Liu, FIG. 1.

To the extent Plaintiff contends that Liu fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-23 - Invalidity of U.S. Patent No. 9859202 in view of Liu - Non-Patent Publication

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of metal pillars of the top package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Liu discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“Referring to Figures 1 and 3, the transfer plate 120 has an upper surface 121, a lower surface 122, and an opening 123. The opening 123 is formed at the center of the transfer plate 120 to correspond to the chip 112 of the first semiconductor package 110. The transfer plate 120 includes a plurality of upper connecting pads 124, a plurality of lower connecting pads 125, and a plurality of electrical vias 126. The upper connecting pads 124 are formed on the upper surface 121 of the transfer plate 120. The lower connecting pads 125 correspond to the upper connecting pads 124 and are formed on the lower surface 122 of the transfer plate 120. In this embodiment, the electrical vias 126 are arranged around the periphery of the opening 123. The diameter of the electrical vias 126 is no less than 1.5 mm. Each electrical via 126 penetrates through the vertically corresponding upper connecting pad 124 and lower connecting pad 125 and has a metal layer 127 formed therein. The metal layer 127 is formed on the sidewall of the corresponding electrical via 126 and connects the corresponding upper connecting pads 124 and lower connecting pads 125, so that the corresponding upper</p>

Appendix A-23 - Invalidity of U.S. Patent No. 9859202 in view of Liu - Non-Patent Publication

	<p>connecting pads 124 and lower connecting pads 125 are electrically conductive. Preferably, the metal layer 127 is integrally formed with the upper connecting pads 124 and the lower connecting pads 125. Alternatively, the metal layer 127 may directly extend to cover the peripheral edges of the electrical vias 126 at both the first surface 121 and the second surface 122, to facilitate the protruding formation of the solder materials 128. A plurality of solder materials 128 are formed within the electrical vias 126 and protrude from the upper connecting pads 124 and the lower connecting pads 125 of the transfer plate 120.” Liu, [3-4].</p> <p>“The second semiconductor package 130 may be a ball grid array package, for example a Plastic Ball Grid Array package (PBGA) or a chip-scale package. In this embodiment, a plastic ball grid array package is used. The second semiconductor package 130 comprises a substrate 131, a chip 132, and an encapsulant 133. The substrate 131 has a carrier surface 134 and a bonding surface 135. The chip 132 is disposed on the carrier surface 134 and is electrically connected to the carrier surface 134 of the substrate 131 via a plurality of bonding wires 136. The encapsulant 133 is formed on the carrier surface 134 to seal the chip 132 and the bonding wires 136. A plurality of external terminals 137 are formed on the bonding surface 135 of the substrate 131. The external terminals 137 are selected from solder balls and bumps. The external terminals 137 are electrically bonded to the bonding pads 117 of the first semiconductor package 110 through the solder materials 128 passing through the electrical vias 126.” Liu, [4].</p> <p>“Therefore, the present invention uses the solder materials 128 of the transfer plate 120 to pass through the electrical vias 126 and bond the bonding pads 117 of the first semiconductor package 110 with the external terminals 137 of the second semiconductor package 130, thereby achieving the effect of multi-package stacking.” Liu, [4].</p>
--	--

	<p>“Preferably, the height of the solder materials 128 protruding from the lower connecting pads 125 of the transfer plate 120 is no less than the height protruding from the upper connecting pads 124 of the transfer plate 120.” Liu, [4].</p> <p>“Claim 1. A stacked multi-package structure, comprising: a first semiconductor package, comprising at least a substrate and a chip, the substrate having a first surface and a second surface, the first surface including a packaging area and a connecting the chip being disposed in the packaging area, and the connecting area having a plurality of bonding pads formed therein; area, a transfer plate (spacer) having an upper surface, a lower surface, and an opening, the opening corresponding to the chip of the first semiconductor package, the transfer plate comprising: • • • a plurality of upper connecting pads formed on the upper surface of the transfer plate; a plurality of lower connecting pads formed on the lower surface of the transfer plate; a plurality of electrical vias penetrating through the upper connecting pads and the lower connecting pads and having a metal layer formed therein; and a plurality of solder materials formed within the electrical vias and protruding from the upper connecting pads and the lower connecting pads of the transfer plate; and a second semiconductor package having a plurality of external terminals; wherein the solder materials of the transfer plate bond the bonding pads of the first semiconductor package and the external terminals of the second semiconductor package.” Liu, [6].</p> <p>“Claim 16. The transfer plate as described in Claim 15, suitable for a stacked multi-package structure, wherein the sidewall metal layer extends to cover the peripheral edges of the corresponding electrical vias at both the first surface and the second surface, to facilitate the protruding formation of the solder materials.” Liu, [7].</p>

Liu, FIG. 1.

To the extent Plaintiff contends that Liu fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

U.S. Patent Publication No. 5334804 (“Love”) is titled Wire Interconnect Structures for Connecting an Integrated Circuit to a Substrate and lists David G. Love, Larry L. Moresco, William T. Chou, David A. Horine, Connie M. Wong, and Solomon I. Beilin as inventors. Love is assigned to Fujitsu Limited. Love anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Love is a U.S. patent that was filed November 17, 1992. Love is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Love, or otherwise rendered obvious by disclosures and teachings of Love, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Love does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Love with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Love, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Love “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Love or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Love set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Love discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“The present invention recognizes that these problems experienced in the prior art may be addressed by an interconnect structure having a substrate with a plurality of electrically conductive posts mechanically mounted vertically to the surface of the supporting substrate. The present invention further recognizes that the effects of thermal mechanical stress may be reduced by having a large aspect ratio for each post and by having means disposed at one or both ends of each post for de-concentrating the mechanical stress and strain developed along the body of the post. The present invention further recognizes that the substrate may be the</p>

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>supporting substrate or may be an intermediate substrate which is interposed between the IC chip and a major supporting substrate. In the latter case, electrically conductive posts are disposed on both surfaces of the intermediate interposer substrate. Additionally, the present invention recognizes that such a structure is more reliable than the C4 and UNIAX processes and has the potential of being mass produced at costs lower than those associated with the BIP process.” Love, [4:50-5:3].</p> <p>“FIG. 5 is a cross-sectional view of a second embodiment of the wire interconnect structure according to the present invention, which has been given the general reference designation of 200. The embodiment is referred to as wire interconnect structure 200 and is for electrically coupling a major substrate 90 to integrated circuit chip 70', as shown in FIG. 5. Wire interconnect structure 200 may be used for coupling electrical signals and power between major substrate 90 and IC chip 70'. Wire interconnect structure 200 comprises an interconnect substrate 212 disposed intermediate between major substrate 90 and IC chip 70', and having a first surface 213 and a second surface 214. Interconnect substrate 212 is also referred to as an interposer substrate or an intermediate substrate because it is disposed between substrate 90 and chip 70'. Wire interconnect structure 200 further comprises a first interconnect column 15a on surface 213 constructed according to the first embodiment of the present invention shown in FIGS. 1-3, and a second interconnect column 15b on surface 214, also constructed according to the first embodiment of the present invention.” Love, [12:4-12:25].</p>
--	--

Love, FIG. 5

Love discloses, either expressly or inherently, a bottom package substrate.

See, e.g.:

“FIG. 5 is a cross-sectional view of a second embodiment of the wire interconnect structure according to the present invention, which has been given the general reference designation of 200. The embodiment is referred to as wire interconnect structure 200 and is for electrically coupling a major substrate 90 to integrated circuit chip 70', as shown in FIG. 5. Wire

interconnect structure 200 may be used for coupling electrical signals and power between major substrate 90 and IC chip 70'. Wire interconnect structure 200 comprises an interconnect substrate 212 disposed intermediate between major substrate 90 and IC chip 70', and having a first surface 213 and a second surface 214." Love, [12:4-12:16].

FIG. 5

Love, FIG. 5

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>“First interconnect column 15a is disposed on first surface 213 of substrate 212 such that its bottom end 17 and base pad 20 are mounted to surface 213. First interconnect column 15a is for making contact to IC chip 70'. In a similar manner, second interconnect column 15b is disposed on second surface 214 of substrate 212, such that its bottom end 17 and base pad 20 are mounted to second surface 214. Second interconnect column 15b is for making contact to major substrate 90.” Love, [12:34-12:41].</p> <p>“As indicated above, not all of the interconnect columns 15a and 15b may have the same height, and integrated circuit chip 70' may be warped. Substrate 212 and major substrate 90 may each also be warped, usually each on the order of 2 microns or less, measured from low point to high point. As such, there may be one or more interconnect columns in an array of such columns which does not fully contact either integrated circuit chip 70' or major substrate 90. Such a case in which contact is not made to either of chip 70' and substrate 90 is shown by two interconnect columns 15e and 15f in FIG. 5, as an example. Two gaps 231 and 232 are shown between interconnect column 15e and IC chip 70' and between interconnect column 15f and major substrate 90, respectively. However, as described above with reference to interconnect structure 10, the initial 5 micron height of bump 80 is generally sufficiently high to make electrical contact to an interconnect column which does not physically make contact to its corresponding substrate or IC chip.” Love, [13:41-13:60].</p> <p>To the extent Plaintiff contends that Love fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Love discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p>

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p><i>See, e.g.:</i></p> <p>“As a practical matter, integrated circuit chip 70' may have a surface which is warped, with a typical maximum deviation of approximately 2 microns from low point to high point. As such, not every interconnect column 15 will make contact to the surface of integrated circuit chip 70'. However, generally at least three of the interconnect structures will contact the surface of integrated circuit chip 70'. Given that the maximum warpage of the surface of chip 70' is approximately 2 microns and that the variation in height of interconnect columns 15 is approximately 2 microns, there is a possibility that one or more of the interconnect columns 15 may be spaced approximately 4 microns away from the surface of chip 70' after the contacting process is completed. However, bump 80 is typically at least 5 microns high and is able to contact its corresponding interconnect structure 10 and form a bond thereto should such a gap exist between the interconnect column and chip 70'. As bump 80 is made from a conductive material, an electrical signal is able to be transmitted between interconnect structure 10 and chip 70' even if interconnect column 15 does not physically touch the surface of chip 70' (e.g., pad 75). It may be appreciated that bumps of solder material can be formed up to a height of 75 microns so that contact can be made if the spacing between chip 70' and an interconnect structure 10 is greater than 5 microns.” Love, [11:4-11:30].</p> <p>“In the embodiments of the present invention in which bumps 80 comprise a metal, such as indium, bismuth, gallium, tin, lead, or their alloys, the surface tension of bump 80, when molten, aids in bringing the array of bumps 80 into alignment with array 100. Under reflow conditions, each of the metal bumps 80 seeks a minimum surface area around the corresponding interconnect column 15 of the wire interconnect array 100 as it flows around the structure, the minimum surface area being achieved when the bump is symmetrically disposed around the top end of its corresponding column 15. The surface tension of each</p>
--	--

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>bump surface applies a force between its respective IC chip pad and its corresponding interconnect column 15 in a direction which causes the bump to be symmetrically positioned around its corresponding interconnect column. As such, any misalignment that may occur in positioning IC chip 70' over array 100 before the heat-bonding process will be corrected, or minimized, by the surface tension forces as long as there is an initial contact of a few bumps with their corresponding interconnect structures. Depending upon the material of bump 80 and the size and geometry of the interconnect structure, the surface tension forces can be significant, and may be quite large in comparison to the gravitational force applied to chip 70' during the heat-bonding process.” Love, [11:32-11:56].</p> <p>“FIG. 5 is a cross-sectional view of a second embodiment of the wire interconnect structure according to the present invention, which has been given the general reference designation of 200. The embodiment is referred to as wire interconnect structure 200 and is for electrically coupling a major substrate 90 to integrated circuit chip 70', as shown in FIG. 5. Wire interconnect structure 200 may be used for coupling electrical signals and power between major substrate 90 and IC chip 70'. Wire interconnect structure 200 comprises an interconnect substrate 212 disposed intermediate between major substrate 90 and IC chip 70', and having a first surface 213 and a second surface 214.” Love, [12:4-12:16].</p>

<p>[1.D] the spacer connector comprises a core substrate;</p>	<p>Love discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Wire interconnect structure 200 comprises an interconnect substrate 212 disposed intermediate between major substrate 90 and IC chip 70', and having a first surface 213 and a second surface 214. Interconnect substrate 212 is also referred to as an interposer substrate or an intermediate substrate because it is disposed between substrate 90 and chip 70'. Wire interconnect structure 200 further comprises a first interconnect column 15a on surface 213 constructed according to the first embodiment of the present invention shown in FIGS. 1-3, and a second interconnect column 15b on surface 214, also constructed according to the first embodiment of the present invention.” Love, [12:13-12:25].</p>
--	--

	<p>Love, FIG. 5</p> <p>“Interconnect structure 200 further comprises a coupling means for electrically coupling first interconnect column 15a to second interconnect column 15b. In a preferred embodiment of the present invention, the coupling means comprises a through hole 220 passing through substrate 212 between first surface 213 and second surface 214, which is filled with a plug of conductive material 224. Through hole 220 includes a first end 221 next to base pad 20 and bottom end 17 of interconnect column 15a, and a second end 222 next to the base pad 20 and bottom end 17 of second interconnect column 15b. Plug 224 preferably comprises a metal, such as copper, or metal alloy which is formed within through hole 220. Plug 224 makes electrical contact to corresponding pads 20 of each of interconnect columns 15a and 15b and forms a conductive path therebetween, thereby electrically coupling columns 15a and 15b to one another.” Love, [12:42-12:59].</p> <p>“Interconnect substrate 212 may have a thickness in the range of 100 microns to 2,000 microns, with a value of 250 microns being presently preferred. Additionally, substrate 212 is formed from a non-conductive material and is preferably rigid. For example, substrate 212 may comprise a ceramic material, alumina, a glass material, sapphire, or a composite of polyimide and a rigid material. Through hole 220 is preferably circular in cross-section (as seen from the top plan view of substrate 212), and preferably has a diameter in the range of 12 microns to 50 microns. In one embodiment of interconnect structure 200, through hole 220 has a diameter of approximately 25 microns. Through hole 220 may be formed through substrate 212 by such means as laser drilling, photo etching followed by chemical milling, or by punching techniques. Such techniques are well known to those skilled in the art. The preferred technique used will likely depend on the choice of substrate material.” Love, [12:60-13:11].</p>
--	--

“Flow diagram 300 begins at block 302 with starting substrate 212, which may be made of ceramic. At block 304, through hole 220 is formed through substrate 212 and then plated with conductive material 224. A partial cross-sectional view of substrate 212 showing through hole 220 after the processing of block 304 is shown at 304A in FIG. 6A-1. In order to more clearly show the features of the layers to be subsequently deposited on the surfaces of substrate 212, the horizontal dimension of substrate 212 has been relatively expanded in the drawings shown in the FIGS. 6A-6D and the dimensions of some features have been enlarged so as to make them more readily apparent in these Figures. Through hole 220 may be formed in substrate 212 by a number of methods known in the art as described above. Likewise, conductive material 224 may be formed by a number of methods known in the art. For a single wire interconnect structure 10, the formation of through hole 220 is not a requirement, but may be performed if it provides an advantage in arranging the signal traces on substrate 212 for a particular application.” Love, [14:17-14:37].

Love, FIG. 6A-1

“At block 306, a base pad 20 for each interconnect column 15a and 15b is formed. For each side of substrate 212, the following steps are performed. First, a seed layer of copper is sputtered on each surface of substrate 212. Preferably, the seed layer may comprise an initial

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>thin layer of chromium followed by a thin layer of copper (Cr/Cu), may comprise an initial thin layer of titanium followed by a thin layer of copper Ti/Cu), or may comprise a titanium-tungsten alloy layer (50%--50%) followed a layer of copper (Ti--W/Cu). Prior to depositing the seed layer, the surfaces of substrate 212 are cleaned well so as to activate these surfaces for the sputtered seed layer. Second, a photoresist (PR) layer is applied to each substrate side, and portions of the photoresist are removed where pads 20 are to be formed (e.g., exposing the photoresist to UV light through a mask and developing). This exposes the seed layer where pads 20 are to be formed. Third, copper is electroplated onto the exposed areas of the seed layer to a desired thickness, of for example ~1 micron, to form pads 20. The photoresist is then removed. The appearance of substrate 212 and pads 20 at the end of these steps is shown at a partial cross-section 306A of substrate 212 in FIG. 6A-2. A single wire interconnect structure 10 or a one-sided interconnect array 100 may be formed by only processing one side of substrate 212.” Love, [14:56-15:15].</p> <p>To the extent Plaintiff contends that Love fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Love discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Interconnect structure 200 further comprises a coupling means for electrically coupling first interconnect column 15a to second interconnect column 15b. For a single wire interconnect structure 10, the formation of through hole 220 is not a requirement, but may be performed if it provides an advantage in arranging the signal traces on substrate 212 for a particular application.” Love, [14:17-14:37].</p>
--	---

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>“In one embodiment of the method of the present invention, through hole 220 may be formed and plated with conductive material 224 by the following sequence of steps. First, conductive through holes 220 are formed by either laser drilling or chemical milling from one surface, e.g., the “top” surface. As a second step, a layer of conductive material, such as copper, is sputtered on the other surface, the “back surface” of substrate 212. This sputtered layer will provide a seed layer for a subsequent plating step. As a third step, a conductive material, such as copper, is formed within through holes 220 by electrolytic or electroless plating. As a fourth step, a non-conductive protective layer is deposited on the front surface to protect the through holes 220 from a subsequent etching step. As a fifth step, the metal layer on the back surface is removed by etching. Finally, the protective layer on the front surface is removed and the surfaces of substrate 212 may be mechanically lapped to provide planar surfaces.” Love, [14:38-14:55].</p> <p>To the extent Plaintiff contends that Love fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.F] a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars;</p>	<p>Love discloses, either expressly or inherently, a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.</p> <p><i>See, e.g.:</i></p> <p>“In a preferred embodiment of the present invention, interconnect column 15 further comprises a base pad 20 disposed between surface 13 and bottom end 17 of post 14. Base</p>

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	pad 20 is mounted to surface 13, and bottom end 17 of post 14 is mounted to base pad 20.” Love, [7:32-7:36].
--	---

	<p>Love, FIG. 5</p> <p>“Preferably, base pad 20 comprises a metallic material, such as copper, nickel, cobalt, gold, or palladium. As described below in greater detail, base pad 20 facilitates the construction of post 14 by electroless or electrolytic plating, and preferably the top layer of base pad 20 comprises the same material as that of post 14.” Love, [7:36-7:42].</p> <p>“As an option, interconnect structure 10 may include a wire trace 50 on surface 13 for connecting an electronic signal present within substrate 12 to wire interconnect column 15. This signal may, for example, be generated by circuitry within substrate 12 or connected to substrate 12 by another interconnect structure. Trace 50 is electrically coupled to base pad 20 of interconnect column 15 and, in turn, to post 14. As an equivalent, a via in substrate 12 may be used.” Love, [7:43-7:51].</p> <p>“Fillet 22 serves to de-concentrate any of the mechanical stress and strain at the junction of end 17 and base pad 20 that may occur when post 14 is flexed. For example, when a force parallel to surface 13 is applied to the right side of post 14 near top end 18 by chip 70, post 14 will flex such that end 18 is displaced towards the left of its resting point. When flexed in this manner, forces are transmitted to fillet 22 which distribute the forces over a larger area, thereby preventing bottom end 17 from detaching from base pad 20. The transmitted forces include compressive forces applied to fillet 22 at the top of fillet 22 at its left side near point 28 and to the bottom of fillet 22 at its right side near point 29, and tensile forces applied at the right top side and the bottom right side of fillet 22. As the transmitted forces are distributed over a larger area, fillet 22 comprises means for de-concentrating mechanical strain at bottom end 17 of post 14.” Love, [10:5-10:22].</p>
--	---

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>“In one embodiment of the present invention, base pad 20 of each interconnect columns 15a-15d is approximately 40 microns wide and the bottom end 17 is approximately 10 microns in diameter, thereby allowing a 15 micron misalignment error for each of interconnect columns 15a and 15b. Other, more complex structures for interconnecting columns 15a and 15b can be used. It is not intended that the present invention be limited to the use of through holes or opposing interconnect columns.” Love, [13:32-13:39].</p> <p>To the extent Plaintiff contends that Love fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.G] wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate,</p>	<p>Love discloses, either expressly or inherently, wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“First interconnect column 15a is disposed on first surface 213 of substrate 212 such that its bottom end 17 and base pad 20 are mounted to surface 213. First interconnect column 15a is for making contact to IC chip 70’. In a similar manner, second interconnect column 15b is disposed on second surface 214 of substrate 212, such that its bottom end 17 and base pad 20 are mounted to second surface 214.” Love, [12:34-12:41].</p> <p>“At block 317, portions of spacer layer 354 underlying post locations 358 are removed. This is may be done by reactive ion etching, other plasma etching processes, or wet etching processes. These portions of layer 354 are removed to expose respective areas of pads 20 upon which respective posts 14 are to be built. An etch process is selected such that relatively</p>

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>little aluminum (layer 356) is removed. Bottom ends 17 of posts 14 are to be mounted at these exposed areas of pads 20.” Love, [16:40-16:48].</p> <p>“At block 320, a conductive material, preferably copper, is deposited on the exposed areas of pads 20. This is preferably done by electroless plating both surfaces of substrate 212. The copper material is only deposited on the exposed surface of each base pad 20 and is not deposited on the top of polyimide layer 354. In this regard, layer 354 also functions as a plating mask. The copper material builds up from each base pad 20 in the corresponding via thereby forming the interior portion 24 of each post 14.” Love, [17:26-17:35].</p> <p>“Interconnect column 415 further comprises a peripheral edge 19 formed around bottom end 17 next to surface 413, and in particular the outer peripheral portions of base pad 20 and base pedestal 21.” Love, [19:61-19:64].</p> <p>“At block 726, portions of spacer layer 460 underlying post locations 464 are removed. This may be done by reactive ion etching, other plasma etching processes, or wet etching processes. These portions of layer 460 are removed to expose respective areas of base pedestals 21 upon which respective posts 14 are to be built. An etch process is selected such that relatively little aluminum (layer 462) is removed. Bottom ends 17 of posts 14 are to be mounted at these exposed areas of base pedestals 21.” Love, [23:55-23:64].</p>
--	--

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>“At block 730, a conductive material, preferably copper, is deposited on the exposed areas of pedestal 21. This may be done by electroless plating or electrolytic plating of substrate surface 413. The copper material is only deposited on the exposed surface of each base pedestal 21 and is not deposited on the top of spacer layer 460. In this regard, spacer layer 460 also functions as a plating mask. The copper material builds up from each base pedestal 21 in the corresponding via thereby forming the interior portion 24 of each post 14. Each post 14 builds up around its corresponding fillet 22, making contact to the fillet at its peripheral edge 19.” Love, [24:25-24:36].</p> <p>To the extent Plaintiff contends that Love fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.H] the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector,</p>	<p>Love discloses, either expressly or inherently, the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p>See, e.g.:</p> <p>“To communicate the signal present on trace 50 to circuitry on integrated circuit chip 70, post 14 is electrically and mechanically connected to integrated circuit 70 via a bump 80 of reflowable and electrically conductive material. (The term “connecting” used herein is intended to have the breadth of the term “coupling” and to mean all means by which elements such as post 14 and chip 70 may be electrically coupled and/or mechanically coupled to one another. For example, electrically connecting is intended to encompass a direct wire</p>

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>connection as well as a capacitive coupling between post 14 and IC chip 70, which may be provided by an element electrically and mechanically coupled between the two.) In one preferred embodiment of the present invention, bump 80 comprises a solder material, which is defined as a material which may be reflowed repeatedly and at a relatively low temperature in comparison to the melting temperature of post 14.” Love, [7:52-8:2].</p> <p>“To couple post 14 to bump 80, both post 14 and bump 80 are heated to a temperature which causes the material of bump 80 to become reflowable, in the case of a solder material, or pliable, in the case of a polymer material. Post 14 preferably comprises a material having a higher melting or reflow temperature point than the material of bump 80. During this heating process, chip 70 and substrate 12 are brought in close proximity to one another such that bump 80 makes contact with top end 18 of post 14. Light pressure, on the order of the weight of integrated circuit chip 70 (for example less than 0.5 N/cm.sup.2), is applied between substrate 12 and chip 70 during the contact process. Preferably, the heating process is performed in a forming gas atmosphere, such as 4% to 10% hydrogen in nitrogen, at a temperature exceeding the melting point of the material of bump 80. Once the melting temperature of the material of bump 80 is reached, bump 80 begins to reflow around post 14 near top end 18. Once reflowed, the temperature of substrate 12 and integrated circuit 70 is lowered to cause bump 80 to solidify around post 14, thereby making electrical mechanical coupling thereto.” Love, [8:57-9:11].</p> <p>“As indicated above, when bump 80 is joined to interconnect column 15, bump 80 reflows around post 14, ending substantially at point 27. This is shown in FIG. 3, which shows a cross-section of wire interconnect structure 10, interconnect column 15, substrate 12 and IC chip 70 taken through a vertical plane lying along line 2--2 shown in FIG. 1. Bump 80 also reflows outwardly along the surface of IC chip 70. In one embodiment of the present invention, bump 80 comprises solder disposed on a circular conductive pad 75 of IC chip 70</p>
--	---

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>having a diameter of about 25 microns. Pad 75 is surrounded by material which does not readily wet to solder. A non-wettable ring is thereby formed around pad 75, which forces the solder material to have a certain height (i.e., ball limiting metalization). For a 25 micron circular pad, this height is approximately 5 microns. Bump 80 may be deposited on IC chip 70 using any of the following standard methods of bump deposition well known in the art: lift-off, subtractive, additive, or shadow-mask vapor deposition.” Love, [10:23-10:42].</p>
--	--

	<p>Love, FIG. 3</p> <p>“FIG. 4 is an isometric view of a wire interconnect structure comprising an array of interconnect columns, each interconnect column in the array being the same as interconnect column 15 shown in FIGS. 1 and 2 with the exception that the corresponding electrical trace 50 for each structure is not necessarily oriented in the same direction as that shown in FIGS. 1 and 2. The wire interconnect array has been given the general reference designation of 100 in FIG. 4. Wire interconnect array 100 comprises a plurality of interconnect columns 15 disposed on substrate 12. Using present technology, these interconnect structures may be spaced as close as 30 microns to one another, a distance which may be substantially less than their height. Also shown in FIG. 4 is an integrated circuit chip 70' having a plurality of bumps 80. The plurality of bumps 80 are configured in a “mirrored” array corresponding to array 100 such that each bump is in a generally confronting and corresponding relationship to a respective interconnect column 15. The interconnect columns 15 are bonded to their respective bumps 80 with the above-described heat-reflow process after first being brought into registration by known means.” Love, [10:47-11:2].</p>
--	---

Love, FIG. 4

“FIG. 5 is a cross-sectional view of a second embodiment of the wire interconnect structure according to the present invention, which has been given the general reference designation of 200. The embodiment is referred to as wire interconnect structure 200 and is for electrically coupling a major substrate 90 to integrated circuit chip 70', as shown in FIG. 5. Wire interconnect structure 200 may be used for coupling electrical signals and power between major substrate 90 and IC chip 70'. Wire interconnect structure 200 comprises an interconnect substrate 212 disposed intermediate between major substrate 90 and IC chip 70', and having a first surface 213 and a second surface 214. Interconnect substrate 212 is also referred to as an interposer substrate or an intermediate substrate because it is disposed between substrate 90 and chip 70'. Wire interconnect structure 200 further comprises a first interconnect column 15a on surface 213 constructed according to the first embodiment of the present invention shown in FIGS. 1-3, and a second interconnect column 15b on surface 214, also constructed

according to the first embodiment of the present invention. Each of the interconnect columns 15a and 15b comprises a post 14 with elongated body 16 and ends 17 and 18, a base pad 20, a fillet 22, and a peripheral edge 19, as described above.” Love, [12:4-12:28].

FIG. 5

Love, FIG. 5

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>“Interconnect structure 200 further comprises a coupling means for electrically coupling first interconnect column 15a to second interconnect column 15b. In a preferred embodiment of the present invention, the coupling means comprises a through hole 220 passing through substrate 212 between first surface 213 and second surface 214, which is filled with a plug of conductive material 224. Through hole 220 includes a first end 221 next to base pad 20 and bottom end 17 of interconnect column 15a, and a second end 222 next to the base pad 20 and bottom end 17 of second interconnect column 15b. Plug 224 preferably comprises a metal, such as copper, or metal alloy which is formed within through hole 220. Plug 224 makes electrical contact to corresponding pads 20 of each of interconnect columns 15a and 15b and forms a conductive path therebetween, thereby electrically coupling columns 15a and 15b to one another.” Love, [12:42-12:59].</p> <p>To the extent Plaintiff contends that Love fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.I] the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and</p>	<p>Love discloses, either expressly or inherently, the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p>See, e.g.:</p> <p>“FIG. 5 is a cross-sectional view of a second embodiment of the wire interconnect structure according to the present invention, which has been given the general reference designation of 200. The embodiment is referred to as wire interconnect structure 200 and is for electrically coupling a major substrate 90 to integrated circuit chip 70’, as shown in FIG. 5. Wire</p>

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>interconnect structure 200 may be used for coupling electrical signals and power between major substrate 90 and IC chip 70'. Wire interconnect structure 200 comprises an interconnect substrate 212 disposed intermediate between major substrate 90 and IC chip 70', and having a first surface 213 and a second surface 214." Love, [12:4-12:16].</p> <p>"Wire interconnect structure 200 further comprises a first interconnect column 15a on surface 213 constructed according to the first embodiment of the present invention shown in FIGS. 1-3, and a second interconnect column 15b on surface 214, also constructed according to the first embodiment of the present invention. Each of the interconnect columns 15a and 15b comprises a post 14 with elongated body 16 and ends 17 and 18, a base pad 20, a fillet 22, and a peripheral edge 19, as described above. Additionally, post 14 comprises an interior portion 24, a coating layer 25, and an oxide layer 26, all as described above. The reference numerals used in describing interconnect column 15 shown in FIGS. 1-3 have been used for interconnect columns 15a and 15b of FIG. 5. First interconnect column 15a is disposed on first surface 213 of substrate 212 such that its bottom end 17 and base pad 20 are mounted to surface 213. First interconnect column 15a is for making contact to IC chip 70'. In a similar manner, second interconnect column 15b is disposed on second surface 214 of substrate 212, such that its bottom end 17 and base pad 20 are mounted to second surface 214. Second interconnect column 15b is for making contact to major substrate 90. Interconnect structure 200 further comprises a coupling means for electrically coupling first interconnect column 15a to second interconnect column 15b." Love, [12:19-12:44].</p>
--	---

Love, FIG. 1

“In a preferred embodiment of the present invention, the coupling means comprises a through hole 220 passing through substrate 212 between first surface 213 and second surface 214, which is filled with a plug of conductive material 224. Through hole 220 includes a first end 221 next to base pad 20 and bottom end 17 of interconnect column 15a, and a second end 222 next to the base pad 20 and bottom end 17 of second interconnect column 15b. Plug 224 preferably comprises a metal, such as copper, or metal alloy which is formed within through hole 220. Plug 224 makes electrical contact to corresponding pads 20 of each of interconnect columns 15a and 15b and forms a conductive path therebetween, thereby electrically coupling columns 15a and 15b to one another.” Love, [12:44-12:59].

“Also in a preferred embodiment of interconnect structure 200, the posts of interconnect columns 15a and 15b are disposed substantially opposite to one another at respective opposite

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>ends of through hole 220 to facilitate the electrical connection therebetween. However, it may be appreciated that the interconnect columns may be somewhat offset from an exact opposing relationship, as shown, for example, by two interconnect columns 15c and 15d in FIG. 5. Interconnect column 15c is disposed on surface 213 and interconnect column 15d is disposed on surface 214. Interconnect columns 15c and 15d are disposed at opposite ends of a through hole 220a, with an offset 230 in the placement of interconnect column 15d. Such an offset may occur during the construction of interconnect column 15d. As described below in greater detail, photo-lithographic steps applied separately to surfaces 213 and 214 of substrate 212 may be used to form interconnect columns 15c and 15d. The use of separate photo-lithographic steps is susceptible to alignment errors, which may give rise to offset 230. In one embodiment of the present invention, base pad 20 of each interconnect columns 15a-15d is approximately 40 microns wide and the bottom end 17 is approximately 10 microns in diameter, thereby allowing a 15 micron misalignment error for each of interconnect columns 15a and 15b. Other, more complex structures for interconnecting columns 15a and 15b can be used. It is not intended that the present invention be limited to the use of through holes or opposing interconnect columns.” Love, [13:12-13:39].</p>
--	--

	<p>Love, FIG. 5</p> <p>“At block 304, through hole 220 is formed through substrate 212 and then plated with conductive material 224. A partial cross-sectional view of substrate 212 showing through hole 220 after the processing of block 304 is shown at 304A in FIG. 6A-1. In order to more clearly show the features of the layers to be subsequently deposited on the surfaces of substrate 212, the horizontal dimension of substrate 212 has been relatively expanded in the drawings shown in the FIGS. 6A-6D and the dimensions of some features have been enlarged so as to make them more readily apparent in these Figures. Through hole 220 may be formed in substrate 212 by a number of methods known in the art as described above. Likewise, conductive material 224 may be formed by a number of methods known in the art. For a single wire interconnect structure 10, the formation of through hole 220 is not a requirement, but may be performed if it provides an advantage in arranging the signal traces on substrate 212 for a particular application. In one embodiment of the method of the present invention, through hole 220 may be formed and plated with conductive material 224 by the following sequence of steps.” Love, [14:18-14:41].</p> <p>“At block 306, a base pad 20 for each interconnect column 15a and 15b is formed. For each side of substrate 212, the following steps are performed. First, a seed layer of copper is sputtered on each surface of substrate 212. Preferably, the seed layer may comprise an initial thin layer of chromium followed by a thin layer of copper (Cr/Cu), may comprise an initial thin layer of titanium followed by a thin layer of copper Ti/Cu), or may comprise a titanium-tungsten alloy layer (50%--50%) followed a layer of copper (Ti--W/Cu). Prior to depositing the seed layer, the surfaces of substrate 212 are cleaned well so as to activate these surfaces for the sputtered seed layer. Second, a photoresist (PR) layer is applied to each substrate side, and portions of the photoresist are removed where pads 20 are to be formed (e.g., exposing the photoresist to UV light through a mask and developing). This exposes the seed layer</p>
--	---

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>where pads 20 are to be formed. Third, copper is electroplated onto the exposed areas of the seed layer to a desired thickness, of for example, about 1 micron, to form pads 20. The photoresist is then removed. The appearance of substrate 212 and pads 20 at the end of these steps is shown at a partial cross-section 306A of substrate 212 in FIG. 6A-2. A single wire interconnect structure 10 or a one-sided interconnect array 100 may be formed by only processing one side of substrate 212. The copper plug 224 in through hole 220 and pads 20 on the surfaces of substrate 212 collectively comprise an electrical conductive path from a first area (i.e., pad 20) on surface 213 to a second area (i.e., pad 20) on surface 214.” Love, [14:56-15:20].</p>

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Love discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“As a practical matter, integrated circuit chip 70' may have a surface which is warped, with a typical maximum deviation of approximately 2 microns from low point to high point. As such, not every interconnect column 15 will make contact to the surface of integrated circuit chip 70'. However, generally at least three of the interconnect structures will contact the surface of integrated circuit chip 70'. Given that the maximum warpage of the surface of chip 70' is approximately 2 microns and that the variation in height of interconnect columns 15 is approximately 2 microns, there is a possibility that one or more of the interconnect columns 15 may be spaced approximately 4 microns away from the surface of chip 70' after the contacting process is completed. However, bump 80 is typically at least 5 microns high and is able to contact its corresponding interconnect structure 10 and form a bond thereto should</p>

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>such a gap exist between the interconnect column and chip 70'. As bump 80 is made from a conductive material, an electrical signal is able to be transmitted between interconnect structure 10 and chip 70' even if interconnect column 15 does not physically touch the surface of chip 70' (e.g., pad 75). It may be appreciated that bumps of solder material can be formed up to a height of 75 microns so that contact can be made if the spacing between chip 70' and an interconnect structure 10 is greater than 5 microns." Love, [11:4-11:30].</p>
--	---

	<p>Love, FIG. 5</p> <p>“In the embodiments of the present invention in which bumps 80 comprise a metal, such as indium, bismuth, gallium, tin, lead, or their alloys, the surface tension of bump 80, when molten, aids in bringing the array of bumps 80 into alignment with array 100. Under reflow conditions, each of the metal bumps 80 seeks a minimum surface area around the corresponding interconnect column 15 of the wire interconnect array 100 as it flows around the structure, the minimum surface area being achieved when the bump is symmetrically disposed around the top end of its corresponding column 15. The surface tension of each bump surface applies a force between its respective IC chip pad and its corresponding interconnect column 15 in a direction which causes the bump to be symmetrically positioned around its corresponding interconnect column. As such, any misalignment that may occur in positioning IC chip 70' over array 100 before the heat-bonding process will be corrected, or minimized, by the surface tension forces as long as there is an initial contact of a few bumps with their corresponding interconnect structures. Depending upon the material of bump 80 and the size and geometry of the interconnect structure, the surface tension forces can be significant, and may be quite large in comparison to the gravitational force applied to chip 70' during the heat-bonding process.” Love, [11:32-11:56].</p> <p>To the extent Plaintiff contends that Love fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

Claim Limitation	Disclosure
<p>[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p>	<p>Love discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 4 is an isometric view of a wire interconnect structure comprising an array of interconnect columns, each interconnect column in the array being the same as interconnect column 15 shown in FIGS. 1 and 2 with the exception that the corresponding electrical trace 50 for each structure is not necessarily oriented in the same direction as that shown in FIGS. 1 and 2. The wire interconnect array has been given the general reference designation of 100 in FIG. 4. Wire interconnect array 100 comprises a plurality of interconnect columns 15 disposed on substrate 12. Using present technology, these interconnect structures may be spaced as close as 30 microns to one another, a distance which may be substantially less than their height. Also shown in FIG. 4 is an integrated circuit chip 70' having a plurality of bumps 80. The plurality of bumps 80 are configured in a “mirrored” array corresponding to array 100 such that each bump is in a generally confronting and corresponding relationship to a respective interconnect column 15.” Love, [10:47-10:66].</p>

Love, FIG. 4

“The interconnect columns 15 are bonded to their respective bumps 80 with the above-described heat-reflow process after first being brought into registration by known means.”
Love, [10:66-11:2].

“In the embodiments of the present invention in which bumps 80 comprise a metal, such as indium, bismuth, gallium, tin, lead, or their alloys, the surface tension of bump 80, when molten, aids in bringing the array of bumps 80 into alignment with array 100. Under reflow conditions, each of the metal bumps 80 seeks a minimum surface area around the corresponding interconnect column 15 of the wire interconnect array 100 as it flows around

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>the structure, the minimum surface area being achieved when the bump is symmetrically disposed around the top end of its corresponding column 15.” Love, [11:32-11:41].</p> <p>“Also in a preferred embodiment of interconnect structure 200, the posts of interconnect columns 15a and 15b are disposed substantially opposite to one another at respective opposite ends of through hole 220 to facilitate the electrical connection therebetween.” Love, [13:12-13:16].</p>
--	---

FIG. 5

	<p>Love, FIG. 5</p> <p>“However, it may be appreciated that the interconnect columns may be somewhat offset from an exact opposing relationship, as shown, for example, by two interconnect columns 15c and 15d in FIG. 5. Interconnect column 15c is disposed on surface 213 and interconnect column 15d is disposed on surface 214. Interconnect columns 15c and 15d are disposed at opposite ends of a through hole 220a, with an offset 230 in the placement of interconnect column 15d. Such an offset may occur during the construction of interconnect column 15d. As described below in greater detail, photo-lithographic steps applied separately to surfaces 213 and 214 of substrate 212 may be used to form interconnect columns 15c and 15d. The use of separate photo-lithographic steps is susceptible to alignment errors, which may give rise to offset 230. In one embodiment of the present invention, base pad 20 of each interconnect columns 15a-15d is approximately 40 microns wide and the bottom end 17 is approximately 10 microns in diameter, thereby allowing a 15 micron misalignment error for each of interconnect columns 15a and 15b.” Love, [13:16-13:36].</p> <p>“A single wire interconnect structure 10 or a one-sided interconnect array 100 may be formed by only processing one side of substrate 212. The copper plug 224 in through hole 220 and pads 20 on the surfaces of substrate 212 collectively comprise an electrical conductive path from a first area (i.e., pad 20) on surface 213 to a second area (i.e., pad 20) on surface 214. It may be further appreciated that the above steps for forming through hole 220 and pads 20 collectively comprise a means for forming such an electrically conductive path. At block 308, substrate 212 is prepared for the formation of fillet rings for fillets 22. At block 308, a layer 350 of photoresist is spun on each side (surface) of substrate 212. Next, a portion of layer 350 is removed over each base pad 20 where the fillets 22 are to be formed.” Love, [15:12-15:28].</p>
--	---

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>To the extent Plaintiff contends that Love fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Love discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“In a preferred embodiment of the present invention, the material of post 14 comprises copper. In a preferred embodiment of the present invention, top end 18 has a substantially flat surface which is substantially co-planar with surface 13. Also in a preferred embodiment, the body 16 of each post 14 of structure 10 is substantially circular in a cross-sectional plane co-planar with the surface of its top end 18.” Love, [7:3-7:11].</p> <p>“To couple post 14 to bump 80, both post 14 and bump 80 are heated to a temperature which causes the material of bump 80 to become reflowable, in the case of a solder material, or</p>

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>pliable, in the case of a polymer material. Post 14 preferably comprises a material having a higher melting or reflow temperature point than the material of bump 80. During this heating process, chip 70 and substrate 12 are brought in close proximity to one another such that bump 80 makes contact with top end 18 of post 14. Light pressure, on the order of the weight of integrated circuit chip 70 (for example less than 0.5 N/cm.sup.2), is applied between substrate 12 and chip 70 during the contact process. Preferably, the heating process is performed in a forming gas atmosphere, such as 4% to 10% hydrogen in nitrogen, at a temperature exceeding the melting point of the material of bump 80. Once the melting temperature of the material of bump 80 is reached, bump 80 begins to reflow around post 14 near top end 18. Once reflowed, the temperature of substrate 12 and integrated circuit 70 is lowered to cause bump 80 to solidify around post 14, thereby making electrical mechanical coupling thereto." Love, [8:57-9:11].</p> <p>"FIG. 2 is a cross-sectional view of the wire interconnect structure shown in FIG. 1 taken along a vertical plane passing through the line 2--2 shown in FIG. 1. The reference numerals used in FIG. 1 are also used to show the same items in FIG. 2. FIG. 2 shows the features of post 14 in greater detail. In one embodiment of the present invention, post 14 further comprises an interior portion 24 of copper, a coating layer 25 of nickel surrounding interior portion 24, and a nickel oxide layer 26 disposed on nickel layer 25. Layer 25 may typically have a thickness of approximately one micron or less, and oxide layer 26 may have a thickness in the range of 0.1 microns to 0.2 microns. The thicknesses of these layers have been relatively enlarged in the Figures so that these layers may be more clearly shown. Nickel oxide layer 26 extends in the direction of elongation of body 16 from a point 28 near bottom end 17 of post 14 to a point 27 near top end 18 of post 14. As seen in FIG. 1, each of points 27 and 28 is intermediate between bottom end 17 and top end 18 of post 14, with point 28 being intermediate between point 27 and bottom end 17." Love, [9:12-9:32].</p>
--	--

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>“FIG. 3, which shows a cross-section of wire interconnect structure 10, interconnect column 15, substrate 12 and IC chip 70 taken through a vertical plane lying along line 2--2 shown in FIG. 1. Bump 80 also reflows outwardly along the surface of IC chip 70. In one embodiment of the present invention, bump 80 comprises solder disposed on a circular conductive pad 75 of IC chip 70 having a diameter of about 25 microns. Pad 75 is surrounded by material which does not readily wet to solder. A non-wettable ring is thereby formed around pad 75, which forces the solder material to have a certain height (i.e., ball limiting metalization). For a 25 micron circular pad, this height is approximately 5 microns. Bump 80 may be deposited on IC chip 70 using any of the following standard methods of bump deposition well known in the art: lift-off, subtractive, additive, or shadow-mask vapor deposition.” Love, [10:25-10:42].</p>
--	--

	<p>Love, FIG. 3</p> <p>“FIG. 5 is a cross-sectional view of a second embodiment of the wire interconnect structure according to the present invention, which has been given the general reference designation of 200. The embodiment is referred to as wire interconnect structure 200 and is for electrically coupling a major substrate 90 to integrated circuit chip 70’, as shown in FIG. 5. Wire interconnect structure 200 may be used for coupling electrical signals and power between major substrate 90 and IC chip 70’. Wire interconnect structure 200 comprises an interconnect substrate 212 disposed intermediate between major substrate 90 and IC chip 70’, and having a first surface 213 and a second surface 214. Interconnect substrate 212 is also referred to as an interposer substrate or an intermediate substrate because it is disposed between substrate 90 and chip 70’. Wire interconnect structure 200 further comprises a first interconnect column 15a on surface 213 constructed according to the first embodiment of the present invention shown in FIGS. 1-3, and a second interconnect column 15b on surface 214, also constructed according to the first embodiment of the present invention. Each of the interconnect columns 15a and 15b comprises a post 14 with elongated body 16 and ends 17 and 18, a base pad 20, a fillet 22, and a peripheral edge 19, as described above. Additionally, post 14 comprises an interior portion 24, a coating layer 25, and an oxide layer 26, all as described above. The reference numerals used in describing interconnect column 15 shown in FIGS. 1-3 have been used for interconnect columns 15a and 15b of FIG. 5. First interconnect column 15a is disposed on first surface 213 of substrate 212 such that its bottom end 17 and base pad 20 are mounted to surface 213. First interconnect column 15a is for making contact to IC chip 70’. In a similar manner, second interconnect column 15b is disposed on second surface 214 of substrate 212, such that its bottom end 17 and base pad 20 are mounted to second surface 214. Second interconnect column 15b is for making contact to major substrate 90. Interconnect structure 200 further comprises a coupling means for electrically coupling first interconnect column 15a to second interconnect column 15b. In a preferred embodiment of</p>
--	---

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>the present invention, the coupling means comprises a through hole 220 passing through substrate 212 between first surface 213 and second surface 214, which is filled with a plug of conductive material 224. Through hole 220 includes a first end 221 next to base pad 20 and bottom end 17 of interconnect column 15a, and a second end 222 next to the base pad 20 and bottom end 17 of second interconnect column 15b. Plug 224 preferably comprises a metal, such as copper, or metal alloy which is formed within through hole 220. Plug 224 makes electrical contact to corresponding pads 20 of each of interconnect columns 15a and 15b and forms a conductive path therebetween, thereby electrically coupling columns 15a and 15b to one another.” Love, [12:4-12:59].</p>
--	--

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>Love, FIG. 5</p> <p>“Also in a preferred embodiment of interconnect structure 200, the posts of interconnect columns 15a and 15b are disposed substantially opposite to one another at respective opposite ends of through hole 220 to facilitate the electrical connection therebetween. However, it may be appreciated that the interconnect columns may be somewhat offset from an exact opposing relationship, as shown, for example, by two interconnect columns 15c and 15d in FIG. 5. Interconnect column 15c is disposed on surface 213 and interconnect column 15d is disposed on surface 214. Interconnect columns 15c and 15d are disposed at opposite ends of a through hole 220a, with an offset 230 in the placement of interconnect column 15d.” Love, [13:12-13:25].</p> <p>To the extent Plaintiff contends that Love fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to the bottom end of a corresponding metal pillar among the plurality of metal pillars,</p>	<p>Love discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom</p>

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

<p>the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“In a preferred embodiment of the present invention, interconnect column 15 further comprises a base pad 20 disposed between surface 13 and bottom end 17 of post 14. Base pad 20 is mounted to surface 13, and bottom end 17 of post 14 is mounted to base pad 20. Preferably, base pad 20 comprises a metallic material, such as copper, nickel, cobalt, gold, or palladium. As described below in greater detail, base pad 20 facilitates the construction of post 14 by electroless or electrolytic plating, and preferably the top layer of base pad 20 comprises the same material as that of post 14.” Love, [7:32-7:42].</p> <p>“This aids in the above-described alignment of chip 70' and array 100 by surface tension forces since it provides a large surface area for top end 18 while making it easier for post 14 to be flexed near the bottom of the post by the surface tension forces applied at top end 18. (The tapered shape, along with leverage effects, allows post 14 to flex more near the middle and bottom than the top.) Such flexing helps to bring an interconnect column 15 and its corresponding bump 80 into closer alignment in cases where they initially are not well centered (i.e., aligned). FIG. 5 is a cross-sectional view of a second embodiment of the wire interconnect structure according to the present invention, which has been given the general reference designation of 200. The embodiment is referred to as wire interconnect structure 200 and is for electrically coupling a major substrate 90 to integrated circuit chip 70', as shown in FIG. 5. Wire interconnect structure 200 may be used for coupling electrical signals and power between major substrate 90 and IC chip 70'. Wire interconnect structure 200 comprises an interconnect substrate 212 disposed intermediate between major substrate 90 and IC chip 70', and having a first surface 213 and a second surface 214. Interconnect</p>
---	---

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>substrate 212 is also referred to as an interposer substrate or an intermediate substrate because it is disposed between substrate 90 and chip 70'. Wire interconnect structure 200 further comprises a first interconnect column 15a on surface 213 constructed according to the first embodiment of the present invention shown in FIGS. 1-3, and a second interconnect column 15b on surface 214, also constructed according to the first embodiment of the present invention. Each of the interconnect columns 15a and 15b comprises a post 14 with elongated body 16 and ends 17 and 18, a base pad 20, a fillet 22, and a peripheral edge 19, as described above. Additionally, post 14 comprises an interior portion 24, a coating layer 25, and an oxide layer 26, all as described above. The reference numerals used in describing interconnect column 15 shown in FIGS. 1-3 have been used for interconnect columns 15a and 15b of FIG. 5. First interconnect column 15a is disposed on first surface 213 of substrate 212 such that its bottom end 17 and base pad 20 are mounted to surface 213. First interconnect column 15a is for making contact to IC chip 70'. In a similar manner, second interconnect column 15b is disposed on second surface 214 of substrate 212, such that its bottom end 17 and base pad 20 are mounted to second surface 214." Love, [11:60-12:41].</p>
--	---

	<p>Love, FIG. 5</p> <p>“Interconnect structure 200 further comprises a coupling means for electrically coupling first interconnect column 15a to second interconnect column 15b. In a preferred embodiment of the present invention, the coupling means comprises a through hole 220 passing through substrate 212 between first surface 213 and second surface 214, which is filled with a plug of conductive material 224. Through hole 220 includes a first end 221 next to base pad 20 and bottom end 17 of interconnect column 15a, and a second end 222 next to the base pad 20 and bottom end 17 of second interconnect column 15b. Plug 224 preferably comprises a metal, such as copper, or metal alloy which is formed within through hole 220. Plug 224 makes electrical contact to corresponding pads 20 of each of interconnect columns 15a and 15b and forms a conductive path therebetween, thereby electrically coupling columns 15a and 15b to one another.” Love, [12:42-12:59].</p> <p>“At block 306, a base pad 20 for each interconnect column 15a and 15b is formed. For each side of substrate 212, the following steps are performed. First, a seed layer of copper is sputtered on each surface of substrate 212. Preferably, the seed layer may comprise an initial thin layer of chromium followed by a thin layer of copper (Cr/Cu), may comprise an initial thin layer of titanium followed by a thin layer of copper Ti/Cu), or may comprise a titanium-tungsten alloy layer (50%--50%) followed a layer of copper (Ti--W/Cu). Prior to depositing the seed layer, the surfaces of substrate 212 are cleaned well so as to activate these surfaces for the sputtered seed layer. Second, a photoresist (PR) layer is applied to each substrate side, and portions of the photoresist are removed where pads 20 are to be formed (e.g., exposing the photoresist to UV light through a mask and developing). This exposes the seed layer where pads 20 are to be formed. Third, copper is electroplated onto the exposed areas of the seed layer to a desired thickness, of for example about 1 micron, to form pads 20. The photoresist is then removed. The appearance of substrate 212 and pads 20 at the end of these</p>
--	--

Appendix A-24 - Invalidity of U.S. Patent No. 9859202 in view of Love - U.S. Patent No. 5334804

	<p>steps is shown at a partial cross-section 306A of substrate 212 in FIG. 6A-2.” Love, [14:56-15:12].</p> <p>“In a preferred embodiment of the present invention, interconnect column 415 further comprises a base pad 20 and a base pedestal 21. Base pad 20 is mounted to surface 413 and disposed between surface 413 and base pedestal 21. Base pedestal 21 is mounted to base pad 20 and disposed between base pad 20 and bottom end 17 of post 14. Bottom end 17 of post 14 is mounted to base pedestal 21. Preferably, each of base pad 20 and base pedestal 21 comprises a metallic material, such as copper, nickel, cobalt, gold, or palladium.” Love, [19:24-19:33].</p> <p>“In a preferred embodiment of interconnect column 415, a fillet 22 of rigid material is disposed along peripheral edge 19. Fillet 22 preferably comprises a solder. An exemplary solder for fillet 22 is an alloy of tin and lead, such as 60/40 (tin/lead). Fillet 22 contacts the outer portions of base pad 20, outer portions of base pedestal 21, and portions of post 14 near bottom end 17, as shown in FIG. 7. Fillet 22 has an outside surface extending between post 14 and base pad 20 which may be “S”-shaped. Fillet 22 extends up post 14 from end 17 to substantially point 28. Fillet 22 extends outward from pedestal 21 onto base pad 20 to a point 29. Fillet 22 preferably is disposed in (i.e., fills in) the corner formed between pedestal 21 and base pad 20.” Love, [19:64-20:11].</p> <p>To the extent Plaintiff contends that Love fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-25 - Invalidity of U.S. Patent No. 9859202 in view of Muthukumar - U.S. Patent Publication No. 20130127054

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Muthukumar - U.S. Patent Publication No. 20130127054

U.S. Patent Publication No. 20130127054 (“Muthukumar”) is titled Stacked-Chip Packages in Package-on-Package Apparatus, Methods of Assembling Same, and Systems Containing Same and lists Sriram Muthukumar and Charles A. Gealer as inventors. Muthukumar anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Muthukumar is a U.S. patent publication that was filed January 14, 2013 and published May 23, 2013. Muthukumar claims priority to US 12/459,226 filed on June 26, 2009. Muthukumar is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Muthukumar, or otherwise rendered obvious by disclosures and teachings of Muthukumar, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Muthukumar does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Muthukumar with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Muthukumar, either alone or in combination with other prior art cited by Samsung and/or with the

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-25 - Invalidity of U.S. Patent No. 9859202 in view of Muthukumar - U.S. Patent Publication No. 20130127054

knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Muthukumar “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Muthukumar or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Muthukumar set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Muthukumar discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 a is a cross-section elevation of a mounting substrate and interposer apparatus 100 for a stacked-chip package according to an example embodiment. The apparatus 100 is depicted vertically (Z-direction) in exploded view including a package substrate 110 and an interposer 130. The package substrate 110 includes a die side 112 to accept a processor, and a land side 114 for coupling to outside communication such as a board. The “board” may be an external- or near-external structure for a hand-held device such as a wireless</p>

communicator. The package substrate 110 includes a bottom-chip footprint 116 on the die side 112. The bottom-chip footprint 116 may be ascertained in subsequent drawings disclosed herein by projecting illustrated processors on respective die sides of illustrated mounting substrates.” Muthukumar, [0021].

Fig. 1a

Muthukumar, Fig. 1a

“The apparatus 100 is assembled with the interposer 130 that mates to the die-side ball grid array 122. The interposer 130 includes a die side 132 and a top side 134 and has an offset height 136 configured to match an offset height 138 above the package substrate 110 for a multiple die stack (MDS) that will occupy the bottom-chip footprint 116. The interposer 130 may include a core 140 and interconnects 142. In an embodiment, die-side electrical bumps 144 and top-side electrical bumps 146 are coupled to the interconnects 142.” Muthukumar, [0026].

“The apparatus 101 illustrates that the interposer offset height 136 matches the package-substrate offset height 138 (FIG. 1 a). The bottom-chip footprint 116 is surrounded by the interposer 130 and will surround the multiple-die stack that is to be assembled as part of the apparatus 101.” Muthukumar, [0027].

“A bottom chip 150 is placed within the bottom-chip footprint 116 (FIG. 1 b). In an embodiment, the bottom chip 150 is a flip chip 150 that has been flip-chip bonded though a chip ball array, one electrical bump of which is referenced with numeral 152. In an embodiment, an underfill 154 has been flowed to fortify bonding between the bottom chip 150 and the package substrate 110. In a processing embodiment, reflow of the electrical bumps 152 is carried out during simultaneous curing of the underfill 154. In a processing embodiment, reflow of the electrical bumps 152 is carried out during simultaneous curing of the fill material 148.” Muthukumar, [0029].

Fig. 1b

	<p>Muthukumar, Fig. 1b</p> <p>“FIG. 1 e is a cross-section elevation of a package-on-package (PoP) stacked chip apparatus 104 that has assembled with the apparatus depicted in FIG. 1 d after further processing according to an example embodiment. The bottom chip 150 and the top chip 158 are set within the interposer offset 136 and a top package 164 has been mated to the top side 134 of the interposer 130. The top package 164 may have a mounting substrate 170 for communication to the bottom chip 150 and/or the top chip 158. The top package 164 is depicted as a wire-bond enabling solution such as for an original-equipment manufacturer. Two wire-bonded dice are depicted in the top package 164. A die located in the top package 164 may be referred to as a microelectronic device. In an embodiment, the mixed-stack apparatus 103 depicted in FIG. 1 d is provided to accommodate a top package 164 such as for a smart phone, where smart-phone specific microelectronic devices are in the top package 164 and support microelectronic devices are in the chip stack.” Muthukumar, [0035].</p>
--	--

Fig. 1e

Muthukumar, Fig. 1e

“It can be seen that the mixed stack of the bottom chip 150 and top chip 158 have been accommodated by the interposer offset 136 such that the top package 164 does not interfere with the mixed stack. Consequently, the PoP stacked-chip apparatus is assembled with sufficient interposer offset 136 to accommodate an offset height of the chip stack that may vary depending upon a specific application.” Muthukumar, [0037].

“FIG. 2 b is a cross-section elevation of a PoP stacked-chip apparatus 201 that has assembled from the apparatus depicted in FIG. 2 a after further processing according to an example embodiment. The bottom chip 250 and the top chip 258 are set within the interposer offset

236 and a top package 264 has been mated to the top side 234 of the interposer 230. The top package 264 may have a mounting substrate 270 for communication to the bottom chip 250 and/or the top chip 258. The top package is depicted as TSV enabling solution such as for an original-equipment manufacturer. In an embodiment, the chip stack apparatus 200 depicted in FIG. 2 a is provided to accommodate a top package 264 such as for a smart phone.” Muthukumar, [0044].

Muthukumar, Figs. 2a, 2b

“In an embodiment, the bottom chip 150 is a processor and the top chip 158 is a radio-frequency (RF) device.” Muthukumar, [0054].

Appendix A-25 - Invalidity of U.S. Patent No. 9859202 in view of Muthukumar - U.S. Patent Publication No. 20130127054

<p>[1.A] a bottom package substrate;</p>	<p>Muthukumar discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“A bottom chip 150 is placed within the bottom-chip footprint 116 (FIG. 1 b). In an embodiment, the bottom chip 150 is a flip chip 150 that has been flip-chip bonded though a chip ball array, one electrical bump of which is referenced with numeral 152. In an embodiment, an underfill 154 has been flowed to fortify bonding between the bottom chip 150 and the package substrate 110. In a processing embodiment, reflow of the electrical bumps 152 is carried out during simultaneous curing of the underfill 154. In a processing embodiment, reflow of the electrical bumps 152 is carried out during simultaneous curing of the fill material 148.” Muthukumar, [0029].</p>
---	---

Fig. 16

Muthukumar, Fig. 1b

“FIG. 1 e is a cross-section elevation of a package-on-package (PoP) stacked chip apparatus 104 that has assembled with the apparatus depicted in FIG. 1 d after further processing according to an example embodiment. The bottom chip 150 and the top chip 158 are set within the interposer offset 136 and a top package 164 has been mated to the top side 134 of the interposer 130. The top package 164 may have a mounting substrate 170 for communication to the bottom chip 150 and/or the top chip 158. The top package 164 is depicted as a wire-bond enabling solution such as for an original-equipment manufacturer. Two wire-bonded dice are depicted in the top package 164. A die located in the top package 164 may be referred to as a microelectronic device. In an embodiment, the mixed-stack apparatus 103 depicted in FIG. 1 d is provided to accommodate a top package 164 such as

for a smart phone, where smart-phone specific microelectronic devices are in the top package 164 and support microelectronic devices are in the chip stack.” Muthukumar, [0035].

Muthukumar, Fig. 1e

“FIG. 2 b is a cross-section elevation of a PoP stacked-chip apparatus 201 that has assembled from the apparatus depicted in FIG. 2 a after further processing according to an example embodiment. The bottom chip 250 and the top chip 258 are set within the interposer offset

236 and a top package 264 has been mated to the top side 234 of the interposer 230. The top package 264 may have a mounting substrate 270 for communication to the bottom chip 250 and/or the top chip 258. The top package is depicted as TSV enabling solution such as for an original-equipment manufacturer. In an embodiment, the chip stack apparatus 200 depicted in FIG. 2 a is provided to accommodate a top package 264 such as for a smart phone.” Muthukumar, [0044].

Muthukumar, Figs. 2a, 2b

Appendix A-25 - Invalidity of U.S. Patent No. 9859202 in view of Muthukumar - U.S. Patent Publication No. 20130127054

	<p>To the extent Plaintiff contends that Muthukumar fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Muthukumar discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 e is a cross-section elevation of a package-on-package (PoP) stacked chip apparatus 104 that has assembled with the apparatus depicted in FIG. 1 d after further processing according to an example embodiment. The bottom chip 150 and the top chip 158 are set within the interposer offset 136 and a top package 164 has been mated to the top side 134 of the interposer 130. The top package 164 may have a mounting substrate 170 for communication to the bottom chip 150 and/or the top chip 158. The top package 164 is depicted as a wire-bond enabling solution such as for an original-equipment manufacturer. Two wire-bonded dice are depicted in the top package 164. A die located in the top package 164 may be referred to as a microelectronic device. In an embodiment, the mixed-stack apparatus 103 depicted in FIG. 1 d is provided to accommodate a top package 164 such as for a smart phone, where smart-phone specific microelectronic devices are in the top package 164 and support microelectronic devices are in the chip stack.” Muthukumar, [0035].</p>

	<div data-bbox="337 436 909 1360"><p>A cross-sectional diagram of a PoP stacked-chip apparatus 201. The diagram shows a top chip 250 and a bottom chip 236 stacked vertically. The bottom chip 150 and the top chip 158 are set within the interposer offset 136 and a top package 164 has been mated to the top side 134 of the interposer 130. The top package 164 may have a mounting substrate 170 for communication to the bottom chip 150 and/or the top chip 158. The top package 164 is depicted as a wire-bond enabling solution such as for an original-equipment manufacturer. Two wire-bonded dice are depicted in the top package 164. A die located in the top package 164 may be referred to as a microelectronic device. In an embodiment, the mixed-stack apparatus 103 depicted in FIG. 1 d is provided to accommodate a top package 164 such as

for a smart phone, where smart-phone specific microelectronic devices are in the top package 164 and support microelectronic devices are in the chip stack.” Muthukumar, [0035].

Muthukumar, Fig. 1e

“It can be seen that the mixed stack of the bottom chip 150 and top chip 158 have been accommodated by the interposer offset 136 such that the top package 164 does not interfere with the mixed stack. Consequently, the PoP stacked-chip apparatus is assembled with

	<p>sufficient interposer offset 136 to accommodate an offset height of the chip stack that may vary depending upon a specific application.” Muthukumar, [0037].</p> <p>“FIG. 2 b is a cross-section elevation of a PoP stacked-chip apparatus 201 that has assembled from the apparatus depicted in FIG. 2 a after further processing according to an example embodiment. The bottom chip 250 and the top chip 258 are set within the interposer offset 236 and a top package 264 has been mated to the top side 234 of the interposer 230. The top package 264 may have a mounting substrate 270 for communication to the bottom chip 250 and/or the top chip 258. The top package is depicted as TSV enabling solution such as for an original-equipment manufacturer. In an embodiment, the chip stack apparatus 200 depicted in FIG. 2 a is provided to accommodate a top package 264 such as for a smart phone.” Muthukumar, [0044].</p>
--	---

Muthukumar, Figs. 2a, 2b

“In an embodiment, the bottom chip 150 is a processor and the top chip 158 is a radio-frequency (RF) device.” Muthukumar, [0054].

To the extent Plaintiff contends that Muthukumar fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the

The top package 264 may have a mounting substrate 270 for communication to the bottom chip 250 and/or the top chip 258. The top package is depicted as TSV enabling solution such as for an original-equipment manufacturer. In an embodiment, the chip stack apparatus 200 depicted in FIG. 2 a is provided to accommodate a top package 264 such as for a smart phone.”</p> <p>Muthukumar, [0044].</p>
--	--

Muthukumar, Figs. 2a, 2b

To the extent Plaintiff contends that Muthukumar fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Nakatani - U.S. Patent Publication No. 20040227258

U.S. Patent Publication No. 20040227258 (“Nakatani”) is titled Electronic Component Packaging Structure and Method for Producing the Same and lists Seiichi Nakatani as inventor. Nakatani is assigned to Matsushita Electric Industrial Co., Ltd. Nakatani anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ‘202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Nakatani is a U.S. patent publication that was filed May 5, 2004 and published November 18, 2004. Nakatani claims priority to JP 2003-135799 filed on May 14, 2003. Nakatani is therefore prior art to the ‘202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Nakatani, or otherwise rendered obvious by disclosures and teachings of Nakatani, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Nakatani does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Nakatani with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ‘202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Nakatani, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-26 - Invalidity of U.S. Patent No. 9859202 in view of Nakatani - U.S. Patent Publication No. 20040227258

To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Nakatani “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Nakatani or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Nakatani set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Nakatani discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 is a cross-sectional view showing a configuration of a semiconductor package according to this embodiment. In FIG. 1, reference numeral 101 denotes an electrical insulating encapsulation resin made of a mixture in which an inorganic filler and an organic resin are combined. Reference numeral 102 denotes a semiconductor chip that is embedded in the electrical insulating encapsulation resin 101 and is integrated therewith. Reference numeral 103 denotes an inner via that is formed in a thickness direction of the electrical</p>

	<p>insulating encapsulation resin 101, which establishes electric connection between protruding electrodes 105 and 106 that are formed on both surfaces of the electrical insulating encapsulation resin 101. In this example, the protruding electrodes 105 and 106 are formed with solder so that the protrusions are 100 m in length and have a hemispherical shape with a diameter of 200 m. Reference numerals 107 a and 107 b denote electrodes formed at the both surfaces of the electrical insulating encapsulation resin, which are base electrodes for the protruding electrodes 105 and 106.” Nakatani, [0081].</p> <p>“FIG. 3 is a cross-sectional view of an electronic component packaging structure in which circuit boards are connected electrically with each other using the above-stated semiconductor package 100. Reference numerals 201 and 202 denote circuit boards that are electrically connected, and 203 and 204 denote insulation materials of the circuit boards 201 and 202. Available insulation materials of the circuit boards include a reinforcing member made of paper, glass woven fabric, glass non-woven fabric, aramid non-woven fabric or the like that is impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin or the like. Reference numerals 207, 208 and 209 denote wiring patterns, and 206 and 205 denote inner vias that connect layers. As the wiring patterns, copper foil can be used, for example, to which chemical etching can be applied so as to form a desired wiring pattern. As for the inner vias 205 and 206, copper plating or a conductive paste is applied to holes processed with a drill or a laser, so as to establish electric connection. On the circuit boards 201 and 202, semiconductor chips 215 and 212 and chip components 211 and 210 are mounted. A method for the mounting is not limited to a mounting method using solder, but a conductive adhesive can be used. As for the semiconductor chips, wire bonding, flip-chip bonding and the like are available, and the semiconductor chips 215 and 212 may be flip-chip mounted via bumps 213 and may be encapsulated with an encapsulation resin 214. Reference numeral 100 denotes the semiconductor package shown in FIG. 1, which connects electrically the circuit board 201 and the circuit board 202 via the protruding electrodes 105</p>
--	---

and 106, and at the same time allows the circuit boards 201 and 202 to be bonded and secured firmly with each other using solder.” Nakatani, [0092-0093].

FIG. 3

Nakatani, FIG. 3

“FIG. 4 is a cross-sectional view of an electronic component packaging structure that electrically connects circuit boards with the same semiconductor package 100 as in Embodiment 1. Reference numeral 301 denotes a circuit board, which includes an insulation material 303, a wiring pattern 304 and an inner via 305. On the circuit board 301, a semiconductor chip 306 and chip components 308, 309 and 310 are mounted. The semiconductor package 100 has the same configuration as shown in FIG. 1, and has protruding electrodes 105 and 106. The semiconductor package 100 connects electrically and mechanically with another circuit board 312 by means of firm securing using solder.” Nakatani, [0095].

	<p>“FIG. 6 is a cross-sectional view showing an electronic component packaging structure that electrically connects circuit boards by using the above-described semiconductor package 500. The remaining components and configurations are the same as in those of FIG. 2, and therefore the same reference numerals are used and their explanations are omitted. Only essential points are described below. The semiconductor package 500 electrically connects the circuit board 201 and the circuit board 202 via protruding electrodes, and at the same time bonds the circuit board 201 and the circuit board 202 firmly using solder.” Nakatani, [0104].</p> <p>“FIG. 8 is a cross-sectional view of an electronic component packaging structure that electrically connects circuit boards using the above-stated semiconductor package 600. The remaining components and configurations are the same as in those of FIG. 3, and therefore the same reference numerals are used and their explanations are omitted. Only essential points are described below. The semiconductor package 600 electrically connects a circuit board 301 and a circuit board 312 via protruding electrodes, and at the same time bonds the circuit board 301 and the circuit board 312 firmly using solder.” Nakatani, [0104].</p> <p>“FIG. 13 is a cross-sectional view showing a configuration in which circuit boards are connected electrically by using the semiconductor package 900 of this embodiment and the semiconductor package 100 of FIG. 1. Reference numerals 180 and 181 denote circuit boards to be electrically-connected, and 182 and 183 denote insulation materials of the circuit boards 180 and 181, respectively. Available insulation materials of the circuit boards, as in the case of Embodiment 1, are a reinforcing member made of paper, glass woven fabric, glass non-woven fabric, aramid non-woven fabric and the like that are impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin and the like. Reference numerals 186 and 209 denote wiring patterns of the circuit boards 180 and 181, and 185 and 184 denote inner vias that connect layers. On the circuit boards 180 and 181, semiconductor chips 190 and 191 and chip components 188 and 189 are mounted. As for the semiconductor chips, a</p>
--	---

Appendix A-26 - Invalidity of U.S. Patent No. 9859202 in view of Nakatani - U.S. Patent Publication No. 20040227258

	<p>flip-chip packaging method is available, and the semiconductor chips 190 and 191 are connected with wiring patterns on the circuit boards via bumps. In order to electrically connect the circuit boards 180 and 181 with a narrow pitch, this embodiment shows an example where two semiconductor packages are used. By using the two semiconductor packages 100 and 900 for connecting circuit boards 180 and 181 in the vicinity of both end portions of the circuit boards as in FIG. 13, a package that not only allows the electrical connection with a narrow pitch but also provides an excellent mechanical strength can be obtained.” Nakatani, [0116-0118].</p>
[1.A] a bottom package substrate;	<p>Nakatani discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 3 is a cross-sectional view of an electronic component packaging structure in which circuit boards are connected electrically with each other using the above-stated semiconductor package 100. Reference numerals 201 and 202 denote circuit boards that are electrically connected, and 203 and 204 denote insulation materials of the circuit boards 201 and 202. Available insulation materials of the circuit boards include a reinforcing member made of paper, glass woven fabric, glass non-woven fabric, aramid non-woven fabric or the like that is impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin or the like. Reference numerals 207, 208 and 209 denote wiring patterns, and 206 and 205 denote inner vias that connect layers. As the wiring patterns, copper foil can be used, for example, to which chemical etching can be applied so as to form a desired wiring pattern. As for the inner vias 205 and 206, copper plating or a conductive paste is applied to holes processed with a drill or a laser, so as to establish electric connection. On the circuit boards 201 and 202, semiconductor chips 215 and 212 and chip components 211 and 210 are mounted. A method for the mounting is not limited to a mounting method using solder, but</p>

a conductive adhesive can be used. As for the semiconductor chips, wire bonding, flip-chip bonding and the like are available, and the semiconductor chips 215 and 212 may be flip-chip mounted via bumps 213 and may be encapsulated with an encapsulation resin 214. Reference numeral 100 denotes the semiconductor package shown in FIG. 1, which connects electrically the circuit board 201 and the circuit board 202 via the protruding electrodes 105 and 106, and at the same time allows the circuit boards 201 and 202 to be bonded and secured firmly with each other using solder.” Nakatani, [0092-0093].

FIG. 3

Nakatani, FIG. 3

“FIG. 4 is a cross-sectional view of an electronic component packaging structure that electrically connects circuit boards with the same semiconductor package 100 as in Embodiment 1. Reference numeral 301 denotes a circuit board, which includes an insulation material 303, a wiring pattern 304 and an inner via 305. On the circuit board 301, a semiconductor chip 306 and chip components 308, 309 and 310 are mounted. The

	<p>semiconductor package 100 has the same configuration as shown in FIG. 1, and has protruding electrodes 105 and 106. The semiconductor package 100 connects electrically and mechanically with another circuit board 312 by means of firm securing using solder.” Nakatani, [0095].</p> <p>“FIG. 6 is a cross-sectional view showing an electronic component packaging structure that electrically connects circuit boards by using the above-described semiconductor package 500. The remaining components and configurations are the same as in those of FIG. 2, and therefore the same reference numerals are used and their explanations are omitted. Only essential points are described below. The semiconductor package 500 electrically connects the circuit board 201 and the circuit board 202 via protruding electrodes, and at the same time bonds the circuit board 201 and the circuit board 202 firmly using solder.” Nakatani, [0104].</p> <p>“FIG. 8 is a cross-sectional view of an electronic component packaging structure that electrically connects circuit boards using the above-stated semiconductor package 600. The remaining components and configurations are the same as in those of FIG. 3, and therefore the same reference numerals are used and their explanations are omitted. Only essential points are described below. The semiconductor package 600 electrically connects a circuit board 301 and a circuit board 312 via protruding electrodes, and at the same time bonds the circuit board 301 and the circuit board 312 firmly using solder.” Nakatani, [0104].</p> <p>“FIG. 13 is a cross-sectional view showing a configuration in which circuit boards are connected electrically by using the semiconductor package 900 of this embodiment and the semiconductor package 100 of FIG. 1. Reference numerals 180 and 181 denote circuit boards to be electrically-connected, and 182 and 183 denote insulation materials of the circuit boards 180 and 181, respectively. Available insulation materials of the circuit boards, as in the case of Embodiment 1, are a reinforcing member made of paper, glass woven fabric, glass non-</p>

Appendix A-26 - Invalidity of U.S. Patent No. 9859202 in view of Nakatani - U.S. Patent Publication No. 20040227258

	<p>woven fabric, aramid non-woven fabric and the like that are impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin and the like. Reference numerals 186 and 209 denote wiring patterns of the circuit boards 180 and 181, and 185 and 184 denote inner vias that connect layers.” Nakatani, [0116].</p> <p>“Next, as shown in FIG. 8, the circuit board 301 and the circuit board 312 were electrically connected via the protruding electrodes using the above-stated semiconductor package 600, and at the same time the circuit boards 301 and 312 were firmly bonded and secured to each other using solder. More specifically, as the circuit board 301 having an inner via structure across the entire layers, a four-layered wiring structured aramid epoxy resin board was used. Nickel and gold plating were applied to a wiring pattern of this aramid epoxy resin board in the same manner as above so as to facilitate soldering, and a solder paste was printed using a metal mask on the wiring pattern subjected to the gold plating.” Nakatani, [0147-0148].</p> <p>To the extent Plaintiff contends that Nakatani fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Nakatani discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 3 is a cross-sectional view of an electronic component packaging structure in which circuit boards are connected electrically with each other using the above-stated semiconductor package 100. Reference numerals 201 and 202 denote circuit boards that are</p>

	<p>electrically connected, and 203 and 204 denote insulation materials of the circuit boards 201 and 202. Available insulation materials of the circuit boards include a reinforcing member made of paper, glass woven fabric, glass non-woven fabric, aramid non-woven fabric or the like that is impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin or the like. Reference numerals 207, 208 and 209 denote wiring patterns, and 206 and 205 denote inner vias that connect layers. As the wiring patterns, copper foil can be used, for example, to which chemical etching can be applied so as to form a desired wiring pattern. As for the inner vias 205 and 206, copper plating or a conductive paste is applied to holes processed with a drill or a laser, so as to establish electric connection. On the circuit boards 201 and 202, semiconductor chips 215 and 212 and chip components 211 and 210 are mounted. A method for the mounting is not limited to a mounting method using solder, but a conductive adhesive can be used. As for the semiconductor chips, wire bonding, flip-chip bonding and the like are available, and the semiconductor chips 215 and 212 may be flip-chip mounted via bumps 213 and may be encapsulated with an encapsulation resin 214. Reference numeral 100 denotes the semiconductor package shown in FIG. 1, which connects electrically the circuit board 201 and the circuit board 202 via the protruding electrodes 105 and 106, and at the same time allows the circuit boards 201 and 202 to be bonded and secured firmly with each other using solder.” Nakatani, [0092-0093].</p>
--	---

FIG. 3

Nakatani, FIG. 3

“FIG. 4 is a cross-sectional view of an electronic component packaging structure that electrically connects circuit boards with the same semiconductor package 100 as in Embodiment 1. Reference numeral 301 denotes a circuit board, which includes an insulation material 303, a wiring pattern 304 and an inner via 305. On the circuit board 301, a semiconductor chip 306 and chip components 308, 309 and 310 are mounted. The semiconductor package 100 has the same configuration as shown in FIG. 1, and has protruding electrodes 105 and 106. The semiconductor package 100 connects electrically and mechanically with another circuit board 312 by means of firm securing using solder.” Nakatani, [0095].

“FIG. 6 is a cross-sectional view showing an electronic component packaging structure that electrically connects circuit boards by using the above-described semiconductor package 500. The remaining components and configurations are the same as in those of FIG. 2, and

	<p>therefore the same reference numerals are used and their explanations are omitted. Only essential points are described below. The semiconductor package 500 electrically connects the circuit board 201 and the circuit board 202 via protruding electrodes, and at the same time bonds the circuit board 201 and the circuit board 202 firmly using solder.” Nakatani, [0104].</p> <p>“FIG. 8 is a cross-sectional view of an electronic component packaging structure that electrically connects circuit boards using the above-stated semiconductor package 600. The remaining components and configurations are the same as in those of FIG. 3, and therefore the same reference numerals are used and their explanations are omitted. Only essential points are described below. The semiconductor package 600 electrically connects a circuit board 301 and a circuit board 312 via protruding electrodes, and at the same time bonds the circuit board 301 and the circuit board 312 firmly using solder.” Nakatani, [0104].</p> <p>“FIG. 13 is a cross-sectional view showing a configuration in which circuit boards are connected electrically by using the semiconductor package 900 of this embodiment and the semiconductor package 100 of FIG. 1. Reference numerals 180 and 181 denote circuit boards to be electrically-connected, and 182 and 183 denote insulation materials of the circuit boards 180 and 181, respectively. Available insulation materials of the circuit boards, as in the case of Embodiment 1, are a reinforcing member made of paper, glass woven fabric, glass non-woven fabric, aramid non-woven fabric and the like that are impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin and the like. Reference numerals 186 and 209 denote wiring patterns of the circuit boards 180 and 181, and 185 and 184 denote inner vias that connect layers.” Nakatani, [0116].</p> <p>“Next, as shown in FIG. 8, the circuit board 301 and the circuit board 312 were electrically connected via the protruding electrodes using the above-stated semiconductor package 600,</p>
--	--

Appendix A-26 - Invalidity of U.S. Patent No. 9859202 in view of Nakatani - U.S. Patent Publication No. 20040227258

	<p>and at the same time the circuit boards 301 and 312 were firmly bonded and secured to each other using solder.” Nakatani, [0147].</p> <p>To the extent Plaintiff contends that Nakatani fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Nakatani discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 3 is a cross-sectional view of an electronic component packaging structure in which circuit boards are connected electrically with each other using the above-stated semiconductor package 100. Reference numerals 201 and 202 denote circuit boards that are electrically connected, and 203 and 204 denote insulation materials of the circuit boards 201 and 202. Available insulation materials of the circuit boards include a reinforcing member made of paper, glass woven fabric, glass non-woven fabric, aramid non-woven fabric or the like that is impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin or the like. Reference numerals 207, 208 and 209 denote wiring patterns, and 206 and 205 denote inner vias that connect layers. As the wiring patterns, copper foil can be used, for example, to which chemical etching can be applied so as to form a desired wiring pattern. As for the inner vias 205 and 206, copper plating or a conductive paste is applied to holes processed with a drill or a laser, so as to establish electric connection. On the circuit boards 201 and 202, semiconductor chips 215 and 212 and chip components 211 and 210 are</p>

mounted. A method for the mounting is not limited to a mounting method using solder, but a conductive adhesive can be used. As for the semiconductor chips, wire bonding, flip-chip bonding and the like are available, and the semiconductor chips 215 and 212 may be flip-chip mounted via bumps 213 and may be encapsulated with an encapsulation resin 214. Reference numeral 100 denotes the semiconductor package shown in FIG. 1, which connects electrically the circuit board 201 and the circuit board 202 via the protruding electrodes 105 and 106, and at the same time allows the circuit boards 201 and 202 to be bonded and secured firmly with each other using solder.” Nakatani, [0092-0093].

FIG. 3

Nakatani, FIG. 3

“FIG. 4 is a cross-sectional view of an electronic component packaging structure that electrically connects circuit boards with the same semiconductor package 100 as in Embodiment 1. Reference numeral 301 denotes a circuit board, which includes an insulation material 303, a wiring pattern 304 and an inner via 305. On the circuit board 301, a

	<p>semiconductor chip 306 and chip components 308, 309 and 310 are mounted. The semiconductor package 100 has the same configuration as shown in FIG. 1, and has protruding electrodes 105 and 106. The semiconductor package 100 connects electrically and mechanically with another circuit board 312 by means of firm securing using solder.” Nakatani, [0095].</p> <p>“FIG. 6 is a cross-sectional view showing an electronic component packaging structure that electrically connects circuit boards by using the above-described semiconductor package 500. The remaining components and configurations are the same as in those of FIG. 2, and therefore the same reference numerals are used and their explanations are omitted. Only essential points are described below. The semiconductor package 500 electrically connects the circuit board 201 and the circuit board 202 via protruding electrodes, and at the same time bonds the circuit board 201 and the circuit board 202 firmly using solder.” Nakatani, [0104].</p> <p>“FIG. 8 is a cross-sectional view of an electronic component packaging structure that electrically connects circuit boards using the above-stated semiconductor package 600. The remaining components and configurations are the same as in those of FIG. 3, and therefore the same reference numerals are used and their explanations are omitted. Only essential points are described below. The semiconductor package 600 electrically connects a circuit board 301 and a circuit board 312 via protruding electrodes, and at the same time bonds the circuit board 301 and the circuit board 312 firmly using solder.” Nakatani, [0104].</p> <p>“FIG. 13 is a cross-sectional view showing a configuration in which circuit boards are connected electrically by using the semiconductor package 900 of this embodiment and the semiconductor package 100 of FIG. 1. Reference numerals 180 and 181 denote circuit boards to be electrically-connected, and 182 and 183 denote insulation materials of the circuit boards 180 and 181, respectively. Available insulation materials of the circuit boards, as in the case</p>
--	--

	<p>of Embodiment 1, are a reinforcing member made of paper, glass woven fabric, glass non-woven fabric, aramid non-woven fabric and the like that are impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin and the like. Reference numerals 186 and 209 denote wiring patterns of the circuit boards 180 and 181, and 185 and 184 denote inner vias that connect layers. On the circuit boards 180 and 181, semiconductor chips 190 and 191 and chip components 188 and 189 are mounted. As for the semiconductor chips, a flip-chip packaging method is available, and the semiconductor chips 190 and 191 are connected with wiring patterns on the circuit boards via bumps. In order to electrically connect the circuit boards 180 and 181 with a narrow pitch, this embodiment shows an example where two semiconductor packages are used. By using the two semiconductor packages 100 and 900 for connecting circuit boards 180 and 181 in the vicinity of both end portions of the circuit boards as in FIG. 13, a package that not only allows the electrical connection with a narrow pitch but also provides an excellent mechanical strength can be obtained.” Nakatani, [0116-0118].</p> <p>“Next, as shown in FIG. 8, the circuit board 301 and the circuit board 312 were electrically connected via the protruding electrodes using the above-stated semiconductor package 600, and at the same time the circuit boards 301 and 312 were firmly bonded and secured to each other using solder. More specifically, as the circuit board 301 having an inner via structure across the entire layers, a four-layered wiring structured aramid epoxy resin board was used. Nickel and gold plating were applied to a wiring pattern of this aramid epoxy resin board in the same manner as above so as to facilitate soldering, and a solder paste was printed using a metal mask on the wiring pattern subjected to the gold plating. The material of the solder used was Pb free solder made of SnAgCu. The above-stated semiconductor package 600 was aligned with the portions where the solder had been printed and was mounted thereon. Thereafter, by using a solder reflow device, soldering was conducted on the aramid epoxy</p>

Only essential points are described below. The semiconductor package 600 electrically connects a circuit board 301 and a circuit board 312 via protruding electrodes, and at the same time bonds the circuit board 301 and the circuit board 312 firmly using solder.” Nakatani, [0104].</p>
--	---

	<p>“FIG. 13 is a cross-sectional view showing a configuration in which circuit boards are connected electrically by using the semiconductor package 900 of this embodiment and the semiconductor package 100 of FIG. 1. Reference numerals 180 and 181 denote circuit boards to be electrically-connected, and 182 and 183 denote insulation materials of the circuit boards 180 and 181, respectively. Available insulation materials of the circuit boards, as in the case of Embodiment 1, are a reinforcing member made of paper, glass woven fabric, glass non-woven fabric, aramid non-woven fabric and the like that are impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin and the like. Reference numerals 186 and 209 denote wiring patterns of the circuit boards 180 and 181, and 185 and 184 denote inner vias that connect layers. On the circuit boards 180 and 181, semiconductor chips 190 and 191 and chip components 188 and 189 are mounted. As for the semiconductor chips, a flip-chip packaging method is available, and the semiconductor chips 190 and 191 are connected with wiring patterns on the circuit boards via bumps. In order to electrically connect the circuit boards 180 and 181 with a narrow pitch, this embodiment shows an example where two semiconductor packages are used. By using the two semiconductor packages 100 and 900 for connecting circuit boards 180 and 181 in the vicinity of both end portions of the circuit boards as in FIG. 13, a package that not only allows the electrical connection with a narrow pitch but also provides an excellent mechanical strength can be obtained.” Nakatani, [0116-0118].</p> <p>“More specifically, as the circuit board 301 having an inner via structure across the entire layers, a four-layered wiring structured aramid epoxy resin board was used. Nickel and gold plating were applied to a wiring pattern of this aramid epoxy resin board in the same manner as above so as to facilitate soldering, and a solder paste was printed using a metal mask on the wiring pattern subjected to the gold plating. The material of the solder used was Pb free solder made of SnAgCu. The above-stated semiconductor package 600 was aligned with the portions where the solder had been printed and was mounted thereon. Thereafter, by using a</p>
--	---

	<p>solder reflow device, soldering was conducted on the aramid epoxy resin board 301 on which the semiconductor package 600 had been mounted. The reflow was conducted under the profile of once keeping a temperature at 150 C. and then applying heat so as to reach 250 C., where the state at 250 C. was kept for about 10 seconds. As a result, protruding electrodes on the semiconductor package 600 and the wiring pattern 304 on the aramid epoxy resin board 301 were connected electrically and mechanically using the solder. Next, other protruding electrodes on the semiconductor package 600 and the wiring pattern of the FPC 312 were connected. The FPC 312 included a base film made of polyimide and wiring patterns were connected on both faces of the base film via adhesive layers. Similarly to the above, the solder paste like the above was printed on the wiring pattern 313 of the FPC 312 using a metal mask, and the FPC 312 was aligned with the protruding electrodes on a semiconductor package 600 on a different side from the above, and soldering was conducted by a reflow device while keeping their positions. As a result, the desired wiring patterns of the aramid epoxy resin board 301 and the FPC 312 could be connected electrically and mechanically via the protruding electrodes of the semiconductor package 600.” Nakatani, [0148].</p> <p>To the extent Plaintiff contends that Nakatani fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

	<p>“FIG. 1 is a cross-sectional view showing a configuration of a semiconductor package according to this embodiment. In FIG. 1, reference numeral 101 denotes an electrical insulating encapsulation resin made of a mixture in which an inorganic filler and an organic resin are combined. Reference numeral 102 denotes a semiconductor chip that is embedded in the electrical insulating encapsulation resin 101 and is integrated therewith. Reference numeral 103 denotes an inner via that is formed in a thickness direction of the electrical insulating encapsulation resin 101, which establishes electric connection between protruding electrodes 105 and 106 that are formed on both surfaces of the electrical insulating encapsulation resin 101. In this example, the protruding electrodes 105 and 106 are formed with solder so that the protrusions are 100 μm in length and have a hemispherical shape with a diameter of 200 μm. Reference numerals 107 a and 107 b denote electrodes formed at the both surfaces of the electrical insulating encapsulation resin, which are base electrodes for the protruding electrodes 105 and 106. The base electrodes 107 a and 107 b can be formed concurrently when the semiconductor chip 102 is embedded in the electrical insulating encapsulation resin. The base electrodes can be formed as follows: a semiconductor chip 102 is mounted on a metal substrate, and an electrical insulating encapsulation resin that has been processed into a sheet form is laminated thereon. Then, heat and pressure are applied thereto so that the semiconductor chip 102 is embedded, and thereafter the metal substrate is processed so as to form the base electrodes. A lead frame with a pattern formed therein may be integrated with the electrical insulating encapsulation resin as the base electrodes.” Nakatani, [0081].</p>

Fig. 1

Nakatani, FIG. 1

“FIG. 3 is a cross-sectional view of an electronic component packaging structure in which circuit boards are connected electrically with each other using the above-stated semiconductor package 100. Reference numerals 201 and 202 denote circuit boards that are electrically connected, and 203 and 204 denote insulation materials of the circuit boards 201 and 202. Available insulation materials of the circuit boards include a reinforcing member made of paper, glass woven fabric, glass non-woven fabric, aramid non-woven fabric or the

	<p>like that is impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin or the like. Reference numerals 207, 208 and 209 denote wiring patterns, and 206 and 205 denote inner vias that connect layers. As the wiring patterns, copper foil can be used, for example, to which chemical etching can be applied so as to form a desired wiring pattern. As for the inner vias 205 and 206, copper plating or a conductive paste is applied to holes processed with a drill or a laser, so as to establish electric connection. On the circuit boards 201 and 202, semiconductor chips 215 and 212 and chip components 211 and 210 are mounted. A method for the mounting is not limited to a mounting method using solder, but a conductive adhesive can be used. As for the semiconductor chips, wire bonding, flip-chip bonding and the like are available, and the semiconductor chips 215 and 212 may be flip-chip mounted via bumps 213 and may be encapsulated with an encapsulation resin 214. Reference numeral 100 denotes the semiconductor package shown in FIG. 1, which connects electrically the circuit board 201 and the circuit board 202 via the protruding electrodes 105 and 106, and at the same time allows the circuit boards 201 and 202 to be bonded and secured firmly with each other using solder.” Nakatani, [0092-0093].</p>

FIG. 3

Nakatani, FIG. 3

“FIG. 4 is a cross-sectional view of an electronic component packaging structure that electrically connects circuit boards with the same semiconductor package 100 as in Embodiment 1. Reference numeral 301 denotes a circuit board, which includes an insulation material 303, a wiring pattern 304 and an inner via 305. On the circuit board 301, a semiconductor chip 306 and chip components 308, 309 and 310 are mounted. The semiconductor package 100 has the same configuration as shown in FIG. 1, and has protruding electrodes 105 and 106. The semiconductor package 100 connects electrically and mechanically with another circuit board 312 by means of firm securing using solder.” Nakatani, [0095].

“FIG. 6 is a cross-sectional view showing an electronic component packaging structure that electrically connects circuit boards by using the above-described semiconductor package 500. The remaining components and configurations are the same as in those of FIG. 2, and

	<p>therefore the same reference numerals are used and their explanations are omitted. Only essential points are described below. The semiconductor package 500 electrically connects the circuit board 201 and the circuit board 202 via protruding electrodes, and at the same time bonds the circuit board 201 and the circuit board 202 firmly using solder.” Nakatani, [0104].</p> <p>“FIG. 8 is a cross-sectional view of an electronic component packaging structure that electrically connects circuit boards using the above-stated semiconductor package 600. The remaining components and configurations are the same as in those of FIG. 3, and therefore the same reference numerals are used and their explanations are omitted. Only essential points are described below. The semiconductor package 600 electrically connects a circuit board 301 and a circuit board 312 via protruding electrodes, and at the same time bonds the circuit board 301 and the circuit board 312 firmly using solder.” Nakatani, [0104].</p> <p>“FIG. 13 is a cross-sectional view showing a configuration in which circuit boards are connected electrically by using the semiconductor package 900 of this embodiment and the semiconductor package 100 of FIG. 1. Reference numerals 180 and 181 denote circuit boards to be electrically-connected, and 182 and 183 denote insulation materials of the circuit boards 180 and 181, respectively. Available insulation materials of the circuit boards, as in the case of Embodiment 1, are a reinforcing member made of paper, glass woven fabric, glass non-woven fabric, aramid non-woven fabric and the like that are impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin and the like. Reference numerals 186 and 209 denote wiring patterns of the circuit boards 180 and 181, and 185 and 184 denote inner vias that connect layers. On the circuit boards 180 and 181, semiconductor chips 190 and 191 and chip components 188 and 189 are mounted. As for the semiconductor chips, a flip-chip packaging method is available, and the semiconductor chips 190 and 191 are connected with wiring patterns on the circuit boards via bumps. In order to electrically connect the circuit boards 180 and 181 with a narrow pitch, this embodiment shows an</p>

FIG. 3

Nakatani, FIG. 3

“Reference numeral 100 denotes the semiconductor package shown in FIG. 1, which connects electrically the circuit board 201 and the circuit board 202 via the protruding electrodes 105 and 106, and at the same time allows the circuit boards 201 and 202 to be bonded and secured firmly with each other using solder.” Nakatani, [0093]

“The semiconductor package 500 electrically connects the circuit board 201 and the circuit board 202 via protruding electrodes, and at the same time bonds the circuit board 201 and the circuit board 202 firmly using solder.” Nakatani, [0101].

“The semiconductor package 600 electrically connects a circuit board 301 and a circuit board 312 via protruding electrodes, and at the same time bonds the circuit board 301 and the circuit board 312 firmly using solder.” Nakatani, [0104].

Appendix A-26 - Invalidity of U.S. Patent No. 9859202 in view of Nakatani - U.S. Patent Publication No. 20040227258

	<p>“On the circuit boards 180 and 181, semiconductor chips 190 and 191 and chip components 188 and 189 are mounted. As for the semiconductor chips, a flip-chip packaging method is available, and the semiconductor chips 190 and 191 are connected with wiring patterns on the circuit boards via bumps.” Nakatani, [0117].</p> <p>To the extent Plaintiff contends that Nakatani fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the top package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the bottom package substrate are connected to the corresponding top ends of the plurality of metal pillars of the	<p>Nakatani discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 3 is a cross-sectional view of an electronic component packaging structure in which circuit boards are connected electrically with each other using the above-stated semiconductor package 100. Reference numerals 201 and 202 denote circuit boards that are</p>

spacer connector via the corresponding top metal pads of the spacer connector.

electrically connected, and 203 and 204 denote insulation materials of the circuit boards 201 and 202. Available insulation materials of the circuit boards include a reinforcing member made of paper, glass woven fabric, glass non-woven fabric, aramid non-woven fabric or the like that is impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin or the like. Reference numerals 207, 208 and 209 denote wiring patterns, and 206 and 205 denote inner vias that connect layers.” Nakatani, [0092].

FIG. 3

Nakatani, FIG. 3

“Reference numeral 100 denotes the semiconductor package shown in FIG. 1, which connects electrically the circuit board 201 and the circuit board 202 via the protruding electrodes 105 and 106, and at the same time allows the circuit boards 201 and 202 to be bonded and secured firmly with each other using solder.” Nakatani, [0093].

Appendix A-26 - Invalidity of U.S. Patent No. 9859202 in view of Nakatani - U.S. Patent Publication No. 20040227258

	<p>“The semiconductor package 600 electrically connects a circuit board 301 and a circuit board 312 via protruding electrodes, and at the same time bonds the circuit board 301 and the circuit board 312 firmly using solder.” Nakatani, [0104].</p> <p>“In FIG. 10, reference numeral 802 denotes a circuit board in which insulation layers and wiring patterns are formed in an arbitrary laminated manner, and these layers are connected with an inner via. On the circuit board 802, a semiconductor chip 801 is mounted, and the semiconductor chip 801 is connected with a wiring pattern on the circuit 802 via a wire 803. Another wiring pattern on the circuit board 802 is connected with a lead frame 804 via a wire 805. The lead frame 804 is bent as shown in FIG. 10 so as to prevent the wire 805 connected therewith by the wire bonding from being exposed to the surface of the semiconductor package. Reference numeral 809 denotes a wiring pattern formed at a surface of the circuit board 802, and a protruding electrode 807 is formed on a surface of this wiring pattern 809” Nakatani, [0108].</p> <p>To the extent Plaintiff contends that Nakatani fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[9] The structure of claim 4, wherein the spacer connector further comprises a	Nakatani discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the

Appendix A-26 - Invalidity of U.S. Patent No. 9859202 in view of Nakatani - U.S. Patent Publication No. 20040227258

<p>plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 3 is a cross-sectional view of an electronic component packaging structure in which circuit boards are connected electrically with each other using the above-stated semiconductor package 100. Reference numerals 201 and 202 denote circuit boards that are electrically connected, and 203 and 204 denote insulation materials of the circuit boards 201 and 202. Available insulation materials of the circuit boards include a reinforcing member made of paper, glass woven fabric, glass non-woven fabric, aramid non-woven fabric or the like that is impregnated with an organic resin made of epoxy resin, cyanate resin, phenol resin or the like. Reference numerals 207, 208 and 209 denote wiring patterns, and 206 and 205 denote inner vias that connect layers. As the wiring patterns, copper foil can be used, for example, to which chemical etching can be applied so as to form a desired wiring pattern. As for the inner vias 205 and 206, copper plating or a conductive paste is applied to holes processed with a drill or a laser, so as to establish electric connection. On the circuit boards 201 and 202, semiconductor chips 215 and 212 and chip components 211 and 210 are mounted. A method for the mounting is not limited to a mounting method using solder, but a conductive adhesive can be used. As for the semiconductor chips, wire bonding, flip-chip bonding and the like are available, and the semiconductor chips 215 and 212 may be flip-chip mounted via bumps 213 and may be encapsulated with an encapsulation resin 214. Reference numeral 100 denotes the semiconductor package shown in FIG. 1, which connects electrically the circuit board 201 and the circuit board 202 via the protruding electrodes 105</p>
--	--

and 106, and at the same time allows the circuit boards 201 and 202 to be bonded and secured firmly with each other using solder.” Nakatani, [0092-0093].

FIG. 3

Nakatani, FIG. 3

“FIG. 5 is a cross-sectional view showing a configuration of a semiconductor package 500 according to this embodiment. In FIG. 5, reference numeral 501 denotes a semiconductor chip and 502 denotes another semiconductor chip. The semiconductor chips 501 and 502 face each other with rear faces opposite to their circuit-face side. The respective circuit faces are connected electrically with protruding electrodes 503 and 505. Reference numerals 506 a and 506 b are base electrodes that are formed at surfaces of the semiconductor chips 501 and 502, respectively. Reference numeral 504 denotes an electrical insulating encapsulation resin molded member, which protects the semiconductor chips 501 and 502. The semiconductor chips 501 and 502 are secured with each other at their rear faces via an adhesive, encapsulation is conducted up to the same height as each of the surfaces of the circuit-faces

	<p>using a transfer molding device, and thereafter the protruding electrodes 503 and 505 are mounted on electrodes on the circuit-faces of the respective semiconductor chips 501 and 502 using a solder ball and the like.” Nakatani, [0098-0099].</p> <p>“FIG. 6 is a cross-sectional view showing an electronic component packaging structure that electrically connects circuit boards by using the above-described semiconductor package 500. The remaining components and configurations are the same as in those of FIG. 2, and therefore the same reference numerals are used and their explanations are omitted. Only essential points are described below. The semiconductor package 500 electrically connects the circuit board 201 and the circuit board 202 via protruding electrodes, and at the same time bonds the circuit board 201 and the circuit board 202 firmly using solder. At this time, by binding the semiconductor package 500 and the wiring patterns 208 of the circuit boards 201 and 202 with an encapsulation resin, still firmer bonding can be carried out.” Nakatani, [0101].</p> <p>“Finally, solder balls with a diameter of 0.4 mm were mounted on the multilayered board and the semiconductor chip electrodes using a solder ball mounter. Thus, the semiconductor package was manufactured by the above-stated method. On the wiring pattern of the semiconductor module of the present invention, a semiconductor chip and an electronic component further can be mounted, and therefore a significantly high-density packaged semiconductor module can be obtained. The thus manufactured semiconductor package not only allows circuit boards to be connected with each other, but also has an especially good effect of allowing a semiconductor chip and a passive component to be mounted on protruding electrodes manufactured on a side of the semiconductor chip as well, thus enabling a still higher-density package.” Nakatani, [0143-0145].</p>
--	--

	<p>“Next, as shown in FIG. 8, the circuit board 301 and the circuit board 312 were electrically connected via the protruding electrodes using the above-stated semiconductor package 600, and at the same time the circuit boards 301 and 312 were firmly bonded and secured to each other using solder. More specifically, as the circuit board 301 having an inner via structure across the entire layers, a four-layered wiring structured aramid epoxy resin board was used. Nickel and gold plating were applied to a wiring pattern of this aramid epoxy resin board in the same manner as above so as to facilitate soldering, and a solder paste was printed using a metal mask on the wiring pattern subjected to the gold plating. The material of the solder used was Pb free solder made of SnAgCu. The above-stated semiconductor package 600 was aligned with the portions where the solder had been printed and was mounted thereon. Thereafter, by using a solder reflow device, soldering was conducted on the aramid epoxy resin board 301 on which the semiconductor package 600 had been mounted. The reflow was conducted under the profile of once keeping a temperature at 150 C. and then applying heat so as to reach 250 C., where the state at 250 C. was kept for about 10 seconds. As a result, protruding electrodes on the semiconductor package 600 and the wiring pattern 304 on the aramid epoxy resin board 301 were connected electrically and mechanically using the solder. Next, other protruding electrodes on the semiconductor package 600 and the wiring pattern of the FPC 312 were connected.” Nakatani, [0147-0148].</p> <p>To the extent Plaintiff contends that Nakatani fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-27 - Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

U.S. Patent No. 6521530 (“Peters”) is titled Composite Interposer and Method for Producing a Composite Interposer and lists Michael G. Peters, Mark Thomas McCormack, and Aris Bernales as inventors. Peters is assigned to Fujitsu Limited. Peters anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Peters is a U.S. patent that was filed May 23, 2001 and published June 20, 2002. Peters claims priority to US 6,081,026 filed on November 13, 1998. Peters is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Peters, or otherwise rendered obvious by disclosures and teachings of Peters, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Peters does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Peters with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Peters, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-27 - Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Peters “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Peters or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Peters set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Peters discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 is a schematic cross-sectional view of one embodiment of the reduced cross-talk signal interposer 100 of the present invention, and is shown positioned between a printed circuit board 102 and an integrated circuit chip 104. The legend for the figure identifies some of the components of the complete structure. As shown in the figure, interposer 100 includes two primary sections; a signal core 106 and a power/ground wrap 108. The two sections can be fabricated and tested separately and then joined together using a z-connection technology,</p>

Appendix A-27 - Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

	e.g., solder bumps, anisotropic conducting polymers, or another suitable method.” Peters, [7:36-7:46].
--	--

	<p>Peters, FIG. 1</p> <p>“FIG. 3 is a schematic cross-sectional view of one embodiment of the circuit signal core 106 which is part of the interposer of the present invention. Signal core 106 is formed from a conductive core or substrate 111 through which holes or apertures are formed. Conductive core 111 is typically formed from a suitable metal and serves as both a power/ground layer for the interposer and as a reinforcing structure for the signal layers of signal core 106. A dielectric film 110 (e.g., Polyimide, BT, etc.) is arranged on both sides of conductive core 111. Signal lines 113 are defined on a patterned metal layer formed on each of the two dielectric film layers. The two patterned metal layers are interconnected as desired by either a through via or a conductive post structure 112, with the through via or conductive post being suitable for interconnecting the signal core to other layers of the interposer structure, or to the mounting substrate or integrated circuit chips.” Peters, [8:18-8:34].</p> <p>“Referring now to FIG. 5, there is seen a schematic cross-sectional view of power ground wrap 108 which is part of embodiments of the interposer of the present invention. Power ground wrap 108 is formed from a dielectric film 120 (e.g. Polyimide, Bt, etc.) on both sides of which is patterned a metal layer. The two metal layers are interconnected as desired by either a through via or conductive post. Substrate 120 is formed into the shape shown in the figure, i.e., a box-shaped structure having a space between an upper and lower substrate.” Peters, [8:51-8:60].</p> <p>“With the signal core of FIG. 4 inserted between the upper and lower substrates of the power/ground wrap, signal connections may be made between the base substrate (element 102 of FIG. 2), the signal core, and the integrated circuit chip(s) in isolation from the power and ground connections between the base substrate and the chip(s). This permits an increase</p>
--	--

Appendix A-27 - Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

	<p>in signal line density and minimization of signal path lengths while achieving a high degree of electrical isolation between the different types of lines.” Peters, [9:17-9:26].</p> <p>“FIG. 16 discloses a four (4) micro-singulated silicon die 160 surrounding a voltage pad area, generally illustrated as 164. Each micro-singulated silicon die 160 is segmented into four (4) discrete capacitor areas, which are typically necessary to provide high capacitance values with >Ghz resonance frequencies. Each of the segmented discrete capacitor areas on the singulated die 160 may be multilayer parallel capacitors. A top layer 168 (see FIG. 16) of common ground shielding is provided.” Peters, [15:18-15:26].</p>
[1.A] a bottom package substrate;	<p>Peters discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 15 is a schematic cross-sectional view of another embodiment of the composite interposer of the present inventions positioned between a printed circuit board and an integrated circuit chip. FIG. 16 is a top plan view of the composite interposer of FIG.” Peters, [6:21-6:26].</p> <p>“FIG. 2 is a schematic cross-sectional view of another embodiment of the signal interposer 100 positioned between the printed board 102 and the integrated circuit chip 104.” Peters, [8:14-8:17].</p> <p>“With the signal core of FIG. 4 inserted between the upper and lower substrates of the power/ground wrap, signal connections may be made between the base substrate (element 102 of FIG. 2), the signal core, and the integrated circuit chip(s) in isolation from the power and ground connections between the base substrate and the chip(s).” Peters, [9:17-9:23].</p>

Appendix A-27 - Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

	<p>“FIG. 1 is a schematic cross-sectional view of one embodiment of the reduced cross-talk signal interposer 100 of the present invention, and is shown positioned between a printed circuit board 102 and an integrated circuit chip 104. The legend for the figure identifies some of the components of the complete structure. As shown in the figure, interposer 100 includes two primary sections; a signal core 106 and a power/ground wrap 108. The two sections can be fabricated and tested separately and then joined together using a z-connection technology, e.g., solder bumps, anisotropic conducting polymers, or another suitable method.” Peters, [12:65-13:8].</p>

Appendix A-27 - Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

	<p>Peters, FIG. 1</p> <p>“FIG. 14 is a schematic cross-sectional view of a different construction of the reduced cross-talk signal interposer of the present invention, and is shown positioned between a printed circuit board and an integrated circuit chip.” Peters, [12:65-13:1].</p> <p>“In FIGS. 17-23 there is illustrated a process flow of a method for fabricating one embodiment of the composite interposer 101. In the process step illustrated in FIG. 17, a silicon layer 170 (e.g. a previously processed and tested silicon wafer) having a thickness ranging from about 100 m to about 300 m, such as about 200 m, is adhesively attached to the circuit board 102 (i.e., an organic board).” Peters, [15:33-15:39].</p> <p>“In FIG. 67, two mating (and similarly processed) substrates 380 380 are aligned (one or both of which may be conventional rigid printed circuit board, printed circuit flex, semiconductor, glass or ceramic) such that the solder bumps 396 a 396 a are in contact with mating pads possessing a solder wettable surface (e.g. Au, Au/Ni, Cu, Pd, In, Sn, or solder alloys).” Peters, [25:52-25:58].</p> <p>To the extent Plaintiff contends that Peters fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom</p>	<p>Peters discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p>

Appendix A-27 - Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

package substrate and the top package substrate, wherein	<p><i>See, e.g.:</i></p> <p>“As shown in FIG. 1, edge connectors 1500 may be used to electrically connect different ground layers (e.g., the lower surface of the lower power/ground substrate to the upper surface of the upper power/ground substrate), different power layers (e.g., the upper surface of the lower power/ground substrate to the lower surface of the upper power/ground substrate), or the power/ground layer of the signal core to other ground or power layers of the interposer. Although a single set of edge connectors 1500 is shown in the figure, note that if the upper and lower power/ground substrates are fabricated separately (rather than formed from a flexible substrate which is bent into a U shape), then a set of connectors 1500 may be used at both ends of the two power/ground substrates.” Peters, [8:1-8:14].</p> <p>“FIG. 2 is a schematic cross-sectional view of another embodiment of the signal interposer 100 positioned between the printed board 102 and the integrated circuit chip 104.” Peters, [8:14-8:17].</p> <p>“FIG. 3 is a schematic cross-sectional view of one embodiment of the circuit signal core 106 which is part of the interposer of the present invention. Signal core 106 is formed from a conductive core or substrate 111 through which holes or apertures are formed. Conductive core 111 is typically formed from a suitable metal and serves as both a power/ground layer for the interposer and as a reinforcing structure for the signal layers of signal core 106. A dielectric film 110 (e.g., Polyimide, BT, etc.) is arranged on both sides of conductive core 111. Signal lines 113 are defined on a patterned metal layer formed on each of the two dielectric film layers. The two patterned metal layers are interconnected as desired by either a through via or a conductive post structure 112, with the through via or conductive post being suitable for interconnecting the signal core to other layers of the interposer structure, or to the mounting substrate or integrated circuit chips.” Peters, [8:18-8:34].</p>
--	--

	<p>“Referring now to FIG. 5, there is seen a schematic cross-sectional view of power ground wrap 108 which is part of embodiments of the interposer of the present invention. Power ground wrap 108 is formed from a dielectric film 120 (e.g. Polyimide, Bt, etc.) on both sides of which is patterned a metal layer. The two metal layers are interconnected as desired by either a through via or conductive post. Substrate 120 is formed into the shape shown in the figure, i.e., a box-shaped structure having a space between an upper and lower substrate.” Peters, [8:51-8:60].</p> <p>“FIG. 1 is a schematic cross-sectional view of one embodiment of the reduced cross-talk signal interposer 100 of the present invention, and is shown positioned between a printed circuit board 102 and an integrated circuit chip 104. The legend for the figure identifies some of the components of the complete structure. As shown in the figure, interposer 100 includes two primary sections; a signal core 106 and a power/ground wrap 108. The two sections can be fabricated and tested separately and then joined together using a z-connection technology, e.g., solder bumps, anisotropic conducting polymers, or another suitable method. This reduces the cycle time for manufacturing and testing of the structure, and increases the types of processing techniques which may be used to form the different parts of the final structure. As shown in the figure, in accordance with the present invention, power and ground interconnections are routed between the mounting substrate 102 and the chip(s) 104 without passing through the signal core 106. On the other hand, the signal lines are routed between the mounting substrate 102 and the chip(s) 104 by passing only through the signal core. This architecture provides electrical isolation between the power, ground, and signal interconnections (and hence reduces noise and other problems caused by capacitive coupling between lines) while increasing the density of signal lines which can be connected between the substrate and chip(s). Signal core 106 includes a power/ground layer 109 positioned between signal layers which are on either side of that substrate and together form the basis</p>

A dielectric film 110 (e.g., Polyimide, BT, etc.) is arranged on both sides of conductive core 111. Signal lines 113 are defined on a patterned metal layer formed on each of the two dielectric film layers. The two patterned metal layers are interconnected as desired by either a through via or a conductive post structure 112, with the through via or conductive post being suitable for interconnecting the signal core to other layers of the interposer structure, or to the mounting substrate or integrated circuit chips.” Peters, [8:20-8:34].</p>

FIG. 3

Peters, FIG. 3

“FIGS. 6 (a) to 6 (g) show a process flow for one preferred method of fabricating the signal core which is part of the reduced cross-talk interposer of embodiments of the present invention. In the process flow shown in FIG. 6, the metal layers on the two sides of the core substrate are interconnected by a through via. As shown in the figures, the process flow begins with a conductive layer, which may be formed from a suitable metal 202 (FIG. 6 (a)). Holes or apertures are formed in layer 202 at the positions where through vias or conductive posts will later be formed (FIG. 6 (b)). A dielectric layer 204 is then formed on each surface of conductive layer 202. Dielectric layers 204 may be laminated onto each surface of layer 202 (FIGS. 6 (c) and 6 (d)). Vias 206 are formed through dielectric layers 204 in the locations corresponding to the predefined apertures in conductive layer 202 (FIG. 6 (e)). Vias 206 may be formed by means of a laser drill or plasma etch process. Vias 206 are then metallized and a seed layer 208 is deposited on the surface of each dielectric layer

Appendix A-27 - Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

	<p>204 using electroless plating, direct plating, sputtering, or another suitable process (FIG. 6 (f)).” Peters, [9:33-9:52].</p> <p>“FIGS. 12 (a) to 12 (g) illustrate a process flow for an additional method of fabricating the signal core which is part of the reduced cross-talk interposer of the present invention. In the process flow shown in FIG. 12, a conductive layer 1202 again has holes or apertures formed through it at desired locations (FIGS. 12 (a) and 12 (b)). A dielectric layer 1204 is formed (e.g., laminated) onto one surface of conductive layer 1202. A dielectric having a previously formed metallized surface or layer 1205 is then laminated onto the other surface of conductive layer 1202 (FIGS. 12 (c) and 12 (d)). Vias 1206 are formed through dielectric layers 1204 in the locations corresponding to the predefined apertures in conductive layer 1202 (FIG. 12 (e)). Vias 1206 may be formed by means of a laser drill or plasma etch process.” Peters, [11:35-11:48].</p> <p>“Referring now to FIGS. 24-30 for another embodiment of the present invention, instead of dielectric layer 190 being employed to fill openings 184 and 196 and to exposed semiconductor groups 174 and exposed portions of the segmented silicon layers 170 a, 170 b, 170 c and 170 d of FIG. 19, a high-aspect-ratio capable material 201 (see FIG. 27) is employed to fill openings 184 and 196, and to cover the exposed semiconductor groups 174 and exposed portions of the segmented silicon layers 170 a, 170 b, 170 c, and 170 d of FIG. 26. High-aspect-ratio capable material is material which is capable of passing into a high aspect ratio aperture to form high aspect ratio vias. The aspect ratio of an aperture or a corresponding via structure may be defined as the high H of the aperture divided by the smallest cross-sectional width D of the aperture. For example, an aperture with a height H and a width D has as aspect ratio of H/D. The apertures or the formed via structures may have aspect ratios of about 20:1 or more with heights of, e.g., about 450 microns or more, and preferably aspect ratios of about 30:1 or more with heights of, e.g., about 600 microns or</p>
--	---

Appendix A-27 - Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

	<p>more. Material 201 has an aspect ratio ranging from about 2:1 to about 40:1, preferably from about 4:1 to about 15:1, more preferably from about 6:1 to about 8:1. Material 201 is preferably an epoxy polymer which may be purchased commercially under the trade name SU-8 which was originally developed and patented by IBM-Watson Research Center (Yorktown Height, USA). Current manufacturers of SU-8 are MicroChem Corp. (previously named Microlithography Chemical Corp.), Sotec Microsystems (spin-off from EPFL) in Switzerland, and Mimotec (also spin-off from EPFL). After vias 192 (which are preferably photo-definable through vias, not produced by laser drilling) are formed, layers 201 a, 201 b, 201 c, and 201 d remain from the material 201.” Peters, [16:61-17:27].</p> <p>“Plated vias 264 264 may then be formed respectively between residual silicon layers 230 a, 230 b, and between residual silicon layers 230 b, 230 c, and through dielectric layers 238, 247 and the metal layers, as shown in FIG. 37. Optionally, plated vias 264 264 may be filled with a dielectric material 268 and capped with caps 270 270. Plated vias 264 264 may be formed by any suitable conventional process, such as by laser drilling the necessary vias, and plating (e.g. with copper) by the combination of e-less and electrolytic plating.” Peters, [18:39-18:48].</p> <p>“Circuit board 102 is adhesively connected to the dielectric material 260 b, as also reflected in FIG. 36, and openings 280 280 are subsequently produced between residual silicon layers 230 a, 230 b and residual silicon layers 230 b, 230 c and through dielectric layer 238, dielectric material 260 and circuit board 102, as shown in FIG. 43. Openings 240 are also produced through the dielectric layer 238 to expose operable, non-defective devices or pads 234 a, 234 b, 234 c and 234 d. It is assumed that devices or pads 234 e and 234 f when previously tested, such as previously described with respect to the test performed on the structure of FIG. 39, were discovered to be defective; thus, no openings 240 are to be formed in the dielectric layer 238 to expose devices or pads 234 e and 234 f. Openings 240 over</p>

plurality of metal pillars of the spacer connector,	<p><i>See, e.g.:</i></p> <p>“FIG. 1 is a schematic cross-sectional view of one embodiment of the reduced cross-talk signal interposer 100 of the present invention, and is shown positioned between a printed circuit board 102 and an integrated circuit chip 104. The legend for the figure identifies some of the components of the complete structure. As shown in the figure, interposer 100 includes two primary sections; a signal core 106 and a power/ground wrap 108. The two sections can be fabricated and tested separately and then joined together using a z-connection technology, e.g., solder bumps, anisotropic conducting polymers, or another suitable method.” Peters, [7:36-7:46].</p>
---	---

	<p>Peters, FIG. 1</p> <p>“As shown in the figure, in accordance with the present invention, power and ground interconnections are routed between the mounting substrate 102 and the chip(s) 104 without passing through the signal core 106. On the other hand, the signal lines are routed between the mounting substrate 102 and the chip(s) 104 by passing only through the signal core. This architecture provides electrical isolation between the power, ground, and signal interconnections (and hence reduces noise and other problems caused by capacitive coupling between lines) while increasing the density of signal lines which can be connected between the substrate and chip(s). Signal core 106 includes a power/ground layer 109 positioned between signal layers which are on either side of that substrate and together form the basis for the signal core. Power/ground layer 109 acts to reduce cross-talk between signal lines on the same or different signal layers of signal core 106.” Peters, [7:51-7:67].</p> <p>“As shown in FIG. 1, edge connectors 1500 may be used to electrically connect different ground layers (e.g., the lower surface of the lower power/ground substrate to the upper surface of the upper power/ground substrate), different power layers (e.g., the upper surface of the lower power/ground substrate to the lower surface of the upper power/ground substrate), or the power/ground layer of the signal core to other ground or power layers of the interposer. Although a single set of edge connectors 1500 is shown in the figure, note that if the upper and lower power/ground substrates are fabricated separately (rather than formed from a flexible substrate which is bent into a “U” shape), then a set of connectors 1500 may be used at both ends of the two power/ground substrates. FIG. 2 is a schematic cross-sectional view of another embodiment of the signal interposer 100 positioned between the printed board 102 and the integrated circuit chip 104.” Peters, [8:1-8:17].</p>
--	--

	<p>“Referring now to FIG. 5, there is seen a schematic cross-sectional view of power ground wrap 108 which is part of embodiments of the interposer of the present invention. Power ground wrap 108 is formed from a dielectric film 120 (e.g. Polyimide, Bt, etc.) on both sides of which is patterned a metal layer. The two metal layers are interconnected as desired by either a through via or conductive post.” Peters, [8:51-8:57].</p> <p>“FIGS. 8 (a) to 8 (g) show a process flow for yet another method of fabricating another embodiment of the signal core which is part of embodiments of the interposer of the present invention. In the process flow shown in FIG. 8, the metal layers on the two sides of the dielectric substrate are interconnected by a conductive post. As shown in the figures, the process flow begins with a substrate 720 (FIG. 8 (a)). A metal layer 704 is then formed over the substrate and patterned (FIG. 8 (b)). A resist layer 720 is then formed over the patterned metal layer (FIG. 8 (c)). The top resist layer is then patterned to form the locations 722 for the posts (FIG. 8 (d)). The conductive posts 724 are then formed by a suitable electrolytic deposition process. A dielectric layer is then formed over the posts (FIG. 8 (e)). A chemical-mechanical polishing process is then used to planarize the top dielectric layer and level the posts (FIG. 8 (f)). Finally, a metallization step is used to form conductive contacts 726 on the tops of the posts FIG. 8 (g)” Peters, [10:21-10:38].</p> <p>“FIGS. 10 (a) to 10 (e) show a process flow for an additional method of fabricating the power/ground wrap 108 which is part of the interposer of the present invention. The fabrication process shown begins with a dielectric substrate 1000 (FIG. 10 (a)). Through vias 1002 are formed in the substrate at the desired locations (FIG. 10 (b)). The vias may be formed by a laser drill, plasma etching, or another suitable method. The vias are then filled with a conductive material, and a conductive layer 1004 is formed on the upper and lower surfaces of the substrate (FIG. 10 (c)). The conductive material may be applied by an electroless and/or electrolytic plating process.” Peters, [10:66-11:10].</p>
--	---

Appendix A-27 - Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

	<p>“The integrated circuit chip(s) can be attached to the interposer 108 by flip chip, TAB (tape automated bonding), flip TAB, wire bonding, or another suitable method. For most applications, the preferred interconnection method is a flip chip area array process. The interposer can be connected to the PCB or other substrate by means of a ball grid array (BGA).” Peters, [13:30-13:36].</p> <p>To the extent Plaintiff contends that Peters fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.I] the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and</p>	<p>Peters discloses, either expressly or inherently, the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“As shown in FIG. 1, edge connectors 1500 may be used to electrically connect different ground layers (e.g., the lower surface of the lower power/ground substrate to the upper surface of the upper power/ground substrate), different power layers (e.g., the upper surface of the lower power/ground substrate to the lower surface of the upper power/ground substrate), or the power/ground layer of the signal core to other ground or power layers of the interposer. Although a single set of edge connectors 1500 is shown in the figure, note that if the upper and lower power/ground substrates are fabricated separately (rather than formed from a flexible substrate which is bent into a U shape), then a set of connectors 1500 may be used at both ends of the two power/ground substrates.” Peters, [8:1-8:14].</p>

	<p>“FIG. 3 is a schematic cross-sectional view of one embodiment of the circuit signal core 106 which is part of the interposer of the present invention. Signal core 106 is formed from a conductive core or substrate 111 through which holes or apertures are formed. Conductive core 111 is typically formed from a suitable metal and serves as both a power/ground layer for the interposer and as a reinforcing structure for the signal layers of signal core 106. A dielectric film 110 (e.g., Polyimide, BT, etc.) is arranged on both sides of conductive core 111. Signal lines 113 are defined on a patterned metal layer formed on each of the two dielectric film layers. The two patterned metal layers are interconnected as desired by either a through via or a conductive post structure 112, with the through via or conductive post being suitable for interconnecting the signal core to other layers of the interposer structure, or to the mounting substrate or integrated circuit chips.” Peters, [8:18-8:34].</p> <p>“Referring now to FIG. 5, there is seen a schematic cross-sectional view of power ground wrap 108 which is part of embodiments of the interposer of the present invention. Power ground wrap 108 is formed from a dielectric film 120 (e.g. Polyimide, Bt, etc.) on both sides of which is patterned a metal layer. The two metal layers are interconnected as desired by either a through via or conductive post.” Peters, [8:51-8:57].</p> <p>“FIGS. 6 (a) to 6 (g) show a process flow for one preferred method of fabricating the signal core which is part of the reduced cross-talk interposer of embodiments of the present invention. In the process flow shown in FIG. 6, the metal layers on the two sides of the core substrate are interconnected by a through via. As shown in the figures, the process flow begins with a conductive layer, which may be formed from a suitable metal 202 (FIG. 6 (a)). Holes or apertures are formed in layer 202 at the positions where through vias or conductive posts will later be formed (FIG. 6 (b)). A dielectric layer 204 is then formed on each surface of conductive layer 202. Dielectric layers 204 may be laminated onto each</p>
--	--

	<p>surface of layer 202 (FIGS. 6 (c) and 6 (d)). Vias 206 are formed through dielectric layers 204 in the locations corresponding to the predefined apertures in conductive layer 202 (FIG. 6 (e)). Vias 206 may be formed by means of a laser drill or plasma etch process. Vias 206 are then metallized and a seed layer 208 is deposited on the surface of each dielectric layer 204 using electroless plating, direct plating, sputtering, or another suitable process (FIG. 6 (f)). Seed layer 208 is then built up to form a metal layer of desired thickness which is patterned as desired to form signal lines 210 and signal pads 211 (FIG. 6 (g)).” Peters, [9:33-9:55].</p> <p>“FIGS. 8 (a) to 8 (g) show a process flow for yet another method of fabricating another embodiment of the signal core which is part of embodiments of the interposer of the present invention. In the process flow shown in FIG. 8, the metal layers on the two sides of the dielectric substrate are interconnected by a conductive post. As shown in the figures, the process flow begins with a substrate 720 (FIG. 8 (a)). A metal layer 704 is then formed over the substrate and patterned (FIG. 8 (b)). A resist layer 720 is then formed over the patterned metal layer (FIG. 8 (c)). The top resist layer is then patterned to form the locations 722 for the posts (FIG. 8 (d)). The conductive posts 724 are then formed by a suitable electrolytic deposition process. A dielectric layer is then formed over the posts (FIG. 8 (e)). A chemical-mechanical polishing process is then used to planarize the top dielectric layer and level the posts (FIG. 8 (f)). Finally, a metallization step is used to form conductive contacts 726 on the tops of the posts FIG. 8 (g)).” Peters, [10:21-10:38].</p> <p>“FIG. 1 is a schematic cross-sectional view of one embodiment of the reduced cross-talk signal interposer 100 of the present invention, and is shown positioned between a printed circuit board 102 and an integrated circuit chip 104. The legend for the figure identifies some of the components of the complete structure. As shown in the figure, interposer 100 includes two primary sections; a signal core 106 and a power/ground wrap 108. The two sections can</p>
--	--

	<p>be fabricated and tested separately and then joined together using a z-connection technology, e.g., solder bumps, anisotropic conducting polymers, or another suitable method. This reduces the cycle time for manufacturing and testing of the structure, and increases the types of processing techniques which may be used to form the different parts of the final structure. As shown in the figure, in accordance with the present invention, power and ground interconnections are routed between the mounting substrate 102 and the chip(s) 104 without passing through the signal core 106. On the other hand, the signal lines are routed between the mounting substrate 102 and the chip(s) 104 by passing only through the signal core. This architecture provides electrical isolation between the power, ground, and signal interconnections (and hence reduces noise and other problems caused by capacitive coupling between lines) while increasing the density of signal lines which can be connected between the substrate and chip(s). Signal core 106 includes a power/ground layer 109 positioned between signal layers which are on either side of that substrate and together form the basis for the signal core.” Peters, [12:65-13:27].</p>

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	<p>Peters discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p>

Appendix A-27 - Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	<p>“FIG. 1 is a schematic cross-sectional view of one embodiment of the reduced cross-talk signal interposer 100 of the present invention, and is shown positioned between a printed circuit board 102 and an integrated circuit chip 104. The legend for the figure identifies some of the components of the complete structure. As shown in the figure, interposer 100 includes two primary sections; a signal core 106 and a power/ground wrap 108. The two sections can be fabricated and tested separately and then joined together using a z-connection technology, e.g., solder bumps, anisotropic conducting polymers, or another suitable method. This reduces the cycle time for manufacturing and testing of the structure, and increases the types of processing techniques which may be used to form the different parts of the final structure.” Peters, [7:36-7:50].</p>
--	---

	<p>Peters, FIG. 1</p> <p>“As shown in the figure, in accordance with the present invention, power and ground interconnections are routed between the mounting substrate 102 and the chip(s) 104 without passing through the signal core 106. On the other hand, the signal lines are routed between the mounting substrate 102 and the chip(s) 104 by passing only through the signal core. This architecture provides electrical isolation between the power, ground, and signal interconnections (and hence reduces noise and other problems caused by capacitive coupling between lines) while increasing the density of signal lines which can be connected between the substrate and chip(s). Signal core 106 includes a power/ground layer 109 positioned between signal layers which are on either side of that substrate and together form the basis for the signal core. Power/ground layer 109 acts to reduce cross-talk between signal lines on the same or different signal layers of signal core 106.” Peters, [7:51-7:67].</p> <p>“As shown in FIG. 1, edge connectors 1500 may be used to electrically connect different ground layers (e.g., the lower surface of the lower power/ground substrate to the upper surface of the upper power/ground substrate), different power layers (e.g., the upper surface of the lower power/ground substrate to the lower surface of the upper power/ground substrate), or the power/ground layer of the signal core to other ground or power layers of the interposer. Although a single set of edge connectors 1500 is shown in the figure, note that if the upper and lower power/ground substrates are fabricated separately (rather than formed from a flexible substrate which is bent into a “U” shape), then a set of connectors 1500 may be used at both ends of the two power/ground substrates. FIG. 2 is a schematic cross-sectional view of another embodiment of the signal interposer 100 positioned between the printed board 102 and the integrated circuit chip 104.” Peters, [8:1-8:17].</p>
--	--

Appendix A-27 - Invalidity of U.S. Patent No. 9859202 in view of Peters - U.S. Patent No. 6521530

	<p>To the extent Plaintiff contends that Peters fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-28 - Invalidity of U.S. Patent No. 9859202 in view of Savastious '170 - U.S. Patent No. 7049170

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Savastious '170 - U.S. Patent No. 7049170

U.S. Patent No. 7049170 ("Savastious '170") is titled Integrated Circuits and Packaging Substrates with Cavities, and Attachment Methods Including Insertion of Protruding Contact Pads into Cavities and lists Sergey Savastious, Patrick B. Halahan, and Sam Kao as inventors. Savastious '170 is assigned to Tru-Si Technologies, Inc. Savastious '170 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 ("the '202 Patent") under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff's apparent infringement theory.² Savastious '170 is a U.S. patent that was filed December 17, 2003 and published June 23, 2005. Savastious '170 is therefore prior art to the '202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Savastious '170, or otherwise rendered obvious by disclosures and teachings of Savastious '170, including under TopWire's apparent interpretation of the Asserted Claims as Samsung understands them from TopWire's Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Savastious '170 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Savastious '170 with: (1) the knowledge of one of ordinary skill in the art ("POSITA") to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung's other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung's Invalidity Contentions with respect to the '202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Savastious '170, either alone or in combination with other prior art cited by Samsung and/or with

¹ As used herein, "Asserted Claims" refers only to those claims charted in TopWire's March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court's order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire's apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung's interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-28 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '170 - U.S. Patent No. 7049170

the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Savastiouk '170 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Savastiouk '170 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Savastiouk '170 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Savastiouk '170 discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>"FIG. 1, die (“IC”) 124 is flip-chip attached, with solder 126, to the intermediate substrate 110 (“BGA substrate”), and BGA substrate 110 is soldered to PCB 130 (with solder 134). BGA substrate 110 provides interconnect lines (not shown) between die 124 and PCB 130." Savastiouk '170, [1:26-1:31].</p>

Appendix A-28 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '170 - U.S. Patent No. 7049170

	<p>"FIG. 2 illustrates another package with two intermediate substrates 110, 120 between dies (ICs) 124 and PCB 130. Intermediate substrate 110 is a BT substrate, soldered to the underlying PCB 130 with solder balls 134. Intermediate substrate 120 is a silicon interposer attached to the top surface of BT substrate 110 by an adhesive (not shown). Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140 and separated by dielectric layers 144. Dies 124 are attached to interposer 120 with their contact pads facing up." Savastiouk '170, [1:63-2:5].</p> <p>"FIG. 3 illustrates an integrated circuit packaging substrate 310 having two intermediate integrated circuit packaging substrates 110, 120. Substrate 120 is a silicon interposer attached to BT substrate 110. Dies 124 and PCB 130 will be attached later. Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140. Substrate 140 has substantially planar top and bottom surfaces, and is quite thin. In some embodiments, the planarity of substrate 140 is suitable for fine geometry photolithography (finer than possible with BT and FR4 substrates). The thickness of substrate 140 can be 100 μm or less (50 μm to 35 μm thickness values believed to be achievable, and smaller values may be possible). Layers 136 provide interconnect lines and may also provide power and ground planes, resistors, inductors, capacitor plates for decoupling capacitors and other capacitor types, and possibly other elements, known or to be invented. Layers 136 can be separated from each other, and from the substrate, by dielectric layers 144. Layers 136 contact each other and the silicon substrate through openings in the dielectric layers. Layers 136 can also be formed directly on the silicon substrate if desired. Layers 136 provide contact pads 136 C at the top surface of the interposer. The contact pads are available for flip-chip attachment to dies 124. Silicon substrate 140 includes metalized through-silicon vias 330 that pass between the top and bottom surfaces of substrate 140. Conductive paths are provided from contact pads 136 C at the top of the interposer to contact pads 340 at the bottom of the interposer through the vias 330." Savastiouk '170, [3:52-4:13].</p>
--	--

Savastiouk '170, FIG. 3

"FIG. 12 is similar to FIG. 11, but solder balls 1210 have been attached to contact pads 136 C. Solder balls 1210 eliminate the need for solder balls 370 (FIG. 3) on dies 124. The packaging substrate manufacturer can provide solder balls 1210 to simplify the die 124 attachment for the substrate buyers." Savastiouk '170, [9:3-9:8].

"FIGS. 13–14 illustrate a possible manufacturing sequence with multiple die levels 124. 1, 124. 2, 124. 3 attached to the packaging substrate. The packaging substrate is manufactured as in FIG. 12. The interposer vias are marked 330. 0 (instead of 330 as in FIG. 12), the contact pads at the bottom of the interposer are marked 340. 0, and the solder at the top is marked 1210. 0. Each die 124. 1 has one or more metalized through vias 330. 1 formed in

Appendix A-28 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '170 - U.S. Patent No. 7049170

	<p>the die's semiconductor substrate 140. 1 (e.g. monocrystalline silicon). Each via 330. 1 passes between the top and bottom surfaces of substrate 140. 1. Conductive paths are provided from contact pads at the top of the die 124. 1 to contact pads 340. 1 at the bottom of the die through the vias 330. 1." Savastiouk '170, [9:43-9:56].</p> <p>"FIG. 15. The attachment of dies 124. 1 to interposer 120 is performed by the same techniques as the attachment of the interposer to BT substrate 110. The attachment of dies 124. 2 to dies 124. 1 can also be performed in this way. As shown in FIG. 15, the top dielectric layer 144 in interposer 120 is a thick layer, e.g. 50 μm thick. This can be a photoimageable material such as described above for BT layer 110. 3. Openings in top layer 144 expose contact pads 136 C. Contact pads 340. 1 on die 124. 1 protrude by some distance, e.g. 50 μm, below the bottom surface of silicon substrate 140. 1 of die 124. 1. The contact pads are inserted into the cavities in the top surface of the interposer." Savastiouk '170, [11:11-11:23].</p>
[1.A] a bottom package substrate;	<p>Savastiouk '170 discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>"FIG. 2 illustrates another package with two intermediate substrates 110, 120 between dies (ICs) 124 and PCB 130. Intermediate substrate 110 is a BT substrate, soldered to the underlying PCB 130 with solder balls 134. Intermediate substrate 120 is a silicon interposer attached to the top surface of BT substrate 110 by an adhesive (not shown)." Savastiouk '170, [1:63-2:1].</p> <p>"FIG. 3 illustrates an integrated circuit packaging substrate 310 having two intermediate integrated circuit packaging substrates 110, 120. Substrate 120 is a silicon interposer attached to BT substrate 110. Dies 124 and PCB 130 will be attached later. Silicon interposer 120</p>

Appendix A-28 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '170 - U.S. Patent No. 7049170

	<p>includes metal layers 136 formed over silicon substrate 140. Substrate 140 has substantially planar top and bottom surfaces, and is quite thin. In some embodiments, the planarity of substrate 140 is suitable for fine geometry photolithography (finer than possible with BT and FR4 substrates). The thickness of substrate 140 can be 100 μm or less (50 μm to 35 μm thickness values believed to be achievable, and smaller values may be possible). Layers 136 provide interconnect lines and may also provide power and ground planes, resistors, inductors, capacitor plates for decoupling capacitors and other capacitor types, and possibly other elements, known or to be invented. Layers 136 can be separated from each other, and from the substrate, by dielectric layers 144. Layers 136 contact each other and the silicon substrate through openings in the dielectric layers. Layers 136 can also be formed directly on the silicon substrate if desired. Layers 136 provide contact pads 136 C at the top surface of the interposer. The contact pads are available for flip-chip attachment to dies 124. Silicon substrate 140 includes metalized through-silicon vias 330 that pass between the top and bottom surfaces of substrate 140. Conductive paths are provided from contact pads 136 C at the top of the interposer to contact pads 340 at the bottom of the interposer through the vias 330. Contact pads 340 are attached to contact pads 350 at the top surface of BT substrate 110. Interconnects (not shown) in BT substrate 110 connect the contact pads 350 to contact pads 360 at the bottom surface of substrate 110." Savastiouk '170, [3:52-4:18].</p>
--	---

Savastiouk '170, FIG. 3.

"Interposer 120 (diced or undiced) can be attached to a conventional BT substrate 110 with solder, conductive epoxy, anisotropic adhesive, thermocompression, or possibly by other techniques, known or to be invented. In some embodiments, however, specially processed BT substrates are used to minimize the interposer handling." Savastiouk '170, [6:59-6:64].

"BT substrate 110 of FIGS. 9 and 10 is formed from one or more BT layers laminated in a conventional manner. Three layers 110. 1, 110. 2, 110. 3 are shown, but any number of layers can be present. Thin film metal layers 910 (e.g. copper) are formed on BT layers 110.i (i=1, 2, 3) and on the bottom side of layer 110. 1 in a conventional manner to provide signal routing paths and ground and power planes. Layers 910 are interconnected through vias in the BT layers 110.i (i.e. 110. 1, 110. 2, 110. 3) using known techniques to provide conductive paths

Appendix A-28 - Invalidity of U.S. Patent No. 9859202 in view of Savastious '170 - U.S. Patent No. 7049170

	<p>between contact pads 350 and contact pads 360. The bottom metal layer 910 provides contact pads 360 (FIG. 3) at the bottom surface of BT substrate 110." Savastious '170, [7:14-7:26].</p> <p>"Silicon interposer contact pads 340 will be inserted into these cavities to form a reliable mechanical and electrical contact. In one embodiment, each cavity 920 has a diameter D_{cav}=150 μm to accommodate a 50 μm to 60 μm diameter D_c of the contact pads 340. D_c can be calculated starting with the diameter D_v (FIG. 4) of via 330, by subtracting double the thickness of the layers 410, 420, 430. 1, 444, 448. The depth H_{cav} of each cavity 920 (about equal to the thickness of layer 110. 3) is 50 μm for a 50 μm height H_d of contact pads 340 (H_{cav} is measured to the top surface of contact pads 350)." Savastious '170, [7:33-7:44].</p> <p>"FIGS. 13–14 illustrate a possible manufacturing sequence with multiple die levels 124. 1, 124. 2, 124. 3 attached to the packaging substrate. The packaging substrate is manufactured as in FIG. 12. The interposer vias are marked 330. 0 (instead of 330 as in FIG. 12), the contact pads at the bottom of the interposer are marked 340. 0, and the solder at the top is marked 1210. 0." Savastious '170, [9:43-9:49].</p> <p>To the extent Plaintiff contends that Savastious '170 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.B] a top package substrate stacked on top of the bottom package substrate;	<p>Savastious '170 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p>

"FIG. 2 illustrates another package with two intermediate substrates 110, 120 between dies (ICs) 124 and PCB 130. Intermediate substrate 110 is a BT substrate, soldered to the underlying PCB 130 with solder balls 134. Intermediate substrate 120 is a silicon interposer attached to the top surface of BT substrate 110 by an adhesive (not shown)." Savastiouk '170, [1:63-2:1].

"FIG. 3 illustrates an integrated circuit packaging substrate 310 having two intermediate integrated circuit packaging substrates 110, 120. Substrate 120 is a silicon interposer attached to BT substrate 110. Dies 124 and PCB 130 will be attached later. Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140." Savastiouk '170, [3:52-3:58].

Savastiouk '170, FIG. 3.

Appendix A-28 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '170 - U.S. Patent No. 7049170

	<p>"Silicon interposer 120 can be manufactured using conventional techniques. See e.g. the aforementioned U.S. Pat. No. 6,322,903. Other techniques are described in U.S. patent application Ser. No. 10/410,929 filed on Apr. 9, 2003 by P. Halahan et al., entitled "Electroplating and electroless plating of conductive materials into openings, and structures obtained thereby", incorporated herein by reference. Still other techniques can possible be used, whether known or to be invented." Savastiouk '170, [4:51-4:59].</p> <p>"Interposer 120 (diced or undiced) can be attached to a conventional BT substrate 110 with solder, conductive epoxy, anisotropic adhesive, thermocompression, or possibly by other techniques, known or to be invented." Savastiouk '170, [6:59-6:62].</p> <p>"Silicon interposer contact pads 340 will be inserted into these cavities to form a reliable mechanical and electrical contact." Savastiouk '170, [7:33-7:35].</p> <p>"Interposer wafer 120 is placed on BT substrate 110 (FIG. 10). Protruding contact pads 340 enter the cavities 920 and contact the solder 930 but do not necessarily reach the metal 910 of contact pads 350. A uniform height of contact pads 340 is not required for a good electrical contact. Underfill 940 spreads out under the interposer." Savastiouk '170, [7:66-8:4].</p> <p>To the extent Plaintiff contends that Savastiouk '170 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-28 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '170 - U.S. Patent No. 7049170

<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Savastiouk '170 discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>"Underfill 940 spreads out under the interposer. In the embodiment shown, the bottom surface of silicon 140 does not reach the BT substrate. Underfill 940 helps insulate the silicon from solder 930." Savastiouk '170, [8:4-8:7].</p> <p>"In one embodiment, the final value of the gap G 1 between the silicon 140 and the BT substrate 110 is 25 μm. The gap values of 5 to 10 μm and larger are believed to be appropriate to provide sufficient electrical insulation if no dielectric is formed on the bottom surface of silicon 140." Savastiouk '170, [8:20-8:25].</p>
---	--

Savastiouk '170, FIG. 3.

"As shown in FIG. 15, the top dielectric layer 144 in interposer 120 is a thick layer, e.g. 50 μm thick. This can be a photoimageable material such as described above for BT layer 110. 3. Openings in top layer 144 expose contact pads 136 C. Contact pads 340. 1 on die 124. 1 protrude by some distance, e.g. 50 μm , below the bottom surface of silicon substrate 140. 1 of die 124. 1." Savastiouk '170, [11:16-11:22].

"In some embodiments, the same dimensions are obtained as for the attachment between the BT substrate and the interposer, i.e. the final value of the gap between the silicon 140, 1 and interposer 120 is 25 μm (gap values of 5 to 0 μm and larger are believed to be appropriate to provide sufficient electrical insulation if no dielectric is formed on the bottom surface of

Appendix A-28 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '170 - U.S. Patent No. 7049170

	<p>silicon 140. 1); the contact 340. 1 portion inside the cavities in top layer 144 is 25 μm high (note dimension C 1 in FIG. 10)." Savastiouk '170, [11:32-11:40].</p> <p>"Underfill (not shown) can be injected between the interposer and the dies 124. 1 using known techniques." Savastiouk '170, [11:42-11:43].</p> <p>"For example, in some embodiments, before the interposer is thinned, solder paste 1210. 0 is placed into the cavities on top of the interposer, then a no-fill underfill is dispensed and a die or dies 124. 1 placed on the interposer, then a heating step is performed." Savastiouk '170, [11:48-11:52].</p> <p>To the extent Plaintiff contends that Savastiouk '170 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.D] the spacer connector comprises a core substrate;	<p>Savastiouk '170 discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>"Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140" Savastiouk '170, [2:2-2:3].</p>

	<p>FIG. 3</p>
<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Savastiouk '170, FIG. 3.</p> <p>"Silicon substrate 140 includes metalized through-silicon vias 330 that pass between the top and bottom surfaces of substrate 140." Savastiouk '170, [4:9-4:11].</p> <p>To the extent Plaintiff contends that Savastiouk '170 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p> <p>Savastiouk '170 discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p>See, e.g.:</p>

"Silicon substrate 140 includes metalized through-silicon vias 330 that pass between the top and bottom surfaces of substrate 140. Conductive paths are provided from contact pads 136 C at the top of the interposer to contact pads 340 at the bottom of the interposer through the vias 330." Savastiouk '170, [4:9-4:13].

Savastiouk '170, FIG. 3.

"Vias 330 (FIG. 4) are etched in the top surface of silicon substrate 140 (e.g. monocrystalline silicon) by DRIE (deep reactive ion etching) to an exemplary depth $H_v=150\text{ }\mu\text{m}$. (The dimensions, etching processes, and other particulars are exemplary and not limiting.) The via diameter D_v is $25\text{ }\mu\text{m}$ to $100\text{ }\mu\text{m}$." Savastiouk '170, [4:60-4:65].

Appendix A-28 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '170 - U.S. Patent No. 7049170

	<p>"Copper 430. 2 is electroplated on nickel 448 to fill the vias 330 and possibly protrude out of the vias." Savastiouk '170, [5:17-5:18].</p> <p>"In some embodiments, metal 430. 2 does not fill the through-silicon vias. Metal 430. 2 is a thin film deposited over the via sidewalls, and it can be part of a layer 136." Savastiouk '170, [6:53-6:55].</p> <p>"Each die 124. 1 has one or more metalized through vias 330. 1 formed in the die's semiconductor substrate 140. 1 (e.g. monocrystalline silicon). Each via 330. 1 passes between the top and bottom surfaces of substrate 140. 1. Conductive paths are provided from contact pads at the top of the die 124. 1 to contact pads 340. 1 at the bottom of the die through the vias 330. 1." Savastiouk '170, [9:50-9:56].</p> <p>"Dies 124. 2 may be similar to dies 124. 1, but there is no solder on dies 124. 2. Dies 124. 2 include metalized vias 330. 2 in semiconductor substrates 140. 2, and contact pads 340. 2 protruding out of the vias." Savastiouk '170, [10:10-10:13].</p> <p>To the extent Plaintiff contends that Savastiouk '170 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.F] a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars;	<p>Savastiouk '170 discloses, either expressly or inherently, a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.</p> <p><i>See, e.g.:</i></p>

"Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140. Substrate 140 has substantially planar top and bottom surfaces, and is quite thin. In some embodiments, the planarity of substrate 140 is suitable for fine geometry photolithography (finer than possible with BT and FR4 substrates). The thickness of substrate 140 can be 100 μm or less (50 μm to 35 μm thickness values believed to be achievable, and smaller values may be possible). Layers 136 provide interconnect lines and may also provide power and ground planes, resistors, inductors, capacitor plates for decoupling capacitors and other capacitor types, and possibly other elements, known or to be invented. Layers 136 can be separated from each other, and from the substrate, by dielectric layers 144. Layers 136 contact each other and the silicon substrate through openings in the dielectric layers. Layers 136 can also be formed directly on the silicon substrate if desired. Layers 136 provide contact pads 136C at the top surface of the interposer. The contact pads are available for flip-chip attachment to dies 124." Savastiouk '170, [3:57-4:8].

Appendix A-28 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '170 - U.S. Patent No. 7049170

	<p>Savastiouk '170, FIG. 3.</p> <p>"Silicon substrate 140 includes metalized through-silicon vias 330 that pass between the top and bottom surfaces of substrate 140. Conductive paths are provided from contact pads 136 C at the top of the interposer to contact pads 340 at the bottom of the interposer through the vias 330." Savastiouk '170, [4:9-4:13].</p> <p>"FIG. 12 is similar to FIG. 11, but solder balls 1210 have been attached to contact pads 136 C. Solder balls 1210 eliminate the need for solder balls 370 (FIG. 3) on dies 124. The packaging substrate manufacturer can provide solder balls 1210 to simplify the die 124 attachment for the substrate buyers. Solder 1210 can be attached to the interposer at any fabrication stage. In one embodiment, solder 1210 is attached to pads 136 C before the interposer wafer is thinned, i.e. before the stage of FIG. 8." Savastiouk '170, [9:3-9:11].</p> <p>"Each die 124. 1 has one or more metalized through vias 330. 1 formed in the die's semiconductor substrate 140. 1 (e.g. monocrystalline silicon). Each via 330. 1 passes between the top and bottom surfaces of substrate 140. 1. Conductive paths are provided from contact pads at the top of the die 124. 1 to contact pads 340. 1 at the bottom of the die through the vias 330. 1." Savastiouk '170, [9:50-9:56].</p> <p>"As shown in FIG. 15, the top dielectric layer 144 in interposer 120 is a thick layer, e.g. 50 μm thick. This can be a photoimageable material such as described above for BT layer 110. 3." Savastiouk '170, [11:16-11:19].</p> <p>"Metal layer 1110 (e.g. gold or nickel) can be deposited on the sidewalls and bottom of the vias in top layer 144 to improve the electrical connection and provide a barrier against copper</p>

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Savastiouk '170 discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>"FIG. 2 illustrates another package with two intermediate substrates 110, 120 between dies (ICs) 124 and PCB 130. Intermediate substrate 110 is a BT substrate, soldered to the underlying PCB 130 with solder balls 134. Intermediate substrate 120 is a silicon interposer attached to the top surface of BT substrate 110 by an adhesive (not shown). Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140 and separated by dielectric layers 144. Dies 124 are attached to interposer 120 with their contact pads facing up." Savastiouk '170, [1:63-2:5].</p> <p>"FIG. 3 illustrates an integrated circuit packaging substrate 310 having two intermediate integrated circuit packaging substrates 110, 120. Substrate 120 is a silicon interposer attached to BT substrate 110. Dies 124 and PCB 130 will be attached later." Savastiouk '170, [3:52-3:56].</p>

Savastiouk '170, FIG. 3.

"FIGS. 13–14 illustrate a possible manufacturing sequence with multiple die levels 124. 1, 124. 2, 124. 3 attached to the packaging substrate. The packaging substrate is manufactured as in FIG. 12. The interposer vias are marked 330. 0 (instead of 330 as in FIG. 12), the contact pads at the bottom of the interposer are marked 340. 0, and the solder at the top is marked 1210. 0." Savastiouk '170, [9:43-9:49].

"At step 1430, dies 124. 1 are soldered to interposer 120 with solder 1210. 0, at a temperature of about 218° C. or higher, but below 230° C. not to melt the solder 930. The copper from contact pads 340. 1 dissolves in solder 1210. 0 and increases its melting temperature to about 230° C. Solder 1210. 1 may melt, but its melting temperature does not increase because the solder 1210. 1 is not in contact with copper or other material that could increase the solder

Appendix A-28 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '170 - U.S. Patent No. 7049170

	<p>melting temperature (the top surface portions of the top contact pads of die 124. 1 are made of suitable materials to ensure that the solder melting temperature does not increase)." Savastiouk '170, [10:34-10:45].</p> <p>"For example, any number of dies can be used at each level. Also, one or more dies 124. 2 can be attached directly to interposer 120, i.e. there may be three levels of dies over one interposer area but only two levels of dies over another interposer area. Any number of die levels can be present in different interposer areas." Savastiouk '170, [10:60-10:65].</p> <p>"In some embodiments, interposer 120 and/or dies 124. 1 are provided with deep cavities 920 at the top surface to increase the mechanical strength of the solder attachment and provide a reliable electrical contact. See FIG. 15. The attachment of dies 124. 1 to interposer 120 is performed by the same techniques as the attachment of the interposer to BT substrate 110." Savastiouk '170, [11:8-11:14].</p> <p>To the extent Plaintiff contends that Savastiouk '170 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '636 - U.S. Patent Publication No. 20050189636

U.S. Patent Publication No. 20050189636 (“Savastiouk '636”) is titled Packaging Substrates for Integrated Circuits and Soldering Methods and lists Sergey Savastiouk, Patrick B. Halahan, and Sam Kao as inventors. Savastiouk '636 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the '202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Savastiouk '636 is a U.S. patent publication that was filed May 5, 2005 and published September 1, 2005. Savastiouk '636 claims priority to US 10/739,707 filed on December 17, 2003. Savastiouk '636 is therefore prior art to the '202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Savastiouk '636, or otherwise rendered obvious by disclosures and teachings of Savastiouk '636, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Savastiouk '636 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Savastiouk '636 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the '202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Savastiouk '636, either alone or in combination with other prior art cited by Samsung and/or with

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-29 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '636 - U.S. Patent Publication No. 20050189636

the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Savastiouk '636 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Savastiouk '636 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Savastiouk '636 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	To the extent the preamble is a limitation, Savastiouk '636 discloses, either expressly or inherently, a structure. <i>See, e.g.:</i> “FIG. 1 illustrates another package with two intermediate substrates 110, 120 between dies (ICs) 124 and PCB 130. Intermediate substrate 110 is a BT substrate, soldered to the underlying PCB 130 with solder balls 134. Intermediate substrate 120 is a silicon interposer attached to the top surface of BT substrate 110 by an adhesive (not shown). Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140 and separated by dielectric

layers 144. Dies 124 are attached to interposer 120 with their contact pads facing up. Savastriouk '636, [0008].

FIG. 1
PRIOR ART

Savastiouk '636, FIG. 1

“FIG. 3 illustrates an integrated circuit packaging substrate 310 having two intermediate integrated circuit packaging substrates 110, 120. Substrate 120 is a silicon interposer attached to BT substrate 110. Dies 124 and PCB 130 will be attached later. Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140. Substrate 140 has substantially planar top and bottom surfaces, and is quite thin. In some embodiments, the planarity of substrate 140 is suitable for fine geometry photolithography (finer than possible with BT and FR4 substrates). The thickness of substrate 140 can be 100 μm or less (50 μm to 35 μm thickness values believed to be achievable, and smaller values may be possible). Layers 136 provide interconnect lines and may also provide power and ground planes, resistors, inductors, capacitor plates for decoupling capacitors and other capacitor types, and possibly other elements, known or to be invented. Layers 136 can be separated from each other, and from the substrate, by dielectric layers 144. Layers 136 contact each other and the silicon substrate through openings in the dielectric layers. Layers 136 can also be formed directly on

the silicon substrate if desired. Layers 136 provide contact pads 136 C at the top surface of the interposer. The contact pads are available for flip-chip attachment to dies 124. Silicon substrate 140 includes metalized through-silicon vias 330 that pass between the top and bottom surfaces of substrate 140. Conductive paths are provided from contact pads 136 C at the top of the interposer to contact pads 340 at the bottom of the interposer through the vias 330.” Savastiouk '636, [0025-0027].

Savastiouk '636, FIG. 3

“FIG. 15, the top dielectric layer 144 in interposer 120 is a thick layer, e.g. 50 μm thick. This can be a photoimageable material such as described above for BT layer 110. 3. Openings in top layer 144 expose contact pads 136 C. Contact pads 340. 1 on die 124. 1 protrude by some distance, e.g. 50 μm , below the bottom surface of silicon substrate 140. 1 of die 124. 1. The contact pads are inserted into the cavities in the top surface of the interposer. These cavities

are the openings in top layer 144 that expose the contact pads 136 C." Savastiouk '636, [0048].

Savastiouk '636, FIG. 15

“FIGS. 13-14 illustrate a possible manufacturing sequence with multiple die levels 124. 1, 124. 2, 124. 3 attached to the packaging substrate. The packaging substrate is manufactured as in FIG. 12. The interposer vias are marked 330. 0 (instead of 330 as in FIG. 12), the contact pads at the bottom of the interposer are marked 340. 0, and the solder at the top is marked 1210. 0. Each die 124. 1 has one or more metalized through vias 330. 1 formed in the die's semiconductor substrate 140. 1 (e.g. monocrystalline silicon). Each via 330. 1 passes between the top and bottom surfaces of substrate 140. 1. Conductive paths are provided from

	<p>contact pads at the top of the die 124. 1 to contact pads 340. 1 at the bottom of the die through the vias 330. 1. Contact pads 340. 1 protrude out of the respective vias 330. 1.” Savastiouk '636, [0067-0069].</p>  <p>FIG. 13</p> <p>FIG. 14</p> <p>Savastiouk '636, FIG. 13</p>
<p>[1.A] a bottom package substrate;</p>	<p>Savastiouk '636 discloses, either expressly or inherently, a bottom package substrate.</p> <p>See, e.g.:</p>

“FIG. 1 illustrates another package with two intermediate substrates 110, 120 between dies (ICs) 124 and PCB 130. Intermediate substrate 110 is a BT substrate, soldered to the underlying PCB 130 with solder balls 134. Intermediate substrate 120 is a silicon interposer attached to the top surface of BT substrate 110 by an adhesive (not shown).” Savastiouk '636, [0008].

FIG. 1
PRIOR ART

Savastiouk '636, FIG. 1

“For commercial reasons, a manufacturer may sell packaging substrates consisting substantially of a silicon interposer 120 and a BT substrate 110 (FIG. 2). Then the buyers of the packaging substrates attach the dies 124 and the PCBs 130 to the packaging substrates.” Savastiouk '636, [0010].

“In some embodiments of the present invention, a packaging substrate is provided which, like the packaging substrate of FIG. 2, includes a silicon interposer and a BT substrate. However, the silicon interposer has contact pads both on the top and the bottom, and has

	<p>through-silicon vias made in the silicon substrate of the interposer. Conductive paths going through the through-silicon vias connect the contact pads on the top of the interposer to the contact pads on the bottom.” Savastiouk ’636, [0014].</p> <p>“FIG. 3 illustrates an integrated circuit packaging substrate 310 having two intermediate integrated circuit packaging substrates 110, 120. Substrate 120 is a silicon interposer attached to BT substrate 110. Dies 124 and PCB 130 will be attached later. Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140. Substrate 140 has substantially planar top and bottom surfaces, and is quite thin. In some embodiments, the planarity of substrate 140 is suitable for fine geometry photolithography (finer than possible with BT and FR4 substrates). The thickness of substrate 140 can be 100 μm or less (50 μm to 35 μm thickness values believed to be achievable, and smaller values may be possible). Layers 136 provide interconnect lines and may also provide power and ground planes, resistors, inductors, capacitor plates for decoupling capacitors and other capacitor types, and possibly other elements, known or to be invented. Layers 136 can be separated from each other, and from the substrate, by dielectric layers 144. Layers 136 contact each other and the silicon substrate through openings in the dielectric layers. Layers 136 can also be formed directly on the silicon substrate if desired. Layers 136 provide contact pads 136 C at the top surface of the interposer. The contact pads are available for flip-chip attachment to dies 124. Silicon substrate 140 includes metalized through-silicon vias 330 that pass between the top and bottom surfaces of substrate 140. Conductive paths are provided from contact pads 136 C at the top of the interposer to contact pads 340 at the bottom of the interposer through the vias 330. Contact pads 340 are attached to contact pads 350 at the top surface of BT substrate 110. Interconnects (not shown) in BT substrate 110 connect the contact pads 350 to contact pads 360 at the bottom surface of substrate 110.” Savastiouk ’636, [0024-0028].</p>
--	---

Savastiouk '636, FIG. 3

“BT substrate 110 of FIGS. 9 and 10 is formed from one or more BT layers laminated in a conventional manner. Three layers 110. 1, 110. 2, 110. 3 are shown, but any number of layers can be present. Thin film metal layers 910 (e.g. copper) are formed on BT layers 110.i (i=1, 2, 3) and on the bottom side of layer 110. 1 in a conventional manner to provide signal routing paths and ground and power planes. Layers 910 are interconnected through vias in the BT layers 110.i (i.e. 110. 1, 110. 2, 110. 3) using known techniques to provide conductive paths between contact pads 350 and contact pads 360.” Savastiouk '636, [0048-0049].

FIG. 10

Savastiouk '636, FIG. 10

“The bottom metal layer 910 provides contact pads 360 (FIG. 3) at the bottom surface of BT substrate 110. The difference between the BT substrate 110 of FIG. 9 and a conventional BT substrate is that the top contact pads 350, and the top metal layer 910, are formed below the top BT layer 110. 3. In FIG. 9, the top contact pads 350 and the top metal 910 are formed on BT layer 110. 2. Layer 110. 3 has vias 920 exposing the contact pads 350. Vias 920 form cavities in the top surface of BT substrate 110. Silicon interposer contact pads 340 will be inserted into these cavities to form a reliable mechanical and electrical contact.” Savastiouk ’636, [0049-0050].

	 <p>FIG. 9</p> <p>Savastiouk '636, FIG. 9</p> <p>To the extent Plaintiff contends that Savastiouk '636 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Savastiouk '636 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p>See, e.g.:</p> <p>“FIG. 1 illustrates another package with two intermediate substrates 110, 120 between dies (ICs) 124 and PCB 130. Intermediate substrate 110 is a BT substrate, soldered to the underlying PCB 130 with solder balls 134. Intermediate substrate 120 is a silicon interposer attached to the top surface of BT substrate 110 by an adhesive (not shown).” Savastiouk '636, [0008].</p>

Appendix A-29 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '636 - U.S. Patent Publication No. 20050189636

	<p>“For commercial reasons, a manufacturer may sell packaging substrates consisting substantially of a silicon interposer 120 and a BT substrate 110 (FIG. 2). Then the buyers of the packaging substrates attach the dies 124 and the PCBs 130 to the packaging substrates.” Savastiouk '636, [0010].</p> <p>“In some embodiments of the present invention, a packaging substrate is provided which, like the packaging substrate of FIG. 2, includes a silicon interposer and a BT substrate. However, the silicon interposer has contact pads both on the top and the bottom, and has through-silicon vias made in the silicon substrate of the interposer.” Savastiouk '636, [0014].</p> <p>“FIG. 3 illustrates an integrated circuit packaging substrate 310 having two intermediate integrated circuit packaging substrates 110, 120. Substrate 120 is a silicon interposer attached to BT substrate 110. Dies 124 and PCB 130 will be attached later. Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140.” Savastiouk '636, [0025-0026].</p> <p>“Interposer 120 (diced or undiced) can be attached to a conventional BT substrate 110 with solder, conductive epoxy, anisotropic adhesive, thermocompression, or possibly by other techniques, known or to be invented.” Savastiouk '636, [0048].</p> <p>“Multiple interposers can be placed on BT substrate 110, and the solder reflow and underfill curing can be performed in a single heating step for all the interposers.” Savastiouk '636, [0060].</p> <p>To the extent Plaintiff contends that Savastiouk '636 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Appendix A-29 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '636 - U.S. Patent Publication No. 20050189636

<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Savastiouk '636 discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“Silicon substrate 140 includes metalized through-silicon vias 330 that pass between the top and bottom surfaces of substrate 140. Conductive paths are provided from contact pads 136 C at the top of the interposer to contact pads 340 at the bottom of the interposer through the vias 330. Contact pads 340 are attached to contact pads 350 at the top surface of BT substrate 110. Interconnects (not shown) in BT substrate 110 connect the contact pads 350 to contact pads 360 at the bottom surface of substrate 110.” Savastiouk '636, [0027-0028].</p> <p>“Metal contact pads 340 are metal protrusions formed by the metal layers 430. 2, 448, 444, 430. 1, 420 below the bottom surface of silicon 140. In some embodiments, the height Hd of metal contact pads 340 is 50 μm.” Savastiouk '636, [0043-0044].</p> <p>“Interposer wafer 120 is placed on BT substrate 110 (FIG. 10). Protruding contact pads 340 enter the cavities 920 and contact the solder 930 but do not necessarily reach the metal 910 of contact pads 350. A uniform height of contact pads 340 is not required for a good electrical contact. Underfill 940 spreads out under the interposer. In the embodiment shown, the bottom surface of silicon 140 does not reach the BT substrate.” Savastiouk '636, [0055-0056].</p> <p>“In the embodiment shown, the bottom surface of silicon 140 does not reach the BT substrate. Underfill 940 helps insulate the silicon from solder 930. Therefore, it is unnecessary to form a dielectric layer on the bottom silicon surface. The interposer placement can be performed with a placement tool of type SIPLACE F4 available from Siemens corporation of Germany.</p>
---	---

	<p>The placement tool picks up the interposer from the top by a vacuum holder 1010 schematically shown in FIG. 10. The vacuum pick-up flattens the interposer if the interposer is warped.” Savastiouk ’636, [0056-0057].</p> <p>“In one embodiment, the final value of the gap GI between the silicon 140 and the BT substrate 110 is 25 μm. The gap values of 5 to 10 μm and larger are believed to be appropriate to provide sufficient electrical insulation if no dielectric is formed on the bottom surface of silicon 140. The contact 340 portion inside the vias 920 is 25 μm high (C 1 =25 μm in FIG. 10). The value C 1 is in the range from 10 μm to 45 μm in some embodiments.” Savastiouk ’636, [0058-0059].</p> <p>“As shown in FIG. 15, the top dielectric layer 144 in interposer 120 is a thick layer, e.g. 50 μm thick. This can be a photoimageable material such as described above for BT layer 110. 3. Openings in top layer 144 expose contact pads 136 C. Contact pads 340. 1 on die 124. 1 protrude by some distance, e.g. 50 μm, below the bottom surface of silicon substrate 140. 1 of die 124. 1. The contact pads are inserted into the cavities in the top surface of the interposer. These cavities are the openings in top layer 144 that expose the contact pads 136 C. Metal layer 1110 (e.g. gold or nickel) can be deposited on the sidewalls and bottom of the vias in top layer 144 to improve the electrical connection and provide a barrier against copper 136 diffusion into solder 1210. 0. Alternatively, metal 1110 can be plated only on the bottom of the openings to provide a copper diffusion barrier. In some embodiments, the same dimensions are obtained as for the attachment between the BT substrate and the interposer, i.e. the final value of the gap between the silicon 140. 1 and interposer 120 is 25 μm (gap values of 5 to 10 μm and larger are believed to be appropriate to provide sufficient electrical insulation if no dielectric is formed on the bottom surface of silicon 140. 1); the contact 340. 1 portion inside the cavities in top layer 144 is 25 μm high (note dimension C 1 in FIG. 10).</p>
--	---

Appendix A-29 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '636 - U.S. Patent Publication No. 20050189636

	<p>This value is in the range from 10 μm to 45 μm in some embodiments.” Savastiouk '636, [0080-0083].</p> <p>To the extent Plaintiff contends that Savastiouk '636 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.D] the spacer connector comprises a core substrate;	<p>Savastiouk '636 discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140 and separated by dielectric layers 144. Dies 124 are attached to interposer 120 with their contact pads facing up. The dies' contact pads are wire bonded to contact pads 136 C. 1 provided by metal layers 136. The wire bonding is done with bond wires 150.” Savastiouk '636, [0008].</p> <p>“In some embodiments, the interposer is thinned before attachment to the BT substrate. The semiconductor substrate of the interposer can be quite thin, e.g. 100 μm or thinner. The semiconductor substrate and the interposer may have substantially planar top and bottom surfaces, as opposed to interposers with cavities large enough to contain a die, with the cavities' sidewalls being thicker than the rest of the interposer to increase the interposer's mechanical strength (see U.S. patent application Ser.” Savastiouk '636, [0015].</p> <p>“Layers 136 contact each other and the silicon substrate through openings in the dielectric layers. Layers 136 can also be formed directly on the silicon substrate if desired. Layers 136</p>

	<p>provide contact pads 136 C at the top surface of the interposer. The contact pads are available for flip-chip attachment to dies 124. Silicon substrate 140 includes metalized through-silicon vias 330 that pass between the top and bottom surfaces of substrate 140. Conductive paths are provided from contact pads 136 C at the top of the interposer to contact pads 340 at the bottom of the interposer through the vias 330. Contact pads 340 are attached to contact pads 350 at the top surface of BT substrate 110. Interconnects (not shown) in BT substrate 110 connect the contact pads 350 to contact pads 360 at the bottom surface of substrate 110.” Savastiouk '636, [0026-0028].</p> <p>“Silicon interposer 120 can be manufactured using conventional techniques. See e.g. the aforementioned U.S. Pat. No. 6,322,903. Other techniques are described in U.S. patent application Ser. No. 10/410,929 filed on Apr. 9, 2003 by P. Halahan et al., entitled “Electroplating and electroless plating of conductive materials into openings, and structures obtained thereby”, incorporated herein by reference. Still other techniques can possible be used, whether known or to be invented. An exemplary manufacturing process is as follows. Vias 330 (FIG. 4) are etched in the top surface of silicon substrate 140 (e.g. monocrystalline silicon) by DRIE (deep reactive ion etching) to an exemplary depth $H_v=150\text{ }\mu\text{m}$.” Savastiouk '636, [0031].</p>
--	---

Savastiouk '636, FIG. 4

“Metal layers 136 (FIG. 7) and dielectric layers 144 are deposited on the interposer wafer and patterned to provide interconnects and, possibly, other elements as described above. In some embodiments, metal 136 is copper and dielectric 144 is polyimide, but other materials can also be used.” Savastiouk '636, [0038].

Savastiouk '636, FIG. 7

“Interposer 120 (diced or undiced) can be attached to a conventional BT substrate 110 with solder, conductive epoxy, anisotropic adhesive, thermocompression, or possibly by other techniques, known or to be invented. In some embodiments, however, specially processed BT substrates are used to minimize the interposer handling. The interposer handling should preferably be minimized if the interposer is thin. The interposer’s silicon substrate 140 can be 100 μm or thinner, the interposer can be fragile, and its heat dissipation capability can be low.” Savastiouk ’636, [0048].

To the extent Plaintiff contends that Savastouk '636 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Savastiouk '636 discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p>See, e.g.:</p> <p>“Silicon substrate 140 includes metalized through-silicon vias 330 that pass between the top and bottom surfaces of substrate 140. Appendix A-29 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '636 - U.S. Patent Publication No. 20050189636

	<p>(i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.I] the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and</p>	<p>Savastiouk '636 discloses, either expressly or inherently, the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“Contact pads 340 are attached to contact pads 350 at the top surface of BT substrate 110. Interconnects (not shown) in BT substrate 110 connect the contact pads 350 to contact pads 360 at the bottom surface of substrate 110. Solder balls 134 are formed on pads 360 by conventional techniques for attachment to PCB 130. The size and spacing (pitch) of contact pads 136 C on interposer 120 matches the size and the pitch of the contact pads on dies 124. If dies 124 are silicon integrated circuits, their CTE matches the CTE of the interposer, so the pitch of contact pads 136 C can be small because the low thermal stresses at the interface between the dies and the interposer make it unnecessary to use large solder balls 370. The contact pads 340 on the bottom of the interposer match the top contact pads 350 of BT substrate 110.” Savastiouk '636, [0027-0029].</p> <p>“BT substrate 110 of FIGS. 9 and 10 is formed from one or more BT layers laminated in a conventional manner. Three layers 110. 1, 110. 2, 110. 3 are shown, but any number of layers can be present. Thin film metal layers 910 (e.g. copper) are formed on BT layers 110.i (i=1, 2, 3) and on the bottom side of layer 110. 1 in a conventional manner to provide signal routing paths and ground and power planes. Layers 910 are interconnected through vias in the BT layers 110.i (i.e. 110. 1, 110. 2, 110. 3) using known techniques to provide conductive paths</p>

between contact pads 350 and contact pads 360. The bottom metal layer 910 provides contact pads 360 (FIG. 3) at the bottom surface of BT substrate 110." Savastiouk '636, [0049].

FIG. 10

Savastiouk '636, FIG. 10

“The difference between the BT substrate 110 of FIG. 9 and a conventional BT substrate is that the top contact pads 350, and the top metal layer 910, are formed below the top BT layer 110. 3. In FIG. 9, the top contact pads 350 and the top metal 910 are formed on BT layer 110. 2. Layer 110. 3 has vias 920 exposing the contact pads 350. Vias 920 form cavities in the top surface of BT substrate 110. Silicon interposer contact pads 340 will be inserted into these

cavities to form a reliable mechanical and electrical contact. In one embodiment, each cavity 920 has a diameter $D_{cav}=150\text{ }\mu\text{m}$ to accommodate a $50\text{ }\mu\text{m}$ to $60\text{ }\mu\text{m}$ diameter Dc of the contact pads 340. Dc can be calculated starting with the diameter Dv (FIG. 4) of via 330, by subtracting double the thickness of the layers 410, 420, 430, 1, 444, 448. The depth Hcav of each cavity 920 (about equal to the thickness of layer 110. 3) is $50\text{ }\mu\text{m}$ for a $50\text{ }\mu\text{m}$ height Hd of contact pads 340 (Hcav is measured to the top surface of contact pads 350).” Savastiouk ’636, [0050-0051].

Savastiouk '636, FIG. 9

“FIG. 11 illustrates another embodiment. The BT substrate 110 is similar to the BT substrate of FIGS. 9 and 10, but a metal layer 1110 is formed on the bottom and sidewalls of each cavity 920. Metal 1110 is believed to improve the strength and the electrical conductivity of the solder bond between contact pads 340 and contact pads 350. Metal layer 1110 can be copper deposited on the BT substrate and patterned by lift-off or some other process. In FIG. 11, metal 1110 extends out of cavities 920 to the top surface of the BT layer 110. 3 but does not provide any interconnects or other elements on the top surface of layer 110. 3. Metal 1110 is present only in the immediate vicinity of each cavity 920. Each contact 350 includes the

portions of metal layers 910, 1110 on the bottom and sidewalls of the corresponding cavity 920. In other embodiments, metal 1110 provides an additional level of interconnects and/or a power or ground plane on layer 110. 3." Savastiouk '636, [0061].

FIG. 11

Savastiouk '636, FIG. 11

“In the BT embodiment described above, the BT layers 110. 1, 110. 2, 110. 3 are laminated on top of each other. Each layer 110. 1, 110. 2 is a solid sheet placed laminated on the structure in a solid form. In some embodiments, the top layer 110. 3 is made from a material different from the material of layers 110. 1, 110. 2. For example, solder dam materials can be used, such as photoimageable polyimide, Dupont VACREL 8100, Dupont Flexible PhotolImageable Coverlay (PIC) 1000 & 2000, Shipley (Dynachem) DynaMASK 5000,

	<p>Shipley ConforMASK 2500, and possibly others. Some of the solder dam materials (e.g. polyimide) can be deposited in a liquid (possibly viscous) form and then cured. FIG. 12 is similar to FIG. 11, but solder balls 1210 have been attached to contact pads 136 C. Solder balls 1210 eliminate the need for solder balls 370 (FIG. 3) on dies 124. The packaging substrate manufacturer can provide solder balls 1210 to simplify the die 124 attachment for the substrate buyers. Solder 1210 can be attached to the interposer at any fabrication stage. In one embodiment, solder 1210 is attached to pads 136 C before the interposer wafer is thinned, i.e. before the stage of FIG. 8. The interposer wafer is mechanically stronger at this stage and its heat dissipating capability is higher, so the interposer handling is easier. Metal 1110 may be omitted (as in FIG. 10). In some embodiments, solder 1210 has a lower melting temperature than solder 930. Therefore, solder 930 is not melted during the attachment of dies 124. In the embodiment of FIG. 12, solder 1210 has the same or higher melting temperature than solder 930, but the melting temperature of solder 930 is increased during the attachment of interposer 120 to BT substrate 110. The melting temperature of solder 930 becomes higher than the melting temperature of solder 1210. The melting temperature of solder 930 is increased because the copper from layer 1110 and/or layer 350 dissolves in solder 930.” Savastiouk ’636, [0062-0066].</p> <p>“Also, in some embodiments, the cavities 920 (FIG. 9) extend through two or more BT layers, for example, through layers 110. 3 and 110. 2. Contact pads 350 can thus be formed from the metal layer 910 located between the BT layers 110. 1, 110. 2. The layer 910 on BT layer 110. 2 can be used for interconnects, power or ground planes, or other elements as discussed above.” Savastiouk ’636, [0087].</p> <p>To the extent Plaintiff contends that Savastiouk ’636 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with</p>

	(i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.
<p>[1.J] the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of top metal pillars of the bottom package substrate; and</p>	<p>Savastiouk '636 discloses, either expressly or inherently, the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140. Substrate 140 has substantially planar top and bottom surfaces, and is quite thin. In some embodiments, the planarity of substrate 140 is suitable for fine geometry photolithography (finer than possible with BT and FR4 substrates). The thickness of substrate 140 can be 100 μm or less (50 μm to 35 μm thickness values believed to be achievable, and smaller values may be possible). Layers 136 provide interconnect lines and may also provide power and ground planes, resistors, inductors, capacitor plates for decoupling capacitors and other capacitor types, and possibly other elements, known or to be invented. Layers 136 can be separated from each other, and from the substrate, by dielectric layers 144. Layers 136 contact each other and the silicon substrate through openings in the dielectric layers. Layers 136 can also be formed directly on the silicon substrate if desired. Layers 136 provide contact pads 136 C at the top surface of the interposer. The contact pads are available for flip-chip attachment to dies 124. Silicon substrate 140 includes metalized through-silicon vias 330 that pass between the top and bottom surfaces of substrate 140. Conductive paths are provided from contact pads 136 C at the top of the interposer to contact pads 340 at the bottom of the interposer through the vias 330. Contact pads 340 are attached to contact pads 350 at the top surface of BT substrate 110. Interconnects (not shown) in BT substrate 110 connect the contact pads</p>

	<p>350 to contact pads 360 at the bottom surface of substrate 110.” Savastiouk ’636, [0025-0028].</p> <p>“Metal contact pads 340 are metal protrusions formed by the metal layers 430. 2, 448, 444, 430. 1, 420 below the bottom surface of silicon 140. In some embodiments, the height Hd of metal contact pads 340 is 50 μm. A dielectric layer (not shown) can optionally be formed on the bottom surface of the interposer to cover the silicon 140 but not the metal contact pads 340. The dielectric can be formed without photolithography. See the aforementioned U.S. Pat. Nos. 6,322,903 and 6,498,381 and U.S. patent application Ser. No. 10/410,929. The interposer wafer can be diced if desired. The dicing can be performed at the same time as the interposer wafer thinning if vias were formed along the dicing lines (scribe lines) simultaneously with vias 330 at the stage of FIG. 4. See U.S. Pat. No. 6,498,074 issued Dec. 24, 2002 to Siniaguine et al., entitled “THINNING AND DICING OF SEMICONDUCTOR WAFERS...”, incorporated herein by reference. In some embodiments, the interposer wafer is not diced. ICs 124 will be attached to the wafer. In some embodiments, metal 430. 2 does not fill the through-silicon vias. Metal 430. 2 is a thin film deposited over the via sidewalls, and it can be part of a layer 136. See the aforementioned U.S. Pat. No. 6,498,381. Also, in some embodiments the contact pads 340 do not protrude out of the bottom surface of the interposer. Interposer 120 (diced or undiced) can be attached to a conventional BT substrate 110 with solder, conductive epoxy, anisotropic adhesive, thermocompression, or possibly by other techniques, known or to be invented.” Savastiouk ’636, [0043-0048].</p> <p>“Interposer wafer 120 is placed on BT substrate 110 (FIG. 10). Protruding contact pads 340 enter the cavities 920 and contact the solder 930 but do not necessarily reach the metal 910 of contact pads 350. A uniform height of contact pads 340 is not required for a good electrical contact. Underfill 940 spreads out under the interposer. In the embodiment shown, the bottom surface of silicon 140 does not reach the BT substrate. Underfill 940 helps insulate the silicon</p>
--	---

from solder 930. Therefore, it is unnecessary to form a dielectric layer on the bottom silicon surface. The interposer placement can be performed with a placement tool of type SIPLACE F4 available from Siemens corporation of Germany. The placement tool picks up the interposer from the top by a vacuum holder 1010 schematically shown in FIG. 10. The vacuum pick-up flattens the interposer if the interposer is warped. Dielectric 144 protects the interposer from being damaged by the holder. Other placement tools, with vacuum and non-vacuum holders, known or to be invented, can also possibly be used. The structure is heated to reflow the solder paste 930 and cure the underfill 940. The solder wets the bottom and side surfaces of copper contact pads 340." Savastiousk '636, [0055-0058].

FIG. 10

Savastiouk '636, FIG. 10

	<p>“Each die 124. 1 has one or more metalized through vias 330. 1 formed in the die’s semiconductor substrate 140. 1 (e.g. monocrystalline silicon). Each via 330. 1 passes between the top and bottom surfaces of substrate 140. 1. Conductive paths are provided from contact pads at the top of the die 124. 1 to contact pads 340. 1 at the bottom of the die through the vias 330. 1. Contact pads 340. 1 protrude out of the respective vias 330. 1. The dies 124. 1 can be manufactured using the same techniques as described above for interposer 120 (involving the wafer thinning to expose the contact pads 340. 1). Each die may have the same general structure as interposer 120 in FIG. 12. Of course, the circuitry in dies 124. 1 does not have to be identical to the interposer circuitry, and different dies 124. 1 may differ from each other. Also, contact pads 340. 1 may have smaller dimensions, and may be placed closer to each other, as they do not have to meet the BT substrate dimension requirements.” Savastiouk ’636, [0069].</p> <p>“Dies 124. 2 may be similar to dies 124. 1, but there is no solder on dies 124. 2. Dies 124. 2 include metalized vias 330. 2 in semiconductor substrates 140. 2, and contact pads 340. 2 protruding out of the vias. The active surface of dies 124. 2 is the top surface in some embodiments. The third level dies 124. 3 are like dies 124 in FIG. 3. Their active surface is the bottom surface. Solder 370 is attached to the bottom contact pads.” Savastiouk ’636, [0070-0071].</p> <p>“At step 1430, dies 124. 1 are soldered to interposer 120 with solder 1210. 0, at a temperature of about 218° C. or higher, but below 230° C. not to melt the solder 930. The copper from contact pads 340. 1 dissolves in solder 1210. 0 and increases its melting temperature to about 230° C. Solder 1210. 1 may melt, but its melting temperature does not increase because the solder 1210. 1 is not in contact with copper or other material that could increase the solder melting temperature (the top surface portions of the top contact pads of die 124. 1 are made of suitable materials to ensure that the solder melting temperature does not increase). At step</p>

Appendix A-29 - Invalidity of U.S. Patent No. 9859202 in view of Savastiouk '636 - U.S. Patent Publication No. 20050189636

	<p>1440, dies 124. 2 are attached to dies 124. 1 with solder 1210. 1. Solders 1210. 0 and 930 do not melt. The melting temperature of solder 1210. 1 is increased to about 230° C. due to the diffusion of copper from contact pads 340. 2.” Savastiouk '636, [0074-0076].</p> <p>To the extent Plaintiff contends that Savastiouk '636 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.K] a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein</p>	<p>Savastiouk '636 discloses, either expressly or inherently, a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 illustrates another package with two intermediate substrates 110, 120 between dies (ICs) 124 and PCB 130. Intermediate substrate 110 is a BT substrate, soldered to the underlying PCB 130 with solder balls 134. Intermediate substrate 120 is a silicon interposer attached to the top surface of BT substrate 110 by an adhesive (not shown). Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140 and separated by dielectric layers 144. Dies 124 are attached to interposer 120 with their contact pads facing up.” Savastiouk '636, [0008].</p>

FIG. 1
PRIOR ART

Savastiouk '636, FIG. 1

“The dies’ contact pads are wire bonded to contact pads 136 C. 1 provided by metal layers 136. The wire bonding is done with bond wires 150. Contact pads 136 C. 2 on top of the interposer are wire bonded to contact pads 360 on top of BT substrate 110 using bond wires 160. Interconnect lines made from layers 136 connect the contact pads 136 C. 1 to the contact pads 136 C. 2. Metal layers 136 provide interconnects between the dies 124.” Savastiouk '636, [0008-0009].

“FIG. 3 illustrates an integrated circuit packaging substrate 310 having two intermediate integrated circuit packaging substrates 110, 120. Substrate 120 is a silicon interposer attached to BT substrate 110. Dies 124 and PCB 130 will be attached later.” Savastiouk '636, [0025].

Savastiouk '636, FIG. 3

“In one embodiment, the final value of the gap GI between the silicon 140 and the BT substrate 110 is 25 μm . The gap values of 5 to 10 μm and larger are believed to be appropriate to provide sufficient electrical insulation if no dielectric is formed on the bottom surface of silicon 140. The contact 340 portion inside the vias 920 is 25 μm high (C 1 =25 μm in FIG. 10).” Savastiouk ’636, [0058].

“As shown in FIG. 15, the top dielectric layer 144 in interposer 120 is a thick layer, e.g. 50 μm thick. This can be a photoimageable material such as described above for BT layer 110. 3. Openings in top layer 144 expose contact pads 136 C. Contact pads 340. 1 on die 124. 1 protrude by some distance, e.g. 50 μm , below the bottom surface of silicon substrate 140. 1 of die 124. 1. The contact pads are inserted into the cavities in the top surface of the interposer.” Savastiouk '636, [0080-0081].

Savastiouk '636, FIG. 15

“In some embodiments, the same dimensions are obtained as for the attachment between the BT substrate and the interposer, i.e. the final value of the gap between the silicon 140, 1 and interposer 120 is 25 μm (gap values of 5 to 10 μm and larger are believed to be appropriate to provide sufficient electrical insulation if no dielectric is formed on the bottom surface of silicon 140, 1); the contact 340, 1 portion inside the cavities in top layer 144 is 25 μm high (note dimension C 1 in FIG. 10).” Savastiouk ’636, [0083].

[1.M] the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.	<p>Savastiouk '636 discloses, either expressly or inherently, the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.</p> <p><i>See, e.g.:</i></p>

	<p>“FIG. 12. The interposer vias are marked 330. 0 (instead of 330 as in FIG. 12), the contact pads at the bottom of the interposer are marked 340. 0, and the solder at the top is marked 1210. 0. Each die 124. 1 has one or more metalized through vias 330. 1 formed in the die’s semiconductor substrate 140. 1 (e.g. monocrystalline silicon). Each via 330. 1 passes between the top and bottom surfaces of substrate 140. 1. Conductive paths are provided from contact pads at the top of the die 124. 1 to contact pads 340. 1 at the bottom of the die through the vias 330. 1. Contact pads 340. 1 protrude out of the respective vias 330. 1. The dies 124. 1 can be manufactured using the same techniques as described above for interposer 120 (involving the wafer thinning to expose the contact pads 340. 1). Each die may have the same general structure as interposer 120 in FIG. 12. Of course, the circuitry in dies 124. 1 does not have to be identical to the interposer circuitry, and different dies 124. 1 may differ from each other.” Savastiouk ’636, [0026-0029].</p>
--	---

FIG. 12

Savastiouk '636, FIG. 12

“In the embodiment shown, the bottom surface of silicon 140 does not reach the BT substrate. Underfill 940 helps insulate the silicon from solder 930. Therefore, it is unnecessary to form a dielectric layer on the bottom silicon surface. The interposer placement can be performed with a placement tool of type SIPLACE F4 available from Siemens corporation of Germany. The placement tool picks up the interposer from the top by a vacuum holder 1010 schematically shown in FIG. 10. The vacuum pick-up flattens the interposer if the interposer is warped. Dielectric 144 protects the interposer from being damaged by the holder. Other placement tools, with vacuum and non-vacuum holders, known or to be invented, can also possibly be used. The structure is heated to reflow the solder paste 930 and cure the underfill

940. The solder wets the bottom and side surfaces of copper contact pads 340. In one embodiment, the final value of the gap GI between the silicon 140 and the BT substrate 110 is 25 μm .” Savastiouk '636, [0056-0058].

FIG. 10

Savastiouk '636, FIG. 10

“As shown in FIG. 15, the top dielectric layer 144 in interposer 120 is a thick layer, e.g. 50 μm thick. This can be a photoimageable material such as described above for BT layer 110. 3. Openings in top layer 144 expose contact pads 136 C. Contact pads 340. 1 on die 124. 1 protrude by some distance, e.g. 50 μm , below the bottom surface of silicon substrate 140. 1 of die 124. 1. The contact pads are inserted into the cavities in the top surface of the

	<p>interposer. These cavities are the openings in top layer 144 that expose the contact pads 136 C. Metal layer 1110 (e.g. gold or nickel) can be deposited on the sidewalls and bottom of the vias in top layer 144 to improve the electrical connection and provide a barrier against copper 136 diffusion into solder 1210. 0. Alternatively, metal 1110 can be plated only on the bottom of the openings to provide a copper diffusion barrier. In some embodiments, the same dimensions are obtained as for the attachment between the BT substrate and the interposer, i.e. the final value of the gap between the silicon 140. 1 and interposer 120 is 25 μm (gap values of 5 to 10 μm and larger are believed to be appropriate to provide sufficient electrical insulation if no dielectric is formed on the bottom surface of silicon 140. 1); the contact 340. 1 portion inside the cavities in top layer 144 is 25 μm high (note dimension C 1 in FIG. 10).” Savastiouk '636, [0081-0083].</p>

--	--

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
-------------------------	-------------------

[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

Savastiouk '636 discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

See, e.g.:

Savastiouk '636, FIG. 3

To the extent Plaintiff contends that Savastiouk '636 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Claim Limitation	Disclosure
<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of metal pillars of the top package substrate via the corresponding top metal pads of the spacer connector.</p>	<p>Savastiouk '636 discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p>See, e.g.:</p> <p>“FIG. 3 illustrates an integrated circuit packaging substrate 310 having two intermediate integrated circuit packaging substrates 110, 120. Substrate 120 is a silicon interposer attached to BT substrate 110. Dies 124 and PCB 130 will be attached later. Silicon interposer 120 includes metal layers 136 formed over silicon substrate 140. Substrate 140 has substantially planar top and bottom surfaces, and is quite thin. In some embodiments, the planarity of substrate 140 is suitable for fine geometry photolithography (finer than possible with BT and FR4 substrates). The thickness of substrate 140 can be 100 μm or less (50 μm to 35 μm thickness values believed to be achievable, and smaller values may be possible). Layers 136 provide interconnect lines and may also provide power and ground planes, resistors, inductors, capacitor plates for decoupling capacitors and other capacitor types, and possibly other elements, known or to be invented. Layers 136 can be separated from each other, and from the substrate, by dielectric layers 144. Layers 136 contact each other and the silicon substrate through openings in the dielectric layers. Layers 136 can also be formed directly on the silicon substrate if desired. Layers 136 provide contact pads 136 C at the top surface of</p>

the interposer. The contact pads are available for flip-chip attachment to dies 124. Silicon substrate 140 includes metalized through-silicon vias 330 that pass between the top and bottom surfaces of substrate 140. Conductive paths are provided from contact pads 136 C at the top of the interposer to contact pads 340 at the bottom of the interposer through the vias 330.” Savastiouk '636, [0025-0027].

Savastiouk '636, FIG. 3

“Contact pads 340 are attached to contact pads 350 at the top surface of BT substrate 110. Interconnects (not shown) in BT substrate 110 connect the contact pads 350 to contact pads 360 at the bottom surface of substrate 110. Solder balls 134 are formed on pads 360 by conventional techniques for attachment to PCB 130. The size and spacing (pitch) of contact pads 136 C on interposer 120 matches the size and the pitch of the contact pads on dies 124. If dies 124 are silicon integrated circuits, their CTE matches the CTE of the interposer, so the pitch of contact pads 136 C can be small because the low thermal stresses at the interface

	<p>between the dies and the interposer make it unnecessary to use large solder balls 370. The contact pads 340 on the bottom of the interposer match the top contact pads 350 of BT substrate 110.” Savastiouk ’636, [0027-0029].</p> <p>“To facilitate the interposer handling, the metal contact pads 340 are formed to protrude out of vias 330. The protruding contact pads 340 are inserted into cavities in BT substrate 110, as explained in more detail below. The invention is not limited to the protruding contact pads or the cavities however.” Savastiouk ’636, [0030].</p> <p>“FIG. 12 is similar to FIG. 11, but solder balls 1210 have been attached to contact pads 136 C. Solder balls 1210 eliminate the need for solder balls 370 (FIG. 3) on dies 124. The packaging substrate manufacturer can provide solder balls 1210 to simplify the die 124 attachment for the substrate buyers. Solder 1210 can be attached to the interposer at any fabrication stage. In one embodiment, solder 1210 is attached to pads 136 C before the interposer wafer is thinned, i.e. before the stage of FIG. 8.” Savastiouk ’636, [0062-0063].</p>
--	---

FIG. 12

Savastiouk '636, FIG. 12

FIG. 11

Savastiouk '636, FIG. 11

“FIGS. 13-14 illustrate a possible manufacturing sequence with multiple die levels 124. 1, 124. 2, 124. 3 attached to the packaging substrate. The packaging substrate is manufactured as in FIG. 12. The interposer vias are marked 330. 0 (instead of 330 as in FIG. 12), the contact pads at the bottom of the interposer are marked 340. 0, and the solder at the top is marked 1210. 0. Each die 124. 1 has one or more metalized through vias 330. 1 formed in the die’s semiconductor substrate 140. 1 (e.g. monocrystalline silicon). Each via 330. 1 passes between the top and bottom surfaces of substrate 140. 1. Conductive paths are provided from contact pads at the top of the die 124. 1 to contact pads 340. 1 at the bottom of the die through the vias 330. 1. Contact pads 340. 1 protrude out of the respective vias 330. 1.” Savastiouk '636, [0067-0069].

FIG. 13

Savastiouk '636, FIG. 13

“The attachment of dies 124. 1 to interposer 120 is performed by the same techniques as the attachment of the interposer to BT substrate 110. The attachment of dies 124. 2 to dies 124. 1 can also be performed in this way. As shown in FIG. 15, the top dielectric layer 144 in interposer 120 is a thick layer, e.g. 50 μm thick. This can be a photoimageable material such as described above for BT layer 110. 3. Openings in top layer 144 expose contact pads 136 C. Contact pads 340. 1 on die 124. 1 protrude by some distance, e.g. 50 μm, below the bottom surface of silicon substrate 140. 1 of die 124. 1.” Savastiouk '636, [0080-0081].

Savastiouk '636, FIG. 15

To the extent Plaintiff contends that Savastiouk '636 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-30 - Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

U.S. Patent No.9685414 (“Shuto”) is titled Package Assembly for Embedded Die and Associated Techniques and Configurations and lists Takashi Shuto as inventor. Shuto is assigned to Intel Corporation. Shuto anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Shuto is a U.S. patent that was filed June 26, 2013 and published January 1, 2015. Shuto is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Shuto, or otherwise rendered obvious by disclosures and teachings of Shuto, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Shuto does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Shuto with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Shuto, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-30 - Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

Where the chart below states that Shuto “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Shuto or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Shuto set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Shuto discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 schematically illustrates a cross-section side view of an example integrated circuit (IC) package assembly (hereinafter “package assembly 100”), in accordance with some embodiments. In some embodiments, the package assembly 100 includes a package substrate 104 coupled with one or more dies (e.g., dies 102 a, 102 b) and a circuit board 106, as can be seen. In an embodiment, the package assembly 100 may refer to only the package substrate 104. The package substrate 104 may include a die attach layer 108, a reinforced layer (hereinafter “reinforced plate 110”), a laminate layer 112 and one or more build-up layers (hereinafter “build-up layers 114”), coupled as shown.” Shuto, [3:13-3:25].</p>

FIG. 1

Shuto, FIG. 1

“FIG. 3 schematically illustrates a cross-section side view of another example IC package assembly (hereinafter “package assembly 300”), in accordance with some embodiments. The package assembly 300 may comport with embodiments described in connection with package assembly 100 or 200, except that the reinforced plate 110 of the package assembly 300 of FIG. 3 includes an electrically conductive core 110 f such as a metal (e.g., aluminum or copper) and an electrically insulative layer 110 g disposed on the core 110 f to provide a barrier between material of the core 110 f and interconnects (e.g., PTHs 110 b) that are disposed in the reinforced plate 110 to prevent shorts and/or leakage.” Shuto, [8:35-8:46].

FIG. 3

Shuto, FIG. 3

“FIG. 4 schematically illustrates a cross-section side view of yet another example IC package assembly (hereinafter “package assembly 400”), in accordance with some embodiments. In some embodiments, the die 102 b may be coupled with an inactive side I of the die 102 a, as can be seen. In the depicted embodiment, the die 102 b is coupled with the die 102 a using solderable material 116 (e.g., or other suitable FLIs) that extends through the die attach layer 108.” Shuto, [8:58-8:65].

FIG. 4

Shuto, FIG. 4

“FIG. 5 schematically illustrates a cross-section side view of still yet another example IC package assembly (hereinafter “package assembly 500”), in accordance with some embodiments. The package assembly 500 depicts an example PoP configuration. In the package assembly 500, a package substrate 555 including a die 102 c is coupled with the package substrate 104 of package assembly 300 using package-level interconnects such as, for example, solder balls 120.” Shuto, [9:6-9:14].

Shuto, FIG. 5

“FIG. 6 schematically illustrates a cross-section side view of still yet another example IC package assembly (hereinafter “package assembly 600”), in accordance with some embodiments. The package assembly 600 depicts another PoP assembly. In the package assembly 600, a package substrate 555 including a die 102 c is coupled with the package substrate 104 of package assembly 400 using package-level interconnects such as, for example, solder balls 120.” Shuto, [9:45-9:53].

FIG. 6

Shuto, FIG. 6

“According to various embodiments, the present disclosure describes an apparatus (e.g., package assembly) comprising a die attach layer, a die coupled with the die attach layer, the die having an active side including active devices of the die and an inactive side disposed opposite to the active side, a reinforced plate coupled with the die attach layer, the reinforced plate having a first side and a second side disposed opposite to the first side and a cavity disposed in the reinforced plate and one or more build-up layers coupled with the second side of the reinforced plate, the one or more build-up layers including an insulator and conductive features disposed in the insulator, the conductive features being electrically coupled with the die, wherein the inactive side of the die is in direct contact with the die attach layer, the first

Appendix A-30 - Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

	side of the reinforced plate is in direct contact with the die attach layer and the die is disposed in the cavity.” Shuto, [12:46-12:61].
[1.A] a bottom package substrate;	<p>Shuto discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 schematically illustrates a cross-section side view of an example integrated circuit (IC) package assembly (hereinafter “package assembly 100”), in accordance with some embodiments. In some embodiments, the package assembly 100 includes a package substrate 104 coupled with one or more dies (e.g., dies 102 a, 102 b) and a circuit board 106, as can be seen. In an embodiment, the package assembly 100 may refer to only the package substrate 104. The package substrate 104 may include a die attach layer 108, a reinforced layer (hereinafter “reinforced plate 110”), a laminate layer 112 and one or more build-up layers (hereinafter “build-up layers 114”), coupled as shown.” Shuto, [3:13-3:25].</p>

FIG. 1

Shuto, FIG. 1

“In some embodiments, the conductive features 114 b of the build-up layers 114 may be electrically coupled with the dies 102 a and/or 102 b (e.g., and possibly other dies) and configured to route electrical signals of the dies 102 a and/or 102 b through the package substrate 104. The electrical signals may include, for example, input/output (I/O signals) and/or power/ground signals associated with operation of the dies 102 a, 102 b. In some embodiments, the conductive features 114 b may route electrical signals between the dies 102 a, 102 b. In this regard, the dies 102 a and 102 b may be electrically coupled with one another. In some embodiments, the conductive features 114 b may route electrical signals between one or more of the dies 102 a, 102 b and another electrical component such as, for

Appendix A-30 - Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

	<p>example, a circuit board 106 by way of interconnects in the laminate layer 112, PTHs 110 b and/or package-level interconnects such as solder balls 120.” Shuto, [6:8-6:24].</p> <p>“In some embodiments, one or more package-level interconnects such as, for example, solder balls 120 may be coupled with the package substrate 104 to further route the electrical signals to another electrical component such as circuit board 106. The solder balls 120 may be arranged in a ball-grid array (BGA) configuration in some embodiments. The package-level interconnects may include other suitable structures such as, for example, land-grid array (LGA) structures. The package-level interconnects (e.g., solder balls 120) may be coupled with the PTHs 110 b through the die attach layer 108, as can be seen, in some embodiments. In other embodiments, additional build-up layers (not shown) may be formed on the die attach layer 108 to provide additional electrical routing for the package substrate 104 and the package-level interconnects may be coupled with the additional build-up layers.” Shuto, [6:25-6:40].</p> <p>“The package assembly 100 may further include a circuit board 106 coupled with the package substrate 104 through the package-level interconnects (e.g., solder balls 120). Only a small portion of the circuit board 106 may be depicted for the sake of discussion. The package-level interconnects may be coupled with contacts (e.g., pads) of the circuit board 106 to route electrical signals of the dies 102 a, 102 b between the package substrate 104 and the circuit board 106. The circuit board 106 may be a printed circuit board (PCB) composed of an electrically insulative material such as, for example, an epoxy laminate. For example, the circuit board 106 may include electrically insulating layers composed of materials such as, for example, polytetrafluoroethylene, phenolic cotton paper materials such as Flame Retardant 4 (FR-4), FR-1, cotton paper and epoxy materials such as CEM-1 or CEM-3, or woven glass materials that are laminated together using an epoxy resin prepreg material. Electrical routing structures (not shown) such as traces, trenches, vias, and the like may be</p>
--	---

Appendix A-30 - Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

	<p>formed through the electrically insulating layers to route the electrical signals of the dies 102 a, 102 b through the circuit board 106. The circuit board 106 may be composed of other suitable materials in other embodiments. In some embodiments, the circuit board 106 is a motherboard (e.g., motherboard 802 of FIG. 8).” Shuto, [6:41-6:64].</p> <p>To the extent Plaintiff contends that Shuto fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Shuto discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 schematically illustrates a cross-section side view of an example integrated circuit (IC) package assembly (hereinafter “package assembly 100”), in accordance with some embodiments. In some embodiments, the package assembly 100 includes a package substrate 104 coupled with one or more dies (e.g., dies 102 a, 102 b) and a circuit board 106, as can be seen. In an embodiment, the package assembly 100 may refer to only the package substrate 104. The package substrate 104 may include a die attach layer 108, a reinforced layer (hereinafter “reinforced plate 110”), a laminate layer 112 and one or more build-up layers (hereinafter “build-up layers 114”), coupled as shown.” Shuto, [3:13-3:25].</p>

FIG. 1

Shuto, FIG. 1

“The package substrate 104 may include a die attach layer 108, which may be used as a substrate for attachment of the die 102 a. That is, in some embodiments, the die 102 a may be coupled in direct contact with the die attach layer 108. In some embodiments, the die attach layer 108 may be composed of an electrically insulative material such as, for example, an epoxy resin. In some embodiments, the die attach layer 108 may be composed of a same material as an insulator 114 a of the build-up layers 114. The die attach layer 108 may be composed of other suitable materials in other embodiments.” Shuto, [3:26-3:36].

	<p>“In some embodiments, the reinforced plate 110 may be composed of an epoxy resin with glass cloth. In other embodiments, the reinforced plate 110 may be composed of a metal (e.g., as described in connection with FIG. 3). The reinforced plate 110 may be composed of other suitable materials in other embodiments. The reinforced plate 110 may strengthen the package substrate 104 for handling and/or assembly associated with fabrication of the build-up layers 114 using, for example bumpless build-up layer (BBUL) techniques. For example, in some embodiments, the reinforced plate 110 may obviate a need for using a fixture jig, which may be used for handling and/or assembly during fabrication of a flexible package substrate. The reinforced plate 110 may have a first side, S1, and a second side, S2, disposed opposite to the first side S1. In some embodiments, the first side S1 may be in direct contact with the die attach layer 108. The reinforced plate 110 may further have a cavity 110 a formed in the reinforced plate 110. In some embodiments, the cavity 110 a may pass through the reinforced plate 110 to provide an opening between the first side S1 and the second side S2, as can be seen.” Shuto, [3:66-4:20].</p> <p>“In some embodiments, the prepreg material of the laminate layer 112 and die encapsulant material 112 a may include an epoxy resin with glass cloth. The prepreg material may further strengthen and/or reinforce the package substrate 104 for handling and/or assembly associated with fabrication of the build-up layers 114. The material of the laminate layer 112 and die encapsulant material 112 a may include other suitable materials in other embodiments. One or more interconnects may be formed in the laminate layer 112 to electrically couple the die 102 a with conductive features 114 b (e.g., electrical routing features) of the build-up layers 114. For example, in some embodiments, the interconnects may include via structures 112 b that extend through the laminate layer 112 and die encapsulant material 112 a to corresponding contacts such as pads on the die 102 a. The via structures 112 b may be formed using any suitable process including, for example, a laser process to remove material of the laminate layer 112 and die encapsulant material 112 a to</p>
--	--

	<p>provide a laser via joint between the die 102 a and the build-up layers 114. The laser via joint may have a structure consistent with being formed by a laser process. For example, a profile of the laser via joint may taper as can be seen. The interconnects of the laminate layer 112 may include other suitable interconnect structures in other embodiments.” Shuto, [4:63-5:21].</p> <p>“The package substrate 104 may further include the build-up layers 114 coupled with the first side of reinforced plate 110. In some embodiments, an individual build-up layer of the build-up layers 114 is in direct contact with the laminate layer 112. The build-up layers 114 may include electrical routing features (e.g., hereinafter “conductive features 114 b”) of individual build-up layers 114 coupled together in an electrically insulative material (hereinafter “insulator 114 a”). The conductive features 114 b may include, for example, trenches, vias, traces or other suitable routing structures composed of an electrically conductive material such as metal (e.g., copper). The insulator 114 a may be composed of an epoxy resin. The conductive features 114 b and the insulator 114 a may be composed of other suitable materials in other embodiments. In some embodiments, the build-up layers 114 may be formed using Ajinomoto Build-up Film (ABF) techniques. Other suitable techniques to fabricate the build-up layers 114 may be used in other embodiments. In some embodiments, another die 102 b may be coupled with the package substrate 104. For example, in the depicted embodiment, the die 102 b is coupled with the build-up layers 114 in a flip-chip configuration using solderable material 116 such as solder bumps to couple corresponding contacts (e.g., pads) on the die 102 b with the conductive features 114 b of the build-up layers 114. In some embodiments, an underfill material 118 may be disposed between an active side of the die 102 b and the package substrate 104. The die 102 b may be coupled with the package substrate 104 using other suitable techniques such as, for example, wirebonding techniques, embedding techniques and the like or other FLI interconnect structures such as pillars to couple the die 102 b with the package substrate 104.” Shuto, [5:37-6:2].</p>
--	---

Appendix A-30 - Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

	<p>“In some embodiments, the conductive features 114 b of the build-up layers 114 may be electrically coupled with the dies 102 a and/or 102 b (e.g., and possibly other dies) and configured to route electrical signals of the dies 102 a and/or 102 b through the package substrate 104. The electrical signals may include, for example, input/output (I/O signals) and/or power/ground signals associated with operation of the dies 102 a, 102 b. In some embodiments, the conductive features 114 b may route electrical signals between the dies 102 a, 102 b. In this regard, the dies 102 a and 102 b may be electrically coupled with one another. In some embodiments, the conductive features 114 b may route electrical signals between one or more of the dies 102 a, 102 b and another electrical component such as, for example, a circuit board 106 by way of interconnects in the laminate layer 112, PTHs 110 b and/or package-level interconnects such as solder balls 120.” Shuto, [6:8-6:24].</p> <p>To the extent Plaintiff contends that Shuto fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Shuto discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p>See, e.g.:</p> <p>“FIG. 1 schematically illustrates a cross-section side view of an example integrated circuit (IC) package assembly (hereinafter “package assembly 100”), in accordance with some embodiments. be seen. In an embodiment, the package assembly 100 may refer to only the package substrate 104. The package substrate 104 may include a die attach layer 108, a reinforced layer (hereinafter “reinforced plate 110”), a laminate layer 112 and one or more build-up layers (hereinafter “build-up layers 114”), coupled as shown.” Shuto, [3:13-3:25].

FIG. 1

Shuto, FIG. 1

“In some embodiments, the reinforced plate 110 may be composed of an epoxy resin with glass cloth. In other embodiments, the reinforced plate 110 may be composed of a metal (e.g., as described in connection with FIG. 3). The reinforced plate 110 may be composed of other suitable materials in other embodiments. The reinforced plate 110 may strengthen the

	<p>package substrate 104 for handling and/or assembly associated with fabrication of the build-up layers 114 using, for example bumpless build-up layer (BBUL) techniques. For example, in some embodiments, the reinforced plate 110 may obviate a need for using a fixture jig, which may be used for handling and/or assembly during fabrication of a flexible package substrate. The reinforced plate 110 may have a first side, S1, and a second side, S2, disposed opposite to the first side S1. In some embodiments, the first side S1 may be in direct contact with the die attach layer 108. The reinforced plate 110 may further have a cavity 110 a formed in the reinforced plate 110. In some embodiments, the cavity 110 a may pass through the reinforced plate 110 to provide an opening between the first side S1 and the second side S2, as can be seen.” Shuto, [3:66-4:20].</p> <p>“In some embodiments, the die 102 a may be disposed in the cavity 110 a. The die may have a thickness that is less than a thickness of the reinforced plate 110 as measured from the first side S1 to the second side S2, as can be seen, in some embodiments. Embedding the die 102 a in the cavity 110 a may reduce a total height (e.g., Z dimension indicated by arrow in FIG. 1) of the package substrate 104 and/or package assembly 100. For example, a separate discrete interposer element may not be needed to couple the package substrate 104 housing the die 102 a with the die 102 b (e.g., no need for micro-solder ball connections between packages housing respective dies 102 a and 102 b), which may allow reduction of the package height.” Shuto, [4:21-4:33].</p> <p>“The package substrate 104 may further include the build-up layers 114 coupled with the first side of reinforced plate 110. In some embodiments, an individual build-up layer of the build-up layers 114 is in direct contact with the laminate layer 112. The build-up layers 114 may include electrical routing features (e.g., hereinafter “conductive features 114 b”) of individual build-up layers 114 coupled together in an electrically insulative material (hereinafter “insulator 114 a”). The conductive features 114 b may include, for example, trenches, vias,</p>
--	---

	<p>traces or other suitable routing structures composed of an electrically conductive material such as metal (e.g., copper). The insulator 114 a may be composed of an epoxy resin. The conductive features 114 b and the insulator 114 a may be composed of other suitable materials in other embodiments. In some embodiments, the build-up layers 114 may be formed using Ajinomoto Build-up Film (ABF) techniques. Other suitable techniques to fabricate the build-up layers 114 may be used in other embodiments. In some embodiments, another die 102 b may be coupled with the package substrate 104. For example, in the depicted embodiment, the die 102 b is coupled with the build-up layers 114 in a flip-chip configuration using solderable material 116 such as solder bumps to couple corresponding contacts (e.g., pads) on the die 102 b with the conductive features 114 b of the build-up layers 114. In some embodiments, an underfill material 118 may be disposed between an active side of the die 102 b and the package substrate 104. The die 102 b may be coupled with the package substrate 104 using other suitable techniques such as, for example, wirebonding techniques, embedding techniques and the like or other FLI interconnect structures such as pillars to couple the die 102 b with the package substrate 104.” Shuto, [5:37-6:2].</p> <p>“In some embodiments, the conductive features 114 b of the build-up layers 114 may be electrically coupled with the dies 102 a and/or 102 b (e.g., and possibly other dies) and configured to route electrical signals of the dies 102 a and/or 102 b through the package substrate 104. The electrical signals may include, for example, input/output (I/O signals) and/or power/ground signals associated with operation of the dies 102 a, 102 b. In some embodiments, the conductive features 114 b may route electrical signals between the dies 102 a, 102 b. In this regard, the dies 102 a and 102 b may be electrically coupled with one another. In some embodiments, the conductive features 114 b may route electrical signals between one or more of the dies 102 a, 102 b and another electrical component such as, for example, a circuit board 106 by way of interconnects in the laminate layer 112, PTHs 110 b and/or package-level interconnects such as solder balls 120.” Shuto, [6:8-6:24].</p>
--	--

Appendix A-30 - Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

	<p>To the extent Plaintiff contends that Shuto fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.D] the spacer connector comprises a core substrate;</p>	<p>Shuto discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 schematically illustrates a cross-section side view of an example integrated circuit (IC) package assembly (hereinafter “package assembly 100”), in accordance with some embodiments. 	<p>interconnects may include other suitable structures such as, for example, land-grid array (LGA) structures. The package-level interconnects (e.g., solder balls 120) may be coupled with the PTHs 110 b through the die attach layer 108, as can be seen, in some embodiments. In other embodiments, additional build-up layers (not shown) may be formed on the die attach layer 108 to provide additional electrical routing for the package substrate 104 and the package-level interconnects may be coupled with the additional build-up layers.” Shuto, [6:25-6:40].</p> <p>To the extent Plaintiff contends that Shuto fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Shuto discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 schematically illustrates a cross-section side view of an example integrated circuit (IC) package assembly (hereinafter “package assembly 100”), in accordance with some embodiments. In some embodiments, the package assembly 100 includes a package substrate 104 coupled with one or more dies (e.g., dies 102 a, 102 b) and a circuit board 106, as can be seen. In an embodiment, the package assembly 100 may refer to only the package substrate 104. The package substrate 104 may include a die attach layer 108, a reinforced layer (hereinafter “reinforced plate 110”), a laminate layer 112 and one or more build-up layers (hereinafter “build-up layers 114”), coupled as shown.” Shuto, [3:13-3:25].</p>

FIG. 1

Shuto, FIG. 1

“In some embodiments, the reinforced plate 110 may be composed of an epoxy resin with glass cloth. In other embodiments, the reinforced plate 110 may be composed of a metal (e.g., as described in connection with FIG. 3). The reinforced plate 110 may be composed of other suitable materials in other embodiments. The reinforced plate 110 may strengthen the package substrate 104 for handling and/or assembly associated with fabrication of the build-up layers 114 using, for example bumpless build-up layer (BBUL) techniques. For example, in some embodiments, the reinforced plate 110 may obviate a need for using a fixture jig, which may be used for handling and/or assembly during fabrication of a flexible package substrate. The reinforced plate 110 may have a first side, S1, and a second side, S2, disposed

	<p>opposite to the first side S1. In some embodiments, the first side S1 may be in direct contact with the die attach layer 108. The reinforced plate 110 may further have a cavity 110 a formed in the reinforced plate 110. In some embodiments, the cavity 110 a may pass through the reinforced plate 110 to provide an opening between the first side S1 and the second side S2, as can be seen.” Shuto, [3:66-4:20].</p> <p>“In some embodiments, the die 102 a may be disposed in the cavity 110 a. The die may have a thickness that is less than a thickness of the reinforced plate 110 as measured from the first side S1 to the second side S2, as can be seen, in some embodiments. Embedding the die 102 a in the cavity 110 a may reduce a total height (e.g., Z dimension indicated by arrow in FIG. 1) of the package substrate 104 and/or package assembly 100. For example, a separate discrete interposer element may not be needed to couple the package substrate 104 housing the die 102 a with the die 102 b (e.g., no need for micro-solder ball connections between packages housing respective dies 102 a and 102 b), which may allow reduction of the package height.” Shuto, [4:21-4:33].</p> <p>“In some embodiments, the reinforced plate 110 may include one or more interconnects configured to electrically couple the first side S1 and the second side S2 of the reinforced plate 110 such as, for example, plated through holes (PTHs) 110 b. The PTHs 110 b may be configured to route electrical signals of the die 102 a (and/or possibly other dies such as die 102 b). In some embodiments, the PTHs 110 b may include a plated opening 110 c composed of an electrically conductive material such as a metal (e.g., copper) filled with a plugging material 110 d such as, for example, epoxy resin. The reinforced plate 110 may include other suitable interconnect structures formed through the reinforced plate 110 to route the electrical signals in other embodiments.” Shuto, [4:34-4:47].</p>
--	--

	<p>“The package substrate 104 may further include the build-up layers 114 coupled with the first side of reinforced plate 110. In some embodiments, an individual build-up layer of the build-up layers 114 is in direct contact with the laminate layer 112. The build-up layers 114 may include electrical routing features (e.g., hereinafter “conductive features 114 b”) of individual build-up layers 114 coupled together in an electrically insulative material (hereinafter “insulator 114 a”). The conductive features 114 b may include, for example, trenches, vias, traces or other suitable routing structures composed of an electrically conductive material such as metal (e.g., copper). The insulator 114 a may be composed of an epoxy resin. The conductive features 114 b and the insulator 114 a may be composed of other suitable materials in other embodiments. In some embodiments, the build-up layers 114 may be formed using Ajinomoto Build-up Film (ABF) techniques. Other suitable techniques to fabricate the build-up layers 114 may be used in other embodiments. In some embodiments, another die 102 b may be coupled with the package substrate 104. For example, in the depicted embodiment, the die 102 b is coupled with the build-up layers 114 in a flip-chip configuration using solderable material 116 such as solder bumps to couple corresponding contacts (e.g., pads) on the die 102 b with the conductive features 114 b of the build-up layers 114. The electrical signals may include, for example, input/output (I/O signals) and/or power/ground signals associated with operation of the dies 102 a, 102 b. In some</p>

embodiments, the conductive features 114 b may route electrical signals between the dies 102 a, 102 b. In this regard, the dies 102 a and 102 b may be electrically coupled with one another. In some embodiments, the conductive features 114 b may route electrical signals between one or more of the dies 102 a, 102 b and another electrical component such as, for example, a circuit board 106 by way of interconnects in the laminate layer 112, PTHs 110 b and/or package-level interconnects such as solder balls 120.” Shuto, [6:8-6:24].

Shuto, FIG. 1

“In some embodiments, one or more package-level interconnects such as, for example, solder balls 120 may be coupled with the package substrate 104 to further route the electrical signals

	<p>to another electrical component such as circuit board 106. The solder balls 120 may be arranged in a ball-grid array (BGA) configuration in some embodiments. The package-level interconnects may include other suitable structures such as, for example, land-grid array (LGA) structures. The package-level interconnects (e.g., solder balls 120) may be coupled with the PTHs 110 b through the die attach layer 108, as can be seen, in some embodiments. In other embodiments, additional build-up layers (not shown) may be formed on the die attach layer 108 to provide additional electrical routing for the package substrate 104 and the package-level interconnects may be coupled with the additional build-up layers.” Shuto, [6:25-6:40].</p> <p>“The package assembly 100 may further include a circuit board 106 coupled with the package substrate 104 through the package-level interconnects (e.g., solder balls 120). Only a small portion of the circuit board 106 may be depicted for the sake of discussion. The package-level interconnects may be coupled with contacts (e.g., pads) of the circuit board 106 to route electrical signals of the dies 102 a, 102 b between the package substrate 104 and the circuit board 106. The circuit board 106 may be a printed circuit board (PCB) composed of an electrically insulative material such as, for example, an epoxy laminate. For example, the circuit board 106 may include electrically insulating layers composed of materials such as, for example, polytetrafluoroethylene, phenolic cotton paper materials such as Flame Retardant 4 (FR-4), FR-1, cotton paper and epoxy materials such as CEM-1 or CEM-3, or woven glass materials that are laminated together using an epoxy resin prepreg material. Electrical routing structures (not shown) such as traces, trenches, vias, and the like may be formed through the electrically insulating layers to route the electrical signals of the dies 102 a, 102 b through the circuit board 106. The circuit board 106 may be composed of other suitable materials in other embodiments. In some embodiments, the circuit board 106 is a motherboard (e.g., motherboard 802 of FIG. 8).” Shuto, [6:41-6:64].</p>

In some embodiments, the cavity 110 a may pass through the reinforced plate 110 to provide an opening between the first side S1 and the second side S2, as can be seen.” Shuto, [3:66-4:20].</p>
--	--

	<p>“In some embodiments, the die 102 a may be disposed in the cavity 110 a. The die may have a thickness that is less than a thickness of the reinforced plate 110 as measured from the first side S1 to the second side S2, as can be seen, in some embodiments. Embedding the die 102 a in the cavity 110 a may reduce a total height (e.g., Z dimension indicated by arrow in FIG. 1) of the package substrate 104 and/or package assembly 100. For example, a separate discrete interposer element may not be needed to couple the package substrate 104 housing the die 102 a with the die 102 b (e.g., no need for micro-solder ball connections between packages housing respective dies 102 a and 102 b), which may allow reduction of the package height.” Shuto, [4:21-4:33].</p> <p>“In some embodiments, the prepreg material of the laminate layer 112 and die encapsulant material 112 a may include an epoxy resin with glass cloth. The prepreg material may further strengthen and/or reinforce the package substrate 104 for handling and/or assembly associated with fabrication of the build-up layers 114. The material of the laminate layer 112 and die encapsulant material 112 a may include other suitable materials in other embodiments. One or more interconnects may be formed in the laminate layer 112 to electrically couple the die 102 a with conductive features 114 b (e.g., electrical routing features) of the build-up layers 114. For example, in some embodiments, the interconnects may include via structures 112 b that extend through the laminate layer 112 and die encapsulant material 112 a to corresponding contacts such as pads on the die 102 a. The via structures 112 b may be formed using any suitable process including, for example, a laser process to remove material of the laminate layer 112 and die encapsulant material 112 a to provide a laser via joint between the die 102 a and the build-up layers 114. The laser via joint may have a structure consistent with being formed by a laser process. For example, a profile of the laser via joint may taper as can be seen. The interconnects of the laminate layer 112 may include other suitable interconnect structures in other embodiments.” Shuto, [4:63-5:21].</p>
--	--

	<p>“The package substrate 104 may further include the build-up layers 114 coupled with the first side of reinforced plate 110. In some embodiments, an individual build-up layer of the build-up layers 114 is in direct contact with the laminate layer 112. The build-up layers 114 may include electrical routing features (e.g., hereinafter “conductive features 114 b”) of individual build-up layers 114 coupled together in an electrically insulative material (hereinafter “insulator 114 a”). The conductive features 114 b may include, for example, trenches, vias, traces or other suitable routing structures composed of an electrically conductive material such as metal (e.g., copper). The insulator 114 a may be composed of an epoxy resin. The conductive features 114 b and the insulator 114 a may be composed of other suitable materials in other embodiments. In some embodiments, the build-up layers 114 may be formed using Ajinomoto Build-up Film (ABF) techniques. Other suitable techniques to fabricate the build-up layers 114 may be used in other embodiments. In some embodiments, another die 102 b may be coupled with the package substrate 104. For example, in the depicted embodiment, the die 102 b is coupled with the build-up layers 114 in a flip-chip configuration using solderable material 116 such as solder bumps to couple corresponding contacts (e.g., pads) on the die 102 b with the conductive features 114 b of the build-up layers 114. In some embodiments, an underfill material 118 may be disposed between an active side of the die 102 b and the package substrate 104. The die 102 b may be coupled with the package substrate 104 using other suitable techniques such as, for example, wirebonding techniques, embedding techniques and the like or other FLI interconnect structures such as pillars to couple the die 102 b with the package substrate 104.” Shuto, [5:37-6:2].</p> <p>“According to various embodiments, the first die 102 a may be a logic die such as, for example, a processor or ASIC and the second die 102 b may be a memory die. The first dies 102 a and/or 102 b may be configured to perform other functions in other embodiments.” Shuto, [6:3-6:7].</p>
--	--

	<p>“In some embodiments, the conductive features 114 b of the build-up layers 114 may be electrically coupled with the dies 102 a and/or 102 b (e.g., and possibly other dies) and configured to route electrical signals of the dies 102 a and/or 102 b through the package substrate 104. The electrical signals may include, for example, input/output (I/O signals) and/or power/ground signals associated with operation of the dies 102 a, 102 b. In some embodiments, the conductive features 114 b may route electrical signals between the dies 102 a, 102 b. In this regard, the dies 102 a and 102 b may be electrically coupled with one another. In some embodiments, the conductive features 114 b may route electrical signals between one or more of the dies 102 a, 102 b and another electrical component such as, for example, a circuit board 106 by way of interconnects in the laminate layer 112, PTHs 110 b and/or package-level interconnects such as solder balls 120.” Shuto, [6:8-6:24].</p> <p>“In some embodiments, one or more package-level interconnects such as, for example, solder balls 120 may be coupled with the package substrate 104 to further route the electrical signals to another electrical component such as circuit board 106. The solder balls 120 may be arranged in a ball-grid array (BGA) configuration in some embodiments. The package-level interconnects may include other suitable structures such as, for example, land-grid array (LGA) structures. The package-level interconnects (e.g., solder balls 120) may be coupled with the PTHs 110 b through the die attach layer 108, as can be seen, in some embodiments. In other embodiments, additional build-up layers (not shown) may be formed on the die attach layer 108 to provide additional electrical routing for the package substrate 104 and the package-level interconnects may be coupled with the additional build-up layers.” Shuto, [6:25-6:40].</p> <p>“The package assembly 100 may further include a circuit board 106 coupled with the package substrate 104 through the package-level interconnects (e.g., solder balls 120). Only a small portion of the circuit board 106 may be depicted for the sake of discussion. The package-</p>

Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced</p>	<p>Shuto discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p>

downwardly from the bottom surface of the top package substrate.

See, e.g.:

“FIG. 1 schematically illustrates a cross-section side view of an example integrated circuit (IC) package assembly (hereinafter “package assembly 100”), in accordance with some embodiments. In some embodiments, the package assembly 100 includes a package substrate 104 coupled with one or more dies (e.g., dies 102 a, 102 b) and a circuit board 106, as can be seen. In an embodiment, the package assembly 100 may refer to only the package substrate 104. The package substrate 104 may include a die attach layer 112 and one or more build-up layers (hereinafter “reinforced plate 110”), a laminate layer 112 and one or more build-up layers (hereinafter “build-up layers 114”), coupled as shown.” Shuto, [3:13-3:25].

FIG. 1

	<p>Shuto, FIG. 1</p> <p>“In some embodiments, the die 102 a may be disposed in the cavity 110 a. The die may have a thickness that is less than a thickness of the reinforced plate 110 as measured from the first side S1 to the second side S2, as can be seen, in some embodiments. Embedding the die 102 a in the cavity 110 a may reduce a total height (e.g., Z dimension indicated by arrow in FIG. 1) of the package substrate 104 and/or package assembly 100. For example, a separate discrete interposer element may not be needed to couple the package substrate 104 housing the die 102 a with the die 102 b (e.g., no need for micro-solder ball connections between packages housing respective dies 102 a and 102 b), which may allow reduction of the package height.” Shuto, [4:21-4:33].</p> <p>“The package substrate 104 may further include the build-up layers 114 coupled with the first side of reinforced plate 110. In some embodiments, an individual build-up layer of the build-up layers 114 is in direct contact with the laminate layer 112. The build-up layers 114 may include electrical routing features (e.g., hereinafter “conductive features 114 b”) of individual build-up layers 114 coupled together in an electrically insulative material (hereinafter “insulator 114 a”). The conductive features 114 b may include, for example, trenches, vias, traces or other suitable routing structures composed of an electrically conductive material such as metal (e.g., copper). The insulator 114 a may be composed of an epoxy resin. The conductive features 114 b and the insulator 114 a may be composed of other suitable materials in other embodiments. In some embodiments, the build-up layers 114 may be formed using Ajinomoto Build-up Film (ABF) techniques. Other suitable techniques to fabricate the build-up layers 114 may be used in other embodiments. In some embodiments, another die 102 b may be coupled with the package substrate 104. For example, in the depicted embodiment, the die 102 b is coupled with the build-up layers 114 in a flip-chip configuration using solderable material 116 such as solder bumps to couple corresponding</p>
--	---

Appendix A-30 - Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

	<p>contacts (e.g., pads) on the die 102 b with the conductive features 114 b of the build-up layers 114. In some embodiments, an underfill material 118 may be disposed between an active side of the die 102 b and the package substrate 104. The die 102 b may be coupled with the package substrate 104 using other suitable techniques such as, for example, wirebonding techniques, embedding techniques and the like or other FLI interconnect structures such as pillars to couple the die 102 b with the package substrate 104.” Shuto, [5:37-6:2].</p> <p>“According to various embodiments, the first die 102 a may be a logic die such as, for example, a processor or ASIC and the second die 102 b may be a memory die. The first dies 102 a and/or 102 b may be configured to perform other functions in other embodiments.” Shuto, [6:3-6:7].</p> <p>“In some embodiments, the conductive features 114 b of the build-up layers 114 may be electrically coupled with the dies 102 a and/or 102 b (e.g., and possibly other dies) and configured to route electrical signals of the dies 102 a and/or 102 b through the package substrate 104. The electrical signals may include, for example, input/output (I/O signals) and/or power/ground signals associated with operation of the dies 102 a, 102 b. In some embodiments, the conductive features 114 b may route electrical signals between the dies 102 a, 102 b. In this regard, the dies 102 a and 102 b may be electrically coupled with one another. In some embodiments, the conductive features 114 b may route electrical signals between one or more of the dies 102 a, 102 b and another electrical component such as, for example, a circuit board 106 by way of interconnects in the laminate layer 112, PTHs 110 b and/or package-level interconnects such as solder balls 120.” Shuto, [6:8-6:24].</p> <p>“The package assembly 100 may further include a circuit board 106 coupled with the package substrate 104 through the package-level interconnects (e.g., solder balls 120). Only a small portion of the circuit board 106 may be depicted for the sake of discussion. The package-</p>

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate,	Shuto discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is

Appendix A-30 - Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.	<p>stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 schematically illustrates a cross-section side view of an example integrated circuit (IC) package assembly (hereinafter “package assembly 100”), in accordance with some embodiments. In some embodiments, the package assembly 100 includes a package substrate 104 coupled with one or more dies (e.g., dies 102 a, 102 b) and a circuit board 106, as can be seen. In an embodiment, the package assembly 100 may refer to only the package substrate 104. The package substrate 104 may include a die attach layer 108, a reinforced layer (hereinafter “reinforced plate 110”), a laminate layer 112 and one or more build-up layers (hereinafter “build-up layers 114”), coupled as shown.” Shuto, [3:13-3:25].</p>
---	--

FIG. 1

Shuto, FIG. 1

“In some embodiments, the die 102 a may be disposed in the cavity 110 a. The die may have a thickness that is less than a thickness of the reinforced plate 110 as measured from the first side S1 to the second side S2, as can be seen, in some embodiments. Embedding the die 102 a in the cavity 110 a may reduce a total height (e.g., Z dimension indicated by arrow in FIG. 1) of the package substrate 104 and/or package assembly 100. For example, a separate discrete interposer element may not be needed to couple the package substrate 104 housing the die 102 a with the die 102 b (e.g., no need for micro-solder ball connections between packages housing respective dies 102 a and 102 b), which may allow reduction of the package height.” Shuto, [4:21-4:33].

	<p>“The package substrate 104 may further include the build-up layers 114 coupled with the first side of reinforced plate 110. In some embodiments, an individual build-up layer of the build-up layers 114 is in direct contact with the laminate layer 112. The build-up layers 114 may include electrical routing features (e.g., hereinafter “conductive features 114 b”) of individual build-up layers 114 coupled together in an electrically insulative material (hereinafter “insulator 114 a”). The conductive features 114 b may include, for example, trenches, vias, traces or other suitable routing structures composed of an electrically conductive material such as metal (e.g., copper). The insulator 114 a may be composed of an epoxy resin. The conductive features 114 b and the insulator 114 a may be composed of other suitable materials in other embodiments. In some embodiments, the build-up layers 114 may be formed using Ajinomoto Build-up Film (ABF) techniques. Other suitable techniques to fabricate the build-up layers 114 may be used in other embodiments. In some embodiments, another die 102 b may be coupled with the package substrate 104. For example, in the depicted embodiment, the die 102 b is coupled with the build-up layers 114 in a flip-chip configuration using solderable material 116 such as solder bumps to couple corresponding contacts (e.g., pads) on the die 102 b with the conductive features 114 b of the build-up layers 114. In some embodiments, an underfill material 118 may be disposed between an active side of the die 102 b and the package substrate 104. The die 102 b may be coupled with the package substrate 104 using other suitable techniques such as, for example, wirebonding techniques, embedding techniques and the like or other FLI interconnect structures such as pillars to couple the die 102 b with the package substrate 104.” Shuto, [5:37-6:2].</p> <p>“According to various embodiments, the first die 102 a may be a logic die such as, for example, a processor or ASIC and the second die 102 b may be a memory die. The first dies 102 a and/or 102 b may be configured to perform other functions in other embodiments.” Shuto, [6:3-6:7].</p>
--	--

	<p>“In some embodiments, the conductive features 114 b of the build-up layers 114 may be electrically coupled with the dies 102 a and/or 102 b (e.g., and possibly other dies) and configured to route electrical signals of the dies 102 a and/or 102 b through the package substrate 104. The electrical signals may include, for example, input/output (I/O signals) and/or power/ground signals associated with operation of the dies 102 a, 102 b. In some embodiments, the conductive features 114 b may route electrical signals between the dies 102 a, 102 b. In this regard, the dies 102 a and 102 b may be electrically coupled with one another. In some embodiments, the conductive features 114 b may route electrical signals between one or more of the dies 102 a, 102 b and another electrical component such as, for example, a circuit board 106 by way of interconnects in the laminate layer 112, PTHs 110 b and/or package-level interconnects such as solder balls 120.” Shuto, [6:8-6:24].</p> <p>“The package assembly 100 may further include a circuit board 106 coupled with the package substrate 104 through the package-level interconnects (e.g., solder balls 120). Claim 6, U.S. Patent No. 9859202

Appendix A-30 - Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

Claim Limitation	Disclosure
<p>[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Shuto discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 schematically illustrates a cross-section side view of an example integrated circuit (IC) package assembly (hereinafter “package assembly 100”), in accordance with some embodiments. In some embodiments, the package assembly 100 includes a package substrate 104 coupled with one or more dies (e.g., dies 102 a, 102 b) and a circuit board 106, as can be seen. In an embodiment, the package assembly 100 may refer to only the package substrate 104. The package substrate 104 may include a die attach layer 108, a reinforced layer (hereinafter “reinforced plate 110”), a laminate layer 112 and one or more build-up layers (hereinafter “build-up layers 114”), coupled as shown.” Shuto, [3:13-3:25].</p>

FIG. 1

Shuto, FIG. 1

“The package substrate 104 may include a die attach layer 108, which may be used as a substrate for attachment of the die 102 a. That is, in some embodiments, the die 102 a may be coupled in direct contact with the die attach layer 108. In some embodiments, the die attach layer 108 may be composed of an electrically insulative material such as, for example, an epoxy resin. In some embodiments, the die attach layer 108 may be composed of a same material as an insulator 114 a of the build-up layers 114. The die attach layer 108 may be composed of other suitable materials in other embodiments.” Shuto, [3:26-3:36].

	<p>“In some embodiments, the reinforced plate 110 may be composed of an epoxy resin with glass cloth. In other embodiments, the reinforced plate 110 may be composed of a metal (e.g., as described in connection with FIG. 3). The reinforced plate 110 may be composed of other suitable materials in other embodiments. The reinforced plate 110 may strengthen the package substrate 104 for handling and/or assembly associated with fabrication of the build-up layers 114 using, for example bumpless build-up layer (BBUL) techniques. For example, in some embodiments, the reinforced plate 110 may obviate a need for using a fixture jig, which may be used for handling and/or assembly during fabrication of a flexible package substrate. The reinforced plate 110 may have a first side, S1, and a second side, S2, disposed opposite to the first side S1. In some embodiments, the first side S1 may be in direct contact with the die attach layer 108. The reinforced plate 110 may further have a cavity 110 a formed in the reinforced plate 110. In some embodiments, the cavity 110 a may pass through the reinforced plate 110 to provide an opening between the first side S1 and the second side S2, as can be seen.” Shuto, [3:66-4:20].</p> <p>“In some embodiments, the prepreg material of the laminate layer 112 and die encapsulant material 112 a may include an epoxy resin with glass cloth. The prepreg material may further strengthen and/or reinforce the package substrate 104 for handling and/or assembly associated with fabrication of the build-up layers 114. The material of the laminate layer 112 and die encapsulant material 112 a may include other suitable materials in other embodiments. One or more interconnects may be formed in the laminate layer 112 to electrically couple the die 102 a with conductive features 114 b (e.g., electrical routing features) of the build-up layers 114. For example, in some embodiments, the interconnects may include via structures 112 b that extend through the laminate layer 112 and die encapsulant material 112 a to corresponding contacts such as pads on the die 102 a. The via structures 112 b may be formed using any suitable process including, for example, a laser process to remove material of the laminate layer 112 and die encapsulant material 112 a to</p>
--	--

	<p>provide a laser via joint between the die 102 a and the build-up layers 114. The laser via joint may have a structure consistent with being formed by a laser process. For example, a profile of the laser via joint may taper as can be seen. The interconnects of the laminate layer 112 may include other suitable interconnect structures in other embodiments.” Shuto, [4:63-5:21].</p> <p>“The package substrate 104 may further include the build-up layers 114 coupled with the first side of reinforced plate 110. In some embodiments, an individual build-up layer of the build-up layers 114 is in direct contact with the laminate layer 112. The build-up layers 114 may include electrical routing features (e.g., hereinafter “conductive features 114 b”) of individual build-up layers 114 coupled together in an electrically insulative material (hereinafter “insulator 114 a”). The conductive features 114 b may include, for example, trenches, vias, traces or other suitable routing structures composed of an electrically conductive material such as metal (e.g., copper). The insulator 114 a may be composed of an epoxy resin. The conductive features 114 b and the insulator 114 a may be composed of other suitable materials in other embodiments. In some embodiments, the build-up layers 114 may be formed using Ajinomoto Build-up Film (ABF) techniques. Other suitable techniques to fabricate the build-up layers 114 may be used in other embodiments. In some embodiments, another die 102 b may be coupled with the package substrate 104. For example, in the depicted embodiment, the die 102 b is coupled with the build-up layers 114 in a flip-chip configuration using solderable material 116 such as solder bumps to couple corresponding contacts (e.g., pads) on the die 102 b with the conductive features 114 b of the build-up layers 114. In some embodiments, an underfill material 118 may be disposed between an active side of the die 102 b and the package substrate 104. The die 102 b may be coupled with the package substrate 104 using other suitable techniques such as, for example, wirebonding techniques, embedding techniques and the like or other FLI interconnect structures such as pillars to couple the die 102 b with the package substrate 104.” Shuto, [5:37-6:2].</p>
--	---

Appendix A-30 - Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

	<p>“In some embodiments, the conductive features 114 b of the build-up layers 114 may be electrically coupled with the dies 102 a and/or 102 b (e.g., and possibly other dies) and configured to route electrical signals of the dies 102 a and/or 102 b through the package substrate 104. The electrical signals may include, for example, input/output (I/O signals) and/or power/ground signals associated with operation of the dies 102 a, 102 b. In some embodiments, the conductive features 114 b may route electrical signals between the dies 102 a, 102 b. In this regard, the dies 102 a and 102 b may be electrically coupled with one another. In some embodiments, the conductive features 114 b may route electrical signals between one or more of the dies 102 a, 102 b and another electrical component such as, for example, a circuit board 106 by way of interconnects in the laminate layer 112, PTHs 110 b and/or package-level interconnects such as solder balls 120.” Shuto, [6:8-6:24].</p> <p>“In some embodiments, one or more package-level interconnects such as, for example, solder balls 120 may be coupled with the package substrate 104 to further route the electrical signals to another electrical component such as circuit board 106. The solder balls 120 may be arranged in a ball-grid array (BGA) configuration in some embodiments. The package-level interconnects may include other suitable structures such as, for example, land-grid array (LGA) structures. The package-level interconnects (e.g., solder balls 120) may be coupled with the PTHs 110 b through the die attach layer 108, as can be seen, in some embodiments. In other embodiments, additional build-up layers (not shown) may be formed on the die attach layer 108 to provide additional electrical routing for the package substrate 104 and the package-level interconnects may be coupled with the additional build-up layers.” Shuto, [6:25-6:40].</p> <p>“The package assembly 100 may further include a circuit board 106 coupled with the package substrate 104 through the package-level interconnects (e.g., solder balls 120). Only a small portion of the circuit board 106 may be depicted for the sake of discussion. The package-</p>

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on	Shuto discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to

Appendix A-30 - Invalidity of U.S. Patent No. 9859202 in view of Shuto - U.S. Patent No. 9685414

the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	<p>corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 schematically illustrates a cross-section side view of an example integrated circuit (IC) package assembly (hereinafter “package assembly 100”), in accordance with some embodiments. In some embodiments, the package assembly 100 includes a package substrate 104 coupled with one or more dies (e.g., dies 102 a, 102 b) and a circuit board 106, as can be seen. In an embodiment, the package assembly 100 may refer to only the package substrate 104. The package substrate 104 may include a die attach layer 108, a reinforced layer (hereinafter “reinforced plate 110”), a laminate layer 112 and one or more build-up layers (hereinafter “build-up layers 114”), coupled as shown.” Shuto, [3:13-3:25].</p>
---	---

FIG. 1

Shuto, FIG. 1

“In some embodiments, the reinforced plate 110 may be composed of an epoxy resin with glass cloth. In other embodiments, the reinforced plate 110 may be composed of a metal (e.g., as described in connection with FIG. 3). The reinforced plate 110 may be composed of other suitable materials in other embodiments. The reinforced plate 110 may strengthen the package substrate 104 for handling and/or assembly associated with fabrication of the build-up layers 114 using, for example bumpless build-up layer (BBUL) techniques. For example, in some embodiments, the reinforced plate 110 may obviate a need for using a fixture jig, which may be used for handling and/or assembly during fabrication of a flexible package substrate. The reinforced plate 110 may have a first side, S1, and a second side, S2, disposed

	<p>opposite to the first side S1. In some embodiments, the first side S1 may be in direct contact with the die attach layer 108. The reinforced plate 110 may further have a cavity 110 a formed in the reinforced plate 110. In some embodiments, the cavity 110 a may pass through the reinforced plate 110 to provide an opening between the first side S1 and the second side S2, as can be seen.” Shuto, [3:66-4:20].</p> <p>“In some embodiments, the prepreg material of the laminate layer 112 and die encapsulant material 112 a may include an epoxy resin with glass cloth. The prepreg material may further strengthen and/or reinforce the package substrate 104 for handling and/or assembly associated with fabrication of the build-up layers 114. The material of the laminate layer 112 and die encapsulant material 112 a may include other suitable materials in other embodiments. One or more interconnects may be formed in the laminate layer 112 to electrically couple the die 102 a with conductive features 114 b (e.g., electrical routing features) of the build-up layers 114. For example, in some embodiments, the interconnects may include via structures 112 b that extend through the laminate layer 112 and die encapsulant material 112 a to corresponding contacts such as pads on the die 102 a. The via structures 112 b may be formed using any suitable process including, for example, a laser process to remove material of the laminate layer 112 and die encapsulant material 112 a to provide a laser via joint between the die 102 a and the build-up layers 114. The laser via joint may have a structure consistent with being formed by a laser process. For example, a profile of the laser via joint may taper as can be seen. E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

U.S. Patent Publication No. 20110147908 (“Sun”) is titled Module for Use in a Multi Package Assembly and a Method of Making the Module and the Multi Package Assembly and lists Peng Sun, Kuen Vincent Leung, and Xun Qing Shi as inventors. Sun anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Sun is a U.S. patent publication that was filed December 17, 2009 and published June 23, 2011. Sun is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Sun, or otherwise rendered obvious by disclosures and teachings of Sun, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Sun does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Sun with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Sun, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Sun “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Sun or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Sun set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Sun discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 2 shows a module 100 for use in a multichip package. In particular a module for use in the lower part of a PoP assembly. It comprises a first substrate 110 which may be a PCB, preferably a BT core substrate. A (bismaleimide triazine) core substrate, is a substrate comprising a BT core layer with a metal layer on either side. BT has the advantage that it is a polyimide with higher thermal stability, better chemical resistance and mechanical properties compared to the epoxy resin used in same other types of PCB. Solder balls 130 are provided on the lower side of the first substrate 110 to enable the module 100 to be</p>

	<p>mounted to an external apparatus, such as a motherboard. A chip 200, which may be a memory chip or a processor, is mounted to the first substrate 100. It may be mounted by any appropriate method, for example die attachment with wire bonding, flip chip etc. Wires 220 connect a bonding pad 210 on top of the chip 200 with a bonding pad 240 on the upper side of the first substrate 110. A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chip 200. The second substrate 300 has a plurality of first connectors 320 for connecting the substrate electrically with the first substrate 110. The first connectors are provided on a first (underside) of the second substrate. A plurality of second connectors 310 are provided on the second (upper surface) of the second substrate 300. The first and second connectors preferably take the form of metal pillars, for example copper pillars. The first connectors may be electrically connected to the electrical contacts of the first substrate 110 by solder bonding or intermetallic bonding) 140. The assembly is overmolded with a molding material 120. The molding material covers the chip 200, the upper surface of the first substrate 110 and the second substrate 300. This overmolding helps to provide solidity and stability to the assembly and minimizes the occurrence of warping. Upper ends 311 of the second connectors 310 are exposed and are level with or extend above the upper surface of the overmold. The upper ends 311 may make contact with an external module.” Sun, [0047-0048].</p> <p>“FIG. 3 shows another embodiment of the first module, similar to FIG. 2. Like reference numerals are used to describe like parts and will not be described again. This embodiment has two chips 500 (a) and 500 (b) stacked one on top of the other. The first chip 500 (a) is mounted to the first substrate 110 by any suitable means. The second chip 500 (b) is mounted on top of the first chip 500 (a) and spaced apart from the first chip by a spacer 530. Wires 520 connect bonding pads on the chips 500 (a), 500 (b) to bonding pads on the first substrate 110. The molding material 120 covers both the first and second chips.” Sun, [0048-0049].</p>
--	--

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

	<p>“FIG. 4 is a third embodiment similar to the first two embodiments. It has two chips 810 and 820 mounted side by side on the first substrate 110. The overmolding material covers both the first and second chips 810, 820.” Sun, [0050].</p> <p>“FIG. 12 is a schematic diagram of a PoP assembly 1 comprising a second module 5 mounted on a first module 10. The first module 5 is a module of the type described above, e.g. with reference to FIG. 2. It forms a lower module of the PoP assembly. In this example, it has two chips 200, 200 a stacked one on top of the other and connected to a first substrate 110 by wires 220 and 220 a respectively. Both chips are processors. Other embodiments could have a different number or type of chips and different method of connecting the chips to the substrate 110. The upper module 5 comprises a pair of chips 30, 31 mounted to a first (upper) side of a third substrate 20. The third substrate may be a PCB, preferably a BT core substrate. The chips 30, 31 are electrically connected to the third substrate 20 by wires 16 or any other suitable means. Preferably the chips 30 and 31 are memory chips. The second module 5 is overmolded with a molding material 18 which covers the chips 30, 31 and the third substrate 20. The second (lower) side of the third substrate 20 is mounted to the first module 10. Specifically the third substrate is mounted directly to the second connectors 310 of the first module 5. Upper ends of the second connectors 310 connect with a conducting electrical contacts (not shown) of the second (lower) side of the third substrate 20 in order to allow communication of electrical signals between the two modules.” Sun, [0058-0059].</p> <p>“The first module 1 will now be described in more detail. It comprises a first substrate 110 which may be a PCB, preferably a BT core substrate. Solder balls 130 are provided on the lower side of the first substrate 110 to enable the module 100 to be mounted to an external apparatus, such as a motherboard. A pair of chips 200, 200 a may be memory chips or a processor, are mounted to the first substrate 110. They may be mounted by any appropriate</p>
--	--

	<p>method, for example wire bonding, die attachment etc. Wires 220, 220 a connect a bonding pad on top of the chip 200 with a bonding pad on the upper side of the first substrate 110. A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chips 200, 200 a. The second substrate 300 has a plurality of first connectors 320 for connecting the substrate electrically with the first substrate 110. The first connectors are provided on a first (underside) of the second substrate. A plurality of second connectors 310 are provided on the second (upper surface) of the second substrate 300. The first and second connectors preferably take the form of metal pillars, for example copper pillars. The first connectors may be electrically connected to the electrical contacts of the first substrate 110 by solder bonding 140. The first module 10 is overmolded with a molding material 120. The molding material covers the chips 200, 200 a, the upper surface of the first substrate 110 and the second substrate 300. This overmolding helps to provide solidity and stability to the assembly and minimizes the occurrence of warping. Upper ends 311 of the second connectors 310 are exposed above the overmold 120. The upper ends 311 make contact with electrical contacts of the second module 5.” Sun, [0060-0061].</p> <p>“FIG. 13 shows the second substrate and surrounding components in more detail. In particular, it illustrates the vias 390 extending through the second substrate 300. First metal connectors 320 are provided on a second (lower) side of the second substrate 300. These are surrounded by the molding compound 120 and mounted to the first substrate 110. Second metal connectors 320 are provided on the first (upper) side of the second substrate. They are surrounded by the molding compound 120 and have exposed upper ends 311. The second metal connectors 310 are aligned with corresponding second metal connectors 310 on the opposite side of the substrate 300. Vias 390 electrically connect each second metal connector 310 with a corresponding first metal connector 320. The vias 390 extend through the second substrate 300. The via has first 391 and second 392 side walls. These side walls 391, 392</p>
--	--

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

	<p>may be part of the same (e.g. circular) side wall or may be separate side walls. The via 390 further comprises a core 395 between the side walls and extending between the first and second metal connectors 320, 310. In the illustrated embodiment shown in FIG. 13 the side walls 391, 392 are electrically conductive (e.g. made of metal) and put the first and second metal connectors 320, 310 in electrical contact with each other.” Sun, [0062-0064].</p>
<p>[1.A] a bottom package substrate;</p>	<p>Sun discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 2 shows a module 100 for use in a multichip package. In particular a module for use in the lower part of a PoP assembly. It comprises a first substrate 110 which maybe a PCB, preferably a BT core substrate. A (bismaleimide triazine) core substrate, is a substrate comprising a BT core layer with a metal layer on either side. BT has the advantage that it is a polyimide with higher thermal stability, better chemical resistance and mechanical properties compared to the epoxy resin used in same other types of PCB. Solder balls 130 are provided on the lower side of the first substrate 110 to enable the module 100 to be mounted to an external apparatus, such as a motherboard.” Sun, [0047].</p>

FIG. 12

Sun, FIG. 12

“A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chip 200. The second substrate 300 has a plurality of first connectors 320 for connecting the substrate electrically with the first substrate 110. The first connectors are provided on a first (underside) of the second substrate. A plurality of second connectors 310 are provided on the second (upper surface) of the second substrate 300. The first and second connectors preferably take the form of metal pillars, for example copper pillars. The first connectors may be electrically connected to the electrical contacts of the first substrate 110 by solder bonding or intermetallic bonding) 140. The assembly is overmolded with a molding material 120. The molding material covers the chip 200, the upper surface of the first substrate 110 and the second substrate 300. This overmolding helps

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

	<p>to provide solidity and stability to the assembly and minimizes the occurrence of warping. Upper ends 311 of the second connectors 310 are exposed and are level with or extend above the upper surface of the overmold. The upper ends 311 may make contact with an external module. For example an upper PoP module may be mounted on top of the first module 110 and make electrical contact via the second connectors 311.” Sun, [0048].</p> <p>“FIG. 12 is a schematic diagram of a PoP assembly 1 comprising a second module 5 mounted on a first module 10. The first module 5 is a module of the type described above, e.g. with reference to FIG. 2. It forms a lower module of the PoP assembly. In this example, it has two chips 200, 200 a stacked one on top of the other and connected to a first substrate 110 by wires 220 and 220 a respectively.” Sun, [0058].</p> <p>To the extent Plaintiff contends that Sun fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Sun discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“A typical PoP assembly 1 is shown in FIG. 1. It comprises a first electronic package 5 mounted on top of a second electronic package 10. Typically the top package 5 has a memory device, while the bottom package has a processor. Due to their compact nature, PoP assemblies are used in many electronic devices. For example in a mobile phone the top package may have a memory device and the bottom package a baseband or applications</p>

	<p>processor. In a digital camera the top package may have a memory device and the bottom package an image processor. In a handheld computer or game system, the top package may have a memory device and the bottom package an audio or graphics processor. The top package in FIG. 1 has a substrate 20. Typically the substrate will be a BT core substrate. A pair of chips 30, 31 are mounted to the substrate 20. Wires 16, 18 connect the chips 30, 31 to electrical contacts 11 of the substrate 20. The top package is covered with a molding compound 30 (over molded). This strengthens the assembly and helps to protect the components from damage. The lower package 10 also comprises a substrate 40 and a chip 50 mounted to the substrate. The chip 50 is connected to electrical contacts 41 of the substrate by wires 45. An overmold 60 covers the chip 50 and a surrounding part of the substrate on which the chip is mounted. The top package 5 is mounted to the bottom package 10 by solder balls 70.” Sun, [0003-0007].</p> <p>“A second aspect of the present invention provides a multi-package assembly comprising the module of the first aspect of the present invention as the first module and a second module comprising a chip mounted on a third substrate. The second module may be mounted to the first module; preferably it is mounted directly to the overmold of the first module. The third substrate is preferably mounted to the first module. For example the third substrate may be mounted to the second substrate of the first module via overmold of the second substrate and/or the second electrical connectors. Preferably the at least one second electrical connector is in electrical contact with a conducting contact of the third substrate. Preferably the at least one second connector is in direct physical contact with the third substrate. The chip of the second module is preferably mounted to a first side of the third substrate and a second side of the third substrate is preferably mounted to the first module. E.g. the third substrate may be mounted to the second substrate via the overmold of the second substrate and/or the second electrical connectors.” Sun, [0020-0023].</p>
--	--

	<p>“FIG. 2 shows a module 100 for use in a multichip package. In particular a module for use in the lower part of a PoP assembly. It comprises a first substrate 110 which maybe a PCB, preferably a BT core substrate. A (bismaleimide triazine) core substrate, is a substrate comprising a BT core layer with a metal layer on either side. BT has the advantage that it is a polymide with higher thermal stability, better chemical resistance and mechanical properties compared to the epoxy resin used in same other types of PCB. Solder balls 130 are provided on the lower side of the first substrate 110 to enable the module 100 to be mounted to an external apparatus, such as a motherboard. A chip 200, which may be a memory chip or a processor, is mounted to the first substrate 100. It may be mounted by any appropriate method, for example die attachment with wire bonding, flip chip etc. Wires 220 connect a bonding pad 210 on top of the chip 200 with a bonding pad 240 on the upper side of the first substrate 110. A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chip 200. The second substrate 300 has a plurality of first connectors 320 for connecting the substrate electrically with the first substrate 110. The first connectors are provided on a first (underside) of the second substrate. A plurality of second connectors 310 are provided on the second (upper surface) of the second substrate 300. The first and second connectors preferably take the form of metal pillars, for example copper pillars. The first connectors may be electrically connected to the electrical contacts of the first substrate 110 by solder bonding or intermetallic bonding) 140. The assembly is overmolded with a molding material 120. The molding material covers the chip 200, the upper surface of the first substrate 110 and the second substrate 300. This overmolding helps to provide solidity and stability to the assembly and minimizes the occurrence of warping. Upper ends 311 of the second connectors 310 are exposed and are level with or extend above the upper surface of the overmold. The upper ends 311 may make contact with an external module. For example an upper PoP module may be mounted on top of the first module 110 and make electrical contact via the second connectors 311.” Sun, [0047-0048].</p>
--	--

	<p>“FIG. 12 is a schematic diagram of a PoP assembly 1 comprising a second module 5 mounted on a first module 10. The first module 5 is a module of the type described above, e.g. with reference to FIG. 2. It forms a lower module of the PoP assembly. In this example, it has two chips 200, 200 a stacked one on top of the other and connected to a first substrate 110 by wires 220 and 220 a respectively. Both chips are processors. Other embodiments could have a different number or type of chips and different method of connecting the chips to the substrate 110. The upper module 5 comprises a pair of chips 30, 31 mounted to a first (upper) side of a third substrate 20. The third substrate may be a PCB, preferably a BT core substrate. The chips 30, 31 are electrically connected to the third substrate 20 by wires 16 or any other suitable means. Preferably the chips 30 and 31 are memory chips. The second module 5 is overmolded with a molding material 18 which covers the chips 30, 31 and the third substrate 20. The second (lower) side of the third substrate 20 is mounted to the first module 10.” Sun, [0058-0059].</p>
--	---

FIG.12

Sun, FIG. 12

“While FIG. 12 shows a gap between the first and second modules, in other embodiments the overmold 120 of the first module may extend flush with the upper ends of the second connectors and the third substrate 20 of the second module 5 may rest on the overmold 120 of the first module. That is the third substrate 20 may be in direct contact with the overmold between the overmold 120 and second connectors 310 and the third substrate 20 of the second module 5.” Sun, [0059].

“The first module 1 will now be described in more detail. It comprises a first substrate 110 which may be a PCB, preferably a BT core substrate. Solder balls 130 are provided on the

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

	<p>lower side of the first substrate 110 to enable the module 100 to be mounted to an external apparatus, such as a motherboard. A pair of chips 200, 200 a may be memory chips or a processor, are mounted to the first substrate 110. They may be mounted by any appropriate method, for example wire bonding, die attachment etc. Wires 220, 220 a connect a bonding pad on top of the chip 200 with a bonding pad on the upper side of the first substrate 110. A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chips 200, 200 a. The second substrate 300 has a plurality of first connectors 320 for connecting the substrate electrically with the first substrate 110. The first connectors are provided on a first (underside) of the second substrate. A plurality of second connectors 310 are provided on the second (upper surface) of the second substrate 300. The first and second connectors preferably take the form of metal pillars, for example copper pillars. The first connectors may be electrically connected to the electrical contacts of the first substrate 110 by solder bonding 140. The first module 10 is overmolded with a molding material 120. The molding material covers the chips 200, 200 a, the upper surface of the first substrate 110 and the second substrate 300. This overmolding helps to provide solidity and stability to the assembly and minimizes the occurrence of warping. Upper ends 311 of the second connectors 310 are exposed above the overmold 120. The upper ends 311 make contact with electrical contacts of the second module 5." Sun, [0060-0061].</p> <p>To the extent Plaintiff contends that Sun fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

--	---

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

	<p>“In the illustrated embodiment shown in FIG. 13 the side walls 391, 392 are electrically conductive (e.g. made of metal) and put the first and second metal connectors 320, 310 in electrical contact with each other. The core 395 of the via is an insulator. In alternative embodiments the core could instead by a conductive material (e.g. metal) or even a void. In still further embodiments the side walls could be an insulator and the core could be made of conductive material (e.g. metal).” Sun, [0064].</p> <p>“FIG. 14 (a) illustrates a pair of second connectors 310. They have the same structure as the first connectors 320. They are formed of metal pillars, preferably copper pillars. It can be seen that the pillars have fine pitch and a well defined shape. By way of contrast FIG. 14 (b) shows an arrangement with a pair of solder balls 140 between a substrate 20 and a substrate 300. It can be seen that the solder balls have a less fine pitch and less well defined shape than the metal pillars. Furthermore, at typical processing temperatures (e.g. around 260 degrees Celsius) the solder balls will melt and collapse down, while the metal (e.g. copper) pillars will remain solid and well defined. As a result, for a given stand off height, metal pillars provide a superior solution to solder balls for connecting the upper and lower surfaces of the second substrate to respective other substrates. The metal pillars allow finer pitch and thus denser electrical connections. A small amount of solder or bonding pads may used to connect the metal pillars to the respective other substrates.” Sun, [0066].</p>
--	--

FIG. 14(a)

Sun, FIG. 14(a)

“A second module may then be mounted to the first module shown in FIG. 16 (f) to form a PoP assembly. The second module may be a module 5 as shown in FIG. 12 and described above; it comprises a chip 30 mounted on a third substrate 20. The chip 30 is mounted on the first (upper) side of the third substrate, while electrical contacts (e.g. bonding pads or lands) present on the second (lower) side of the third substrate are placed in contact with the exposed ends of the second electrical connectors 310 of the first module 10.” Sun, [0074].

To the extent Plaintiff contends that Sun fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general

	knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.
[1.H] the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector, connector,	<p>Sun discloses, either expressly or inherently, the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“Preferably there are a plurality of first electrical connectors and a plurality of second electrical connectors. For example, there may be four or more first electrical connectors on the underside of the second substrate and four or more second electrical connectors on the top side of the second substrate. Preferably the first and second electrical connectors are metal pillars, e.g. copper pillars. Preferably the first and second electrical connectors are separate pieces (i.e. not integral parts of the same pillar). Metal pillars allow for fine pitch and maintain their shape at high processing temperatures (e.g. 260° C.), compared to solder joints which melt and break down at such temperatures. However, solder joints may be used to join the metal pillars to a substrate above or below (e.g. to the second substrate and to the first substrate or to a substrate of an external module mounted to the first module).” Sun, [0015].</p> <p>“The vias electrically connect the at least one first electrical connector with the at least one second electrical connector. Preferably the via and the first and second electrical connectors which the via connects are three separate pieces.” Sun, [0017].</p> <p>“The second (lower) side of the third substrate 20 is mounted to the first module 10. Specifically the third substrate is mounted directly to the second connectors 310 of the first module 5. Upper ends of the second connectors 310 connect with a conducting electrical</p>

contacts (not shown) of the second (lower) side of the third substrate 20 in order to allow communication of electrical signals between the two modules.” Sun, [0059].

FIG. 14(a)

Sun, FIG. 14(a)

“Vias 390 electrically connect each second metal connector 310 with a corresponding first metal connector 320.” Sun, [0063].

“The vias 390 extend through the second substrate 300. The via has first 391 and second 392 side walls. These side walls 391, 392 may be part of the same (e.g. circular) side wall or may be separate side walls. The via 390 further comprises a core 395 between the side walls and extending between the first and second metal connectors 320, 310.” Sun, [0063].

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

	<p>“FIG. 14 (a) illustrates a pair of second connectors 310. They have the same structure as the first connectors 320. They are formed of metal pillars, preferably copper pillars. It can be seen that the pillars have fine pitch and a well defined shape. By way of contrast FIG. 14 (b) shows an arrangement with a pair of solder balls 140 between a substrate 20 and a substrate 300. It can be seen that the solder balls have a less fine pitch and less well defined shape than the metal pillars. Furthermore, at typical processing temperatures (e.g. around 260 degrees Celsius) the solder balls will melt and collapse down, while the metal (e.g. copper) pillars will remain solid and well defined. As a result, for a given stand off height, metal pillars provide a superior solution to solder balls for connecting the upper and lower surfaces of the second substrate to respective other substrates. The metal pillars allow finer pitch and thus denser electrical connections. A small amount of solder or bonding pads may be used to connect the metal pillars to the respective other substrates.” Sun, [0066].</p> <p>To the extent Plaintiff contends that Sun fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.I] the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and</p>	<p>Sun discloses, either expressly or inherently, the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p>See, e.g.:</p> <p>“Preferably there are a plurality of first electrical connectors and a plurality of second electrical connectors. FIG.13

Sun, FIG. 13

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

	<p>“A second module may then be mounted to the first module shown in FIG. 16 (f) to form a PoP assembly. The second module may be a module 5 as shown in FIG. 12 and described above; it comprises a chip 30 mounted on a third substrate 20. The chip 30 is mounted on the first (upper) side of the third substrate, while electrical contacts (e.g. bonding pads or lands) present on the second (lower) side of the third substrate are placed in contact with the exposed ends of the second electrical connectors 310 of the first module 10.” Sun, [0074].</p> <p>To the extent Plaintiff contends that Sun fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.K] a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein</p>	<p>Sun discloses, either expressly or inherently, a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“A chip 200, which may be a memory chip or a processor, is mounted to the first substrate 100. It may be mounted by any appropriate method, for example die attachment with wire bonding, flip chip etc. Wires 220 connect a bonding pad 210 on top of the chip 200 with a bonding pad 240 on the upper side of the first substrate 110. A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chip 200.” Sun, [0047-0048].</p>

FIG.12

Sun, FIG. 12

“This embodiment has two chips 500 (a) and 500 (b) stacked one on top of the other. The first chip 500 (a) is mounted to the first substrate 110 by any suitable means. The second chip 500 (b) is mounted on top of the first chip 500 (a) and spaced apart from the first chip by a spacer 530. Wires 520 connect bonding pads on the chips 500 (a), 500 (b) to bonding pads on the first substrate 110. The molding material 120 covers both the first and second chips.” Sun, [0049].

“FIG. 4 is a third embodiment similar to the first two embodiments. It has two chips 810 and 820 mounted side by side on the first substrate 110. The overmolding material covers both the first and second chips 810, 820.” Sun, [0050].

	<p>“FIG. 5 shows a fourth embodiment similar to the first embodiment. The chip 800 is mounted on the first substrate 110. A wire 920 connects the chip 800 and the second substrate 300. The molding material covers the chip 800 and the first and second substrates 110, 300.” Sun, [0051].</p> <p>“FIG. 12 is a schematic diagram of a PoP assembly 1 comprising a second module 5 mounted on a first module 10. The first module 5 is a module of the type described above, e.g. with reference to FIG. 2. It forms a lower module of the PoP assembly. In this example, it has two chips 200, 200 a stacked one on top of the other and connected to a first substrate 110 by wires 220 and 220 a respectively. Both chips are processors. Other embodiments could have a different number or type of chips and different method of connecting the chips to the substrate 110. The upper module 5 comprises a pair of chips 30, 31 mounted to a first (upper) side of a third substrate 20. The third substrate may be a PCB, preferably a BT core substrate. The chips 30, 31 are electrically connected to the third substrate 20 by wires 16 or any other suitable means. Preferably the chips 30 and 31 are memory chips. The second module 5 is overmolded with a molding material 18 which covers the chips 30, 31 and the third substrate 20. The second (lower) side of the third substrate 20 is mounted to the first module 10. Specifically the third substrate is mounted directly to the second connectors 310 of the first module 5.” Sun, [0058-0059].</p> <p>“The first module 1 will now be described in more detail. It comprises a first substrate 110 which may be a PCB, preferably a BT core substrate. Solder balls 130 are provided on the lower side of the first substrate 110 to enable the module 100 to be mounted to an external apparatus, such as a motherboard. A pair of chips 200, 200 a may be memory chips or a processor, are mounted to the first substrate 110. They may be mounted by any appropriate method, for example wire bonding, die attachment etc. Wires 220, 220 a connect a bonding</p>
--	--

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

	<p>pad on top of the chip 200 with a bonding pad on the upper side of the first substrate 110. A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chips 200, 200 a.” Sun, [0060-0061].</p> <p>“The second substrate 300 has a plurality of first connectors 320 for connecting the substrate electrically with the first substrate 110. The first connectors are provided on a first (underside) of the second substrate. A plurality of second connectors 310 are provided on the second (upper surface) of the second substrate 300. The first and second connectors preferably take the form of metal pillars, for example copper pillars. The first connectors may be electrically connected to the electrical contacts of the first substrate 110 by solder bonding 140. The first module 10 is overmolded with a molding material 120. The molding material covers the chips 200, 200 a, the upper surface of the first substrate 110 and the second substrate 300. This overmolding helps to provide solidity and stability to the assembly and minimizes the occurrence of warping. Upper ends 311 of the second connectors 310 are exposed above the overmold 120. The upper ends 311 make contact with electrical contacts of the second module 5.” Sun, [0061].</p> <p>To the extent Plaintiff contends that Sun fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.L] the bottom chip is mounted to the top surface of the bottom package substrate, and</p>	<p>Sun discloses, either expressly or inherently, the bottom chip is mounted to the top surface of the bottom package substrate.</p> <p><i>See, e.g.:</i></p>

“A chip 200, which may be a memory chip or a processor, is mounted to the first substrate 100. It may be mounted by any appropriate method, for example die attachment with wire bonding, flip chip etc. Wires 220 connect a bonding pad 210 on top of the chip 200 with a bonding pad 240 on the upper side of the first substrate 110.” Sun, [0047].

FIG. 12

Sun, FIG. 12

“FIG. 3 shows another embodiment of the first module, similar to FIG. 2. Like reference numerals are used to describe like parts and will not be described again. This embodiment has two chips 500 (a) and 500 (b) stacked one on top of the other. The first chip 500 (a) is mounted to the first substrate 110 by any suitable means.” Sun, [0048-0049].

	knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.
[1.M] the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.	<p>Sun discloses, either expressly or inherently, the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.</p> <p><i>See, e.g.:</i></p> <p>“As the lower module has a second substrate with electrical connectors on either side, the stand off height may be increased. Further, the opening in the second substrate makes room for one or more chips mounted to the first substrate. Overmolded means that molding material covers the second substrate. As the ‘intermediate’ second substrate and the second connectors are overmolded, the assembly is less prone to warpage. Preferably the at least one chip is overmolded. Preferably the first substrate is overmolded. Preferably the overmold extends over the first substrate at least as far as the second substrate; more preferably the whole of the first substrate is overmolded. The assembly is also relatively cheap to manufacture compared to other arrangements which require laser drilling or other complex machinery.”</p> <p>Sun, [0014].</p> <p>“A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chips 200, 200 a. The second substrate 300 has a plurality of first connectors 320 for connecting the substrate electrically with the first substrate 110. The first connectors are provided on a first (underside) of the second substrate. A plurality of second connectors 310 are provided on the second (upper surface) of the second substrate 300. The first and second connectors preferably take the form of metal pillars, for example copper pillars. The first connectors may be electrically connected to the electrical contacts of the first substrate 110 by solder bonding 140. The first module 10 is overmolded</p>

	<p>with a molding material 120. The molding material covers the chips 200, 200 a, the upper surface of the first substrate 110 and the second substrate 300. This overmolding helps to provide solidity and stability to the assembly and minimizes the occurrence of warping. Upper ends 311 of the second connectors 310 are exposed above the overmold 120. The upper ends 311 make contact with electrical contacts of the second module 5.” Sun, [0048].</p> <p>“FIG. 9 shows yet another arrangement in which the second substrate 300 is rectangular and has a rectangular opening 340 in the middle. Second connectors 310 are provided in a line on each side and corresponding first connectors (not shown) are provided on the opposite face of the substrate. Each side has a gap 350. The gaps 350 are of different shapes and join the central opening 340.” Sun, [0055].</p> <p>“FIG. 12 is a schematic diagram of a PoP assembly 1 comprising a second module 5 mounted on a first module 10. The first module 5 is a module of the type described above, e.g. with reference to FIG. 2. It forms a lower module of the PoP assembly. In this example, it has two chips 200, 200 a stacked one on top of the other and connected to a first substrate 110 by wires 220 and 220 a respectively. Both chips are processors. Other embodiments could have a different number or type of chips and different method of connecting the chips to the substrate 110.” Sun, [0058].</p>
--	---

FIG. 12

Sun, FIG. 12

“The upper module 5 comprises a pair of chips 30, 31 mounted to a first (upper) side of a third substrate 20. The third substrate may be a PCB, preferably a BT core substrate. The chips 30, 31 are electrically connected to the third substrate 20 by wires 16 or any other suitable means. Preferably the chips 30 and 31 are memory chips. The second module 5 is overmolded with a molding material 18 which covers the chips 30, 31 and the third substrate 20. The second (lower) side of the third substrate 20 is mounted to the first module 10. Specifically the third substrate is mounted directly to the second connectors 310 of the first module 5. Upper ends of the second connectors 310 connect with a conducting electrical contacts (not shown) of the second (lower) side of the third substrate 20 in order to allow communication of electrical signals between the two modules. While FIG. 12 shows a gap

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

	<p>between the first and second modules, in other embodiments the overmold 120 of the first module may extend flush with the upper ends of the second connectors and the third substrate 20 of the second module 5 may rest on the overmold 120 of the first module. That is the third substrate 20 may be in direct contact with the overmold 120. In this embodiment there are no intervening PCBs or other electric circuits or insulators between the overmold 120 and second connectors 310 and the third substrate 20 of the second module 5. In this embodiment the two chips 31, 30 are memory chips, but in other embodiments they may be different types of chips (e.g. processors).” Sun, [0059].</p> <p>To the extent Plaintiff contends that Sun fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.	<p>Sun discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Secondly, the space between the upper and lower packages is limited. It would be desirable to increase the vertical separation (stand off height) in order to make room for more and larger chips and enable stacking of chips on the lower substrate.” Sun, [0010].</p>

	<p>“As the lower module has a second substrate with electrical connectors on either side, the stand off height may be increased. Further, the opening in the second substrate makes room for one or more chips mounted to the first substrate. Overmolded means that molding material covers the second substrate. As the ‘intermediate’ second substrate and the second connectors are overmolded, the assembly is less prone to warpage. Preferably the at least one chip is overmolded. Preferably the first substrate is overmolded. Preferably the overmold extends over the first substrate at least as far as the second substrate; more preferably the whole of the first substrate is overmolded. The assembly is also relatively cheap to manufacture compared to other arrangements which require laser drilling or other complex machinery.” Sun, [0014].</p> <p>“A chip 200, which may be a memory chip or a processor, is mounted to the first substrate 100. It may be mounted by any appropriate method, for example die attachment with wire bonding, flip chip etc. Wires 220 connect a bonding pad 210 on top of the chip 200 with a bonding pad 240 on the upper side of the first substrate 110.” Sun, [0047].</p> <p>“FIG. 12 is a schematic diagram of a PoP assembly 1 comprising a second module 5 mounted on a first module 10. The first module 5 is a module of the type described above, e.g. with reference to FIG. 2. It forms a lower module of the PoP assembly. In this example, it has two chips 200, 200 a stacked one on top of the other and connected to a first substrate 110 by wires 220 and 220 a respectively. Both chips are processors. Other embodiments could have a different number or type of chips and different method of connecting the chips to the substrate 110.” Sun, [0058].</p>
--	---

FIG.12

Sun, FIG. 12

“The first module 1 will now be described in more detail. It comprises a first substrate 110 which may be a PCB, preferably a BT core substrate. Solder balls 130 are provided on the lower side of the first substrate 110 to enable the module 100 to be mounted to an external apparatus, such as a motherboard. A pair of chips 200, 200 a may be memory chips or a processor, are mounted to the first substrate 110. They may be mounted by any appropriate method, for example wire bonding, die attachment etc. Wires 220, 220 a connect a bonding pad on top of the chip 200 with a bonding pad on the upper side of the first substrate 110. A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chips 200, 200 a. The second substrate 300 has a plurality of first connectors 320 for connecting the substrate electrically with the first

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

	<p>substrate 110. The first connectors are provided on a first (underside) of the second substrate. A plurality of second connectors 310 are provided on the second (upper surface) of the second substrate 300. The first and second connectors preferably take the form of metal pillars, for example copper pillars. The first connectors may be electrically connected to the electrical contacts of the first substrate 110 by solder bonding 140. The first module 10 is overmolded with a molding material 120. The molding material covers the chips 200, 200 a, the upper surface of the first substrate 110 and the second substrate 300. This overmolding helps to provide solidity and stability to the assembly and minimizes the occurrence of warping. Upper ends 311 of the second connectors 310 are exposed above the overmold 120. The upper ends 311 make contact with electrical contacts of the second module 5.” Sun, [0060-0061].</p> <p>To the extent Plaintiff contends that Sun fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.	Sun discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

<p>bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p><i>See, e.g.:</i></p> <p>“The top package in FIG. 1 has a substrate 20. Typically the substrate will be a BT core substrate. A pair of chips 30, 31 are mounted to the substrate 20. Wires 16, 18 connect the chips 30, 31 to electrical contacts 11 of the substrate 20. The top package is covered with a molding compound 30 (over molded). This strengthens the assembly and helps to protect the components from damage. The lower package 10 also comprises a substrate 40 and a chip 50 mounted to the substrate. The chip 50 is connected to electrical contacts 41 of the substrate by wires 45. An overmold 60 covers the chip 50 and a surrounding part of the substrate on which the chip is mounted. The top package 5 is mounted to the bottom package 10 by solder balls 70. The solder balls 70 space the two packages apart allowing room for the chip 50 of the lower package. The solder balls 70 connect with electrical contacts on the lower side of the substrate 20 and electrical contacts on the upper surface of the substrate 40. This allows electrical signals to be passed between the upper and lower packages.” Sun, [0005-0007].</p> <p>“FIG. 2 shows a module 100 for use in a multichip package. In particular a module for use in the lower part of a PoP assembly. It comprises a first substrate 110 which maybe a PCB, preferably a BT core substrate. A (bismaleimide triazine) core substrate, is a substrate comprising a BT core layer with a metal layer on either side. BT has the advantage that it is a polyimide with higher thermal stability, better chemical resistance and mechanical properties compared to the epoxy resin used in same other types of PCB. Solder balls 130 are provided on the lower side of the first substrate 110 to enable the module 100 to be mounted to an external apparatus, such as a motherboard. A chip 200, which may be a memory chip or a processor, is mounted to the first substrate 100. It may be mounted by any appropriate method, for example die attachment with wire bonding, flip chip etc. Wires 220 connect a bonding pad 210 on top of the chip 200 with a bonding pad 240 on the upper side of the first substrate 110. A second substrate 300 is mounted to the first substrate 110. The</p>
---	--

	<p>second substrate has an opening therein for accommodating the chip 200. The second substrate 300 has a plurality of first connectors 320 for connecting the substrate electrically with the first substrate 110. The first connectors are provided on a first (underside) of the second substrate. A plurality of second connectors 310 are provided on the second (upper surface) of the second substrate 300. The first and second connectors preferably take the form of metal pillars, for example copper pillars. The first connectors may be electrically connected to the electrical contacts of the first substrate 110 by solder bonding or intermetallic bonding) 140. The assembly is overmolded with a molding material 120. The molding material covers the chip 200, the upper surface of the first substrate 110 and the second substrate 300. This overmolding helps to provide solidity and stability to the assembly and minimizes the occurrence of warping. Upper ends 311 of the second connectors 310 are exposed and are level with or extend above the upper surface of the overmold. The upper ends 311 may make contact with an external module. For example an upper PoP module may be mounted on top of the first module 110 and make electrical contact via the second connectors 311.” Sun, [0047-0048].</p> <p>“FIG. 4 is a third embodiment similar to the first two embodiments. It has two chips 810 and 820 mounted side by side on the first substrate 110. The overmolding material covers both the first and second chips 810, 820.” Sun, [0050].</p> <p>“FIG. 8 is a plan view of another arrangement. A double row of second connectors 310 is provided on each side of the rectangular second substrate 300, surrounding the opening 330. First connectors are provided at corresponding locations on the other side. Further, there is an electronic device 340 mounted on top of the second substrate on the same side as the second connectors. The electronic device 340 could be, for example, a capacitor, resistor or active component.” Sun, [0054].</p>
--	--

	<p>“The first module 5 is a module of the type described above, e.g. with reference to FIG. 2. It forms a lower module of the PoP assembly. In this example, it has two chips 200, 200 a stacked one on top of the other and connected to a first substrate 110 by wires 220 and 220 a respectively. Both chips are processors. Other embodiments could have a different number or type of chips and different method of connecting the chips to the substrate 110. The upper module 5 comprises a pair of chips 30, 31 mounted to a first (upper) side of a third substrate 20. The third substrate may be a PCB, preferably a BT core substrate. The chips 30, 31 are electrically connected to the third substrate 20 by wires 16 or any other suitable means. Preferably the chips 30 and 31 are memory chips. The second module 5 is overmolded with a molding material 18 which covers the chips 30, 31 and the third substrate 20. The second (lower) side of the third substrate 20 is mounted to the first module 10. Specifically the third substrate is mounted directly to the second connectors 310 of the first module 5.” Sun, [0058-0059].</p>
--	--

FIG.12

Sun, FIG. 12

“In this embodiment there are no intervening PCBs or other electric circuits or insulators between the overmold 120 and second connectors 310 and the third substrate 20 of the second module 5. In this embodiment the two chips 31, 30 are memory chips, but in other embodiments they may be different types of chips (e.g. processors). The first module 1 will now be described in more detail. It comprises a first substrate 110 which may be a PCB, preferably a BT core substrate. Solder balls 130 are provided on the lower side of the first substrate 110 to enable the module 100 to be mounted to an external apparatus, such as a motherboard. A pair of chips 200, 200 a may be memory chips or a processor, are mounted to the first substrate 110. They may be mounted by any appropriate method, for example wire bonding, die attachment etc. Wires 220, 220 a connect a bonding pad on top of the chip 200

Appendix A-31 - Invalidity of U.S. Patent No. 9859202 in view of Sun - U.S. Patent Publication No. 20110147908

	<p>with a bonding pad on the upper side of the first substrate 110. A second substrate 300 is mounted to the first substrate 110. The second substrate has an opening therein for accommodating the chips 200, 200 a. The second substrate 300 has a plurality of first connectors 320 for connecting the substrate electrically with the first substrate 110. The first connectors are provided on a first (underside) of the second substrate. A plurality of second connectors 310 are provided on the second (upper surface) of the second substrate 300. The first and second connectors preferably take the form of metal pillars, for example copper pillars. The first connectors may be electrically connected to the electrical contacts of the first substrate 110 by solder bonding 140. The first module 10 is overmolded with a molding material 120. The molding material covers the chips 200, 200 a, the upper surface of the first substrate 110 and the second substrate 300. This overmolding helps to provide solidity and stability to the assembly and minimizes the occurrence of warping. Upper ends 311 of the second connectors 310 are exposed above the overmold 120. The upper ends 311 make contact with electrical contacts of the second module 5.” Sun, [0059-0061].</p> <p>To the extent Plaintiff contends that Sun fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

	opposite side of the substrate 300. Vias 390 electrically connect each second metal connector 310 with a corresponding first metal connector 320.” Sun, [0062-0063].
--	--

FIG.13

Sun, FIG. 13

	<p>“In the illustrated embodiment shown in FIG. 13 the side walls 391, 392 are electrically conductive (e.g. made of metal) and put the first and second metal connectors 320, 310 in electrical contact with each other. The core 395 of the via is an insulator. In alternative embodiments the core could instead by a conductive material (e.g. metal) or even a void. In still further embodiments the side walls could be an insulator and the core could be made of conductive material (e.g. metal).” Sun, [0064].</p> <p>“FIG. 14 (a) illustrates a pair of second connectors 310. They have the same structure as the first connectors 320. They are formed of metal pillars, preferably copper pillars. It can be seen that the pillars have fine pitch and a well defined shape. By way of contrast FIG. 14 (b) shows an arrangement with a pair of solder balls 140 between a substrate 20 and a substrate 300. It can be seen that the solder balls have a less fine pitch and less well defined shape than the metal pillars. Furthermore, at typical processing temperatures (e.g. around 260 degrees Celsius) the solder balls will melt and collapse down, while the metal (e.g. copper) pillars will remain solid and well defined. As a result, for a given stand off height, metal pillars provide a superior solution to solder balls for connecting the upper and lower surfaces of the second substrate to respective other substrates. The metal pillars allow finer pitch and thus denser electrical connections. A small amount of solder or bonding pads may be used to connect the metal pillars to the respective other substrates.” Sun, [0066].</p> <p>“A second module may then be mounted to the first module shown in FIG. 16 (f) to form a PoP assembly. The second module may be a module 5 as shown in FIG. 12 and described above; it comprises a chip 30 mounted on a third substrate 20. The chip 30 is mounted on the first (upper) side of the third substrate, while electrical contacts (e.g. bonding pads or lands) present on the second (lower) side of the third substrate are placed in contact with the exposed ends of the second electrical connectors 310 of the first module 10.” Sun, [0074].</p>

Appendix A-32 - Invalidity of U.S. Patent No. 9859202 in view of Takeda - U.S. Patent Publication No. 20120139010

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Takeda - U.S. Patent Publication No. 20120139010

U.S. Patent Publication No. 20120139010 (“Takeda”) is titled Interposer and Semiconductor Device and lists Tsutomu Takeda as inventor. Takeda anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Takeda is a U.S. patent publication that was filed December 5, 2011 and published June 7, 2012. Takeda claims priority to JP 2010-270079 filed on December 3, 2010. Takeda is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Takeda, or otherwise rendered obvious by disclosures and teachings of Takeda, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Takeda does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Takeda with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Takeda, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-32 - Invalidity of U.S. Patent No. 9859202 in view of Takeda - U.S. Patent Publication No. 20120139010

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Takeda “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Takeda or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Takeda set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Takeda discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“The interposer 1 indicated in FIG. 1 includes a silicon substrate 2, a multilayer wiring portion 3, and an encapsulant resin 4 formed on one side surface of the silicon substrate 2, a bump forming portion 5 provided on another side surface of the silicon substrate 2, penetrating electrodes 6 that penetrate the silicon substrate 2 in the thickness direction, and capacitors (electronic parts for mounting) 7 provided in a cavity 11 of the silicon substrate 2.” Takeda, [0035].</p>

FIG. 1

Takeda, FIG. 1

“As shown in FIG. 2, with respect to the interposer 1, each first UBM structure 8 is formed on the multilayer wiring portion 3 to which each connection portion 31 of the electronic part (mounting electronic part) 30 is electrically connected via a bump 32. In this way, the electronic part 30 is mounted on the interposer 1.” Takeda, [0035].

FIG. 2

Takeda, FIG 2.

“The first wiring layer 12 is formed with a predetermined pattern on the silicon substrate 2. The second wiring layer 13 is formed on the first wiring layer 12 with a predetermined pattern. In the present invention, the first wiring layer 12 includes pad-ports 12 a formed on areas which correspond to the cavity portions 11, in which the pad portions 12 a are electrically connected to the capacitors 7. The pad portions 12 a are electrically connected to the first UBM structures 8 via the first wiring layer 12, the via electrodes 15, and the second wiring layer 13, where the first UBM structures 8 respectively correspond to pins (power supply connections) and ground pins (ground connections) of the electronic part 30. Therefore, with reference to the interposer 1, the capacitors 7 are connected to the pad portions 12 a with the electronic part 30 being mounted on the interposer 1. The capacitors 7 are electrically connected to the power supply pins and ground pins via each of the above

	<p>parts. In descriptions below, other pads excluding the pad portions 12 a of the first wiring layer 12 will be referred to as wiring 12.” Takeda, [0040].</p> <p>“The bump 9 is a conductive terminal with a round shape, and formed of a low melting point metal such as solder. The bump 9 is provided on each of the second UBM structures 20 (e.g., on the conductive portion 20 d). The interposer 1 is mounted on the wiring substrate 40 by connecting each bump 9 with each pad portion 41 b of the wiring substrate 40.” Takeda, [0065].</p> <p>“Next, a description will be given of a semiconductor device (a semiconductor device of the present invention) that utilizes the interposer in accordance with the present invention. FIG. 11 is a schematic diagram that illustrates a longitudinal cross-section of a semiconductor device 50 in accordance with an embodiment of the present invention. The semiconductor device 50 of FIG. 11 includes an interposer 1, an electronic part (mounting electronic part) 30 mounted on the interposer 1, and a buildup substrate (wiring substrate) 40 on which the interposer 1 is mounted.” Takeda, [0146-0148].</p>
--	--

Takeda, FIG. 11

“The wiring substrate 40 includes a substrate 42 and multilayer wiring portions 43 disposed on both sides of the substrate 42. Each of the multilayer wiring portions 43 includes three wiring layers 44, 45, and 46. One side of the multilayer wiring portions 43 includes multiple pad portions 41 a and 41 b, which are electrically connected to the wiring layers 44, 45, and 46, respectively. Furthermore, the other side of the multilayer wiring portions 43 includes multiple bumps 47, which are electrically connected to the wiring layers 44, 45 and 46, respectively.” Takeda, [0152].

“The bumps 9 of the interposer 1 are respectively connected to the pad portions 41 b, and the connecting terminals 7 b are respectively connected to pad portions 41 a of the wiring

Appendix A-32 - Invalidity of U.S. Patent No. 9859202 in view of Takeda - U.S. Patent Publication No. 20120139010

	<p>substrate 40. In this way, the interposer 1 is mounted on the wiring substrate 40.” Takeda, [0153].</p> <p>“As the connection terminals 7 b of the capacitors 7 are electrically connected to the pad portions 41 a of the wiring substrate 40, each of the wiring layers of the wiring substrate 40 can be used as power supply paths, so that sufficient power supply can be achieved. Thereby, the semiconductor device in accordance with the present embodiment can perform stable operation.” Takeda, [0155].</p>
<p>[1.A] a bottom package substrate;</p>	<p>Takeda discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Next, a description will be given of a semiconductor device (a semiconductor device of the present invention) that utilizes the interposer in accordance with the present invention. FIG. 11 is a schematic diagram that illustrates a longitudinal cross-section of a semiconductor device 50 in accordance with an embodiment of the present invention. The semiconductor device 50 of FIG. 11 includes an interposer 1, an electronic part (mounting electronic part) 30 mounted on the interposer 1, and a buildup substrate (wiring substrate) 40 on which the interposer 1 is mounted.” Takeda, [0146-0148].</p>

FIG. 11

Takeda, FIG. 11

“The wiring substrate 40 includes a substrate 42 and multilayer wiring portions 43 disposed on both sides of the substrate 42. Each of the multilayer wiring portions 43 includes three wiring layers 44, 45, and 46. One side of the multilayer wiring portions 43 includes multiple pad portions 41a and 41b, which are electrically connected to the wiring layers 44, 45, and 46, respectively. Furthermore, the other side of the multilayer wiring portions 43 includes multiple bumps 47, which are electrically connected to the wiring layers 44, 45 and 46, respectively.” Takeda, [0152].

	<p>“The bumps 9 of the interposer 1 are respectively connected to the pad portions 41 b, and the connecting terminals 7 b are respectively connected to pad portions 41 a of the wiring substrate 40. In this way, the interposer 1 is mounted on the wiring substrate 40.” Takeda, [0153].</p> <p>“As the connection terminals 7 b of the capacitors 7 are electrically connected to the pad portions 41 a of the wiring substrate 40, each of the wiring layers of the wiring substrate 40 can be used as power supply paths, so that sufficient power supply can be achieved. Thereby, the semiconductor device in accordance with the present embodiment can perform stable operation.” Takeda, [0155].</p> <p>To the extent Plaintiff contends that Takeda fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.K] a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein	<p>Takeda discloses, either expressly or inherently, a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p>

	<p style="text-align: center;">FIG. 11</p>  <p style="text-align: center;">Takeda, FIG. 11</p> <p>To the extent Plaintiff contends that Takeda fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.L] the bottom chip is mounted to the top surface of the bottom package substrate, and</p>	<p>Takeda discloses, either expressly or inherently, the bottom chip is mounted to the top surface of the bottom package substrate.</p> <p>See, <i>e.g.</i>:</p>

FIG. 11

Takeda, FIG. 11

To the extent Plaintiff contends that Takeda fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Takeda discloses, either expressly or inherently, the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.

See, e.g.:

FIG. 11

Takeda, FIG. 11

To the extent Plaintiff contends that Takeda fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
------------------	------------

[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.

Takeda discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.

See, e.g.:

FIG. 11

Takeda, FIG. 11

To the extent Plaintiff contends that Takeda fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-32 - Invalidity of U.S. Patent No. 9859202 in view of Takeda - U.S. Patent Publication No. 20120139010

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.	<p>Takeda discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p>See, e.g.:</p> <p>“FIG. 2 is a schematic diagram that illustrates a longitudinal cross-section of the interposer 1, in which an electronic part 30 is mounted on an interposer 1 and the interposer 1 is mounted on a wiring substrate 3.” Takeda, [0019].</p>

FIG. 2

Takeda, FIG. 2

“As shown in FIG. 2, with respect to the interposer 1, each first UBM structure 8 is formed on the multilayer wiring portion 3 to which each connection portion 31 of the electronic part (mounting electronic part) 30 is electrically connected via a bump 32. In this way, the electronic part 30 is mounted on the interposer 1. Furthermore, each bump 9 of the bump forming portion 5 is electrically connected to a respective pad portion 41 b of the wiring substrate 40, so that the interposer 1 is mounted to the wiring substrate 40.” Takeda, [0035-0036].

“Furthermore, with respect to the interposer 1 in accordance with the present invention, capacitors 7 are respectively provided in each of the cavity portions 11 of the silicon substrate 2. The connecting terminal 7 a of the capacitor 7 is electrically connected to the pad portion 12 a that is exposed in the cavity portion 11.” Takeda, [0066].

“Next, a description will be given of a semiconductor device (a semiconductor device of the present invention) that utilizes the interposer in accordance with the present invention. FIG. 11 is a schematic diagram that illustrates a longitudinal cross-section of a semiconductor device 50 in accordance with an embodiment of the present invention. The semiconductor device 50 of FIG. 11 includes an interposer 1, an electronic part (mounting electronic part) 30 mounted on the interposer 1, and a buildup substrate (wiring substrate) 40 on which the interposer 1 is mounted.” Takeda, [0146-0148].

FIG. 11

Takeda, FIG. 11

Appendix A-32 - Invalidity of U.S. Patent No. 9859202 in view of Takeda - U.S. Patent Publication No. 20120139010

	<p>“The electronic part 30 includes multiple connection portions 31 at the back surface of the electronic part 30, and the multiple connection portions 31 are connected to each of the first UBM structures 8, so that the electronic part 30 is mounted on the interposer 1. For the interposer 1 mounted by the electronic part 30, the capacitors 7 are disposed in the cavity portion 10 and electrically connected to the ground pins and the power supply pins of the electronic part 30 via each of portions of the multilayer wiring portion 3.” Takeda, [0150-0151].</p> <p>To the extent Plaintiff contends that Takeda fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 4, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.	<p>Takeda discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The first wiring layer 12 is formed with a predetermined pattern on the silicon substrate 2. The second wiring layer 13 is formed on the first wiring layer 12 with a predetermined</p>

	<p>pattern. In the present invention, the first wiring layer 12 includes pad-portions 12 a formed on areas which correspond to the cavity portions 11, in which the pad portions 12 a are electrically connected to the capacitors 7. The pad portions 12 a are electrically connected to the first UBM structures 8 via the first wiring layer 12, the via electrodes 15, and the second wiring layer 13, where the first UBM structures 8 respectively correspond to pins (power supply connections) and ground pins (ground connections) of the electronic part 30. Therefore, with reference to the interposer 1, the capacitors 7 are connected to the pad portions 12 a with the electronic part 30 being mounted on the interposer 1. The capacitors 7 are electrically connected to the power supply pins and ground pins via each of the above parts. In descriptions below, other pads excluding the pad portions 12 a of the first wiring layer 12 will be referred to as wiring 12.” Takeda, [0040].</p> <p>“Next, a description will be given of a semiconductor device (a semiconductor device of the present invention) that utilizes the interposer in accordance with the present invention. FIG. 11 is a schematic diagram that illustrates a longitudinal cross-section of a semiconductor device 50 in accordance with an embodiment of the present invention. The semiconductor device 50 of FIG. 11 includes an interposer 1, an electronic part (mounting electronic part) 30 mounted on the interposer 1, and a buildup substrate (wiring substrate) 40 on which the interposer 1 is mounted.” Takeda, [0146-0148].</p>
--	---

FIG. 11

Takeda, FIG. 11

“The wiring substrate 40 includes a substrate 42 and multilayer wiring portions 43 disposed on both sides of the substrate 42. Each of the multilayer wiring portions 43 includes three wiring layers 44, 45, and 46. One side of the multilayer wiring portions 43 includes multiple pad portions 41a and 41b, which are electrically connected to the wiring layers 44, 45, and 46, respectively. Furthermore, the other side of the multilayer wiring portions 43 includes multiple bumps 47, which are electrically connected to the wiring layers 44, 45 and 46, respectively.” Takeda, [0152].

Appendix A-32 - Invalidity of U.S. Patent No. 9859202 in view of Takeda - U.S. Patent Publication No. 20120139010

	<p>“The bumps 9 of the interposer 1 are respectively connected to the pad portions 41 b, and the connecting terminals 7 b are respectively connected to pad portions 41 a of the wiring substrate 40. In this way, the interposer 1 is mounted on the wiring substrate 40.” Takeda, [0153].</p> <p>To the extent Plaintiff contends that Takeda fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	<p>Takeda discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p>

spacer connector via the corresponding top metal pads of the spacer connector.

FIG. 11

Takeda, FIG. 11

To the extent Plaintiff contends that Takeda fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
------------------	------------

Appendix A-32 - Invalidity of U.S. Patent No. 9859202 in view of Takeda - U.S. Patent Publication No. 20120139010

<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of metal pillars of the top package substrate via the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Takeda discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“The first wiring layer 12 is formed with a predetermined pattern on the silicon substrate 2. The second wiring layer 13 is formed on the first wiring layer 12 with a predetermined pattern. In the present invention, the first wiring layer 12 includes pad-portions 12 a formed on areas which correspond to the cavity portions 11, in which the pad portions 12 a are electrically connected to the capacitors 7. The pad portions 12 a are electrically connected to the first UBM structures 8 via the first wiring layer 12, the via electrodes 15, and the second wiring layer 13, where the first UBM structures 8 respectively correspond to pins (power supply connections) and ground pins (ground connections) of the electronic part 30. Therefore, with reference to the interposer 1, the capacitors 7 are connected to the pad portions 12 a with the electronic part 30 being mounted on the interposer 1. The capacitors 7 are electrically connected to the power supply pins and ground pins via each of the above parts. In descriptions below, other pads excluding the pad portions 12 a of the first wiring layer 12 will be referred to as wiring 12.” Takeda, [0040].</p> <p>“The bump 9 is a conductive terminal with a round shape, and formed of a low melting point metal such as solder. The bump 9 is provided on each of the second UBM structures 20 (e.g., on the conductive portion 20 d). The interposer 1 is mounted on the wiring substrate 40 by</p>
--	---

connecting each bump 9 with each pad portion 41 b of the wiring substrate 40.” Takeda, [0065].

“Next, a description will be given of a semiconductor device (a semiconductor device of the present invention) that utilizes the interposer in accordance with the present invention. FIG. 11 is a schematic diagram that illustrates a longitudinal cross-section of a semiconductor device 50 in accordance with an embodiment of the present invention. The semiconductor device 50 of FIG. 11 includes an interposer 1, an electronic part (mounting electronic part) 30 mounted on the interposer 1, and a buildup substrate (wiring substrate) 40 on which the interposer 1 is mounted.” Takeda, [0146-0148].

FIG. 11

	<p>Takeda, FIG. 11</p> <p>“The wiring substrate 40 includes a substrate 42 and multilayer wiring portions 43 disposed on both sides of the substrate 42. Each of the multilayer wiring portions 43 includes three wiring layers 44, 45, and 46. One side of the multilayer wiring portions 43 includes multiple pad portions 41 a and 41 b, which are electrically connected to the wiring layers 44, 45, and 46, respectively. Furthermore, the other side of the multilayer wiring portions 43 includes multiple bumps 47, which are electrically connected to the wiring layers 44, 45 and 46, respectively.” Takeda, [0152].</p> <p>“The bumps 9 of the interposer 1 are respectively connected to the pad portions 41 b, and the connecting terminals 7 b are respectively connected to pad portions 41 a of the wiring substrate 40. In this way, the interposer 1 is mounted on the wiring substrate 40.” Takeda, [0153].</p> <p>“As the connection terminals 7 b of the capacitors 7 are electrically connected to the pad portions 41 a of the wiring substrate 40, each of the wiring layers of the wiring substrate 40 can be used as power supply paths, so that sufficient power supply can be achieved. Thereby, the semiconductor device in accordance with the present embodiment can perform stable operation.” Takeda, [0155].</p> <p>To the extent Plaintiff contends that Takeda fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-33 - Invalidity of U.S. Patent No. 9859202 in view of Waite - U.S. Patent No. 8379403

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Waite - U.S. Patent No. 8379403

U.S. Patent No.8379403 (“Waite”) is titled Spacer-Connector and Circuit Board Assembly and lists David W. Waite, James L. Blair, Ashish Lohiya, Arvid G. Sammulu, Jeffery T. Smith, and Saritha Narra as inventors. Waite is assigned to Qualcomm, Incorporated. Waite anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Waite is a U.S. patent that was filed March 30, 2010 and published October 7, 2010. Waite claims priority to a provisional application filed on April 2, 2009. Waite is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Waite, or otherwise rendered obvious by disclosures and teachings of Waite, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Waite does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Waite with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Waite, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-33 - Invalidity of U.S. Patent No. 9859202 in view of Waite - U.S. Patent No. 8379403

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Waite “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Waite or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Waite set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Waite discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 2A illustrates a motherboard 200 on which a daughter board 202 is mounted. Daughter board 202 is supported on the motherboard 200 by first and second spacer-connectors 204 which connectors 204 include conductive pathways discussed hereinafter. A first conductive elastomer 206 provides an electrical connection between the daughter board 202 and the spacer-connectors 204, and a second conductive elastomer 208 provides an electrical connection between the motherboard 200 and the spacer-connector assembly 204.” Waite, [4:3-4:11].</p>

FIG. 2A

Waite, FIG. 2A

“FIG. 2B illustrates a plan view of the spacer-connector 204. A portion illustrated in FIG. 2A is enclosed within the dashed area. As can be seen from the plan view, the spacer-connector has two pad arrays 250 (or connectors) with frame elements 218 (including frame 318 and frame well 316 in FIG. 3) disposed around the pad array 250. An open area or cavity 260 may provide for access to the underside of the DUT as illustrated in FIG. 2A. The cavity 260 can be located between the pad arrays 250 and may be enclosed by a thin web of material 265.” Waite, [6:31-6:39].

Appendix A-33 - Invalidity of U.S. Patent No. 9859202 in view of Waite - U.S. Patent No. 8379403

	<p>“FIG. 4A, spacer-connector 204 includes a body of material (PCB) 220 having a plurality of signal vias 402 and ground vias 428 and parallel ground planes 422 formed therein coupled to pad arrays on the surface. The body of material 220 may be formed from multiple layers of high performance printed circuit board material, FR4, for example, separated by conductive layers of, for example, copper. The cavity 260 between a pair of connectors/pad arrays of spacer-connector 204 can be produced by milling out a single piece of circuit board. The cavity 260 provides room for RF tuning components 406 and/or other components to be located immediately below the DUT 214, either on the bottom side 408 of daughter board 202 or on the top side of the motherboard 200 allowing for relatively short connections between the tuning elements 406 and the DUT 214.” Waite, [6:59-7:6].</p> <p>“FIG. 4B illustrates an alternative configuration where spacer-connector 204 is located on only one side of the DUT 214 and socket 212 assembly and may contain a single pad array portion as illustrated in FIG. 2C, for example. To maintain mechanical stability of the daughter board 202 a separate mechanical spacer 480 may be provided. Additionally, spacer-connector 204 and mechanical spacer 480 will cause an area 482 to be formed under the daughter board 202, which can also be used for mounting components 406.” Waite, [7:26-7:34].</p> <p>“In order to connect RF signals to/from DUT 214 and tuning elements 406 on the daughter board 202 with RF components and pathways located on motherboard 200, a wide band RF pathway between the DUT 214 and the motherboard 200 is provided through connector of spacer-connector 204. The pathway through connector of spacer-connector 204 includes impedance controlled vias 402 connected to conductive pads on the surfaces of the connector of spacer-connector 204.” Waite, [7:39-7:46].</p>
--	---

Appendix A-33 - Invalidity of U.S. Patent No. 9859202 in view of Waite - U.S. Patent No. 8379403

	<p>“FIG. 8 also illustrates a sectional view of a multilayered PCB having a plurality of ground planes 422 separated by layers of dielectric material 424. Further, additional conductive planes/traces may be included internally (e.g., 432, 433) separated by dielectric layers for routing signals internally. Conductive ground vias 428 and signal vias 402, 432 can run substantially perpendicular to the ground planes 422. Each via is connected to contact pads (308, 312) affixed to it at each PCB surface.” Waite, [9:67-10:5].</p>
[1.A] a bottom package substrate;	<p>Waite discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Lower contact pads 306 of the daughter board 202 are coupled to upper contact pads 308 of the first spacer-connector 204, through the multiple conductive elements 302 of the first conductive elastomer 206. Similarly, upper contact pads 310 of the motherboard 200 are coupled to lower spacer contact pads 312 of the first connector 204 through the conductive elements 302 of the second conductive elastomer 208.” Waite, [4:19-4:26].</p> <p>“With reference to FIG. 4A, spacer-connector 204 includes a body of material (PCB) 220 having a plurality of signal vias 402 and ground vias 428 and parallel ground planes 422 formed therein coupled to pad arrays on the surface. The body of material 220 may be formed from multiple layers of high performance printed circuit board material, FR4, for example, separated by conductive layers of, for example, copper. The cavity 260 between a pair of connectors/pad arrays of spacer-connector 204 can be produced by milling out a single piece of circuit board. The cavity 260 provides room for RF tuning components 406 and/or other components to be located immediately below the DUT 214, either on the bottom side 408 of daughter board 202 or on the top side of the motherboard 200 allowing for relatively short connections between the tuning elements 406 and the DUT 214.” Waite, [6:59-7:6].</p>

FIG. 4A

Waite, FIG. 4A

“In order to connect RF signals to/from DUT 214 and tuning elements 406 on the daughter board 202 with RF components and pathways located on motherboard 200, a wide band RF pathway between the DUT 214 and the motherboard 200 is provided through connector of spacer-connector 204.” Waite, [7:39-7:43].

To the extent Plaintiff contends that Waite fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-33 - Invalidity of U.S. Patent No. 9859202 in view of Waite - U.S. Patent No. 8379403

<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Waite discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Other embodiments may include more than two connectors of spacer-connector 204 arranged around socket 212 to provide a larger area for connections between the DUT 214 and the motherboard 200. The assembly of the motherboard 200, the first and second conductive elastomers 206, 208 and the connectors of spacer-connector 204 are compressed to from the conductive elements in the first and second conductive elastomers 206, 208 into conductive pathways. Stiffener blocks 216 may be provided to keep an even amount of pressure over the spacer-connectors 204 and to maintain good electrical connections between the first and second conductive elastomers 206, 208 and the connectors of spacer-connector 204.” Waite, [5:21-5:34].</p> <p>“With reference to FIG. 4A, spacer-connector 204 includes a body of material (PCB) 220 having a plurality of signal vias 402 and ground vias 428 and parallel ground planes 422 formed therein coupled to pad arrays on the surface. The body of material 220 may be formed from multiple layers of high performance printed circuit board material, FR4, for example, separated by conductive layers of, for example, copper. The cavity 260 between a pair of connectors/pad arrays of spacer-connector 204 can be produced by milling out a single piece of circuit board. The cavity 260 provides room for RF tuning components 406 and/or other components to be located immediately below the DUT 214, either on the bottom side 408 of daughter board 202 or on the top side of the motherboard 200 allowing for relatively short connections between the tuning elements 406 and the DUT 214.” Waite, [6:59-7:6].</p>
---	---

FIG. 4A

Waite, FIG. 4A

“FIG. 4B illustrates an alternative configuration where spacer-connector 204 is located on only one side of the DUT 214 and socket 212 assembly and may contain a single pad array portion as illustrated in FIG. 2C, for example. To maintain mechanical stability of the daughter board 202 a separate mechanical spacer 480 may be provided. Additionally, spacer-connector 204 and mechanical spacer 480 will cause an area 482 to be formed under the daughter board 202, which can also be used for mounting components 406.” Waite, [7:26-7:34].

To the extent Plaintiff contends that Waite fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general

	<p>motherboard 200 in the region between the daughter board 202 and the motherboard 200.” Waite, [9:26-9:34].</p> <p>To the extent Plaintiff contends that Waite fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.M] the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.</p>	<p>Waite discloses, either expressly or inherently, the at least one spacer connector comprises two spacer connectors arranged on opposite sides of the bottom chip.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 2A illustrates a motherboard 200 on which a daughter board 202 is mounted. Daughter board 202 is supported on the motherboard 200 by first and second spacer-connectors 204 which connectors 204 include conductive pathways discussed hereinafter.” Waite, [4:3-4:7].</p> <p>“FIG. 2B illustrates a plan view of the spacer-connector 204. A portion illustrated in FIG. 2A is enclosed within the dashed area. As can be seen from the plan view, the spacer-connector has two pad arrays 250 (or connectors) with frame elements 218 (including frame 318 and frame well 316 in FIG. 3) disposed around the pad array 250. An open area or cavity 260 may provide for access to the underside of the DUT as illustrated in FIG. 2A. The cavity 260 can be located between the pad arrays 250 and may be enclosed by a thin web of material 265.” Waite, [6:31-6:39].</p> <p>“FIG. 4A, spacer-connector 204 includes a body of material (PCB) 220 having a plurality of signal vias 402 and ground vias 428 and parallel ground planes 422 formed therein coupled</p>

Appendix A-33 - Invalidity of U.S. Patent No. 9859202 in view of Waite - U.S. Patent No. 8379403

to pad arrays on the surface. The body of material 220 may be formed from multiple layers of high performance printed circuit board material, FR4, for example, separated by conductive layers of, for example, copper. The cavity 260 between a pair of connectors/pad arrays of spacer-connector 204 can be produced by milling out a single piece of circuit board. The cavity 260 provides room for RF tuning components 406 and/or other components to be located immediately below the DUT 214, either on the bottom side 408 of daughter board 202 or on the top side of the motherboard 200 allowing for relatively short connections between the tuning elements 406 and the DUT 214.” Waite, [6:59-7:6].

Waite, FIG. 4A

Appendix A-33 - Invalidity of U.S. Patent No. 9859202 in view of Waite - U.S. Patent No. 8379403

	<p>“The first and second connectors of spacer-connector 204 may be connected to one another by a thin web of material 265 illustrated in FIGS. 2B and 4. This web 265 is provided primarily to maintain a desired separation and registration between the first and second connectors of spacer-connector 204. Additionally, the web material 265 can provide mechanical support to inhibit the center of the daughter board 202 from excessive deflection or “spring boarding.” Additionally, the web material 265 can form a barrier to prevent contamination from getting into the spacer cavity 260.” Waite, [7:16-7:25].</p> <p>“FIG. 4B illustrates an alternative configuration where spacer-connector 204 is located on only one side of the DUT 214 and socket 212 assembly and may contain a single pad array portion as illustrated in FIG. 2C, for example. To maintain mechanical stability of the daughter board 202 a separate mechanical spacer 480 may be provided. Additionally, spacer-connector 204 and mechanical spacer 480 will cause an area 482 to be formed under the daughter board 202, which can also be used for mounting components 406.” Waite, [7:26-7:34].</p> <p>To the extent Plaintiff contends that Waite fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
-------------------------	-------------------

Appendix A-33 - Invalidity of U.S. Patent No. 9859202 in view of Waite - U.S. Patent No. 8379403

<p>[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p>	<p>Waite discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p> <p><i>See, e.g.:</i></p> <p>“With reference to FIG. 4A, spacer-connector 204 includes a body of material (PCB) 220 having a plurality of signal vias 402 and ground vias 428 and parallel ground planes 422 formed therein coupled to pad arrays on the surface. The body of material 220 may be formed from multiple layers of high performance printed circuit board material, FR4, for example, separated by conductive layers of, for example, copper. The cavity 260 between a pair of connectors/pad arrays of spacer-connector 204 can be produced by milling out a single piece of circuit board. The cavity 260 provides room for RF tuning components 406 and/or other components to be located immediately below the DUT 214, either on the bottom side 408 of daughter board 202 or on the top side of the motherboard 200 allowing for relatively short connections between the tuning elements 406 and the DUT 214. Pressure components 216 (e.g., stiffener blocks) may be provided as discussed above to fasten the assembly and provide a substantially homogeneous pressure across the conductive elastomers 206, 208 and connectors (pad arrays) of spacer-connector 204. It will be appreciated that the thickness of the conductive elastomers 206, 208 is greatly exaggerated and that in most embodiments, there would be no perceptible spacing between the spacer-connector 204 and the daughter board 202 and mother board 200.” Waite, [6:59-7:15].</p>
---	--

FIG. 4A

Waite, FIG. 4A

To the extent Plaintiff contends that Waite fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
------------------	------------

Appendix A-33 - Invalidity of U.S. Patent No. 9859202 in view of Waite - U.S. Patent No. 8379403

[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.

Waite discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.

See, e.g.:

FIG. 4A

Waite, FIG. 4A

To the extent Plaintiff contends that Waite fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-33 - Invalidity of U.S. Patent No. 9859202 in view of Waite - U.S. Patent No. 8379403

Claim 4, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p>	<p>Waite discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Further, the high density conductive grid of the conductive elastomers 206, 208 can accommodate misalignment of opposing mating surface pads. The density of the conductive elastomer conductive elements is chosen to ensure that a requisite number of elements make contact to a sustentative portion of each of the related pads.” Waite, [1:39-1:44].</p> <p>“Lower contact pads 306 of the daughter board 202 are coupled to upper contact pads 308 of the first spacer-connector 204, through the multiple conductive elements 302 of the first conductive elastomer 206. Similarly, upper contact pads 310 of the motherboard 200 are coupled to lower spacer contact pads 312 of the first connector 204 through the conductive elements 302 of the second conductive elastomer 208.” Waite, [4:19-4:26].</p>

FIG. 3

Waite, FIG. 3

Appendix A-33 - Invalidity of U.S. Patent No. 9859202 in view of Waite - U.S. Patent No. 8379403

	<p>“The pathway through connector of spacer-connector 204 includes impedance controlled vias 402 connected to conductive pads on the surfaces of the connector of spacer-connector 204.” Waite, [7:43-7:46].</p> <p>“As illustrated in FIGS. 5A and 5B, the impedance controlled/signal vias 402 surrounded by a plurality of ground vias 428 to form an RF via arrangement 508. Controlling the number and placement of the ground vias 428 around the signal via 402 maintains tight control of the pathway characteristics such as impedance, return loss, bandwidth, etc. This allows a signal to pass through the connector of spacer-connector 204 in a transparent way.” Waite, [7:46-7:54].</p> <p>“Further, it will also be appreciated that the ground and/or power pad/vias may be further arranged to provide additional isolation to a critical high frequency signals (e.g., 504). FIG. 5D illustrates another pad/via arrangement for spacer-connector 204. This configuration is similar to that of FIG. 5B, but also includes impedance controlled conductive vias 402 configured as a fully differential via set 514.” Waite, [8:35-8:41].</p> <p>“FIG. 8 also illustrates a sectional view of a multilayered PCB having a plurality of ground planes 422 separated by layers of dielectric material 424. Further, additional conductive planes/traces may be included internally (e.g., 432, 433) separated by dielectric layers for routing signals internally. Conductive ground vias 428 and signal vias 402, 432 can run substantially perpendicular to the ground planes 422. Each via is connected to contact pads (308, 312) affixed to it at each PCB surface.” Waite, [9:67-10:5].</p> <p>To the extent Plaintiff contends that Waite fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general</p>

Appendix A-34 - Invalidity of U.S. Patent No. 9859202 in view of Wu - U.S. Patent No. 10319607

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Wu - U.S. Patent No. 10319607

U.S. Patent No.10319607 (“Wu”) is titled Package-on-Package Structure with Organic Interposer and lists Jiun Yi Wu, Yu-Min Liang, Mirmg-Ji Lii, Chien-Hsun Lee, Tsung-Ding Wang, and Jung Wei Cheng as inventors. Wu is assigned to Taiwan Semiconductor Manufacturing Company, Ltd. Wu anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Wu is a U.S. patent that was filed August 22, 2014 and published February 25, 2016. Wu is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(2).

The chart below provides representative examples of where each element of each Asserted Claim is found within Wu, or otherwise rendered obvious by disclosures and teachings of Wu, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Wu does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Wu with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Wu, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-34 - Invalidity of U.S. Patent No. 9859202 in view of Wu - U.S. Patent No. 10319607

such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Wu “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Wu or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Wu set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Wu discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“The apparatus may be otherwise oriented (rotated 90 degrees or at other orientations) and the spatially relative descriptors used herein may likewise be interpreted accordingly. 3D integrated circuits are formed by stacking multiple chips. Electrical connectivity for signals and power connections from external devices are provided to various levels of the package by vertical interconnections. Described herein is a structure having reduced interconnection pitch between levels.” Wu, [2:19-2:28].</p>

	<p>“FIG. 1 is a cross-sectional view illustrating a substrate 110 according to some embodiments. The substrate 110 has a first redistribution layer (RDL) 102 and a second RDL 104 disposed on opposite sides of a substrate layer 108. The substrate layer 108 has one or more vias 120 extending from the top surface of the substrate layer 108 to the bottom surface of the substrate layer 108. The vias 120 connect conductive features 112 in the top RDL 102 to conductive features 112 in the bottom RDL 104.” Wu, [2:37-2:45].</p>  <p style="text-align: center;">Fig. 1</p> <p>Wu, FIG. 1</p> <p>“FIG. 4 is a cross-sectional view illustrating mounting an interposer 402 on the substrate 110 according to some embodiments. In an interposer first process, an interposer 402 is initially provided and mounted over the substrate 110 by attaching pillars 416 on the interposer 402 to the pillars 202 on the substrate 110. The interposer 402 has an interposer substrate 408 with a top RDL 404 and bottom RDL 406 disposed on the top and bottom surfaces of the</p>

	<p>one of the lands is aligned directly over the die and wherein a pitch of the connectors is different than a pitch of the lands.” Wu, [9:1-9:12].</p> <p>“According to another embodiment, a device comprises a substrate having a die disposed on a first side of the substrate and first pillars disposed on the first side of the substrate. The first pillars have a first pitch. A moldable underfill (MUF) is disposed on the first side of the substrate, with the MUF surrounding the die and each of the first pillars. An interposer is mounted over the first side of the substrate and has lands disposed on a first side of the interposer. The lands have a second pitch greater than the first pitch, and at least one of the lands is aligned directly over the die. Second pillars are disposed on a second side of the interposer, and the second pillars are bonded to the first pillars and provide electrical connectivity between the interposer and the substrate.” Wu, [9:1-9:13].</p>
[1.A] a bottom package substrate;	<p>Wu discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1 is a cross-sectional view illustrating a substrate 110 according to some embodiments. The substrate 110 has a first redistribution layer (RDL) 102 and a second RDL 104 disposed on opposite sides of a substrate layer 108. The substrate layer 108 has one or more vias 120 extending from the top surface of the substrate layer 108 to the bottom surface of the substrate layer 108. The vias 120 connect conductive features 112 in the top RDL 102 to conductive features 112 in the bottom RDL 104. The bottom RDL 104 and top RDL 102 each have one or more insulating layers with the conductive features 112 disposed therein. The top RDL 102 has one or more lands 106 disposed on the top surfaces. Die lands 118 are disposed on the top surface of the top RDL 102.” Wu, [2:38-2:51].</p>

Fig. 1

Wu, FIG. 1

“The bottom RDL 104 also has lands 114 disposed on a bottom surface. In some embodiments, a protective layer 116 is disposed over the lands 114 on the bottom surface of the bottom RDL 104 and has openings exposing surfaces of the lands 114.” Wu, [2:54-2:58].

“In an embodiment, substrate 110 is formed by forming the bottom RDL 104 first, with the substrate layer 108 formed over the bottom RDL 104 and the top RDL 102 subsequently formed over the substrate layer 108. The RDLs 102 and 104 are formed by metal layer deposition and patterning by, for example, deposition of a seed layer, masking and deposition of metal over the patterned mask. The mask and exposed portions of the seed layer are removed, and a dielectric layer such as PBO, polyimide, or the like is formed around the patterned metal elements.” Wu, [2:59-3:1].

“The vias 120 are formed by plating or otherwise depositing metal in the via openings formed in the substrate layer 108. In other embodiments, the substrate layer 108 is formed first, with

the top RDL 102 and bottom RDL 104 formed on respective surfaces of the substrate layer 108. In such an embodiment, the substrate layer 108 is formed on a carrier or other support surface with bottom RDL layers (such as metal traces or copper foil) on opposite sides of the substrate layer 108.” Wu, [3:24-3:33].

“FIG. 3 is a cross-sectional view illustrating mounting a die 302 on the substrate 110 according to some embodiments. In some embodiments, the die 302 has one or more active or passive devices such as transistors, inductors, capacitors, resistors or the like disposed therein. The die 302 is attached to the die lands 118 by, for example, a flip-chip bonding technique.” Wu, [4:44-4:50].

Fig. 3

Wu, FIG. 3

“FIG. 6 is a cross-sectional view illustrating mounting connectors 602 on the substrate 110 according to some embodiments. Connectors 602, such as, for example, solder balls, are mounted on the lands 114. In other embodiments, the connectors 602 are conductive bumps, pillars, studs or another conductive structure.” Wu, [6:30-6:35].

	 <p style="text-align: center;">Fig. 6</p> <p>Wu, FIG. 6</p> <p>To the extent Plaintiff contends that Wu fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Wu discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p>See, <i>e.g.</i>:</p> <p>“FIG. 1 is a cross-sectional view illustrating a substrate 110 according to some embodiments. Wu, FIG. 7

“FIG. 10 is a cross-sectional view illustrating mounting of the package 702 on the interposer 402 in an interposer last process according to some embodiments. The package 702 is mounted to the interposer by connectors 704, as described above.” Wu, [7:24-7:28].

Fig. 10

Wu, FIG. 10

“According to an embodiment, a device comprises a substrate having a die mounted on the first side of the substrate and a moldable underfill (MUF) disposed on the first side of the substrate and around the die. An interposer is mounted on the first side of the substrate, with the interposer having lands disposed on a first side of the interposer. The interposer mounted to the substrate by connectors bonded to a second side of the interposer, the connectors providing electrical connectivity between the interposer and the substrate. A package is mounted on the first side of the interposer and is electrically connected to the lands.” Wu, [8:55-8:65].

Appendix A-34 - Invalidity of U.S. Patent No. 9859202 in view of Wu - U.S. Patent No. 10319607

	<p>“A method of forming a device according to an embodiment comprises mounting a die on a first side of a substrate and forming first pillars on the first side of the substrate. A moldable underfill (MUF) is applied on the first side of the substrate and surrounds the die and each of the first pillars. An interposer is mounted on the first side of the substrate by bonding second pillars on a second side of the interposer to the first pillars. The interposer has lands disposed on a first side of the interposer and at least one of the lands is aligned directly over the die. After the mounting the interposer, the first pillars and second pillars provide electrical connectivity between the interposer and the substrate. A package is mounted on the lands and the die is disposed between the first pillars.” Wu, [9:15-9:28].</p> <p>To the extent Plaintiff contends that Wu fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Wu discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p>See, e.g.:</p> <p>“FIG. 4 is a cross-sectional view illustrating mounting an interposer 402 on the substrate 110 according to some embodiments. In an interposer first process, an interposer 402 is initially provided and mounted over the substrate 110 by attaching pillars 416 on the interposer 402 to the pillars 202 on the substrate 110. The interposer 402 has an interposer substrate 408 with a top RDL 404 and bottom RDL 406 disposed on the top and bottom surfaces of the interposer substrate 408. Vias 410 in the interposer substrate 408 connect the bottom RDL</p>

406 to the top RDL 404. The interposer substrate 408 is formed, in some embodiments, from an organic material such as an epoxy impregnated glass-fiber laminate, polymer impregnated glass-fiber laminate, preimpregnated composite fiber, Ajinomoto build-up film (ABF), molding compound, epoxy, PBO, polyimide or another organic material.” Wu, [4:57-5:5].

Fig. 4

Wu, FIG. 4

“FIG. 5 is a cross-sectional view illustrating application of a moldable underfill (MUF) 502 according to some embodiments. In the interposer first process, the interposer 402 is mounted to the substrate 110 and the MUF 502 is formed between the joined interposer 402 and substrate 110. In some embodiments, the MUF 502 is a molding compound, epoxy, PBO, polyimide or another moldable insulating material. The MUF 502 is injected between the interposer 402 and the substrate 110 and retained in place by way of a mold or the like during application and curing. In such an embodiment, the MUF 502 contacts the sidewalls of the pillars 202 and 416 and surrounds the pillars 202, connecting members 414 and pillars 416.

Additionally, the MUF 502 contacts and extends from the top surface of the substrate 110 to contact the bottom surface of the interposer 402. In some embodiments, the top surface of the die 302 is spaced apart from the bottom surface of the interposer 402, and a portion of the MUF 502 is disposed in the space between the die 302 and the interposer 402.” Wu, [6:10-6:28].

Fig. 5

Wu, FIG. 5

“FIG. 7 is a cross-sectional view illustrating mounting a package 702 on the interposer 402 according to some embodiments. Package connectors 704 such as, for example, solder balls, pillars, studs, conductive bumps, or the like bond the package 702 to the interposer 402. The connectors 704 electrically connect the lands 412 on the top surface of the interposer 402 to the lands 716 on the bottom surface of the package 702.” Wu, [6:36-6:43].

Fig. 7

Wu, FIG. 7

“FIG. 9 is a cross-sectional view illustrating mounting of the interposer 402 on the substrate 110 after formation of the MUF 802 according to some embodiments. In such embodiments, pillars 416 extend into the openings 804, with the connecting members 414 disposed in the openings 804. The sidewalls of the openings 804 are, in some embodiments, spaced apart from the sidewalls of the pillars 202 and 416.” Wu, [7:17-7:23].

Fig. 9

Wu, FIG. 9

“FIG. 11A is a cross sectional enlarged view illustrating a MUF 802 over the die 302 and spaced apart from the interposer 402 according to some embodiments. In such embodiments, the MUF 802 is formed by the interposer last process, with the MUF 802 molded to cover the die 302. The MUF 802 is spaced apart from the bottom surface of the interposer 402 by an air gap 1104 having a distance less than the separation between the top surface of the die 302 and the bottom surface of the interposer 402. In some embodiments, the air gap 1104 helps the pillars 202 and 416 successfully bond to each other without being influenced by the height and surface uniformity of MUF 802 in the interposer last process.” Wu, [7:34-7:46].

Fig. 11A

Wu, FIG. 11A

“FIG. 11B is a cross-sectional enlarged view illustrating the die 302 extending above the MUF 802 according to some embodiments. In such embodiments, the MUF is formed by the interposer last process, with the MUF 802 molded around the die 302. The die 302 has a top surface that is exposed through the top surface of the MUF 802. The MUF 802 is spaced apart from the bottom surface of the interposer 402 by an air gap 1104 having a distance equal to, or greater than, the separation between the top surface of the die 302 and the bottom surface of the interposer 402.” Wu, [7:47-7:56].

Appendix A-34 - Invalidity of U.S. Patent No. 9859202 in view of Wu - U.S. Patent No. 10319607

plurality of metal pillars of the spacer connector, and	<p>“FIG. 2 is a cross-sectional view illustrating formation of pillars 202 on the substrate 110 according to some embodiments. In some embodiments, the pillars 202 are formed by initially depositing a seed layer over the lands 106. The seed layer is formed from copper (Cu), titanium (Ti), aluminum (Al), an alloy of the same, or another conductive material. The seed layer is formed by, for example, electroless copper deposition, atomic layer deposition, physical vapor deposition (PVD) by sputtering Ti, Cu, or another deposition process. A mask layer is formed over the seed layer from a material such as a photoresist or the like. The mask layer is patterned to form openings exposing the lands 106 by, for example, exposing and developing a photoresist mask layer. A metal layer is formed over the patterned mask layer by, for example physical vapor deposition, electroless plating, seed layer deposition by ALD and electroplating, or by another metal formation process. In some embodiments, the deposited metal layer is planarized by, for example, a chemical-mechanical polish (CMP), grinding, etching, or the like. The planarization step removes excess deposited metal from over the patterned mask layer, leaving pillars 202. The mask layer is then removed by, for example, chemical stripping or ashing with a plasma oxygen treatment. The seed layer outside of the pillars 202 subsequently removed by etching or the like. In some embodiments, a tin (Sn) plating layer is applied over the pillars 202, with the tin reflowed after etching or otherwise removing the excess seed layer material. In some embodiments, the pillars 202 are formed with a pitch between adjacent pillars that is between about 200 μm and about 400 μm.” Wu, [3:45-4:8].</p>
---	--

Fig. 2

Wu, FIG. 2

“FIG. 4 is a cross-sectional view illustrating mounting an interposer 402 on the substrate 110 according to some embodiments. In an interposer first process, an interposer 402 is initially provided and mounted over the substrate 110 by attaching pillars 416 on the interposer 402 to the pillars 202 on the substrate 110. The interposer 402 has an interposer substrate 408 with a top RDL 404 and bottom RDL 406 disposed on the top and bottom surfaces of the interposer substrate 408. Vias 410 in the interposer substrate 408 connect the bottom RDL 406 to the top RDL 404. The interposer substrate 408 is formed, in some embodiments, from an organic material such as an epoxy impregnated glass-fiber laminate, polymer impregnated glass-fiber laminate, preimpregnated composite fiber, Ajinomoto build-up film (ABF), molding compound, epoxy, PBO, polyimide or another organic material. It has been discovered that an interposer with an organic interposer substrate 408 provides a structure with a coefficient of thermal expansion (CTE) that more closely matches the CTE of a substrate 110 than an inorganic interposer substrate 408. It should be understood that the matching of the CTEs for the interposer 402 will depend on the materials used for the substrate 110. However, the interposer substrate 408 is not limited to such material, as in

	<p>other embodiments, the interposer substrate 408 is formed from an oxide, oxynitride, nitride, or another insulating material. The interposer substrate 408 and vias 410 are formed, in some embodiments as described above with respect to the substrate layer 108 and vias 120.” Wu, [4:57-5:18].</p> <p>“In some embodiments, the interposer substrate 408 is formed first, with the top RDL 404 and bottom RDL 406 subsequently formed, respectively, on the top surface and bottom surface of the interposer substrate 408. In other embodiments, the interposer 402 is formed by forming the top RDL 404 or bottom RDL 406 on a carrier or the like, with the interposer substrate 408 formed on the first formed RDL 404 / 406 and the remaining RDL 404 / 406 formed over the interposer substrate 408. The RDLs 404 and 406 are formed as described above with respect to RDLs 102 and 104. While the top RDL 404 and bottom RDL 406 of the interposer 402 are illustrated as each having a single layer of conductive features, the RDLs 404 and 406 are not limited to such structures, as the RDLs 404 and 406, in some embodiments, have multiple conductive features and dielectric layers. The conductive features in the bottom RDL 406 comprise lands 418 that are exposed at the bottom side of the interposer 402 by openings in an overlying protection layer 422. The protection layer 420 on the top RDL 404 has openings exposing lands 412 for subsequent mounting of an external device such as a die, package, board, device or the like. It has been discovered that the interposer 402 having lands 412 on the top surface that are disposed over the die 302 permits connectors for subsequently formed devices to have a pitch that is different than the pitch of the pillars 416. In particular, a larger pitch for the lands 412 permits greater spacing of the connectors on the lands 412, preventing solder bridging between adjacent connectors, and permitting larger connectors. Additionally, the lands 412 being disposed over the die 302 allows for a greater number of lands 412 and associated connectors than the number of pillars 416. In some embodiments, the lands 412 have exposed regions with a diameter between about 200 μm and about 400 μm and a pitch between about 350 μm and about 650 μm. Pillars</p>
--	---

Appendix A-34 - Invalidity of U.S. Patent No. 9859202 in view of Wu - U.S. Patent No. 10319607

	<p>416 are disposed on the lands 418 and extend through the openings in the protection layer 422. In some embodiments, the pillars 416 are formed as described above with respect to pillars 202, with the pillars 416 formed over the protection layer 422 instead of over the solder resist 204. In some embodiments, the pillars 416 on the interposer 402 are formed to have about the same size and pitch as the pillars 202 on the substrate 110, and with a complementary arrangement so that pillars 416 align with pillars 202 when the interposer 402 is mounted on the substrate 110. The interposer 402 is mounted to the substrate 110 by aligning the pillars 416 over the pillars 202 and bonding the aligned pairs of pillars 202 and 416 to each other. In some embodiments, a connecting member 414, such as a solder cap, tin layer, or other conductive material is used to joining the aligned ends of the pillars 202 and 416.” Wu, [5:19-6:3].</p> <p>“FIG. 9 is a cross-sectional view illustrating mounting of the interposer 402 on the substrate 110 after formation of the MUF 802 according to some embodiments. In such embodiments, pillars 416 extend into the openings 804, with the connecting members 414 disposed in the openings 804. The sidewalls of the openings 804 are, in some embodiments, spaced apart from the sidewalls of the pillars 202 and 416.” Wu, [7:17-7:23].</p>

<p>[1.K] a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein</p>	<p>Wu discloses, either expressly or inherently, a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 4 is a cross-sectional view illustrating mounting an interposer 402 on the substrate 110 according to some embodiments. In an interposer first process, an interposer 402 is initially provided and mounted over the substrate 110 by attaching pillars 416 on the interposer 402 to the pillars 202 on the substrate 110. The interposer 402 has an interposer substrate 408 with a top RDL 404 and bottom RDL 406 disposed on the top and bottom surfaces of the interposer substrate 408. Vias 410 in the interposer substrate 408 connect the bottom RDL 406 to the top RDL 404. The interposer substrate 408 is formed, in some embodiments, from an organic material such as an epoxy impregnated glass-fiber laminate, polymer impregnated glass-fiber laminate, preimpregnated composite fiber, Ajinomoto build-up film (ABF),</p>

	<p>molding compound, epoxy, PBO, polyimide or another organic material. It has been discovered that an interposer with an organic interposer substrate 408 provides a structure with a coefficient of thermal expansion (CTE) that more closely matches the CTE of a substrate 110 than an inorganic interposer substrate 408. It should be understood that the matching of the CTEs for the interposer 402 will depend on the materials used for the substrate 110. However, the interposer substrate 408 is not limited to such material, as in other embodiments, the interposer substrate 408 is formed from an oxide, oxynitride, nitride, or another insulating material. The interposer substrate 408 and vias 410 are formed, in some embodiments as described above with respect to the substrate layer 108 and vias 120. In some embodiments, the interposer substrate 408 is formed first, with the top RDL 404 and bottom RDL 406 subsequently formed, respectively, on the top surface and bottom surface of the interposer substrate 408. In other embodiments, the interposer 402 is formed by forming the top RDL 404 or bottom RDL 406 on a carrier or the like, with the interposer substrate 408 formed on the first formed RDL 404 / 406 and the remaining RDL 404 / 406 formed over the interposer substrate 408. The RDLs 404 and 406 are formed as described above with respect to RDLs 102 and 104. While the top RDL 404 and bottom RDL 406 of the interposer 402 are illustrated as each having a single layer of conductive features, the RDLs 404 and 406 are not limited to such structures, as the RDLs 404 and 406, in some embodiments, have multiple conductive features and dielectric layers. The conductive features in the bottom RDL 406 comprise lands 418 that are exposed at the bottom side of the interposer 402 by openings in an overlying protection layer 422. The protection layer 420 on the top RDL 404 has openings exposing lands 412 for subsequent mounting of an external device such as a die, package, board, device or the like. It has been discovered that the interposer 402 having lands 412 on the top surface that are disposed over the die 302 permits connectors for subsequently formed devices to have a pitch that is different than the pitch of the pillars 416. In particular, a larger pitch for the lands 412 permits greater spacing of the connectors on the lands 412, preventing solder bridging between adjacent connectors, and permitting larger connectors. Additionally,</p>
--	--

	<p>the lands 412 being disposed over the die 302 allows for a greater number of lands 412 and associated connectors than the number of pillars 416.” Wu, [4:58-5:51].</p> <div data-bbox="430 714 738 1365"><p>The diagram is a cross-sectional view of a semiconductor assembly. At the bottom is a substrate 110. On top of the substrate are several pillars 202. A die 302 is mounted on top of the pillars. The die has lands 412 on its top surface. A moldable underfill (MUF) 502 is applied between the die and the substrate. The MUF 502 is shown as a hatched region. It is disposed over the lands 412 and around the pillars 202. The MUF 502 is shown to be in contact with the top surface of the substrate 110 and the bottom surface of the die 302. Other labels include 418, 416, 414, 204, 402, 404, 406, 408, 420, 418, 412, 410, 108, and 120.</p></div> <p>Fig. 4</p> <p>Wu, FIG. 4</p> <p>“FIG. 5 is a cross-sectional view illustrating application of a moldable underfill (MUF) 502 according to some embodiments. In the interposer first process, the interposer 402 is mounted to the substrate 110 and the MUF 502 is formed between the joined interposer 402 and substrate 110. In some embodiments, the MUF 502 is a molding compound, epoxy, PBO, polyimide or another moldable insulating material. The MUF 502 is injected between the interposer 402 and the substrate 110 and retained in place by way of a mold or the like during application and curing. In such an embodiment, the MUF 502 contacts the sidewalls of the pillars 202 and 416 and surrounds the pillars 202, connecting members 414 and pillars 416. Additionally, the MUF 502 contacts and extends from the top surface of the substrate 110 to contact the bottom surface of the interposer 402. In some embodiments, the die 302 has one or more active or passive devices such as transistors, inductors, capacitors, resistors or the like disposed therein. The die 302 is attached to the die lands 118 by, for example, a flip-chip bonding technique. In some embodiments, connectors 304 are disposed between contact pads on the</p>

die 302 and the die lands 118. The connectors 304 bond the die 302 to the die lands 118 while providing electrical connections between the die 302 and the die lands 118.” Wu, [4:43-4:53].

Fig. 3

Wu, FIG. 3

“FIG. 5 is a cross-sectional view illustrating application of a moldable underfill (MUF) 502 according to some embodiments. In the interposer first process, the interposer 402 is mounted to the substrate 110 and the MUF 502 is formed between the joined interposer 402 and substrate 110. In some embodiments, the MUF 502 is a molding compound, epoxy, PBO, polyimide or another moldable insulating material. The MUF 502 is injected between the interposer 402 and the substrate 110 and retained in place by way of a mold or the like during application and curing. In such an embodiment, the MUF 502 contacts the sidewalls of the pillars 202 and 416 and surrounds the pillars 202, connecting members 414 and pillars 416. Additionally, the MUF 502 contacts and extends from the top surface of the substrate 110 to contact the bottom surface of the interposer 402. In some embodiments, the top surface of the die 302 is spaced apart from the bottom surface of the interposer 402, and a portion of the MUF 502 is disposed in the space between the die 302 and the interposer 402. In some

	<p>embodiments, a portion of the MUF 502 extends between the die 302 and the substrate 110.” Wu, [6:10-6:29].</p>  <p>Fig. 5</p> <p>Wu, FIG. 5</p> <p>“FIG. 8 is a cross-sectional view illustrating formation of an MUF 802 prior to mounting the interposer 402 according to some embodiments. The MUF 802 is formed after the die 302 is mounted to the substrate 110 as shown in FIGS. 1 and 3, and in some embodiments, the MUF 802 is also formed after formation of the pillars 202 as shown in FIG.” Wu, [6:60-6:66].</p>
--	---

Fig. 8

Wu, FIG. 8

“FIG. 11C is a cross-sectional enlarged view illustrating a die attachment film (DAF) 110C disposed on the top surface of the die 302 according to some embodiments. In some embodiments, the die 302 is attached to the interposer prior to the die 302 being mounted to the substrate 110. In such embodiments, the die 302 is mounted to the substrate 110 when the interposer 402 is mounted to the substrate 110. In other embodiments, the DAF 110C is applied to the die 302 or to the interposer after the die 302 is mounted to the substrate 110 and prior to the interposer 402 being mounted to the substrate 110.” Wu, [7:57-7:67].

	<div data-bbox="326 678 613 1367"><p>The diagram is a cross-sectional view of a substrate assembly. It shows a top layer 1106, a middle layer 302, and a bottom layer 110. There are three vertical vias or pillars, each labeled 502, extending from the middle layer 302 through the bottom layer 110. The vias are filled with a material, and the space between them is also filled. A bracket 402 is shown at the top of the vias, indicating a specific region or layer.</p></div> <div data-bbox="664 928 699 1056"><p>Fig. 11C</p></div> <div data-bbox="722 1211 755 1388"><p>Wu, FIG. 11C</p></div> <div data-bbox="803 178 1073 1297"><p>“FIG. 11D is a cross-sectional enlarged view illustrating an underfill (UF) 1108 disposed between the die 302 and the substrate 110. The UF 1108 is a molding compound, epoxy, PBO, polyimide or another moldable insulating material, and in some embodiments, the UF 1108 is a different material than the MUF 502. In some embodiments the UF 1108 is dispensed along the bottom edge of the die 302, so that the UF 1108 will flow and fill the space in between the bottom of die 302 and the substrate 110 through capillary effect.” Wu, [8:6-8:15].</p></div>

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Wu discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“In some embodiments, the die 302 has one or more active or passive devices such as transistors, inductors, capacitors, resistors or the like disposed therein. The die 302 is attached to the die lands 118 by, for example, a flip-chip bonding technique. In some embodiments, connectors 304 are disposed between contact pads on the die 302 and the die lands 118. The connectors 304 bond the die 302 to the die lands 118 while providing electrical connections between the die 302 and the die lands 118. In some embodiments, the connectors 304 are</p>

	<p>solder balls, controlled collapse chip connections (C 4), a land grid array, microbumps, pillars, studs, or the like.” Wu, [4:45-4:57].</p> <p>“It has been discovered that the interposer 402 having lands 412 on the top surface that are disposed over the die 302 permits connectors for subsequently formed devices to have a pitch that is different than the pitch of the pillars 416. In particular, a larger pitch for the lands 412 permits greater spacing of the connectors on the lands 412, preventing solder bridging between adjacent connectors, and permitting larger connectors. Additionally, the lands 412 being disposed over the die 302 allows for a greater number of lands 412 and associated connectors than the number of pillars 416.” Wu, [5:41-5:51].</p> <p>“In some embodiments, the top surface of the die 302 is spaced apart from the bottom surface of the interposer 402, and a portion of the MUF 502 is disposed in the space between the die 302 and the interposer 402.” Wu, [6:24-6:28].</p> <p>“FIG. 7 is a cross-sectional view illustrating mounting a package 702 on the interposer 402 according to some embodiments. Package connectors 704 such as, for example, solder balls, pillars, studs, conductive bumps, or the like bond the package 702 to the interposer 402. The connectors 704 electrically connect the lands 412 on the top surface of the interposer 402 to the lands 716 on the bottom surface of the package 702. In some embodiments, the package 702 has one or more dies 710 electrically connected to conductive features 714 that are in turn electrically connected to the lands 716 by way of vias 712 disposed in a package substrate 706. While the package 702 is illustrated herein as having a substrate 706 with dies 710 disposed thereon, the structure is not limited to having such a package 702 with such an arrangement.” Wu, [6:36-6:51].</p>
--	---

Appendix A-34 - Invalidity of U.S. Patent No. 9859202 in view of Wu - U.S. Patent No. 10319607

	<p>“While the package 702 is illustrated herein as having a substrate 706 with dies 710 disposed thereon, the structure is not limited to having such a package 702 with such an arrangement. In other embodiments, the package 702 is a die or chip mounted directly on the connectors 704, multiple dies or packages on the connectors 704 or another arrangement.” Wu, [6:48-6:53].</p> <p>“FIG. 10 is a cross-sectional view illustrating mounting of the package 702 on the interposer 402 in an interposer last process according to some embodiments. The package 702 is mounted to the interposer by connectors 704, as described above.” Wu, [7:24-7:28].</p> <p>To the extent Plaintiff contends that Wu fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-34 - Invalidity of U.S. Patent No. 9859202 in view of Wu - U.S. Patent No. 10319607

	<p>connect the lands 412 on the top surface of the interposer 402 to the lands 716 on the bottom surface of the package 702.” Wu, [6:38-6:43].</p> <p>“FIG. 9 is a cross-sectional view illustrating mounting of the interposer 402 on the substrate 110 after formation of the MUF 802 according to some embodiments. In such embodiments, pillars 416 extend into the openings 804, with the connecting members 414 disposed in the openings 804.” Wu, [7:17-7:21].</p> <p>To the extent Plaintiff contends that Wu fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	<p>Wu discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p>

Appendix A-34 - Invalidity of U.S. Patent No. 9859202 in view of Wu - U.S. Patent No. 10319607

<p>pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>“FIG. 4 is a cross-sectional view illustrating mounting an interposer 402 on the substrate 110 according to some embodiments. In an interposer first process, an interposer 402 is initially provided and mounted over the substrate 110 by attaching pillars 416 on the interposer 402 to the pillars 202 on the substrate 110. The interposer 402 has an interposer substrate 408 with a top RDL 404 and bottom RDL 406 disposed on the top and bottom surfaces of the interposer substrate 408. Vias 410 in the interposer substrate 408 connect the bottom RDL 406 to the top RDL 404. The interposer substrate 408 is formed, in some embodiments, from an organic material such as an epoxy impregnated glass-fiber laminate, polymer impregnated glass-fiber laminate, preimpregnated composite fiber, Ajinomoto build-up film (ABF), molding compound, epoxy, PBO, polyimide or another organic material. It has been discovered that an interposer with an organic interposer substrate 408 provides a structure with a coefficient of thermal expansion (CTE) that more closely matches the CTE of a substrate 110 than an inorganic interposer substrate 408. It should be understood that the matching of the CTEs for the interposer 402 will depend on the materials used for the substrate 110. However, the interposer substrate 408 is not limited to such material, as in other embodiments, the interposer substrate 408 is formed from an oxide, oxynitride, nitride, or another insulating material. The interposer substrate 408 and vias 410 are formed, in some embodiments as described above with respect to the substrate layer 108 and vias 120. In some embodiments, the interposer substrate 408 is formed first, with the top RDL 404 and bottom RDL 406 subsequently formed, respectively, on the top surface and bottom surface of the interposer substrate 408. In other embodiments, the interposer 402 is formed by forming the top RDL 404 or bottom RDL 406 on a carrier or the like, with the interposer substrate 408 formed on the first formed RDL 404 / 406 and the remaining RDL 404 / 406 formed over the interposer substrate 408.” Wu, [4:58-5:27].</p>
---	---

Fig. 4

Wu, FIG. 4

“In some embodiments, the pillars 416 on the interposer 402 are formed to have about the same size and pitch as the pillars 202 on the substrate 110, and with a complementary arrangement so that pillars 416 align with pillars 202 when the interposer 402 is mounted on the substrate 110. The interposer 402 is mounted to the substrate 110 by aligning the pillars 416 over the pillars 202 and bonding the aligned pairs of pillars 202 and 416 to each other.

In some embodiments, a connecting member 414, such as a solder cap, tin layer, or other conductive material is used to joining the aligned ends of the pillars 202 and 416. The connecting member is, for example, formed on one set of pillars 202 or 416 prior to the pillars 202 and 416 being connected. The pillars 202 and 416 are then brought together, and the connecting member 414 is subjected to heat and/or pressure to reflow the material of the connecting member 414 or otherwise bond the aligned pairs of pillars 202 and 416.” Wu, [5:60-6:9].

“FIG. 7 is a cross-sectional view illustrating mounting a package 702 on the interposer 402 according to some embodiments. Package connectors 704 such as, for example, solder balls, pillars, studs, conductive bumps, or the like bond the package 702 to the interposer 402. The connectors 704 electrically connect the lands 412 on the top surface of the interposer 402 to the lands 716 on the bottom surface of the package 702.” Wu, [6:36-6:43].

Fig. 7

Wu, FIG. 7

“FIG. 9 is a cross-sectional view illustrating mounting of the interposer 402 on the substrate 110 after formation of the MUF 802 according to some embodiments. In such embodiments, pillars 416 extend into the openings 804, with the connecting members 414 disposed in the

openings 804. The sidewalls of the openings 804 are, in some embodiments, spaced apart from the sidewalls of the pillars 202 and 416.” Wu, [7:17-7:23].

Fig. 9

Wu, FIG. 9

“FIG. 12A is a cross-sectional enlarged view illustrating an alternative pillar 202 arrangement according to some embodiments. The pillars 202 are formed on the substrate 110 and extend above the top surface of the die 302. The connecting members 414 bond the pillars 202 to the lands 418 on the bottom surface of the interposer 402.” Wu, [8:26-8:32].

Fig. 12A

Wu, FIG. 12A

“FIG. 12B is a cross-sectional enlarged view illustrating an alternative pillar 416 arrangement according to some embodiments. The pillars 416 are formed on the interposer 402 and extend below the top surface of the die 302. The connecting members 414 directly bond the pillars 416 to the lands 106 on the top surface of the substrate 110.” Wu, [8:33-8:38].

	 <p>Fig. 12B</p> <p>Wu, FIG. 12B</p> <p>To the extent Plaintiff contends that Wu fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the bottom end of a corresponding metal	Wu discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the

Appendix A-34 - Invalidity of U.S. Patent No. 9859202 in view of Wu - U.S. Patent No. 10319607

<p>pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 4 is a cross-sectional view illustrating mounting an interposer 402 on the substrate 110 according to some embodiments. In an interposer first process, an interposer 402 is initially provided and mounted over the substrate 110 by attaching pillars 416 on the interposer 402 to the pillars 202 on the substrate 110. The interposer 402 has an interposer substrate 408 with a top RDL 404 and bottom RDL 406 disposed on the top and bottom surfaces of the interposer substrate 408. Vias 410 in the interposer substrate 408 connect the bottom RDL 406 to the top RDL 404. The interposer substrate 408 is formed, in some embodiments, from an organic material such as an epoxy impregnated glass-fiber laminate, polymer impregnated glass-fiber laminate, preimpregnated composite fiber, Ajinomoto build-up film (ABF), molding compound, epoxy, PBO, polyimide or another organic material. It has been discovered that an interposer with an organic interposer substrate 408 provides a structure with a coefficient of thermal expansion (CTE) that more closely matches the CTE of a substrate 110 than an inorganic interposer substrate 408. It should be understood that the matching of the CTEs for the interposer 402 will depend on the materials used for the substrate 110. However, the interposer substrate 408 is not limited to such material, as in other embodiments, the interposer substrate 408 is formed from an oxide, oxynitride, nitride, or another insulating material. The interposer substrate 408 and vias 410 are formed, in some embodiments as described above with respect to the substrate layer 108 and vias 120. In some embodiments, the interposer substrate 408 is formed first, with the top RDL 404 and bottom RDL 406 subsequently formed, respectively, on the top surface and bottom surface of the interposer substrate 408. In other embodiments, the interposer 402 is formed by forming the</p>
--	---

	<p>top RDL 404 or bottom RDL 406 on a carrier or the like, with the interposer substrate 408 formed on the first formed RDL 404 / 406 and the remaining RDL 404 / 406 formed over the interposer substrate 408. The RDLs 404 and 406 are formed as described above with respect to RDLs 102 and 104. While the top RDL 404 and bottom RDL 406 of the interposer 402 are illustrated as each having a single layer of conductive features, the RDLs 404 and 406 are not limited to such structures, as the RDLs 404 and 406, in some embodiments, have multiple conductive features and dielectric layers. The conductive features in the bottom RDL 406 comprise lands 418 that are exposed at the bottom side of the interposer 402 by openings in an overlying protection layer 422. The protection layer 420 on the top RDL 404 has openings exposing lands 412 for subsequent mounting of an external device such as a die, package, board, device or the like. It has been discovered that the interposer 402 having lands 412 on the top surface that are disposed over the die 302 permits connectors for subsequently formed devices to have a pitch that is different than the pitch of the pillars 416. In particular, a larger pitch for the lands 412 permits greater spacing of the connectors on the lands 412, preventing solder bridging between adjacent connectors, and permitting larger connectors. Additionally, the lands 412 being disposed over the die 302 allows for a greater number of lands 412 and associated connectors than the number of pillars 416. In some embodiments, the lands 412 have exposed regions with a diameter between about 200 μm and about 400 μm and a pitch between about 350 μm and about 650 μm. Pillars 416 are disposed on the lands 418 and extend through the openings in the protection layer 422. In some embodiments, the pillars 416 are formed as described above with respect to the pillars 202, with the pillars 416 formed over the protection layer 422 instead of over the solder resist 204. In some embodiments, the pillars 416 on the interposer 402 are formed to have about the same size and pitch as the pillars 202 on the substrate 110, and with a complementary arrangement so that pillars 416 align with pillars 202 when the interposer 402 is mounted on the substrate 110. The interposer 402 is mounted to the substrate 110 by aligning the pillars 416 over the pillars 202 and bonding the aligned pairs of pillars 202 and 416 to each other. In some embodiments, a</p>
--	--

connecting member 414, such as a solder cap, tin layer, or other conductive material is used to joining the aligned ends of the pillars 202 and 416. The connecting member is, for example, formed on one set of pillars 202 or 416 prior to the pillars 202 and 416 being connected. The pillars 202 and 416 are then brought together, and the connecting member 414 is subjected to heat and/or pressure to reflow the material of the connecting member 414 or otherwise bond the aligned pairs of pillars 202 and 416.” Wu, [4:58-6:9].

Fig. 4

Wu, FIG. 4

“FIG. 7 is a cross-sectional view illustrating mounting a package 702 on the interposer 402 according to some embodiments. Package connectors 704 such as, for example, solder balls, pillars, studs, conductive bumps, or the like bond the package 702 to the interposer 402. The connectors 704 electrically connect the lands 412 on the top surface of the interposer 402 to the lands 716 on the bottom surface of the package 702. In some embodiments, the package 702 has one or more dies 710 electrically connected to conductive features 714 that are in

	<p>turn electrically connected to the lands 716 by way of vias 712 disposed in a package substrate 706. While the package 702 is illustrated herein as having a substrate 706 with dies 710 disposed thereon, the structure is not limited to having such a package 702 with such an arrangement. In other embodiments, the package 702 is a die or chip mounted directly on the connectors 704, multiple dies or packages on the connectors 704 or another arrangement. While FIGS. 1 through 7 describe a process for forming the described structure using an interposer first process, in other embodiments, an interposer last process is employed to form the structure. In such embodiments, the MUF 502 is formed prior to mounting the interposer 402 to the substrate 110, as shown in FIGS. 8 through 10. FIG. 8 is a cross-sectional view illustrating formation of an MUF 802 prior to mounting the interposer 402 according to some embodiments. The MUF 802 is formed after the die 302 is mounted to the substrate 110 as shown in FIGS. 1 and 3, and in some embodiments, the MUF 802 is also formed after formation of the pillars 202 as shown in FIG. 2. In such embodiments, the MUF 802 is formed with openings 804 exposing the pillars 202.” Wu, [6:36-7:1].</p> <p>“FIG. 12A is a cross-sectional enlarged view illustrating an alternative pillar 202 arrangement according to some embodiments. The pillars 202 are formed on the substrate 110 and extend above the top surface of the die 302. The connecting members 414 bond the pillars 202 to the lands 418 on the bottom surface of the interposer 402. FIG. 12B is a cross-sectional enlarged view illustrating an alternative pillar 416 arrangement according to some embodiments. The pillars 416 are formed on the interposer 402 and extend below the top surface of the die 302. The connecting members 414 directly bond the pillars 416 to the lands 106 on the top surface of the substrate 110.” Wu, [8:26-8:38].</p>
--	--

Fig. 12A

Wu, FIG. 12A

“According to an embodiment, a device comprises a substrate having a die mounted on the first side of the substrate and a moldable underfill (MUF) disposed on the first side of the substrate and around the die. An interposer is mounted on the first side of the substrate, with the interposer having lands disposed on a first side of the interposer. The interposer mounted to the substrate by connectors bonded to a second side of the interposer, the connectors providing electrical connectivity between the interposer and the substrate. A package is mounted on the first side of the interposer and is electrically connected to the lands. At least one of the lands is aligned directly over the die and wherein a pitch of the connectors is different than a pitch of the lands.” Wu, [8:55-8:67].

“According to another embodiment, a device comprises a substrate having a die disposed on a first side of the substrate and first pillars disposed on the first side of the substrate. The first pillars have a first pitch. A moldable underfill (MUF) is disposed on the first side of the

Appendix A-34 - Invalidity of U.S. Patent No. 9859202 in view of Wu - U.S. Patent No. 10319607

	<p>substrate, with the MUF surrounding the die and each of the first pillars. An interposer is mounted over the first side of the substrate and has lands disposed on a first side of the interposer. The lands have a second pitch greater than the first pitch, and at least one of the lands is aligned directly over the die. Second pillars are disposed on a second side of the interposer, and the second pillars are bonded to the first pillars and provide electrical connectivity between the interposer and the substrate.” Wu, [9:1-9:13].</p> <p>“A method of forming a device according to an embodiment comprises mounting a die on a first side of a substrate and forming first pillars on the first side of the substrate. A moldable underfill (MUF) is applied on the first side of the substrate and surrounds the die and each of the first pillars. An interposer is mounted on the first side of the substrate by bonding second pillars on a second side of the interposer to the first pillars. The interposer has lands disposed on a first side of the interposer and at least one of the lands is aligned directly over the die. After the mounting the interposer, the first pillars and second pillars provide electrical connectivity between the interposer and the substrate. A package is mounted on the lands and the die is disposed between the first pillars.” Wu, [9:15-9:28].</p> <p>To the extent Plaintiff contends that Wu fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Yoo - U.S. Patent Publication No. 20120119370

U.S. Patent Publication No. 20120119370 (“Yoo”) is titled Semiconductor Package and Semiconductor System Including the Same and lists Jae-Wook Yoo as inventor. Yoo anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ‘202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Yoo is a U.S. patent publication that was filed September 16, 2011 and published May 17, 2012. Yoo claims priority to KR 10-2010-0112273 filed on November 11, 2010. Yoo is therefore prior art to the ‘202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Yoo, or otherwise rendered obvious by disclosures and teachings of Yoo, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Yoo does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Yoo with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ‘202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Yoo, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-35 - Invalidity of U.S. Patent No. 9859202 in view of Yoo - U.S. Patent Publication No. 20120119370

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Yoo “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Yoo or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Yoo set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Yoo discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“External terminals 146 such as, for example, solder balls are bonded to a portion of the other surface of the package substrate 140. The semiconductor device 110 is electrically connected to the package substrate through bumps 117.” Yoo, [0065].</p> <p>“As a set on which a semiconductor package is mounted decreases in thickness, a semiconductor package needs to also have a reduced thickness. Decreasing the thickness of a semiconductor substrate is a commonly used method to reduce the thickness of a</p>

	<p>semiconductor package. However, this method may cause warping at a middle portion of the package substrate 140. Thus, since the interconnect structure 210 suffers less deformation than the solder balls, warping of the package substrate 140 can be prevented by disposing the interconnect structure 210 on the middle portion of the package substrate 140.” Yoo, [0067-0068].</p> <p>“FIG. 12 is a cross-sectional view of a semiconductor package 106 a according to another embodiment of the present inventive concept. The semiconductor package 106 a according to the present embodiment is formed using a Package-On-Package (POP) packaging technique, but is not limited thereto. In the semiconductor package 106 a according to the present embodiment, an interconnect structure 220 is disposed between a first semiconductor package 144 and a package substrate 140 so as to create a space between the first semiconductor package 144 and the package substrate 140 in which a second semiconductor package 110 b is mounted. The first semiconductor package 144 includes chip- form semiconductor devices 110 and 110 a sequentially stacked on a package substrate 140 a. According to an embodiment, the chip- form semiconductor devices 110 and 110 a are connected to a package substrate 140 a by wire bonding 122, 122 a, but are not limited thereto. The interconnect structure 220 may serve as an interconnect in a POP semiconductor package as well. According to an embodiment, the first semiconductor package 144 exchanges signals with the outside through the interconnect structure 220 and the package substrate 140.” Yoo, [0069-0072].</p>
--	---

Fig. 12

Yoo, FIG. 12

“Referring to FIG. 13, in the semiconductor package 106 according to the present embodiment, an interconnect structure 50 is disposed between a first semiconductor package 144 and an interconnect structure 220. A space is created between the package substrates 140

	<p>and 140 a, by the interconnect structures 50 and 220, and a second semiconductor package 110 b is disposed within the space.” Yoo, [0074].</p> <p>“FIG. 14 is a cross-sectional view of a semiconductor package 107 according to another embodiment of the present inventive concept. Referring to FIG. 14, the semiconductor package according to the present embodiment includes the semiconductor package 101 described with reference to FIG. 7 and a semiconductor package 1101 having a mirror image of the semiconductor package 101 with respect to a package substrate 140. For example, according to an embodiment, the semiconductor package 101 is disposed on a top surface of the package substrate 140 and the semiconductor package 1101 is disposed on a bottom surface thereof.” Yoo, [0075].</p> <p>“The semiconductor package 101 has the same construction as that described with reference to FIG. 7. In the semiconductor package 1101, an interconnect structure 440, acting as an interposer, is disposed between a semiconductor device 1110 and the package substrate 140. The interconnect structure 440 includes anodized insulation regions 414 and interconnects 412 defined by the anodized insulation regions 414. The interconnect structure 40 acting as an interposer is connected to the semiconductor device 110 via the bumps 112, but is not limited thereto.” Yoo, [0076].</p> <p>“The memory device 1730 may include a volatile memory such as dynamic random access memory (DRAM) and a nonvolatile memory such as a flash memory. For example, an information processing system such as a mobile device or desk top computer may be equipped with a flash memory. The flash memory may be used to construct a semiconductor disk device (SSD). In an embodiment, the electronic system 1700 stably stores a large amount of data in the flash memory.” Yoo, [0083].</p>
--	--

<p>[1.A] a bottom package substrate;</p>	<p>Yoo discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“External terminals 146 such as, for example, solder balls are bonded to a portion of the other surface of the package substrate 140. The semiconductor device 110 is electrically connected to the package substrate through bumps 117.” Yoo, [0065].</p> <p>“As a set on which a semiconductor package is mounted decreases in thickness, a semiconductor package needs to also have a reduced thickness. Decreasing the thickness of a semiconductor substrate is a commonly used method to reduce the thickness of a semiconductor package. However, this method may cause warping at a middle portion of the package substrate 140. Thus, since the interconnect structure 210 suffers less deformation than the solder balls, warping of the package substrate 140 can be prevented by disposing the interconnect structure 210 on the middle portion of the package substrate 140.” Yoo, [0067-0068].</p> <p>“FIG. 12 is a cross-sectional view of a semiconductor package 106 a according to another embodiment of the present inventive concept. The semiconductor package 106 a according to the present embodiment is formed using a Package-On-Package (POP) packaging technique, but is not limited thereto. In the semiconductor package 106 a according to the present embodiment, an interconnect structure 220 is disposed between a first semiconductor package 144 and a package substrate 140 so as to create a space between the first semiconductor package 144 and the package substrate 140 in which a second semiconductor package 110 b is mounted. The first semiconductor package 144 includes chip- form semiconductor devices 110 and 110 a sequentially stacked on a package substrate 140 a. According to an embodiment, the chip- form semiconductor devices 110 and 110 a are</p>

Appendix A-35 - Invalidity of U.S. Patent No. 9859202 in view of Yoo - U.S. Patent Publication No. 20120119370

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Yoo discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“External terminals 146 such as, for example, solder balls are bonded to a portion of the other surface of the package substrate 140. The semiconductor device 110 is electrically connected to the package substrate through bumps 117.” Yoo, [0065].</p> <p>“FIG. 12 is a cross-sectional view of a semiconductor package 106 a according to another embodiment of the present inventive concept. The semiconductor package 106 a according to the present embodiment is formed using a Package-On-Package (POP) packaging technique, but is not limited thereto. In the semiconductor package 106 a according to the present embodiment, an interconnect structure 220 is disposed between a first semiconductor package 144 and a package substrate 140 so as to create a space between the first semiconductor package 144 and the package substrate 140 in which a second semiconductor package 110 b is mounted. The first semiconductor package 144 includes chip- form semiconductor devices 110 and 110 a sequentially stacked on a package substrate 140 a. According to an embodiment, the chip- form semiconductor devices 110 and 110 a are connected to a package substrate 140 a by wire bonding 122, 122 a, but are not limited thereto. The interconnect structure 220 may serve as an interconnect in a POP semiconductor package as well. According to an embodiment, the first semiconductor package 144</p>

exchanges signals with the outside through the interconnect structure 220 and the package substrate 140." Yoo, [0069-0072].

Fig. 12

Yoo, FIG. 12

Appendix A-35 - Invalidity of U.S. Patent No. 9859202 in view of Yoo - U.S. Patent Publication No. 20120119370

	<p>“The memory device 1730 may include a volatile memory such as dynamic random access memory (DRAM) and a nonvolatile memory such as a flash memory. For example, an information processing system such as a mobile device or desk top computer may be equipped with a flash memory. The flash memory may be used to construct a semiconductor disk device (SSD). In an embodiment, the electronic system 1700 stably stores a large amount of data in the flash memory.” Yoo, [0083].</p> <p>To the extent Plaintiff contends that Yoo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 4, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.	<p>Yoo discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“For example, the semiconductor device 110 may be connected to the interconnect structure 40 using a solder paste (150 in FIG. 8) instead of the bumps 112. The interconnect structure 40 may also be connected to the package substrate 140 through bumps, a solder paste, or</p>

	<p>other various materials. Although not shown in FIG. 7, the semiconductor package 101 may further include a molding layer for molding the semiconductor device 110 on the package substrate 140 and external terminals such as solder balls attached to a bottom of the package substrate 140. FIG. 8 is a cross-sectional view of a semiconductor package according to another embodiment of the present inventive concept. Referring to FIG. 8, a semiconductor device 110 connects to an interconnect structure 40 through a solder paste 150 and the interconnect structure 40 connects to a package substrate 140 through a solder paste 160. Referring to FIG. 8, a chip pad 114 is mounted on a surface of the chip-form semiconductor device 110, and a protective layer 118 is also formed on the surface of the chip-form semiconductor device 110, and includes an open portion exposing at least a portion of the chip pad 114. An under barrier metal (UBM) 116 is formed on a portion of the protective layer 118 and in the open portion of the protective layer on the exposed portion of the chip pad 114. The solder paste 150 is interposed between the UBM 116 and a first region 42 b of an interconnect 42. A package pad 144 is disposed on a surface of the package substrate 140, and a protective layer 148 is formed on the surface of the package substrate, and includes an open portion exposing at least a portion of the package pad 144. The solder paste 160 is disposed between the exposed portion of the package pad 144 and a second region 42 a of the interconnect 42 in the interconnect structure 40.” Yoo, [0054-0058].</p> <p>“FIG. 12 is a cross-sectional view of a semiconductor package 106 a according to another embodiment of the present inventive concept. The semiconductor package 106 a according to the present embodiment is formed using a Package-On-Package (POP) packaging technique, but is not limited thereto. In the semiconductor package 106 a according to the present embodiment, an interconnect structure 220 is disposed between a first semiconductor package 144 and a package substrate 140 so as to create a space between the first semiconductor package 144 and the package substrate 140 in which a second semiconductor package 110 b is mounted. Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“For example, the semiconductor device 110 may be connected to the interconnect structure 40 using a solder paste (150 in FIG. 8) instead of the bumps 112. The interconnect structure 40 may also be connected to the package substrate 140 through bumps, a solder paste, or other various materials. Although not shown in FIG. 7, the semiconductor package 101 may further include a molding layer for molding the semiconductor device 110 on the package substrate 140 and external terminals such as solder balls attached to a bottom of the package substrate 140. FIG. 8 is a cross-sectional view of a semiconductor package according to another embodiment of the present inventive concept. Referring to FIG. 8, a semiconductor device 110 connects to an interconnect structure 40 through a solder paste 150 and the interconnect structure 40 connects to a package substrate 140 through a solder paste 160.</p>	<p>Yoo discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“For example, the semiconductor device 110 may be connected to the interconnect structure 40 using a solder paste (150 in FIG. 8) instead of the bumps 112. The interconnect structure 40 may also be connected to the package substrate 140 through bumps, a solder paste, or other various materials. Although not shown in FIG. 7, the semiconductor package 101 may further include a molding layer for molding the semiconductor device 110 on the package substrate 140 and external terminals such as solder balls attached to a bottom of the package substrate 140. FIG. 8 is a cross-sectional view of a semiconductor package according to another embodiment of the present inventive concept. Referring to FIG. 8, a semiconductor device 110 connects to an interconnect structure 40 through a solder paste 150 and the interconnect structure 40 connects to a package substrate 140 through a solder paste 160.</p>

	<p>Referring to FIG. 8, a chip pad 114 is mounted on a surface of the chip-form semiconductor device 110, and a protective layer 118 is also formed on the surface of the chip-form semiconductor device 110, and includes an open portion exposing at least a portion of the chip pad 114. An under barrier metal (UBM) 116 is formed on a portion of the protective layer 118 and in the open portion of the protective layer on the exposed portion of the chip pad 114. The solder paste 150 is interposed between the UBM 116 and a first region 42 b of an interconnect 42. A package pad 144 is disposed on a surface of the package substrate 140, and a protective layer 148 is formed on the surface of the package substrate, and includes an open portion exposing at least a portion of the package pad 144. The solder paste 160 is disposed between the exposed portion of the package pad 144 and a second region 42 a of the interconnect 42 in the interconnect structure 40.” Yoo, [0054-0058].</p> <p>“As a set on which a semiconductor package is mounted decreases in thickness, a semiconductor package needs to also have a reduced thickness. Decreasing the thickness of a semiconductor substrate is a commonly used method to reduce the thickness of a semiconductor package. However, this method may cause warping at a middle portion of the package substrate 140. Thus, since the interconnect structure 210 suffers less deformation than the solder balls, warping of the package substrate 140 can be prevented by disposing the interconnect structure 210 on the middle portion of the package substrate 140.” Yoo, [0067-0068].</p> <p>“FIG. 12 is a cross-sectional view of a semiconductor package 106 a according to another embodiment of the present inventive concept. The semiconductor package 106 a according to the present embodiment is formed using a Package-On-Package (POP) packaging technique, but is not limited thereto. In the semiconductor package 106 a according to the present embodiment, an interconnect structure 220 is disposed between a first semiconductor package 144 and a package substrate 140 so as to create a space between the first</p>
--	---

	<p>semiconductor package 144 and the package substrate 140 in which a second semiconductor package 110 b is mounted. The first semiconductor package 144 includes chip- form semiconductor devices 110 and 110 a sequentially stacked on a package substrate 140 a. According to an embodiment, the chip- form semiconductor devices 110 and 110 a are connected to a package substrate 140 a by wire bonding 122, 122 a, but are not limited thereto. The interconnect structure 220 may serve as an interconnect in a POP semiconductor package as well. According to an embodiment, the first semiconductor package 144 exchanges signals with the outside through the interconnect structure 220 and the package substrate 140.” Yoo, [0069-0072].</p>
--	--

Fig. 12

Yoo, FIG. 12

“The semiconductor package 101 has the same construction as that described with reference to FIG. 7. In the semiconductor package 1101, an interconnect structure 440, acting as an interposer, is disposed between a semiconductor device 1110 and the package substrate 140.

Appendix A-35 - Invalidity of U.S. Patent No. 9859202 in view of Yoo - U.S. Patent Publication No. 20120119370

	<p>The interconnect structure 440 includes anodized insulation regions 414 and interconnects 412 defined by the anodized insulation regions 414. The interconnect structure 40 acting as an interposer is connected to the semiconductor device 110 via the bumps 112, but is not limited thereto.” Yoo, [0076].</p> <p>To the extent Plaintiff contends that Yoo fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the plurality of metal pillars among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	<p>Yoo discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 2 is a cross-sectional view showing another example of an interconnect structure 20 for use in a semiconductor package according to embodiments of the present inventive</p>

package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

concept. Referring to FIG. 2, the interconnects 22 of the interconnect structure 20 are thicker than the anodized insulation regions 24. According to an embodiment, the interconnects 22 protrude upward above and/or downward below the anodized insulation regions 24 by a predetermined height H in order to facilitate coupling of the interconnects 22 with other semiconductor devices, which is described in more detail with reference to FIG. 8. After forming the anodized insulation regions 24 using the anodizing process, etching is performed to remove a portion of a surface of the anodized insulation regions 24. That is, etching is performed to cause the interconnects 22 to protrude higher than the anodized insulation regions 24.” Yoo, [0042-0044].

Fig. 2

	<p>Yoo, FIG. 2</p> <p>“FIG. 12 is a cross-sectional view of a semiconductor package 106 a according to another embodiment of the present inventive concept. The semiconductor package 106 a according to the present embodiment is formed using a Package-On-Package (POP) packaging technique, but is not limited thereto. In the semiconductor package 106 a according to the present embodiment, an interconnect structure 220 is disposed between a first semiconductor package 144 and a package substrate 140 so as to create a space between the first semiconductor package 144 and the package substrate 140 in which a second semiconductor package 110 b is mounted. The first semiconductor package 144 includes chip- form semiconductor devices 110 and 110 a sequentially stacked on a package substrate 140 a. According to an embodiment, the chip- form semiconductor devices 110 and 110 a are connected to a package substrate 140 a by wire bonding 122, 122 a, but are not limited thereto. The interconnect structure 220 may serve as an interconnect in a POP semiconductor package as well. According to an embodiment, the first semiconductor package 144 exchanges signals with the outside through the interconnect structure 220 and the package substrate 140.” Yoo, [0069-0072].</p>

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Yu '671 - U.S. Patent No. 10026671

U.S. Patent No. 10026671 (“Yu '671”) is titled Substrate Design for Semiconductor Packages and Method of Forming Same and lists Chen-Hua Yu, Mirng-Ji Lii, Chien-Hsun Lee, Tsung-Ding Wang, Jung Wei Cheng, Ming-Che Liu, Hao-Cheng Hou, and Hung-Jen Lin as inventors. Yu '671 is assigned to Taiwan Semiconductor Manufacturing Company, Ltd. Yu '671 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the '202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Yu '671 is a U.S. patent that was filed August 29, 2014 and published August 20, 2015. Yu '671 claims priority to US 14/181,305 filed on February 14, 2014. Yu '671 is therefore prior art to the '202 patent under at least 35 U.S.C. § 102(a)(2).

The chart below provides representative examples of where each element of each Asserted Claim is found within Yu '671, or otherwise rendered obvious by disclosures and teachings of Yu '671, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Yu '671 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Yu '671 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the '202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Yu '671, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-36 - Invalidity of U.S. Patent No. 9859202 in view of Yu '671 - U.S. Patent No. 10026671

To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Yu '671 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Yu '671 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Yu '671 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Yu '671 discloses, either expressly or inherently, a structure.</p> <p>See, <i>e.g.</i>:</p> <p>“FIGS. 1A through 1N illustrate cross-sectional views of various intermediary stages of manufacturing an integrated circuit (IC) package 100 (see FIG. 1N) in accordance with various embodiments. FIG. 1A illustrates a plurality of dies 10. Dies 10 may include a substrate, active devices, and interconnect layers (not shown). The substrate may be a bulk silicon substrate although other semiconductor materials including group III, group IV, and group V elements may also be used. Alternatively, the substrate may be a silicon-on-insulator</p>

	<p>(SOI) substrate. Active devices such as transistors may be formed on the top surface of the substrate. Interconnect layers may be formed over the active devices and the substrate.” Yu '671, [2:63-3:8].</p> <div data-bbox="511 441 657 1365"></div> <p data-bbox="673 840 706 966">FIG. 1A</p> <p data-bbox="738 1155 771 1386">Yu '671, FIG. 1A.</p> <p data-bbox="820 178 1209 1302">“FIG. 3B illustrates the singulation of dies 10 (e.g., along scribe lines using a suitable pick and place tool) and the attachment of dies 10 to package substrate 30 through connectors 26. Notably, die 10 may be bonded to package substrate 30 prior to the attachment of dies 32 to package 300. The configuration of package substrate 30 in package 300 may be altered from the configuration in package 100. For example, cavity 36 may be disposed on an opposing side (rather than a same side) of package substrate 30. In package 300, die 10 may be bonded to a surface 30 A of package substrate 30. Surface 30 A may be substantially level. Package substrate 30 may further include surface 30 B (e.g., in cavity 36) and surface 30 C opposing die 10. Due to the inclusion of cavity 36, surfaces 30 B and 30 C may not be substantially level.” Yu '671, [8:27-8:42].</p>
--	---

Yu '671, FIG. 3B.

“However, as illustrated by the cross-sectional view of FIG. 9C, in package 800, connectors 26 may be replaced by an interposer 802, which is used to bond a bottom surface of RDLs 18 to a top surface of package substrate 30. Referring to FIG. 9A, interposer 802 includes a substrate 804 having conductive vias 814 extending therethrough.” Yu ’671 [13:9-13:15].

Yu '671, FIG. 9C.

“Subsequently, as illustrated by FIG. 11C, connectors 26 are used to bond RDLs 18 to a package substrate 30. FIG. 11C further illustrates the completed package 900 after the formation of additional features, such as, heat dissipation feature 40 and connectors 44. FIG. 12 illustrates a process flow 1000 of a method for forming a semiconductor device package in accordance with some embodiments. In step 1002, one or more RDLs (e.g., RDLs 18) are formed on a surface of a first die (e.g., die 10). The one or more RDLs may extend laterally past edges of the first die (e.g., over a molding compound), and thus such RDLs may also be referred to as fan-out RDLs.” Yu '671, [14:20-14:31].

FIG. 11C

Yu '671, FIG. 11C.

“In step 1008, a package substrate (e.g., package substrate 30) is bonded to the surface of the one or more RDLs using the connector element. In some embodiments, the package substrate and the one or more second dies are bonded to a same surface of the one or more RDLs, and the one or more second dies may be disposed between the package substrate and the one or more RDLs. In order to accommodate this configuration, in such embodiments, the connector element may have a greater vertical dimension than the one or more second dies.” Yu ’671, [14:47-14:56].

Appendix A-36 - Invalidity of U.S. Patent No. 9859202 in view of Yu ‘671 - U.S. Patent No. 10026671

	<p>“Thus, as described above, a package substrate may include a cavity. A first die may be bonded to the package substrate. Where the cavity may be on the same side of the package substrate as the first die or on an opposing side of the package substrate as the first die. One or more second dies may be bonded to the package substrate and the first die, and the second dies may be disposed in the cavity.” Yu ‘671, [14:57-14:63].</p>
[1.A] a bottom package substrate;	<p>Yu ‘671 discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Next, as illustrated by FIG. 1K, each die stack 10 / 32 may be bonded to a package substrate 30 through connectors 26. A reflow may be performed on connectors 26 to bond die stack 10 / 32 to package substrate 30. Subsequently, as illustrated by FIG. 1L, an underfill 46 may be dispensed between die stack 10 / 32 and package substrate 30 around connectors 26. Underfill 46 may be substantially similar to underfill 34. Package substrate 30 may be an interposer, a printed circuit board (PCB), and the like. For example, package substrate 30 may include a core 37 and one or more build-up layers 39 (labeled 39 A and 39 B) disposed on either side of core 37.” Yu ‘671, [5:13-5:24].</p>

Yu '671, FIG. 1K.

“FIG. 3B illustrates the singulation of dies 10 (e.g., along scribe lines using a suitable pick and place tool) and the attachment of dies 10 to package substrate 30 through connectors 26. Notably, die 10 may be bonded to package substrate 30 prior to the attachment of dies 32 to package 300. The configuration of package substrate 30 in package 300 may be altered from the configuration in package 100. For example, cavity 36 may be disposed on an opposing side (rather than a same side) of package substrate 30. In package 300, die 10 may be bonded to a surface 30 A of package substrate 30. Surface 30 A may be substantially level. Package substrate 30 may further include surface 30 B (e.g., in cavity 36) and surface 30 C opposing die 10. Due to the inclusion of cavity 36, surfaces 30 B and 30 C may not be substantially level.” Yu ’671, [8:27-8:42].

Yu '671, FIG. 3B.

“However, as illustrated by the cross-sectional view of FIG. 9C, in package 800, connectors 26 may be replaced by an interposer 802, which is used to bond a bottom surface of RDLs 18 to a top surface of package substrate 30. Referring to FIG. 9A, interposer 802 includes a substrate 804 having conductive vias 814 extending therethrough.” Yu ’671 [13:9-13:15].

Yu '671, FIG. 9A.

“Subsequently, as illustrated by FIG. 11C, connectors 26 are used to bond RDLs 18 to a package substrate 30. FIG. 11C further illustrates the completed package 900 after the formation of additional features, such as, heat dissipation feature 40 and connectors 44. FIG. 12 illustrates a process flow 1000 of a method for forming a semiconductor device package in accordance with some embodiments. In step 1002, one or more RDLs (e.g., RDLs 18) are formed on a surface of a first die (e.g., die 10). The one or more RDLs may extend laterally past edges of the first die (e.g., over a molding compound), and thus such RDLs may also be referred to as fan-out RDLs.” Yu '671, [14:20-14:31].

FIG. 11C

Yu '671, FIG. 11C.

“In step 1008, a package substrate (e.g., package substrate 30) is bonded to the surface of the one or more RDLs using the connector element. In some embodiments, the package

Appendix A-36 - Invalidity of U.S. Patent No. 9859202 in view of Yu '671 - U.S. Patent No. 10026671

	<p>substrate and the one or more second dies are bonded to a same surface of the one or more RDLs, and the one or more second dies may be disposed between the package substrate and the one or more RDLs. In order to accommodate this configuration, in such embodiments, the connector element may have a greater vertical dimension than the one or more second dies.” Yu ’671, [14:47-14:56].</p> <p>“Thus, as described above, a package substrate may include a cavity. A first die may be bonded to the package substrate. Where the cavity may be on the same side of the package substrate as the first die or on an opposing side of the package substrate as the first die. One or more second dies may be bonded to the package substrate and the first die, and the second dies may be disposed in the cavity.” Yu ’671, [14:57-14:63].</p> <p>To the extent Plaintiff contends that Yu ’671 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>Yu ’671 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p>

	 <p>FIG. 9A and FIG. 9C are cross-sectional views of a semiconductor device assembly. FIG. 9A shows a top package substrate 10 with a bottom surface 16 and a top surface 40. A spacer connector 18 is positioned between the bottom package substrate 10 and the top package substrate 30. The spacer connector 18 includes a central core 32 and side walls 812. The top package substrate 30 has a bottom surface 30 and a top surface 44. FIG. 9C shows a similar assembly with a spacer connector 18 between the bottom package substrate 10 and the top package substrate 30. The spacer connector 18 includes a central core 32 and side walls 812. The top package substrate 30 has a bottom surface 30 and a top surface 44.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Yu '671, FIG. 9C.</p> <p>To the extent Plaintiff contends that Yu '671 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p> <p>Yu '671 discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p>See, e.g.:</p>

Appendix A-36 - Invalidity of U.S. Patent No. 9859202 in view of Yu '671 - U.S. Patent No. 10026671

	<p>“Subsequently, die stacks 10 / 34 may be singulated for packaging in an IC package. The singulation of die stacks 10 / 34 may include the use of a suitable pick-and-place tool. Next, as illustrated by FIG. 1K, each die stack 10 / 32 may be bonded to a package substrate 30 through connectors 26. A reflow may be performed on connectors 26 to bond die stack 10 / 32 to package substrate 30. Subsequently, as illustrated by FIG. 1L, an underfill 46 may be dispensed between die stack 10 / 32 and package substrate 30 around connectors 26. Underfill 46 may be substantially similar to underfill 34. Package substrate 30 may be an interposer, a printed circuit board (PCB), and the like. For example, package substrate 30 may include a core 37 and one or more build-up layers 39 (labeled 39 A and 39 B) disposed on either side of core 37. Interconnect structures 38 (e.g., conductive lines, vias, and/or through vias) may be included in package substrate 30 to provide functional electrical purposes such as power, ground, and/or signal layers. Other configurations of package substrate 30 may also be used. Furthermore, package substrate 30 may include a cavity 36. Cavity 36 may not extend through package substrate 30. Rather, a portion or all of build-up layers 39 A (e.g., build-up layers 39 disposed on a same side of core 37 as die stack 10 / 32) may be patterned to form cavity 36.” Yu '671, [5:9-5:33].</p> <p>“In packages 600 and 650, dies 32 and package substrate 30 may be bonded to a same surface of RDLs 18, which electrically connects dies 32, package substrate 30, and die 10. In such embodiments, dies 32 may be disposed between RDLs 18 and package substrate 30. Connectors 26 (e.g., bonding RDLs 18 to package substrate 30) maybe elongated to provide a sufficient standoff height to accommodate the vertical dimension of dies 32. For example, connectors 26 may have a vertical dimension that is greater than the combined vertical dimensions of dies 32 and connectors 24 (used to bond dies 32 to RDLs 18).” Yu '671, [10:12-10:22].</p>
--	---

	<p>“Each connector 26 may comprise one or more conductive pillars 27 comprising copper, nickel, gold, aluminum, combinations thereof, and the like, for example. In some embodiments (e.g., as illustrated by FIG. 6A), each connector 26 may include a single conductive pillar 27 extending from a bottom surface of RDLs 18. A solder region 26 ” (e.g., a solder ball) may be disposed on conductive pillar 27, and solder region 26 ” may contact and electrically connect to a contact pad on package substrate 30. In other embodiments (e.g., as illustrated by FIG. 6B), each connector 26 may include a first conductive pillar 27 ’ and a second conductive pillar 27 ”. The first conductive pillar 27 ’ extends from a bottom surface of RDLs 18. The second conductive pillar 27 ” extends from a top surface of package substrate 30. In such embodiments, solder ball 26 ” may be disposed between and contact the two conductive pillars 27 ’ and 27 ”. In packages 600 and 650, conductive pillars 27, 27 ’, and 27 ” may be elongated and relatively large compared to solder region 26 ”.” Yu ’671, [10:23-10:41].</p> <p>“FIG. 7 illustrates a cross-sectional view of semiconductor device package 700. Package 700 may be substantially similar to package 600 or 650 where like reference numerals represent like elements. However, connectors 26 have an alternative configuration in package 700. For example, connectors 26 in package 700 may comprise solder regions 702 and 704, and such connectors 26 are used to bond a bottom surface of RDLs 18 to a top surface of package substrate 30. RDLs 18 may provide electrical connection between die 10 (e.g., a logic die), dies 32, and package substrate 30. Similarly to packages 600 and 650, connectors 26 may have a vertical dimension that is sufficiently large to accommodate dies 32 between RDLs 18 and package substrate 30.” Yu ’671, [10:58-11:3].</p>
--	---

FIG. 7

Yu '671, FIG. 7.

“Referring to FIG. 9A, interposer 802 includes a substrate 804 having conductive vias 814 extending therethrough. Substrate 804 may comprise silicon and may or may not further comprise filler materials (e.g., e.g., silica filler, glass filler, aluminum oxide, silicon oxide, and the like). Conductive vias 814 may comprise copper, nickel, gold, aluminum combinations thereof, and the like, and conductive vias 814 may extend from a top surface to a bottom surface of substrate 804. Contact pads 806 (e.g., comprising a conductive material) may be formed on top and bottom surfaces of substrate 804 on conductive vias 814. In the illustrated embodiment, interposer 802 may be laminated to a bottom surface of RDLs 18 (as indicated by arrows 810), and contact pads 806 may be electrically connected to conductive features (not separately illustrated) in RDLs 18. Such conductive features may further provide electrical connection between interposer 802 and dies 10 / 32. Interposer 802

may have a suitable configuration and vertical dimension to accommodate dies 32 between RDLs 18 and package substrate 30.” Yu ’671, [13:14-13:33].

Yu ’671, FIG. 9A.

“In FIG. 11B, interposer 802 is bonded to connectors 26 with solder regions 26 ” extending through substrate 804. Interposer 802 may be attached to solder regions 26 ” using a reflow process, for example. In some embodiments, solder regions 26 ” may further extend past a bottom surface of interposer 802. Furthermore, contact pads 806 may be electrically connected to connectors 26. Connectors 26 bonds interposer 802 to RDLs 18, and dies 32 may be disposed in a through hole 808 of interposer 802. Subsequently, as illustrated by FIG. 11C, connectors 26 are used to bond RDLs 18 to a package substrate 30.” Yu ’671, [14:11-14:22].

To the extent Plaintiff contends that Yu ’671 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the

Claim 2, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p>	<p>Yu '671 discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Although a particular configuration of dies 10 and RDLs 18 is illustrated, alternative configurations may be applied (e.g., having a different number of RDLs 18 and/or connectors 24 / 26) in alternative embodiments. In FIG. 1H, a plurality of dies 32 may be bonded to dies 10 through connectors 24 (e.g., by reflowing connectors 24) to form die stacks 10 / 32. Dies 32 may be electrically connected to active devices in dies 10 through RDLs 18. In some embodiments, die stack 10 / 32 may include memory dies 32 (e.g., dynamic random access memory (DRAM) dies) bonded to dies 10, which may be logic dies providing control functionality for memory dies 32. In alternative embodiments, other types of dies may be included in dies stacks 10 / 32. Next, as illustrated in FIG. 1I, underfill 34 may be dispensed between dies 32 and RDLs 18 around connectors 24.” Yu '671, [4:56-5:4].</p>

	<p>“Subsequently, die stacks 10 / 34 may be singulated for packaging in an IC package. The singulation of die stacks 10 / 34 may include the use of a suitable pick-and-place tool. Next, as illustrated by FIG. 1K, each die stack 10 / 32 may be bonded to a package substrate 30 through connectors 26. A reflow may be performed on connectors 26 to bond die stack 10 / 32 to package substrate 30. Subsequently, as illustrated by FIG. 1L, an underfill 46 may be dispensed between die stack 10 / 32 and package substrate 30 around connectors 26. Underfill 46 may be substantially similar to underfill 34. Package substrate 30 may be an interposer, a printed circuit board (PCB), and the like. For example, package substrate 30 may include a core 37 and one or more build-up layers 39 (labeled 39 A and 39 B) disposed on either side of core 37. Interconnect structures 38 (e.g., conductive lines, vias, and/or through vias) may be included in package substrate 30 to provide functional electrical purposes such as power, ground, and/or signal layers. Other configurations of package substrate 30 may also be used. Furthermore, package substrate 30 may include a cavity 36. Cavity 36 may not extend through package substrate 30. Rather, a portion or all of build-up layers 39 A (e.g., build-up layers 39 disposed on a same side of core 37 as die stack 10 / 32) may be patterned to form cavity 36. As illustrated in FIG. 1L, cavity 36 may not affect the configuration of core 37 and/or build-up layers 39 B (e.g., build-up layers 39 disposed on an opposite side of core 37 as die stack 10 / 32).” Yu '671, [5:9-5:36].</p> <p>“In FIG. 4H, a build-up layer 39 ' may be laminated over conductive lines 38 ' (shown in ghost). The lamination of build-up layer 39 ' may include a curing process (e.g., a heat treatment or pressing process). Openings 62 may be patterned in build-up layer 39 ' (e.g., through laser drilling), and openings 62 may be aligned with conductive lines 38 '. As illustrated by FIG. 4I, additional conductive lines 38 " may be formed over build-up layer 39 ' using a substantially similar process as illustrated by FIGS. 4E through 4H for forming conductive lines 38 ' (e.g., conductive layer plating and patterning). The conductive layer</p>
--	---

Appendix A-36 - Invalidity of U.S. Patent No. 9859202 in view of Yu '671 - U.S. Patent No. 10026671

	<p>plating process used for forming conductive lines 38 " may also plate openings 62 (not illustrated in FIG. 4H), thus forming conductive vias (not illustrated) for interconnecting conductive lines 38 ' and 38 " through build-up layer 39 '. Conductive lines 38 " may be patterned to align with conductive vias formed in openings 62. The process steps illustrated by FIGS. 4E through 4I may be repeated as desired to form any number of build-up layers (e.g., power, ground, and/or signal layers) in package substrate 30. Furthermore, although FIGS. 4E through 4I only illustrate the formation of interconnect structures 38 /build-up layers 39 on one side of core 37, similar processes may be applied to form of interconnect structures 38 /build-up layers 39 on an opposing side of core 37. FIG. 4J a solder resist 64 may be formed over build-up layers 39 (e.g., on both sides of core 37). Next, as illustrated by FIG. 4K, cavity 36 may be patterned in package substrate 30. The formation of cavity 36 may include patterning solder resist 63 (e.g., using an exposure technique) and a laser etching build-up layers 39 using material 54 ' as a laser stop layer. Thus, cavity 36 may not extend through package substrate 30." Yu '671, [6:17-6:48].</p> <p>"Referring back to FIG. 1L, when die stack 10 / 34 is bonded to package substrate 30, dies 32 may be disposed, at least partially, in cavity 36. In a top down view of package 100 (not shown), cavity 36 may encircle dies 32. Thus, the bonded structure may advantageously have a relatively small form factor and higher bandwidth." Yu '671, [6:58-6:63].</p> <p>"FIG. 3C illustrates the formation of various other features of package 300. For example, a reflow may be performed on connectors 26 and underfill 46 may be dispensed around connectors 26. Connectors 44 may be attached to surface 30 C of package substrate 30 opposite die 10. Furthermore, a heat dissipation feature 40 may be disposed over die 10 /molding compound 16. An interfacing material 42 (e.g., including a TIM and/or adhesive material) may be disposed between heat dissipation feature 40 and die 10 /molding compound 16." Yu '671, [8:50-8:59].</p>
--	--

Yu '671, FIG. 3C.

“In some embodiments, die 32 may be disposed in a cavity formed in substrate 30 (as illustrated by FIG. 5A). In other embodiments, die 32 may be disposed in a through-hole 74 in substrate 30 (as illustrated by FIG. 5B). Through hole 74 may be formed in substrate 30, for example, using a laser drilling process.” Yu '671, [9:46-9:51].

To the extent Plaintiff contends that Yu '671 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-36 - Invalidity of U.S. Patent No. 9859202 in view of Yu '671 - U.S. Patent No. 10026671

Claim 4, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p>	<p>Yu '671 discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“In other embodiments (e.g., as illustrated by FIG. 6B), each connector 26 may include a first conductive pillar 27 ' and a second conductive pillar 27 ". The first conductive pillar 27 ' extends from a bottom surface of RDLs 18. The second conductive pillar 27 " extends from a top surface of package substrate 30.” Yu '671, [10:31-10:36].</p> <p>“In such embodiments, solder ball 26 " may be disposed between and contact the two conductive pillars 27 ' and 27 ". In packages 600 and 650, conductive pillars 27, 27 ', and 27 " may be elongated and relatively large compared to solder region 26 ".” Yu '671, [10:36-10:41].</p> <p>“Furthermore, in FIG. 6B, each of the first and second conductive pillars 27 ' and 27 " (of package 650) may account for at least about 20% to about 50% of the vertical dimension of each respective connector 26. In some embodiments, each conductive pillar 27 (in FIG. 6A) and conductive pillars 27 ' and 27 " (in FIG. 6B) may have a vertical dimension of about 100 μm or more.” Yu '671, [10:46-10:52].</p>

FIG. 6B

Yu '671, FIG. 6B.

“Referring to FIG. 9A, interposer 802 includes a substrate 804 having conductive vias 814 extending therethrough. Substrate 804 may comprise silicon and may or may not further comprise filler materials (e.g., e.g., silica filler, glass filler, aluminum oxide, silicon oxide, and the like). Conductive vias 814 may comprise copper, nickel, gold, aluminum combinations thereof, and the like, and conductive vias 814 may extend from a top surface to a bottom surface of substrate 804. Contact pads 806 (e.g., comprising a conductive material) may be formed on top and bottom surfaces of substrate 804 on conductive vias 814. In the illustrated embodiment, interposer 802 may be laminated to a bottom surface of RDLs 18 (as indicated by arrows 810), and contact pads 806 may be electrically connected to conductive features (not separately illustrated) in RDLs 18.” Yu ’671, [13:14-13:28].

“Subsequently, package substrate 30 may be bonded to a bottom surface of interposer 802 using connectors 812 (e.g., solder balls), which may be aligned with conductive vias 814.” Yu ’671, [13:38-13:41].

	<p>To the extent Plaintiff contends that Yu '671 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Yu '671 discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1E illustrates the formation of redistribution layers (RDLs) 18 over dies 10 and molding compound 16. As illustrated by FIG. 1E, RDLs 18 may extend laterally past edges of dies 10 over molding compound 16. RDLs 18 may include interconnect structures 20 formed in one or more polymer layers 22. Polymer layers 22 may be formed of any suitable material (e.g., polyimide (PI), polybenzoxazole (PBO), benzocyclobuten (BCB), epoxy, silicone, acrylates, nano-filled pheno resin, siloxane, a fluorinated polymer, polynorbornene, and the like) using any suitable method, such as, a spin-on coating technique, and the like. Interconnect structures 20 (e.g., conductive lines and/or vias) may be formed in polymer</p>

layers 22 and electrically connected to contact layer 12 of dies 10. The formation of interconnect structures 20 may include patterning polymer layers 22 (e.g., using a combination of photolithography and etching processes) and forming interconnect structures 20 (e.g., depositing a seed layer and using a mask layer to define the shape of interconnect structures 20) in the patterned polymer layers 22. Interconnect structures 20 may be formed of copper or a copper alloy although other metals such as aluminum, gold, and the like may also be used. Interconnect structures 20 may be electrically connected to contact pads in contact layer 12 (and as a result, active devices) in dies 10.” Yu ’671, [3:61-4:17].

FIG. 1E

Yu ’671, FIG. 1E.

“As illustrated by FIGS. 4E through 4I, one or more build-up layers 39 having interconnect structures 38 may be formed on either side of core 37. The formation of build-up layers 39 may include plating core 37 with a conductive layer 58, for example, comprising copper as illustrated by FIG. 4E. Next, as illustrated by FIGS. 4F and 4G, conductive layer 58 may be patterned to form conductive lines 38’. The patterning of conductive layer 58 may include laminating a dry film 60 (e.g., a photoresist) over conductive layer 58, patterning dry film 60 (e.g., using suitable exposure techniques), and etching conductive layer 58 using the patterned dry film 60 as a mask. Subsequently, dry film 60 may be removed. In FIG. 4H, a build-up layer 39’ may be laminated over conductive lines 38’ (shown in ghost). The

	<p>lamination of build-up layer 39 ' may include a curing process (e.g., a heat treatment or pressing process). Openings 62 may be patterned in build-up layer 39 ' (e.g., through laser drilling), and openings 62 may be aligned with conductive lines 38 '. As illustrated by FIG. 4I, additional conductive lines 38 " may be formed over build-up layer 39 ' using a substantially similar process as illustrated by FIGS. 4E through 4H for forming conductive lines 38 ' (e.g., conductive layer plating and patterning). The conductive layer plating process used for forming conductive lines 38 " may also plate openings 62 (not illustrated in FIG. 4H), thus forming conductive vias (not illustrated) for interconnecting conductive lines 38 ' and 38 " through build-up layer 39 '. Conductive lines 38 " may be patterned to align with conductive vias formed in openings 62." Yu '671, [6:4-6:33].</p> <div data-bbox="771 955 1019 1318"></div> <p>FIG. 4E</p> <p>Yu '671, FIG. 4E.</p> <p>“FIGS. 6A and 6B illustrate cross-sectional views of semiconductor device packages 600 and 650, respectively. Packages 600 and 650 may be substantially similar to package 100 where like reference numerals represent like elements. Package substrates 30 in packages 600 and 650 may not include any cavities or through holes disposed therein. Rather, both top and bottom surfaces of package substrate 30 may be substantially level. In packages 600 and 650,</p>
--	---

	<p>dies 32 and package substrate 30 may be bonded to a same surface of RDLs 18, which electrically connects dies 32, package substrate 30, and die 10. In such embodiments, dies 32 may be disposed between RDLs 18 and package substrate 30. Connectors 26 (e.g., bonding RDLs 18 to package substrate 30) maybe elongated to provide a sufficient standoff height to accommodate the vertical dimension of dies 32. For example, connectors 26 may have a vertical dimension that is greater than the combined vertical dimensions of dies 32 and connectors 24 (used to bond dies 32 to RDLs 18). Each connector 26 may comprise one or more conductive pillars 27 comprising copper, nickel, gold, aluminum, combinations thereof, and the like, for example. In some embodiments (e.g., as illustrated by FIG. 6A), each connector 26 may include a single conductive pillar 27 extending from a bottom surface of RDLs 18. A solder region 26 " (e.g., a solder ball) may be disposed on conductive pillar 27, and solder region 26 " may contact and electrically connect to a contact pad on package substrate 30. In other embodiments (e.g., as illustrated by FIG. 6B), each connector 26 may include a first conductive pillar 27 ' and a second conductive pillar 27 ". The first conductive pillar 27 ' extends from a bottom surface of RDLs 18. The second conductive pillar 27 " extends from a top surface of package substrate 30. In such embodiments, solder ball 26 " may be disposed between and contact the two conductive pillars 27 ' and 27 ". Yu '671, [10:4-10:38].</p>

Yu '671, FIG. 6A & 6B.

“Referring to FIG. 9A, interposer 802 includes a substrate 804 having conductive vias 814 extending therethrough. Substrate 804 may comprise silicon and may or may not further comprise filler materials (e.g., e.g., silica filler, glass filler, aluminum oxide, silicon oxide, and the like). Conductive vias 814 may comprise copper, nickel, gold, aluminum combinations thereof, and the like, and conductive vias 814 may extend from a top surface to a bottom surface of substrate 804. Contact pads 806 (e.g., comprising a conductive material) may be formed on top and bottom surfaces of substrate 804 on conductive vias 814. In the illustrated embodiment, interposer 802 may be laminated to a bottom surface of RDLs 18 (as indicated by arrows 810), and contact pads 806 may be electrically connected to conductive features (not separately illustrated) in RDLs 18. Such conductive features may

Appendix A-36 - Invalidity of U.S. Patent No. 9859202 in view of Yu ‘671 - U.S. Patent No. 10026671

	<p>further provide electrical connection between interposer 802 and dies 10 / 32. Interposer 802 may have a suitable configuration and vertical dimension to accommodate dies 32 between RDLs 18 and package substrate 30. For example, interposer 802 may include a through-hole extending therethrough as illustrated by the top down view of interposer 802 provided by FIG. 9B. When interposer 802 is bonded to RDLs 18, dies 32 may be (at least partially) disposed in through-hole 808. Subsequently, package substrate 30 may be bonded to a bottom surface of interposer 802 using connectors 812 (e.g., solder balls), which may be aligned with conductive vias 814.” Yu ‘671, [13:14-13:41].</p> <p>“FIGS. 10A through 10D illustrate cross-sectional views of forming a semiconductor device package 850 according to alternative embodiments. Package 850 may be substantially similar to package 800 where like reference numerals represent like elements. In package 850, interposer 802 may be bonded to RDLs 18 by connectors 26 rather than laminated on RDLs 18. In some embodiments (e.g., as illustrated by FIG. 10A), interposer 802 may be bonded to RDLs 18 prior to the attachment of package substrate 30. In alternative embodiments (e.g., as illustrated by FIG. 10B), interposer 802 may be first bonded to package substrate 30 (e.g., using connectors 812 and/or a lamination process), and die 10 /RDLs 18 are subsequently attached. FIG. 10C illustrates the bonded package 850 having die 10, RDLs 18, interposer 802, dies 32 disposed in through hole 808 of interposer 802, and package substrate 30.” Yu ‘671, [13:46-13:61].</p>
--	---

FIG. 10B

Yu '671, FIG. 10A & 10B.

“FIGS. 11A through 11C illustrate cross-sectional views of forming a semiconductor device package 900 according to alternative embodiments. Package 900 may be substantially similar to package 800 where like reference numerals represent like elements. In package 900, interposer 802 may not include conductive vias 814 (see FIG. 9A). Rather, at least a portion of connectors 26 may extend through openings 902 in interposer 802 to bond RDLs 18 to package substrate 30. For example, referring to FIG. 11A, an interposer 802 is provided having through holes 902 extending through substrate 804. Also provided are connectors 26

disposed on a bottom surface of RDLs 18. Connectors 26 may include UBMs 26' and solder regions 26". In some embodiments, solder regions 26" may have a sufficient vertical dimension to extend through openings 902 in interposer 802. In FIG. 11B, interposer 802 is bonded to connectors 26 with solder regions 26" extending through substrate 804. Interposer 802 may be attached to solder regions 26" using a reflow process, for example. In some embodiments, solder regions 26" may further extend past a bottom surface of interposer 802. Furthermore, contact pads 806 may be electrically connected to connectors 26. Connectors 26 bonds interposer 802 to RDLs 18, and dies 32 may be disposed in a through hole 808 of interposer 802. Subsequently, as illustrated by FIG. 11C, connectors 26 are used to bond RDLs 18 to a package substrate 30." Yu '671, [13:64-14:22].

Yu '671, FIG. 11A.

To the extent Plaintiff contends that Yu '671 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-36 - Invalidity of U.S. Patent No. 9859202 in view of Yu '671 - U.S. Patent No. 10026671

Claim 9, U.S. Patent No. 9859202

Claim Limitation	Disclosure
<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of metal pillars of the top package substrate via the corresponding top metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars are connected to corresponding top ends of the plurality of metal pillars of the top package substrate via the corresponding top metal pads of the spacer connector.</p>	<p>Yu '671 discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars are connected to corresponding top ends of the plurality of metal pillars of the top package substrate via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“In FIG. 4A, core 37 is provided. Core 37 may be a metal-clad insulated base material such as a copper-clad epoxy-impregnated glass-cloth laminate, a copper-clad polyimide-impregnated glass-cloth laminate, or the like. As illustrated by FIG. 4B, cavity 36 and/or through holes 52 may be formed in core 37, for example, using a mechanical drilling or milling process. The mechanical drilling/milling process may extend through holes 52 through core 37. However, the mechanical drilling/milling process may not extend cavity 36 through core 37. Next, in FIG. 4C, surfaces of through hole 52 and cavity 36 may be plated with metallic material 54, for example, using an electrochemical plating process. In some embodiments, metallic material 54 may comprise copper. The plating of through holes 52 may form through vias for providing electrical connections from one side of core 37 to another.” Yu '671, [5:47-5:63].</p>

Yu '671, FIG. 4A.

“Next, as illustrated by FIGS. 4F and 4G, conductive layer 58 may be patterned to form conductive lines 38'. The patterning of conductive layer 58 may include laminating a dry film 60 (e.g., a photoresist) over conductive layer 58, patterning dry film 60 (e.g., using suitable exposure techniques), and etching conductive layer 58 using the patterned dry film 60 as a mask. Subsequently, dry film 60 may be removed. In FIG. 4H, a build-up layer 39' may be laminated over conductive lines 38' (shown in ghost). The lamination of build-up layer 39' may include a curing process (e.g., a heat treatment or pressing process). Openings 62 may be patterned in build-up layer 39' (e.g., through laser drilling), and openings 62 may be aligned with conductive lines 38'. As illustrated by FIG. 4I, additional conductive lines 38'' may be formed over build-up layer 39' using a substantially similar process as illustrated by FIGS. 4E through 4H for forming conductive lines 38' (e.g., conductive layer plating and

	<p>patterning). The conductive layer plating process used for forming conductive lines 38 " may also plate openings 62 (not illustrated in FIG. 4H), thus forming conductive vias (not illustrated) for interconnecting conductive lines 38 ' and 38 " through build-up layer 39 '. Conductive lines 38 " may be patterned to align with conductive vias formed in openings 62. The process steps illustrated by FIGS. 4E through 4I may be repeated as desired to form any number of build-up layers (e.g., power, ground, and/or signal layers) in package substrate 30. Furthermore, although FIGS. 4E through 4I only illustrate the formation of interconnect structures 38 /build-up layers 39 on one side of core 37, similar processes may be applied to form of interconnect structures 38 /build-up layers 39 on an opposing side of core 37." Yu '671, [6:9-6:40].</p> <p>"Referring to FIG. 9A, interposer 802 includes a substrate 804 having conductive vias 814 extending therethrough. Substrate 804 may comprise silicon and may or may not further comprise filler materials (e.g., e.g., silica filler, glass filler, aluminum oxide, silicon oxide, and the like). Conductive vias 814 may comprise copper, nickel, gold, aluminum combinations thereof, and the like, and conductive vias 814 may extend from a top surface to a bottom surface of substrate 804. Contact pads 806 (e.g., comprising a conductive material) may be formed on top and bottom surfaces of substrate 804 on conductive vias 814. In the illustrated embodiment, interposer 802 may be laminated to a bottom surface of RDLs 18 (as indicated by arrows 810), and contact pads 806 may be electrically connected to conductive features (not separately illustrated) in RDLs 18. Such conductive features may further provide electrical connection between interposer 802 and dies 10 / 32. Interposer 802 may have a suitable configuration and vertical dimension to accommodate dies 32 between RDLs 18 and package substrate 30. For example, interposer 802 may include a through-hole extending therethrough as illustrated by the top down view of interposer 802 provided by FIG. 9B. When interposer 802 is bonded to RDLs 18, dies 32 may be (at least partially) disposed in through-hole 808. Subsequently, package substrate 30 may be bonded to a bottom</p>
--	--

	<p>surface of interposer 802 using connectors 812 (e.g., solder balls), which may be aligned with conductive vias 814.” Yu ‘671, [13:14-13:41].</p> <p>“FIGS. 10A through 10D illustrate cross-sectional views of forming a semiconductor device package 850 according to alternative embodiments. Package 850 may be substantially similar to package 800 where like reference numerals represent like elements. In package 850, interposer 802 may be bonded to RDLs 18 by connectors 26 rather than laminated on RDLs 18. In some embodiments (e.g., as illustrated by FIG. 10A), interposer 802 may be bonded to RDLs 18 prior to the attachment of package substrate 30. In alternative embodiments (e.g., as illustrated by FIG. 10B), interposer 802 may be first bonded to package substrate 30 (e.g., using connectors 812 and/or a lamination process), and die 10 /RDLs 18 are subsequently attached. FIG. 10C illustrates the bonded package 850 having die 10, RDLs 18, interposer 802, dies 32 disposed in through hole 808 of interposer 802, and package substrate 30.” Yu ‘671, [13:46-13:61].</p>
--	---

Yu '671, FIG. 10A & 10B.

“FIGS. 11A through 11C illustrate cross-sectional views of forming a semiconductor device package 900 according to alternative embodiments. Package 900 may be substantially similar to package 800 where like reference numerals represent like elements. In package 900, interposer 802 may not include conductive vias 814 (see FIG. 9A). Rather, at least a portion of connectors 26 may extend through openings 902 in interposer 802 to bond RDLs 18 to package substrate 30. For example, referring to FIG. 11A, an interposer 802 is provided having through holes 902 extending through substrate 804. Also provided are connectors 26 disposed on a bottom surface of RDLs 18. Connectors 26 may include UBMs 26 ' and solder regions 26 ". In some embodiments, solder regions 26 " may have a sufficient vertical

Appendix A-37 - Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

E.D. Tex. Case No. 2:25-CV-118

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

U.S. Patent No.11107798 (“Yu ’798”) is titled Semiconductor Packages and Methods of Forming the Same and lists Chen-Hua Yu, Jing-Cheng Lin, and Po-Hao Tsai as inventors. Yu ’798 is assigned to Taiwan Semiconductor Manufacturing Company, Ltd. Yu ’798 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Yu ’798 is a U.S. patent that was filed May 18, 2020 and published September 3, 2020. Yu ’798 claims priority to US 9,543,170 filed on August 22, 2014. Yu ’798 is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(2).

The chart below provides representative examples of where each element of each Asserted Claim is found within Yu ’798, or otherwise rendered obvious by disclosures and teachings of Yu ’798, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Yu ’798 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Yu ’798 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Yu ’798, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-37 - Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Yu '798 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Yu '798 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Yu '798 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Yu '798 discloses, either expressly or inherently, a structure.</p> <p>See, e.g.:</p> <p>“FIG. 2C illustrates the semiconductor packages 300 being singulated. The semiconductor packages 300 may be removed from the frame 138 and placed over a structure 232, such as a dicing tape. The semiconductor packages 300 may be singulated by a cutting tool 234, such as a die saw, a laser, the like, or a combination thereof. The numbers of the first packages 100 and the second packages 200 in FIGS. 1A through 1J and FIGS. 2A through 2C are only for illustrative purposes and are not limiting.” Yu '798, [9:48-9:56].</p>

FIG. 2C

Yu '798, FIG. 2C.

“FIGS. 3A through 3C illustrate cross-sectional views of semiconductor packages 300 in accordance with some embodiments.” Yu '798, [9:59-9:61].

	<div data-bbox="324 714 763 1323"></div> <div data-bbox="779 1008 812 1113"><p>FIG. 3A</p></div> <div data-bbox="844 1155 876 1386"><p>Yu '798, FIG. 3A.</p></div> <div data-bbox="925 178 1039 1302"><p>“FIG. 8 illustrates a cross-sectional view of a semiconductor package 400 in accordance with some embodiments. The semiconductor package 400 includes the semiconductor package 300 being mounted to a package substrate 402.” Yu '798, [12:27-12:30].</p></div>

FIG. 8

Yu '798, FIG. 8.

“An embodiment is a method including forming a first package. The forming the first package including forming a first dielectric layer over a carrier substrate, forming a first electrical connector over the first dielectric layer, attaching a first die adjacent the first electrical connector and over the first dielectric layer, forming a redistribution layer over the first die and the first electrical connector, forming a second electrical connector over the redistribution layer, the second electrical connector being coupled to at least one of the first die and the first electrical connector, removing the carrier substrate to expose the first

Appendix A-37 - Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

	<p>dielectric layer, and removing the first dielectric layer to expose portions of the first die and the first electrical connector.” Yu ’798, [13:34-13:46].</p> <p>“A further embodiment is a semiconductor package including a first package. The first package including a first die, an encapsulant surrounding the first die, and a through package via extending through the encapsulant. The semiconductor package further including a second package comprising a second die, the second package being bonded to the first package by a set of connectors, and an underfill between the first package and the second package and surrounding the set of connectors, the underfill having sidewalls that are substantially perpendicular to a backside surface of the first die.” Yu ’798, [13:61-14:3].</p> <p>“A further embodiment is a package including a first package. The first package includes a first die, an encapsulant extending along sidewalls of the first die, and a plurality of conductive columns extending through the encapsulant. The package further includes a second package bonded to the first package.” Yu ’798, [14:4-14:9].</p>
[1.A] a bottom package substrate;	<p>Yu ’798 discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1F illustrates forming a redistribution layer 131 over the dies 120, the TTVs 110, and the molding material 130. The redistribution layer 131 may include one or more metal layers, sometimes referred to as M 1 and/or M N, wherein the metal layer M 1 is the metal layer immediately adjacent the dies 120, and metal layer M N (sometimes referred to as the top metal layer M N) is the metal layer furthest from the dies 120. Throughout the description, the term “metal layer” refers to the collection of metal lines 132 in the same layer. The redistribution layer 131 may include one or more passivation layers 134, wherein the one or</p>

	<p>more metal layers (M 1 through M N) are disposed in the one or more passivation layers 134. The passivation layers 134 can be silicon nitride, silicon carbide, silicon oxide, low-k dielectrics such as carbon doped oxides, extremely low-k dielectrics such as porous carbon doped silicon dioxide, a polymer, such as an epoxy, polyimide, BCB, PBO, solder resist (SR), the like, or a combination thereof, although other relatively soft, often organic, dielectric materials can also be used, and deposited by CVD, PVD, ALD, a spin-on-dielectric process, a lamination process, the like, or a combination thereof. The passivation layers 134 may undergo a curing step to cure the passivation layers 134, wherein the curing may be a thermal curing, a UV curing, the like, or a combination thereof.” Yu ’798, [5:16-5:41].</p> <div data-bbox="776 499 950 1346"><p>The diagram shows a cross-section of a semiconductor device. It features a substrate 202 at the bottom, which is a semiconductor material like silicon or germanium. Above the substrate is a series of alternating layers: a conductive layer 130, a dielectric layer 131, another conductive layer 132, and a final dielectric layer 134. The passivation layers 134 are shown as thicker regions that encapsulate the underlying conductive and dielectric layers. The layers are labeled with reference numerals 130, 131, 132, and 134.</p></div> <p style="text-align: center;">FIG. 1F</p> <p>Yu ’798, FIG. 1F.</p> <p>“The substrate 202 may be made of a semiconductor material such as silicon, germanium, diamond, or the like. Alternatively, compound materials such as silicon germanium, silicon</p>

Appendix A-37 - Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

	<p>carbide, gallium arsenic, indium arsenide, indium phosphide, silicon germanium carbide, gallium arsenic phosphide, gallium indium phosphide, combinations of these, and the like, may also be used. Additionally, the substrate 202 may be a silicon-on-insulator (SOI) substrate. Generally, an SOI substrate includes a layer of a semiconductor material such as epitaxial silicon, germanium, silicon germanium, SOI, silicon germanium on insulator (SGOI), or combinations thereof. The substrate 202 is, in one alternative embodiment, based on an insulating core such as a fiberglass reinforced resin core. One example core material is fiberglass resin such as FR4. Alternatives for the core material include bismaleimide-triazine (BT) resin, or alternatively, other printed circuit board (PCB) materials or films. Build up films such as Ajinomoto build-up film (ABF) or other laminates may be used for substrate 202. The substrate 202 may be referred to as a package substrate 202.” Yu ’798, [7:38-7:57].</p> <p>“The substrate 202 may have bond pads 204 on a first side the substrate 202 to couple to the stacked dies 212, and bond pads 206 on a second side of the substrate 202, the second side being opposite the first side of the substrate 202, to couple to the conductive connectors 210.” Yu ’798, [8:10-8:14].</p> <p>“FIG. 8 illustrates a cross-sectional view of a semiconductor package 400 in accordance with some embodiments. The semiconductor package 400 includes the semiconductor package 300 being mounted to a package substrate 402. The semiconductor package 300 may be any of the embodiments of the semiconductor package 300 described above. The semiconductor package 300 is mounted to the package substrate 402 using the conductive connectors 136.” Yu ’798, [12:27-12:34].</p>
--	---

FIG. 8

Yu '798, FIG. 8.

“The package substrate 402 may be made of a semiconductor material such as silicon, germanium, diamond, or the like. Alternatively, compound materials such as silicon germanium, silicon carbide, gallium arsenic, indium arsenide, indium phosphide, silicon germanium carbide, gallium arsenic phosphide, gallium indium phosphide, combinations of these, and the like, may also be used. Additionally, the package substrate 402 may be a SOI substrate. Generally, an SOI substrate includes a layer of a semiconductor material such as epitaxial silicon, germanium, silicon germanium, SOI, SGOI, or combinations thereof. The

Appendix A-37 - Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

	<p>package substrate 402 is, in one alternative embodiment, based on an insulating core such as a fiberglass reinforced resin core. One example core material is fiberglass resin such as FR4. Alternatives for the core material include bismaleimide-triazine BT resin, or alternatively, other PCB materials or films. Build up films such as ABF or other laminates may be used for package substrate 402.” Yu '798, [12:35-12:52].</p> <p>“The package substrate 402 may also include metallization layers and vias 404. The metallization layers 404 may be formed over the active and passive devices and are designed to connect the various devices to form functional circuitry. The metallization layers 404 may be formed of alternating layers of dielectric (e.g., low-k dielectric material) and conductive material (e.g., copper) with vias interconnecting the layers of conductive material and may be formed through any suitable process (such as deposition, damascene, dual damascene, or the like).” Yu '798, [12:60-13:2].</p> <p>To the extent Plaintiff contends that Yu '798 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.B] a top package substrate stacked on top of the bottom package substrate;	<p>Yu '798 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Referring to FIG. 2A, second packages 200 are bonded to the first package 100 with a set of conductive connectors 210 forming semiconductor packages 300. The second packages 200 each include a substrate 202 and one or more stacked dies 212 (212 A and 212 B)</p>

coupled to the substrate 202. The substrate 202 may be made of a semiconductor material such as silicon, germanium, diamond, or the like. Alternatively, compound materials such as silicon germanium, silicon carbide, gallium arsenic, indium arsenide, indium phosphide, silicon germanium carbide, gallium arsenic phosphide, gallium indium phosphide, combinations of these, and the like, may also be used. Additionally, the substrate 202 may be a silicon-on-insulator (SOI) substrate.” Yu ’798, [7:32-7:45].

FIG. 2A

Yu '798, FIG. 2A.

“After the second packages 200 are formed, the packages 200 are bonded to the first packages 100 by way of conductive connectors 210, the bond pads 206, and the TIVs 110. In some embodiments, the stacked memory dies 212 may be coupled to the dies 120 through the wire

Appendix A-37 - Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

	<p>bonds 214, the bond pads 204 and 206, through vias 208, the conductive connectors 210, and the TIVs 110.” Yu ’798, [9:4-9:10].</p> <p>“FIG. 2B illustrates forming an underfill 220 between the first package 100 and the second package 200 and between the conductive connectors 210. The underfill 220 may be formed of a liquid epoxy, a deformable gel, a silicon rubber, a non-conductive film, a polymer, PBO, polyimide, solder resist, or a combination thereof. The underfill 220 provides structural support for the conductive connectors 210, and may be dispensed using capillary force after the conductive connectors 210 are bonded between the first package 100 and the second package 200.” Yu ’798, [9:34-9:43].</p>  <p style="text-align: center;">FIG. 2B</p> <p>Yu ’798, FIG. 2B.</p>
--	--

“FIG. 4B illustrates attaching second packages 200 to the first package 100 of FIG. 4A. This is similar to the process described above in FIG. 2A, except that the underfill 220 is present during the bonding process. Details regarding this embodiment that are similar to those for the previously described embodiment will not be repeated herein. The packages 200 and 100 will then be singulated as described above in FIG. 2C.” Yu '798, [11:24-11:31].

FIG. 4B

Yu '798, FIG. 4B.

“FIG. 8 illustrates a cross-sectional view of a semiconductor package 400 in accordance with some embodiments. The semiconductor package 400 includes the semiconductor package 300 being mounted to a package substrate 402. The semiconductor package 300 may be any of the embodiments of the semiconductor package 300 described above. The semiconductor package 300 is mounted to the package substrate 402 using the conductive connectors 136. The package substrate 402 may be made of a semiconductor material such as silicon,

germanium, diamond, or the like. Alternatively, compound materials such as silicon germanium, silicon carbide, gallium arsenic, indium arsenide, indium phosphide, silicon germanium carbide, gallium arsenic phosphide, gallium indium phosphide, combinations of these, and the like, may also be used. Additionally, the package substrate 402 may be a SOI substrate.” Yu '798, [12:27-12:42].

FIG. 8

Yu '798, FIG. 8.

“Another embodiment is a method including forming a first die package, the first die package including a first die, a first electrical connector, and a first redistribution layer, the first redistribution layer being coupled to the first die and the first electrical connector, forming an underfill over the first die package, patterning the underfill to have an opening to expose a portion of the first electrical connector, and bonding a second die package to the first die

Appendix A-37 - Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

	<p>package with a bonding structure, the bonding structure being coupled to the first electrical connector in the opening of the underfill.” Yu ’798, [13:51-13:60].</p> <p>To the extent Plaintiff contends that Yu ’798 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Yu ’798 discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“After the second packages 200 are formed, the packages 200 are bonded to the first packages 100 by way of conductive connectors 210, the bond pads 206, and the TIVs 110. In some embodiments, the stacked memory dies 212 may be coupled to the dies 120 through the wire bonds 214, the bond pads 204 and 206, through vias 208, the conductive connectors 210, and the TIVs 110. The conductive connectors 210 may be similar to the conductive connectors 136 described above and the description is not repeated herein, although the conductive connectors 210 and 136 need not be the same. In some embodiments, before bonding the conductive connectors 210, the conductive connectors 210 are coated with a flux (not shown), such as a no-clean flux. The conductive connectors 210 may be dipped in the flux or the flux may be jetted onto the conductive connectors 210. In another embodiment, the flux may be applied to the surfaces of the TIVs 110. The bonding between the second package 200 and the first package 100 may be a solder bonding or a direct metal-to-metal (such as a copper-to-copper or tin-to-tin) bonding. In an embodiment, the second package 200 is bonded to the</p>

	<p>first package 100 by a reflow process. During this reflow process, the conductive connectors 210 are in contact with the bond pads 206 and the TIV's 110 to physically and electrically couple the second package 200 to the first package 100.” Yu '798, [9:4-9:28].</p> <p>“FIG. 2B illustrates forming an underfill 220 between the first package 100 and the second package 200 and between the conductive connectors 210. The underfill 220 may be formed of a liquid epoxy, a deformable gel, a silicon rubber, a non-conductive film, a polymer, PBO, polyimide, solder resist, or a combination thereof. The underfill 220 provides structural support for the conductive connectors 210, and may be dispensed using capillary force after the conductive connectors 210 are bonded between the first package 100 and the second package 200. In these embodiments, the underfill 220 includes a fillet where a sidewalls 220 A that are diagonal to backside surfaces 120 B of the dies 120. In some embodiments, the underfill 220 is formed to leave openings 222 over the dies 120.” Yu '798, [9:34-9:47].</p> <p>“The underfill 220 has a height H 220 between the first and second packages 100 and 200 (sometimes referred to as a standoff height). In an embodiment, the height H 220 is from about 1 μm to about 200 μm.” Yu '798, [10:6-10:9].</p> <p>“The underfill 220 may be formed to have the height H 220 from about 1 μm to about 200 μm. In this embodiment, the underfill 220 has sidewalls 220 A that are substantially perpendicular to backside surfaces 120 B of the dies 120.” Yu '798, [11:17-11:21].</p> <p>“FIG. 4B illustrates attaching second packages 200 to the first package 100 of FIG. 4A. This is similar to the process described above in FIG. 2A, except that the underfill 220 is present during the bonding process.” Yu '798, [11:24-11:27].</p>
--	--

FIG. 4B

Yu '798, FIG. 4B.

“The semiconductor package 400 includes an underfill 406 between the semiconductor package 300 and the substrate 402 and between the conductive connectors 136. The underfill 406 may be formed of a liquid epoxy, a deformable gel, a silicon rubber, a non-conductive film, a polymer, PBO, polyimide, solder resist, or a combination thereof. The underfill 406 provides structural support for the conductive connectors 136, and may be dispensed using capillary force after the conductive connectors 136 are bonded between the semiconductor package 300 and the substrate 402.” Yu ’798, [13:5-13:14].

To the extent Plaintiff contends that Yu '798 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

The dies 120 may be a single die or may be more than two dies. The dies 120 may include a logic die, such as a central processing unit (CPU), a graphics processing unit (GPU), the like, or a combination thereof. In some embodiments, the dies 120 include a die stack (not shown) which may include both logic dies and memory dies. The dies 120 may include an input/output (I/O) die, such as a wide I/O die that provides a connection between the first package 10 and the</p>

	<p>subsequently attached second package 200 (see FIG. 2A). The dies 120 include contact areas 124 on a second side of the dies 120.” Yu ’798, [3:63-4:11].</p>  <p>FIG. 1D</p> <p>Yu ’798, FIG. 1D.</p> <p>“Referring to FIG. 2A, second packages 200 are bonded to the first package 100 with a set of conductive connectors 210 forming semiconductor packages 300. The second packages 200 each include a substrate 202 and one or more stacked dies 212 (212 A and 212 B) coupled to the substrate 202. The substrate 202 may be made of a semiconductor material such as silicon, germanium, diamond, or the like. Alternatively, compound materials such as silicon germanium, silicon carbide, gallium arsenic, indium arsenide, indium phosphide, silicon germanium carbide, gallium arsenic phosphide, gallium indium phosphide, combinations of these, and the like, may also be used. Additionally, the substrate 202 may</p>
--	--

	<p>be a silicon-on-insulator (SOI) substrate. Generally, an SOI substrate includes a layer of a semiconductor material such as epitaxial silicon, germanium, silicon germanium, SOI, silicon germanium on insulator (SGOI), or combinations thereof. The substrate 202 is, in one alternative embodiment, based on an insulating core such as a fiberglass reinforced resin core. One example core material is fiberglass resin such as FR4. Alternatives for the core material include bismaleimide-triazine (BT) resin, or alternatively, other printed circuit board (PCB) materials or films. Build up films such as Ajinomoto build-up film (ABF) or other laminates may be used for substrate 202. The substrate 202 may be referred to as a package substrate 202. The substrate 202 may include active and passive devices (not shown in FIG. 2A). As one of ordinary skill in the art will recognize, a wide variety of devices such as transistors, capacitors, resistors, combinations of these, and the like may be used to generate the structural and functional requirements of the design for the semiconductor package 300. The devices may be formed using any suitable methods. The substrate 202 may also include metallization layers (not shown) and through vias 208. The metallization layers may be formed over the active and passive devices and are designed to connect the various devices to form functional circuitry. The metallization layers may be formed of alternating layers of dielectric (e.g., low-k dielectric material) and conductive material (e.g., copper) with vias interconnecting the layers of conductive material and may be formed through any suitable process (such as deposition, damascene, dual damascene, or the like). In some embodiments, the substrate 202 is substantially free of active and passive devices. The substrate 202 may have bond pads 204 on a first side the substrate 202 to couple to the stacked dies 212, and bond pads 206 on a second side of the substrate 202, the second side being opposite the first side of the substrate 202, to couple to the conductive connectors 210. In some embodiments, the bond pads 204 and 206 are formed by forming recesses (not shown) into dielectric layers (not shown) on the first and second sides of the substrate 202. The recesses may be formed to allow the bond pads 204 and 206 to be embedded into the dielectric layers. In other embodiments, the recesses are omitted as the bond pads 204 and 206 may be formed on the</p>
--	---

	<p>dielectric layer. In some embodiments, the bond pads 204 and 206 include a thin seed layer (not shown) made of copper, titanium, nickel, gold, palladium, the like, or a combination thereof. The conductive material of the bond pads 204 and 206 may be deposited over the thin seed layer. The conductive material may be formed by an electro-chemical plating process, an electroless plating process, CVD, ALD, PVD, the like, or a combination thereof. In an embodiment, the conductive material of the bond pads 204 and 206 is copper, tungsten, aluminum, silver, gold, the like, or a combination thereof. In an embodiment, the bond pads 204 and 206 are UBMs that include three layers of conductive materials, such as a layer of titanium, a layer of copper, and a layer of nickel. However, one of ordinary skill in the art will recognize that there are many suitable arrangements of materials and layers, such as an arrangement of chrome/chrome-copper alloy/copper/gold, an arrangement of titanium/titanium tungsten/copper, or an arrangement of copper/nickel/gold, that are suitable for the formation of the UBMs 204 and 206. Any suitable materials or layers of material that may be used for the UBMs 204 and 206 are fully intended to be included within the scope of the current application. In some embodiments, the through vias 208 extend through the substrate 202 and couple at least one bond pad 204 to at least one bond pad 206. In the illustrated embodiment, the stacked dies 212 are coupled to the substrate 202 by wire bonds 214, although other connections may be used, such as conductive bumps. In an embodiment, the stacked dies 212 are stacked memory dies. For example, the stacked memory dies 212 may include low-power (LP) double data rate (DDR) memory modules, such as LPDDR1, LPDDR2, LPDDR3, or the like memory modules. In some embodiments, the stacked dies 212 and the wire bonds 214 may be encapsulated by a molding material 216. The molding material 216 may be molded on the stacked dies 212 and the wire bonds 214, for example, using compression molding. In some embodiments, the molding material 216 is a molding compound, a polymer, an epoxy, silicon oxide filler material, the like, or a combination thereof. A curing step may be performed to cure the molding material 216, wherein the curing may be a thermal curing, a UV curing, the like, or a combination thereof. In some</p>
--	--

embodiments, the stacked dies 212 and the wire bonds 214 are buried in the molding material 216, and after the curing of the molding material 216, a planarization step, such as a grinding, is performed to remove excess portions of the molding material 216 and provide a substantially planar surface for the second packages 200. After the second packages 200 are formed, the packages 200 are bonded to the first packages 100 by way of conductive connectors 210, the bond pads 206, and the TIVs 110. In some embodiments, the stacked memory dies 212 may be coupled to the dies 120 through the wire bonds 214, the bond pads 204 and 206, through vias 208, the conductive connectors 210, and the TIVs 110.” Yu ’798, [7:32-9:9].

FIG. 2A

	<p>Yu '798, FIG. 2A.</p> <p>“FIG. 2B illustrates forming an underfill 220 between the first package 100 and the second package 200 and between the conductive connectors 210. The underfill 220 may be formed of a liquid epoxy, a deformable gel, a silicon rubber, a non-conductive film, a polymer, PBO, polyimide, solder resist, or a combination thereof. The underfill 220 provides structural support for the conductive connectors 210, and may be dispensed using capillary force after the conductive connectors 210 are bonded between the first package 100 and the second package 200. In these embodiments, the underfill 220 includes a fillet where a sidewalls 220 A that are diagonal to backside surfaces 120 B of the dies 120. In some embodiments, the underfill 220 is formed to leave openings 222 over the dies 120.” Yu '798, [9:34-9:47].</p> <p>“FIG. 3A, this embodiment has the underfill 220 including fillets. The first package 100 has a width W 100, the second package has a width W 200, and the underfill 220 has an outer width W 220 between the first and second packages 100 and 200. The opening 222 in the underfill 220 has a width W 222 and the die 120 has a width W 120. In an embodiment, the width W 220 is less than or equal to the width W 100, the width W 200 is less than or equal to the width W 220, and the width W 222 is less than or equal to the width W 120. In another embodiment, the width W 220 is less than the width W 100, the width W 200 is less than the width W 220, and the width W 222 is less than the width W 120. The underfill 220 has a height H 220 between the first and second packages 100 and 200 (sometimes referred to as a standoff height). In an embodiment, the height H 220 is from about 1 μm to about 200 μm. FIG. 3B illustrates another embodiment of the semiconductor package 300.” Yu '798, [9:61-10:11].</p>

Claim 3, U.S. Patent No. 9859202

Claim Limitation	Disclosure
------------------	------------

Appendix A-37 - Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>Yu '798 discloses, either expressly or inherently, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p> <p>“FIG. 1G illustrates the formation of a set of conductive connectors 136 over and electrically coupled to the redistribution layer 131. The conductive connectors 136 may be solder balls, metal pillars, controlled collapse chip connection (C4) bumps, micro bumps, electroless nickel-electroless palladium-immersion gold technique (ENEPIG) formed bumps, or the like. The conductive connectors 136 may include a conductive material such as solder, copper, aluminum, gold, nickel, silver, palladium, tin, the like, or a combination thereof.” Yu '798, [6:11-6:20].</p>
---	---

FIG. 1G

Yu '798, FIG. 1G.

“Referring to FIG. 2A, second packages 200 are bonded to the first package 100 with a set of conductive connectors 210 forming semiconductor packages 300. The second packages 200 each include a substrate 202 and one or more stacked dies 212 (212 A and 212 B) coupled to the substrate 202.” Yu '798, [7:32-7:38].

FIG. 2A

Yu '798, FIG. 2A.

“In the illustrated embodiment, the stacked dies 212 are coupled to the substrate 202 by wire bonds 214, although other connections may be used, such as conductive bumps. In an embodiment, the stacked dies 212 are stacked memory dies. For example, the stacked memory dies 212 may include low-power (LP) double data rate (DDR) memory modules, such as LPDDR1, LPDDR2, LPDDR3, or the like memory modules. In some embodiments, the stacked dies 212 and the wire bonds 214 may be encapsulated by a molding material 216. The molding material 216 may be molded on the stacked dies 212 and the wire bonds 214, for example, using compression molding. In some embodiments, the molding material 216 is a molding compound, a polymer, an epoxy, silicon oxide filler material, the like, or a combination thereof. A curing step may be performed to cure the molding material 216, wherein the curing may be a thermal curing, a UV curing, the like, or a combination thereof. In some embodiments, the stacked dies 212 and the wire bonds 214 are buried in the molding

	<p>material 216, and after the curing of the molding material 216, a planarization step, such as a grinding, is performed to remove excess portions of the molding material 216 and provide a substantially planar surface for the second packages 200. After the second packages 200 are formed, the packages 200 are bonded to the first packages 100 by way of conductive connectors 210, the bond pads 206, and the TIVs 110. In some embodiments, the stacked memory dies 212 may be coupled to the dies 120 through the wire bonds 214, the bond pads 204 and 206, through vias 208, the conductive connectors 210, and the TIVs 110.” Yu ’798, [8:47-9:10].</p> <p>“FIG. 2B illustrates forming an underfill 220 between the first package 100 and the second package 200 and between the conductive connectors 210. The underfill 220 may be formed of a liquid epoxy, a deformable gel, a silicon rubber, a non-conductive film, a polymer, PBO, polyimide, solder resist, or a combination thereof. The underfill 220 provides structural support for the conductive connectors 210, and may be dispensed using capillary force after the conductive connectors 210 are bonded between the first package 100 and the second package 200. In these embodiments, the underfill 220 includes a fillet where a sidewalls 220 A that are diagonal to backside surfaces 120 B of the dies 120. In some embodiments, the underfill 220 is formed to leave openings 222 over the dies 120.” Yu ’798, [9:34-9:47].</p>
--	---

FIG. 2B

Yu '798, FIG. 2B.

“Referring the FIG. 3A, this embodiment has the underfill 220 including fillets. The first package 100 has a width W_{100} , the second package has a width W_{200} , and the underfill 220 has an outer width W_{220} between the first and second packages 100 and 200. The opening 222 in the underfill 220 has a width W_{222} and the die 120 has a width W_{120} . In an embodiment, the width W_{220} is less than or equal to the width W_{100} , the width W_{200} is less than or equal to the width W_{220} , and the width W_{222} is less than or equal to the width W_{120} . In another embodiment, the width W_{220} is less than the width W_{100} , the width W_{200} is less than the width W_{220} , and the width W_{222} is less than the width W_{120} .” Yu '798, [9:61-10:5].

FIG. 3A

Yu '798, FIG. 3A.

“FIG. 8 illustrates a cross-sectional view of a semiconductor package 400 in accordance with some embodiments. The semiconductor package 400 includes the semiconductor package 300 being mounted to a package substrate 402. The semiconductor package 300 may be any of the embodiments of the semiconductor package 300 described above. The semiconductor package 300 is mounted to the package substrate 402 using the conductive connectors 136.”
Yu '798, [12:27-12:34].

	 <p style="text-align: center;">FIG. 8</p> <p>Yu '798, FIG. 8.</p> <p>To the extent Plaintiff contends that Yu '798 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Claim 4, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of metal pillars of the top package substrate is aligned with a corresponding metal	Yu '798 discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal

Appendix A-37 - Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

<p>bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p>	<p>pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“The substrate 202 may have bond pads 204 on a first side the substrate 202 to couple to the stacked dies 212, and bond pads 206 on a second side of the substrate 202, the second side being opposite the first side of the substrate 202, to couple to the conductive connectors 210.” Yu ’798, [8:10-8:14].</p> <p>“In some embodiments, the through vias 208 extend through the substrate 202 and couple at least one bond pad 204 to at least one bond pad 206.” Yu ’798, [8:43-8:46].</p> <p>“After the second packages 200 are formed, the packages 200 are bonded to the first packages 100 by way of conductive connectors 210, the bond pads 206, and the TIVs 110. In some embodiments, the stacked memory dies 212 may be coupled to the dies 120 through the wire bonds 214, the bond pads 204 and 206, through vias 208, the conductive connectors 210, and the TIVs 110.” Yu ’798, [9:4-9:10].</p> <p>“In some embodiments, the stacked memory dies 212 may be coupled to the dies 120 through the wire bonds 214, the bond pads 204 and 206, through vias 208, the conductive connectors 210, and the TIVs 110.” Yu ’798, [9:7-9:10].</p> <p>“In another embodiment, the flux may be applied to the surfaces of the TIVs 110. The bonding between the second package 200 and the first package 100 may be a solder bonding or a direct metal-to-metal (such as a copper-to-copper or tin-to-tin) bonding. In an embodiment, the second package 200 is bonded to the first package 100 by a reflow process.</p>
---	--

Appendix A-37 - Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

	<p>During this reflow process, the conductive connectors 210 are in contact with the bond pads 206 and the TIVs 110 to physically and electrically couple the second package 200 to the first package 100.” Yu ’798, [9:19-9:29].</p> <p>“The metallization layers may be formed of alternating layers of dielectric (e.g., low-k dielectric material) and conductive material (e.g., copper) with vias interconnecting the layers of conductive material and may be formed through any suitable process (such as deposition, damascene, dual damascene, or the like).” Yu ’798, [12:64-13:2].</p> <p>To the extent Plaintiff contends that Yu ’798 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 6, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	<p>Yu ’798 discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p>

ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

FIG. 8

Yu '798, FIG. 8.

To the extent Plaintiff contends that Yu '798 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Claim 9, U.S. Patent No. 9859202

Appendix A-37 - Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

Claim Limitation	Disclosure
<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of metal pillars of the top package substrate via the plurality of bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>Yu '798 discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“The conductive connectors 136 may be solder balls, metal pillars, controlled collapse chip connection (C4) bumps, micro bumps, electroless nickel-electroless palladium-immersion gold technique (ENEPIG) formed bumps, or the like. The conductive connectors 136 may include a conductive material such as solder, copper, aluminum, gold, nickel, silver, palladium, tin, the like, or a combination thereof. In an embodiment in which the conductive connectors 136 are solder bumps, the conductive connectors 136 are formed by initially forming a layer of solder through such commonly used methods such as evaporation, electroplating, printing, solder transfer, ball placement, or the like. Once a layer of solder has been formed on the structure, a reflow may be performed in order to shape the material into the desired bump shapes. In another embodiment, the conductive connectors 136 are metal pillars (such as a copper pillar) formed by a sputtering, printing, electro plating, electroless plating, CVD, or the like. The metal pillars may be solder free and have substantially vertical sidewalls. In some embodiments, a metal cap layer (not shown) is formed on the top of the metal pillar connectors 136.” Yu '798, [6:13-6:34].</p>

	<p>“Although not shown, there may be UBMs coupled to the redistribution layer 131 with the conductive connectors 136 coupled to the UBMs (not shown). The UBMs may be formed by first forming a set of openings (not shown) may be formed through the topmost passivation layer 134 to expose surfaces of the metal lines 132 in the metal layer M N. The UBMs may extend through these openings in the passivation layer 134 and also extend along a surface of passivation layer 134. The UBMs may include three layers of conductive materials, such as a layer of titanium, a layer of copper, and a layer of nickel.” Yu ’798, [6:38-6:48].</p>  <p>FIG. 1F</p> <p>Yu ’798, FIG. 1F.</p> <p>“In some embodiments, the bond pads 204 and 206 are formed by forming recesses (not shown) into dielectric layers (not shown) on the first and second sides of the substrate 202. The recesses may be formed to allow the bond pads 204 and 206 to be embedded into the dielectric layers. In other embodiments, the recesses are omitted as the bond pads 204 and 206 may be formed on the dielectric layer. In some embodiments, the bond pads 204 and 206</p>
--	---

Appendix A-37 - Invalidity of U.S. Patent No. 9859202 in view of Yu '798 - U.S. Patent No. 11107798

	<p>include a thin seed layer (not shown) made of copper, titanium, nickel, gold, palladium, the like, or a combination thereof. The conductive material of the bond pads 204 and 206 may be deposited over the thin seed layer.” Yu ’798, [8:14-8:26].</p> <p>“In some embodiments, the through vias 208 extend through the substrate 202 and couple at least one bond pad 204 to at least one bond pad 206.” Yu ’798, [8:43-8:46].</p> <p>“The conductive connectors 210 may be similar to the conductive connectors 136 described above and the description is not repeated herein, although the conductive connectors 210 and 136 need not be the same. In some embodiments, before bonding the conductive connectors 210, the conductive connectors 210 are coated with a flux (not shown), such as a no-clean flux. The conductive connectors 210 may be dipped in the flux or the flux may be jetted onto the conductive connectors 210. In another embodiment, the flux may be applied to the surfaces of the TIVs 110. The bonding between the second package 200 and the first package 100 may be a solder bonding or a direct metal-to-metal (such as a copper-to-copper or tin-to-tin) bonding.” Yu ’798, [9:11-9:23].</p> <p>“After the bonding process, an intermetallic compound (IMC) 218 may form at the interface of the TIVs 110 and the conductive connectors 210 and also at the interface between the conductive connectors 210 and the bond pads 206 (not shown).” Yu ’798, [9:29-9:33].</p> <p>To the extent Plaintiff contends that Yu ’798 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

**Appendix A-38 - Invalidity of U.S. Patent No. 9859202 in view of Polymer Adhesives and Encapsulants for Microelectronic Applications
- Non-Patent Publication**

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Polymer Adhesives and Encapsulants for Microelectronic Applications - Non-Patent Publication

Polymer Adhesives and Encapsulants for Microelectronic Applications was published by Richard C. Benson, Dawnielle Farrar, and Joseph A. Miragliotta. Polymer Adhesives and Encapsulants for Microelectronic Applications anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ‘202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Polymer Adhesives and Encapsulants for Microelectronic Applications is an academic article that was published January 1, 2008. Polymer Adhesives and Encapsulants for Microelectronic Applications is therefore prior art to the ‘202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Polymer Adhesives and Encapsulants for Microelectronic Applications, or otherwise rendered obvious by disclosures and teachings of Polymer Adhesives and Encapsulants for Microelectronic Applications, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Polymer Adhesives and Encapsulants for Microelectronic Applications does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Polymer Adhesives and Encapsulants for Microelectronic Applications with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-38 - Invalidity of U.S. Patent No. 9859202 in view of Polymer Adhesives and Encapsulants for Microelectronic Applications
- Non-Patent Publication

one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ‘202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Polymer Adhesives and Encapsulants for Microelectronic Applications, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Polymer Adhesives and Encapsulants for Microelectronic Applications “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Polymer Adhesives and Encapsulants for Microelectronic Applications or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Polymer Adhesives and Encapsulants for Microelectronic Applications set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	To the extent the preamble is a limitation, Polymer Adhesives and Encapsulants for Microelectronic Applications discloses, either expressly or inherently, a structure. <i>See, e.g.:</i>

Appendix A-38 - Invalidity of U.S. Patent No. 9859202 in view of Polymer Adhesives and Encapsulants for Microelectronic Applications
- Non-Patent Publication

	<p>"In flip-chip devices, polymers are being used for electrical interconnects instead of metallurgical joints. Polymer encapsulants are widely used to package microelectronic and optoelectronic devices when hermetic-" Polymer Adhesives and Encapsulants for Microelectronic Applications, [58].</p>
[1.A] a bottom package substrate;	<p>Polymer Adhesives and Encapsulants for Microelectronic Applications discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>"Polymer adhesives can be dispensed from tubes, screen- printed, or placed on substrates in a tape format (generally that is pressure-sensitive)." Polymer Adhesives and Encapsulants for Microelectronic Applications, [59].</p> <p>"When thermal or electrical conductivity is not required, insulating polymer adhesives are used for bonding surface-mounted components to printed circuit boards, semiconductor die to substrates, substrates to packages, and lids to packages (where hermeticity is not required)." Polymer Adhesives and Encapsulants for Microelectronic Applications, [60].</p> <p>"Polymers filled with thermally conducting particles are used as thermal interface materials (TIMs) in applications where moderate, but not maximum, heat transport is required." Polymer Adhesives and Encapsulants for Microelectronic Applications, [60].</p> <p>"LSI VCSEL array PD array Interposer Microlens array -Solder bumps LSI PD array Polymer waveguide VCSEL array protocols have been developed to assess the effects of stress factors on the electrical performance of the device and evaluate the reliability. 27 These</p>

Appendix A-38 - Invalidity of U.S. Patent No. 9859202 in view of Polymer Adhesives and Encapsulants for Microelectronic Applications
- Non-Patent Publication

	<p>tests include burn-in or high-" Polymer Adhesives and Encapsulants for Microelectronic Applications, [68].</p> <p>"For encapsulated devices, test protocols were developed by the Joint Electron Device Engineering Council (JEDEC) and employ severe conditions of temperature, humidity, and bias that accelerate the penetration of moisture through the external protective material (encapsulant or seal) or along the interface between the external protective material and the metallic conductors that pass through it." Polymer Adhesives and Encapsulants for Microelectronic Applications, [68].</p> <p>To the extent Plaintiff contends that Polymer Adhesives and Encapsulants for Microelectronic Applications fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.B] a top package substrate stacked on top of the bottom package substrate;	<p>Polymer Adhesives and Encapsulants for Microelectronic Applications discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>"In flip-chip devices, polymers are being used for electrical interconnects instead of metallurgical joints. Polymer encapsulants are widely used to package microelectronic and optoelectronic devices when hermetic-" Polymer Adhesives and Encapsulants for Microelectronic Applications, [58].</p>

Appendix A-38 - Invalidity of U.S. Patent No. 9859202 in view of Polymer Adhesives and Encapsulants for Microelectronic Applications
- Non-Patent Publication

	<p>“Polymer adhesives can be dispensed from tubes, screen- printed, or placed on substrates in a tape format (generally that is pressure-sensitive). Thermoset materials (e.g., epoxies, polyimides, and cyanate esters) require exposure to elevated temperatures to cure or induce cross-linking chemical reactions between the monomers.” Polymer Adhesives and Encapsulants for Microelectronic Applications, [59].</p> <p>“Polymers filled with thermally conducting particles are used as thermal interface materials (TIMs) in applications where moderate, but not maximum, heat transport is required. Thermal conduction and the role of phonon transport at solid/solid interfaces are not well under-” Polymer Adhesives and Encapsulants for Microelectronic Applications, [60].</p> <p>“When thermal or electrical conductivity is not required, insulating polymer adhesives are used for bonding surface-mounted components to printed circuit boards, semiconductor die to substrates, substrates to packages, and lids to packages (where hermeticity is” Polymer Adhesives and Encapsulants for Microelectronic Applications, [60].</p> <p>“Various approaches have been investigated to improve the thermal conductivity of polymeric TIMs. Recent investigations have been made by using electro- spun fibers that were embedded with different thermally conductive particles, but the resultant TIMs did not have a significantly higher thermal conductivity than” Polymer Adhesives and Encapsulants for Microelectronic Applications, [60].</p> <p>“LSI VCSEL array PD array Interposer Microlens array -Solder bumps LSI PD array Polymer waveguide VCSEL array protocols have been developed to assess the effects of stress factors on the electrical performance of the device and evaluate the reliability. 27 These</p>

- Non-Patent Publication

	<p>tests include burn-in or high-" Polymer Adhesives and Encapsulants for Microelectronic Applications, [68].</p> <p>To the extent Plaintiff contends that Polymer Adhesives and Encapsulants for Microelectronic Applications fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>Polymer Adhesives and Encapsulants for Microelectronic Applications discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>"Miragliotta his article provides an overview of the use of polymer adhesives in microelectronic packaging, with key applications including die attachment," Polymer Adhesives and Encapsulants for Microelectronic Applications, [58].</p> <p>"In flip-chip devices, polymers are being used for electrical interconnects instead of metallurgical joints." Polymer Adhesives and Encapsulants for Microelectronic Applications, [58].</p>

Appendix A-38 - Invalidity of U.S. Patent No. 9859202 in view of Polymer Adhesives and Encapsulants for Microelectronic Applications
- Non-Patent Publication

	<p>“Polymer adhesives can be dispensed from tubes, screen- printed, or placed on substrates in a tape format (generally that is pressure-sensitive).” Polymer Adhesives and Encapsulants for Microelectronic Applications, [59].</p> <p>“Underfill materials are primarily used to improve the reliability of the flip-chip solder interconnects. These materials fill the gap between the chip and substrate and surround the solder joints, thereby reducing any thermal stress that may be induced on the solder joint as, for example, a result of thermal cycling.” Polymer Adhesives and Encapsulants for Microelectronic Applications, [63].</p> <p>“A flip- chip device is defined as a die/chip mounted on a substrate by using various interconnection materials such as solder bumps, wire/stud bump interconnects, and ICAs/ACAs.” Polymer Adhesives and Encapsulants for Microelectronic Applications, [63].</p> <p>“The gap height typically ranges from 30 μm to 200 μm, and the underfill material flows via capillary forces (i.e., it is wicked) through the gap and around the solder bumps.” Polymer Adhesives and Encapsulants for Microelectronic Applications, [63].</p> <p>To the extent Plaintiff contends that Polymer Adhesives and Encapsulants for Microelectronic Applications fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.D] the spacer connector comprises a core substrate;	<p>Polymer Adhesives and Encapsulants for Microelectronic Applications discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p>

Appendix A-38 - Invalidity of U.S. Patent No. 9859202 in view of Polymer Adhesives and Encapsulants for Microelectronic Applications
- Non-Patent Publication

	<p><i>See, e.g.:</i></p> <p>“Another emerging application area is the use of polymer adhesives in optoelectronic devices. Over the past decade, the introduction of miniaturized optical components and interconnects within microelectronic devices has led to the development of new processes for polymer-based packaging (see Fig. 11). Although most development efforts have focused on the fabrication of polymer-based optical components, packaging issues associated with interconnect alignment and encapsulation also are critical to device performance. 35 For the latter, conventional electronics packaging technologies (e.g., automatic pick-and-place and transfer molding) are being used in the mass production of optoelectronic devices that include optical transceivers.” Polymer Adhesives and Encapsulants for Microelectronic Applications, [68].</p> <p>To the extent Plaintiff contends that Polymer Adhesives and Encapsulants for Microelectronic Applications fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.E] a plurality of metal pillars, each passing through the core substrate; and	<p>Polymer Adhesives and Encapsulants for Microelectronic Applications discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p>

Appendix A-38 - Invalidity of U.S. Patent No. 9859202 in view of Polymer Adhesives and Encapsulants for Microelectronic Applications
- Non-Patent Publication

	<p>“Polymers filled with thermally conducting particles are used as thermal interface materials (TIMs) in applications where moderate, but not maximum, heat transport is required. Thermal conduction and the role of phonon transport at solid/solid interfaces are not well understood for TIMs. Comprehensive measurements, along with modeling, recently have been made on electrically insulating TIMs to determine the effect of the bulk thermal conductivity of filler particles, bondline thickness, and the various interfaces (substrate/polymer matrix, polymer matrix/particle, and particle/particle) on the overall thermal conductivity of the TIM.² As the bulk” Polymer Adhesives and Encapsulants for Microelectronic Applications, [60].</p> <p>“When thermal or electrical conductivity is not required, insulating polymer adhesives are used for bonding surface-mounted components to printed circuit boards, semiconductor die to substrates, substrates to packages, and lids to packages (where hermeticity is not required). The materials used are typically unfilled epoxies, although other polymers are used occasionally. A major application involves the use of adhesives as underfills for flip-chip devices to provide some stress relief of the solder joints during temperature cycling (see Underfill Materials for Flip-Chip Devices below). Another application of polymer adhesives, in particular benzocyclobutenes (BCB) and polyimides, is to serve as the dielectric layer/adhesive for redistributing the metal interconnection geometry on die (this application is not discussed in this article).” Polymer Adhesives and Encapsulants for Microelectronic Applications, [60].</p> <p>“Various factors affect the overall conductivity of filled adhesives: polymer chemistry, the volume fraction of filler, and the filler properties (material type, coatings, particle morphology, and size distribution). The actual formulation chemistry of commercial adhesives is proprietary, and various additives are present at low concentrations to improve</p>

Appendix A-38 - Invalidity of U.S. Patent No. 9859202 in view of Polymer Adhesives and Encapsulants for Microelectronic Applications
- Non-Patent Publication

	<p>the performance of the adhesive. The electrical conductivity of the cured adhesive is generally described by percolation theory, with tunneling processes possibly occurring during the early stages of the cure. The particle fraction at which conductance first occurs is the percolation threshold, and it depends on the morphology and size of the metallic fillers.” Polymer Adhesives and Encapsulants for Microelectronic Applications, [61].</p> <p>“In addition to traditional semiconductor devices, chip-level packaging of MEMS occasionally involves the use of encapsulants to minimize the impact of environmental factors on the micrometer-scaled movable elements. In most applications, polymer encapsulation of MEMS devices protects movable fragile parts during wafer handling, wafer dicing, or plastic molding. Encapsulation provides a more robust device for transportation and handling without altering the performance of the devices. Several MEMS packaging techniques have been reported involving wafer-to-wafer bonding and thin-film sacrificial-based sealing methods. 33,34 As shown in Fig. 10, Insulator (a) Unity- (b) Polymer overcoat (c) (d) Metal Figure 10. MEMS packaging sequence that produces an encapsulated and released micrometer-scaled movable device. (Reproduced with permission from Ref. 34 © 2006, Institute of Physics.)” Polymer Adhesives and Encapsulants for Microelectronic Applications, [67-68].</p> <p>To the extent Plaintiff contends that Polymer Adhesives and Encapsulants for Microelectronic Applications fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-36 - Invalidity of U.S. Patent No. 9,859,202 in view of Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration - Non-Patent Publication

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9,859,202 in view of Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration - Non-Patent Publication

Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration and was published by Rabindra N. Das, et al. in the 25th International Symposium on Microelectronics. Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration is an academic article that was published September 13, 2012. Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration, or otherwise rendered obvious by disclosures and teachings of Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration does not disclose any claim

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions asserted herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-36 - Invalidity of U.S. Patent No. 9,859,202 in view of Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration - Non-Patent Publication

elements of the Asserted Claims, it would have been obvious to combine the teachings of Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ‘202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration set forth in this chart.

Claim 1, U.S. Patent No. 9,859,202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	To the extent the preamble is a limitation, Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration discloses, either expressly or inherently, a structure.

Appendix A-36 - Invalidity of U.S. Patent No. 9,859,202 in view of Package-Interposer-Package (PIP): A Breakthrough Package-on-Package (PoP) Technology for 3D-Integration - Non-Patent Publication

	<p><i>See, e.g.:</i></p> <p>“Figure 2: Package-Interposer-Package (PIP) construction with a single interposer. E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Copper Pillar Bumping Technology - Non-Patent Publication

Copper Pillar Bumping Technology was published by Christopher Henderson. Copper Pillar Bumping Technology anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Copper Pillar Bumping Technology is an academic article that was published June 27, 2012. Copper Pillar Bumping Technology is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Copper Pillar Bumping Technology, or otherwise rendered obvious by disclosures and teachings of Copper Pillar Bumping Technology, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Copper Pillar Bumping Technology does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Copper Pillar Bumping Technology with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Copper Pillar Bumping Technology, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-40 - Invalidity of U.S. Patent No. 9859202 in view of Copper Pillar Bumping Technology - Non-Patent Publication

TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Copper Pillar Bumping Technology “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Copper Pillar Bumping Technology or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Copper Pillar Bumping Technology set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Copper Pillar Bumping Technology discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“Figure 1 shows an example where copper pillar bumping enables 3-D integration and packaging. In this example, the silicon interposer is attached to the package substrate using copper pillar bumps. TSVs through the silicon interposer bring signals to the active dice on top.” Copper Pillar Bumping Technology, [1].</p>

Appendix A-40 - Invalidity of U.S. Patent No. 9859202 in view of Copper Pillar Bumping Technology - Non-Patent Publication

	<p>“Figure 3. Optical image of a cross-section through an FCOL package with copper pillar bumps.” Copper Pillar Bumping Technology, [3].</p> <p>“Figure 4 helps to illustrate the micro-bumping process. This is a process that facilitates die-to-die bonding. Copper pillars are attached to both dice, with tin solder applied to one of the die. In this example, we show it applied to the flipped die. The dice are brought in contact with one another and then subjected to reflow.” Copper Pillar Bumping Technology, [3].</p> <p>“For small dice, copper pillars can be used with no underfill in injection-molded components like QFN and Thin Small Outline Packages, or TSOPs. The connections can be made using solder materials with no-clean fluxes. For medium and large-sized dice, underfills with flux are required to stabilize the stresses between the die and the substrate.” Copper Pillar Bumping Technology, [3].</p> <p>“Here is an example of a small die in a flip chip on lead, or FCOL, package. The copper pillar is mounted to the bond pad, and the die is flipped upside down and mounted to the copper leadframe with a reflow-able tin solder.” Copper Pillar Bumping Technology, [3].</p> <p>“Copper pillar bumps are now commonly used on QFN packages. They provide benefits for high-speed circuits, including improved co-planarity and heat dissipation.” Copper Pillar Bumping Technology, [3].</p>
[1.A] a bottom package substrate;	<p>Copper Pillar Bumping Technology discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p>

Appendix A-40 - Invalidity of U.S. Patent No. 9859202 in view of Copper Pillar Bumping Technology - Non-Patent Publication

	<p>“In this example, the silicon interposer is attached to the package substrate using copper pillar” Copper Pillar Bumping Technology, [1].</p> <p>“For medium and large-sized dice, underfills with flux are required to stabilize the stresses between the die and the substrate.” Copper Pillar Bumping Technology, [3].</p> <p>“Copper pillars are attached to both dice, with tin solder applied to one of the die. In this example, we show it applied to the flipped die. The dice are brought in contact with one another and then subjected to reflow.” Copper Pillar Bumping Technology, [3].</p> <p>“For large dice, Intel, Amkor and Texas Instruments have all released products that use fine pitch copper pillar bumps.” Copper Pillar Bumping Technology, [3].</p> <p>“Here is an example of a small die in a flip chip on lead, or FCOL, package. The copper pillar is mounted to the bond pad, and the die is flipped upside down and mounted to the copper leadframe with a reflow-able tin solder.” Copper Pillar Bumping Technology, [3].</p> <p>“Most manufacturers are experimenting with no-flow underfills, no-clean fluxes, and pre-plated leadframes (typically nickel-palladium-gold) to provide both manufacturability and reliability improvements.” Copper Pillar Bumping Technology, [4].</p> <p>To the extent Plaintiff contends that Copper Pillar Bumping Technology fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

**Appendix A-41 - Invalidity of U.S. Patent No. 9859202 in view of Embedded Glass Interposer for Heterogeneous Multi-Chip Integration
Non-Patent Publication**

E.D. Tex. Case No. 2:25-CV-1183

**INVALIDITY CLAIM CHART
Invalidity of U.S. Patent No. 9859202 in view of Embedded Glass Interposer for Heterogeneous Multi-Chip Integration - Non-Patent
Publication**

Embedded Glass Interposer for Heterogeneous Multi-Chip Integration was published by Dyi-Chung Hu. Embedded Glass Interposer for Heterogeneous Multi-Chip Integration anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Embedded Glass Interposer for Heterogeneous Multi-Chip Integration is an academic article that was published May 29, 2015. Embedded Glass Interposer for Heterogeneous Multi-Chip Integration is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Embedded Glass Interposer for Heterogeneous Multi-Chip Integration, or otherwise rendered obvious by disclosures and teachings of Embedded Glass Interposer for Heterogeneous Multi-Chip Integration, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Embedded Glass Interposer for Heterogeneous Multi-Chip Integration does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Embedded Glass Interposer for Heterogeneous Multi-Chip Integration with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations;

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-41 - Invalidity of U.S. Patent No. 9859202 in view of Embedded Glass Interposer for Heterogeneous Multi-Chip Integration
Non-Patent Publication

and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ‘202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Embedded Glass Interposer for Heterogeneous Multi-Chip Integration, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Embedded Glass Interposer for Heterogeneous Multi-Chip Integration “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Embedded Glass Interposer for Heterogeneous Multi-Chip Integration or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Embedded Glass Interposer for Heterogeneous Multi-Chip Integration set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Embedded Glass Interposer for Heterogeneous Multi-Chip Integration discloses, either expressly or inherently, a structure.</p> <p>See, e.g.:</p> <p>“In this study, an EIC substrate with embedded glass interposer for flip chip assembly is demonstrated. Glass interposers with size of 21x14 mm² and 100 μm thickness, through glass</p>

vias (TGV) of 30 μm diameter, and line/space of 3 $\mu\text{m}/3 \mu\text{m}$ were produced. Subsequently, the glass interposer was embedded in built-up dielectric materials to form the EIC substrate. Multi-layers dielectrics were built up with filled blind vias and RDL patterns to fan-out the circuits from the embedded glass interposer.” Embedded Glass Interposer for Heterogeneous Multi-Chip Integration, [314].

Embedded Glass Interposer for Heterogeneous Multi-Chip Integration, FIG. 2.

“Figure 2. FC-EIC structure for (a) single chip integration and (b) multi-chip integration” Embedded Glass Interposer for Heterogeneous Multi-Chip Integration, [315].

“Table 1 showed the general specifications of the interposers used in this study.” Embedded Glass Interposer for Heterogeneous Multi-Chip Integration, [315].

“The general specifications of EIC- Glass substrate were listed in Table 2.” Embedded Glass Interposer for Heterogeneous Multi-Chip Integration, [315].

“Table 3. General specifications of the chips to be integrated in EIC-Glass substrate” Embedded Glass Interposer for Heterogeneous Multi-Chip Integration, [315].

Appendix A-42 - Invalidity of U.S. Patent No. 9859202 in view of The Requirement of Future Substrate - Maker Point of View - - Non-Patent Publication

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of The Requirement of Future Substrate - Maker Point of View - - Non-Patent Publication

The Requirement of Future Substrate - Maker Point of View - and was published by Dyi-Chung Hu. The Requirement of Future Substrate - Maker Point of View - anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² The Requirement of Future Substrate - Maker Point of View - is a conference presentation that was published April 22, 2014. The Requirement of Future Substrate - Maker Point of View - is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within The Requirement of Future Substrate - Maker Point of View -, or otherwise rendered obvious by disclosures and teachings of The Requirement of Future Substrate - Maker Point of View -, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that The Requirement of Future Substrate - Maker Point of View - does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of The Requirement of Future Substrate - Maker Point of View - with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 patent. TopWire has

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-42 - Invalidity of U.S. Patent No. 9859202 in view of The Requirement of Future Substrate - Maker Point of View - - Non-Patent Publication

yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by The Requirement of Future Substrate - Maker Point of View -, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that The Requirement of Future Substrate - Maker Point of View - “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to The Requirement of Future Substrate - Maker Point of View - or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding The Requirement of Future Substrate - Maker Point of View - set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Unimicron

The Requirement of Future Substrate - Maker Point of View -, at 24.

Chip on Interposer on Substrate vs. FC-EIC®

- **Chip on Interposer on Substrate: (ColoS)**
 - Interposer need double side RDL/Bumping and assembly process.
 - Four testing steps are used: Interposer, carrier, Interposer+carrier, chip+interposer +carrier.
- **FC-EIC®: Flip Chip – Embedded Interposer Carrier**
 - Interposer need to be embedded into the substrate.
 - Only *two* testing steps are used: interposer, and interposer+carrier.
 - Risk of thin wafer handling process is reduced.

Appendix A-43 - Invalidity of U.S. Patent No. 9859202 in view of IPC-4761 - Non-Patent Publication

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART Invalidity of U.S. Patent No. 9859202 in view of IPC-4761 - Non-Patent Publication

IPC-4761 Design Guide for Protection of Printed Board Via Structures (“IPC-4761”) was published by Associate Connecting Electronics Industries (IPC). IPC-4761 anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ‘202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² IPC-4761 is an industry standard document that was published May 7, 2008. IPC-4761 is therefore prior art to the ‘202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within IPC-4761, or otherwise rendered obvious by disclosures and teachings of IPC-4761, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that IPC-4761 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of IPC-4761 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ‘202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by IPC-4761, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-43 - Invalidity of U.S. Patent No. 9859202 in view of IPC-4761 - Non-Patent Publication

Where the chart below states that IPC-4761 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to IPC-4761 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding IPC-4761 set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, IPC-4761 discloses, either expressly or inherently, a structure.</p> <p>See, <i>e.g.</i>:</p> <p>“Interconnect vias are utilized in routing high-density surface mount components. They provide continuity between the lands on the PWB surface and internal circuitry connections. They are located in close proximity to the lands and the component in order to minimize signal length and to avoid interference with other circuitry on the outer layer. Because they are close to both the component body and the solder joint, care must be taken in the design to avoid harm to either.” IPC-4761, [8].</p>
[1.A] a bottom package substrate;	IPC-4761 discloses, either expressly or inherently, a bottom package substrate.

Appendix A-43 - Invalidity of U.S. Patent No. 9859202 in view of IPC-4761 - Non-Patent Publication

	<p><i>See, e.g.:</i></p> <p>“Interconnect vias are utilized in routing high-density surface mount components. They provide continuity between the lands on the PWB surface and internal circuitry connections. They are located in close proximity to the lands and the component in order to minimize signal length and to avoid interference with other circuitry on the outer layer. Because they are close to both the component body and the solder joint, care must be taken in the design to avoid harm to either.” IPC-4761, [8].</p> <p>To the extent Plaintiff contends that IPC-4761 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.B] a top package substrate stacked on top of the bottom package substrate;	<p>IPC-4761 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Interconnect vias are utilized in routing high-density surface mount components. They provide continuity between the lands on the PWB surface and internal circuitry connections. They are located in close proximity to the lands and the component in order to minimize signal length and to avoid interference with other circuitry on the outer layer. Because they are close to both the component body and the solder joint, care must be taken in the design to avoid harm to either.” IPC-4761, [8].</p>

Appendix A-43 - Invalidity of U.S. Patent No. 9859202 in view of IPC-4761 - Non-Patent Publication

	<p>To the extent Plaintiff contends that IPC-4761 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.C] at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein</p>	<p>IPC-4761 discloses, either expressly or inherently, at least one spacer connector interposed between the bottom package substrate and the top package substrate to define a space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p>

Figure 5-8 Examples of Type VII Filled and Capped Via

Appendix A-43 - Invalidity of U.S. Patent No. 9859202 in view of IPC-4761 - Non-Patent Publication

	<p>IPC-4761, FIG. 5-8.</p> <p>To the extent Plaintiff contends that IPC-4761 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.D] the spacer connector comprises a core substrate;</p>	<p>IPC-4761 discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p>

Figure 5-8 Examples of Type VII Filled and Capped Via

Appendix A-43 - Invalidity of U.S. Patent No. 9859202 in view of IPC-4761 - Non-Patent Publication

	<p>IPC-4761, FIG. 5-8.</p> <p>To the extent Plaintiff contends that IPC-4761 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>IPC-4761 discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“Interconnect vias are utilized in routing high-density surface mount components. They provide continuity between the lands on the PWB surface and internal circuitry connections. They are located in close proximity to the lands and the component in order to minimize signal length and to avoid interference with other circuitry on the outer layer. Because they are close to both the component body and the solder joint, care must be taken in the design to avoid harm to either.” IPC-4761, [8].</p> <p>“Conductive hole plugging materials are polymer-based and filled with metal particles, usually silver or copper.” IPC-4761, [11].</p> <p>“Fill or Plug Adhesion When required, materials must not separate from any metallized surface” IPC-4761, [12].</p>

Appendix A-43 - Invalidity of U.S. Patent No. 9859202 in view of IPC-4761 - Non-Patent Publication

	<p>“Plating - When required, capable of being plated uniformly • Plating adhesion - Minimize separation from the fill material during subsequent processing when required.” IPC-4761, [12].</p> <p>“A via with material applied into the via targeting a full penetration and encapsulation of the hole (see Figure 5-5).” IPC-4761, [15].</p> <p>“Via Metallization When vias are to be solder coated, before they are coated the plug of material in the hole can become loose as the solder reflows or melts during soldering processes.” IPC-4761, [16].</p> <p>To the extent Plaintiff contends that IPC-4761 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.F] a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars;</p>	<p>IPC-4761 discloses, either expressly or inherently, a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.</p> <p><i>See, e.g.:</i></p> <p>“Filled and Capped Via (Type VII Via) A Type V via with a secondary metallized coating covering the via (see Figure 5-8). The metallization is on both sides: Process: Metallized coating over Type V. Applicable where high density features are required. Benefits: Via-In-Pad and Ball-on-Via pad. Via stacking. Applicable where high density features are required. Benefits useful in sequential lamination processes.” IPC-4761, [at 9].</p>

Figure 5-8 Examples of Type VII Filled and Capped Via

Appendix A-43 - Invalidity of U.S. Patent No. 9859202 in view of IPC-4761 - Non-Patent Publication

	<p>IPC-4761, FIG. 5-8.</p> <p>“Concerns: Adhesion of the metallized coating to the via fill and copper pad. Copper thickness. The planarity between the fill material and the copper surface. CTE mismatch between the fill material and metallization resulting in air gap (fill material shrinkage). Less than 100% via fill may result in a metallized cap that is too thin or a dimple that can also cause entrapped air resulting in voids in BGA solder joints. Pinholes in the metallized coatings result in non-solderable areas of a land where the capped via is intended for a BGA solder joint. Reduced solder volume is also a concern with dimples.” IPC-4761, [at 10].</p>
--	---

Table 5-1 Application Guidelines for Via Protection Types ¹										
Description (Type)	Applications									
	Before Final Finish	After Non-Melting Metal Final Finish	Prevent air leakage in ICT (Vacuum Seal) ²	Keeping chemistry or solder from passing through the via	Keeping chemistry or solder from being trapped in the via	Dielectric protection of via land	Fill holes in cores prior to lamination	Improves surface planarity	Best For thermal conductivity ³	Prevent migration of solder, adhesives or encapsulants into vias
Tented - Single-Sided (Ia)				NOT RECOMMENDED ⁵						
Tented - Double-Sided (Ib)	X	X	X	X	X	X				X
Tented and Covered - Single-Sided (IIa)				NOT RECOMMENDED ⁵						
Tented and Covered - Double-Sided (Ib)	X	X	X	X	X	X				X
Plugged - Single-Sided (IIa)				NOT RECOMMENDED ⁵						
Plugged - Double-Sided (IIb)	X	X	X	X	X	X		X		X
Plugged and Covered - Single-Sided (IVa)				NOT RECOMMENDED ⁵						
Plugged and Covered Double-sided (IVb)	X	X	X	X	X	X				X
Filled (fully plugged) (V)	X	X	X	X	X		X	X	X	X
Filled and Covered (VI)	X	X	X	X	X	X				X
Filled and Capped (VII) ²	X	X	X	X	X		X	X	X	X

1) Descriptions of specific types of via protection are provided in 5.1 through 5.7.

2) Not recommended over melting metals.

3) It is recommended to use a thermally conductive hole filling ink (e.g. silver ink).

4) When specifying Via-in-Pad, it is recommended that Type VII via protection be used.

5) See 3.4 for concerns associated with single sided via protection.

IPC-4761, Table 5-1.

“this document does recognize manufacturing processes where solder mask flows into the hole during liquid solder mask application, without intending to provide complete coverage or protection, and may result in partial plugging. This is not acceptable with bare copper surface finishes.” IPC-4761, [at 10].

“Interconnect vias are utilized in routing high-density surface mount components. They provide continuity between the lands on the PWB surface and internal circuitry connections. They are located in close proximity to the lands and the component in order to minimize

Appendix A-43 - Invalidity of U.S. Patent No. 9859202 in view of IPC-4761 - Non-Patent Publication

	<p>signal length and to avoid interference with other circuitry on the outer layer. Because they are close to both the component body and the solder joint, care must be taken in the design to avoid harm to either.” IPC-4761, [8].</p> <p>To the extent Plaintiff contends that IPC-4761 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.G] wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate,	<p>IPC-4761 discloses, either expressly or inherently, wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate.</p> <p><i>See, e.g.:</i></p>

Appendix A-44 - Invalidity of U.S. Patent No. 9859202 in view of Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module - Non-Patent Publication

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART
Invalidity of U.S. Patent No. 9859202 in view of Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module - Non-Patent Publication

Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module was published by Christian Kriedl. Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory². Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module is a dissertation that was published December 31, 2011. Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, or otherwise rendered obvious by disclosures and teachings of Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-44 - Invalidity of U.S. Patent No. 9859202 in view of Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module - Non-Patent Publication

Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ‘202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p>

	<p>“By enlarging the silicon size of a DEPFET sensor, while keeping the size of the active area constant, space can be created for directly mounting the steering and readout chips onto the detector silicon and for routing the interconnection and power traces. On a highly integrated and densely populated area of such all-silicon modules, the routing of a huge amount of signal and power connections is a difficult task. The components, located on the detector silicon, must not influence the detector or the electronics operation. Figure 3.2 shows a sketch of the module concept. The steering chips are located on the long side of the detector, while the readout chips are mounted on the short end. This setup results in short and low capacitance matrix steering signals, which can be charged 3.2. WAFER THINNING 23 quickly. A high capacitive load on the drain lines is not as limiting as on the control lines, because the DEPFET is operated in drain read-out mode, yielding to a current signal. Control, data and power lines have to be connected directly to the silicon, the module is mounted on a support structure, which is also used for actively cooling the readout chips. By thinning the silicon of the detector and the chips, the material budget of the module can be reduced furthermore. For interconnecting the chips with the detector module, the flip chip technology has been chosen.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [32-33].</p> <p>“Figure 3.15 shows a drawing of the two barrels without the steering and readout chips. The ladders of both layers are 15.4mm wide, while the outer layer has much longer ladders. Overlapping ladders cover the inactive part of the support frame carrying the steering chips. The active area will be thinned to 75µm using the technology presented in chapter 3.2 to reduce the multiple scattering effects. The support frame is 400 µm thick and will be 38 88 CHAPTER 3. THE DEPFET AS A VERTEX DETECTOR Figure 3.15: The two layers of Belle II PXD with the longer outer layer. The gray area marks the active region containing the DEPFET pixel cells. [10] Pixel size µm² 50 x 55 and 50 × 60 Layer Radius Number of</p>

	<p>(mm) ladders 1 14 8 Length (mm) 2×68 Ladder active length(mm) $2 \times 45 \ 2 \ 22 \ 12 \ 2 \times 85 \ 2 \times 62 \ 50 \times 70$ and 50×85 Table 3.3: Belle II DEPFET vertex detector layer configuration. partially thinned. The $75\mu\text{m}$ thin active area is mechanically more robust and allows better position resolution than the $50\mu\text{m}$ option. Charge generated by an incident particle passing through the thicker detector is shared between more pixels. [28] Table 3.3 shows a summary of the ladder dimensions. The width of the modules is 15.4mm with a 2.2mm wide balcony for the steering chips on one side and a $400\mu\text{m}$ wide support frame on the other side of the module. The active area has a width of 12.8mm. 256 pixel columns can be realized with the given pixel width of $50\mu\text{m}$. Both layers will have 1600 pixel rows with two different pixel pitches. Smaller pixels are located close to the beam collision point, while larger pixels are used towards the end of stave. The outer layer is build with $70\mu\text{m}$ and $85 \ \mu\text{m}$ long pixels, whereas $55\mu\text{m}$ and $60\mu\text{m}$ short pixels are used on the inner layer [29] to keep the occupancy low.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [47-49].</p> <p>“Figure 3.17 shows the mounting scheme with the beam pipe in the middle and two half barrels containing both layers. The outer layer is mounted on the support structure with the chips facing outwards and the inner layer facing towards the beam pipe. The support structure itself is mounted on the beam pipe, while one end is fixed and the other end floats on the beam pipe to compensate for thermal expansion. The ladders float on the structure using a slot instead of a hole for screwing the silicon to the structure. The kapton flex cable of 6mm width is affixed on the support structure for stress relief and to keep the electrical connection from the kapton to the silicon module stable. Between the kapton cables are the pipes for the coolant connected to the support structure. After everything is assembled on the two halves, they are mounted on the beam pipe. 40” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [49-50].</p>
--	--

	<p>“The flip-chip bonding process offers advantages over the wire bonding connection, such as a lower area requirement, shorter paths between substrate and chip, lower inductance and a fast parallel bonding process. The pads of substrate and chip are placed face-to- face and brought into contact using a conductive material. Flip-chip bonding needs less area on the substrate, because the landing pads are covered by the chip, whereas wire bonding needs space for wire looping and for the destination pads located around the chip. The path between source and destination pads is only a few tens of micrometers long, whereas bonding wires are in the range of hundreds or thousands of micrometers. Different conductive materials can be used to form the interconnection, e.g. gold-stud bumps, solder bumps, indium bumps or conductive glues and films. Gold-stud bumps can be easily placed with a modified wire bonder, but require high bonding forces in the range of 40-60gr/bump and temperatures up to 320 °C. Indium can be bonded with 60°C and <10gr/bump, but the bumps are deposited by evaporation, which needs additional preprocessing. Solder bumps can be deposited in many ways (see chapter 6.4), including a flexible single ball placement. Solder processing parameters range between those of gold and indium bumps. Glues and foils share the advantage of supporting the mechanical stability of an assembly by their adhesive properties. They require lower temperatures and forces for curing the adhesive, but have a higher resistivity and require larger pads and pitches.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [91].</p> <p>“The first test vehicles used were made of glass substrates with gold coated structures. They included 4 daisy chain connections of 16 bumps each, with probe pads for connectivity tests. Single bump and double bump approaches have been tested. Single bump assemblies use bumps on the chip only, while bumps on the chip and on the substrate are called double bump. The same flip-chip parameters have been used with all assemblies. A pressure of 80gr/bump</p>
--	--

Appendix A-44 - Invalidity of U.S. Patent No. 9859202 in view of Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module - Non-Patent Publication

	<p>and 350°C for 120 seconds forms the connection during the thermocompression bonding. Both assembly types showed successful bonds on all bumps, determined by the electrical connection. A resistivity of 13 ± 0.2 has been measured for all snake structures, which includes the trace resistances. The bond quality has been checked by shearing the chip off the substrate. The bond interface broke equally on the chip and on the substrate side of the bump, indicating that thermosonic bumping and thermocompression flip-chip bonding created equally good bonds.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [100].</p> <p>“The gold dummy chips were sufficient for the first test, but the Switcher3 and DCD chips, as well as the DEPFET module are based on silicon substrates with aluminum structures and have a higher pad count. The higher pad count results in a high pressure applied to the chip and substrate, which can possibly cause mechanical defects on the thinned DEPFET modules. A new set of test vehicles has been developed during the thesis, to adopt the bumping and the flip-chip processes to aluminum structured devices. The dummy chips should be mechanically as similar as possible to the real chips, although they were manufactured in a different technology and without active devices. 6” wafers with a single aluminum layer have been used to produce the test dummies. They were structured with a wafer size mask, which allowed to include a full size ILC module design as a mechanical demonstrator together with the DCD and Switcher dummy chips.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [100-101].</p>
[1.A] a bottom package substrate;	<p>Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p>

	<p>“By enlarging the silicon size of a DEPFET sensor, while keeping the size of the active area constant, space can be created for directly mounting the steering and readout chips onto the detector silicon and for routing the interconnection and power traces. On a highly integrated and densely populated area of such all-silicon modules, the routing of a huge amount of signal and power connections is a difficult task. The components, located on the detector silicon, must not influence the detector or the electronics operation. Figure 3.2 shows a sketch of the module concept. The steering chips are located on the long side of the detector, while the readout chips are mounted on the short end. This setup results in short and low capacitance matrix steering signals, which can be charged 3.2. WAFER THINNING 23 quickly. A high capacitive load on the drain lines is not as limiting as on the control lines, because the DEPFET is operated in drain read-out mode, yielding to a current signal. Control, data and power lines have to be connected directly to the silicon, the module is mounted on a support structure, which is also used for actively cooling the readout chips.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [32-33].</p> <p>“The DEPFET uses pixel sizes of $25\mu\text{m} \times 25\mu\text{m}$, which allows a binary resolution of $25\mu\text{m}/\sqrt{12} \approx 7\mu\text{m}$. The pixel signal is compared with a threshold value to detect a hit at the binary read-out scheme. Only this hit information is stored. A resolution of $3.5\mu\text{m}$ is achieved with the $50\mu\text{m}$ thin detector by interpolation using the center-of-gravity method and a signal-to-noise ratio of 40 [12]. Figure 3.9 shows the innermost layer. The modules are placed as close as possible to the beam pipe, at a radius of 1.5cm. The steering chips are at the long side of the matrix and the readout chips are at the short end. The modules are overlapping, to</p> <p>28 80 CHAPTER 3. 	<p>Number of Ladder length” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [37-38].</p> <p>“The flip-chip bonding process offers advantages over the wire bonding connection, such as a lower area requirement, shorter paths between substrate and chip, lower inductance and a fast parallel bonding process. The pads of substrate and chip are placed face-to- face and brought into contact using a conductive material. Flip-chip bonding needs less area on the substrate, because the landing pads are covered by the chip, whereas wire bonding needs space for wire looping and for the destination pads located around the chip. The path between source and destination pads is only a few tens of micrometers long, whereas bonding wires are in the range of hundreds or thousands of micrometers. Different conductive materials can be used to form the interconnection, e.g. gold-stud bumps, solder bumps, indium bumps or conductive glues and films.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [91].</p> <p>“The substrate pads have to be cleaned of remaining solder prior soldering a new chip. The solder jetting machine has been ordered with an additional desoldering head. It allows a selective removal of solder balls. Its working principle is shown in figure 6.14. The substrate is pre-heated to a temperature below the melting point to assist a selective melting of solder balls. The solder ball’s temperature is increased above the melting point by hot nitrogen gas blown through a heating nozzle (A). The head moves then downwards and vacuum is applied to the tapered capillary. A sideways movement pushes the solder ball to the pads edge and the vacuum removes it (B).” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [99].</p>

	<p>“The DEPFET matrixes of the PXD5 production for characterization of the ILC type designs were tested in setups with the read-out and steering chips wire bonded to the matrix. The novel all-silicon module approach, with flip-chip bonded chips, has not yet been demonstrated with active components. The first DEPFET matrixes with flip-chip interconnection of the read-out and steering chips were included on the PXD6 wafer run. Different matrix design are used to evaluate the optimal pixel layout for the Belle II vertex detector. Most of the matrixes are still wire bondable for a faster comparison of different matrix types with the same steering and readout chips. They are bonded to PCBs, which can be plugged into the read-out system. Some matrix types have flip-chip footprints on the detector silicon, to build all-silicon modules. Most of the flip-chip matrixes have an active area of 128×16 pixels, which is sufficient for evaluation of the flip-chip module performance. Large matrixes with more than 768×120 pixels are included on the wafer too, to gain information about the production yield and the performance of large matrixes. The wafers will be partially thinned with the technology presented in 3.2. The PXD6 matrixes are the first thinned and bump bondable DEPFET matrixes. Besides the DEPFET design evaluation, work on the mechanical integration of the modules in the Belle II detector is necessary. A support carrier is needed to mount the modules in two concentric layers around the beam pipe. The data signals and power supply lines have to be routed on a cable through the Belle detector to the DEPFET ladders. The cable has to be securely connected to the modules. Power dissipated by chips and DEPFET transistors has to be removed by cooling and the thermal expansion of the material has to be taken into account for the mechanical designs. The signal routing and cable mounting on the module with a constrained size require training. Two” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [115-117].</p>

Appendix A-44 - Invalidity of U.S. Patent No. 9859202 in view of Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module - Non-Patent Publication

	<p>“The PXD6 production provides two poly-silicon layers for the DEPFET gate and clear- gate structures. Two aluminum metal layers with a sheet resistance of 30m/□ are available for routing the power supplies and the data signals. Gold stud bumps have to be used to interconnect the flip-chip devices, as the pad metallization is aluminum and an additional under bump metallization is not available. Since the test structures presented in chapter 6.5.5 couldn’t provide information on the insulator stability and the impact of bumping on pads with traces routed below, this routing option was avoided. The traces are routed in between the bumps with at least 7μm distance to pads, to accommodate the pad deformation during uncentered bump placement. A bump pad is designed with both metal layers, as this design showed a good bondability on the bumping test structures. Poly-silicon is forming a barrier layer below each bump pad and thereby prohibits shorts between the bulk material and the metal layers.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [119].</p> <p>To the extent Plaintiff contends that Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
[1.B] a top package substrate stacked on top of the bottom package substrate;	<p>Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p><i>See, e.g.:</i></p>

	<p>“The chips can be directly connected to the matrix by wire- or bump-bond techniques or by an intermediate layer of PCB¹, silicon or a kapton based flex board.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [31].</p> <p>“The All-Silicon Model By enlarging the silicon size of a DEPFET sensor, while keeping the size of the active area constant, space can be created for directly mounting the steering and readout chips onto the detector silicon and for routing the interconnection and power traces. On a highly integrated and densely populated area of such all-silicon modules, the routing of a huge amount of signal and power connections is a difficult task. The components, located on the detector silicon, must not influence the detector or the electronics operation. Figure 3.2 shows a sketch of the module concept. <p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“The additional routing layer can be seen between the bumps, which connects the bumps and is also used to distribute a supply voltage across the chip.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [96-97].</p> <p>“The solder jetting technology was chosen, because it doesn’t need mask sets and can be flexibly adjusted to different bump patterns. It neither needs toxic chemicals for plating, nor solder pastes. The solder is delivered as a powder with single spheres of a controlled diameter. The machine can support sphere diameters from 60µm up to 760µm. Currently, only the 60 µm diameter balls are in use. Figure 6.8 illustrates the solder jetting process. The solder balls are stored in a reservoir and singularized by a disk with holes and thickness matching the ball diameter. A single ball is fed into the capillary with an exit hole smaller than the ball (A). It clogs the hole and nitrogen pressure is applied to the airtight bond head. An infrared laser pulse melts the ball in the capillary (B) and the pressure blows the melted solder out (C). It is deposited onto the destination pad and solidifies (D). This process requires</p>

Appendix A-44 - Invalidity of U.S. Patent No. 9859202 in view of Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module - Non-Patent Publication

	<p>nitrogen gas to prevent the solder balls from oxidizing during the jetting process and during storage in the reservoir. The process can be adopted to different ball sizes by exchanging the capillary and the singularization disc. An under bump metallization is also required for the solder jetting process. As the devices are delivered with an aluminum pad finish and the standard UBM processes are not available, a flattened gold stud bump is used to place on the solder spheres. The gold bumps are flattened (coined) by pressing a glass plate with a defined force upon the bumps. A force of 40gr/bump creates a flat top with 40µm diameter on the 60µm diameter gold bump (figure 6.9). Afterwards, the chip has been solder bumped with 60µm solder balls, which created bumps with 65µm diameter and 40µm height (figure 6.11).” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [97].</p> <p>“The HyperImage medical imaging project [51] develops a hybrid system of time-of-flight positron emission tomography and magnetic resonance imaging. A multi channel read- out ASIC has been developed, which allows time-stamping in the range of 15 picoseconds [52]. A stack of 3 PCBs contains the silicon photo-multiplier (SiPM) detectors on top, the read- out ASICS in the middle and a controller board at the bottom [53].” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [109].</p> <p>“A ceramic interposer with filled through hole vias is used to connect the detector with the read-out ASIC and provides a fan-out for the ASIC’s power and data signals. The detector is flip-chip bonded to one side of the interposer, while the ASIC is bonded to the other side.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [114].</p>

	<p>manufactured: One includes the metal layers of a DEPFET matrix in the active area to measure the parasitic capacitances and to check the yield issue (see figure 7.10). The other layout has test structures in this area, needed to operate and to test the chip performance.</p> <p>7.2.1 Switcher Balcony The Switcher balcony layout of the MCM is comparable to the PXD6 layout. Figure 7.11 shows a single Switcher with routing and decoupling. The first layer is used to route the control and strobe signals, as well as the JTAG slow control from the DHP chips to the Switchers. The digital power supply located left of the bumps is also routed in long buses to all chips. The second layer interconnects the chips with the buses and with the gate and clear lines of the matrix area. Termination resistors for the differential signals are not yet included into the chip and discrete surface mount resistors with a size of 01005 (0.4 × 0.2mm²) had to be added to the MCM layout. Wire bond pads are foreseen to short circuit the serial input and output lines in case of a broken Switcher. The resistor and the wire bond jumper pads are located in the ‘active area’ and are only needed for the MCM design. The final Switcher production will include the termination resistors. The right picture in figure 7.11 shows the 3rd metal layer. It is used to provide the bump landing pads in the solderable copper metallization.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [130].</p> <p>To the extent Plaintiff contends that Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

	<p>To the extent Plaintiff contends that Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.H] the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector,</p>	<p>Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module discloses, either expressly or inherently, the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.</p> <p><i>See, e.g.:</i></p> <p>“A sideways movement pushes the solder ball to the pads edge and the vacuum removes it (B). 6.5 Test Structures Test substrates and test chips were used for evaluation of the flipping process, which create daisy chain connection of bumps after flipping. The substrate includes multiple pads for probing the connectivity of the daisy chained bump connections. Flip-chip process parameters like pressure, time and temperature were evaluated with gold stud” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [99-100].</p> <p>“The first test vehicles used were made of glass substrates with gold coated structures. They included 4 daisy chain connections of 16 bumps each, with probe pads for connectivity tests. Single bump and double bump approaches have been tested. Single bump assemblies use bumps on the chip only, while bumps on the chip and on the substrate are called double bump. The same flip-chip parameters have been used with all assemblies. A pressure of 80gr/bump</p>

	<p>and 350°C for 120 seconds forms the connection during the thermocompression bonding. Both assembly types showed successful bonds on all bumps, determined by the electrical connection.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [100].</p> <p>“The gold dummy chips were sufficient for the first test, but the Switcher3 and DCD chips, as well as the DEPFET module are based on silicon substrates with aluminum structures and have a higher pad count. The higher pad count results in a high pressure applied to the chip and substrate, which can possibly cause mechanical defects on the thinned DEPFET modules. A new set of test vehicles has been developed during the thesis, to adopt the bumping and the flip-chip processes to aluminum structured devices. The dummy chips should be mechanically as similar as possible to the real chips, although they were manufactured in a different technology and without active devices.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [101].</p> <p>“The digital output signals are routed to the DCD-RO converter chip, which is located close to the DCDB on the same wire bond adapter. It converts the DCDB’s single ended signals to differential pairs, which can be wire bonded to a PCB. Additional sense pads allow measurements of the supply voltages close to the chips, to compensate for voltage drops caused by the sheet resistance of the adapter’s aluminum traces. Two adapter types were designed for the Switcher-B. The first type (figure 6.28) can control a DEPFET Matrix of the PXD6 production (see chapter 7.1). It connects all 16 gate and clear signals of the matrix. The second adapter type is required to operate the matrixes from the previous DEPFET production PXD5, which were designed for the Switcher3. Two chips are needed to provide the gate and clear signals, as the bond pads are located on opposite sides of the matrix. While the gate signals can be connected by the first adapter type, the second type has to be used to</p>
--	---

	<p>connect to the clear pads¹. 1The matrix rows would be read out and cleared in opposite directions, if the first type also used to provide the clear signals. The Switcher-B is rotated by 180° on the second adapter type. 6.6. WIRE BONDING ADAPTERS 97 Figure 6.29: Damaged aluminum caused by a touching gold wire due to a bumping machine malfunction. Figure 6.30: Short circuit on a wire bond adapter caused by incomplete etching. Figure 6.31: Photograph of an assembled wire bond adapter with a DCD-RO (left) and a DCDB (right). The different chip thicknesses are well visible. The first adapters were produced together with the Belle-type dummy chips and didn't include a passivation layer. They were sensitive to mechanical damages during handling or to machine malfunction during bumping. This caused damaged or shorted metal traces, as displayed in figure 6.29. The next iteration of the adapters included a passivation layer to protect the soft aluminum traces. The adapter close to the wafer edge showed shorts between metal traces caused by dust particle contaminations during lithography or etching (figure 6.30). The adapters were therefore optically inspected and selected prior bumping and flip-chip assembly. <p>[1.K] a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein</p>	<p>Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module discloses, either expressly or inherently, a bottom chip arranged in the space between the bottom package substrate and the top package substrate, wherein.</p> <p><i>See, e.g.:</i></p> <p>“The DEPFET uses a pn-junction with a fully depleted bulk for signal generation and sidewards depletion to modulate the electrical field. A p-MOS signal amplification transistor is integrated in the front-side of the high resistivity n-type detector material. The highly p-doped back side implantation and the p-implantation of the transistor are used for sidewards depletion. The n⁺-contact needed for depletion is not shown in figure 2.8 and is located outside the sensitive area. The potential minimum for electrons is shifted towards the front side, to $\approx 1\mu\text{m}$ below the surface. A structured n⁺-implant is located beneath the transistor channel and creates the potential minimum, which collects the signal electrons.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [24].</p> <p>“By enlarging the silicon size of a DEPFET sensor, while keeping the size of the active area constant, space can be created for directly mounting the steering and readout chips onto the detector silicon and for routing the interconnection and power traces. On a highly integrated and densely populated area of such all-silicon modules, the routing of a huge amount of signal and power connections is a difficult task. The components, located on the detector silicon, must not influence the detector or the electronics operation. Figure 3.2 shows a sketch of the module concept. The steering chips are located on the long side of the detector, while the readout chips are mounted on the short end. This setup results in short and low capacitance matrix steering signals, which can be charged 3.2. WAFER THINNING 23 quickly. A high capacitive load on the drain lines is not as limiting as on the control lines, because the</p>
---	--

	<p>DEPFET is operated in drain read-out mode, yielding to a current signal. Control, data and power lines have to be connected directly to the silicon, the module is mounted on a support structure, which is also used for actively cooling the readout chips. By thinning the silicon of the detector and the chips, the material budget of the module can be reduced furthermore. For interconnecting the chips with the detector module,” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [32-33].</p> <p>“A benefit of the DEPFET is its low power consumption. A pixel consumes $ID \times VDS$ $100\mu A \times 5V \approx 500\mu W$ during read out. The power consumption of a switched off pixel is almost zero, although it is still sensitive and collects signal electrons. A half module has 2 rows of 512 DEPFET pixels activated during read out with the readout scheme described above. Therefore, an inner layer module consumes 1W. Adding the Switcher steering chips’ 0.85W and the DCD readout chips’ 2048 channels, with 5mW per channel, this sums up to $\approx 12W$.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [40].</p> <p>“The flip-chip bonding process offers advantages over the wire bonding connection, such as a lower area requirement, shorter paths between substrate and chip, lower inductance and a fast parallel bonding process. The pads of substrate and chip are placed face-to- face and brought into contact using a conductive material. Flip-chip bonding needs less area on the substrate, because the landing pads are covered by the chip, whereas wire bonding needs space for wire looping and for the destination pads located around the chip. The path between source and destination pads is only a few tens of micrometers long, whereas bonding wires are in the range of hundreds or thousands of micrometers.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [91].</p>
--	---

Appendix A-44 - Invalidity of U.S. Patent No. 9859202 in view of Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module - Non-Patent Publication

	<p>“The manual process in the ‘Fineplacer Lambda’ is depicted in figure 6.2. The substrate is placed on the table and the bumped chip is fixed on the bond head by vacuum. An optical beam splitter superimposes the two images of the chip and the substrate to visualize the relative position of pads and bumps (A). The substrate is moved horizontally and the chip is rotated by the operator, until the pads and bumps are aligned. The chip is placed on the substrate in a precise 90° movement, maintaining the aligned position (B). The desired force is applied and a temperature cycle is started to form the bonds (C). Temperatures 6.3. GOLD-STUD FLIP-CHIP BONDING” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [92-93].</p> <p>“The DEPFET matrixes of the PXD5 production for characterization of the ILC type designs were tested in setups with the read-out and steering chips wire bonded to the matrix. The novel all-silicon module approach, with flip-chip bonded chips, has not yet been demonstrated with active components. The first DEPFET matrixes with flip-chip interconnection of the read-out and steering chips were included on the PXD6 wafer run. Different matrix design are used to evaluate the optimal pixel layout for the Belle II vertex detector.” Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module, [117].</p> <p>To the extent Plaintiff contends that Steering Electronics, Module Design and Construction of an All Silicon DEPFET Module fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

Appendix A-45 - Invalidity of U.S. Patent No. 9859202 in view of All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices - Non-Patent Publication

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART
Invalidity of U.S. Patent No. 9859202 in view of All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices - Non-Patent Publication

All-Copper Chip-To-Substrate Interconnects For High Performance Integrated Circuit Devices was published by Tyler N. Osborn. All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ‘202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory². All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices is a dissertation that was published April 2, 2009. All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices is therefore prior art to the ‘202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, or otherwise rendered obvious by disclosures and teachings of All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices with: (1) the

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-45 - Invalidity of U.S. Patent No. 9859202 in view of All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices - Non-Patent Publication

knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ‘202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	To the extent the preamble is a limitation, All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices discloses, either expressly or inherently, a structure. <i>See, e.g.:</i>

Appendix A-45 - Invalidity of U.S. Patent No. 9859202 in view of All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices - Non-Patent Publication

	<p>“In this work, all-copper connections between silicon microchips and substrates are developed. The semiconductor industry advances the transistor density on a microchip based on the roadmap set by Moore’s Law. Communicating with a microprocessor which has nearly one billion transistors is a daunting challenge. Interconnects from the chip to the system (i.e. memory, graphics, drives, power supply) are rapidly growing in number and becoming a serious concern. Specifically, the solder ball connections that are formed between the chip itself and the package are challenging to make and still have acceptable electrical and mechanical performance.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [16].</p> <p>“The fabrication process flow diagram is shown in Figure 3.1. A seed layer consisting of Cr/Cu/Ti (50nm/500nm/10nm) was DC sputtered onto a bare <100> 4” Si wafer. Then, a Unaxis PECVD system was used to deposit 1.5 μm of silicon dioxide at 250°C on top of the Ti layer. Microposit SC1813 photoresist (Shipley Corporation) was spun on the silicon dioxide surface. After photo-patterning the photoresist layer, buffered oxide etch (BOE) was used to etch the SiO₂ and Ti layers in the exposed areas down to the underlying Cu seed layer. Remaining photoresist was removed by acetone rinsing. Next, a thick layer of Avatrel 2195P polymer (Promerus LLC, Brecksville, OH) was spun onto the sample surface. The spin speed for the polymer was 500 RPM for 60 seconds. After spin-coating, a 100°C soft-bake was performed on a hotplate for 40 minutes. The Avatrel layer was then photo-patterned using 250 mJ/cm² dose at 365nm wavelength. Following exposure a post-exposure bake was applied in an oven at 100°C for 20 minutes. Then, the layer was developed in BioAct EC-7R Defluxer for 30 seconds immersed in an ultra-sonic bath. The polymer pattern generated high aspect ratio hollow core molds for copper pillar electroplating. 33 Si Cu and SiO₂ Deposition</p>

	<p>SiO2 Patterning Polymer Coating SiO2 Cu” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [50-51].</p> <p>“After electroplating, test chips were then diced and flip-chip aligned in a RD Automation M- 34 10A flip-chip bonder or alternatively in a FineTech Fineplacer bonder. Aligned samples were then temporarily held together with a low temperature melting wax. The aligned samples were then placed into a copper electroless plating bath.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [52-53].</p> <p>“To fabricate test samples on the printed circuit board materials an alternate approach was taken show in Figure 3.3. FR-406 (FR-4) from Isola Global was received with copper laminated to the surface. On top of the copper layer a thin Ti adhesion layer, 10 nm, was sputtered onto the surface. Then, a thick layer of Avatrel 2195P was spin- coated to 50 μm thickness. This layer was photo-defined to create openings for pillars. Buffered oxide etch was used to remove the Ti from the holes. Then, the previously described electroplating process was used to build up the copper pillars. Finally, the substrates were cut into 10mm x 10mm test samples for bonding to fabricated silicon test chips.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [54].</p> <p>“The effects of increased modulus of the polymer collar were experimentally verified. Copper pillars were fabricated with three different photodefinable polymer collars, each with a different elastic modulus. The samples were bonded via the electroless copper plating and annealing process, as described previously, and then shear tested to investigate the mechanical strength.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [55].</p>
--	--

Appendix A-45 - Invalidity of U.S. Patent No. 9859202 in view of All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices - Non-Patent Publication

	<p>“Copper pillars were pre-fabricated on silicon substrates and flip-chip assembled, as previously discussed³. The test samples were electrolessly copper plated and joined using copper baths with different PEG concentrations. The samples were then potted in epoxy and cross-sectioned prior to any annealing to analyze the joint between the deposited metal.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [107].</p>
[1.A] a bottom package substrate;	<p>All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p> <p>“Chip-to-substrate interconnects provide power, electrical contacts, and a mechanical link between the chip and the substrate. The two most common chip assembly schemes today, wire bonding and flip chip bonding are illustrated in Figure 1 (a) and (b), respectively. [1-4] The area-array flip-chip configuration provides for a higher number of I/O and the electrical environment is superior to wire bonding because it has lower inductance and capacitance. An area array of flip-chip solder balls has more I/O than peripheral wire bonds. Flip-chip connections also provide an additional thermal path for chip cooling through the I/O. Flip chip assembly uses metal connections; often solder spheres, to connect the chip to the substrate and/or the substrate to the board as shown in Figure 1 (b). Chips can also be connected directly to the board in a chip-on-board (COB) configuration, Figure 1 (c). COB is a less costly and lower profile (total height) technology; however, the substrate helps in electrical fan-out and allows for a higher number of I/O. The substrate also assists in assembly of a heat-sink which is needed on high power chips.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [19-20].</p>

Appendix A-45 - Invalidity of U.S. Patent No. 9859202 in view of All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices - Non-Patent Publication

	<p>“Packaging with cost-effective organic printed circuit boards requires that elevated temperature excursions be as low as possible, but definitely below 250 C.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [23].</p> <p>“To fabricate test samples on the printed circuit board materials an alternate approach was taken show in Figure 3.3. FR-406 (FR-4) from Isola Global was received with copper laminated to the surface. On top of the copper layer a thin Ti adhesion layer, 10 nm, was sputtered onto the surface. Then, a thick layer of Avatrel 2195P was spin- coated to 50 μm thickness. This layer was photo-defined to create openings for pillars. Buffered oxide etch was used to remove the Ti from the holes. Then, the previously described electroplating process was used to build up the copper pillars. Finally, the substrates were cut into 10mm x 10mm test samples for bonding to fabricated silicon test chips.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [54].</p> <p>“Samples were made using the flip-chip alignment, electroless plating, and low temperature annealing process described above. An anneal temperature of 180°C for one hour was used. Bonding between silicon and the organic materials is unique versus the silicon-to-silicon bonding tests in that the materials no longer have the same coefficient of thermal expansion (CTE). The CTE of Si is 3 ppm/°C versus 14 ppm/°C for FR-4 and 15 ppm/°C for BT. During the annealing process, the copper interconnects will be under shear stress conditions. Brongersma et al have shown that copper films under stress during recrystallization can exhibit unusually large grain growth termed super secondary grain growth. [56] Shear loading conditions could potentially be helpful to the bonding process and encourage grain growth in the bonded 53 53 region. After annealing, the samples were shear tested and compared to silicon-to-silicon bonded samples annealed at the same temperature. The</p>

Appendix A-45 - Invalidity of U.S. Patent No. 9859202 in view of All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices - Non-Patent Publication

	<p>silicon-to-board bonded samples exhibit different failure characteristics versus silicon-to-silicon bonding. Since the Avatrel is no longer a single polymer collar surrounding the copper pillar on the organic substrate, but instead a continuous polymer film, it can no longer detach from the surface easily during shear force testing. Therefore, the stress failure takes place in two steps. First, the copper pillar is broken from the copper laminate surface (pillar-to-surface adhesion). Then, the pillar is pulled out from the polymer film and remains attached to the pillar on the silicon sample surface. An example of successful bonding chip-to-substrate that survived the destructive shear force testing is shown in cross-section in Figure 4.7. It exhibits very uniform cross-section and no interfaces between the bonded pillar structures. All of the samples tested showed no visible degradation of the organic board materials.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [71-72].</p> <p>“Since increasing the temperature alone leads to transport limitations and porosity, an additive based strategy was employed. If the temperature could be increased, but the deposition rate suppressed by adsorption of an inhibitor, the kinetically controlled conditions could be maintained. PEG was chosen as an inhibiting additive since its interactions with copper surfaces and electroless plating chemistries have been studied.[73-79] In order to characterize the effects of PEG on our electroless plating rate, various concentrations of PEG were used and the plating rate was measured. Clean copper 87 surfaces were used for this experiment to reduce the transport limitations as much as” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [105-106].</p> <p>“Since the industry is moving towards on-chip interconnect networks that require the use of brittle inter-metal dielectric materials to meet low-k requirements, stress on these networks in the package is a serious concern.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [112].</p>

	<p>separation distances between the pillar top surfaces, different height pillars were electroplated onto the samples of 30, 40, and 50 μm, leading to separation distances between the pillar surfaces of approximately 65, 45, and 25 μm respectively.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [53].</p> <p>“The solder reflow process has unique capabilities to overcome the non-planarity of organic substrates and either elongate or flatten as necessary to bond the chip to the package. Assessing the z-axis height mismatch the all-copper process can overcome is important in characterizing its dexterity versus traditional solder processing. Figure 4.5 shows SEM images of the results of testing separation distances of approximately 25, 45, 51 and 65 μm.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [69-70].</p> <p>“Figure 4.5: SEM images showing the effects of increasing separation distance between pillar surfaces at distances of: (left) 25 μm (middle) 45 μm (right) 65 μm” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [70].</p> <p>“Figure 5.2: Illustration and finite element model of the single copper pillar system used in this study” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [80].</p> <p>To the extent Plaintiff contends that All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	---

Appendix A-45 - Invalidity of U.S. Patent No. 9859202 in view of All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices - Non-Patent Publication

<p>[1.D] the spacer connector comprises a core substrate;</p>	<p>All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices discloses, either expressly or inherently, the spacer connector comprises a core substrate.</p> <p><i>See, e.g.:</i></p> <p>“The structure has been simplified to eliminate one of the half-turn structures, shown in Fig. 2.4.[17] The electrical properties of the compliant I/O are an essential element of the design. Of particular interest for helix structures is the self-inductance, which ranged from 0.03 to 0.15 nH for the designs studied.[17] 11 A bimetallic beam structure has been designed and studied. [18] The bimetallic internal stress gradient in the beam creates an upward bending of the beam upon release from the surface. Solder attachment metal on the released end of the beam provides for attachment to the next layer of packaging.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [29-30].</p> <p>“Finally, more complex beam shapes have been investigated. Liao et al. have studied released beams on the chip.[19] The beams are anchored on both ends (on the chip) and released in the middle. The released portion of the beam can take a variety of forms, including ‘S’ shaped elements. A solder attachment bump can be placed in the middle of the release beam. This provides extensive design freedom.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [30].</p> <p>“By applying a metal conductor to the 13 exterior of a polymer pillar, the compliance of the interconnect structure could be improved. Aggarwal et al. showed that by using a compliant polyimide core material with a copper shell the compliance increased versus the use of a solid copper pillar of the same diameter (as shown in Figure 2.6).[24] Due to the skin effect at high operating frequency, the copper shell does not have to be very thick since the signal does not</p>
--	---

Appendix A-45 - Invalidity of U.S. Patent No. 9859202 in view of All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices - Non-Patent Publication

	<p>penetrate deep into the metal. For example, copper has a skin depth of approximately $1.2\text{ }\mu\text{m}$ at 3 GHz operating frequency. This portion of metal is primarily involved in the transmission of the electrical signal. As operating frequency increases the skin depth continues to decrease which works in favor of these structures since the exterior copper thickness limits the mechanical compliance.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [31-32].</p> <p>“Thus, one can consider geometries other than cylindrical in order to distribute a given force (dictated by the CTE mismatch between Si and FR-4) over a wider area (lower effective stress at the critical point in the chip-pillar interface). Expanding the effective surface area of the pillar in the direction of the thermal expansion was achieved by considering an elliptical pillar. Using the ellipse requires careful consideration of the orientation of the I/O so that the broader face of the elliptical pillar is facing the direction of thermal expansion. Three different elliptical shapes were chosen based on their eccentricity. For simplicity, the ratio of the two diameters that define the ellipse, A and B, will be used to define the shape, as shown in Figure 5.7. While holding the cross-sectional area approximately constant, three different A/B ratios were chosen and compared to the $50\text{ }\mu\text{m}$ diameter circular pillar. Cross-sectional plots of the stress at the chip surface for a cylinder with $A/B = 1$ and an ellipse with $A/B = 3$ are” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [86].</p> <p>To the extent Plaintiff contends that All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>

<p>[1.E] a plurality of metal pillars, each passing through the core substrate; and</p>	<p>All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.</p> <p><i>See, e.g.:</i></p> <p>“The materials available to create capped solid metal pillar connections are highly variable and most likely depend on cost and application requirements” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [31].</p> <p>“Huffman et al. have shown that pure tin placed between two copper bumps can be used to create a solid pillar interconnect (as shown in Figure2.7).[25] It was shown that 2 μm thick tin layers would form homogeneous Cu3Sn intermetallics in the bonded region, but were very sensitive to non-planarity between chip and substrate. Small variations in the vertical separation between bumps could prevent forming of a solid bond. Thicker tin layers, 3.7 – 6 μm, were used to alleviate the sensitivity to non-planarity and lower bonding pressures were used to prevent squeeze out of the tin. Unfortunately, this resulted in bond intermetallics layers consisting of a tri-layer structure of Cu3Sn/Cu6Sn5/Cu3Sn. Higher pressures could still achieve the homogeneous Cu3Sn intermetallic but led to significant squeeze out of tin. The results also showed that, based on die shear testing, the homogeneous bonded Cu3Sn intermetallic led to higher shear strength” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [33].</p> <p>“By using an undercut photoresist pattern as the electroplating mold cone shaped gold bumps can be created. Due to the extremely small cross-section of the tip of the cone, the material can be made to yield and flatten during the thermo-compressive bonding cycle. Figure 2.11</p>

<p>[1.J] the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of top metal pillars of the bottom package substrate; and</p>	<p>All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices discloses, either expressly or inherently, the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of top metal pillars of the bottom package substrate.</p> <p>See, e.g.:</p> <p>“The all-copper process entails electroless copper deposition between two copper pillars, followed by low temperature annealing to ‘knit’ together the seam left between xvi the two pillars and mechanically strengthen the joint. It was found that using a commercially available electroless copper bath for the plating, followed by annealing at 180 C for 1 hour, the shear strength of the copper-copper bond was approximately 165 MPa. Cross-section analysis showed that during the deposition process plating occurs until a fine seam remains between the two plated surfaces. Then, upon annealing the seam begins to diminish and finally disappear after annealing at 180 C. This is significant since 180 C is compatible with cost-effective organic substrate materials such as FR-4, which are commonly used for typical flip-chip packaging.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [16-17].</p>

Appendix A-45 - Invalidity of U.S. Patent No. 9859202 in view of All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices - Non-Patent Publication

	<p>“Chip-to-substrate interconnects provide power, electrical contacts, and a mechanical link between the chip and the substrate. The two most common chip assembly schemes today, wire bonding and flip chip bonding are illustrated in Figure 1 (a) and (b), respectively. [1-4] The area-array flip-chip configuration provides for a higher number of I/O and the electrical environment is superior to wire bonding because it has lower inductance and capacitance. An area array of flip-chip solder balls has more I/O than peripheral wire bonds. Flip-chip connections also provide an additional thermal path for chip cooling through the I/O.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [19].</p> <p>“The fabrication process flow diagram is shown in Figure 3.1. A seed layer consisting of Cr/Cu/Ti (50nm/500nm/10nm) was DC sputtered onto a bare <100> 4” Si wafer. 	<p>10mm test samples for bonding to fabricated silicon test chips.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [54].</p> <p>“Samples were made using the flip-chip alignment, electroless plating, and low temperature annealing process described above. An anneal temperature of 180°C for one hour was used. Bonding between silicon and the organic materials is unique versus the silicon-to-silicon bonding tests in that the materials no longer have the same coefficient of thermal expansion (CTE). The CTE of Si is 3 ppm/°C versus 14 ppm/°C for FR-4 and 15 ppm/°C for BT. During the annealing process, the copper interconnects will be under shear stress conditions.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [71].</p> <p>“After annealing, the samples were shear tested and compared to silicon-to-silicon bonded samples annealed at the same temperature. The silicon-to-board bonded samples exhibit different failure characteristics versus silicon-to-silicon bonding. Since the Avarel is no longer a single polymer collar surrounding the copper pillar on the organic substrate, but instead a continuous polymer film, it can no longer detach from the surface easily during shear force testing.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [72].</p> <p>“An example of successful bonding chip-to-substrate that survived the destructive shear force testing is shown in cross-section in Figure 4.7. It exhibits very uniform cross-section and no interfaces between the bonded pillar structures. All of the samples tested showed no visible degradation of the organic board materials.” All-Copper Chip-to-Substrate Interconnects for High Performance Integrated Circuit Devices, [72].</p>

Appendix A-46 - Invalidity of U.S. Patent No. 9859202 in view of Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects - Non-Patent Publication

E.D. Tex. Case No. 2:25-CV-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9859202 in view of Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects - Non-Patent Publication

Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects was published by Aibin Yu, et al. Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects anticipates and/or renders obvious all Asserted Claims¹ of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.² Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects is an academic article that was published July 18, 2011. Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects is therefore prior art to the ’202 patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects, or otherwise rendered obvious by disclosures and teachings of Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative,

¹ As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

² To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-46 - Invalidity of U.S. Patent No. 9859202 in view of Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects - Non-Patent Publication

and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ‘202 patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects set forth in this chart.

Claim 1, U.S. Patent No. 9859202

Appendix A-46 - Invalidity of U.S. Patent No. 9859202 in view of Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects - Non-Patent Publication

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“Fig. 1 shows a schematic drawing of the packaging structure with a top Si die and a Si interposer. On the top Si die, there are Cu pillars/Sn caps fabricated on it whereas on the TO MEET the miniaturization trend and to reduce power Si interposer, there are TSVs that are filled with Cu and on chip integration with Si interposer technology is studied extensively as it has the potential to provide ultrafine pitch wiring.” Fabrication of High Aspect Ratio TSV and Assembly with Fine-Pitch Low-Cost Solder Microbump for Si Interposer Technology with High-Density Interconnects, [1336].</p>

Appendix A-47 - Invalidity of U.S. Patent No. 9,859,202 in view of Teensy Board

E.D. Tex. Case No. 2:25-cv-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9,859,202 in view of Teensy Board

The Teensy series, including but not limited to Teensy 2.0, Teensy 3.0, and Teensy 3.1, stacked with various adaptors, including but not limited to Audio Adaptor, SD Adaptor, Wiz820+SD Adaptor, OctoWS2811 Adaptor, Wiz812 Adaptor, and XBee Adaptor (hereinafter “Teensy Board”) was in public use, on sale (including sold to customers and potential customers), and/or otherwise available to the public by PJRC, LLC at least by Dec. 21, 2014.¹ Teensy Board anticipates and/or renders obvious all Asserted Claims² of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.³ Teensy Board, or the written materials describing it, excerpted below, is prior art to the ’202 Patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Teensy Board, or otherwise rendered obvious by disclosures and teachings of Teensy Board, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Teensy Board does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Teensy Board with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 Patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Teensy Board, either alone or in combination with other prior art cited by Samsung and/or with

¹ See, e.g., <https://web.archive.org/web/20141221071236/http://www.pjrc.com/store/teensy31.html>

² As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

³ To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserves the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-47 - Invalidity of U.S. Patent No. 9,859,202 in view of Teensy Board

the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Teensy Board “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Teensy Board or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Teensy Board set forth in this chart.

Claim 1

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	To the extent the preamble is a limitation, Teensy Board discloses, either expressly or inherently, a structure. <i>See, e.g.:</i>

Appendix A-47 - Invalidity of U.S. Patent No. 9,859,202 in view of Teensy Board

This photo shows a Teensy 3.1 soldered under the audio adaptor using two [14x1 pins](#).

The optional volume knob and line in/out header are also added.

	 <p>“This audio adaptor lets you easily add high quality 16 bit, 44.1 kHz sample rate (CD quality) audio to your projects with Teensy 3.0 or 3.1. It supports stereo headphone and stereo line-level output, and also stereo line-level input or mono microphone input.</p> <p>The Teensy Audio Library lets you use the input and output simultaneously together with a toolkit of audio processing objects, to easily create all types of sophisticated audio applications. You can play multiple sound files, create synthesized waveforms, apply effects, mix multiple streams and output high quality audio to the headphones or line out pins.</p>
--	--

Appendix A-47 - Invalidity of U.S. Patent No. 9,859,202 in view of Teensy Board

Teensy 3.0 & 3.1 have the Cortex-M4 DSP instructions which provide plenty of computational power for real-time FFT (spectrum analysis), opening up the possibility of creating advanced sound-reactive projects.”

https://web.archive.org/web/20141221060821/http://www.pjrc.com/store/teensy3_audio.html

	<div data-bbox="267 319 873 1278"></div> <p>“This adaptor board connects Teensy 3.1 to thousands of LEDs using the OctoWS2811 Library.</p> <p>The adaptor features a 74HCT245 buffer chip and 100 ohm impedance matching resistors. CAT6 Ethernet cable is used from this board to the LED strips. CAT6 cable is designed for very high bandwidth, minimal cross-talk between twisted pairs, and 100 ohm impedance, for a very high quality signal. The RJ-45 network jacks allow your LED array to be easily disconnected from the electronics.</p> <p>...</p> <p>Teensy 3.1 is added on top of the adaptor using stacking header pins, or a header and socket pair if you wish to be able to remove the Teensy 3.1 board.”</p>

<p>[1.A] a bottom package substrate;</p>	<p>Teensy Board discloses, either expressly or inherently, a bottom package substrate.</p> <p>See, e.g.:</p>

Appendix A-47 - Invalidity of U.S. Patent No. 9,859,202 in view of Teensy Board

“The Teensy USB Development Board is a complete USB-based microcontroller development system. Version 3.0 features a 32 bit ARM processor. All Teensy boards are shipped assembled and fully tested.”

<https://web.archive.org/web/20141221111436/http://www.pjrc.com/store/teensy3.html>

Appendix A-47 - Invalidity of U.S. Patent No. 9,859,202 in view of Teensy Board

“The Teensy USB Development Board is a complete USB-based microcontroller development system. Version 3.1 features a 32 bit ARM processor. All Teensy boards are shipped assembled and fully tested.”

<https://web.archive.org/web/20141221071236/http://www.pjrc.com/store/teensy31.html>

Appendix A-47 - Invalidity of U.S. Patent No. 9,859,202 in view of Teensy Board

	 <p>“Teensy 3.1 is added on top of the adaptor using stacking header pins, or a header and socket pair if you wish to be able to remove the Teensy 3.1 board.”</p> <p>https://web.archive.org/web/20141221070129/http://www.pjrc.com/store/octo28_adaptor.html</p> <p>To the extent Plaintiff contends that Teensy Board fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Appendix A-47 - Invalidity of U.S. Patent No. 9,859,202 in view of Teensy Board

[1.B] a top package substrate stacked on top of the bottom package substrate;

Teensy Board discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.

See, e.g.:

This photo shows a Teensy 3.1 soldered under the audio adaptor using two [14x1 pins](#).

The optional volume knob and line in/out header are also added.

Appendix A-47 - Invalidity of U.S. Patent No. 9,859,202 in view of Teensy Board

	<p>“This audio adaptor lets you easily add high quality 16 bit, 44.1 kHz sample rate (CD quality) audio to your projects with Teensy 3.0 or 3.1. It supports stereo headphone and stereo line-level output, and also stereo line-level input or mono microphone input.</p> <p>The Teensy Audio Library lets you use the input and output simultaneously together with a toolkit of audio processing objects, to easily create all types of sophisticated audio applications. You can play multiple sound files, create synthesized waveforms, apply effects, mix multiple streams and output high quality audio to the headphones or line out pins.</p> <p>Teensy 3.0 & 3.1 have the Cortex-M4 DSP instructions which provide plenty of computational power for real-time FFT (spectrum analysis), opening up the possibility of creating advanced sound-reactive projects.”</p> <p>https://web.archive.org/web/20141221060821/http://www.pjrc.com/store/teensy3_audio.html</p>
--	---

Appendix A-47 - Invalidity of U.S. Patent No. 9,859,202 in view of Teensy Board

“The Teensy USB Development Board is a complete USB-based microcontroller development system. Version 3.0 features a 32 bit ARM processor. All Teensy boards are shipped assembled and fully tested.”

Appendix A-48 - Invalidity of U.S. Patent No. 9,859,202 in view of Sseed Board

E.D. Tex. Case No. 2:25-cv-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9,859,202 in view of Sseed Board

The Sseed stackable logic boards, including but not limited to Bugduino, Clio Main Board, MilCandy, Rainbowduino LED driver platform-Atmega 328, Sseeduino ADK Main Board, Sseeduino Ethernet, Sseeduino Lite, Arduino YUN, Sseeduino Mega, Sseeduino Stalker, Sseeduino v3.0, Freeduino USB complete Kit, Orbshield v1.0 Kit, Protoshield Kit for Arduino, and Sseeduino Mega Protoshield Kit (hereinafter “Sseed Board”) was in public use, on sale (including sold to customers and potential customers), and/or otherwise available to the public by Sseed Technology Limited at least by Dec. 14, 2014.¹ Sseed Board anticipates and/or renders obvious all Asserted Claims² of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.³ Sseed Board, or the written materials describing it, excerpted below, is prior art to the ’202 Patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Sseed Board, or otherwise rendered obvious by disclosures and teachings of Sseed Board, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Sseed Board does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Sseed Board with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 Patent. TopWire has yet to identify any limitation of the Asserted Claims that it

¹ See, e.g., https://web.archive.org/web/20141214084852/http://www.sseedstudio.com/wiki/index.php?title=Main_Page#Arduino

² As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

³ To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-48 - Invalidity of U.S. Patent No. 9,859,202 in view of Sseed Board

contends is not fully disclosed by Sseed Board, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Sseed Board “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Sseed Board or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Sseed Board set forth in this chart.

Claim 1

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	To the extent the preamble is a limitation, Sseed Board discloses, either expressly or inherently, a structure. <i>See, e.g.:</i>

Appendix A-48 - Invalidity of U.S. Patent No. 9,859,202 in view of Sseed Board

Appendix A-48 - Invalidity of U.S. Patent No. 9,859,202 in view of Seeed Board

	 <p>“This is the OrbShield, a small circuit board which interfaces with the Arduino microcontroller to convert serial gaming devices to USB HID plug-and-play controllers. It was designed for the SpaceTec SpaceOrb 360, a 6-degree-of-freedom controller for 3d games, and currently supports the SpaceOrb 360 and the Spaceball 2000, 3000, and 4000 series of 3-d CAD controllers.”</p> <p>https://web.archive.org/web/20120920134614/http://www.seeedstudio.com/depot/orbshield-v10-kit-p-671.html?cPath=132_134</p>
--	--

Appendix A-48 - Invalidity of U.S. Patent No. 9,859,202 in view of Seeed Board

	 <p>“The Seeeduino v3 is a microcontroller board based on the ATmega328, and it’s an Arduino compatible board. It has a FTDI USB-to-serial driver chip which can be regarded as a bridge, let your computer can communicate with the board. It has 14 digit pins (which include 6 PWM pins and UART port) and 8 analog pins, a 16 MHz ceramic resonator, a USB connection, a reset button, an ICSP header and a DC power jack. It has two toggle switches, one for input voltage change of ATmega328, the other is enable/disable pin of DTR, which you can use FTDI function alone without the influence of ATmega328. It also has two white Grove connectors, and make it convenient for using Grove products with the board.”</p>

Appendix A-49 - Invalidity of U.S. Patent No. 9,859,202 in view of SainSmart Board

E.D. Tex. Case No. 2:25-cv-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9,859,202 in view of SainSmart Board

The SainSmart controller boards, including but not limited to SainSmart UNO and SainSmart Mega stacked with wireless shields, including but not limited to Ethernet Shield W5100 (hereinafter “SainSmart Board”) was in public use, on sale (including sold to customers and potential customers), and/or otherwise available to the public by SainSmart at least by Feb. 9, 2014.¹ SainSmart Board anticipates and/or renders obvious all Asserted Claims² of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.³ SainSmart Board, or the written materials describing it, excerpted below, is prior art to the ’202 Patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within SainSmart Board, or otherwise rendered obvious by disclosures and teachings of SainSmart Board, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that SainSmart Board does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of SainSmart Board with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 Patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by SainSmart Board, either alone or in combination with other prior art cited by Samsung and/or with

¹ See, e.g., <https://web.archive.org/web/20140209015215/http://www.sainsmart.com/arduino/control-boards.html>

² As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

³ To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-49 - Invalidity of U.S. Patent No. 9,859,202 in view of SainSmart Board

the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that SainSmart Board “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to SainSmart Board or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding SainSmart Board set forth in this chart.

Claim 1

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	To the extent the preamble is a limitation, SainSmart Board discloses, either expressly or inherently, a structure. <i>See, e.g.:</i>

Appendix A-49 - Invalidity of U.S. Patent No. 9,859,202 in view of SainSmart Board

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

E.D. Tex. Case No. 2:25-cv-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

The first generation of Apple iPhone (hereinafter “Apple iPhone 1”) was in public use, on sale (including sold to customers and potential customers), and/or otherwise available to the public by Apple Inc. at least by 2007.¹ Apple iPhone 1 anticipates and/or renders obvious all Asserted Claims² of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.³ Apple iPhone 1, or the written materials describing it, excerpted below, is prior art to the ’202 Patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Apple iPhone 1, or otherwise rendered obvious by disclosures and teachings of Apple iPhone 1, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Apple iPhone 1 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Apple iPhone 1 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 Patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by Apple iPhone 1, either alone or in combination with other prior art cited by Samsung and/or with

¹ See, e.g., [https://en.wikipedia.org/wiki/IPhone_\(1st_generation\)](https://en.wikipedia.org/wiki/IPhone_(1st_generation))

² As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

³ To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Apple iPhone 1 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Apple iPhone 1 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Apple iPhone 1 set forth in this chart.

Claim 1

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	To the extent the preamble is a limitation, Apple iPhone 1 discloses, either expressly or inherently, a structure. <i>See, e.g.:</i>

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

	 <p>“There are two stacked circuit boards on the iPhone. The communications board is on the top, and the logic board is located on the bottom.”</p> <p>https://www.ifixit.com/Guide/iPhone+1st+Generation+Logic+Board+Replacement/447?utm_source=chatgpt.com</p>
[1.A] a bottom package substrate;	Apple iPhone 1 discloses, either expressly or inherently, a bottom package substrate.

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

	 <p>https://www.ifixit.com/Guide/iPhone+1st+Generation+Logic+Board+Replacement/447?utm_source=chatgpt.com</p> <p>To the extent Plaintiff contends that Apple iPhone 1 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

[1.D] the spacer connector comprises a core substrate;

Apple iPhone 1 discloses, either expressly or inherently, the spacer connector comprises a core substrate.

See, e.g.:

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

	 <p>https://www.ifixit.com/Guide/iPhone+1st+Generation+Logic+Board+Replacement/447?utm_source=chatgpt.com</p> <p>To the extent Plaintiff contends that Apple iPhone 1 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

[1.E] a plurality of metal pillars, each passing through the core substrate; and

Apple iPhone 1 discloses, either expressly or inherently, a plurality of metal pillars, each passing through the core substrate.

See, e.g.:

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

	 <p>https://www.ifixit.com/Guide/iPhone+1st+Generation+Logic+Board+Replacement/447?utm_source=chatgpt.com</p> <p>To the extent Plaintiff contends that Apple iPhone 1 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

[1.F] a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars;

Apple iPhone 1 discloses, either expressly or inherently, a plurality of top metal pads, each on a top end of a corresponding metal pillar among the plurality of metal pillars.

See, e.g.:

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

	 <p>https://www.ifixit.com/Guide/iPhone+1st+Generation+Logic+Board+Replacement/447?utm_source=chatgpt.com</p> <p>To the extent Plaintiff contends that Apple iPhone 1 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

[1.G] wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate,

Apple iPhone 1 discloses, either expressly or inherently, wherein a bottom end of each metal pillar among the plurality of metal pillars protrudes downwardly from a bottom surface of the core substrate.

See, e.g.:

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

	 <p>https://www.ifixit.com/Guide/iPhone+1st+Generation+Logic+Board+Replacement/447?utm_source=chatgpt.com</p> <p>To the extent Plaintiff contends that Apple iPhone 1 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

[1.H] the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector,

Apple iPhone 1 discloses, either expressly or inherently, the top package substrate has, on a bottom surface thereof, a plurality of bottom metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.

See, e.g.:

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

	 <p>https://www.ifixit.com/Guide/iPhone+1st+Generation+Logic+Board+Replacement/447?utm_source=chatgpt.com</p> <p>To the extent Plaintiff contends that Apple iPhone 1 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

[1.I] the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and

Apple iPhone 1 discloses, either expressly or inherently, the bottom package substrate has, on a top surface thereof, a plurality of top metal pillars each coupled to a corresponding metal pillar among the plurality of metal pillars of the spacer connector.

See, e.g.:

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

	 <p>https://www.ifixit.com/Guide/iPhone+1st+Generation+Logic+Board+Replacement/447?utm_source=chatgpt.com</p> <p>To the extent Plaintiff contends that Apple iPhone 1 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

[1.J] the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of top metal pillars of the bottom package substrate; and

Apple iPhone 1 discloses, either expressly or inherently, the top package substrate is electrically coupled to the bottom package substrate through the plurality of bottom metal pillars of the top package substrate, the plurality of metal pillars of the spacer connector, and the plurality of top metal pillars of the bottom package substrate.

--	---

Claim 3

Claim Limitation	Disclosure
[3] The structure of claim 2, further comprising: a top chip mounted to the	Apple iPhone 1 discloses, either expressly or inherently, a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

<p>top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p>See, e.g.:</p>  <p>“The chip on the bottom center that looks blank in our image actually has this text: MARVELL, W8686B13, 702AUUP. This is Marvell's 802.11b/g 18.4mm2 chip.</p> <p>The chip in the upper right is a Skyworks GSM/Edge Power amplifier (SKY77340).</p> <p>The silver chip to the left of the Skyworks chip reads CSR 41814 3A06U K715FB. This is a CSR BlueCore4-ROM WLCSP single chip radio and baseband IC for Bluetooth 2+EDR.</p>
--	--

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

	<p>The chip covered by the white sticker in the photo has the part numbers 338S0289 and 8G60710 on it. EETimes claims this is an Infineon M1817A11.</p> <p>The chip with the blue dot on it is rumored to be an Intel Wireless Flash stacked 32 Mb NOR + 16 Mb SRAM chip. Part numbers 1030W0YTQ2, 5716A673, and Z717074A. EE Times adds the part #PF38F1030W0YTQ2.</p> <p>The chip in the lower right reads 338S 0297 G0719. Some claim this is an Apple-branded chip, but it's purpose is currently unknown.</p> <p>The chip in the lower left is an Infineon PMB8876 S-Gold 2 multimedia engine. Part numbers: 337S3235, 60708, and EL629058S03.”</p> <p>https://www.ifixit.com/Teardown/iPhone+1st+Generation+Teardown/599</p> <p>To the extent Plaintiff contends that Apple iPhone 1 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 4

Claim Limitation	Disclosure
[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the	Apple iPhone 1 discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.

metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.

See, e.g.:

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

--	--

“There are two stacked circuit boards on the iPhone. The communications board is on the top, and the logic board is located on the bottom.”

https://www.ifixit.com/Guide/iPhone+1st+Generation+Logic+Board+Replacement/447?utm_source=chatgpt.com

To the extent Plaintiff contends that Apple iPhone 1 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

	(i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.
--	---

Claim 6

Claim Limitation	Disclosure
[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector. <i>See, e.g.:</i>	Apple iPhone 1 discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector. <i>See, e.g.:</i>

To the extent Plaintiff contends that Apple iPhone 1 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with

Appendix A-50 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 1

	(i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.
--	---

Claim 9

Claim Limitation	Disclosure
[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.	Apple iPhone 1 discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector. <i>See, e.g.:</i>

Appendix A-51 - Invalidity of U.S. Patent No. 9,859,202 in view of TMV PoP

E.D. Tex. Case No. 2:25-cv-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9,859,202 in view of TMV PoP

The Through Mold Via Package-on-Package (hereinafter “TMV PoP”) was in public use, on sale (including sold to customers and potential customers), and/or otherwise available to the public by Amkor Technology, Inc. at least by 2011.¹ TMV PoP anticipates and/or renders obvious all Asserted Claims² of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.³ TMV PoP, or the written materials describing it, excerpted below, is prior art to the ’202 Patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within TMV PoP, or otherwise rendered obvious by disclosures and teachings of TMV PoP, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that TMV PoP does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of TMV PoP with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 Patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends

¹ See, e.g., <https://ir.amkor.com/news-releases/news-release-details/sales-amkor-technologies-next-generation-through-mold-package>; <https://web.archive.org/web/20110911192846/http://www.amkor.com/download.cfm?downloadfile=062B7525-0B79-3F7F-5BAC6FA59D9C3582&typename=dmFile&fieldname=filename>

² As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

³ To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-51 - Invalidity of U.S. Patent No. 9,859,202 in view of TMV PoP

is not fully disclosed by TMV PoP, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that TMV PoP “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to TMV PoP or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding TMV PoP set forth in this chart.

Claim 1

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	To the extent the preamble is a limitation, TMV PoP discloses, either expressly or inherently, a structure. <i>See, e.g.:</i>

Appendix A-51 - Invalidity of U.S. Patent No. 9,859,202 in view of TMV PoP

Appendix A-51 - Invalidity of U.S. Patent No. 9,859,202 in view of TMV PoP

A cross-sectional diagram of a TMV PoP Overall Stack Up. It shows a stack of layers: A1 (bottom, orange), A2 (second, green), A3 (third, orange), B1 (fourth, white), B2 (fifth, green), and B3 (top, orange). Dimensions are indicated by arrows: A1 is 0.150 mm, A2 is 0.260 mm, A3 is 0.250 mm, B1 is 0.050 mm, B2 is 0.130 mm, and B3 is 0.400 mm. The overall package height is 1.240 mm. The diagram also shows a mold cap (A3) and a stacked gap (B1).

TMV[®] PoP Overall Stack Up Table

Symbol	Unit	Min	Max	Nom
A1 (Mounted, 0.4 pitch)	mm	0.100	0.200	0.150
A2 (4L laminate)	mm	0.220	0.300	0.260
A3 (Mold cap)	mm	0.230	0.280	0.250
B1 (Stacked gap)	mm	0.020	0.080	0.050
B2 (2L laminate)	mm	0.100	0.160	0.130
B3 (Mold cap)	mm	0.370	0.430	0.400
Overall Package Height	mm	1.140	1.340	1.240

“Amkor developed new technologies to create the next generation PoP solution with interconnect vias through the mold cap, naming this technology Through Mold Via (TMV[®]). TMV technology provides a stable bottom package that enables use of thinner substrates with a larger die to package ratio.”

Claim 2

Claim Limitation	Disclosure
<p>[2] The structure of claim 1, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p>	<p>TMV PoP discloses, either expressly or inherently, wherein a top surface of the bottom chip is spaced downwardly from the bottom surface of the top package substrate.</p> <p><i>See, e.g.:</i></p>

Appendix A-51 - Invalidity of U.S. Patent No. 9,859,202 in view of TMV PoP

A cross-sectional diagram of a TMV PoP Overall Stack Up Table. The diagram shows a stack of layers labeled A1, A2, A3, B1, B2, and B3. Layer A1 is the bottom-most layer, followed by A2, A3, B1, B2, and B3 at the top. The layers are shown in various colors: A1 is orange, A2 is green, A3 is yellow, B1 is white, B2 is blue, and B3 is grey. The diagram also shows the overall package height and the dimensions of each layer.

	<p>https://amkormarcomexternal.blob.core.windows.net/amkordotcom/wp-content/uploads/2018/02/PoP_DS586.pdf</p> <p>To the extent Plaintiff contends that TMV PoP fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 3

Claim Limitation	Disclosure
<p>[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p>	<p>TMV PoP discloses, either expressly or inherently, a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.</p> <p><i>See, e.g.:</i></p>

Appendix A-51 - Invalidity of U.S. Patent No. 9,859,202 in view of TMV PoP

A cross-sectional diagram of a TMV PoP Overall Stack Up Table. The diagram shows a stack of layers labeled A1, A2, A3, B1, B2, and B3. Layer A1 is the bottom-most layer, followed by A2, A3, B1, B2, and B3 at the top. The layers are shown in various colors: A1 is orange, A2 is green, A3 is yellow, B1 is white, B2 is blue, and B3 is grey. The diagram also shows the overall package height and the dimensions of each layer.

Appendix A-52 - Invalidity of U.S. Patent No. 9,859,202 in view of MCeP

E.D. Tex. Case No. 2:25-cv-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9,859,202 in view of MCeP

The Molded Core embedded Package (hereinafter “MCeP”) was in public use, on sale (including sold to customers and potential customers), and/or otherwise available to the public by Shinko Electric Industries Co., Ltd. at least by 2013.¹ MCeP anticipates and/or renders obvious all Asserted Claims² of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.³ MCeP, or the written materials describing it, excerpted below, is prior art to the ’202 Patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within MCeP, or otherwise rendered obvious by disclosures and teachings of MCeP, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that MCeP does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of MCeP with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 Patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by MCeP, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire

¹ See, e.g., <https://web.archive.org/web/20130215093055/http://www.shinko.co.jp/english/product/sip/mcep.html#link1>

² As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

³ To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-52 - Invalidity of U.S. Patent No. 9,859,202 in view of MCeP

makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that MCeP “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to MCeP or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding MCeP set forth in this chart.

Claim 1

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	<p>To the extent the preamble is a limitation, MCeP discloses, either expressly or inherently, a structure.</p> <p><i>See, e.g.:</i></p> <p>“We offer MCeP®(Molded Core embedded Package) with the package structure achieved by active and passive components built in. The package type is also called ‘embedded substrate’ in the market. We provide the package features compact and thin package size, excellent electric characteristics, and high reliability enabled by our own packaging technology.”</p> <p>https://web.archive.org/web/20130215093055/http://www.shinko.co.jp/english/product/sip/mcep.html#link1</p>

Therefore, thinner conventional memory packages can be mounted on MCeP.”</p> <p>https://www.google.com/url?sa=t&rct=i&q=&esrc=s&source=web&cd=&ved=2ahUKEwjbr6-qo5SUAxWbFjQIHwIJI4sQFnoECBoQAQ&url=https%3A%2F%2Fimapsource.org%2Farticle%2F56464-thinner-and-miniaturization-embedded-device-package-mcep-for-pop-and-module-application.pdf&usg=AOvVaw0c7ITbFunP15yBoLYXALBj&opi=89978449</p> <p>To the extent Plaintiff contends that MCeP fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 4

Claim Limitation	Disclosure
<p>[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p>	<p>MCeP discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.</p> <p>See, e.g.:</p> <div data-bbox="727 348 1047 1371"> <p>Structure</p> <p>Standard</p> <p>Mold Resin IC Chip Cu Core Solder Ball Top Substrate Embedded Layer Bottom Substrate Capacitor</p> </div> <p>https://www.shinko.co.jp/english/product/docs/mcep_EN.pdf</p>

	<div data-bbox="272 688 701 1369"></div> <div data-bbox="737 735 773 1327"><p>Fig. 13 Structure of Ultra Thin MCeP Type 2</p></div> <div data-bbox="831 199 980 1390"><p>https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=&ved=2ahUKEwjbr6-go5SUAxWbFjQIHwIUI4sQFnoECBoQAQ&url=https%3A%2F%2Fimapsource.org%2Farticle%2F56464-thinner-and-miniaturization-embedded-device-package-mcep-for-pop-and-module-application.pdf&usg=AOvVaw0c7ITbFunP15yBoLYXALBj&opi=89978449</p></div> <div data-bbox="1029 189 1179 1390"><p>To the extent Plaintiff contends that MCeP fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p></div>
<p>Claim Limitation</p>	<p>Claim 6</p> <p>Disclosure</p>

Appendix A-52 - Invalidity of U.S. Patent No. 9,859,202 in view of MCeP

[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the top package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

MCeP discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

To the extent Plaintiff contends that MCeP fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-53 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 4–6

E.D. Tex. Case No. 2:25-cv-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 4–6

The Apple iPhones, including but not limited to iPhone 4, 4S, 5, 5C, 5S, 6, and 6 Plus, which implement Apple application processors, including but not limited to A4, A5, A6, A7, and A8 (hereinafter “Apple iPhone 4–6”) was in public use, on sale (including sold to customers and potential customers), and/or otherwise available to the public by Apple Inc. at least by 2014.¹ Apple iPhone 4–6 anticipates and/or renders obvious all Asserted Claims² of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.³ Apple iPhone 4–6, or the written materials describing it, excerpted below, is prior art to the ’202 Patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within Apple iPhone 4–6, or otherwise rendered obvious by disclosures and teachings of Apple iPhone 4–6, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that Apple iPhone 4–6 does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of Apple iPhone 4–6 with: (1) the knowledge of one of ordinary skill in the art (“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 Patent. TopWire has yet to identify any limitation of the Asserted

¹ See, e.g., <https://en.wikipedia.org/wiki/IPhone#Models>; https://apple.fandom.com/wiki/List_of_Apple_processors; <https://everymac.com/systems/apple/iphone/iphone-faq/iphone-processor-types.html>

² As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

³ To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-53 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 4–6

Claims that it contends is not fully disclosed by Apple iPhone 4–6, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that Apple iPhone 4–6 “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to Apple iPhone 4–6 or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding Apple iPhone 4–6 set forth in this chart.

Claim 1

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	To the extent the preamble is a limitation, Apple iPhone 4–6 discloses, either expressly or inherently, a structure. <i>See, e.g.:</i>

Appendix A-53 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 4-6

	<p>(Top) The top view of the A7 processor/memory PoP. (Bottom) Cross section view of the PoP</p>  <p>https://www.electronics.org/system/files/technical_resource/E15%26S33_03.pdf</p> <p>To the extent Plaintiff contends that Apple iPhone 4-6 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.A] a bottom package substrate;</p>	<p>Apple iPhone 4-6 discloses, either expressly or inherently, a bottom package substrate.</p> <p>See, e.g.:</p>

	 <p>10-Layer PCB</p> <p>https://www.electronics.org/system/files/technical_resource/E15%26S33_03.pdf</p>
<p>[1.B] a top package substrate stacked on top of the bottom package substrate;</p>	<p>To the extent Plaintiff contends that Apple iPhone 4-6 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p> <p>Apple iPhone 4-6 discloses, either expressly or inherently, a top package substrate stacked on top of the bottom package substrate.</p> <p>See, e.g.:</p>

--	---

Claim 3

Claim Limitation	Disclosure
------------------	------------

Appendix A-53 - Invalidity of U.S. Patent No. 9,859,202 in view of Apple iPhone 4-6

[3] The structure of claim 2, further comprising: a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.

Apple iPhone 4–6 discloses, either expressly or inherently, a top chip mounted to the top surface of the top package substrate, wherein in a direction in which the top package substrate is stacked on top of the bottom package substrate, the top chip overlaps the bottom chip and each of the two spacer connectors.

See, e.g.:

Cross Section of the PoP inside iPhone 5s (Chipworks)

	<p>(Top) The top view of the A7 processor/memory PoP. (Bottom) Cross section view of the PoP</p>  <p>https://www.electronics.org/system/files/technical_resource/E15%26S33_03.pdf</p> <p>To the extent Plaintiff contends that Apple iPhone 4-6 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 4

Claim Limitation	Disclosure
------------------	------------

[4] The structure of claim 1, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.

Apple iPhone 4-6 discloses, either expressly or inherently, wherein each bottom metal pillar among the plurality of bottom metal pillars of the top package substrate is aligned with a corresponding metal pillar among the plurality of metal pillars of the spacer connector, and with a corresponding top metal pillar among the plurality of top metal pillars of the bottom package substrate.

See, e.g.:

Cross Section of the PoP inside iPhone 5s (Chipworks)

Apple's A7 processor

Elpida's 1GB LPDDR3

2-2-2 package substrate

The diagram shows a cross-section of a 2-2-2 package substrate. It consists of three main layers: a top package substrate, a spacer connector, and a bottom package substrate. Metal pillars are shown extending through these layers, ensuring alignment between the top and bottom package substrates. The top package substrate contains Apple's A7 processor and Elpida's 1GB LPDDR3 memory. Dimensions are provided for various layers and pillars, including 371.0 μm, 577.9 μm, 1.045 μm, 368.1 μm, 572.9 μm, 1.021 μm, 354.1 μm, and 322.4 μm.

	<p>(Top) The top view of the A7 processor/memory PoP. --	---

Claim 6

Claim Limitation	Disclosure
------------------	------------

[6] The structure of claim 4, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

Apple iPhone 4-6 discloses, either expressly or inherently, wherein the bottom ends of the plurality of metal pillars protruding downwardly from the bottom surface of the core substrate of the spacer connector are connected, in an end-to-end manner, to corresponding top ends of the plurality of top metal pillars of the bottom package substrate, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

See, e.g.:

Cross Section of the PoP inside iPhone 5s (Chipworks)

	<p>(Top) The top view of the A7 processor/memory PoP. (Bottom) Cross section view of the PoP</p>  <p>https://www.electronics.org/system/files/technical_resource/E15%26S33_03.pdf</p> <p>To the extent Plaintiff contends that Apple iPhone 4-6 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
--	--

Claim 9

Claim Limitation	Disclosure
------------------	------------

[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

Apple iPhone 4-6 discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.

See, e.g.:

Cross Section of the PoP inside iPhone 5s (Chipworks)

Apple's A7 processor

Elpida's 1GB LPDDR3

2-2-2 package substrate

**(Top) The top view of the A7 processor/memory PoP.

To the extent Plaintiff contends that Apple iPhone 4-6 fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-54 - Invalidity of U.S. Patent No. 9,859,202 in view of EIT PIP

E.D. Tex. Case No. 2:25-cv-1183

INVALIDITY CLAIM CHART

Invalidity of U.S. Patent No. 9,859,202 in view of EIT PIP

The Package-Interposer-Package (hereinafter “EIT PIP”) was in public use, on sale (including sold to customers and potential customers), and/or otherwise available to the public by Endicott Interconnect Technologies, Inc at least by 2012. For example, on information and belief, at the 45th International Symposium on Microelectronics held in September 2012 in San Diego, California, an EIT PIP sample was publicly exhibited by Endicott Interconnect Technologies as part of its packaging portfolio at the booth 526 under categories, including “3D IC and Packaging Technologies, TSV” and “Electronic Packages & Packaging” in the official conference directory.¹ EIT PIP anticipates and/or renders obvious all Asserted Claims² of U.S. Patent No. 9,859,202 (“the ’202 Patent”) under 35 U.S.C. §§ 102 and/or 103, including under Plaintiff’s apparent infringement theory.³ EIT PIP, or the written materials describing it, excerpted below, is prior art to the ’202 Patent under at least 35 U.S.C. § 102(a)(1).

The chart below provides representative examples of where each element of each Asserted Claim is found within EIT PIP, or otherwise rendered obvious by disclosures and teachings of EIT PIP, including under TopWire’s apparent interpretation of the Asserted Claims as Samsung understands them from TopWire’s Infringement Contentions served March 12, 2026. The cited evidence is merely illustrative, and Samsung reserves the right to cite alternative or additional evidence. To the extent TopWire contends that EIT PIP does not disclose any claim elements of the Asserted Claims, it would have been obvious to combine the teachings of EIT PIP with: (1) the knowledge of one of ordinary skill in the art

¹ See, e.g., <https://imaps.org/page/PastEvents>;

https://cdn.ymaws.com/imaps.org/resource/resmgr/documents/symposium_programs/imaps2012final.pdf; <https://imapsource.org/article/56427-package-interposer-package-pip-a-breakthrough-package-on-package-pop-technology-for-3d-integration>

² As used herein, “Asserted Claims” refers only to those claims charted in TopWire’s March 12, 2026 Infringement Contentions. To the extent TopWire later obtains leave to assert any additional claims for this patent, Samsung will provide its preliminary Invalidity Contentions consistent with the timing requirements set forth in the Court’s order.

³ To the extent that these Invalidity Contentions rely on or otherwise embody particular constructions of terms or phrases in the Asserted Claims, Samsung is not proposing any such constructions as proper constructions of those terms or phrases. Various positions put forth in this document are predicated on TopWire’s apparent interpretation of the Asserted Claims as evidenced by its Infringement Contentions provided to Samsung. Samsung does not agree or acquiesce to any such interpretation by TopWire. The positions presented herein are not intended to and do not necessarily reflect Samsung’s interpretation of the true and proper scope of the Asserted Claims, and Samsung reserve the right to adopt claim construction positions that differ from or even conflict with various positions put forth in this document.

Appendix A-54 - Invalidity of U.S. Patent No. 9,859,202 in view of EIT PIP

(“POSITA”) to show all the limitations of the claims; (2) the teachings of any of the prior art references set forth in Samsung’s other invalidity charts with respect to the one or more limitations; and/or (3) the teachings of any of the prior art references set forth in the cover document of Samsung’s Invalidity Contentions with respect to the ’202 Patent. TopWire has yet to identify any limitation of the Asserted Claims that it contends is not fully disclosed by EIT PIP, either alone or in combination with other prior art cited by Samsung and/or with the knowledge of a POSITA. To the extent TopWire makes any such contention in the future, Samsung expressly reserves the right to rebut any such contention, including by identifying additional obviousness combinations.

Where the chart below states that EIT PIP “discloses” a limitation, such disclosure may be express or inherent. All emphases are added unless otherwise indicated.

Fact Discovery is ongoing and Samsung’s prior art investigation, including via third party discovery, is therefore not yet complete. Samsung reserves the right to rely upon additional evidence of invalidity obtained in the future as to EIT PIP or any other prior art public use/sales/offers for sale that may anticipate or render obvious one or more claim limitations of the Asserted Claims under 35 U.S.C. §§ 102 and/or 103. Samsung may rely on additional documents and/or things that have not yet been located and/or testimony to support the contentions regarding EIT PIP set forth in this chart.

Claim 1

Claim Limitation	Disclosure
[1.PRE] A structure, comprising:	To the extent the preamble is a limitation, EIT PIP discloses, either expressly or inherently, a structure. <i>See, e.g.:</i>

Figure 14: Photograph and schematic representation of PIP attached with low end board.

Appendix A-54 - Invalidity of U.S. Patent No. 9,859,202 in view of EIT PIP

	<p>“A PIP was constructed using an interposer consisting of multiple metal inner planes. A top view of the contacting pads for this interposer is shown schematically in Figure 5.”</p> <p>“As part of an on-going effort to develop new electrical interconnection between the interposer and the package on either side of the interposer, connections can be made by a Figure 5. Top view of interposer A PIP was constructed using an interposer consisting of multiple metal inner planes. A top view of the contacting.”</p> <p>“Figure 6. Process flow for a PIP construction. The interposer has an opening. The top side of the bottom package is connected with the bottom side of the interposer in such a way that die on the bottom package resides within the opening of the interposer. The bottom side of the top package is connected with the top side of the interposer in a subsequent step to complete the PIP structure.”</p> <p>“As stated above, ECA-filled interposers can also be used to produce a PIP structure. High temperature/pressure lamination is used to cure the adhesive in the PIP and provide electrical interconnection among the packages. A variety of interposer structures such as OS/1P, OS/2P, 2S/1P, 2S/2P can be used. Figure 8 shows optical photographs and SEM micrographs of a joining core having ECA-filled holes with diameters ranging from 55 μm to 65 μm, as a typical representative example of an interposer that can be used for PIP. The ECA protrudes above the surface of the dielectric by about 5-10 μm, (Figure 8B).”</p> <p>“Figure 10 shows PIP structures for connecting 4 packages with three interposers. An optical photo of a cross section of the PIP structure built with 4 packages with three interposers is shown in Figure 11.”</p> <p>https://imapsource.org/article/56427-package-interposer-package-pip-a-breakthrough-package-on-package-pop-technology-for-3d-integration</p>
--	---

Appendix A-54 - Invalidity of U.S. Patent No. 9,859,202 in view of EIT PIP

	<p>To the extent Plaintiff contends that EIT PIP fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.</p>
<p>[1.A] a bottom package substrate;</p>	<p>EIT PIP discloses, either expressly or inherently, a bottom package substrate.</p> <p><i>See, e.g.:</i></p>

To the extent Plaintiff contends that EIT PIP fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the general knowledge of one of ordinary skill in the art and/or (ii) the teachings of any of the charted references with respect to this limitation.

Appendix A-54 - Invalidity of U.S. Patent No. 9,859,202 in view of EIT PIP

Claim 9

Claim Limitation	Disclosure
<p>[9] The structure of claim 4, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p>	<p>EIT PIP discloses, either expressly or inherently, wherein the spacer connector further comprises a plurality of bottom metal pads, each on the bottom end of a corresponding metal pillar among the plurality of metal pillars, the bottom ends of the plurality of metal pillars are connected to corresponding top ends of the plurality of top metal pillars of the bottom package substrate via the corresponding bottom metal pads of the spacer connector, and bottom ends of the plurality of bottom metal pillars of the top package substrate are connected to the corresponding top ends of the plurality of metal pillars of the spacer connector via the corresponding top metal pads of the spacer connector.</p> <p><i>See, e.g.:</i></p>

Figure 14: Photograph and schematic representation of PIP attached with low end board.

	 <p>The diagram illustrates a PIP construction with four packages and three interposers. It is shown in a perspective view. Four packages, represented by grey rectangular blocks with multiple pins on their bottom surfaces, are arranged in a row. Between each pair of adjacent packages is an interposer, represented by a light blue rectangular block with pins on its top and bottom surfaces. The interposers are positioned such that their top pins connect to the bottom pins of the package above them, and their bottom pins connect to the bottom pins of the package below them. The entire assembly is supported by a green substrate. Labels with arrows point to the packages and interposers, identifying them as 'Package' and 'Interposer' respectively. The labels are placed below the corresponding components.</p> <p>Figure 10: Schematic of package-Interposer-Package (PIP) construction with 4 packages and 3 interposers.</p> <p>“Connection between interposer and package made using solder between a pad on the interposer and a pad on the package is reworkable, i.e., if initial electrical testing of the assembled structure, Figure 1, indicates that either package and/or interposer are defective, the packages/interposer can be removed without damage to the assembly.”</p> <p>https://imapsource.org/article/56427-package-interposer-package-pip-a-breakthrough-package-on-package-pop-technology-for-3d-integration</p> <p>To the extent Plaintiff contends that EIT PIP fails to disclose this limitation, it would have been obvious to one of ordinary skill in the art based on this reference alone or in combination with (i) the</p>
