in FIG. 39.” Huemoeller, [14:59-15:26].</p>

FIG. 41

Huemoeller, FIG. 41.

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>“FIG. 41 is a cross-sectional view of a package 2900E in accordance with another embodiment. Package 2900E of FIG. 41 is an example of a chip in substrate (CIS) plus flip chip (FC) plus package on package (PoP) package. Package 2900E of FIG. 41 is similar to package 2900D of FIG. 40 and only the significant differences between the packages are discussed below. Referring now to FIGS. 28 and 41 together, in mount additional structures operation 2832, inner and outer, e.g., first and second, electronic structures 4148, 4150 are mounted to redistribution circuit pattern 3934A by inner and outer, e.g., first and second, electrically conductive bumps 4152, 4154. In one embodiment, inner electronic structure 4148 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Inner electronic structure 4148 includes a lower, e.g., first, surface 4156 with terminals 4158 formed thereon. Inner electronic structure 4148 further includes an upper, e.g., second, surface 4160 opposite lower surface 4156. Terminals 4158 are physically and electrically connected to lands 3937A of redistribution circuit pattern 3934A by inner electrically conductive bumps 4152. Outer electronic structure 4150 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Outer electronic structure 4150 includes a lower, e.g., first, surface 4162 with terminals 4164 formed thereon. Outer electronic structure 4150 further includes an upper, e.g., second, surface 4166 opposite lower surface 4162. Terminals 4164 are physically and electrically connected to lands 3937A of redistribution circuit pattern 3934A by outer electrically conductive bumps 4154. More particularly, outer electrically conductive bumps 4154 space outer electronic structure 4150 above inner electronic structure 4148 as illustrated in FIG. 41 such that lower surface 4162 of outer electronic structure 4150 is above upper surface 4160 of inner electronic structure 4148.” Huemoeller, [16:19-16:55].</p> <p>To the extent Plaintiff contends that Huemoeller fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the</p>

	<p>general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Huemoeller discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“As shown in FIG. 4, buildup circuit pattern 418 is embedded within buildup dielectric material 416. Buildup circuit pattern 418 includes electrically conductive traces, lands, and/or vias. In one embodiment, buildup circuit pattern 418 redistributes the pattern of circuit pattern 202 to the pattern of buildup circuit pattern 418. In one embodiment, a trace extends horizontally and in a direction parallel with upper surface 416 U of buildup dielectric material 416. To illustrate, buildup circuit pattern 418 includes a trace 420. Trace 420 is embedded within upper surface 416 U of buildup dielectric material 416 such that buildup dielectric material 416 remains between trace 420 and lower surface 416 L of buildup dielectric material 416. To further illustrate, buildup circuit pattern 418 includes a land 422, sometimes called a pad. Land 422 is embedded within upper surface 416 U of buildup dielectric material 416 such that buildup dielectric material 416 remains between land 422 and lower surface 416 L of buildup dielectric material 416. To further illustrate, embedded buildup circuit pattern 418 includes vias 424, sometimes called blind vias. Vias 424 extend between upper surface 416 U and lower surface 416 L of buildup dielectric material 416. Vias 424 are electrically connected to circuit pattern 202.” Huemoeller, [5:16-5:39].</p> <p>“In form blind via apertures operation 1508, blind via apertures 1812 are formed. Blind via apertures 1812 extend through dielectric material 1610 between upper surface 1610 U and lower surface 1610 L. In one embodiment, blind via apertures 1812 are formed in dielectric</p>

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>material 1610 using laser-ablation and thus have a taper shape as illustrated. Generally, blind via apertures 1812 are formed between top circuit pattern 1602 and bottom circuit pattern 1602 A. Referring now to FIGS. 15 and 19 together, from form blind via apertures operation 1508, flow moves to a fill blind via apertures with electrically conductive material operation 1510. In fill blind via apertures with electrically conductive material operation 1510, blind via apertures 1812 are filled, e.g., with plated copper or other conductive material, to form electrically conductive blind vias 1914. Blind vias 1914 extend between and electrically connect circuit patterns 1602, 1602 A with one another through dielectric material 1610.” Huemoeller, [9:37-9:54].</p> <p>“In form bump pad openings operation 2806, bump pad openings 3112 are formed within dielectric layer 3010 to expose lands 3114 of circuit pattern 2902. Bump pad openings 3112 extend from upper surface 3010 U of dielectric material 3010, through dielectric material 3010 to expose lands 3114. In one embodiment, bump pad openings 3112 are formed using a laser-ablation process and thus have a taper shaped as illustrated in FIG. 31. Referring now to FIGS. 28, 31 and 32 together, from form bump pad openings operation 2806, flow moves to a fill bump pad openings with electrically conductive material operation 2810. In fill bump pad openings with electrically conductive material operation 2810, bump pad openings 3112 are filled with electrically conductive material, e.g., tin plating, to form electrically conductive vias 3216 within bump pad openings 3112. Vias 3216 extend from upper surface 3010 U of dielectric material 3010, through dielectric material 3010, to contact and be electrically connected to lands 3114.” Huemoeller, [12:22-12:39].</p> <p>“As shown in FIG. 35, upper buildup circuit pattern 3528 is embedded within upper buildup dielectric material 3526. Upper buildup circuit pattern 3528 includes electrically conductive traces, lands, and/or vias. In one embodiment, upper buildup circuit pattern 3528 redistributes the pattern of circuit pattern 2902 to the pattern of upper buildup circuit pattern 3528. As</p>
--	--

	<p>indicated by the dashed arrow in FIG. 28, operations 2818, 2820, and 2822 can be repeated any one of a number of times to form additional buildup circuit patterns in additional buildup dielectric materials. In accordance with the embodiment illustrated in FIG. 35, operations 2818, 2820, and 2822 are repeated a second time to form a lower, e.g., second, buildup circuit pattern 3528 A in a lower, e.g., second, buildup dielectric material 3526 A.” Huemoeller, [13:48-13:62].</p> <p>“The laser-ablated via apertures extend through both package body 3324 and dielectric material 3010 to expose portions of circuit pattern 2902. From form laser-ablated artifacts 2826, flow moves to a fill laser-ablated artifacts operation 2830. In fill laser-ablated artifacts operation 2830, the laser-ablated artifacts are filled with an electrically conductive filler material, e.g., copper, to form redistribution circuit pattern 3934 as illustrated in FIG. 39. The laser-ablated artifacts are filled with an electrically conductive filler material in a manner similar to that described above regarding fill artifacts with electrically conductive material operation 114 of FIG. 1 and so is only briefly discussed here. As shown in FIG. 39, redistribution circuit pattern 3934 is embedded within package body 3324 and dielectric material 3010. Redistribution circuit pattern 3934 includes electrically conductive traces, lands, and/or vias. In accordance with this embodiment, redistribution circuit pattern 3934 includes electrically conductive vias 3936 electrically connected to circuit pattern 2902.” Huemoeller, [15:18-15:38].</p> <p>“FIG. 41 is a cross-sectional view of a package 2900E in accordance with another embodiment. Package 2900E of FIG. 41 is an example of a chip in substrate (CIS) plus flip chip (FC) plus package on package (PoP) package. Package 2900E of FIG. 41 is similar to package 2900D of FIG. 40 and only the significant differences between the packages are discussed below. FIG. 41

Huemoeller, FIG. 41.

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>“FIG. 41 is a cross-sectional view of a package 2900E in accordance with another embodiment. Package 2900E of FIG. 41 is an example of a chip in substrate (CIS) plus flip chip (FC) plus package on package (PoP) package. Package 2900E of FIG. 41 is similar to package 2900D of FIG. 40 and only the significant differences between the packages are discussed below. Referring now to FIGS. 28 and 41 together, in mount additional structures operation 2832, inner and outer, e.g., first and second, electronic structures 4148, 4150 are mounted to redistribution circuit pattern 3934A by inner and outer, e.g., first and second, electrically conductive bumps 4152, 4154. In one embodiment, inner electronic structure 4148 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Inner electronic structure 4148 includes a lower, e.g., first, surface 4156 with terminals 4158 formed thereon. Inner electronic structure 4148 further includes an upper, e.g., second, surface 4160 opposite lower surface 4156. Terminals 4158 are physically and electrically connected to lands 3937A of redistribution circuit pattern 3934A by inner electrically conductive bumps 4152. Outer electronic structure 4150 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Outer electronic structure 4150 includes a lower, e.g., first, surface 4162 with terminals 4164 formed thereon. Outer electronic structure 4150 further includes an upper, e.g., second, surface 4166 opposite lower surface 4162. Terminals 4164 are physically and electrically connected to lands 3937A of redistribution circuit pattern 3934A by outer electrically conductive bumps 4154. More particularly, outer electrically conductive bumps 4154 space outer electronic structure 4150 above inner electronic structure 4148 as illustrated in FIG. 41 such that lower surface 4162 of outer electronic structure 4150 is above upper surface 4160 of inner electronic structure 4148.” Huemoeller, [16:19-16:55].</p> <p>To the extent Plaintiff contends that Huemoeller fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the</p>

Huemoeller, FIG. 41.

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>To the extent Plaintiff contends that Huemoeller fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.H] the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector,</p>	<p>Huemoeller discloses, either expressly or inherently, the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“In form blind vias operation 109, at least one electrically conductive blind via 314 is formed. Blind vias 314 extend through dielectric material 212 between upper surface 212 U and lower surface 212 L. Blind vias 314 electrically connect circuit pattern 202 to bottom carrier 210 through dielectric material 212. In one embodiment, to form blind vias 314, via apertures, sometimes called blind via apertures, are formed in dielectric material 212 using laser-ablation. Generally, the via apertures are formed between circuit pattern 202 and bottom carrier 210. The via apertures are filled, e.g., with copper or other conductive material, to form blind vias 314.” Huemoeller, [4:7-4:18].</p> <p>“In fill bump pad openings with electrically conductive material operation 2810, bump pad openings 3112 are filled with electrically conductive material, e.g., tin plating, to form electrically conductive vias 3216 within bump pad openings 3112. Vias 3216 extend from upper surface 3010 U of dielectric material 3010, through dielectric material 3010, to contact and be electrically connected to lands 3114. Vias 3216 include upper exposed surfaces that define lands 3218, which are coplanar with upper surface 3010 U of dielectric material 3010. From fill bump pad openings with electrically conductive material operation 2810, flow</p>

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>moves to a flip chip die attach operation 2812. In flip chip die attach operation 2812, die 836 is flip chip attached to vias 3216. More particularly, bond pads 840 of die 836 are physically and electrically connected to lands 3218 of vias 3216 by flip chip bumps 3220. Flip chip bumps 3220 are copper pillars or gold stud bumps in various embodiments although solder can be used.” Huemoeller, [12:33-12:50].</p> <p>“From mount additional dielectric operation 2818, flow moves to a form artifacts in additional dielectric operation 2820. In form artifacts in additional dielectric operation 2820, upper buildup dielectric material 3526 is laser-ablated resulting in the formation of laser-ablated artifacts in upper buildup dielectric material 3526. The laser-ablated artifacts are formed using a laser-ablation process in a manner similar to that described above regarding form artifacts in additional dielectric operation 112 of FIG. 1 and so is only briefly repeated here. During this laser-ablation process, a laser beam is directed at upper buildup dielectric material 3526 and moved. The laser beam laser-ablates at least partially, and in some places through, upper buildup dielectric material 3526. Accordingly, the laser-ablated artifacts are formed at least partially, and in some places through, upper buildup dielectric material 3526. The laser-ablated artifacts include laser-ablated channels, laser-ablated land openings, and/or laser-ablated via apertures. From form artifacts in additional dielectric operation 2820, flow moves to a fill artifacts with electrically conductive material operation 2822. In fill artifacts with electrically conductive material operation 2822, the laser-ablated artifacts are filled with an electrically conductive filler material, e.g., copper, to form an upper, e.g., first, buildup circuit pattern 3528 as illustrated in FIG. 35. The laser-ablated artifacts are filled with an electrically conductive filler material in a manner similar to that described above regarding fill artifacts with electrically conductive material operation 114 of FIG. 1 and so is only briefly discussed here. As shown in FIG. 35, upper buildup circuit pattern 3528 is embedded within upper buildup dielectric material 3526. Upper buildup circuit pattern 3528 includes electrically conductive traces, lands, and/or vias. In one embodiment, upper buildup circuit</p>

Package 2900E of FIG. 41 is similar to package 2900D of FIG. 40 and only the significant differences between the packages are discussed below. Referring now to FIGS. 28 and 41 together, in mount additional structures operation 2832, inner and outer, e.g., first and second, electronic structures 4148, 4150 are mounted to redistribution circuit pattern 3934A by inner and outer, e.g., first and second, electrically conductive bumps 4152, 4154. In one embodiment, inner electronic structure 4148 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Inner electronic structure 4148 includes a lower, e.g., first, surface 4156 with terminals 4158 formed thereon. Inner electronic structure 4148 further includes an upper, e.g., second, surface 4160 opposite lower surface 4156. Terminals 4158 are physically and electrically connected to lands 3937A of redistribution circuit pattern 3934A by inner electrically conductive bumps 4152. Outer electronic structure 4150 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Outer electronic structure 4150 includes a lower, e.g., first, surface 4162 with terminals 4164 formed thereon. Outer electronic structure 4150 further includes an upper, e.g., second, surface 4166 opposite lower surface 4162. Terminals 4164 are physically and electrically</p>

FIG. 41

Huemoeller, FIG. 41.

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>“Terminals 4158 are physically and electrically connected to lands 3937 A of redistribution circuit pattern 3934 A by inner electrically conductive bumps 4152.” Huemoeller, [16:38-16:40].</p> <p>To the extent Plaintiff contends that Huemoeller fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.K] a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein</p>	<p>Huemoeller discloses, either expressly or inherently, a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“In die attach operation 118, a die 836 is attached to dielectric material 212. Die 836 is generally an electronic component and in one embodiment is an integrated circuit die. Die 836 includes an active surface 838 having bond pads 840 thereon. Die 836 further includes an inactive surface 842 opposite active surface 838. In die attach operation 118, inactive surface 842 is attached to lower surface 212 L of dielectric material 212 by a die attach adhesive 844. From die attach operation 118, flow moves to a wirebond operation 120. In wirebond operation 120, bond pads 840 of die 836 are wire bonded (electrically connected) to lands 834 of circuit pattern 202 by bond wires 846.” Huemoeller, [6:53-6:67].</p>

Huemoeller, FIG. 41.

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>“In die attach operation 1514, die 836 is die attached to upper surface 1610 U of dielectric material 1610. In the embodiment illustrated in FIG. 21, in addition to being attached to upper surface 1610 U of dielectric material 1610, die 836 is also die attached directly to top circuit pattern 1602 and the exposed top surface of a blind via 1914. Die 836 is attached without use of a soldermask over top circuit pattern 1602 and the exposed top surface of blind via 1914. More particularly, inactive surface 842 is attached to upper surface 1610 U of dielectric material 1610, top circuit pattern 1602 and/or the exposed top surface of a blind via 1914 by die attach adhesive 844.” Huemoeller, [10:3-10:14].</p> <p>“Referring now to FIGS. 15 and 27 together, in flip chip die attach operation 1528, die 836 is flip chip attached to bond fingers 2018. More particularly, bond pads 840 of die 836 are physically and electrically connected to bond fingers 2018 by flip chip bumps 2752. From flip chip die attach operation 1528, flow moves, optionally, to encapsulate operation 1520, or directly to remove bottom carrier operation 1522, either of which is performed as discussed above.” Huemoeller, [11:24-11:32].</p> <p>“In flip chip die attach operation 2812, die 836 is flip chip attached to vias 3216. More particularly, bond pads 840 of die 836 are physically and electrically connected to lands 3218 of vias 3216 by flip chip bumps 3220. Flip chip bumps 3220 are copper pillars or gold stud bumps in various embodiments although solder can be used.” Huemoeller, [12:45-12:50].</p> <p>“In one embodiment, an underfill material 3322 is applied between upper surface 3010 U of dielectric material 3010 and active surface 838 of die 836 and around flip chip bumps 3220. A package body 3324 is then applied to encapsulate die 836, underfill 3322, and the exposed portion of upper surface 3010 U of dielectric material 3010.” Huemoeller, [12:53-12:58].</p>
--	--

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>“Referring now to FIG. 37, in accordance with this embodiment, package body 3324 partially encapsulates die 836 such that inactive surface 842 of die 836 is exposed. In this manner, heat transfer from die 836 to the ambient environment is maximized.” Huemoeller, [14:23-14:27].</p> <p>“FIG. 41 is a cross-sectional view of a package 2900E in accordance with another embodiment. Package 2900E of FIG. 41 is an example of a chip in substrate (CIS) plus flip chip (FC) plus package on package (PoP) package. Package 2900E of FIG. 41 is similar to package 2900D of FIG. 40 and only the significant differences between the packages are discussed below. Referring now to FIGS. 28 and 41 together, in mount additional structures operation 2832, inner and outer, e.g., first and second, electronic structures 4148, 4150 are mounted to redistribution circuit pattern 3934A by inner and outer, e.g., first and second, electrically conductive bumps 4152, 4154. In one embodiment, inner electronic structure 4148 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Inner electronic structure 4148 includes a lower, e.g., first, surface 4156 with terminals 4158 formed thereon. Inner electronic structure 4148 further includes an upper, e.g., second, surface 4160 opposite lower surface 4156. Terminals 4158 are physically and electrically connected to lands 3937A of redistribution circuit pattern 3934A by inner electrically conductive bumps 4152. Outer electronic structure 4150 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Outer electronic structure 4150 includes a lower, e.g., first, surface 4162 with terminals 4164 formed thereon. Outer electronic structure 4150 further includes an upper, e.g., second, surface 4166 opposite lower surface 4162. Terminals 4164 are physically and electrically connected to lands 3937A of redistribution circuit pattern 3934A by outer electrically conductive bumps 4154. More particularly, outer electrically conductive bumps 4154 space outer electronic structure 4150 above inner electronic structure 4148 as illustrated in FIG. 41</p>

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to the bottom ends of the plurality of metal pillars of the bottom package substrate via the plurality of metal pillars of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Huemoeller discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“Referring now to FIGS. 1, 2 and 3 together, from provide bottom carrier with dielectric operation 104, flow moves to an embed circuit pattern in dielectric operation 106. In embed circuit pattern in dielectric operation 106, circuit pattern 202 is embedded within dielectric layer 212. More particularly, as shown in FIG. 3, circuit pattern 202 is embedded into an upper, e.g., first, surface 212 U of dielectric material 212. A lower, e.g., second, surface 212 L of dielectric material 212 is mounted to bottom carrier 210. In accordance with one embodiment, circuit pattern 202 is placed on upper surface 212 U of dielectric layer 212. The</p>

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>assembly is heated while circuit pattern 202 is pressed into dielectric material 212, sometimes called a dielectric layer. Due to the heat and pressure, dielectric material 212 is caused to flow around circuit pattern 202 and to top carrier 204. Generally, dielectric material 212 flows to encapsulate circuit pattern 202 within dielectric material 212 such that dielectric material 212 contacts top carrier 204 in the spaces between circuit pattern 202. Dielectric material 212 remains between circuit pattern 202 and bottom carrier 210 thereby electrically isolating circuit pattern 202 and bottom carrier 210 from each other. Stated another way, circuit pattern 202 floats in dielectric material 212. From embed circuit pattern in dielectric operation 106, flow moves to a remove top carrier operation 108. In remove top carrier operation 108, top carrier 204 is removed, e.g., using a selective etch as discussed above, resulting in the structure as illustrated in FIG. 3. From remove top carrier operation 108, flow moves, optionally, to a form blind vias operation 109. In form blind vias operation 109, at least one electrically conductive blind via 314 is formed. Blind vias 314 extend through dielectric material 212 between upper surface 212 U and lower surface 212 L. Blind vias 314 electrically connect circuit pattern 202 to bottom carrier 210 through dielectric material 212. In one embodiment, to form blind vias 314, via apertures, sometimes called blind via apertures, are formed in dielectric material 212 using laser-ablation. Generally, the via apertures are formed between circuit pattern 202 and bottom carrier 210. The via apertures are filled, e.g., with copper or other conductive material, to form blind vias 314.” Huemoeller, [3:45-4:18].</p> <p>“Referring now to FIGS. 1 and 4 together, from form blind vias operation 109 (or directly from remove top carrier operation 108 if form blind vias operation 109 is not performed), flow moves to a mount additional dielectric operation 110. In mount additional dielectric operation 110, a buildup dielectric material 416, sometimes called a buildup dielectric layer or a coreless buildup layer, is mounted to dielectric material 212 and circuit pattern 202. Generally, buildup dielectric material 416 is mounted to dielectric material 212 and over</p>
--	---

	<p>circuit pattern 202 and blind vias 314. More particularly, a lower, e.g., first, surface 416 L of buildup dielectric material 416 is mounted to upper surface 212 U of dielectric material 212. Buildup dielectric material 416 further includes an upper, e.g., second, surface 416 U opposite lower surface 416 L. From mount additional dielectric operation 110, flow moves to a form artifacts in additional dielectric operation 112. In form artifacts in additional dielectric operation 112, buildup dielectric material 416 is laser-ablated resulting in the formation of laser-ablated artifacts in buildup dielectric material 416. The laser-ablated artifacts are formed using a laser-ablation process. During this laser-ablation process, a laser beam is directed at buildup dielectric material 416 and moved. The laser beam laser-ablates at least partially, and in some places through, buildup dielectric material 416. Accordingly, the laser-ablated artifacts are formed at least partially, and in some places through, buildup dielectric material 416. As illustrated in FIG. 4, in one embodiment, the laser-ablated artifacts have a taper profile with the greatest width at upper surface 416 U of buildup dielectric material 416 due to the laser-ablation process. The laser-ablated artifacts include laser-ablated channels, laser-ablated land openings, and/or laser-ablated via apertures. Generally, channels, land openings, and via apertures are particularly shaped laser-ablated voids in buildup dielectric material 416. In one embodiment, a laser-ablated channel, sometimes called a trench, extends horizontally and in a direction parallel with upper surface 416 U of buildup dielectric material 416. In one embodiment, a laser-ablated land opening is an opening, e.g., a circular, rectangular, or other shaped opening, formed using a repeated, e.g., a trepanning, motion of the laser beam. In one embodiment, a laser-ablated via opening, sometimes called a laser-ablated via aperture, is an opening (aperture) extending entirely through buildup dielectric material 416 in a direction perpendicular to upper surface 416 U of buildup dielectric material 416. Although various laser-ablated artifacts are discussed above, in light of this disclosure, those of skill in the art will understand that any one of a number of laser-ablated artifacts can be formed. From form artifacts in additional dielectric operation 112, flow moves to a fill artifacts with electrically conductive material operation</p>
--	---

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>114. In fill artifacts with electrically conductive material operation 114, the laser-ablated artifacts are filled with an electrically conductive filler material, e.g., copper, to form a buildup circuit pattern 418 as illustrated in FIG. 4. Optionally, a single layer automatic optical inspection (AOI) is preformed. As shown in FIG. 4, buildup circuit pattern 418 is embedded within buildup dielectric material 416. Buildup circuit pattern 418 includes electrically conductive traces, lands, and/or vias. In one embodiment, buildup circuit pattern 418 redistributes the pattern of circuit pattern 202 to the pattern of buildup circuit pattern 418. In one embodiment, a trace extends horizontally and in a direction parallel with upper surface 416 U of buildup dielectric material 416. To illustrate, buildup circuit pattern 418 includes a trace 420.” Huemoeller, [4:20-5:25].</p> <p>“Referring now to FIGS. 15 and 18 together, from remove top carrier operation 1506, flow moves to a form blind via apertures operation 1508. In form blind via apertures operation 1508, blind via apertures 1812 are formed. Blind via apertures 1812 extend through dielectric material 1610 between upper surface 1610 U and lower surface 1610 L. In one embodiment, blind via apertures 1812 are formed in dielectric material 1610 using laser-ablation and thus have a taper shape as illustrated. Generally, blind via apertures 1812 are formed between top circuit pattern 1602 and bottom circuit pattern 1602 A. Referring now to FIGS. 15 and 19 together, from form blind via apertures operation 1508, flow moves to a fill blind via apertures with electrically conductive material operation 1510. In fill blind via apertures with electrically conductive material operation 1510, blind via apertures 1812 are filled, e.g., with plated copper or other conductive material, to form electrically conductive blind vias 1914. Blind vias 1914 extend between and electrically connect circuit patterns 1602, 1602 A with one another through dielectric material 1610.” Huemoeller, [9:35-9:54].</p> <p>“Referring now to FIGS. 28 and 35 together, from remove carrier operation 2816, flow moves to a mount additional dielectric operation 2818. In mount additional dielectric operation</p>
--	--

	<p>2818, an upper, e.g., first, buildup dielectric material 3526 is mounted to dielectric material 3010 and circuit pattern 2902. More particularly, an upper, e.g., first, surface 3526 U of upper buildup dielectric material 3526 is mounted to lower surface 3010 L of dielectric material 3010. Upper buildup dielectric material 3526 further includes a lower, e.g., second, surface 3526 L opposite upper surface 3526 U. From mount additional dielectric operation 2818, flow moves to a form artifacts in additional dielectric operation 2820. In form artifacts in additional dielectric operation 2820, upper buildup dielectric material 3526 is laser-ablated resulting in the formation of laser-ablated artifacts in upper buildup dielectric material 3526. The laser-ablated artifacts are formed using a laser-ablation process in a manner similar to that described above regarding form artifacts in additional dielectric operation 112 of FIG. 1 and so is only briefly repeated here. During this laser-ablation process, a laser beam is directed at upper buildup dielectric material 3526 and moved. The laser beam laser-ablates at least partially, and in some places through, upper buildup dielectric material 3526. Accordingly, the laser-ablated artifacts are formed at least partially, and in some places through, upper buildup dielectric material 3526. The laser-ablated artifacts include laser-ablated channels, laser-ablated land openings, and/or laser-ablated via apertures. From form artifacts in additional dielectric operation 2820, flow moves to a fill artifacts with electrically conductive material operation 2822. In fill artifacts with electrically conductive material operation 2822, the laser-ablated artifacts are filled with an electrically conductive filler material, e.g., copper, to form an upper, e.g., first, buildup circuit pattern 3528 as illustrated in FIG. 35. The laser-ablated artifacts are filled with an electrically conductive filler material in a manner similar to that described above regarding fill artifacts with electrically conductive material operation 114 of FIG. 1 and so is only briefly discussed here. As shown in FIG. 35, upper buildup circuit pattern 3528 is embedded within upper buildup dielectric material 3526. Upper buildup circuit pattern 3528 includes electrically conductive traces, lands, and/or vias. In one embodiment, upper buildup circuit pattern 3528 redistributes the pattern of circuit pattern 2902 to the pattern of upper buildup circuit pattern 3528. As indicated by the dashed</p>
--	--

	<p>arrow in FIG. 28, operations 2818, 2820, and 2822 can be repeated any one of a number of times to form additional buildup circuit patterns in additional buildup dielectric materials. In accordance with the embodiment illustrated in FIG. 35, operations 2818, 2820, and 2822 are repeated a second time to form a lower, e.g., second, buildup circuit pattern 3528 A in a lower, e.g., second, buildup dielectric material 3526 A. Lower buildup circuit pattern 3528 A redistributes the pattern of upper buildup circuit pattern 3528 to the pattern of lower buildup circuit pattern 3528 A.” Huemoeller, [13:6-13:66].</p> <p>“Referring now to FIGS. 28 and 39 together, from form interconnection balls operation 2824 (or directly from fill artifacts with electrically conductive material operation 2822 if form interconnection balls operation 2824 is not performed), flow moves to a form laser-ablated artifacts operation 2826. In form laser-ablated artifacts operation 2826, package body 3324 and dielectric material 3010 are laser-ablated resulting in the formation of laser-ablated artifacts extending through package body 3324 and dielectric material 3010 and to circuit pattern 2902. More particularly, portions of circuit pattern 2902 are exposed through the laser-ablated artifacts. The laser-ablated artifacts are formed using a laser-ablation process in a manner similar to that described above regarding form artifacts in additional dielectric operation 112 of FIG. 1 and so is only briefly repeated here. During this laser-ablation process, a laser beam is directed at package body 3324 and moved. The laser beam laser-ablates at least partially, and in some places through, package body 3324 and dielectric material 3010. Accordingly, the laser-ablated artifacts are formed at least partially, and in some places through, package body 3324. Further, the laser-ablated artifacts are formed through dielectric material 3010 to expose portions of circuit pattern 2902. The laser-ablated artifacts include laser-ablated channels, laser-ablated land openings, and/or laser-ablated via apertures. The laser-ablated via apertures extend through both package body 3324 and dielectric material 3010 to expose portions of circuit pattern 2902. From form laser-ablated artifacts 2826, flow moves to a fill laser-ablated artifacts operation 2830. In fill laser-ablated</p>
--	--

Appendix A-15 - Invalidity of U.S. Patent No. 9859202 in view of Huemoeller - U.S. Patent No. 8017436

	<p>artifacts operation 2830, the laser-ablated artifacts are filled with an electrically conductive filler material, e.g., copper, to form redistribution circuit pattern 3934 as illustrated in FIG. 39. The laser-ablated artifacts are filled with an electrically conductive filler material in a manner similar to that described above regarding fill artifacts with electrically conductive material operation 114 of FIG. 1 and so is only briefly discussed here. As shown in FIG. 39, redistribution circuit pattern 3934 is embedded within package body 3324 and dielectric material 3010. Redistribution circuit pattern 3934 includes electrically conductive traces, lands, and/or vias. In accordance with this embodiment, redistribution circuit pattern 3934 includes electrically conductive vias 3936 electrically connected to circuit pattern 2902. The upper exposed surfaces of vias 3936 form lands 3937 of redistribution circuit pattern 3934.” Huemoeller, [14:59-15:39].</p> <p>“FIG. 41 is a cross-sectional view of a package 2900E in accordance with another embodiment. Package 2900E of FIG. 41 is an example of a chip in substrate (CIS) plus flip chip (FC) plus package on package (PoP) package. Package 2900E of FIG. 41 is similar to package 2900D of FIG. 40 and only the significant differences between the packages are discussed below. Referring now to FIGS. 28 and 41 together, in mount additional structures operation 2832, inner and outer, e.g., first and second, electronic structures 4148, 4150 are mounted to redistribution circuit pattern 3934A by inner and outer, e.g., first and second, electrically conductive bumps 4152, 4154. In one embodiment, inner electronic structure 4148 is a die or an electronic component package as discussed above in reference to electronic structure 4040. Inner electronic structure 4148 includes a lower, e.g., first, surface 4156 with terminals 4158 formed thereon. Inner electronic structure 4148 further includes an upper, e.g., second, surface 4160 opposite lower surface 4156. Terminals 4158 are physically and electrically connected to lands 3937A of redistribution circuit pattern 3934A by inner electrically conductive bumps 4152. E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

U.S. Patent Publication No. 20150132950 (“Jung”) is titled Semiconductor Packages, Methods of Manufacturing the Same, And Semiconductor Package Structures Including The Same and lists Deok-Young Jung, Pil-Kyu Kang, Byung-Iyul Park, Ji-Soon Park, Seong-Min Son, Jin-Ho An, and Ji-Hwang Kim as inventors. Jung anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Jung is a U.S. patent publication that was filed January 20, 2015 and published May 14, 2015. Jung claims priority to KR 10-2012-0085396 filed on August 3, 2012. Jung is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Jung, or otherwise rendered obvious by disclosures and teachings of Jung, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Jung does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Jung with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Jung, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Jung “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Jung or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Jung set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Jung discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 20, a semiconductor package 202 according to this example may include a thinned first chip 110 T, a thinned second chip 140 T, and a third chip 170 which are sequentially stacked on the package board 101. The thinned first chip 110 T may include first through-via electrodes 112 and first chip bumps 114 electrically connected to bottom ends of the first through-via electrodes 112, respectively. The thinned second chip 140 T may include second through-via electrodes 143 and second chip bumps 145 electrically connected to bottom ends of the second through-via electrodes 143, respectively.” Jung, [0147-0148].</p>

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

	<p>“FIG. 44B is a cross-sectional side view of a semiconductor package 600 according to another example embodiment. FIG. 44C is a partial enlarged cross-sectional view of a portion denoted as B in FIG. 44B. Referring to FIGS. 44B and 44C, semiconductor substrates 632, 634, and 636 disposed on a package substrate 610 may be provided. Semiconductor devices may be formed on active surfaces of the semiconductor substrates 632, 634, and 636. Also, an interposer 620 may be disposed between the package substrate 610 and the semiconductor substrates 632, 634, and 636. The package substrate 610 may include a base material 612 and connection pads 614 and 616, as also described above in detail with reference to FIG. 44A and thus, additional descriptions thereof are omitted here.” Jung, [0265-0267].</p>

FIG. 44B

Jung, FIG. 44B

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

	<p>“FIG. 44E is a cross-sectional side view of an example of a hybrid memory cube (HMC)-type semiconductor package 703 according to still another example embodiment. Referring to FIG. 44E, a central processing unit (CPU) 722 and a ionic device 720, such as a memory controller, may be disposed on a substrate 710. Also, a plurality of memory devices 730 may be vertically stacked directly on the logic device 720.” Jung, [0283-0284].</p>
<p>[1.A] a bottom package substrate;</p>	<p>Jung discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIGS. 44B and 44C, semiconductor substrates 632, 634, and 636 disposed on a package substrate 610 may be provided. Semiconductor devices may be formed on active surfaces of the semiconductor substrates 632, 634, and 636. Also, an interposer 620 may be disposed between the package substrate 610 and the semiconductor substrates 632, 634, and 636. The package substrate 610 may include a base material 612 and connection pads 614 and 616, as also described above in detail with reference to FIG. 44A and thus, additional descriptions thereof are omitted here.” Jung, [0266-0267].</p>

	<p style="text-align: center;">FIG. 44B</p>  <p style="text-align: center;">Jung, FIG. 44B</p> <p>To the extent Plaintiff contends that Jung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p> <p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p> <p>See, <i>e.g.</i>:</p>
--	---

	<p>“Referring to FIGS. 44B and 44C, semiconductor substrates 632, 634, and 636 disposed on a package substrate 610 may be provided. Semiconductor devices may be formed on active surfaces of the semiconductor substrates 632, 634, and 636. Also, an interposer 620 may be disposed between the package substrate 610 and the semiconductor substrates 632, 634, and 636.” Jung, [0266].</p> <p style="text-align: center;">FIG. 44B</p>  <p style="text-align: center;">Jung, FIG. 44B</p> <p>To the extent Plaintiff contends that Jung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Jung discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“A first underfiller 118 may fill a space between the thinned first chip 110 T and the package board 101. The first chip bumps 114 may be surrounded by the first underfiller 118. A first mold layer may be disposed on the package board 101 and surround a sidewall of the thinned first chip 110 T.” Jung, [0136-0137].</p> <p>“A second underfiller 147 may fill a space between the thinned first chip 110 T and the second chip 140. A second mold layer 150 may be disposed on the first mold layer 120 a. The second mold layer 150 may surround at least a sidewall of the second chip 140.” Jung, [0140-0141].</p> <p>“Referring to FIGS. 44B and 44C, semiconductor substrates 632, 634, and 636 disposed on a package substrate 610 may be provided. Semiconductor devices may be formed on active surfaces of the semiconductor substrates 632, 634, and 636. Also, an interposer 620 may be disposed between the package substrate 610 and the semiconductor substrates 632, 634, and 636. The package substrate 610 may include a base material 612 and connection pads 614 and 616, as also described above in detail with reference to FIG. 44A and thus, additional descriptions thereof are omitted here.” Jung, [0266-0267].</p>
---	---

FIG. 44B

Jung, FIG. 44B

“Referring to FIGS. 44B and 44C, semiconductor substrates 632, 634, and 636 disposed on a package substrate 610 may be provided. Semiconductor devices may be formed on active surfaces of the semiconductor substrates 632, 634, and 636. Also, an interposer 620 may be disposed between the package substrate 610 and the semiconductor substrates 632, 634, and 636. The package substrate 610 may include a base material 612 and connection pads 614 and 616, as also described above in detail with reference to FIG. 44A and thus, additional descriptions thereof are omitted here.” Jung, [0266-0267].

“The interposer 620 may be interposed between the package substrate 610 and the semiconductor substrates 632 and 634. The interposer 620 may include an interposer

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

	<p>substrate 622 having a first surface 601 and a second surface 602 and a through-via electrode 624 extending from the first surface 601 to the second surface 602. Although not illustrated in detail in FIG. 44B, a portion of the through-via electrode 624 may protrude above the second surface 602. The interposer 620 may not only serve as a medium for electrically connecting the semiconductor substrates 632, 634, and 636 with the package substrate 610, but also serve as a medium for electrically connecting the semiconductor substrate 632 and the semiconductor substrate 634, which are arranged horizontally on the interposer 620.” Jung, [0269-0270].</p> <p>To the extent Plaintiff contends that Jung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.D] the spacer connector comprises a core substrate;</p>	<p>Jung discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“The interposer 620 may be interposed between the package substrate 610 and the semiconductor substrates 632 and 634. The interposer 620 may include an interposer substrate 622 having a first surface 601 and a second surface 602 and a through-via electrode 624 extending from the first surface 601 to the second surface 602. Although not illustrated in detail in FIG. 44B, a portion of the through-via electrode 624 may protrude above the second surface 602. The interposer 620 may not only serve as a medium for electrically connecting the semiconductor substrates 632, 634, and 636 with the package substrate 610, but also serve as a medium for electrically connecting the semiconductor substrate 632 and the semiconductor substrate 634, which are arranged horizontally on the interposer 620. That</p>

is, at least two semiconductor substrates may be stacked directly on the interposer 620, and electrical connection between the at least two semiconductor substrates may be enabled by the interposer 620. More specifically, such electrical connection may be achieved by conductive interconnections formed in the interposer 620. Referring to FIG. 44C, which is a detailed view of the portion of the interposer 620, which is denoted as B in FIG. 44B, the through-via electrode 624 extending through the interposer substrate 622 may be provided. Although not specifically shown in FIG. 44C, a spacer insulating layer may be further provided along the circumference of the through-via electrode 624 to provide electrical insulation. Also, the through-via electrode 624 may include a barrier metal layer depending on the properties of a conductive metal.” Jung, [0270-0271].

FIG. 44B

Jung, FIG. 44B

“It will be understood by one of ordinary skill in the art that the silicon oxide layer 650 and the silicon nitride layer 655 shown in FIG. 44C are configured similar to those of FIG. 41. Also, it will be understood by one of ordinary skill in the art that the structure shown in FIG. 42 or Fill. 43 may be applied on the second surface 602 of the interposer 620.” Jung, [0276].

FIG. 44C

Jung, FIG. 44C

To the extent Plaintiff contends that Jung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Jung discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“The interposer 620 may include an interposer substrate 622 having a first surface 601 and a second surface 602 and a through-via electrode 624 extending from the first surface 601 to the second surface 602. Although not illustrated in detail in FIG. 44B, a portion of the through-via electrode 624 may protrude above the second surface 602. The interposer 620 may not only serve as a medium for electrically connecting the semiconductor substrates 632, 634, and 636 with the package substrate 610, but also serve as a medium for electrically connecting the semiconductor substrate 632 and the semiconductor substrate 634, which are arranged horizontally on the interposer 620. That is, at least two semiconductor substrates may be stacked directly on the interposer 620, and electrical connection between the at least two semiconductor substrates may be enabled by the interposer 620. More specifically, such electrical connection may be achieved by conductive interconnections formed in the interposer 620.” Jung, [0270-0271].</p>
--	--

FIG. 44B

Jung, FIG. 44B

“Referring to FIG. 44C, which is a detailed view of the portion of the interposer 620, which is denoted as B in FIG. 44B, the through-via electrode 624 extending through the interposer substrate 622 may be provided. Although not specifically shown in FIG. 44C, a spacer insulating layer may be further provided along the circumference of the through-via electrode 624 to provide electrical insulation. Also, the through-via electrode 624 may include a barrier metal layer depending on the properties of a conductive metal. A through-via electrode pad 660 may be provided on the second surface 602 and electrically connected to the through-via electrode 624. The through-via electrode pad 660 has been described in detail with reference to FIG. 41, and a method of forming the through-via electrode pad 660 will be described in detail later.” Jung, [0271-0272].

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

	<p>“The silicon oxide layer 650 may extend along the second surface 602 in a horizontal direction, and extend to the through-via electrode 624. The silicon oxide layer 650 may be in direct contact with the second surface 602. In some embodiments, a vertical portion of the silicon oxide layer 650 may be conformally formed on sidewalls 621 of the through-via electrode 624 and may extend from the second surface 602 to the bottom surface 654 of the through-via electrode pad 660.” Jung, [0274].</p> <p>To the extent Plaintiff contends that Jung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.F] a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars;</p>	<p>Jung discloses, either expressly or inherently, a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 44C, which is a detailed view of the portion of the interposer 620, which is denoted as B in FIG. 44B, the through-via electrode 624 extending through the interposer substrate 622 may be provided. Although not specifically shown in FIG. 44C, a spacer insulating layer may be further provided along the circumference of the through-via electrode 624 to provide electrical insulation. Also, the through-via electrode 624 may include a barrier metal layer depending on the properties of a conductive metal. A through-via electrode pad 660 may be provided on the second surface 602 and electrically connected to the through-via electrode 624. The through-via electrode pad 660 has been described in detail with reference</p>

	<p>to FIG. 41, and a method of forming the through-via electrode pad 660 will be described in detail later.” Jung, [0271-0272].</p> <p style="text-align: center;">FIG. 44C</p>  <p>Jung, FIG. 44C</p> <p>“An oxide layer such as a silicon oxide layer 650 may be provided on the second surface 602 and extend along the second surface 602. A silicon nitride layer 655 may be disposed on the silicon oxide layer 650. The silicon nitride layer 655 may be in contact with at least a portion of a bottom surface 654 of the through-via electrode pad 660. The interposer 622 may be, for example, a silicon substrate, but it is not limited thereto.” Jung, [0273].</p> <p>“The silicon oxide layer 650 may extend along the second surface 602 in a horizontal direction, and extend to the through-via electrode 624. The silicon oxide layer 650 may be in</p>
--	--

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

	<p>direct contact with the second surface 602. In some embodiments, a vertical portion of the silicon oxide layer 650 may be conformally formed on sidewalls 621 of the through-via electrode 624 and may extend from the second surface 602 to the bottom surface 654 of the through-via electrode pad 660. The silicon nitride layer 655 may be in direct, contact with the silicon oxide layer 650 and extend in a direction substantially parallel to the second surface 602. Also, the silicon nitride layer 655 may extend under the through-via electrode pad 660. In particular, the silicon nitride layer 655 may be in contact with at least a portion of the bottom surface 654 of the through-via electrode pad 660. In this case, a top surface 633 of the silicon nitride layer 655 may be substantially coplanar with the bottom surface 654 of the through-via electrode pad 660.” Jung, [0274-0275].</p> <p>To the extent Plaintiff contends that Jung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.G] wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate,</p>	<p>Jung discloses, either expressly or inherently, wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“The embodiment shown in FIG. 41 illustrates an example in which the through-via electrode 440 has a via-middle structure. That is, after the semiconductor device unit 424 and the interlayer insulating layer 422 are formed and before the interconnection layer 430 is formed, the through-via electrode 440 may be formed. However, the present inventive concept is not limited thereto and may be applied to a via-first structure or a via-last structure. The via-first structure and the via-last structure are known to one of ordinary skill in the art and thus,</p>

detailed descriptions thereof are omitted. Such examples may be disclosed in U.S. Pat. Nos. 8,653,676 and 8,648,429, the disclosures of which are incorporated herein by reference.”
Jung, [0217].

Jung, FIG. 41

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

	<p>“As shown in FIG. 44A, an underfill 529 may be injected under the first semiconductor device 520 and the second semiconductor device 530. A top surface of the package substrate 510 and the first and second semiconductor devices 520 and 530 may be encapsulated by an encapsulant 540. The encapsulant 540 may be formed of, for example, a polymer material such as an epoxy molding compound (EMC), but is not limited thereto.” Jung, [0263-0264].</p> <p>“Referring to FIG. 44C, which is a detailed view of the portion of the interposer 620, which is denoted as B in FIG. 44B, the through-via electrode 624 extending through the interposer substrate 622 may be provided. Although not specifically shown in FIG. 44C, a spacer insulating layer may be further provided along the circumference of the through-via electrode 624 to provide electrical insulation. Also, the through-via electrode 624 may include a barrier metal layer depending on the properties of a conductive metal. A through-via electrode pad 660 may be provided on the second surface 602 and electrically connected to the through-via electrode 624. The through-via electrode pad 660 has been described in detail with reference to FIG. 41, and a method of forming the through-via electrode pad 660 will be described in detail later.” Jung, [0271-0272].</p>
--	--

	<p style="text-align: center;">FIG. 44C</p>  <p style="text-align: center;">Jung, FIG. 44C</p> <p>To the extent Plaintiff contends that Jung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.H] the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector,</p>	<p>Jung discloses, either expressly or inherently, the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p>See, e.g.:</p>

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

	<p>“A conductive bump, e.g., a solder bump 501 for connecting the semiconductor chip with an external device may be disposed on the connection pad 514. The solder bump 501 may be a tin (Sn)-based solder bump. In more detail, the solder bump 501 may include Sn as a main component, and include Ag and/or Cu. However, the present inventive concept is not limited thereto.” Jung, [0259].</p> <p>“The interposer 620 may include an interposer substrate 622 having a first surface 601 and a second surface 602 and a through-via electrode 624 extending from the first surface 601 to the second surface 602. Although not illustrated in detail in FIG. 44B, a portion of the through-via electrode 624 may protrude above the second surface 602. The interposer 620 may not only serve as a medium for electrically connecting the semiconductor substrates 632, 634, and 636 with the package substrate 610, but also serve as a medium for electrically connecting the semiconductor substrate 632 and the semiconductor substrate 634, which are arranged horizontally on the interposer 620. That is, at least two semiconductor substrates may be stacked directly on the interposer 620, and electrical connection between the at least two semiconductor substrates may be enabled by the interposer 620. More specifically, such electrical connection may be achieved by conductive interconnections formed in the interposer 620.” Jung, [0270-0271].</p>

FIG. 44B

Jung, FIG. 44B

To the extent Plaintiff contends that Jung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

[1.] the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the

See, e.g.:

Jung discloses, either expressly or inherently, the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

<p>plurality of metal pillars of the spacer connector, and</p>	<p>“Referring to FIG. 1 again, the first chip 110 may be mounted on the package board part 101 by a flip-chip bonding method. Thus, the first chip bump 114 of the first chip 110 may be connected to the internal connection pad 107 of the package board part 101. For example, the first chip 110 may be electrically connected to the package board part 101 through the first chip bump 114. For example, mounting the first chip 110 on the package board part 101 may include loading the first chip 110 on the package board part 101 such that the first chip bump 114 is connected to the internal connection pad 107, and filling a space between the first chip and the package board part 101 with a first underfiller 118.” Jung, [0099].</p> <p>“Referring to FIG. 7, an inter-chip pad 130 may be formed on each of the exposed through-via electrodes 112. The inter-chips pads 130 respectively connected to the through-via electrodes 112 may be spaced apart from each other. The inter-chip pad 130 may include a metal. For example, the inter-chip pad 130 may include copper or solder. The inter-chip pad 130 may be formed by various processes, e.g., a plating process, an inkjet process, and/or a patterning process.” Jung, [0111].</p> <p>“Referring to FIG. 8, a second chip 140 may be mounted on each of the thinned first chips 110 T. The second chip 140 may include at least one second chip bump 145. For example, the second chip 140 may be loaded on the thinned first chip 1107 to connect the second chip bump 145 to the inter-chip pad 130, and then a space between the thinned first chip 110 T and the second chip 140 may be filled with a second underfiller 147. Thus, the second chip 140 may be mounted on the thinned first chip 110 T.” Jung, [0112-0113].</p> <p>“Referring to FIG. 18, a semiconductor package 200 according to an example embodiment may include a thinned first chip 110 T mounted on a package board 101 and a second chip 140 mounted on the thinned first chip 110 T. The package board 101 may include external</p>
--	---

	<p>connection pads 105 disposed on a bottom surface of the package board 101 and internal connection pads 107 disposed on a top surface of the package board 101. The thinned first chip 110 T may have a first surface and a second surface opposite to each other. The first surface of the thinned first chip 110 T may be adjacent to the package board 101. The thinned first chip 110 T may include through-via electrodes 112 penetrating the thinned first chip 110 T. The thinned first chip 110 T may have first chip bumps 114 disposed on the first surface thereof. The first chip bumps 114 may be electrically connected to bottom ends of the through-via electrodes 112, respectively. The first chip bumps 114 of the thinned first chip 110 T may be connected to the internal connection pads 107 of the package board 101, respectively.” Jung, [0135-0136].</p> <p>“The connection member 480 may include a conductive pillar 482 and a micro-bump 484. The conductive pillar 482 may be formed using an electroplating process and have a cylindrical shape. In the present embodiment, the conductive pillar 482 may be a copper (Cu) pillar. However, a material for the metal pillar 482 is not limited to copper. For example, the metal pillar 482 may be formed of aluminum (Al), nickel (Ni), gold (Au), or an alloy thereof. On the other hand, the conductive pillar 482 may be formed not only in a cylindrical shape but also in various shapes, such as a rectangular pillar and an elliptical pillar.” Jung, [0231].</p> <p>“Referring to FIGS. 44B and 44C, semiconductor substrates 632, 634, and 636 disposed on a package substrate 610 may be provided. Semiconductor devices may be formed on active surfaces of the semiconductor substrates 632, 634, and 636. Also, an interposer 620 may be disposed between the package substrate 610 and the semiconductor substrates 632, 634, and 636. The package substrate 610 may include a base material 612 and connection pads 614 and 616, as also described above in detail with reference to FIG. 44A and thus, additional descriptions thereof are omitted here. Various semiconductor devices may be provided on the active surface of each of the semiconductor substrates 632, 634, and 636. For example,</p>
--	--

	<p>the semiconductor devices may include a memory device, a core circuit device, a peripheral circuit device, a logic circuit device, or a control circuit device, as described in detail with reference to FIG. 44A and thus, additional descriptions are omitted here. The interposer 620 may be interposed between the package substrate 610 and the semiconductor substrates 632 and 634. The interposer 620 may include an interposer substrate 622 having a first surface 601 and a second surface 602 and a through-via electrode 624 extending from the first surface 601 to the second surface 602. Although not illustrated in detail in FIG. 44B, a portion of the through-via electrode 624 may protrude above the second surface 602. The interposer 620 may not only serve as a medium for electrically connecting the semiconductor substrates 632, 634, and 636 with the package substrate 610, but also serve as a medium for electrically connecting the semiconductor substrate 632 and the semiconductor substrate 634, which are arranged horizontally on the interposer 620. That is, at least two semiconductor substrates may be stacked directly on the interposer 620, and electrical connection between the at least two semiconductor substrates may be enabled by the interposer 620. More specifically, such electrical connection may be achieved by conductive interconnections formed in the interposer 620. Referring to FIG. 44C, which is a detailed view of the portion of the interposer 620, which is denoted as B in FIG. 44B, the through-via electrode 624 extending through the interposer substrate 622 may be provided. Although not specifically shown in FIG. 44C, a spacer insulating layer may be further provided along the circumference of the through-via electrode 624 to provide electrical insulation. Also, the through-via electrode 624 may include a barrier metal layer depending on the properties of a conductive metal. A through-via electrode pad 660 may be provided on the second surface 602 and electrically connected to the through-via electrode 624.” Jung, [0266-0272].</p>
--	--

Jung, FIG. 44B

“The embodiment shown in FIG. 41 illustrates an example in which the through-via electrode 440 has a via-middle structure. That is, after the semiconductor device unit 424 and the interlayer insulating layer 422 are formed and before the interconnection layer 430 is formed, the through-via electrode 440 may be formed. However, the present inventive concept is not limited thereto and may be applied to a via-first structure or a via-last structure. The via-first structure and the via-last structure are known to one of ordinary skill in the art and thus, detailed descriptions thereof are omitted. Such examples may be disclosed in U.S. Pat. Nos. 8,653,676 and 8,648,429, the disclosures of which are incorporated herein by reference.”
Jung, [0217].

Jung, FIG. 41

To the extent Plaintiff contends that Jung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

More specifically, such electrical connection may be achieved by conductive interconnections formed in the interposer 620.” Jung, [0270-0271].</p>

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

<p>[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p>	<p>Jung discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 44B is a cross-sectional side view of a semiconductor package 600 according to another example embodiment. FIG. 44C is a partial enlarged cross-sectional view of a portion denoted as B in FIG. 44B. Referring to FIGS. 44B and 44C, semiconductor substrates 632, 634, and 636 disposed on a package substrate 610 may be provided. Semiconductor devices may be formed on active surfaces of the semiconductor substrates 632, 634, and 636. Also, an interposer 620 may be disposed between the package substrate 610 and the semiconductor substrates 632, 634, and 636.” Jung, [0265-0266].</p>
--	---

FIG. 44B

Jung, FIG. 44B

“The interposer 620 may include an interposer substrate 622 having a first surface 601 and a second surface 602 and a through-via electrode 624 extending from the first surface 601 to the second surface 602. Although not illustrated in detail in FIG. 44B, a portion of the through-via electrode 624 may protrude above the second surface 602. The interposer 620 may not only serve as a medium for electrically connecting the semiconductor substrates 632, 634, and 636 with the package substrate 610, but also serve as a medium for electrically connecting the semiconductor substrate 632 and the semiconductor substrate 634, which are arranged horizontally on the interposer 620. That is, at least two semiconductor substrates may be stacked directly on the interposer 620, and electrical connection between the at least two semiconductor substrates may be enabled by the interposer 620. More specifically, such

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

	<p>electrical connection may be achieved by conductive interconnections formed in the interposer 620.” Jung, [0270-0271].</p> <p>“Referring to FIG. 44C, which is a detailed view of the portion of the interposer 620, which is denoted as B in FIG. 44B, the through-via electrode 624 extending through the interposer substrate 622 may be provided. Although not specifically shown in FIG. 44C, a spacer insulating layer may be further provided along the circumference of the through-via electrode 624 to provide electrical insulation. Also, the through-via electrode 624 may include a barrier metal layer depending on the properties of a conductive metal.” Jung, [0271].</p> <p>To the extent Plaintiff contends that Jung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	Jung discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

<p>the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p><i>See, e.g.:</i></p> <p>“Referring to FIG. 44C, which is a detailed view of the portion of the interposer 620, which is denoted as B in FIG. 44B, the through-via electrode 624 extending through the interposer substrate 622 may be provided. Although not specifically shown in FIG. 44C, a spacer insulating layer may be further provided along the circumference of the through-via electrode 624 to provide electrical insulation. Also, the through-via electrode 624 may include a barrier metal layer depending on the properties of a conductive metal. A through-via electrode pad 660 may be provided on the second surface 602 and electrically connected to the through-via electrode 624. The through-via electrode pad 660 has been described in detail with reference to FIG. 41, and a method of forming the through-via electrode pad 660 will be described in detail later. An oxide layer such as a silicon oxide layer 650 may be provided on the second surface 602 and extend along the second surface 602. A silicon nitride layer 655 may be disposed on the silicon oxide layer 650. The silicon nitride layer 655 may be in contact with at least a portion of a bottom surface 654 of the through-via electrode pad 660. The interposer 622 may be, for example, a silicon substrate, but it is not limited thereto. The silicon oxide layer 650 may extend along the second surface 602 in a horizontal direction, and extend to the through-via electrode 624. The silicon oxide layer 650 may be in direct contact with the second surface 602. In some embodiments, a vertical portion of the silicon oxide layer 650 may be conformally formed on sidewalls 621 of the through-via electrode 624 and may extend from the second surface 602 to the bottom surface 654 of the through-via electrode pad 660. The silicon nitride layer 655 may be in direct, contact with the silicon oxide layer 650 and extend in a direction substantially parallel to the second surface 602. Also, the silicon nitride layer 655 may extend under the through-via electrode pad 660. In particular, the silicon nitride layer 655 may be in contact with at least a portion of the bottom surface 654 of the through-via electrode pad 660. In this case, a top surface 633 of the silicon nitride layer</p>
--	---

655 may be substantially coplanar with the bottom surface 654 of the through-via electrode pad 660.” Jung, [0271-0275].

FIG. 44B

Jung, FIG. 44B

“The embodiment shown in FIG. 41 illustrates an example in which the through-via electrode 440 has a via-middle structure. That is, after the semiconductor device unit 424 and the interlayer insulating layer 422 are formed and before the interconnection layer 430 is formed, the through-via electrode 440 may be formed. However, the present inventive concept is not limited thereto and may be applied to a via-first structure or a via-last structure. The via-first structure and the via-last structure are known to one of ordinary skill in the art and thus, detailed descriptions thereof are omitted. Such examples may be disclosed in U.S. Pat. Nos.

8,653,676 and 8,648,429, the disclosures of which are incorporated herein by reference.”
Jung, [0217].

Jung, FIG. 41

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

	<p>To the extent Plaintiff contends that Jung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to the bottom ends of the plurality of metal pillars of the bottom package substrate via the plurality of metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Jung discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIGS. 44B and 44C, semiconductor substrates 632, 634, and 636 disposed on a package substrate 610 may be provided. Semiconductor devices may be formed on active surfaces of the semiconductor substrates 632, 634, and 636. Also, an interposer 620 may be disposed between the package substrate 610 and the semiconductor substrates 632, 634, and 636.” Jung, [0266].</p>

FIG. 44B

Jung, FIG. 44B

“The interposer 620 may include an interposer substrate 622 having a first surface 601 and a second surface 602 and a through-via electrode 624 extending from the first surface 601 to the second surface 602. Although not illustrated in detail in FIG. 44B, a portion of the through-via electrode 624 may protrude above the second surface 602. The interposer 620 may not only serve as a medium for electrically connecting the semiconductor substrates 632, 634, and 636 with the package substrate 610, but also serve as a medium for electrically connecting the semiconductor substrate 632 and the semiconductor substrate 634, which are arranged horizontally on the interposer 620. That is, at least two semiconductor substrates may be stacked directly on the interposer 620, and electrical connection between the at least two semiconductor substrates may be enabled by the interposer 620. More specifically, such

Appendix A-16 - Invalidity of U.S. Patent No. 9859202 in view of Jung - U.S. Patent Publication No. 20150132950

	<p>electrical connection may be achieved by conductive interconnections formed in the interposer 620.” Jung, [0270-0271].</p> <p>“A through-via electrode pad 660 may be provided on the second surface 602 and electrically connected to the through-via electrode 624. The through-via electrode pad 660 has been described in detail with reference to FIG. 41, and a method of forming the through-via electrode pad 660 will be described in detail later.” Jung, [0272].</p> <p>“The embodiment shown in FIG. 41 illustrates an example in which the through-via electrode 440 has a via-middle structure. That is, after the semiconductor device unit 424 and the interlayer insulating layer 422 are formed and before the interconnection layer 430 is formed, the through-via electrode 440 may be formed. However, the present inventive concept is not limited thereto and may be applied to a via-first structure or a via-last structure. The via-first structure and the via-last structure are known to one of ordinary skill in the art and thus, detailed descriptions thereof are omitted. Such examples may be disclosed in U.S. Pat. Nos. 8,653,676 and 8,648,429, the disclosures of which are incorporated herein by reference.” Jung, [0217].</p>
--	--

Jung, FIG. 41

To the extent Plaintiff contends that Jung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Kim - U.S. Patent Publication No. 20150061093

U.S. Patent Publication No. 20150061093 (“Kim”) is titled Interposer and Semiconductor Package Using the Same, and Method of Manufacturing Interposer and lists Ki Hwan Kim, Jung Hyun Park, Yong Yoon Cho, Sung Won Jeong, Da Hee Kim, And Gi Ho Han as inventors. Kim anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Kim is a U.S. patent publication that was filed August 28, 2014 and published March 5, 2015. Kim claims priority to KR 10-2013-0104142 filed on August 30, 2013. Kim is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Kim, or otherwise rendered obvious by disclosures and teachings of Kim, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Kim does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Kim with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Kim, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-17 - Invalidity of U.S. Patent No. 9859202 in view of Kim - U.S. Patent Publication No. 20150061093

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Kim “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Kim or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Kim set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Kim discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIGS. 1 to 3, an interposer 100 according to an exemplary embodiment of the present invention has as a basic structure an interposer substrate 110 having an upper surface and a lower surface facing the upper surface and a connection electrode 120 disposed on at least any one of an upper surface and a lower surface of the interposer substrate 110.” Kim, [0032].</p>

	<div data-bbox="321 1230 349 1333"><p>【FIG. 1】</p></div> <div data-bbox="414 520 722 1346"></div> <div data-bbox="771 1239 803 1388"><p>Kim, FIG. 1</p></div> <div data-bbox="852 178 1323 1297"><p>“The interposer substrate 110 may be configured of an insulating layer 111 which is made of a rigid dielectric material, such as fiber reinforced bismaleimide triazine (BT), FR-4, glass, and ceramic, or a flexible dielectric material, such as epoxy resin, phenol resin, urethane resin, silicon resin, and polyimide resin, as a base material.” Kim, [0033].</p><p>“The interposer substrate 110 is interlayer connected through the vias 112 through which the insulating layers 111 of each layer penetrate, such that one point on an upper portion of the interposer substrate 110 may be internally conducted to one point on a lower portion thereof. In this configuration, the vias 112 of each layer may have a stack via structure in which the vias are straightly connected to each other. Alternatively, the vias 112 may be formed at different positions for each layer and may also be connected to each other through metal wirings 113 formed on each insulating layer 111.” Kim, [0035].</p></div>
--	--

Kim, FIG. 3

“As described above, the remaining portion of the interposer substrate 110 on which the cavity 110 a is formed may be provided with the connection electrode 120. The drawings illustrate the connection electrodes 120 are disposed on both of the upper and lower surfaces of the interposer substrate 110, but unlike the drawings, the connection electrode 120 may be disposed on any one of the upper and lower surfaces of the interposer substrate 110.” Kim, [0037].

“The connection electrode 120 may receive or transmit electrical signals from the outside, such that at the time of the configuration of the semiconductor package 200 using the interposer 100 according to the exemplary embodiment of the present invention, the connection electrode 120 may serve to electrically connect between the interposer substrate 110 and package substrates 210 which are disposed on the upper and lower portions of the

Appendix A-17 - Invalidity of U.S. Patent No. 9859202 in view of Kim - U.S. Patent Publication No. 20150061093

	<p>interposer substrate 110. Therefore, the connection electrode 120 may be made of any one metal material of Ni, Al, Fe, Cu, Ti, Cr, Au, Ag, Pd, and Pt having excellent electrical conductivity and the number of connection electrodes 120 may be configured in plural, depending on the number of input/output terminals (I/O).” Kim, [0038].</p> <p>“The connection electrode 120 may be configured to include a post part 122 having a pillar shape and a pad part 121 which is disposed between the post part 122 and the interposer substrate 110 to strengthen connection reliability between the vias 112, in which a height of the post part 122 may be controlled corresponding to the thickness of the semiconductor device 220 included in the cavity 110 a at the time of the configuration of the semiconductor package 200. That is, the related art controls the thickness of the interposer depending on the number of layers of the insulating layer forming the interposer substrate, but the interposer 100 according to the exemplary embodiment of the present invention may be set to the required thickness by controlling a height of the connection electrode 120, in detail, the height of the post part 122 which is a component of the connection electrode 120.” Kim, [0039].</p>
[1.A] a bottom package substrate;	<p>Kim discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The interposer substrate 110 is interlayer connected through the vias 112 through which the insulating layers 111 of each layer penetrate, such that one point on an upper portion of the interposer substrate 110 may be internally conducted to one point on a lower portion thereof. In this configuration, the vias 112 of each layer may have a stack via structure in which the vias are straightly connected to each other. Alternatively, the vias 112 may be formed at different positions for each layer and may also be connected to each other through metal wirings 113 formed on each insulating layer 111.” Kim, [0035].</p>

【FIG. 3】

Kim, FIG. 3

“The connection electrode 120 may receive or transmit electrical signals from the outside, such that at the time of the configuration of the semiconductor package 200 using the interposer 100 according to the exemplary embodiment of the present invention, the connection electrode 120 may serve to electrically connect between the interposer substrate 110 and package substrates 210 which are disposed on the upper and lower portions of the interposer substrate 110. Therefore, the connection electrode 120 may be made of any one metal material of Ni, Al, Fe, Cu, Ti, Cr, Au, Ag, Pd, and Pt having excellent electrical conductivity and the number of connection electrodes 120 may be configured in plural, depending on the number of input/output terminals (I/O).” Kim, [0038].

Appendix A-17 - Invalidity of U.S. Patent No. 9859202 in view of Kim - U.S. Patent Publication No. 20150061093

	<p>To the extent Plaintiff contends that Kim fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Kim discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The interposer substrate 110 is interlayer connected through the vias 112 through which the insulating layers 111 of each layer penetrate, such that one point on an upper portion of the interposer substrate 110 may be internally conducted to one point on a lower portion thereof. In this configuration, the vias 112 of each layer may have a stack via structure in which the vias are straightly connected to each other. Alternatively, the vias 112 may be formed at different positions for each layer and may also be connected to each other through metal wirings 113 formed on each insulating layer 111.” Kim, [0035].</p>

【FIG. 3】

Kim, FIG. 3

“The connection electrode 120 may receive or transmit electrical signals from the outside, such that at the time of the configuration of the semiconductor package 200 using the interposer 100 according to the exemplary embodiment of the present invention, the connection electrode 120 may serve to electrically connect between the interposer substrate 110 and package substrates 210 which are disposed on the upper and lower portions of the interposer substrate 110. Therefore, the connection electrode 120 may be made of any one metal material of Ni, Al, Fe, Cu, Ti, Cr, Au, Ag, Pd, and Pt having excellent electrical conductivity and the number of connection electrodes 120 may be configured in plural, depending on the number of input/output terminals (I/O).” Kim, [0038].

Appendix A-17 - Invalidity of U.S. Patent No. 9859202 in view of Kim - U.S. Patent Publication No. 20150061093

	<p>To the extent Plaintiff contends that Kim fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Kim discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIGS. 1 to 3, an interposer 100 according to an exemplary embodiment of the present invention has as a basic structure an interposer substrate 110 having an upper surface and a lower surface facing the upper surface and a connection electrode 120 disposed on at least any one of an upper surface and a lower surface of the interposer substrate 110.” Kim, [0032].</p>

Kim, FIG. 2

“The interposer substrate 110 may be configured of an insulating layer 111 which is made of a rigid dielectric material, such as fiber reinforced bismaleimide triazine (BT), FR-4, glass, and ceramic, or a flexible dielectric material, such as epoxy resin, phenol resin, urethane resin, silicon resin, and polyimide resin, as a base material.” Kim, [0033].

“The interposer substrate 110 is interlayer connected through the vias 112 through which the insulating layers 111 of each layer penetrate, such that one point on an upper portion of the interposer substrate 110 may be internally conducted to one point on a lower portion thereof. In this configuration, the vias 112 of each layer may have a stack via structure in which the

	<p>vias are straightly connected to each other. Appendix A-17 - Invalidity of U.S. Patent No. 9859202 in view of Kim - U.S. Patent Publication No. 20150061093

<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of metal pillars of the top package substrate via the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Kim discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“The interposer substrate 110 is interlayer connected through the vias 112 through which the insulating layers 111 of each layer penetrate, such that one point on an upper portion of the interposer substrate 110 may be internally conducted to one point on a lower portion thereof. In this configuration, the vias 112 of each layer may have a stack via structure in which the vias are straightly connected to each other. Alternatively, the vias 112 may be formed at different positions for each layer and may also be connected to each other through metal wirings 113 formed on each insulating layer 111.” Kim, [0035].</p>
--	---

【FIG. 3】

Kim, FIG. 3

“As described above, the remaining portion of the interposer substrate 110 on which the cavity 110 a is formed may be provided with the connection electrode 120. The drawings illustrate the connection electrodes 120 are disposed on both of the upper and lower surfaces of the interposer substrate 110, but unlike the drawings, the connection electrode 120 may be disposed on any one of the upper and lower surfaces of the interposer substrate 110.” Kim, [0037].

“The connection electrode 120 may receive or transmit electrical signals from the outside, such that at the time of the configuration of the semiconductor package 200 using the interposer 100 according to the exemplary embodiment of the present invention, the

	<p>connection electrode 120 may serve to electrically connect between the interposer substrate 110 and package substrates 210 which are disposed on the upper and lower portions of the interposer substrate 110. Therefore, the connection electrode 120 may be made of any one metal material of Ni, Al, Fe, Cu, Ti, Cr, Au, Ag, Pd, and Pt having excellent electrical conductivity and the number of connection electrodes 120 may be configured in plural, depending on the number of input/output terminals (I/O).” Kim, [0038].</p> <p>“The connection electrode 120 may be configured to include a post part 122 having a pillar shape and a pad part 121 which is disposed between the post part 122 and the interposer substrate 110 to strengthen connection reliability between the vias 112, in which a height of the post part 122 may be controlled corresponding to the thickness of the semiconductor device 220 included in the cavity 110 a at the time of the configuration of the semiconductor package 200. That is, the related art controls the thickness of the interposer depending on the number of layers of the insulating layer forming the interposer substrate, but the interposer 100 according to the exemplary embodiment of the present invention may be set to the required thickness by controlling a height of the connection electrode 120, in detail, the height of the post part 122 which is a component of the connection electrode 120.” Kim, [0039].</p> <p>To the extent Plaintiff contends that Kim fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Kurashima - U.S. Patent Publication No. 20140054773

U.S. Patent Publication No. 20140054773 (“Kurashima”) is titled ELECTRONIC COMPONENT BUILT-IN SUBSTRATE AND METHOD OF MANUFACTURING THE SAME and lists Nobuyuki Kurashima, Tetsuya Koyama, Hajime Hzuka, And Koichi Tanaka as inventors. Kurashima anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Kurashima is a U.S. patent publication that was filed July 17, 2013 and published February 27, 2014. Kurashima claims priority to a JP 2012-186065 filed on August 27, 2012. Kurashima is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Kurashima, or otherwise rendered obvious by disclosures and teachings of Kurashima, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Kurashima does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Kurashima with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Kurashima, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-18 - Invalidity of U.S. Patent No. 9859202 in view of Kurashima - U.S. Patent Publication No. 20140054773

To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Kurashima “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Kurashima or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Kurashima set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Kurashima discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 4A to FIG. 10 are views for explaining a method of manufacturing an electronic component built-in substrate according to an embodiment, and FIG. 11 is a view depicting an electronic component built-in substrate according to an embodiment. In a method of manufacturing an electronic component built-in substrate according to an embodiment, as depicted in FIG. 4A, a lower wiring substrate 5 is prepared. In the lower wiring substrate 5, a core substrate 10 is arranged in the center part in the thickness direction. The core substrate</p>

	<p>10 is formed of insulating material such as a glass epoxy resin, or the like, for example.” Kurashima, [0039-0040].</p> <p style="text-align: center;">FIG. 7B</p> <p style="text-align: center;">Kurashima, FIG. 7B</p> <p>“Then, as depicted in FIG. 7B, the second solder balls 29 on the lower surface side of the upper wiring substrate 7 in FIG. 7A are arranged on the second connection pads P2 on the upper surface side of the above-mentioned intermediate wiring substrate 6 in FIG. 6B, and then the reflow heating is applied. By this matter, the second solder balls 29 of the upper wiring substrate 7 are joined to the second connection pads P2 of the intermediate wiring substrate 6, and thus both members are electrically connected mutually. In this way, the upper</p>
--	--

	<p>wiring substrate 7 is electrically connected to the lower wiring substrate 5 via the second solder balls 29 located under this upper wiring substrate 7, the intermediate wiring substrate 6, and the first solder balls 28 located under this intermediate wiring substrate 6. With the above, a stacked wiring substrate in which the upper wiring substrate 7 is stacked on the lower wiring substrate 5 via the intermediate wiring substrate 6 is obtained. As described above, the first and second connection pads P1, P2 on both surface sides of the intermediate wiring substrate 6 are arranged in the displaced positions mutually. Therefore, the first and second solder balls 28, 29 arranged on the lower and upper sides of the intermediate wiring substrate 6 are also arranged in the displaced positions mutually to correspond to the above displaced positions. Moreover, in the present embodiment, the first and second solder balls 28, 29 arranged on the lower and upper sides of the intermediate wiring substrate 6 are arranged to be displaced in the positions that are not mutually overlapped when viewed from the top, to correspond to the first and second connection pads P1, P2 in FIG. 5B.” Kurashima, [0074-0078].</p> <p>“In the present embodiment, the intermediate wiring substrate 6 is interposed between the lower wiring substrate 5 and the upper wiring substrate 7. Therefore, it is unnecessary to set diameters of the first and second solder balls 28, 29 larger than heights of the semiconductor chip 40 and the chip capacitor 50.” Kurashima, [0079].</p>
[1.A] a bottom package substrate;	<p>Kurashima discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“In a method of manufacturing an electronic component built-in substrate according to an embodiment, as depicted in FIG. 4A, a lower wiring substrate 5 is prepared. In the lower wiring substrate 5, a core substrate 10 is arranged in the center part in the thickness direction.</p>

	<p>The core substrate 10 is formed of insulating material such as a glass epoxy resin, or the like, for example. A first wiring layer 20 made of copper, or the like is formed on both surface sides of the core substrate 10 respectively. Through holes TH each penetrating through in the thickness direction are provided in the core substrate 10. The first wiring layer 20 on both surface sides is mutually connected via a through-hole plating layer 12 which is formed on an inner wall of the through hole TH. A resin R is filled in a remaining hole of the through hole TH. Alternatively, the penetrating electrode may be formed by filling the through hole TH of the core substrate 10 with a metal, thereby the first wiring layers 20 on both surface sides may be mutually connected via the penetrating electrode. An interlayer insulating layer 30 covering the first wiring layer 20 is formed on both surface sides of the core substrate 10 respectively. The interlayer insulating layer 30 is formed of an epoxy resin, a polyimide resin, or the like. Via holes VH each reaching the connection part of the first wiring layer 20 are formed in the interlayer insulating layer 30 on both surface sides respectively. Further, second wiring layers 22 each connected to the first wiring layer 20 via a via conductor which is filled in the via hole VH, are formed on the interlayer insulating layer 30 on both surface sides respectively. Also, a solder resist 32 in which opening portions 32 a are provided on connection pads P of the second wiring layers 22 is formed on the interlayer insulating layer 30 and the second wiring layers 22 on both surface sides of the core substrate 10 respectively.” Kurashima, [0040-0045].</p>
--	---

FIG. 4A

Kurashima, FIG. 4A

“In the case that the large size lower wiring substrate 5 for the purpose of multiple production is used, a plurality of product areas are demarcated on the substrate. In FIG. 4A, one product area of the lower wiring substrate 5 is depicted, and a component mounting area A is demarcated in its center part.” Kurashima, [0046].

“Then, as depicted in FIG. 4B, a semiconductor chip 40 which has bump electrodes 42 on the element forming face side is prepared. Then, the bump electrodes 42 of the semiconductor chip 40 are flip-chip connected to the connection pads P of the second wiring layers 22 in the

	<p>component mounting area A of the lower wiring substrate 5. After this, an underfill resin 44 is filled into a clearance located under the semiconductor chip 40. Further, similarly as depicted in FIG. 4B, a chip capacitor 50 is prepared. Then, the chip capacitor 50 is adhered onto the solder resist 32, which is located to the lateral direction of the semiconductor chip 40, on the upper surface side of the lower wiring substrate 5. The chip capacitor 50 has a connection terminal 52 on both end sides of the lateral direction. The connection terminals 52 located to both end sides are arranged in the parallel direction with the surface of the lower wiring substrate 5. Further, the connection terminal 52 on both end sides of the chip capacitor 50 is electrically connected to the connection pads P of the second wiring layers 22 by a solder layer 54 respectively. In this manner, the semiconductor chip 40 and the chip capacitor 50 are mounted side by side in the component mounting area A on the upper surface side of the lower wiring substrate 5.” Kurashima, [0048-0051].</p> <p>“Then, as depicted in FIG. 6B, the first solder balls 28 on the lower surface side of the intermediate wiring substrate 6 in FIG. 6A are arranged on the connection pads P on the upper surface side of the above lower wiring substrate 5 in FIG. 4B, and then the reflow heating is applied. By this matter, the first solder balls 28 of the intermediate wiring substrate 6 are joined to the connection pads P of the lower wiring substrate 5, and thus both members are electrically connected mutually.” Kurashima, [0065].</p> <p>“Further, an external connection terminal 14 is provided onto the connection pads P on the lower surface side of the lower wiring substrate 5 respectively by mounting the solder ball, or the like.” Kurashima, [0106].</p> <p>“As depicted in FIG. 11, in the electronic component built-in substrate 1 according to the embodiment, the bump electrodes 42 of the semiconductor chip 40 are flip-chip connected to the connection pads P in the component mounting area A of the lower wiring substrate 5</p>
--	---

Appendix A-18 - Invalidity of U.S. Patent No. 9859202 in view of Kurashima - U.S. Patent Publication No. 20140054773

	<p>explained in FIG. 4A. The underfill resin 44 is filled into a clearance under the semiconductor chip 40. The chip capacitor 50 having the connection terminal 52 on both end sides is adhered onto the solder resist 32 of the lower wiring substrate 5 in the lateral direction of the semiconductor chip 40. The connection terminals 52 on both end sides of the chip capacitor 50 are connected to the connection pads P of the lower wiring substrate 5 via the solder layer 54. The intermediate wiring substrate 6 shaped like a frame and explained in FIGS. 5A to 5C is arranged in the periphery of the semiconductor chip and the chip capacitor 50. The intermediate wiring substrate 6 has the opening portion 6 a, which penetrates from the upper surface to the lower surface, in the center part, and the semiconductor chip 40 and the chip capacitor 50 are mounted in this opening portion 6 a. The first connection pads P 1 on the lower surface side of the intermediate wiring substrate 6 are electrically connected to the connection pads P of the lower wiring substrate 5 via the first solder ball 28.” Kurashima, [0108-0112].</p> <p>To the extent Plaintiff contends that Kurashima fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.B] a top package substrate stacked on top of the bottom package substrate;	<p>Kurashima discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“In a method of manufacturing an electronic component built-in substrate according to the preliminary matter, as depicted in FIG. 1, first, bump electrodes 220 of a semiconductor chip 200 are flip-chip connected to connection pads (not shown) of a lower wiring substrate 100.</p>

Appendix A-18 - Invalidity of U.S. Patent No. 9859202 in view of Kurashima - U.S. Patent Publication No. 20140054773

	<p>Then, an underfill resin 240 is filled into a clearance located to the lower side of the semiconductor chip 200. Then, an upper wiring substrate 300 is electrically connected to the lower wiring substrate 100 via solder balls 320.” Kurashima, [0025-0026].</p> <p>“Then, as depicted in FIG. 7B, the second solder balls 29 on the lower surface side of the upper wiring substrate 7 in FIG. 7A are arranged on the second connection pads P 2 on the upper surface side of the above-mentioned intermediate wiring substrate 6 in FIG. 6B, and then the reflow heating is applied. By this matter, the second solder balls 29 of the upper wiring substrate 7 are joined to the second connection pads P 2 of the intermediate wiring substrate 6, and thus both members are electrically connected mutually.” Kurashima, [0073-0075].</p> <p>“In this way, the upper wiring substrate 7 is electrically connected to the lower wiring substrate 5 via the second solder balls 29 located under this upper wiring substrate 7, the intermediate wiring substrate 6, and the first solder balls 28 located under this intermediate wiring substrate 6. With the above, a stacked wiring substrate in which the upper wiring substrate 7 is stacked on the lower wiring substrate 5 via the intermediate wiring substrate 6 is obtained.” Kurashima, [0075-0076].</p>
--	---

FIG. 7B

Kurashima, FIG. 7B

“Then, as depicted in FIG. 8, a molding resin 38 is filled into respective areas between the lower wiring substrate 5, the intermediate wiring substrate 6, and the upper wiring substrate 7 of the stacked wiring substrate 8 in FIG. 7B.” Kurashima, [0090].

“Also, the upper wiring substrate 7 is arranged over the semiconductor chip 40, the chip capacitor 50, and the intermediate wiring substrate 6. The second connection pads P 2 on the upper surface side of the intermediate wiring substrate 6 are electrically connected to the first connection pads P 1 on the lower surface side of the upper wiring substrate 7 via the second solder balls 29. Further, the molding resin 38 sealing the semiconductor chip 40 and the chip

Appendix A-18 - Invalidity of U.S. Patent No. 9859202 in view of Kurashima - U.S. Patent Publication No. 20140054773

	<p>capacitor 50 is filled into respective areas between the lower wiring substrate 5, the intermediate wiring substrate 6, and the upper wiring substrate 7.” Kurashima, [0100-0101].</p> <p>“In the electronic component built-in substrate 1 of the present embodiment, by interposing the intermediate wiring substrate 6 between the lower wiring substrate 5 and the upper wiring substrate 7, the respective diameters of the first and second solder balls 28, 29 can be made small.” Kurashima, [0116].</p> <p>To the extent Plaintiff contends that Kurashima fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Kurashima discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“The intermediate wiring substrate 6 has a frame-like structure in which an opening portion 6a penetrating from the upper surface to the lower surface is provided in the center part. The opening portion 6a of the intermediate wiring substrate 6 corresponds to the above component mounting area A of the lower wiring substrate 5, and the area of this opening portion 6a is set one size larger than the area of the component mounting area A.” Kurashima, [0053].</p>

	<p>“Then, as depicted in FIG. 6B, the first solder balls 28 on the lower surface side of the intermediate wiring substrate 6 in FIG. 6A are arranged on the connection pads P on the upper surface side of the above lower wiring substrate 5 in FIG. 4B, and then the reflow heating is applied. By this matter, the first solder balls 28 of the intermediate wiring substrate 6 are joined to the connection pads P of the lower wiring substrate 5, and thus both members are electrically connected mutually. Consequently, it is in a state that the semiconductor chip 40 and the chip capacitor 50 are mounted in the opening portion 6 a of the intermediate wiring substrate 6.” Kurashima, [0065-0066].</p> <p>“Then, as depicted in FIG. 7B, the second solder balls 29 on the lower surface side of the upper wiring substrate 7 in FIG. 7A are arranged on the second connection pads P 2 on the upper surface side of the above-mentioned intermediate wiring substrate 6 in FIG. 6B, and then the reflow heating is applied. By this matter, the second solder balls 29 of the upper wiring substrate 7 are joined to the second connection pads P 2 of the intermediate wiring substrate 6, and thus both members are electrically connected mutually. In this way, the upper wiring substrate 7 is electrically connected to the lower wiring substrate 5 via the second solder balls 29 located under this upper wiring substrate 7, the intermediate wiring substrate 6, and the first solder balls 28 located under this intermediate wiring substrate 6. With the above, a stacked wiring substrate in which the upper wiring substrate 7 is stacked on the lower wiring substrate 5 via the intermediate wiring substrate 6 is obtained.” Kurashima, [0073-0076].</p> <p>“In the present embodiment, the intermediate wiring substrate 6 is interposed between the lower wiring substrate 5 and the upper wiring substrate 7. Therefore, it is unnecessary to set diameters of the first and second solder balls 28, 29 larger than heights of the semiconductor chip 40 and the chip capacitor 50. For example, in the case that respective heights of the semiconductor chip 40 including the bump electrodes 42 and the chip capacitor 50 are 300</p>
--	---

	<p>μm, a thickness of the intermediate wiring substrate 6 is set to about 150 μm and diameters of the first and second solder balls 28, 29 arranged on the lower and upper sides of this intermediate wiring substrate 6 can be set to about 100 μm.” Kurashima, [0079-0080].</p> <p>FIG. 7B</p>  <p>Kurashima, FIG. 7B</p> <p>“As depicted in FIG. 11, in the electronic component built-in substrate 1 according to the embodiment, the bump electrodes 42 of the semiconductor chip 40 are flip-chip connected to the connection pads P in the component mounting area A of the lower wiring substrate 5</p>
--	---

	<p>explained in FIG. 4A. The underfill resin 44 is filled into a clearance under the semiconductor chip 40. The chip capacitor 50 having the connection terminal 52 on both end sides is adhered onto the solder resist 32 of the lower wiring substrate 5 in the lateral direction of the semiconductor chip 40. The connection terminals 52 on both end sides of the chip capacitor 50 are connected to the connection pads P of the lower wiring substrate 5 via the solder layer 54. The intermediate wiring substrate 6 shaped like a frame and explained in FIGS. 5A to 5C is arranged in the periphery of the semiconductor chip and the chip capacitor 50. The intermediate wiring substrate 6 has the opening portion 6 a, which penetrates from the upper surface to the lower surface, in the center part, and the semiconductor chip 40 and the chip capacitor 50 are mounted in this opening portion 6 a.” Kurashima, [0109-0111].</p> <p>“Further, the molding resin 38 sealing the semiconductor chip 40 and the chip capacitor 50 is filled into respective areas between the lower wiring substrate 5, the intermediate wiring substrate 6, and the upper wiring substrate 7.” Kurashima, [0114].</p> <p>To the extent Plaintiff contends that Kurashima fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.D] the spacer connector comprises a core substrate;	<p>Kurashima discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“In the lower wiring substrate 5, a core substrate 10 is arranged in the center part in the thickness direction. The core substrate 10 is formed of insulating material such as a glass epoxy resin, or the like, for example. A first wiring layer 20 made of copper, or the like is</p>

	<p>formed on both surface sides of the core substrate 10 respectively. Through holes TH each penetrating through in the thickness direction are provided in the core substrate 10. The first wiring layer 20 on both surface sides is mutually connected via a through-hole plating layer 12 which is formed on an inner wall of the through hole TH.” Kurashima, [0040-0042].</p> <p>“The intermediate wiring substrate 6 has a frame-like structure in which an opening portion 6 a penetrating from the upper surface to the lower surface is provided in the center part. The opening portion 6 a of the intermediate wiring substrate 6 corresponds to the above component mounting area A of the lower wiring substrate 5, and the area of this opening portion 6 a is set one size larger than the area of the component mounting area A. In the intermediate wiring substrate 6, a wiring layer 24 is formed on both surface sides of a core substrate 10 a.” Kurashima, [0053-0054].</p> <p>“Similarly to the above-mentioned lower wiring substrate 5, the wiring layers 24 on both surface sides of the core substrate 10 a may be mutually connected via the penetrating electrode formed in the through hole TH.” Kurashima, [0055].</p> <p>“Alternatively, the intermediate wiring substrate 6 may be formed as a coreless substrate that uses a polyimide tape, or the like as a base material and has flexibility.” Kurashima, [0057].</p> <p>“In the intermediate wiring substrate 6, a wiring layer 24 is formed on both surface sides of a core substrate 10 a. The core substrate 10 a is formed of insulating material such as a glass epoxy resin, or the like, for example. The through holes TH penetrating in the thickness direction are provided in the core substrate 10 a. The wiring layers 24 on both surface sides are mutually connected via the through-hole plating layer 12 formed on the inner wall of the through hole TH. The resin R is filled in remaining holes of the through holes TH.” Kurashima, [0068-0069].</p>
--	---

FIG. 7B

Kurashima, FIG. 7B

“In the upper wiring substrate 7, wiring layers 26 are formed on both surface sides of a core substrate 10 b respectively. The core substrate 10 b is formed of insulating material such as a glass epoxy resin, or the like, for example. The through holes TH penetrating in the thickness direction are provided in the core substrate 10 b. The wiring layers 26 on both surface sides are mutually connected via the through-hole plating layer 12 which is formed on the inner wall of the through hole TH. The resin R is filled in the remaining hole of the through hole TH.” Kurashima, [0068-0069].

Appendix A-18 - Invalidity of U.S. Patent No. 9859202 in view of Kurashima - U.S. Patent Publication No. 20140054773

	<p>To the extent Plaintiff contends that Kurashima fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Kurashima discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“A first wiring layer 20 made of copper, or the like is formed on both surface sides of the core substrate 10 respectively. Through holes TH each penetrating through in the thickness direction are provided in the core substrate 10. The first wiring layer 20 on both surface sides is mutually connected via a through-hole plating layer 12 which is formed on an inner wall of the through hole TH.” Kurashima, [0041-0042].</p>

FIG. 7B

Kurashima, FIG. 7B

“Alternatively, the penetrating electrode may be formed by filling the through hole TH of the core substrate 10 with a metal, thereby the first wiring layers 20 on both surface sides may be mutually connected via the penetrating electrode.” Kurashima, [0042].

“The wiring layers 24 on both surface sides are mutually connected via the through-hole plating layer 12 formed on the inner wall of the through hole TH.” Kurashima, [0054].

Appendix A-18 - Invalidity of U.S. Patent No. 9859202 in view of Kurashima - U.S. Patent Publication No. 20140054773

	<p>“Similarly to the above-mentioned lower wiring substrate 5, the wiring layers 24 on both surface sides of the core substrate 10 a may be mutually connected via the penetrating electrode formed in the through hole TH.” Kurashima, [0055].</p> <p>“The wiring layers 26 on both surface sides are mutually connected via the through-hole plating layer 12 which is formed on the inner wall of the through hole TH.” Kurashima, [0069].</p> <p>To the extent Plaintiff contends that Kurashima fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.F] a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars;</p>	<p>Kurashima discloses, either expressly or inherently, a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.</p> <p><i>See, e.g.:</i></p> <p>“The wiring layers 24 on both surface sides are mutually connected via the through-hole plating layer 12 formed on the inner wall of the through hole TH.” Kurashima, [0054].</p> <p>“Then, as depicted in FIG. 6A, a first solder ball 28 is mounted on the first connection pads P 1 on the lower surface side of the intermediate wiring substrate 6 respectively. Then, the first solder balls 28 are joined to the first connection pads P 1 by applying the reflow heating.” Kurashima, [0061-0062].</p>

	<p>“The wiring layers 26 on both surface sides are mutually connected via the through-hole plating layer 12 which is formed on the inner wall of the through hole TH.” Kurashima, [0069].</p> <p>“A solder resist 36 in which opening portions 36 a are provided on the first connection pads P 1 of the wiring layers 26 is formed on the lower surface side of the core substrate 10 b. Similarly, the solder resist 36 in which the opening portions 36 a are provided on the second connection pads P 2 of the wiring layers 26 is formed on the upper surface side of the core substrate 10 b.” Kurashima, [0070-0072].</p> <p>“A solder resist 34 in which opening portions 34 a are provided on first connection pads P 1 of the wiring layer 24 is formed on the lower surface side of the core substrate 10 a. <p>[1.I] the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the</p>	<p>Kurashima discloses, either expressly or inherently, the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p><i>See, e.g.:</i></p>

Appendix A-18 - Invalidity of U.S. Patent No. 9859202 in view of Kurashima - U.S. Patent Publication No. 20140054773

plurality of metal pillars of the spacer connector, and	<p>“Then, as depicted in FIG. 6A, a first solder ball 28 is mounted on the first connection pads P 1 on the lower surface side of the intermediate wiring substrate 6 respectively. Then, the first solder balls 28 are joined to the first connection pads P 1 by applying the reflow heating. The first solder ball 28 is one example of the conductive balls. In FIG. 6A, as the preferred example, the first solder ball 28 is formed by coating a solder layer 28 b on an outer face of a copper core ball 28 a. Alternatively, as the solder ball, the ball which is formed by coating a solder layer on an outer face of a resin core ball may be used. Otherwise, in the case that no harm is caused even when an interval between the stacked substrates is slightly varied, a solder ball formed of the solder over the whole may be used as the solder ball. In this manner, as the example of the conductive ball, the solder ball at least an outer face of which is formed of the solder layer can be used. Then, as depicted in FIG. 6B, the first solder balls 28 on the lower surface side of the intermediate wiring substrate 6 in FIG. 6A are arranged on the connection pads P on the upper surface side of the above lower wiring substrate 5 in FIG. 4B, and then the reflow heating is applied. By this matter, the first solder balls 28 of the intermediate wiring substrate 6 are joined to the connection pads P of the lower wiring substrate 5, and thus both members are electrically connected mutually.” Kurashima, [0061-0065].</p>
---	---

FIG. 6B

Kurashima, FIG. 6B

“Also, in the example in FIG. 5B, the first connection pads P 1 and the second connection pads P 2 on the lower and upper surface sides are arranged in two lines respectively. But the number of arrangement can be set arbitrarily. Then, as depicted in FIG. 6A, a first solder ball 28 is mounted on the first connection pads P 1 on the lower surface side of the intermediate wiring substrate 6 respectively. Then, the first solder balls 28 are joined to the first connection pads P 1 by applying the reflow heating.” Kurashima, [0071-0073].

“In the present embodiment, by adjusting the thickness of the intermediate wiring substrate 6 with regard to the heights of the semiconductor chip and the chip capacitor 50, the first and

	<p>second solder balls 28, 29 whose diameters are fairly smaller than a height of the semiconductor chip 40 can be employed.” Kurashima, [0082].</p> <p>“Also, in the above steps in FIGS. 6A and 6B, the first solder balls 28 may be joined to the connection pads P on the upper surface side of the lower wiring substrate 5, and then the first connection pads P 1 on the lower surface side of the intermediate wiring substrate 6 may joined thereto.” Kurashima, [0087-0088].</p> <p>“The first connection pads P 1 on the lower surface side of the intermediate wiring substrate 6 are electrically connected to the connection pads P of the lower wiring substrate 5 via the first solder ball 28.” Kurashima, [0111-0112].</p> <p>“Further, the clauses are disclosed about the above embodiment hereinafter. (Clause 1) A method of manufacturing an electronic component built-in substrate, comprising: mounting an electronic component on a lower wiring substrate; obtaining a stacked wiring substrate having a structure that an intermediate wiring substrate in which an opening portion housing the electronic component is provided, is connected to the lower wiring substrate via a first conductive ball, and that an upper wiring substrate is connected to the intermediate wiring substrate via a second conductive ball; sealing the electronic component by filling a resin into respective areas between the lower wiring substrate, the intermediate wiring substrate, and the upper wiring substrate; and wherein the first conductive ball and the second conductive ball are arranged in displaced positions mutually. (Clause 2) A method of manufacturing an electronic component built-in substrate, according to clause 1, wherein the obtaining the stacked wiring substrate includes, connecting the intermediate wiring substrate to the lower wiring substrate via the first conductive ball, and connecting the upper wiring substrate to the intermediate wiring substrate via the second conductive ball. (Clause 3) A method of manufacturing an electronic component built-in substrate, according to clause 1,</p>
--	---

Appendix A-18 - Invalidity of U.S. Patent No. 9859202 in view of Kurashima - U.S. Patent Publication No. 20140054773

	<p>wherein the first conductive ball and second conductive ball are arranged in positions that are not overlapped mutually, when viewed from a top.(Clause 4) A method of manufacturing an electronic component built-in substrate, according to clause 1, wherein each diameter of the first conductive ball and the second conductive ball is set smaller than a height of the electronic component.(Clause 5) A method of manufacturing an electronic component built-in substrate, according to clause” Kurashima, [0121-0129].</p> <p>To the extent Plaintiff contends that Kurashima fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.J] the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of top metal pillars of the bottom package substrate; and</p>	<p>Kurashima discloses, either expressly or inherently, the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The wiring layers 24 on both surface sides are mutually connected via the through-hole plating layer 12 formed on the inner wall of the through hole TH.” Kurashima, [0054].</p> <p>“By this matter, the first solder balls 28 of the intermediate wiring substrate 6 are joined to the connection pads P of the lower wiring substrate 5, and thus both members are electrically connected mutually. Consequently, it is in a state that the semiconductor chip 40 and the chip capacitor 50 are mounted in the opening portion 6 a of the intermediate wiring substrate 6.” Kurashima, [0065-0066].</p>

	<p>“The through holes TH penetrating in the thickness direction are provided in the core substrate 10 a. The wiring layers 24 on both surface sides are mutually connected via the through-hole plating layer 12 formed on the inner wall of the through hole TH.” Kurashima, [0068-0069].</p> <p>“By this matter, the second solder balls 29 of the upper wiring substrate 7 are joined to the second connection pads P 2 of the intermediate wiring substrate 6, and thus both members are electrically connected mutually.” Kurashima, [0074].</p> <p>“In this way, the upper wiring substrate 7 is electrically connected to the lower wiring substrate 5 via the second solder balls 29 located under this upper wiring substrate 7, the intermediate wiring substrate 6, and the first solder balls 28 located under this intermediate wiring substrate 6.” Kurashima, [0075].</p>
--	--

FIG. 7B

Kurashima, FIG. 7B

“The first connection pads P 1 on the lower surface side of the intermediate wiring substrate 6 are electrically connected to the connection pads P of the lower wiring substrate 5 via the first solder ball 28. Also, the upper wiring substrate 7 is arranged over the semiconductor chip 40, the chip capacitor 50, and the intermediate wiring substrate 6. The second connection pads P 2 on the upper surface side of the intermediate wiring substrate 6 are electrically connected to the first connection pads P 1 on the lower surface side of the upper wiring substrate 7 via the second solder balls 29.” Kurashima, [0111-0114].

Appendix A-18 - Invalidity of U.S. Patent No. 9859202 in view of Kurashima - U.S. Patent Publication No. 20140054773

	<p>To the extent Plaintiff contends that Kurashima fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.K] a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein</p>	<p>Kurashima discloses, either expressly or inherently, a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“By this matter, it is in a state that the semiconductor chip 200 is housed in an area between the lower wiring substrate 100 and the upper wiring substrate 300.” Kurashima, [0026].</p> <p>“Consequently, it is in a state that the semiconductor chip 40 and the chip capacitor 50 are mounted in the opening portion 6 a of the intermediate wiring substrate 6. Here, the intermediate wiring substrate 6 linked like a frame is illustrated. In this case, the intermediate wiring substrate 6 may be arranged around the semiconductor chip 40 and the chip capacitor 50 in a state that the intermediate wiring substrate 6 is divided into plural parts.” Kurashima, [0066-0067].</p>

FIG. 7B

Kurashima, FIG. 7B

“In this way, the upper wiring substrate 7 is electrically connected to the lower wiring substrate 5 via the second solder balls 29 located under this upper wiring substrate 7, the intermediate wiring substrate 6, and the first solder balls 28 located under this intermediate wiring substrate 6. With the above, a stacked wiring substrate in which the upper wiring substrate 7 is stacked on the lower wiring substrate 5 via the intermediate wiring substrate 6 is obtained.” Kurashima, [0075-0076].

Appendix A-18 - Invalidity of U.S. Patent No. 9859202 in view of Kurashima - U.S. Patent Publication No. 20140054773

	<p>“Then, as depicted in FIG. 8, a molding resin 38 is filled into respective areas between the lower wiring substrate 5, the intermediate wiring substrate 6, and the upper wiring substrate 7 of the stacked wiring substrate 8 in FIG. 7B.” Kurashima, [0090].</p> <p>“The intermediate wiring substrate 6 shaped like a frame and explained in FIGS. 5A to 5C is arranged in the periphery of the semiconductor chip and the chip capacitor 50. The intermediate wiring substrate 6 has the opening portion 6 a, which penetrates from the upper surface to the lower surface, in the center part, and the semiconductor chip 40 and the chip capacitor 50 are mounted in this opening portion 6 a. The first connection pads P 1 on the lower surface side of the intermediate wiring substrate 6 are electrically connected to the connection pads P of the lower wiring substrate 5 via the first solder ball 28. Also, the upper wiring substrate 7 is arranged over the semiconductor chip 40, the chip capacitor 50, and the intermediate wiring substrate 6.” Kurashima, [0110-0113].</p> <p>“Further, the molding resin 38 sealing the semiconductor chip 40 and the chip capacitor 50 is filled into respective areas between the lower wiring substrate 5, the intermediate wiring substrate 6, and the upper wiring substrate 7.” Kurashima, [0114].</p> <p>To the extent Plaintiff contends that Kurashima fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.L] the bottom chip is mounted to the top surface of the bottom package substrate, and	<p>Kurashima discloses, either expressly or inherently, the bottom chip is mounted to the top surface of the bottom package substrate.</p> <p><i>See, e.g.:</i></p>

	<p>“In a method of manufacturing an electronic component built-in substrate according to an embodiment, as depicted in FIG. 4A, a lower wiring substrate 5 is prepared. In the lower wiring substrate 5, a core substrate 10 is arranged in the center part in the thickness direction. The core substrate 10 is formed of insulating material such as a glass epoxy resin, or the like, for example. A first wiring layer 20 made of copper, or the like is formed on both surface sides of the core substrate 10 respectively.” Kurashima, [0040-0041].</p> <p>“Then, as depicted in FIG. 4B, a semiconductor chip 40 which has bump electrodes 42 on the element forming face side is prepared. Then, the bump electrodes 42 of the semiconductor chip 40 are flip-chip connected to the connection pads P of the second wiring layers 22 in the component mounting area A of the lower wiring substrate 5.” Kurashima, [0048].</p>
--	--

FIG. 4B

Kurashima, FIG. 4B

“Further, similarly as depicted in FIG. 4B, a chip capacitor 50 is prepared. Then, the chip capacitor 50 is adhered onto the solder resist 32, which is located to the lateral direction of the semiconductor chip 40, on the upper surface side of the lower wiring substrate 5. The chip capacitor 50 has a connection terminal 52 on both end sides of the lateral direction. The connection terminals 52 located to both end sides are arranged in the parallel direction with the surface of the lower wiring substrate 5. Further, the connection terminal 52 on both end sides of the chip capacitor 50 is electrically connected to the connection pads P of the second wiring layers 22 by a solder layer 54 respectively. In this manner, the semiconductor chip 40

	<p>and the chip capacitor 50 are mounted side by side in the component mounting area A on the upper surface side of the lower wiring substrate 5.” Kurashima, [0049-0051].</p> <p>“Then, as depicted in FIG. 6B, the first solder balls 28 on the lower surface side of the intermediate wiring substrate 6 in FIG. 6A are arranged on the connection pads P on the upper surface side of the above lower wiring substrate 5 in FIG. 4B, and then the reflow heating is applied. By this matter, the first solder balls 28 of the intermediate wiring substrate 6 are joined to the connection pads P of the lower wiring substrate 5, and thus both members are electrically connected mutually. Consequently, it is in a state that the semiconductor chip 40 and the chip capacitor 50 are mounted in the opening portion 6 a of the intermediate wiring substrate 6.” Kurashima, [0065-0066].</p> <p>“As depicted in FIG. 11, in the electronic component built-in substrate 1 according to the embodiment, the bump electrodes 42 of the semiconductor chip 40 are flip-chip connected to the connection pads P in the component mounting area A of the lower wiring substrate 5 explained in FIG. 4A. The underfill resin 44 is filled into a clearance under the semiconductor chip 40. The chip capacitor 50 having the connection terminal 52 on both end sides is adhered onto the solder resist 32 of the lower wiring substrate 5 in the lateral direction of the semiconductor chip 40.” Kurashima, [0109-0110].</p> <p>“The intermediate wiring substrate 6 has the opening portion 6 a, which penetrates from the upper surface to the lower surface, in the center part, and the semiconductor chip 40 and the chip capacitor 50 are mounted in this opening portion 6 a. Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p>	<p>Kurashima discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Consequently, it is in a state that the semiconductor chip 40 and the chip capacitor 50 are mounted in the opening portion 6 a of the intermediate wiring substrate 6. Here, the intermediate wiring substrate 6 linked like a frame is illustrated. In this case, the intermediate wiring substrate 6 may be arranged around the semiconductor chip 40 and the chip capacitor 50 in a state that the intermediate wiring substrate 6 is divided into plural parts.” Kurashima, [0066-0067].</p> <p>“Then, as depicted in FIG. 7B, the second solder balls 29 on the lower surface side of the upper wiring substrate 7 in FIG. 7A are arranged on the second connection pads P 2 on the upper surface side of the above-mentioned intermediate wiring substrate 6 in FIG. 6B, and then the reflow heating is applied. By this matter, the second solder balls 29 of the upper wiring substrate 7 are joined to the second connection pads P 2 of the intermediate wiring substrate 6, and thus both members are electrically connected mutually. In this way, the upper wiring substrate 7 is electrically connected to the lower wiring substrate 5 via the second solder balls 29 located under this upper wiring substrate 7, the intermediate wiring substrate 6, and the first solder balls 28 located under this intermediate wiring substrate 6. With the above, a stacked wiring substrate in which the upper wiring substrate 7 is stacked on the</p>

	<p>lower wiring substrate 5 via the intermediate wiring substrate 6 is obtained.” Kurashima, [0073-0076].</p> <p>FIG. 7B</p>  <p>Kurashima, FIG. 7B</p> <p>“In the present embodiment, the intermediate wiring substrate 6 is interposed between the lower wiring substrate 5 and the upper wiring substrate 7. Therefore, it is unnecessary to set diameters of the first and second solder balls 28, 29 larger than heights of the semiconductor chip 40 and the chip capacitor 50. For example, in the case that respective heights of the semiconductor chip 40 including the bump electrodes 42 and the chip capacitor 50 are 300 μm, a thickness of the intermediate wiring substrate 6 is set to about 150 μm and diameters</p>
--	---

	<p>of the first and second solder balls 28, 29 arranged on the lower and upper sides of this intermediate wiring substrate 6 can be set to about 100 μm.” Kurashima, [0079-0080].</p> <p>“Then, as depicted in FIG. 8, a molding resin 38 is filled into respective areas between the lower wiring substrate 5, the intermediate wiring substrate 6, and the upper wiring substrate 7 of the stacked wiring substrate 8 in FIG. 7B.” Kurashima, [0090].</p> <p>“As depicted in FIG. 11, in the electronic component built-in substrate 1 according to the embodiment, the bump electrodes 42 of the semiconductor chip 40 are flip-chip connected to the connection pads P in the component mounting area A of the lower wiring substrate 5 explained in FIG. 4A. The underfill resin 44 is filled into a clearance under the semiconductor chip 40. The chip capacitor 50 having the connection terminal 52 on both end sides is adhered onto the solder resist 32 of the lower wiring substrate 5 in the lateral direction of the semiconductor chip 40. The connection terminals 52 on both end sides of the chip capacitor 50 are connected to the connection pads P of the lower wiring substrate 5 via the solder layer 54. The intermediate wiring substrate 6 shaped like a frame and explained in FIGS. 5A to 5C is arranged in the periphery of the semiconductor chip and the chip capacitor 50. The intermediate wiring substrate 6 has the opening portion 6 a, which penetrates from the upper surface to the lower surface, in the center part, and the semiconductor chip 40 and the chip capacitor 50 are mounted in this opening portion 6 a.” Kurashima, [0109-0111].</p> <p>“Also, the upper wiring substrate 7 is arranged over the semiconductor chip 40, the chip capacitor 50, and the intermediate wiring substrate 6. The second connection pads P 2 on the upper surface side of the intermediate wiring substrate 6 are electrically connected to the first connection pads P 1 on the lower surface side of the upper wiring substrate 7 via the second solder balls 29.” Kurashima, [0112-0114].</p>

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Kurashima discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“Then, as depicted in FIG. 7B, the second solder balls 29 on the lower surface side of the upper wiring substrate 7 in FIG. 7A are arranged on the second connection pads P 2 on the upper surface side of the above-mentioned intermediate wiring substrate 6 in FIG. 6B, and then the reflow heating is applied. By this matter, the second solder balls 29 of the upper wiring substrate 7 are joined to the second connection pads P 2 of the intermediate wiring substrate 6, and thus both members are electrically connected mutually. In this way, the upper wiring substrate 7 is electrically connected to the lower wiring substrate 5 via the second solder balls 29 located under this upper wiring substrate 7, the intermediate wiring substrate 6, and the first solder balls 28 located under this intermediate wiring substrate 6.” Kurashima, [0064-0067].</p>

	<p>“As depicted in FIG. 11, in the electronic component built-in substrate 1 according to the embodiment, the bump electrodes 42 of the semiconductor chip 40 are flip-chip connected to the connection pads P in the component mounting area A of the lower wiring substrate 5 explained in FIG. 4A. The underfill resin 44 is filled into a clearance under the semiconductor chip 40. The chip capacitor 50 having the connection terminal 52 on both end sides is adhered onto the solder resist 32 of the lower wiring substrate 5 in the lateral direction of the semiconductor chip 40. The connection terminals 52 on both end sides of the chip capacitor 50 are connected to the connection pads P of the lower wiring substrate 5 via the solder layer 54. The intermediate wiring substrate 6 shaped like a frame and explained in FIGS. 5A to 5C is arranged in the periphery of the semiconductor chip and the chip capacitor 50. The intermediate wiring substrate 6 has the opening portion 6 a, which penetrates from the upper surface to the lower surface, in the center part, and the semiconductor chip 40 and the chip capacitor 50 are mounted in this opening portion 6 a. The first connection pads P 1 on the lower surface side of the intermediate wiring substrate 6 are electrically connected to the connection pads P of the lower wiring substrate 5 via the first solder ball 28. Also, the upper wiring substrate 7 is arranged over the semiconductor chip 40, the chip capacitor 50, and the intermediate wiring substrate 6. The second connection pads P 2 on the upper surface side of the intermediate wiring substrate 6 are electrically connected to the first connection pads P 1 on the lower surface side of the upper wiring substrate 7 via the second solder balls 29. Further, the molding resin 38 sealing the semiconductor chip 40 and the chip capacitor 50 is filled into respective areas between the lower wiring substrate 5, the intermediate wiring substrate 6, and the upper wiring substrate 7. Also, the solder bumps 72 of the semiconductor device 70 are connected to the second connection pads P 2 on the upper surface side of the upper wiring substrate 7. The underfill resin 74 is filled into a clearance under the semiconductor device 70.” Kurashima, [0108-0115].</p>

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to the bottom ends of the plurality of metal pillars of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	<p>Kurashima discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p>

corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

“A solder resist 34 in which opening portions 34 a are provided on first connection pads P1 of the wiring layer 24 is formed on the lower surface side of the core substrate 10 a. Similarly, the solder resist 34 in which the opening portions 34 a are provided on second connection pads P2 of the wiring layer 24 is formed on the upper surface side of the core substrate 10 a.” Kurashima, [0056].

FIG. 7B

Kurashima, FIG. 7B

“By reference to a plan view of FIG. 5B together with FIG. 5A, the first connection pads P1 on the lower surface side of the intermediate wiring substrate 6 and the second connection

	<p>pads P2 on the upper surface side thereof are arranged in mutually displaced positions. In FIGS. 5A and 5B, as the preferred example, when viewed from the top, the first connection pads P1 and the second connection pads P2 are arranged in the positions that are not mutually overlapped and are arranged like a staggered arrangement. Any pad arrangements are available if the first connection pads P1 and the second connection pads P2 are arranged in the mutually displaced positions. Besides the example in FIG. 5B, the first connection pads P1 and the second connection pads P2 may be arranged to be displaced in such a state that these connection pads are partially overlapped with each other.” Kurashima, [0059-0060].</p> <p>“Also, in the example in FIG. 5B, the first connection pads P1 and the second connection pads P2 on the lower and upper surface sides are arranged in two lines respectively. But the number of arrangement can be set arbitrarily.” Kurashima, [0061].</p> <p>“Then, as depicted in FIG. 7B, the second solder balls 29 on the lower surface side of the upper wiring substrate 7 in FIG. 7A are arranged on the second connection pads P2 on the upper surface side of the above-mentioned intermediate wiring substrate 6 in FIG. 6B, and then the reflow heating is applied. By this matter, the second solder balls 29 of the upper wiring substrate 7 are joined to the second connection pads P2 of the intermediate wiring substrate 6, and thus both members are electrically connected mutually. In this way, the upper wiring substrate 7 is electrically connected to the lower wiring substrate 5 via the second solder balls 29 located under this upper wiring substrate 7, the intermediate wiring substrate 6, and the first solder balls 28 located under this intermediate wiring substrate 6. With the above, a stacked wiring substrate in which the upper wiring substrate 7 is stacked on the lower wiring substrate 5 via the intermediate wiring substrate 6 is obtained. As described above, the first and second connection pads P1, P2 on both surface sides of the intermediate wiring substrate 6 are arranged in the displaced positions mutually.” Kurashima, [0074-0076].</p>

Appendix A-19 - Invalidity of U.S. Patent No. 9859202 in view of Lee - U.S. Patent No. 9368566

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Lee - U.S. Patent No. 9368566

U.S. Patent No. 9368566 (“Lee”) is titled Package on Package (POP) Integrated Device Comprising a Capacitor in a Substrate and lists Jong-Hoon Lee, Young Kyu Song, Daeik Daniel Kim, Jung Ho Yoon, Uei-Ming Jow, Mario Francisco Velez, Jonghae Kim, Xiaonan Zhang, and Ryan David Lane as inventors. Lee is assigned to QUALCOMM Incorporated. Lee anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Lee is a U.S. patent that was filed July 17, 2014 and published January 21, 2016. Lee is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(2).

The chart below provides representative examples of where each element of each Asserted Claim is found within Lee, or otherwise rendered obvious by disclosures and teachings of Lee, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Lee does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Lee with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Lee, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-19 - Invalidity of U.S. Patent No. 9859202 in view of Lee - U.S. Patent No. 9368566

such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Lee “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Lee or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Lee set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Lee discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“A first example provides an integrated device that includes a substrate, a first die, a first encapsulation layer, a first redistribution portion, a second die, a second encapsulation layer, and a second redistribution portion. The substrate includes a first surface and a second surface. The substrate includes a capacitor. The first die is coupled to the first surface of the substrate. The first encapsulation layer encapsulates the first die. The first redistribution portion is coupled to the first encapsulation layer. The second die is coupled to the second</p>

Appendix A-19 - Invalidity of U.S. Patent No. 9859202 in view of Lee - U.S. Patent No. 9368566

	<p>surface of the substrate. The second encapsulation layer encapsulates the second die. The second redistribution portion is coupled to the second encapsulation layer.” Lee, [1:64-2:8].</p> <p>“Some features pertain to an integrated device (e.g., integrated package device, package-on-package (PoP) device) that includes a substrate, a first die, a first encapsulation layer, a first redistribution portion, a second die, a second encapsulation layer, and a second redistribution portion. The substrate includes a first surface and a second surface. The substrate includes a capacitor. The first die is coupled to the first surface of the substrate. The first encapsulation layer encapsulates the first die. The first redistribution portion is coupled to the first encapsulation. The second die is coupled to the second surface of the substrate. The second encapsulation layer encapsulates the second die. The second redistribution portion is coupled to the second encapsulation layer.” Lee, [4:30-4:43].</p> <p>“FIG. 2 illustrates an exemplary package on package (PoP) integrated device 200 that includes a capacitor in a substrate. As shown in FIG. 2, the integrated device 200 (e.g., integrated package device) includes a first die 202, a second die 206, a substrate 210, a first encapsulation layer 220, a second encapsulation layer 230, a first redistribution portion 240, and a second redistribution portion 250. The substrate 210 includes a dielectric layer 212, a via 214, a pad 216, a first capacitor 217 and a second capacitor 219. In some implementations, the substrate 210 is a laminate substrate. The substrate 210 includes a first surface (e.g., top surface) and a second surface (e.g., bottom surface).” Lee, [5:3-5:14].</p>
--	--

FIG. 2

Lee, FIG. 2

“FIG. 4 illustrates an exemplary package on package (PoP) integrated device 400 that includes a capacitor in a hybrid substrate. As shown in FIG. 4, the integrated device 400 (e.g., integrated package device) includes a first die 402, a second die 406, a substrate 410, a first encapsulation layer 420, a second encapsulation layer 430, a first redistribution portion 440, and a second redistribution portion 450. The substrate 410 includes a first dielectric layer 412, a second dielectric layer 413, a third dielectric layer 415, a via 414, a pad 416, a first capacitor 417 and a second capacitor 419. In some implementations, the substrate 410 is a hybrid laminate substrate.” Lee, [7:64-8:8].

“FIG. 6 illustrates an exemplary package on package (PoP) integrated device 600 that includes a capacitor in a substrate. As shown in FIG. 6, the integrated device 600 (e.g.,

Appendix A-19 - Invalidity of U.S. Patent No. 9859202 in view of Lee - U.S. Patent No. 9368566

	<p>integrated package device) includes a first die 602, a second die 606, a substrate 610, a first encapsulation layer 620, a second encapsulation layer 630, a first redistribution portion 640, and a second redistribution portion 650. The substrate 610 includes a dielectric layer 612, a via 614, a pad 616, a capacitor 618. In some implementations, the substrate 610 is a laminate substrate.” Lee, [11:4-11:13].</p> <p>“Stage 1 of FIG. 10A, illustrates a state after a substrate 1000 that includes a capacitor is provided. In some implementations, the substrate 1000 is similar to the substrate 210 of FIG. 2, the substrate 410 of FIG. 4, or the substrate 610 of FIG. 6, described above. In some implementations, the substrate 1000 is provided by a supplier. In some implementations, the substrate 1000 is fabricated (e.g., formed). The substrate 1000 includes a via 1001 and a pad 1003. The via 1001 is coupled to the pad 1003.” Lee, [16:64-17:5].</p>
[1.A] a bottom package substrate;	<p>Lee discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“As shown in FIG. 1, the integrated device 100 includes a first package 102 and a second package 104. The first package 102 includes a first substrate 106, a first die (e.g., chip) 108, a first set of solder balls 116, a first set of interconnects 118, and a capacitor 120. The first substrate 106 may include traces and/or vias (both of which are not shown).” Lee, [1:12-1:17].</p> <p>“FIG. 2 illustrates an exemplary package on package (PoP) integrated device 200 that includes a capacitor in a substrate. As shown in FIG. 2, the integrated device 200 (e.g., integrated package device) includes a first die 202, a second die 206, a substrate 210, a first</p>

encapsulation layer 220, a second encapsulation layer 230, a first redistribution portion 240, and a second redistribution portion 250.” Lee, [5:3-5:9].

FIG. 2

Lee, FIG. 2

“The substrate 410 includes a first dielectric layer 412, a second dielectric layer 413, a third dielectric layer 415, a via 414, a pad 416, a first capacitor 417 and a second capacitor 419. In some implementations, the substrate 410 is a hybrid laminate substrate. In some implementations, the third dielectric layer 415 has a high k value, relative to the k value of the first dielectric layer 412 and/or the second dielectric layer 413. For example, the third dielectric layer 415 may have a k value that is about at least 2 times greater than the k value of the first dielectric layer 412 and/or the second dielectric layer 413. In some implementations, the substrate 410 may include more than three dielectric layers. The

Appendix A-19 - Invalidity of U.S. Patent No. 9859202 in view of Lee - U.S. Patent No. 9368566

	<p>substrate 410 includes a first surface (e.g., top surface) and a second surface (e.g., bottom surface). The via 414 is coupled to the pad 416. In some implementations, the combination of the via 414 and the pad 416 traverses from the first surface of the substrate 410 to the second surface of the substrate 410. In some implementations, the via 414 and/or the pad 416 is a form of an interconnect that traverses the substrate 410.” Lee, [8:4-8:23].</p> <p>“The substrate 610 includes a dielectric layer 612, a via 614, a pad 616, a capacitor 618. In some implementations, the substrate 610 is a laminate substrate. The substrate 610 includes a first surface (e.g., top surface) and a second surface (e.g., bottom surface). In some implementations, the dielectric layer 612 may include several dielectric layers. In some implementations, the dielectric layers may be the same material. The via 614 is coupled to the pad 616. In some implementations, the combination of the via 614 and the pad 616 traverse from the first surface of the substrate 610 to the second surface of the substrate 610. In some implementations, the via 614 and/or the pad 616 is a form of an interconnect that traverse the substrate 610.” Lee, [11:11-11:23].</p> <p>“Stage 1 of FIG. 10A, illustrates a state after a substrate 1000 that includes a capacitor is provided. In some implementations, the substrate 1000 is similar to the substrate 210 of FIG. 2, the substrate 410 of FIG. 4, or the substrate 610 of FIG. 6, described above. In some implementations, the substrate 1000 is provided by a supplier. In some implementations, the substrate 1000 is fabricated (e.g., formed). The substrate 1000 includes a via 1001 and a pad 1003. The via 1001 is coupled to the pad 1003.” Lee, [16:64-17:5].</p> <p>“Stage 7 of FIG. 10B, illustrates a state after a second die 1012 is provided and coupled to a second surface (e.g., bottom surface) of the substrate 1000. The second die 1012 may include a back side and a front side (e.g., active side). In some implementations, the back side of the second die 1012 is coupled to the second surface of the substrate 1002 using a bonding agent</p>
--	--

Appendix A-19 - Invalidity of U.S. Patent No. 9859202 in view of Lee - U.S. Patent No. 9368566

	<p>(e.g., glue). In some implementations, the substrate 1002 may be flipped upside down before the second die 1012 is coupled to the second surface of the substrate 1000.” Lee, [17:33-17:42].</p> <p>To the extent Plaintiff contends that Lee fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Lee discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 illustrates a conventional package on package (PoP) integrated device. As shown in FIG. 1, the integrated device 100 includes a first package 102 and a second package 104. The first package 102 includes a first substrate 106, a first die (e.g., chip) 108, a first set of solder balls 116, a first set of interconnects 118, and a capacitor 120. The first substrate 106 may include traces and/or vias (both of which are not shown). The second package 104 includes a second substrate 105, a second die 107, a third die 109, a second set of solder balls 115, a first set of wire bonding 117, and a second set of wire bonding 119. The second substrate 105 may include traces and/or vias (both of which are not shown). The second package 104 is positioned above the first package 102.” Lee, [1:11-1:23].</p> <p>“A first example provides an integrated device that includes a substrate, a first die, a first encapsulation layer, a first redistribution portion, a second die, a second encapsulation layer, and a second redistribution portion. The substrate includes a first surface and a second</p>

	<p>implementations, the set of interconnects 232 traverses from a first surface (e.g., top surface) of the second encapsulation layer 230 to a second surface (e.g., bottom surface) of the second encapsulation layer 230. FIG. 2 illustrates that a portion of the set of interconnects 232 in the second encapsulation layer 230 is coupled to the pad 216 in the substrate 210.” Lee, [6:17-6:28].</p> <p>“Stage 12 illustrates a state after at least one cavity 921 is formed in at least one of the dielectric layers. As shown at stage 12, the cavity 921 is formed over a pad 922 (which is part of the first metal layer 902). The cavity traverses, the first, second, fourth, and fifth dielectric layers 904, 908, 916, and 920. In some implementations, the dielectric layer 923 may represent the first, second, fourth, and fifth dielectric layers 904, 908, 916, and 920. In some implementations, the cavity 921 is formed using a laser etching process (e.g., laser ablation). Stage 13 illustrates a state after the cavity 921 is filled with a metal material to define an interconnect 924. In some implementations, the interconnect 924 is a via that is coupled to the pad 922. Different implementations may use different processes to fill the cavity 921. In some implementations, a plating process is used.” Lee, [16:24-16:39].</p> <p>“Stage 2 illustrates a state after an interconnect 1005 is provided (e.g., formed) on the substrate 1000. Specifically, the interconnect 1005 is provided over the via 1001. In some implementations, the interconnect 1005 is a via (e.g., through encapsulation via, through mold via). The interconnect 1005 may be formed on the substrate through one or more plating processes.” Lee, [17:6-17:12].</p> <p>“Stage 9 illustrates a state after a first cavity 1015 and a second cavity 1017 are formed in the second encapsulation layer 1014. Different implementations may use different processes for forming the cavities. In some implementations, a laser etching process (e.g., laser ablation) is used to form the cavities. In some implementations, a photo-etching process is</p>
--	--

Appendix A-19 - Invalidity of U.S. Patent No. 9859202 in view of Lee - U.S. Patent No. 9368566

	<p>used to form the cavities. As shown at stage 9, the cavity 1015 is formed on the pad 1003, and the cavity 1017 is formed on an interconnect (e.g., pad, pillar) of the second die 1012. Stage 10 illustrates a state after the first cavity 1015 and the second cavity 1017 are filled with an electrically conductive material to form an interconnect 1016, and an interconnect 1018, respectively. In some implementations, the interconnect 1016 is a via (e.g., through encapsulation via, through mold via). In some implementations, the interconnect 1018 is a via (e.g., through encapsulation via, through mold via).” Lee, [17:48-17:63].</p> <p>To the extent Plaintiff contends that Lee fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.F] a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars;</p>	<p>Lee discloses, either expressly or inherently, a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 2 illustrates that a portion of the set of interconnects 222 in the first encapsulation layer 220 is coupled to the via 214 in the substrate 210.” Lee, [5:54-5:57].</p> <p>“The second redistribution portion 250 includes a third dielectric layer 252, a second set of redistribution interconnects 254, a third set of redistribution interconnects 256, and a set of under bump metallization (UBM) layers 258. In some implementations, the second redistribution portion 250 may include one, two, or more than two sets of redistribution interconnects. The first set of redistribution interconnects 254 is coupled to the set of interconnects 209 and the set of interconnects 232.” Lee, [6:33-6:41].</p>

“FIG. 3 illustrates a close-up view of a portion of the substrate 210 of FIG. 2. As shown in FIG. 3, the substrate 210 includes the dielectric layer 212, the via 214, the pad 216, the first capacitor 217 and the second capacitor 219. In some implementations, the substrate 210 is a laminate substrate. The substrate 210 includes a first surface (e.g., top surface) and a second surface (e.g., bottom surface). In some implementations, the dielectric layer 212 may include several dielectric layers. The via 214 is coupled to the pad 216. In some implementations, the combination of the via 214 and the pad 216 traverses from the first surface of the substrate 210 to the second surface of the substrate 210. In some implementations, the via 214 and/or the pad 216 is a form of an interconnect that traverses the substrate 210. It should be noted that the substrate 210 may include additional interconnects (e.g., traces, vias), which are not shown for the purpose of clarity. These un-shown (or not visible) interconnects may couple the capacitors 217 and/or 219 to the via 214 and/or pad 216 in some implementations. In some implementations, at least one of the capacitors 217 and/or 219 may be electrically coupled to at least the first die 202 and/or the second die 206. For example, the capacitor 217 may be electrically coupled to the first die 202 through the via 214, the interconnect 222, the interconnect 244, and/or the interconnect 204. Similarly, the capacitor 217 may be electrically coupled to the second die 206 through the via 214, the pad 216, the interconnect 232, the interconnect 254, the interconnect 208, and/or the interconnect 209.” Lee, [6:48-7:8].

FIG. 2

Lee, FIG. 2

“Stage 2 illustrates a state after a first metal layer 802 is provided (e.g., formed) on the carrier 800. Specifically, stage 2 illustrates a state after the first metal layer 802 is formed over a first surface of the carrier 800. In some implementations, providing the first metal layer 802 may include forming the first metal layer 802 and selectively etching portions of the first metal layer 802 to define one or more interconnects (e.g., form one or more pads, vias, traces).” Lee, [13:45-13:52].

“Stage 4 illustrates a state after a second metal layer 806 is provided (e.g., formed) on the first dielectric layer 804. Specifically, stage 4 illustrates a state after the second metal layer 806 is formed over a first surface of the first dielectric layer 804. In some implementations, providing the second metal layer 806 may include forming the second metal layer 806 and

Appendix A-19 - Invalidity of U.S. Patent No. 9859202 in view of Lee - U.S. Patent No. 9368566

	<p>selectively etching portions of the second metal layer 806 to define one or more interconnects (e.g., form one or more pads, vias, traces). In some implementations, the second metal layer 806 is plated on the first dielectric layer 804 using a plating process. In some implementations, some portions of the second metal layer 806 may be coupled to some portions of the first metal layer 802.” Lee, [13:58-14:3].</p> <p>“Stage 10 illustrates a state after a fifth metal layer 818 is provided (e.g., formed) on the fourth dielectric layer 816. Specifically, stage 10 illustrates a state after the fifth metal layer 818 is formed over a first surface of the fourth dielectric layer 816. In some implementations, providing the fifth metal layer 818 may include forming the fifth metal layer 818 and selectively etching portions of the fifth metal layer 818 to define one or more interconnects (e.g., form one or more pads, vias, traces). In some implementations, the fifth metal layer 818 is plated on the fourth dielectric layer 816 using a plating process. In some implementations, some portions of the fifth metal layer 818 may be coupled to some portions of the fourth metal layer 814.” Lee, [14:43-14:55].</p> <p>“Stage 13 illustrates a state after the cavity 821 is filled with a metal material to define an interconnect 824. In some implementations, the interconnect 824 is a via that is coupled to the pad 822. Different implementations may use different processes to fill the cavity 821. In some implementations, a plating process is used.” Lee, [14:65-15:3].</p> <p>To the extent Plaintiff contends that Lee fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p>	<p>Lee discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p> <p><i>See, e.g.:</i></p> <p>“As shown in FIG. 2, the back side of the first die 202 is facing the substrate 210 while the front side (e.g., active side) of the first die 202 is facing away from the substrate 210. The first encapsulation layer 220 encapsulates the first die 202 and the set of die interconnects 204. In some implementations, the first encapsulation layer 220 is one of at least a mold, a polymer, and/or a photo-etchable material. In some implementations, a photo-etchable material is a material that may be etched through a photo etching process. The first encapsulation layer 220 includes a set of interconnects 222. In some implementations, the set of interconnects 222 is one of at least a through encapsulation via (TEV) and/or a through mold via (TMV). In some implementations, the set of interconnects 222 traverses from a first surface (e.g., top surface) of the first encapsulation layer 220 to a second surface (e.g., bottom surface) of the first encapsulation layer 220. FIG. 2 illustrates that a portion of the set of</p>

interconnects 222 in the first encapsulation layer 220 is coupled to the via 214 in the substrate 210.” Lee, [5:38-5:57].

FIG. 2

Lee, FIG. 2

“The back side of the first die 402 is coupled to the first surface of the substrate 410. In some implementations, a bonding agent (e.g., glue) is used to couple the back side of the first die 402 to the first surface of the substrate 410. As shown in FIG. 4, the back side of the first die 402 is facing the substrate 410 while the front side (e.g., active side) of the first die 402 is facing away from the substrate 410. The first encapsulation layer 420 encapsulates the first die 402 and the set of die interconnects 404. In some implementations, the first encapsulation layer 420 is one of at least a mold, a polymer, and/or a photo-etchable material. In some implementations, a photo-etchable material is a material that may be etched through a photo

	<p>etching process. The first encapsulation layer 420 includes a set of interconnects 422. In some implementations, the set of interconnects 422 is one of at least a through encapsulation via (TEV) and/or a through mold via (TMV). In some implementations, the set of interconnects 422 traverses from a first surface (e.g., top surface) of the first encapsulation layer 420 to a second surface (e.g., bottom surface) of the first encapsulation layer 420. FIG. 4 illustrates that a portion of the set of interconnects 422 in the first encapsulation layer 420 is coupled to the via 414 in the substrate 410. The first redistribution portion 440 is coupled to the first surface of the first encapsulation layer 420.” Lee, [8:48-9:6].</p> <p>“The capacitor 618 is further described in detail below in FIG. 7. The first die 602 includes a back side and a front side (e.g., active side). The front side is coupled to a set of die interconnects 604. The set of die interconnects 604 may be one of at least pads and/or pillars in some implementations. The back side of the first die 602 is coupled to the first surface of the substrate 610. In some implementations, a bonding agent (e.g., glue) is used to couple the back side of the first die 602 to the first surface of the substrate 610. As shown in FIG. 6, the back side of the first die 602 is facing the substrate 610 while the front side (e.g., active side) of the first die 602 is facing away from the substrate 610. The first encapsulation layer 620 encapsulates the first die 602 and the set of die interconnects 604. In some implementations, the first encapsulation layer 620 is one of at least a mold, a polymer, and/or a photo-etchable material. In some implementations, a photo-etchable material is a material that may be etched through a photo etching process. The first encapsulation layer 620 includes a set of interconnects 622. In some implementations, the set of interconnects 622 is one of at least a through encapsulation via (TEV) and/or a through mold via (TMV). In some implementations, the set of interconnects 622 traverses from a first surface (e.g., top surface) of the first encapsulation layer 620 to a second surface (e.g., bottom surface) of the first encapsulation layer 620.” Lee, [11:25-11:50].</p>
--	---

Appendix A-19 - Invalidity of U.S. Patent No. 9859202 in view of Lee - U.S. Patent No. 9368566

	<p>“Stage 3 illustrates a state after a first die 1002 is provided and coupled to a first surface (e.g., top surface) of the substrate 1000. The first die 1002 may include a back side and a front side (e.g., active side). In some implementations, the back side of the first die 1002 is coupled to the first surface of the substrate 1000 using a bonding agent (e.g., glue). Stage 4 illustrates a state after a first encapsulation layer 1004 is provided (e.g., formed) on the first surface of the substrate 1000. The first encapsulation layer 1004 covers the first die 1002 and at least some of the interconnect 1005. Stage 5 illustrates a state after a first redistribution interconnect 1006 is provided (e.g., formed) on the first encapsulation layer 1004. In some implementations, the first redistribution interconnect 1006 is formed by forming one or more metal layers and selectively etching portions of the one or more metal layers. The first redistribution interconnect 1006 is coupled to the via 1001 and the first die 1002. Stage 6 illustrates a state after a first dielectric layer 1008 is provided (e.g., formed) on the first encapsulation layer 1004 and the first redistribution interconnect 1006.” Lee, [17:13-17:32].</p> <p>To the extent Plaintiff contends that Lee fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate,	Lee discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is

Appendix A-19 - Invalidity of U.S. Patent No. 9859202 in view of Lee - U.S. Patent No. 9368566

wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.	<p>stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p>See, e.g.:</p> <p>“FIG. 2 illustrates an exemplary package on package (PoP) integrated device 200 that includes a capacitor in a substrate. As shown in FIG. 2, the integrated device 200 (e.g., integrated package device) includes a first die 202, a second die 206, a substrate 210, a first encapsulation layer 220, a second encapsulation layer 230, a first redistribution portion 240, and a second redistribution portion 250. The substrate 210 includes a dielectric layer 212, a via 214, a pad 216, a first capacitor 217 and a second capacitor 219. In some implementations, the substrate 210 is a laminate substrate. The substrate 210 includes a first surface (e.g., top surface) and a second surface (e.g., bottom surface).” Lee, [5:3-5:15].</p> <p>“The first die 202 includes a back side and a front side (e.g., active side). The front side is coupled to a set of die interconnects 204. The set of die interconnects 204 may be one of at least pads and/or pillars in some implementations. The back side of the first die 202 is coupled to the first surface of the substrate 210. In some implementations, a bonding agent (e.g., glue) is used to couple the back side of the first die 202 to the first surface of the substrate 210. As shown in FIG. 2, the back side of the first die 202 is facing the substrate 210 while the front side (e.g., active side) of the first die 202 is facing away from the substrate 210. The first encapsulation layer 220 encapsulates the first die 202 and the set of die interconnects 204.” Lee, [5:31-5:43].</p>
---	--

FIG. 2

Lee, FIG. 2

“The second die 206 includes a back side and a front side (e.g., active side). The front side is coupled to a set of interconnects 208. The set of interconnects 208 may be one of at least pads and/or pillars in some implementations. The back side of the second die 206 is coupled to the second surface of the substrate 210. In some implementations, a bonding agent (e.g., glue) is used to couple the back side of the second die 206 to the second surface of the substrate 210. As shown in FIG. 2, the back side of the second die 206 is facing the substrate 210 while the front side (e.g., active side) of the second die 206 is facing away from the substrate 210. The second encapsulation layer 230 encapsulates the second die 206 and the set of interconnects 208.” Lee, [6:1-6:13].

Appendix A-19 - Invalidity of U.S. Patent No. 9859202 in view of Lee - U.S. Patent No. 9368566

	<p>“The first die 402 includes a back side and a front side (e.g., active side). The front side is coupled to a set of die interconnects 404. The set of die interconnects 404 may be one of at least pads and/or pillars in some implementations. The back side of the first die 402 is coupled to the first surface of the substrate 410. In some implementations, a bonding agent (e.g., glue) is used to couple the back side of the first die 402 to the first surface of the substrate 410. As shown in FIG. 4, the back side of the first die 402 is facing the substrate 410 while the front side (e.g., active side) of the first die 402 is facing away from the substrate 410. The first encapsulation layer 420 encapsulates the first die 402 and the set of die interconnects 404.” Lee, [8:45-8:57].</p> <p>“The second die 406 includes a back side and a front side (e.g., active side). The front side is coupled to a set of interconnects 408. The set of interconnects 408 may be one of at least pads and/or pillars in some implementations. The back side of the second die 406 is coupled to the second surface of the substrate 410. In some implementations, a bonding agent (e.g., glue) is used to couple the back side of the second die 406 to the second surface of the substrate 410. As shown in FIG. 4, the back side of the second die 406 is facing the substrate 410 while the front side (e.g., active side) of the second die 406 is facing away from the substrate 410. The second encapsulation layer 430 encapsulates the second die 406 and the set of interconnects 408.” Lee, [9:15-9:27].</p> <p>“Stage 3 illustrates a state after a first die 1002 is provided and coupled to a first surface (e.g., top surface) of the substrate 1000. The first die 1002 may include a back side and a front side (e.g., active side). In some implementations, the back side of the first die 1002 is coupled to the first surface of the substrate 1000 using a bonding agent (e.g., glue). Stage 4 illustrates a state after a first encapsulation layer 1004 is provided (e.g., formed) on the first surface of the substrate 1000. The first encapsulation layer 1004 covers the first die 1002 and at least some of the interconnect 1005.” Lee, [17:13-17:22].</p>

Claim 4, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p>	<p>Lee discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 2 illustrates that a portion of the set of interconnects 222 in the first encapsulation layer 220 is coupled to the via 214 in the substrate 210. The first redistribution portion 240 is coupled to the first surface of the first encapsulation layer 220. The first redistribution portion 240 includes a second dielectric layer 242 and a first set of redistribution interconnects 244. In some implementations, the first redistribution portion 240 may include more than one set of redistribution interconnects. The first set of redistribution interconnects 244 is coupled to the set of die interconnects 204 and the set of interconnects 222.” Lee, [5:54-5:65].</p>

FIG. 2

Lee, FIG. 2

“FIG. 4 illustrates that a portion of the set of interconnects 422 in the first encapsulation layer 420 is coupled to the via 414 in the substrate 410. The first redistribution portion 440 is coupled to the first surface of the first encapsulation layer 420. The first redistribution portion 440 includes a fourth dielectric layer 442 and a first set of redistribution interconnects 444. In some implementations, the first redistribution portion 440 may include more than one set of redistribution interconnects. The first set of redistribution interconnects 444 is coupled to the set of die interconnects 404 and the set of interconnects 422.” Lee, [9:1-9:12].

“FIG. 4 illustrates that a portion of the set of interconnects 432 in the second encapsulation layer 430 is coupled to the pad 416 in the substrate 410. In some implementations, the set of interconnects 409 is one of at least a through encapsulation via (TEV) and/or a through mold

	<p>via (TMV). The set of interconnects 409 is coupled to the set of interconnects 408. The second redistribution portion 450 is coupled to the first surface of the second encapsulation layer 430.” Lee, [9:39-9:47].</p> <p>“FIG. 6 illustrates that a portion of the set of interconnects 622 in the first encapsulation layer 620 is coupled to the via 614 in the substrate 610. The first redistribution portion 640 is coupled to the first surface of the first encapsulation layer 620. The first redistribution portion 640 includes a second dielectric layer 642 and a first set of redistribution interconnects 644. In some implementations, the first redistribution portion 640 may include more than one set of redistribution interconnects. The first set of redistribution interconnects 644 is coupled to the set of die interconnects 604 and the set of interconnects 622.” Lee, [11:50-11:61].</p> <p>“FIG. 6 illustrates that a portion of the set of interconnects 632 in the second encapsulation layer 630 is coupled to the pad 616 in the substrate 610. In some implementations, the set of interconnects 609 is one of at least a through encapsulation via (TEV) and/or a through mold via (TMV). The set of interconnects 609 is coupled to the set of interconnects 608.” Lee, [12:21-12:27].</p> <p>“Stage 10 illustrates a state after the first cavity 1015 and the second cavity 1017 are filled with an electrically conductive material to form an interconnect 1016, and an interconnect 1018, respectively. In some implementations, the interconnect 1016 is a via (e.g., through encapsulation via, through mold via). In some implementations, the interconnect 1018 is a via (e.g., through encapsulation via, through mold via). Stage 11 illustrates a state after a second redistribution interconnect 1020 is provided (e.g., formed) on the second encapsulation layer 1014. In some implementations, the second redistribution interconnect 1020 is formed by forming one or more metal layers and selectively etching portions of the</p>

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

U.S. Patent No. 7514774 (“Leung”) is titled Stacked Multi-Chip Package with EMI Shielding and lists Lap Wai Leung, Yu-Chih Chen, Man-Lung Sham, and Chang-Hwa Chung, as inventors. Leung is assigned to Hong Kong Applied Science Technology Research Institute Company Limited. Leung anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Leung is a U.S. patent that was filed September 15, 2006 and published March 20, 2008. Leung is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Leung, or otherwise rendered obvious by disclosures and teachings of Leung, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Leung does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Leung with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Leung, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Leung “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Leung or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Leung set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Leung discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“In view of the forgoing, there is disclosed herein a stacked multi-chip package with an EMI shielded space comprising a first substrate having a first ground plane laminated between dielectric layers of the first substrate, an electronic component mounted of a first side of the first substrate layer and a second substrate having a second ground plane laminated between dielectric layers of the second substrate, wherein the first substrate is mounted to the second substrate by a grid array of metallic connecting nodes with the electronic component positioned between the substrates, and at least a group of the metallic connecting nodes</p>

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

	<p>surround the electronic component and are electrically connected to both the first ground plane and the second ground plane.” Leung, [1:57-2:2].</p> <p>“More generally, there is disclosed herein a stacked electronic component package comprising a first substrate, a second substrate mounted to the first substrate, an electronic component positioned between the substrates, a first conductive plane associated with the first substrate, a second conductive plane associated with the second substrate, and a plurality of conductive nodes surrounding the electronic component and interconnected with both the first and second conductive planes.” Leung, [2:14-2:22].</p> <p>“Generally the invention is a stacked multi-chip package with first and second substrates mounted together by a grid array of metallic connecting nodes, such as a solder Ball Grid Array. Each substrate has a ground plane laminated between dielectric layers of the substrate. A sensitive or EMI generating component is mounted between the first and second substrates and is surrounded by a group of the metallic connecting nodes that are also electrically connected to the ground planes of both substrates to form a conductive Faraday cage about the component.” Leung, [2:52-2:60].</p>
--	---

Figure 2

Leung, FIG. 2

“In the drawings there is depicted an exemplary embodiment of the invention as practiced in a multi-chip integrated package having both radio frequency (RF) and digital integrated circuit (IC) chips packaged together in a stacked substrate arrangement. This type of arrangement is often termed a stacked multi-chip module (MCM).” Leung, [2:62-2:67].

“Referring to the drawings generally, in the exemplary embodiment a MCM 1 is mounted to a main system board, or motherboard 2, and interconnected thereto by a Ball Grid Array (BGA) 3. The MCM 1 comprises a supporting substrate 10 having two digital IC chips 11, 12 mounted on its first side and an RF chip 13 mounted on its second side.” Leung, [3:21-3:26].

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

	<p>“The module substrate 10 is mounted and interconnected to the system substrate 20 by the Ball Grid Array (BGA) 3. On the second side of the RF module substrate 10 surrounding the RF chip 13 is a plurality of balls of solder 30, 31 arranged in a grid pattern.” Leung, [3:47-3:51].</p>
<p>[1.A] a bottom package substrate;</p>	<p>Leung discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to the drawings generally, in the exemplary embodiment a MCM 1 is mounted to a main system board, or motherboard 2, and interconnected thereto by a Ball Grid Array (BGA) 3. The MCM 1 comprises a supporting substrate 10 having two digital IC chips 11, 12 mounted on its first side and an RF chip 13 mounted on its second side. The digital IC chips 11, 12 are a memory chip and a logic chip for controlling the RF module 1. The RF chip 13 must be thin enough to mount in the BGA 3 stand-off space 33 between the RF module 1 and the main board 2. A typical RF chip is 15-25 mils thick: too thick for a robust BGA stand-off distance. However, chips can be thinned to between 5-7 mils. Thinning of chips is conventional in the art of IC technology and manufacture. The RF module supporting substrate 10 has printed circuits on one or more of its surfaces and bonding pads for mounted the chips 11, 12, 13 to the supporting substrate 10 in known manner using interconnect wires 14.” Leung, [3:21-3:37].</p>

Figure 2

Leung, FIG. 2

“The surface of the system substrate 20 to receive the RF module 1 is provided with electrical bonding pads 21, 37 or UBM points arranged in a corresponding grid pattern to receive the solder balls 30, 31 of the Ball Grid Array 3 of the RF module 1. At the center of the bonding pad 21, 37 grid pattern is a corresponding RF chip space.” Leung, [3:62-3:67].

“The system substrate 20 is also of a type having one or more conductive ground planes 22 laminated between dielectric layers 23, 24. The inner most line of bonding pads 35 that form the perimeter of the system substrate RF chip space is electrically connected to the system substrate ground plane 22 in the same way as the inner perimeter of solder balls 31 on the module support substrate 10. That is, ground plane vias 36 are formed between the inner perimeter bonding pads 37 of the system substrate and its ground plane 22.” Leung, [3:67-4:9].

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

	<p>“Accordingly, when the RF module 1 is mounted to the system substrate 2, in known manner, via the Ball Grid Array 3 a type of Faraday cage is provided about the RF chip 13 for EMI Shielding of the chip. The Faraday cage comprises upper and lower ground planes 15, 22 of the RF module substrate 10 and the system substrate 20 interconnected around a shielded chip space 32 by a plurality of ground plane vias 34, 36 and the inner perimeter of BGA solder balls 31.” Leung, [4:9-4:17].</p> <p>“Referring to FIG. 7, a large conductive plane or pad 25 may be formed on the surface of one of the substrates, for example the system substrate 20, for receiving the inner perimeter solder balls 31 and forming one side of the shielding cage.” Leung, [5:5-5:10].</p> <p>To the extent Plaintiff contends that Leung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Leung discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Further, the exemplary embodiment is a single stack package having a single interconnecting support substrate bonded to a system substrate or motherboard.” Leung, [3:7-3:9].</p>

“Referring to the drawings generally, in the exemplary embodiment a MCM 1 is mounted to a main system board, or motherboard 2, and interconnected thereto by a Ball Grid Array (BGA) 3. The MCM 1 comprises a supporting substrate 10 having two digital IC chips 11, 12 mounted on its first side and an RF chip 13 mounted on its second side.” Leung, [3:21-3:26].

Figure 2

Leung, FIG. 2

“The module substrate 10 is mounted and interconnected to the system substrate 20 by the Ball Grid Array (BGA) 3. On the second side of the RF module substrate 10 surrounding the RF chip 13 is a plurality of balls of solder 30, 31 arranged in a grid pattern.” Leung, [3:47-3:51].

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

	<p>“Accordingly, when the RF module 1 is mounted to the system substrate 2, in known manner, via the Ball Grid Array 3 a type of Faraday cage is provided about the RF chip 13 for EMI Shielding of the chip.” Leung, [4:9-4:12].</p> <p>“In the current invention, however, the RF chip 13, or other component, being shielded is located in the BGA stand-off space 33 between the substrates 10, 20. The thickness of the epoxy mold 40 encapsulating the RF chip 13 is therefore controlled and trimmed to act as a spacer for the BGA stand-off 33. The epoxy mold 40 of the RF chip 13 is in contact with the system substrate 20 to help support the module substrate 10 which prevents the BGA solder balls 30, 31 from collapsing during the reflow heating process.” Leung, [4:43-4:52].</p> <p>To the extent Plaintiff contends that Leung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Leung discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“Generally the invention is a stacked multi-chip package with first and second substrates mounted together by a grid array of metallic connecting nodes, such as a solder Ball Grid Array. Each substrate has a ground plane laminated between dielectric layers of the substrate. A sensitive or EMI generating component is mounted between the first and second substrates and is surrounded by a group of the metallic connecting nodes that are also electrically</p>

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

	<p>connected to the ground planes of both substrates to form a conductive Faraday cage about the component.” Leung, [2:52-2:61].</p> <p>“The MCM 1 comprises a supporting substrate 10 having two digital IC chips 11, 12 mounted on its first side and an RF chip 13 mounted on its second side. The digital IC chips 11, 12 are a memory chip and a logic chip for controlling the RF module 1. The RF chip 13 must be thin enough to mount in the BGA 3 stand-off space 33 between the RF module 1 and the main board 2.” Leung, [3:24-3:30].</p> <p>“The RF module supporting substrate 10 is of a type having one or more conductive ground planes 15 laminated between dielectric layers 16, 17 of epoxy or other suitable non-conductive material. Substrates of this type are conventional in the art of printed circuit board technology and manufacture. The module substrate 10 is mounted and interconnected to the system substrate 20 by the Ball Grid Array (BGA) 3.” Leung, [3:42-3:48].</p> <p>“The module substrate 10 is mounted and interconnected to the system substrate 20 by the Ball Grid Array (BGA) 3. On the second side of the RF module substrate 10 surrounding the RF chip 13 is a plurality of balls of solder 30, 31 arranged in a grid pattern.” Leung, [3:47-3:51].</p> <p>“Accordingly, when the RF module 1 is mounted to the system substrate 2, in known manner, via the Ball Grid Array 3 a type of Faraday cage is provided about the RF chip 13 for EMI Shielding of the chip.” Leung, [4:9-4:12].</p> <p>“Typically, the gaps between solder balls 31 will be just a few hundreds micrometers, much less than the wavelength of the EMI waves, which will therefore generally not pass through the gaps between solder balls 31. To make the design more robust to vibration in use the</p>
--	---

chips and interconnect wires are overmolded in epoxy casings 40, 41. This is conventional in circuit board and MCM assembly and methods are known in the art. In the current invention, however, the RF chip 13, or other component, being shielded is located in the BGA stand-off space 33 between the substrates 10, 20. The thickness of the epoxy mold 40 encapsulating the RF chip 13 is therefore controlled and trimmed to act as a spacer for the BGA stand-off 33. The epoxy mold 40 of the RF chip 13 is in contact with the system substrate 20 to help support the module substrate 10 which prevents the BGA solder balls 30, 31 from collapsing during the reflow heating process. During the solder printing process, the volume of solder paste on each molding pad may be increased to enhance the tolerance to variations in solder ball height and substrate warpage." Leung, [4:36-4:54].

<p>[1.G] wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate,</p>	
	<p>Leung discloses, either expressly or inherently, wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate.</p> <p>See, e.g.:  Figure 3</p> <p>Leung, FIG. 3</p> <p>To the extent Plaintiff contends that Leung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.H] the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p>See, e.g.:</p>	<p>Leung discloses, either expressly or inherently, the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p>See, e.g.:</p>

plurality of metal pillars of the spacer connector,

“This electrical connection is provided by ground plane vias 34 between the second surface of the substrate 10 and the ground plane 15. The ground plane vias 34 are connected with via bonding pads 35 or under bump metallization (UBM) solder on the second side of the module substrate 10 to which the inner perimeter of solder balls 31 are attached.” Leung, [3:56-3:61].

Leung, FIG. 3

“The inner most line of bonding pads 35 that form the perimeter of the system substrate RF chip space is electrically connected to the system substrate ground plane 22 in the same way as the inner perimeter of solder balls 31 on the module support substrate 10. That is, ground plane vias 36 are formed between the inner perimeter bonding pads 37 of the system substrate and its ground plane 22.” Leung, [4:3-4:9].

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

	<p>“Additionally, referring to FIG. 9, a similar conductive plane or pad 26 may be formed on an opposite side of the substrate mounting the shielded electronic component and connected to the solder balls 31 by plated through-holes” Leung, [5:12-5:17].</p> <p>To the extent Plaintiff contends that Leung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.I] the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and</p>	<p>Leung discloses, either expressly or inherently, the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p>See, e.g.:</p> <p>“The surface of the system substrate 20 to receive the RF module 1 is provided with electrical bonding pads 21, 37 or UBM points arranged in a corresponding grid pattern to receive the solder balls 30, 31 of the Ball Grid Array 3 of the RF module 1. At the center of the bonding pad 21, 37 grid pattern is a corresponding RF chip space. The system substrate 20 is also of a type having one or more conductive ground planes 22 laminated between dielectric layers 23, 24. The inner most line of bonding pads 35 that form the perimeter of the system substrate RF chip space is electrically connected to the system substrate ground plane 22 in the same way as the inner perimeter of solder balls 31 on the module support substrate 10. That is, ground plane vias 36 are formed between the inner perimeter bonding pads 37 of the system substrate and its ground plane 22. Accordingly, when the RF module 1 is mounted to the system substrate 2, in known manner, via the Ball Grid Array 3 a type of Faraday cage is provided about the RF chip 13 for EMI Shielding of the chip. The Faraday cage comprises</p>

	<p>upper and lower ground planes 15, 22 of the RF module substrate 10 and the system substrate 20 interconnected around a shielded chip space 32 by a plurality of ground plane vias 34, 36 and the inner perimeter of BGA solder balls 31. The remaining solder balls 30 (shown in dashed lines in FIG. 6) of the BGA 3 provide electrical interconnection between the RF module 1 and the system 2 in known manner. This electrical interconnection between the RF module 1 and the system 2 is electrically isolated from the ground planes 15, 22 of the module and system substrates 10, 20.” Leung, [3:62-4:23].</p> <div data-bbox="625 430 950 1375"></div> <p>Leung, FIG. 3</p> <p>To the extent Plaintiff contends that Leung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced	Leung discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

downwardly from the bottom surface of the top package substrate.	<p><i>See, e.g.:</i></p> <p>“In view of the forgoing, there is disclosed herein a stacked multi-chip package with an EMI shielded space comprising a first substrate having a first ground plane laminated between dielectric layers of the first substrate, an electronic component mounted of a first side of the first substrate layer and a second substrate having a second ground plane laminated between dielectric layers of the second substrate, wherein the first substrate is mounted to the second substrate by a grid array of metallic connecting nodes with the electronic component positioned between the substrates, and at least a group of the metallic connecting nodes surround the electronic component and are electrically connected to both the first ground plane and the second ground plane.” Leung, [1:57-2:2].</p> <p>“Preferably, the electronic component is an integrated circuit chip, and the chip has been thinned to a thickness of between 5 and 7 mils.” Leung, [2:6-2:8].</p> <p>“The RF chip 13 must be thin enough to mount in the BGA 3 stand-off space 33 between the RF module 1 and the main board 2.” Leung, [3:28-3:30].</p>
--	--

Figure 2

Leung, FIG. 2

“A typical RF chip is 15-25 mils thick: too thick for a robust BGA stand-off distance. However, chips can be thinned to between 5-7 mils.” Leung, [3:30-3:32].

“Accordingly, when the RF module 1 is mounted to the system substrate 2, in known manner, via the Ball Grid Array 3 a type of Faraday cage is provided about the RF chip 13 for EMI Shielding of the chip.” Leung, [4:9-4:12].

“In the current invention, however, the RF chip 13, or other component, being shielded is located in the BGA stand-off space 33 between the substrates 10, 20. The thickness of the epoxy mold 40 encapsulating the RF chip 13 is therefore controlled and trimmed to act as a spacer for the BGA stand-off 33. The epoxy mold 40 of the RF chip 13 is in contact with the

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

	<p>system substrate 20 to help support the module substrate 10 which prevents the BGA solder balls 30, 31 from collapsing during the reflow heating process.” Leung, [4:43-4:52].</p> <p>To the extent Plaintiff contends that Leung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Leung discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“Generally the invention is a stacked multi-chip package with first and second substrates mounted together by a grid array of metallic connecting nodes, such as a solder Ball Grid Array. Each substrate has a ground plane laminated between dielectric layers of the substrate. A sensitive or EMI generating component is mounted between the first and second substrates and is surrounded by a group of the metallic connecting nodes that are also electrically connected to the ground planes of both substrates to form a conductive Faraday cage about the component.” Leung, [2:52-2:61].</p>

“Referring to the drawings generally, in the exemplary embodiment a MCM 1 is mounted to a main system board, or motherboard 2, and interconnected thereto by a Ball Grid Array (BGA) 3. The MCM 1 comprises a supporting substrate 10 having two digital IC chips 11, 12 mounted on its first side and an RF chip 13 mounted on its second side.” Leung, [3:21-3:26].

“The MCM 1 comprises a supporting substrate 10 having two digital IC chips 11, 12 mounted on its first side and an RF chip 13 mounted on its second side. The digital IC chips 11, 12 are a memory chip and a logic chip for controlling the RF module 1.” Leung, [3:24-3:28].

Figure 2

Leung, FIG. 2

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

	<p>“The RF chip 13 must be thin enough to mount in the BGA 3 stand-off space 33 between the RF module 1 and the main board 2. A typical RF chip is 15-25 mils thick; too thick for a robust BGA stand-off distance. However, chips can be thinned to between 5-7 mils.” Leung, [3:28-3:32].</p> <p>“The RF module supporting substrate 10 is of a type having one or more conductive ground planes 15 laminated between dielectric layers 16, 17 of epoxy or other suitable non-conductive material. Substrates of this type are conventional in the art of printed circuit board technology and manufacture. The module substrate 10 is mounted and interconnected to the system substrate 20 by the Ball Grid Array (BGA) 3.” Leung, [3:42-3:48].</p> <p>To the extent Plaintiff contends that Leung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 4, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.	<p>Leung discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p>

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.	<p>“The module substrate 10 is mounted and interconnected to the system substrate 20 by the Ball Grid Array (BGA) 3. On the second side of the RF module substrate 10 surrounding the RF chip 13 is a plurality of balls of solder 30, 31 arranged in a grid pattern.” Leung, [3:47-3:51].</p> <p>“The module substrate 10 is mounted and interconnected to the system substrate 20 by the Ball Grid Array (BGA) 3.” Leung, [3:47-3:48].</p> <p>“The ground plane vias 34 are connected with via bonding pads 35 or under bump metallization (UBM) solder on the second side of the module substrate 10 to which the inner perimeter of solder balls 31 are attached.” Leung, [3:58-3:61].</p> <p>“The surface of the system substrate 20 to receive the RF module 1 is provided with electrical bonding pads 21, 37 or UBM points arranged in a corresponding grid pattern to receive the solder balls 30, 31 of the Ball Grid Array 3 of the RF module 1.” Leung, [3:62-3:66].</p> <p>“Accordingly, when the RF module 1 is mounted to the system substrate 2, in known manner, via the Ball Grid Array 3 a type of Faraday cage is provided about the RF chip 13 for EMI Shielding of the chip.” Leung, [4:9-4:12].</p> <p>“The inner most line of bonding pads 35 that form the perimeter of the system substrate RF chip space is electrically connected to the system substrate ground plane 22 in the same way as the inner perimeter of solder balls 31 on the module support substrate 10. That is, ground plane vias 36 are formed between the inner perimeter bonding pads 37 of the system substrate and its ground plane 22. Accordingly, when the RF module 1 is mounted to the system substrate 2, in known manner, via the Ball Grid Array 3 a type of Faraday cage is provided</p>
--	---

about the RF chip 13 for EMI Shielding of the chip. The Faraday cage comprises upper and lower ground planes 15, 22 of the RF module substrate 10 and the system substrate 20 interconnected around a shielded chip space 32 by a plurality of ground plane vias 34, 36 and the inner perimeter of BGA solder balls 31. The remaining solder balls 30 (shown in dashed lines in FIG. 6) of the BGA 3 provide electrical interconnection between the RF module 1 and the system 2 in known manner.” Leung, [5:33-6:15].

Figure 2

Leung, FIG. 2

To the extent Plaintiff contends that Leung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Leung discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p>See, e.g.:</p>  <p>Leung, FIG. 3</p> <p>To the extent Plaintiff contends that Leung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the</p>

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

	<p>to which the inner perimeter of solder balls 31 are attached. The surface of the system substrate 20 to receive the RF module 1 is provided with electrical bonding pads 21, 37 or UBM points arranged in a corresponding grid pattern to receive the solder balls 30, 31 of the Ball Grid Array 3 of the RF module 1.” Leung, [3:48-3:66].</p> <p>“The ground plane vias 34 are connected with via bonding pads 35 or under bump metallization (UBM) solder on the second side of the module substrate 10 to which the inner perimeter of solder balls 31 are attached. The surface of the system substrate 20 to receive the RF module 1 is provided with electrical bonding pads 21, 37 or UBM points arranged in a corresponding grid pattern to receive the solder balls 30, 31 of the Ball Grid Array 3 of the RF module 1. At the center of the bonding pad 21, 37 grid pattern is a corresponding RF chip space. The system substrate 20 is also of a type having one or more conductive ground planes 22 laminated between dielectric layers 23, 24. The inner most line of bonding pads 35 that form the perimeter of the system substrate RF chip space is electrically connected to the system substrate ground plane 22 in the same way as the inner perimeter of solder balls 31 on the module support substrate 10. That is, ground plane vias 36 are formed between the inner perimeter bonding pads 37 of the system substrate and its ground plane 22.” Leung, [3:58-4:9].</p> <p>“Accordingly, when the RF module 1 is mounted to the system substrate 2, in known manner, via the Ball Grid Array 3 a type of Faraday cage is provided about the RF chip 13 for EMI Shielding of the chip. The Faraday cage comprises upper and lower ground planes 15, 22 of the RF module substrate 10 and the system substrate 20 interconnected around a shielded chip space 32 by a plurality of ground plane vias 34, 36 and the inner perimeter of BGA solder balls 31. The remaining solder balls 30 (shown in dashed lines in FIG. 6) of the BGA 3 provide electrical interconnection between the RF module 1 and the system 2 in known manner.” Leung, [4:9-4:20].</p>
--	--

Appendix A-20 - Invalidity of U.S. Patent No. 9859202 in view of Leung - U.S. Patent No. 7514774

	<p>“Referring to FIG. 7, a large conductive plane or pad 25 may be formed on the surface of one of the substrates, for example the system substrate 20, for receiving the inner perimeter solder balls 31 and forming one side of the shielding cage. Additionally, referring to FIG. 9, a similar conductive plane or pad 26 may be formed on an opposite side of the substrate mounting the shielded electronic component and connected to the solder balls 31 by plated through-holes 27.” Leung, [5:5-5:17].</p> <p>To the extent Plaintiff contends that Leung fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-21 - Invalidity of U.S. Patent No. 9859202 in view of Lin - U.S. Patent No. 10418298

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Lin - U.S. Patent No. 10418298

U.S. Patent No.10418298 (“Lin”) is titled Semiconductor Device and Method of Forming Dual Fan-Out Semiconductor Package and lists Yaojin Lin as inventor. Lin is assigned to STATS ChipPAC Pte. Ltd. Lin anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory². Lin is a U.S. patent that was filed September 24, 2013 and published March 26, 2015. Lin is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Lin, or otherwise rendered obvious by disclosures and teachings of Lin, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Lin does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Lin with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Lin, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-21 - Invalidity of U.S. Patent No. 9859202 in view of Lin - U.S. Patent No. 10418298

Where the chart below states that Lin “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Lin or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Lin set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Lin discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 6 shows dual Fo-WLCSP 230 after singulation. Semiconductor die 124 is electrically connected through build-up interconnect structure 180 and build-up interconnect structure 222 to bumps 220 for connection to external devices.” Lin, [17:40-17:43].</p>

FIG. 6

Lin, FIG. 6

“FIG. 8 shows dual Fo-WLCSP 336 after singulation. Semiconductor die 274 are electrically connected through build-up interconnect structure 270 and build-up interconnect structure 328 to bumps 326 for connection to external devices.” Lin, [24:50-24:54].

FIG. 8

Lin, FIG. 8

“FIG. 10 shows dual Fo-WLCSP 440 after singulation. Semiconductor die 354 is electrically connected through build-up interconnect structure 390 and build-up interconnect structure 432 to bumps 430 for connection to external devices.” Lin, [31:53-31:57].

FIG. 10

Lin, FIG. 10

“FIG. 12 shows dual Fo-PoP 630 after singulation. Semiconductor die 524 is electrically connected through build-up interconnect structure 560 and build-up interconnect structure 610 to bumps 606 for connection to external devices.” Lin, [41:23-41:26].

	<div data-bbox="324 436 673 1375"><p>A detailed cross-sectional diagram of a dual Fo-PoP 760 after singulation. The diagram shows two semiconductor dies, 654 and 654', stacked vertically. Die 654 is connected to a build-up interconnect structure 690. The structure includes various layers and bumps, labeled with reference numerals: 510, 512, 514, 516, 518, 520, 522, 524, 528, 530, 532, 534, 536, 538, 540, 542, 544, 546, 548, 550, 552, 554, 556, 558, 560, 562, 564, 566, 568, 570, 572, 574, 576, 578, 580, 582, 584, 586, 588, 590, 592, 594, 596, 598, 600, 602, 604, 606, 610, 612, 614, 616, 618, 620, 622, 624, 626, 628, 630. The diagram illustrates the electrical connection between the dies and the external devices through the build-up interconnect structure.</p></div> <div data-bbox="690 856 722 976"><p>FIG. 12</p></div> <div data-bbox="747 1239 779 1396"><p>Lin, FIG. 12</p></div> <div data-bbox="828 189 941 1302"><p>“FIG. 13 shows dual Fo-PoP 760 after singulation. Semiconductor die 654 is electrically connected through build-up interconnect structure 690 and build-up interconnect structure 746 to bumps 744 for connection to external devices.” Lin, [49:47-49:50].</p></div>

FIG. 13

Lin, FIG. 13

“FIG. 16 shows dual Fo-WLCSP 900 after singulation. Semiconductor die 354 is electrically connected through build-up interconnect structure 390 and build-up interconnect structure 882 to bumps 896 for connection to external devices.” Lin, [62:50-62:54].

Lin, FIG. 16

[1.A] a bottom package substrate;

Lin discloses, either expressly or inherently, a bottom package substrate.

See, e.g.:

“FIG. 5a shows a cross-sectional view of a portion of a carrier or temporary substrate 160 containing sacrificial base material such as silicon, polymer, beryllium oxide, glass, or other suitable low-cost, rigid material for structural support. An interface layer or double-sided tape 162 is formed over carrier 160 as a temporary adhesive bonding film, etch-stop layer, or thermal release layer. Carrier 160 can be a round or rectangular panel (greater than 300 mm) with capacity for multiple semiconductor die 124. Carrier 160 may have a larger surface area than the surface area of semiconductor wafer 120. A larger carrier reduces the manufacturing cost of the semiconductor package as more semiconductor die can be processed on the larger

	<p>carrier thereby reducing the cost per unit. Semiconductor packaging and processing equipment are designed and configured for the size of the wafer or carrier being processed. To further reduce manufacturing costs, the size of carrier 160 is selected independent of the size of semiconductor die 124 or size of semiconductor wafer 120. That is, carrier 160 has a fixed or standardized size, which can accommodate various size semiconductor die 124 singulated from one or more semiconductor wafers 120. In one embodiment, carrier 160 is circular with a diameter of 330 mm. In another embodiment, carrier 160 is rectangular with a width of 560 mm and length of 600 mm. Semiconductor die 124 may have dimensions of 10 mm by 10 mm, which are placed on the standardized carrier 160.” Lin, [11:16-11:43].</p> <div data-bbox="730 436 915 1348" data-label="Image"> </div> <p>Lin, FIG. 5a</p> <p>FIG. 5a</p> <p>“FIG. 7a shows a cross-sectional view of a portion of a carrier or temporary substrate 250 containing sacrificial base material such as silicon, polymer, beryllium oxide, glass, or other suitable low-cost, rigid material for structural support. An insulating or passivation layer 254 is applied over carrier 250. Insulating layer 254 can be formed using PVD, CVD, printing, spin coating, spray coating, sintering, or thermal oxidation. Insulating layer 254 includes one or more layers of Si₃N₄, SiO₂, SiON, SiO₂/Si₃N₄, Ta₂O₅, Al₂O₃, polymer dielectric, or</p>
--	---

	<p>other material having similar insulating and structural properties. In one embodiment, insulating layer 254 includes a laminated dielectric film. In alternate embodiments, insulating layer 254 can be replaced by a conductive layer, such as Cu. Insulating layer 254 is chosen to have good selectivity as a silicon etchant and can act as an etch stop during later removal of the dummy substrate. An electrically conductive layer or RDL 256 is formed over insulating layer 254 using a patterning and metal deposition process such as sputtering, electrolytic plating, and electroless plating. Conductive layer 256 includes a conductive material, such as Al, Cu, Sn, Ni, Au, Ag, or other electrically conductive material.” Lin, [18:66-19:21].</p> <div data-bbox="641 577 787 1354"> <p>FIG. 7a</p> </div> <p>Lin, FIG. 7a</p> <p>“FIG. 5k, the reconstituted wafer is singulated through build-up interconnect structure 180 and encapsulant 164 using a saw blade or laser cutting tool 182 into individual Fo-WLCSP 186 containing semiconductor die 124. In FIG. 5l Fo-WLCSP 186 from FIG. 5k are mounted to a carrier or temporary substrate 190 with conductive layer 176 of Fo-WLCSP 186 oriented toward the carrier. Carrier or temporary substrate 190 contains sacrificial base material such as silicon, polymer, beryllium oxide, glass, or other suitable low-cost, rigid material for structural support. An interface layer or double-stop tape 192 is formed over carrier 190 as a temporary adhesive bonding film, etch-stop layer, or thermal release layer. Carrier 190 can be a round or rectangular panel (greater than 300 mm) with capacity for multiple Fo-WLCSP 186. Carrier 190 may have a larger surface area than the surface area of the reconstituted</p>
--	--

wafer containing semiconductor die 124 and build-up interconnect structure 180. A larger carrier reduces the manufacturing cost of the semiconductor package as more semiconductor packages can be processed on the larger carrier thereby reducing the cost per unit. Semiconductor packaging and processing equipment are designed and configured for the size of the wafer or carrier being processed. To further reduce manufacturing costs, the size of carrier 190 is selected independent of the size of Fo-WLCSP 186 or the size of the reconstituted wafer containing semiconductor die 124 and build-up interconnect structure 180. That is, carrier 190 has a fixed or standardized size, which can accommodate various size semiconductor packages 186 singulated from one or more reconstituted wafers. In one embodiment, carrier 190 is circular with a diameter of 330 mm. In another embodiment, carrier 190 is rectangular with a width of 560 mm and length of 600 mm. Standardized carrier 190 can handle any size Fo-WLCSP 186, which allows subsequent semiconductor processing equipment to be standardized to a common carrier, i.e., independent of die size or incoming wafer size. Semiconductor packaging equipment can be designed and configured for a standard carrier using a common set of processing tools, equipment, and bill of materials to process any semiconductor die size from any incoming wafer size." Lin, [21:59-22:34].

Appendix A-21 - Invalidity of U.S. Patent No. 9859202 in view of Lin - U.S. Patent No. 10418298

	<p>reinforcement fibers or fabrics. Alternatively, core substrate 572 includes one or more insulating or dielectric layers. A plurality of through vias is formed through core substrate 572 using laser drilling, mechanical drilling, or DRIE. The vias are filled with Al, Cu, Sn, Ni, Au, Ag, Ti, W, or other suitable electrically conductive material using electrolytic plating, electroless plating process, or other suitable deposition process to form z-direction vertical interconnect conductive vias 574. In one embodiment, Cu is deposited over the sidewall of the through vias by electroless plating and electroplating. The through vias are filled with conductive paste or plugging resin with fillers. An electrically conductive layer or RDL 576 is formed over a surface of core substrate 572 and conductive vias 574 using a patterning and metal deposition process such as printing, PVD, CVD, sputtering, electrolytic plating, and electroless plating. Conductive layer 576 includes one or more layers of Al, Cu, Sn, Ni, Au, Ag, or other suitable electrically conductive material. Conductive layer 576 is electrically connected to conductive vias 574. Conductive layer 576 operates as contact pads electrically connected to conductive vias 574. An insulating or passivation layer 578 is formed over the surface of core substrate 572 and conductive layer 576 using PVD, CVD, printing, spin coating, spray coating, slit coating, rolling coating, lamination, sintering, or thermal oxidation. Insulating layer 578 includes one or more layers of SiO₂, Si₃N₄, SiON, Ta₂O₅, Al₂O₃, HfO₂, BCB, PI, PBO, polymer dielectric resist with or without fillers or fibers, or other material having similar structural and dielectric properties. A portion of insulating layer 578 is removed by LDA, etching, or other suitable process to expose portions of conductive layer 576. In one embodiment, insulating layer 578 is a masking layer. An electrically conductive layer or RDL 580 is formed over a surface of core substrate 572 opposite the conductive layer 576 using a patterning and metal deposition process such as printing, PVD, CVD, sputtering, electrolytic plating, and electroless plating. Conductive layer 580 includes one or more layers of Al, Cu, Sn, Ni, Au, Ag, or other suitable electrically conductive material. Conductive layer 580 is electrically connected to conductive vias 574 and conductive layer 576. Alternatively, conductive vias 574 are formed through core substrate</p>

Appendix A-21 - Invalidity of U.S. Patent No. 9859202 in view of Lin - U.S. Patent No. 10418298

	<p>572 after forming conductive layer 576 and/or conductive layer 580. An insulating or passivation layer 582 is formed over conductive layer 580 using PVD, CVD, printing, spin coating, spray coating, slit coating, rolling coating, lamination, sintering, or thermal oxidation. The insulating layer 582 includes one or more layers of SiO₂, Si₃N₄, SiON, Ta₂O₅, Al₂O₃, HfO₂, BCB, PI, PBO, polymer dielectric resist with or without fillers or fibers, or other material having similar structural and dielectric properties. A portion of insulating layer 582 is removed by an exposure and development process, LDA, etching, or other suitable process to expose portions of conductive layer 580. In one embodiment, insulating layer 582 is a masking layer. Substrate 572 is then singulated into individual 3D interconnect units or interposers 570. Interposer 570 provides electrical interconnect vertically across the substrate through conductive vias 574 according to the electrical function of semiconductor die 524 and later mounted semiconductor die or devices. Interposer 570 is known good having been inspected and tested by open/short probe or auto-scope inspection at an interim stage, i.e., prior to mounting Fo-WLCSP 564. In FIG. 11f, an encapsulant or molding compound 590 is deposited over Fo-WLCSP 564 and around interposer 570 using a paste printing, compressive molding, transfer molding, liquid encapsulant molding, vacuum lamination, spin coating, or other suitable applicator.” Lin, [36:57-38:6].</p>

FIG. 11e

Lin, FIG. 11e

“Interposer 570 provides electrical interconnect vertically across the substrate through conductive vias 574 according to the electrical function of semiconductor die 524 and later mounted semiconductor die or devices. Interposer 570 is known good having been inspected and tested by open/short probe or auto-scope inspection at an interim stage, i.e., prior to mounting Fo-WLCSP 564. In FIG. 11f, an encapsulant or molding compound 590 is deposited over Fo-WLCSP 564 and around interposer 570 using a paste printing, compressive molding, transfer molding, liquid encapsulant molding, vacuum lamination, spin coating, or other suitable applicator.” Lin, [37:63-38:7].

Lin, FIG. 11f

“Interposer 710 provides electrical interconnect vertically through dual Fo-PoP 760 according to the design and function of semiconductor die 654 and semiconductor device 750. Interposer 710 can be made with low cost manufacturing technology, such as substrate manufacturing, and provide a cost effective process for forming vertical interconnection in dual Fo-PoP 760. Interposer 710 allows integration of additional packages or devices, e.g., device 750, within dual Fo-PoP 760. Incorporating additional devices in a stacked or “package-on-package” orientation increases the electrical performance and functionality of dual Fo-PoP 760 without increasing the package footprint.” Lin, [49:25-49:37].

“Fo-WLCSP 694, interposer 710, semiconductor device 750, and build-up interconnect structure 746 represent a dual Fo-PoP in reconstituted wafer form. The reconstituted wafer is singulated through build-up interconnect structure 746, semiconductor device 750, and encapsulant 730 using a saw blade or laser cutting tool into individual dual Fo-PoP 760 containing semiconductor die 654, passive device 670, interposer 710, and semiconductor device 750. Alternatively, semiconductor device 750 is mounted after singulation. FIG. 13

Appendix A-21 - Invalidity of U.S. Patent No. 9859202 in view of Lin - U.S. Patent No. 10418298

	<p>shows dual Fo-PoP 760 after singulation. Semiconductor die 654 is electrically connected through build-up interconnect structure 690 and build-up interconnect structure 746 to bumps 744 for connection to external devices.” Lin, [49:38-49:50].</p> <p>“Interposer 810 provides electrical interconnect vertically through dual Fo-PoP 860 according to the design and function of semiconductor die 764 and semiconductor device 850. Interposer 810 can be made with low cost manufacturing technology, such as substrate manufacturing, and provide a cost effective process for forming vertical interconnection in dual Fo-PoP 860. Interposer 810 allows integration of additional packages or devices, e.g., device 850, within dual Fo-PoP 860. Incorporating additional devices in a stacked or “package-on-package” orientation increases the electrical performance and functionality of dual Fo-PoP 860 without increasing the package footprint.” Lin, [57:63-58:7].</p> <p>To the extent Plaintiff contends that Lin fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.D] the spacer connector comprises a core substrate;	<p>Lin discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Interposer 510 includes a core substrate 512. Substrate 512 includes one or more laminated layers of polytetrafluoroethylene pre-impregnated (prepreg), FR-4, FR-1, CEM-1, or CEM-3 with a combination of phenolic cotton paper, epoxy, resin, woven glass, matte glass, polyester, and other reinforcement fibers or fabrics. Alternatively, core substrate 512 includes one or more insulating or passivation layers.” Lin, [33:31-33:38].</p>

<p>[1.K] a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein</p>	<p>Lin discloses, either expressly or inherently, a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“In FIG. 5I Fo-WLCSP 186 from FIG. 5k are mounted to a carrier or temporary substrate 190 with conductive layer 176 of Fo-WLCSP 186 oriented toward the carrier. Carrier or temporary substrate 190 contains sacrificial base material such as silicon, polymer, beryllium oxide, glass, or other suitable low-cost, rigid material for structural support. An interface layer or double-sided tape 192 is formed over carrier 190 as a temporary adhesive bonding film, etch-stop layer, or thermal release layer. Carrier 190 can be a round or rectangular panel (greater than 300 mm) with capacity for multiple Fo-WLCSP 186. Carrier 190 may have a</p>

Appendix A-21 - Invalidity of U.S. Patent No. 9859202 in view of Lin - U.S. Patent No. 10418298

	<p>larger surface area than the surface area of the reconstituted wafer containing semiconductor die 124 and build-up interconnect structure 180. A larger carrier reduces the manufacturing cost of the semiconductor package as more semiconductor packages can be processed on the larger carrier thereby reducing the cost per unit. Semiconductor packaging and processing equipment are designed and configured for the size of the wafer or carrier being processed. To further reduce manufacturing costs, the size of carrier 190 is selected independent of the size of Fo-WLCSP 186 or the size of the reconstituted wafer containing semiconductor die 124 and build-up interconnect structure 180. That is, carrier 190 has a fixed or standardized size, which can accommodate various size semiconductor packages 186 singulated from one or more reconstituted wafers. In one embodiment, carrier 190 is circular with a diameter of 330 mm. In another embodiment, carrier 190 is rectangular with a width of 560 mm and length of 600 mm. Standardized carrier 190 can handle any size Fo-WLCSP 186, which allows subsequent semiconductor processing equipment to be standardized to a common carrier, i.e., independent of die size or incoming wafer size. Semiconductor packaging equipment can be designed and configured for a standard carrier using a common set of processing tools, equipment, and bill of materials to process any semiconductor die size from any incoming wafer size. The common or standardized carrier 190 lowers manufacturing costs and capital risk by reducing or eliminating the need for specialized semiconductor processing lines based on die size or incoming wafer size. By selecting a predetermined carrier size to use for any size semiconductor package from all semiconductor wafer, a flexible manufacturing line can be implemented. In FIG. 5m, an encapsulant or molding compound 194 is deposited over and around Fo-WLCSP 186 using a paste printing, compressive molding, transfer molding, liquid encapsulant molding, vacuum lamination, spin coating, or other suitable applicator.” Lin, [11:14-11:61].</p> <p>“In FIG. 7i, Fo-WLCSPs 300 from FIG. 7h are aligned with and mounted to a carrier 310 with insulating layer 254 of Fo-WLCSP 300 oriented toward carrier 310. Semiconductor die 274 are mounted to build-up interconnect structure 270 using a pick-and-place operation.” Lin, [20:64-21:3].</p>

FIG. 7e

Lin, FIG. 7e

“In FIG. 5I Fo-WLCSP 186 from FIG. 5k are mounted to a carrier or temporary substrate 190 with conductive layer 176 of Fo-WLCSP 186 oriented toward the carrier. Carrier or temporary substrate 190 contains sacrificial base material such as silicon, polymer, beryllium oxide, glass, or other suitable low-cost, rigid material for structural support.” Lin, [21:63-22:1].

FIG. 51

FIG. 9a, with active surface 660 of semiconductor die 654 oriented toward the carrier. The carrier includes a sacrificial base material such as silicon, polymer, beryllium oxide, glass, or other suitable low-cost, rigid material for structural support. An interface layer or double-sided tape, similar to interface layer 352 in FIG. 9a, is formed over the carrier as a temporary adhesive bonding film, etch-stop layer, or thermal release layer." Lin, [42:48-42:62].

FIG. 9a

FIG. 9e

Lin, FIG. 9e

“In FIG. 15d, Fo-WLCSP 400, including semiconductor die 354, passive device 366, and build-up interconnect structure 390, from FIG. 9e and a plurality of semiconductor components or passive devices 886 are disposed over build-up interconnect structure 882 and carrier 870.” Lin, [61:14-61:18].

FIG. 15d

Lin, FIG. 15d

To the extent Plaintiff contends that Lin fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Lin discloses, either expressly or inherently, the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.

See, e.g.:

“FIG. 9a shows a cross-sectional view of a portion of a carrier or temporary substrate 350 containing sacrificial base material such as silicon, polymer, beryllium oxide, glass, or other suitable low-cost, rigid material for structural support. An interface layer or double-sided tape 352 is formed over carrier 350 as a temporary adhesive bonding film, etch-stop layer, or thermal release layer. Semiconductor die 354 similar to semiconductor die 124 from FIG.

3c, are mounted to carrier 350 and interface layer 352 using, for example, a pick and place operation with active surface 360 oriented toward the carrier. A plurality of other semiconductor components or passive devices 366 are mounted to carrier 350 adjacent to semiconductor die 354." Lin, [26:22-26:35].

FIG. 9a

Lin, FIG. 9a

“In FIG. 9f, Fo-WLCSP 400 from FIG. 9e and additional semiconductor components or passive devices 414 are aligned with and mounted to substrate or carrier 410 with insulating layer 386 of Fo-WLCSP 400 oriented toward carrier 410.” Lin, [28:51-28:55].

“FIGS. 11a-11h illustrate, in relation to FIGS. 1 and 2 a - 2 c, a process of forming a dual fan-out semiconductor device including embedded 3D interconnect structures. FIG. 11a shows a cross-sectional view of a portion of a carrier or temporary substrate 500 containing sacrificial base material such as silicon, polymer, beryllium oxide, glass, or other suitable low-cost, rigid material for structural support. An interface layer or double-sided tape 502 is formed over

	<p>carrier 500 as a temporary adhesive bonding film, etch-stop layer, or thermal release layer. Semiconductor die 524, similar to semiconductor die 124 from FIG. 3c, are mounted to carrier 500 and interface layer 502 using, for example, a pick and place operation with active surface 530 oriented toward the carrier.” Lin, [33:13-33:26].</p> <p>Lin, FIG. 11a</p> <p><i>FIG. 11a</i></p> <p>“In FIG. 11e, Fo-WLCSP 564 from FIG. 11d, and 3D interconnect structures or interposers 570 are aligned with and mounted to temporary substrate or carrier 566 with conductive layer 556 of Fo-WLCSP 564 and insulating layer 582 and conductive layer 580 of interposer 570 oriented toward carrier 566.” Lin, [36:57-36:62].</p> <p>“FIG. 13 illustrates an embodiment of dual Fo-PoP 760 including a Fo-WLCSP 694, an interposer 710, and a build-up interconnect structure 746. Fo-WLCSP 694 is similar to Fo-WLCSP 400 in FIG. 9e ; interposer 710 is similar to interposer 570 in FIG. 11e ; build-up interconnect structure 746 is similar to build-up interconnect structure 610 in FIG. 11 h.” Lin, [42:46-42:52].</p>
--	--

FIG. 13

Lin, FIG. 13

“In dual Fo-WLCSP 920, semiconductor die 274 are electrically connected through build-up interconnect structure 270 and build-up interconnect structure 882 to bumps 896 for connection to external devices.” Lin, [65:1-65:4].

To the extent Plaintiff contends that Lin fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
-------------------------	-------------------

Appendix A-21 - Invalidity of U.S. Patent No. 9859202 in view of Lin - U.S. Patent No. 10418298

<p>[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p>	<p>Lin discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p> <p><i>See, e.g.:</i></p> <p>“In FIG. 5m, an encapsulant or molding compound 194 is deposited over and around Fo-WLCSP 186 using a paste printing, compressive molding, transfer molding, liquid encapsulant molding, vacuum lamination, spin coating, or other suitable applicator. Encapsulant 194 can be polymer composite material, such as epoxy resin with filler, epoxy acrylate with filler, or polymer with proper filler. Encapsulant 194 is non-conductive and environmentally protects the semiconductor device from external elements and contaminants. Encapsulant 194 also protects semiconductor die 124 from degradation due to exposure to light. The filler and CTE of encapsulant 194 are selected to aid with gap filling, warpage control, and reliability. Prior to forming encapsulant 194, a backgrinding operation and/or an RF etching, plasma clean, solvent strip, or wet clean process is performed on Fo-WLCSP 186 to roughen the surfaces of encapsulant 164 and build-up interconnect structure 180 and improve adhesion of encapsulant 194. In one embodiment, encapsulant 164 and/or encapsulant 194 include a controlled stress-releasing agent to improve adhesion of encapsulant 194. In FIG. 5n, a portion of back surface 196 of encapsulant 194 and a portion of back surface 166 of encapsulant 164 are removed by grinder 200 in an optional backgrinding operation. The backgrinding operation reduces a thickness of encapsulants 194 and 164 and may expose back surface 128 of semiconductor die 124. In FIG. 5n, surface 198 of encapsulant 194 and surface 199 of encapsulant 164 are co-planar with surface 128 of semiconductor die 124 after the backgrinding operation.” Lin, [14:57-15:20].</p>

Encapsulant 416 can be polymer composite material, such as epoxy resin with filler, epoxy acrylate with filler, or polymer with proper filler. Encapsulant 416 is non-conductive and environmentally protects the semiconductor device from external elements and contaminants. Encapsulant 416 also protects semiconductor die 354 from degradation due to exposure to light. The filler and CTE of encapsulant 416 are selected to aid with gap filling, warpage control, and reliability. Prior to forming encapsulant 416, a backgrinding operation and/or an RF etching, plasma clean, solvent strip, or wet clean process is performed on Fo-WLCSP 400 to roughen the surfaces of encapsulant 370 and build-up interconnect structure 390 and improve adhesion of encapsulant 416. Encapsulant 416 and/or encapsulant 370 include a controlled stress-releasing agent to improve adhesion of encapsulant 416. In one embodiment, a portion of back surface 418 of encapsulant 416 and a portion of back surface 372 of encapsulant 370 are removed in a backgrinding operation. The backgrinding</p></div>
--	---

operation planarizes encapsulant 416 and encapsulant 370, and exposes back surface 358 of semiconductor die 354. The backgrinding operation reduces an overall thickness of the semiconductor package." Lin, [28:61-29:20].

FIG. 15e

Lin, FIG. 15e

“In FIG. 11f, an encapsulant or molding compound 590 is deposited over Fo-WLCSP 564 and around interposer 570 using a paste printing, compressive molding, transfer molding, liquid encapsulant molding, vacuum lamination, spin coating, or other suitable applicator. Encapsulant 590 can be polymer composite material, such as epoxy resin with filler, epoxy acrylate with filler, or polymer with proper filler. Encapsulant 590 is non-conductive and environmentally protects the semiconductor device from external elements and contaminants. Encapsulant 590 also protects semiconductor die 524 from degradation due to exposure to light. The filler and CTE of encapsulant 590 are selected to aid with gap filling, warpage control, and reliability. Prior to forming encapsulant 590, a backgrinding operation and/or an RF etching, plasma clean, solvent strip, or wet clean process is performed on Fo-WLCSP 564 to roughen the surfaces of encapsulant 540 and build-up interconnect structure

	<p>560 and improve adhesion of encapsulant 590. Encapsulant 590 and/or encapsulant 540 include a controlled stress-releasing agent to improve adhesion of encapsulant 590. In one embodiment, a backgrinding operation is performed to remove a portion of encapsulants 590 and 540 and expose conductive layer 576 of interposer 570, conductive layer 516 of interposer 510, and surface 528 of semiconductor die 524.” Lin, [38:3-38:27].</p> <div data-bbox="613 451 820 1354"></div> <p style="text-align: center;"><i>FIG. 11f</i></p> <p>Lin, FIG. 11f</p> <p>“FIG. 13 illustrates an embodiment of dual Fo-PoP 760 including a Fo-WLCSP 694, an interposer 710, and a build-up interconnect structure 746. Fo-WLCSP 694 is similar to Fo-WLCSP 400 in FIG. 9e ; interposer 710 is similar to interposer 570 in FIG. 11e ; build-up interconnect structure 746 is similar to build-up interconnect structure 610 in FIG. 11 h. A semiconductor die 654, similar to semiconductor die 124 in FIG. 3c, is disposed over a temporary substrate or carrier, similar to carrier 350 in FIG. 9a, with active surface 660 of semiconductor die 654 oriented toward the carrier. The carrier includes a sacrificial base material such as silicon, polymer, beryllium oxide, glass, or other suitable low-cost, rigid material for structural support. An interface layer or double-sided tape, similar to interface</p>
--	---

layer 352 in FIG. 9a, is formed over the carrier as a temporary adhesive bonding film, etch-stop layer, or thermal release layer. A semiconductor component or passive device 670, similar to passive device 366 in FIG. 9a, is mounted to the carrier adjacent to semiconductor die 654. An encapsulant 672 is deposited over semiconductor die 654 and passive device 670 using a paste printing, compressive molding, transfer molding, liquid encapsulant molding, vacuum lamination, spin coating, or other suitable applicator. Encapsulant 672 can be a polymer composite material, such as epoxy resin with filler, epoxy acrylate with filler, or polymer with proper filler. Encapsulant 672 is non-conductive and environmentally protects the semiconductor device from external elements and contaminants. Encapsulant 672 also protects semiconductor die 654 from degradation due to exposure to light. The filler and CTE of encapsulant 672 are selected to aid with gap filling, warpage control, and reliability. In one embodiment, a portion of back surface 674 of encapsulant 672 is removed in a backgrinding operation. The backgrinding operation planarizes encapsulant 672 and exposes back surface 658 of semiconductor die 654." Lin, [42:46-43:14].

FIG. 13

	<p>Lin, FIG. 13</p> <p>“Encapsulant 730 can be polymer composite material, such as epoxy resin with filler, epoxy acrylate with filler, or polymer with proper filler. Encapsulant 730 is non-conductive and environmentally protects the semiconductor device from external elements and contaminants. Encapsulant 730 also protects semiconductor die 654 from degradation due to exposure to light. The filler and CTE of encapsulant 730 are selected to aid with gap filling, warpage control, and reliability. Prior to forming encapsulant 730, a backgrinding operation and/or an RF etching, plasma clean, solvent strip, or wet clean process is performed on Fo-WLCSP 694 to roughen the surfaces of encapsulant 672 and build-up interconnect structure 690 and improve adhesion of encapsulant 730. Encapsulant 730 and/or encapsulant 672 include a controlled stress-releasing agent to improve adhesion of encapsulant 730. In one embodiment, a portion of surface 732 of encapsulant 730 and surface 674 of encapsulant 672 is removed in a backgrinding operation to planarize encapsulants 730 and 672 and expose conductive layer 716 of interposer 710 and back surface 658 of semiconductor die 654.” Lin, [46:36-46:56].</p> <p>“In FIG. 15e, an encapsulant or molding compound 890 is deposited over Fo-WLCSP 400, passive devices 886, and build-up interconnect structure 882 using a paste printing, compressive molding, transfer molding, liquid encapsulant molding, vacuum lamination, spin coating, or other suitable applicator. Encapsulant 890 can be polymer composite material, such as epoxy resin with filler, epoxy acrylate with filler, or polymer with proper filler. Encapsulant 890 is non-conductive and environmentally protects the semiconductor device from external elements and contaminants. Encapsulant 890 also protects semiconductor die 354 from degradation due to exposure to light. The filler and CTE of encapsulant 890 are selected to aid with gap filling, warpage control, and reliability. Prior to</p>

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.	<p>Lin discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p>

Appendix A-21 - Invalidity of U.S. Patent No. 9859202 in view of Lin - U.S. Patent No. 10418298

<p>overlaps the bottom chip and each of the two spacer connectors.</p>	<p>“A semiconductor device or component 620 is mounted to conductive layer 576 of interposer 570 and conductive layer 516 of interposer 510 with bumps 622 at the wafer level, i.e., before singulation. Semiconductor device 620 may include filter, memory and other IC chips, processors, microcontrollers, known-good packages, or any other packaged device containing semiconductor die or other electronic devices or circuitry. Bumps 622 are Al, Sn, Ni, Au, Ag, Pb, Bi, Cu, solder, and combinations thereof. Bumps 622 can be eutectic Sn/Pb, high-lead solder, or lead-free solder. Bumps 622 represent one type of interconnect structure that can be formed between semiconductor device 620 and conductive layers 576 and 516. The interconnect structure can also use bond wires, conductive paste, stud bump, micro bump, or other electrical interconnect. Semiconductor device 620 is mounted using pick and place or other suitable operation. Semiconductor device 620 is electrically connected to build-up interconnect structure 560 through conductive vias 514. Semiconductor device 620 is electrically connected to build-up interconnect structure 610 through conductive vias 574.” Lin, [40:48-40:67].</p> <p>“FIG. 12 shows dual Fo-PoP 630 after singulation. Semiconductor die 524 is electrically connected through build-up interconnect structure 560 and build-up interconnect structure 610 to bumps 606 for connection to external devices.” Lin, [41:23-41:26].</p>
--	--

FIG. 12

Lin, FIG. 12

“FIG. 13 illustrates an embodiment of dual Fo-PoP 760 including a Fo-WLCSP 694, an interposer 710, and a build-up interconnect structure 746. Fo-WLCSP 694 is similar to Fo-WLCSP 400 in FIG. 9e ; interposer 710 is similar to interposer 570 in FIG. 11e ; build-up interconnect structure 746 is similar to build-up interconnect structure 610 in FIG. 11h.” Lin, [42:46-42:52].

FIG. 13

Lin, FIG. 13

“A semiconductor device or component 750 is mounted to conductive layer 716 of interposer 710 with bumps 752 at the wafer level, i.e., before singulation. Semiconductor device 750 may include filter, memory and other IC chips, processors, microcontrollers, known-good packages, or any other packaged device containing semiconductor die or other electronic devices or circuitry. Bumps 752 are Al, Sn, Ni, Au, Ag, Pb, Bi, Cu, solder, and combinations thereof. Bumps 752 can be eutectic Sn/Pb, high-lead solder, or lead-free solder. Bumps 752 represent one type of interconnect structure that can be formed between semiconductor devices 750 and conductive layer 716. The interconnect structure can also use bond wires, conductive paste, stud bump, micro bump, or other electrical interconnect. Semiconductor device 750 is mounted using pick and place or other suitable operation. Semiconductor device 750 is electrically connected to build-up interconnect structure 746 through conductive vias 714.” Lin, [49:8-49:25].

	<p>“Semiconductor device or component 850 is mounted to conductive layer 816 of interposer 810 and conductive vias 834 at the wafer level, i.e., before singulation. Semiconductor device 850 may include filter, memory and other IC chips, processors, microcontrollers, known-good packages, or any other packaged device containing semiconductor die or other electronic devices or circuitry. Bumps 852 electrically connect semiconductor device 850 to conductive vias 814 and 834. Bumps 852 are Al, Sn, Ni, Au, Ag, Pb, Bi, Cu, solder, and combinations thereof. Bumps 852 can be eutectic Sn/Pb, high-lead solder, or lead-free solder. Bumps 852 represent one type of interconnect structure that can be formed between semiconductor devices 850 and conductive vias 814 and 834. The interconnect structure can also use bond wires, conductive paste, stud bump, micro bump, or other electrical interconnect. Semiconductor device 850 is mounted using pick and place or other suitable operation. Semiconductor device 850 is electrically connected to build-up interconnect structure 848 through conductive vias 814 and electrically connected to component 800 through conductive vias 834.” Lin, [57:43-57:63].</p> <p>“FIG. 14 shows dual Fo-PoP 860 after singulation. Semiconductor die 764 is electrically connected through build-up interconnect structure 790 and build-up interconnect structure 848 to bumps 846 for connection to external devices.” Lin, [58:18-58:21].</p>

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Lisk - U.S. Patent Publication No. 20140252561

U.S. Patent Publication No. 20140252561 (“Lisk”) is titled VIA-Enabled Package-on-Package and lists Durodami Joscelyn Lisk, Vidhya Ramachandran, and Jae Sik Lee as inventors. Lisk is assigned to Qualcomm Incorporated. Lisk anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Lisk is a U.S. patent publication that was filed March 8, 2013 and published September 11, 2014. Lisk is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Lisk, or otherwise rendered obvious by disclosures and teachings of Lisk, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Lisk does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Lisk with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Lisk, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-22 - Invalidity of U.S. Patent No. 9859202 in view of Lisk - U.S. Patent Publication No. 20140252561

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Lisk “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Lisk or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Lisk set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Lisk discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 3A illustrates an example TSS-enabled PoP (TEP) 300. A second package 315 includes a second package substrate 320 as is conventional in the PoP arts. A first package 316 includes a first package substrate 360 on which a first package die 310 is mounted using interconnects such as controlled collapse chip connection (C4) flip-chip bumps 309 as is also conventional in the PoP arts. First package substrate 360 and second package substrate 320 may each comprise an organic substrate, a semiconductor substrate such as silicon, glass, ceramic, or other suitable materials. Regardless of what materials are used to construct the</p>

package substrates, no interconnects 120 as discussed with regard to MEP 100 are necessary to accommodate the input/output (I/O) signaling for a plurality of second package dies 324 in second package 315. Instead, through silicon vias 322 in first package die 310 accommodate all the I/O signaling for second package dies 324. As used herein, “input/output signaling” includes all the electrical signals received by the second package die(s), including power and ground. Similarly, “input/output signaling” includes all output signals from the second package die(s). Alternative embodiments for TEP 300 may include just a single second package die 324 instead of a plurality of such dies. The terms “first package” and “second package” are used herein simply to denote the different packages as is known in the PoP arts.” Lisk, [0023-0024].

Lisk, FIG. 3A

“Because virtually the entire area of first package die 310 may be used for through silicon vias 322, the interconnect restrictions in PoP technology with regard to the second package die I/O are avoided. In contrast, prior art PoP architectures require the interconnects between the top package substrate and the bottom package substrate to avoid the substrate area on the

Appendix A-22 - Invalidity of U.S. Patent No. 9859202 in view of Lisk - U.S. Patent Publication No. 20140252561

	<p>bottom package substrate occupied by the bottom package die such as discussed above with regard to MEP 100. Prior-art PoP architectures thus have limited signal density as compared to the improved PoPs disclosed herein because the package-to-package interconnects are not limited to a placement on the peripheral of the bottom package substrate. TEP 300 includes an interposer 305 having through substrate vias (TSVs) 321 that couple to through silicon vias 322 in first package die 310 through corresponding interconnects such as micro-bumps 323. Interposer 305 may comprise a semiconductor substrate such as silicon, glass, or other suitable materials.” Lisk, [0025-0026].</p> <p>“FIG. 3B illustrates an alternative embodiment in which a TEP 350 does not include an interposer. Bumps 325 on pads on a lower surface of second package substrate 320 thus couple directly through first package die pads (not illustrated) to first package die through silicon vias 322 (or are coupled to through silicon vias 322 through a backside redistribution layer). As compared to TEP 300, TEP 350 requires fewer manufacturing steps. However, interposer 305 enables additional redistribution of the I/O signaling to second package dies 324. Bumps 325 may comprise interconnects such as copper pillars (micro-bumps), direct metal-to-metal bonds, or collapsed collapse chip connection (C4) bumps or solder balls. Regardless of whether an interposer is included or not, bumps 325 are not restricted to an annular region outside of the area occupied by first package die 310 in direct contrast to conventional PoPs such as MEP 100.” Lisk, [0030-0031].</p>
--	---

FIG. 3B

Lisk, FIG. 3B

“As shown in FIG. 5, pads (not illustrated) on an active surface 501 for first package die 500 are mounted through flip-chip bumps 510 to corresponding pads (also not shown for illustration clarity) on a first package substrate 520. However, it will be appreciated that in alternative embodiments, the active surface orientation of first package die 500 may be reversed. In other words, the advantageous TSS-enabled PoP concepts disclosed herein may be applied to any active surface orientation. An underfill 515 such as an epoxy or other polymeric material may then be applied using capillary action. Alternatively, underfill 515 may be pre-applied at the same time bumps 510 are applied. A through-silicon-via-fabricated interposer 600 may then be bonded to a back surface 605 of first package die 500 as shown in FIG. 6. For illustration clarity, the through silicon vias in interposer 600 are not shown. Bumps 610 couple pads on first package die 500 to corresponding pads on interposer 600 in response to thermo-compression.” Lisk, [0032-0033].

	<div data-bbox="300 724 495 1354"> <p>FIG. 5</p> </div> <div data-bbox="544 1228 576 1386"> <p>Lisk, FIG. 5</p> </div> <div data-bbox="625 178 901 1302"> <p>“Mold compound 715 may then be applied to complete a TEP first package 700 as shown in FIG. 7. An upper surface of interposer 600 is exposed in mold compound 715 such that mold compound 715 only partially encases interposer 600. In this fashion, pads (not illustrated) on the exposed surface of interposer 600 may then be bonded as shown in FIG. 8 through interconnects 805 to corresponding pads on a lower surface of a second package substrate 810 for a second package 800 to complete the manufacture of an interposer-containing TEP 820.” Lisk, [0034].</p> </div> <div data-bbox="950 787 1144 1375"> <p>FIG. 7</p> </div> <div data-bbox="1153 1228 1185 1386"> <p>Lisk, FIG. 7</p> </div> <div data-bbox="1234 178 1356 1302"> <p>“As discussed above, for TEP embodiments that include an interposer, the interposer may be passive or contain active elements. In that regard, an active interposer comprises another die comparable to the first package die discussed above. Several such TSV-containing dies could</p> </div>
--	--

	<p>be stacked within the first package. Moreover, multiple interposers may be used in parallel as shown for TEP 900 of FIG. 9. In particular, an interposer 905 and an interposer 910 both face a back surface of first package die 915. In that regard, interposers 905 and interposer 910 are arranged in parallel in a single layer as opposed to being stacked.” Lisk, [0035].</p>  <p style="text-align: center;">FIG. 9</p> <p>Lisk, FIG. 9</p> <p>To the extent Plaintiff contends that Lisk fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.A] a bottom package substrate;	<p>Lisk discloses, either expressly or inherently, a bottom package substrate.</p> <p>See, e.g.:</p> <p>“Moreover, the mold through vias or other techniques used to form conventional package-to-package interconnects are unnecessary for the improved PoPs disclosed. The following</p>

	<p>discussion will assume without loss of generality that the first package die is a silicon die such that the through substrate vias it contains are through silicon vias.” Lisk, [0021-0022].</p> <p>“A first package 316 includes a first package substrate 360 on which a first package die 310 is mounted using interconnects such as controlled collapse chip connection (C4) flip-chip bumps 309 as is also conventional in the PoP arts. First package substrate 360 and second package substrate 320 may each comprise an organic substrate, a semiconductor substrate such as silicon, glass, ceramic, or other suitable materials.” Lisk, [0023].</p> <p>“Pads (not illustrated) on a lower surface of second package substrate 320 couple to the interposer through silicon vias 321 through interconnects such as bumps 325. More generally, second package substrate 320 may be considered to have a first surface and an opposing second surface.” Lisk, [0027].</p> <p>“Such external device I/O would be carried between interposer 305 and the external devices through silicon vias 322 in first package die 310, bumps 309, first package substrate 360 and balls 361 on a lower surface of first package substrate 360.” Lisk, [0028].</p> <p>“In contrast, MEP 100 would need larger substrate sizes in that it must place its interconnects 120 outside of bottom die 115. In this fashion, the TEPs disclosed herein advantageously will have less warpage as compared to analogous MEPs in that warpage depends upon (among other things), the size of the substrates for the top and bottom packages.” Lisk, [0031].</p> <p>“As shown in FIG. 5, pads (not illustrated) on an active surface 501 for first package die 500 are mounted through flip-chip bumps 510 to corresponding pads (also not shown for illustration clarity) on a first package substrate 520.” Lisk, [0032].</p>
--	---

	 <p>FIG. 5</p> <p>Lisk, FIG. 5</p> <p>To the extent Plaintiff contends that Lisk fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Lisk discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p>See, <i>e.g.</i>:</p> <p>“FIG. 3A illustrates an example TSS-enabled PoP (TEP) 300. A second package 315 includes a second package substrate 320 as is conventional in the PoP arts. A first package 316 includes a first package substrate 360 on which a first package die 310 is mounted using interconnects such as controlled collapse chip connection (C4) flip-chip bumps 309 as is also conventional in the PoP arts. First package substrate 360 and second package substrate 320 may each comprise an organic substrate, a semiconductor substrate such as silicon, glass, ceramic, or other suitable materials.” Lisk, [0023].</p>

“The terms “first package” and “second package” are used herein simply to denote the different packages as is known in the PoP arts. In that regard, first package 316 of FIG. 3A corresponds to a ‘bottom package’ as that term is used in the PoP arts. Similarly second package 315 corresponds to a “top package” as that term is used in the PoP arts.” Lisk, [0024].

“In TEP 300, second package dies 324 are wire-bonded to second package substrate 320 although other mounting technologies may be used such as surface mounting. The wire bonds carry the I/O signaling between second package dies 324 and second package substrate 320. In turn, the I/O signaling for second package dies 324 is carried between second package substrate 320 and interposer 305 through bumps 325. Finally, the I/O signaling for second package dies 324 is carried between interposer 305 and first package die 310 through interposer through silicon vias 321 and first package die's through silicon vias 322. Some I/O signaling for second package dies 324 may originate from or be transmitted to external devices. Such external device I/O would be carried between interposer 305 and the external devices through through silicon vias 322 in first package die 310, bumps 309, first package substrate 360 and balls 361 on a lower surface of first package substrate 360.” Lisk, [0028].

“FIG. 3B illustrates an alternative embodiment in which a TEP 350 does not include an interposer. Bumps 325 on pads on a lower surface of second package substrate 320 thus couple directly through first package die pads (not illustrated) to first package die through silicon vias 322 (or are coupled to through silicon vias 322 through a backside redistribution layer).” Lisk, [0030].

FIG. 3B

Lisk, FIG. 3B

“FIG. 4 illustrates a plan view of a lower surface of second package substrate 320 to show how bumps 325 may use the entire area 400 that faces either first package die 310 (for an interposer-less embodiment such as TEP 350) or interposer 305 (in an interposer-containing embodiment such as TEP 300). In this fashion, substantially more I/O signals can be accommodated as compared to a conventional PoP embodiment. Moreover, because second package substrate 320 can receive bumps 325 across the entire surface area 400 facing first package die 310 (or interposer 305), the size of second package substrate 320 and first package substrate 360 may be reduced accordingly.” Lisk, [0031].

FIG. 4

Lisk, FIG. 4

“An upper surface of interposer 600 is exposed in mold compound 715 such that mold compound 715 only partially encases interposer 600. In this fashion, pads (not illustrated) on the exposed surface of interposer 600 may then be bonded as shown in FIG. 8 through interconnects 805 to corresponding pads on a lower surface of a second package substrate 810 for a second package 800 to complete the manufacture of an interposer-containing TEP 820.” Lisk, [0034].

To the extent Plaintiff contends that Lisk fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-22 - Invalidity of U.S. Patent No. 9859202 in view of Lisk - U.S. Patent Publication No. 20140252561

<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Lisk discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“TEP 300 includes an interposer 305 having through substrate vias (TSVs) 321 that couple to through silicon vias 322 in first package die 310 through corresponding interconnects such as micro-bumps 323. Interposer 305 may comprise a semiconductor substrate such as silicon, glass, or other suitable materials. Should interposer 305 comprise a silicon substrate, TSVs 321 are through silicon vias. On the other hand, should interposer 305 comprise glass, TSVs 322 are through glass vias (TGVs). The following discussion will assume without loss of generality that TSVs 321 are through silicon vias. Interposer 305 allows for additional redistribution of the I/O signaling to second package dies 324. Alternatively, through silicon vias 321 in interposer 305 may couple to the first package die's through silicon vias 322 through a backside redistribution layer (not illustrated) on the backside of first package die 310. Pads (not illustrated) on a lower surface of second package substrate 320 couple to the interposer through silicon vias 321 through interconnects such as bumps 325.” Lisk, [0026-0027].</p> <p>“A through-silicon-via-fabricated interposer 600 may then be bonded to a back surface 605 of first package die 500 as shown in FIG. 6. For illustration clarity, the through silicon vias in interposer 600 are not shown. Bumps 610 couple pads on first package die 500 to corresponding pads on interposer 600 in response to thermo-compression.” Lisk, [0033].</p>
---	---

Lisk, FIG. 6

“Mold compound 715 may then be applied to complete a TEP first package 700 as shown in FIG. 7. An upper surface of interposer 600 is exposed in mold compound 715 such that mold compound 715 only partially encases interposer 600. In this fashion, pads (not illustrated) on the exposed surface of interposer 600 may then be bonded as shown in FIG. 8 through interconnects 805 to corresponding pads on a lower surface of a second package substrate 810 for a second package 800 to complete the manufacture of an interposer-containing TEP 820.” Lisk, [0034].

Lisk, FIG. 7

	<p>“Moreover, multiple interposers may be used in parallel as shown for TEP 900 of FIG. 9. In particular, an interposer 905 and an interposer 910 both face a back surface of first package die 915. In that regard, interposers 905 and interposer 910 are arranged in parallel in a single layer as opposed to being stacked.” Lisk, [0035].</p>  <p style="text-align: center;">FIG. 9</p> <p>Lisk, FIG. 9</p> <p>To the extent Plaintiff contends that Lisk fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.D] the spacer connector comprises a core substrate;</p>	<p>Lisk discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p>See, e.g.:</p> <p>“TEP 300 includes an interposer 305 having through substrate vias (TSVs) 321 that couple to through silicon vias 322 in first package die 310 through corresponding interconnects such</p>

	<p>as micro-bumps 323. Interposer 305 may comprise a semiconductor substrate such as silicon, glass, or other suitable materials.” Lisk, [0026].</p> <p>“Interposer 305 allows for additional redistribution of the I/O signaling to second package dies 324. Alternatively, through silicon vias 321 in interposer 305 may couple to the first package die’s through silicon vias 322 through a backside redistribution layer (not illustrated) on the backside of first package die 310.” Lisk, [0026-0027].</p> <p>“A through-silicon-via-fabricated interposer 600 may then be bonded to a back surface 605 of first package die 500 as shown in FIG. 6. Appendix A-22 - Invalidity of U.S. Patent No. 9859202 in view of Lisk - U.S. Patent Publication No. 20140252561

Claim Limitation	Disclosure
<p>[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p>	<p>Lisk discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p> <p><i>See, e.g.:</i></p> <p>“A second package 315 includes a second package substrate 320 as is conventional in the PoP arts. A first package 316 includes a first package substrate 360 on which a first package die 310 is mounted using interconnects such as controlled collapse chip connection (C4) flip-chip bumps 309 as is also conventional in the PoP arts. First package substrate 360 and second package substrate 320 may each comprise an organic substrate, a semiconductor substrate such as silicon, glass, ceramic, or other suitable materials. Regardless of what materials are used to construct the package substrates, no interconnects 120 as discussed with regard to MEP 100 are necessary to accommodate the input/output (I/O) signaling for a plurality of second package dies 324 in second package 315. Instead, through silicon vias 322 in first package die 310 accommodate all the I/O signaling for second package dies 324.” Lisk, [0023].</p> <p>“FIG. 3A illustrates an example TSS-enabled PoP (TEP) 300. A second package 315 includes a second package substrate 320 as is conventional in the PoP arts. A first package 316 includes a first package substrate 360 on which a first package die 310 is mounted using interconnects such as controlled collapse chip connection (C4) flip-chip bumps 309 as is also conventional in the PoP arts. First package substrate 360 and second package substrate 320 may each comprise an organic substrate, a semiconductor substrate such as silicon, glass, ceramic, or other suitable materials. Regardless of what materials are used to construct the package substrates, no interconnects 120 as discussed with regard to MEP 100 are necessary</p>

	<p>to accommodate the input/output (I/O) signaling for a plurality of second package dies 324 in second package 315. Instead, through silicon vias 322 in first package die 310 accommodate all the I/O signaling for second package dies 324. As used herein, “input/output signaling” includes all the electrical signals received by the second package die(s), including power and ground. Similarly, “input/output signaling” includes all output signals from the second package die(s). Alternative embodiments for TEP 300 may include just a single second package die 324 instead of a plurality of such dies. The terms “first package” and “second package” are used herein simply to denote the different packages as is known in the PoP arts. In that regard, first package 316 of FIG. 3A corresponds to a ‘bottom package’ as that term is used in the PoP arts. Similarly second package 315 corresponds to a “top package” as that term is used in the PoP arts. But such references to “top” or “bottom” are not tied to any particular reference system. In other words, a bottom package does not become a top package simply because a PoP is flipped over. Because virtually the entire area of first package die 310 may be used for through silicon vias 322, the interconnect restrictions in PoP technology with regard to the second package die I/O are avoided. In contrast, prior art PoP architectures require the interconnects between the top package substrate and the bottom package substrate to avoid the substrate area on the bottom package substrate occupied by the bottom package die such as discussed above with regard to MEP 100. Prior-art PoP architectures thus have limited signal density as compared to the improved PoPs disclosed herein because the package-to-package interconnects are not limited to a placement on the peripheral of the bottom package substrate. TEP 300 includes an interposer 305 having through substrate vias (TSVs) 321 that couple to through silicon vias 322 in first package die 310 through corresponding interconnects such as micro-bumps 323. Interposer 305 may comprise a semiconductor substrate such as silicon, glass, or other suitable materials. Should interposer 305 comprise a silicon substrate, TSVs 321 are through silicon vias. On the other hand, should interposer 305 comprise glass, TSVs 332 are through glass vias (TGVs). The following discussion will assume without loss of generality that TSVs 321 are through silicon</p>
--	--

vias. Interposer 305 allows for additional redistribution of the I/O signaling to second package dies 324. Alternatively, through silicon vias 321 in interposer 305 may couple to the first package die's through silicon vias 322 through a backside redistribution layer (not illustrated) on the backside of first package die 310. Pads (not illustrated) on a lower surface of second package substrate 320 couple to the interposer through silicon vias 321 through interconnects such as bumps 325." Lisk, [0023-0027].

“FIG. 3B illustrates an alternative embodiment in which a TEP 350 does not include an interposer. Bumps 325 on pads on a lower surface of second package substrate 320 thus couple directly through first package die pads (not illustrated) to first package die through silicon vias 322 (or are coupled to through silicon vias 322 through a backside redistribution layer). As compared to TEP 300, TEP 350 requires fewer manufacturing steps. However, interposer 305 enables additional redistribution of the I/O signaling to second package dies 324. Bumps 325 may comprise interconnects such as copper pillars (micro-bumps), direct metal-to-metal bonds, or collapsed collapse chip connection (C4) bumps or solder balls. Regardless of whether an interposer is included or not, bumps 325 are not restricted to an annular region outside of the area occupied by first package die 310 in direct contrast to conventional PoPs such as MEP 100.” Lisk, [0030-0031].

FIG. 3B

	<p data-bbox="293 1220 321 1388">Lisk, FIG. 3B</p> <p data-bbox="370 191 597 1297">“An upper surface of interposer 600 is exposed in mold compound 715 such that mold compound 715 only partially encases interposer 600. In this fashion, pads (not illustrated) on the exposed surface of interposer 600 may then be bonded as shown in FIG. 8 through interconnects 805 to corresponding pads on a lower surface of a second package substrate 810 for a second package 800 to complete the manufacture of an interposer-containing TEP 820.” Lisk, [0034].</p> <div data-bbox="667 789 938 1371"></div> <p data-bbox="954 1087 974 1144">FIG. 8</p> <p data-bbox="995 1241 1023 1388">Lisk, FIG. 8</p> <p data-bbox="1073 191 1222 1388">To the extent Plaintiff contends that Lisk fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 3, U.S. Patent No. 9859202

Appendix A-22 - Invalidity of U.S. Patent No. 9859202 in view of Lisk - U.S. Patent Publication No. 20140252561

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Lisk discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“A second package 315 includes a second package substrate 320 as is conventional in the PoP arts. A first package 316 includes a first package substrate 360 on which a first package die 310 is mounted using interconnects such as controlled collapse chip connection (C4) flip-chip bumps 309 as is also conventional in the PoP arts. First package substrate 360 and second package substrate 320 may each comprise an organic substrate, a semiconductor substrate such as silicon, glass, ceramic, or other suitable materials. Regardless of what materials are used to construct the package substrates, no interconnects 120 as discussed with regard to MEP 100 are necessary to accommodate the input/output (I/O) signaling for a plurality of second package dies 324 in second package 315. Instead, through silicon vias 322 in first package die 310 accommodate all the I/O signaling for second package dies 324.” Lisk, [0023].</p> <p>“Because virtually the entire area of first package die 310 may be used for through silicon vias 322, the interconnect restrictions in PoP technology with regard to the second package die I/O are avoided. In contrast, prior art PoP architectures require the interconnects between the top package substrate and the bottom package substrate to avoid the substrate area on the bottom package substrate occupied by the bottom package die such as discussed above with regard to MEP 100. Prior-art PoP architectures thus have limited signal density as compared</p>

	<p>to the improved PoPs disclosed herein because the package-to-package interconnects are not limited to a placement on the peripheral of the bottom package substrate.” Lisk, [0025].</p> <p>“TEP 300 includes an interposer 305 having through substrate vias (TSVs) 321 that couple to through silicon vias 322 in first package die 310 through corresponding interconnects such as micro-bumps 323. Interposer 305 may comprise a semiconductor substrate such as silicon, glass, or other suitable materials. Should interposer 305 comprise a silicon substrate, TSVs 321 are through silicon vias. On the other hand, should interposer 305 comprise glass, TSVs 322 are through glass vias (TGVs). The following discussion will assume without loss of generality that TSVs 321 are through silicon vias. Interposer 305 allows for additional redistribution of the I/O signaling to second package dies 324. Alternatively, through silicon vias 321 in interposer 305 may couple to the first package die's through silicon vias 322 through a backside redistribution layer (not illustrated) on the backside of first package die 310. Pads (not illustrated) on a lower surface of second package substrate 320 couple to the interposer through silicon vias 321 through interconnects such as bumps 325. More generally, second package substrate 320 may be considered to have a first surface and an opposing second surface. Second package dies 324 are mounted on the first surface of second package substrate 320 whereas bumps 325 connect to the opposing second surface of second package substrate 320.” Lisk, [0026-0027].</p> <p>“In TEP 300, second package dies 324 are wire-bonded to second package substrate 320 although other mounting technologies may be used such as surface mounting. The wire bonds carry the I/O signaling between second package dies 324 and second package substrate 320. In turn, the I/O signaling for second package dies 324 is carried between second package substrate 320 and interposer 305 through bumps 325. Finally, the I/O signaling for second package dies 324 is carried between interposer 305 and first package die 310 through</p>

Appendix A-23 - Invalidity of U.S. Patent No. 9859202 in view of Liu - Non-Patent Publication

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Liu - Taiwan Patent Publication No. 200601516

Taiwan Patent Application Publication No. 200601516 (“Liu”) is titled Stacked Multi-Package Module and lists Sheng-Tsung Liu as inventor. Liu anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Liu is a patent publication that was published January 1, 2006. Liu is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Liu, or otherwise rendered obvious by disclosures and teachings of Liu, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Liu does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Liu with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Liu, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-23 - Invalidity of U.S. Patent No. 9859202 in view of Liu - Non-Patent Publication

Where the chart below states that Liu “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Liu or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Liu set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Liu discloses, either expressly or inherently, a structure.</p> <p>See, e.g.:</p> <p>“The present invention relates to a stacked multi-package structure, and more particularly to a stacking structure that uses a transfer plate (spacer) to connect a plurality of semiconductor packages.” Liu, [1]³.</p> <p>“Because the interposer substrate must undergo a ball-planting step and two reflow steps, the process is not only time-consuming and costly, but the interposer substrate is also prone to deformation. (3) Summary of the Invention The primary object of the present invention is to</p>

圖 1 第

Liu, FIG. 1.

[1.A] a bottom package substrate;

Liu discloses, either expressly or inherently, a bottom package substrate.

See, e.g.:

“The first semiconductor package 110 may be a ball grid array (BGA) package, which comprises a substrate 111, a chip 112, and an encapsulant 113. The substrate 111 has a first surface 114 and a second surface 115. Referring to Figures 1 and 2, the first surface 114 of the substrate 111 includes a packaging area 114a and a connecting area 114b. In this embodiment, the packaging area 114a is located at the center of the first surface 114 of the substrate. The chip 112 is disposed on the packaging area 114a and is electrically connected to the first surface 114 of the substrate 111 via a plurality of bonding wires 116. The

Appendix A-23 - Invalidity of U.S. Patent No. 9859202 in view of Liu - Non-Patent Publication

	<p>encapsulant 113 is formed on the packaging area 114a to seal the chip 112 and the bonding wires 116. The connecting area 114b is located at the periphery of the first surface 114 of the substrate 111 and surrounds the packaging area 114a. A plurality of bonding pads 117 are formed in the connecting area 114b. A plurality of ball pads 118 are formed on the second surface 115 of the substrate 111, and a plurality of solder balls 119 are planted on the ball pads 118.” Liu, [3].</p> <p>“According to a specific embodiment of the present invention, referring to Figure 1, a stacked multi-package structure 100 comprises a first semiconductor package 110, a transfer plate (spacer) 120, and a second semiconductor package 130.” Liu, [3].</p> <p>“The second semiconductor package 130 may be a ball grid array package, for example a Plastic Ball Grid Array package (PBGA) or a chip-scale package. In this embodiment, a plastic ball grid array package is used. The second semiconductor package 130 comprises a substrate 131, a chip 132, and an encapsulant 133. The substrate 131 has a carrier surface 134 and a bonding surface 135. The chip 132 is disposed on the carrier surface 134 and is electrically connected to the carrier surface 134 of the substrate 131 via a plurality of bonding wires 136. The encapsulant 133 is formed on the carrier surface 134 to seal the chip 132 and the bonding wires 136. A plurality of external terminals 137 are formed on the bonding surface 135 of the substrate 131.” Liu, [4].</p> <p>“Claim 1. A stacked multi-package structure, comprising: a first semiconductor package, comprising at least a substrate and a chip, the substrate having a first surface and a second surface, the first surface including a packaging area and a connecting the chip being disposed in the packaging area, and the connecting area having a plurality of bonding pads formed therein; area,” Liu, [6].</p>
--	---

“Claim 5. The stacked multi-package structure as described in Claim 1, wherein the first semiconductor package is a ball grid array package.” Liu, [6].

“Claim 9. The stacked multi-package structure as described in Claim 1, wherein the second surface of the substrate has a plurality of ball pads formed thereon.” Liu, [7].

	<p>first surface including a packaging area and a connecting the chip being disposed in the packaging area, and the connecting area having a plurality of bonding pads formed therein; area, a transfer plate (spacer) having an upper surface, a lower surface, and an opening, the opening corresponding to the chip of the first semiconductor package, the transfer plate comprising: • • • a plurality of upper connecting pads formed on the upper surface of the transfer plate; a plurality of lower connecting pads formed on the lower surface of the transfer plate; a plurality of electrical vias penetrating through the upper connecting pads and the lower connecting pads and having a metal layer formed therein; and a plurality of solder materials formed within the electrical vias and protruding from the upper connecting pads and the lower connecting pads of the transfer plate; and” Liu, [6].</p> <p>“The transfer plate includes a plurality of upper connecting pads, a plurality of lower connecting pads, and a plurality of electrical vias with a metal layer. The electrical vias connect the upper connecting pads and lower connecting pads. A plurality of solder materials are formed within the electrical vias and protrude from the upper and lower connecting pads of the transfer plate.” Liu, [6].</p> <p>“A transfer plate suitable for a stacked multi-package structure, having a first surface and a second surface, the transfer plate comprising: • • an opening penetrating through the first surface and the second surface; a plurality of electrical vias penetrating through the first surface and the second surface and having a sidewall metal layer formed therein; and a plurality of solder materials formed within the electrical vias and protruding from the first surface and the second surface of the transfer plate.” Liu, [7].</p> <p>“The transfer plate as described in Claim 15, suitable for a stacked multi-package structure, wherein the sidewall metal layer extends to cover the peripheral edges of the corresponding</p>
--	---

	 <p>The diagram shows a cross-section of a multi-layered substrate assembly. It consists of a top package substrate (121) with a bottom surface (122) having a plurality of metal pillars (123). These pillars are coupled to a corresponding metal pillar (124) in a bottom metal layer (125) of a spacer connector (126). The spacer connector also includes upper connecting pads (127) and lower connecting pads (128). The entire assembly is shown in a cross-sectional view with various layers and components labeled with reference numerals.</p> <p style="text-align: center;">第 3 圖</p> <p style="text-align: center;">Liu, FIG. 3.</p> <p>To the extent Plaintiff contends that Liu fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.H] the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector,</p>	<p>Liu discloses, either expressly or inherently, the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p>See, e.g.:</p> <p>“A secondary object of the present invention is to provide a transfer plate suitable for a stacked multi-package structure that includes a plurality of upper connecting pads, a plurality of lower connecting pads, and a plurality of electrical vias. A plurality of solder materials are</p>
