A food warming apparatus includes a heating compartment that can hold one or more trays containing previously cooked food portions. A rack in the heating compartment includes a support member, a channel, and a stop that blocks the front end of the channel. A cover that includes a horizontal section and a vertical section is mounted on the support such that the horizontal section is supported on one side by the support member and on the other side by the vertical section, which is positioned in the channel behind the stop. When a tray is inserted into the receiving space defined by the cover and support member, the cover is lifted up so that the horizontal section rests on the tray and at least partially blocks the open top of the tray, thereby restricting evaporation of liquids from the previously cooked food portions contained in the tray.

APPARATUS AND METHOD FOR MAINTAINING COOKED FOOD IN A READY-TO-USE CONDITION

BACKGROUND OF THE INVENTION

[0001] 1. Field of the Invention

[0002] This invention relates to the field of food preparation. More particularly, this invention relates to an apparatus and method for maintaining in a ready-to-use condition cooked food portions contained in a food tray, wherein a cover comprising a horizontal section and a vertical section is used to cover the food trays.

[0003] 2. Description of Related Art

[0004] In many establishments, such as fast food restaurants, certain food items are cooked well in advance of when they are ordered by or served to the customer. Examples of such food items can include sandwich fillings, such as cooked eggs, hamburger patties, breaded foods, such as chicken nuggets, or baked goods, such as muffins. These previously cooked food items are often maintained in a ready-to-use condition until they served to the customer. This typically involves maintaining the previously cooked food items at a serving temperature in the range of from about 140° F. to about 200° F., depending on the food item.

[0005] Various food warming apparatus have been developed to maintain previously cooked food items at a desired serving temperature. Such food warming apparatus are sometimes referred to as staging cabinets, holding cabinets, or warming cabinets. One of the challenges associated with food warming apparatus is being able to preserve the flavor, appearance, and texture of the previously cooked food items while they are being maintained at the desired serving temperature. In particular, certain types of food items, such as cooked eggs and hamburger patties have a tendency to dry out undesirably when they are kept warm for extended periods of time.

[0006] One commonly used way to protect previously cooked food items for which drying out is a concern, is to place the food items in a container, such as a tray, and to provide a cover for the container. The cover restricts evaporation of moisture from the previously cooked food items. With a reduced amount of moisture vapor being able to escape from the covered container, the previously cooked food items contained therein do not dry out as rapidly.

[0007] Conventional covers are inconvenient to use in food fast restaurants and similar establishments. This is because when previously cooked food portions are taken from the food warming apparatus, the cover typically must be removed from the tray to gain access to the food items contained therein, and must be replaced to protect the remaining food portions contained in the tray. The steps of removing and replacing a cover can take an amount of time that is unacceptably large in fast food restaurants. The removed cover can also become misplaced or contaminated and can get in the way of other activities in the kitchen area.

SUMMARY

[0008] In a first principal aspect, an exemplary embodiment provides a food warming apparatus for maintaining previously cooked food portions contained in at least one tray in a ready-to-use condition. The food warming apparatus comprises a cabinet having at least one heating compartment therein. At least one support member is disposed in the at least

one heating compartment. At least one cover is removably mounted on the at least one support member. The at least one cover has a horizontal section and a vertical section extending downwardly from the horizontal section. The horizontal section is supported on a first side by the vertical section and is supported on a second side by the at least one support member. The at least one cover and at least one support member cooperatively define at least one receiving space for receiving the at least one tray.

[0009] In a second principal aspect, an exemplary embodiment provides a method for covering a tray in a food warming apparatus. The food warming apparatus includes a heating compartment. The tray has a lip defining a tray opening. In accordance with the method, a support that fits into the heating compartment is provided. The support includes a support member. A cover for the tray is provided. The cover has a horizontal section and a vertical section extending downwardly from the horizontal section. The cover is mounted on the support such that the horizontal section is supported on a first side by the vertical section and is supported on a second side by the support member. The support member with the cover mounted thereon is inserted into the heating compartment. The tray is inserted into a receiving space cooperatively defined by the cover and the support until the horizontal section of the cover rests on the lip of the tray and at least partially blocks the tray opening.

BRIEF DESCRIPTION OF THE DRAWINGS

[0010] FIG. 1 is an isometric view of a food warming apparatus, in accordance with an exemplary embodiment.

[0011] FIG. 2 is an isometric view of a rack, in accordance with an exemplary embodiment.

[0012] FIG. 3 is a front view of the rack of FIG. 2, in accordance with an exemplary embodiment.

[0013] FIG. 4 is a top view of the rack of FIG. 2, in accordance with an exemplary embodiment.

[0014] FIG. 5 is an isometric view of two covers and two trays, in combination with the rack of FIG. 2, in accordance with an exemplary embodiment.

[0015] FIG. 6 is a front view of the combination of FIG. 5, in accordance with an exemplary embodiment.

[0016] FIG. 7 is an isometric view of the combination of FIG. 5, with one of the trays removed, in accordance with an exemplary embodiment.

[0017] FIG. 8 is a front view of the combination of FIG. 5, with one of the trays removed, in accordance with an exemplary embodiment.

DETAILED DESCRIPTION

1. Overview

[0018] A food warming apparatus is able to maintain previously cooked food portions in a ready-to-use condition. The previously cooked food portions may be placed in one or more open-top containers, which are referred to herein as "trays." The trays containing the previously cooked food portions may be placed in one or more heating compartments to maintain the portions at a desired temperature. Covers may cover some or all of the trays in the heating compartments so as to restrict evaporation of moisture or other liquid from the previously cooked food portions.

[0019] One or more support members may be placed in the heating compartments to support covers independently of the trays. Thus, a tray may be covered by inserting it into a

heating compartment, in which a cover that is supported by a support member is already in place. In addition, one or more stops may be used to retain the covers in the heating compartments. That way, when a tray is withdrawn from a heating compartment, the cover stays inside the compartment.

[0020] The support members and stops for a heating compartment may be part of a unitary support structure, such as a rack. The rack may include a frame and one or more support members that extend upwardly from the frame. The rack may also include channel members that define a channel that can be used to laterally position a cover within the heating compartment. In particular, the cover may have a horizontal section and a vertical section that extends downwardly from the horizontal section. The vertical section may be fitted into the channel so as to laterally position the cover and support one side of the horizontal section of the cover. The other side of the horizontal section may be supported by a support member.

[0021] In this arrangement, the cover and support member cooperatively define a receiving space for receiving a tray. Thus, a tray containing previously cooked food portions may be placed in the heating compartment by inserting it in the receiving space. When the tray is fully inserted, the horizontal section of the cover at least partially blocks the open top of the tray, so as to restrict evaporation of liquid from the previously cooked food portions contained in the tray.

[0022] In an exemplary embodiment, the insertion of the tray into the receiving space lifts the cover off of the support member so that the cover instead rests on the tray. When the tray is subsequently removed, the cover returns to rest on the support member. The stop may block the front of the channel, so that the cover remains in the compartment when the tray is removed.

[0023] Configuring the covers so that they stay in the heating compartment can provide benefits for establishments such as fast food restaurants. In particular, a tray containing previously cooked food portions may be inserted into the heating compartment and covered in one step, and the tray may be withdrawn from the heating compartment and uncovered in one step, thereby saving time. In addition, the inconvenience and the possibilities of contamination associated with direct handling of covers can be reduced.

2. Exemplary Food Warming Apparatus

[0024] With reference to FIG. 1, an exemplary food warming apparatus 10 includes a housing or cabinet 12 that has a top 14, a bottom 16, a front 18, a back 20, and sides 22. The interior of cabinet 12 is divided into heating compartments 24, 26, 28, and 30. Although FIG. 1 shows exemplary food warming apparatus 10 with four heating compartments, it is to be understood that a food warming apparatus could be provided with a greater or fewer number of heating compartments.

[0025] In the example shown in FIG. 1, front 18 is open to provide access to compartments 24, 26, 28, and 30. However, it is to be understood that back 20 could also be open to provide access to compartments 24, 26, 28, and 30, for example, in a pass-through configuration. Each of compartments 24, 26, 28, and 30 includes an upper compartment surface and a lower compartment surface. Thus, compartment 24 includes upper compartment surface 32 and lower compartment 34, as shown in FIG. 1. Compartments 26, 28, and 30 may be similarly configured.

[0026] Each of compartments 24, 26, 28, and 30 is sized to accommodate one or more trays, as exemplified in FIG. 1 by

trays 40 and 42 in compartment 24. Although FIG. 1 shows two trays in each compartment, it is to be understood that the compartments may be sized to accommodate a greater or fewer number of trays. In addition, although FIG. 1 shows each compartment filled with its maximum number of trays, it is to be understood that a compartment might hold less than the maximum number of trays at any given time.

[0027] In each compartment, trays may be supported by a support structure such as a rack. For example, FIG. 1 shows trays 40 and 42 in compartment 24 supported by a rack 44. The rack may be mounted in the compartment in various ways. For example, a rack could rest on the lower compartment surface. Alternatively, a rack could be supported above the lower compartment surface by mounting brackets disposed on the side walls of the compartment. Thus, compartment 24 is shown with mounting bracket 45 supporting rack 44.

[0028] Covers may cover some or all of the trays in the compartments. For example, trays 40 and 42 in compartment 24 may be covered by covers 46 and 48, respectively. The operational relationship between trays 40 and 42, rack 44, and covers 44 and 46 is described in more detail below.

[0029] Each of compartments 24, 26, 28, and 30 may be heated by a respective heating system. In an exemplary embodiment, each heating system includes one or more resistive heaters for heating its respective compartment from above and/or from below. For example, compartment 24 may be heated through upper compartment surface 32 by heater plates 50 and 52, which may be positioned over trays 40 and 42, respectively. Compartment 24 may also be heated through lower compartment surface 34 by similar heater plates. Compartments 26, 28, and 30 may be heated in a similar manner.

[0030] Food warming apparatus 10 may include various controls for enabling an operator to control its operation and various indicators for displaying information to the operator. Some of the controls and indicators may be arranged in a control panel 54 disposed on front 18. Other controls and indicators may be arranged in interface bars 56, 58, 60, and 62, associated with compartments 24, 26, 28, and 30, respectively.

[0031] Control panel 54 may enable the operator to select setpoint temperatures for the compartment (or for specific trays in the compartments). A control system in food warming apparatus 10 may control the heating systems for the compartments (e.g., thermostatically) so as to achieve and maintain the setpoint temperatures. In an exemplary embodiment, the control system may measure the temperature at the heating system (e.g., at heater plate 50 or 52), so that the setpoint temperature corresponds to the temperature at the heating system. The temperature of the food inside of the covered tray in the compartment may be lower than the setpoint temperature. For example, it may be desirable to maintain previously cooked food portions at a temperature that may range from about 140° F. to about 200° F. To achieve this food temperature, the setpoint temperature may need to be as high as 400° F.

[0032] Interface bars 56, 58, 60, and 62 may each enable an operator to select a hold time for the respective compartment (or for a specific tray in the compartment) based, for example, on the particular food product contained in the compartment (or contained in a specific tray in the compartment). The operator may select the hold time by scrolling through a list of food products, each of which has been associated with a

preset hold time. A display on the interface bar may display descriptions of the food products as the operator scrolls through the list and may then display a description of the selected food product.

[0033] When the selected food product is placed in the compartment, the operator may interact with the compartment's interface bar to start a timer. When the hold time has been reached, the compartment's interface bar may provide an indication to the operator. The operator may then replace the food product with fresh food product and interact with the interface bar to re-set the timer.

3. Exemplary Rack

[0034] FIGS. 2, 3, and 4 are isometric, front, and top views, respectively, of rack 44. In this example, rack 44 includes a frame 100 and support members 102 and 104 extending upwardly from frame 100. Frame 100 may be mounted in compartment 24 as shown in FIG. 1, i.e., supported by mounting bracket 45. Alternatively, frame 100 may rest on lower compartment surface 34.

[0035] The front of frame 100 may be defined by one or more laterally-extending front members 106, and the back of frame 100 may be defined by one or more laterally-extending back members 108. Frame 100 may further include a plurality of cross-pieces 110 extending between front members 106 and back members 108.

[0036] In an exemplary embodiment, support members 102 and 104 are brackets that extend between front members 106 and back members 108. In this configuration, the tops of support members 102 and 104 provide horizontal support edges for supporting horizontal sections of covers 40 and 42, respectively. The bottoms of support members 102 and 104 are attached to front members 106 and to back members 108.

[0037] Rack 44 may also include channel members 112, 114, and 116 extending between front members 106 and back members 108. Channel members 112 and 114 define a first channel 118, and channel members 114 and 116 define a second channel 120. As described in more detail below, first channel 118 receives a vertical section of cover 40, and second channel 120 receives a vertical section of cover 42.

[0038] Rack 44 may further include a stop 122 that blocks the front ends of channels 118 and 120. As best shown in FIG. 4, stop 122 may be provided as a bar that extends between channel members 112 and 116. A similar stop could also be provided to block the back ends of channels 118 and 120.

[0039] Channel members 112 and 116 may also extend in front of stop 122 to provide a handle 124. As shown in FIG. 1, handle 124 may extend out of the open front of compartment 24.

4. Exemplary Covers

[0040] FIGS. 5 and 6 are isometric and front views, respectively, of a combination in which trays 40 and 42 are supported by rack 44 and are covered by covers 46 and 48, respectively. Cover 46 has a horizontal section 70 and a vertical section 72 attached to and extending downwardly from one side of horizontal section 70. Cover 48 similarly has a horizontal section 74 and a vertical section 76 attached to and extending downwardly from one side of horizontal section 74. In an exemplary embodiment, covers 46 and 48 are arranged so that vertical sections 72 and 76 are adjacent, as best shown in FIG. 6.

[0041] Vertical sections 72 and 76 may include a plurality of bends so that they may be fitted into separate channels, e.g., with vertical section 72 in channel 118 and vertical section 76 in channel 120. When vertical sections 72 and 76 are in channels 118 and 120, respectively, they are also positioned behind stop 122.

[0042] In an exemplary embodiment, covers 46 and 48 are made out of a sheet material. The sheet material could be a metal, such as stainless steel, aluminum, or titanium, with a thickness ranging from about 0.024 inches to about 0.125 inches, depending on the type of metal. A metal cover could be anodized black or other color based, for example, on desired thermal characteristics. It is to be understood that covers 46 and 48 could also be made out of other materials, such as plastics (e.g., high temperature Nylon, polysulfone, polyimide, polyethersulfone, polyetherimide, or polyphenylene sulfide), depending on the operating temperatures that the covers experience.

[0043] To construct a cover out of a sheet material, a generally rectangular piece of the sheet material may be bent to an approximately 90 degree angle so as to define a generally rectangular horizontal section and a generally rectangular vertical section. The vertical section may be further bent inward so that the lower edge of the vertical section is positioned under the horizontal section. The three free edges of the horizontal section may also be bent to provide additional stiffness. For example, horizontal section 70 of cover 46 may include turned-up edges 78 along three sides, and horizontal section 74 of cover 48 may include turned-up edges 80 along three sides, as best shown in FIG. 5. Preferably, turned-up edges 78 and 80 do not contact upper compartment surface 32 when covers 46 and 48 are in compartment 24.

[0044] In the configuration shown in FIGS. 5 and 6, covers 46 and 48 are supported by trays 40 and 42, rather than by rack 44. In particular, tray 40 includes a lip 82 that extends above support member 102, and tray 42 includes a lip 84 that extends above support member 104. As a result, horizontal sections 70 and 74 rest on lips 82 and 84, respectively, rather than on support members 102 and 104. In addition, the lower edges of vertical sections 72 and 76 do not reach down to the level of front member 106, as best shown in FIG. 6.

[0045] However, covers 46 and 48 change position when trays 40 and 42 are removed. For example, FIGS. 7 and 8 illustrate how the position of cover 48 changes when tray 42 is withdrawn from compartment 24. With tray 42 no longer supporting cover 48, horizontal section 74 rests on support member 104 and the lower edge of vertical section 76 rests on front member 106, as best shown in FIG. 8. Thus, one side of horizontal section 74 is supported by vertical section 76, and the opposite side of horizontal section 74 is supported by support member 104.

[0046] When tray 42 is withdrawn, cover 48 stays in compartment 24 because of stop 122. In particular, when tray 42 is pulled forward, cover 48 may be pulled with it. However, the forward motion of cover 48 will be blocked when vertical section 76 in channel 120 reaches stop 122. In this way, stop 122 retains covers 46 and 48 in compartment 24.

[0047] In the configuration illustrated in FIGS. 7 and 8, cover 48 and rack 44 cooperatively define a receiving space into which tray 42 can be inserted. The receiving space is defined above by horizontal section 74, defined below by front member 106 and defined along the sides by channel member 116 and support member 104. However, the height of tray 42 is greater than the height of the receiving space, i.e.,

the distance between front member 106 and horizontal section 74. As a result, when tray 42 is inserted into the receiving space, cover 74 is pushed upward, so that horizontal section 74 lifts off of support member 104 and vertical section lifts off of front member 106. When tray 42 has been fully inserted, horizontal section 74 will again rest on lip 84, as shown in FIGS. 5 and 6.

[0048] The double-headed arrow in FIG. 7 shows the directions in which tray 42 may be inserted and withdrawn from under cover 48. Tray 42 may include a handle 86 to facilitate its movement in the directions indicated by the double-headed arrow. Also as shown in FIG. 7, lip 84 may surround a top opening 88 that provides access to the interior of tray 42. The interior of tray 42 defines a space that may be used to contain previously cooked food portions. The height of this interior space may be defined by the distance between a generally flat bottom wall 90 of tray 42 and the upper surface of lip 84. The sides of the interior space may be defined by four side walls 92 that extend between bottom wall 90 and lip 84.

5. Exemplary Method Of Use

[0049] When tray 42 contains previously cooked food portions, tray 42 may be inserted under cover 48 in heating compartment 24 of food warming apparatus 10 in order to maintain the previously cooked food portions in a ready-to-use condition. In particular, heating compartment 24 may be heated to maintain the previously cooked food portions at a desired holding temperature, as described above. In addition, horizontal section 74 of cover 48 may, at least partially, block top opening 88 so as to restrict evaporation of liquid from the previously cooked food portions.

[0050] Tray 42 may be withdrawn from compartment 24 in order to use one or more of the previously cooked food portions, for example, to prepare a food item ordered by a customer. In particular, withdrawing tray 42 from compartment 24 allows an operator to access the previously cooked food portions through the top opening of tray 42.

[0051] Covers 46 and 48 may be periodically removed from compartment 24, for example, in order to clean them. To remove covers 46 and 48, trays 40 and 42 may first be withdrawn from compartment 24. Then, rack 44 may be pulled out of compartment 24, e.g., using handle 124, with covers 46 and 48 still mounted thereon. Once rack 44 has been withdrawn, covers 46 and 48 may be lifted off.

[0052] Trays 40 and 42, rack 44, and covers 46 and 48 may be assembled in compartment 24 in the following way. First, covers 46 and 48 are mounted on rack 44. More particularly, cover 46 is mounted by fitting vertical section 72 into channel 118 behind stop 122 so that horizontal section 70 rests on support member 102. Similarly, cover 48 is mounted by fitting vertical section 76 into channel 120 behind stop 122 so that horizontal section 74 rests on support member 104.

[0053] Once covers 46 and 48 have been mounted in this way, rack 44 may be inserted into compartment 24 through the front opening, e.g., using handle 124, so that frame 100 is supported by lower compartment surface 34, by mounting bracket 45, or in some other way. Trays 40 and 42 may then be inserted into compartment 24 by sliding them over frame

member 106. The insertion of trays 40 and 42 lifts up covers 46 and 48, as described above, to attain the configuration illustrated in FIGS. 5 and 6.

6. Conclusion

[0054] While certain features and embodiments of the present invention have been described in detail herein, it is to be understood that the invention encompasses all modifications and enhancements within the scope and spirit of the following claims.

What is claimed is:

1. A food warming apparatus for maintaining previously cooked food portions contained in at least one tray in a ready-to-use condition, said at least one tray having a lip defining a tray opening, said food warming apparatus comprising:

a cabinet having at least one heating compartment therein; at least one support member disposed in said at least one heating compartment; and

at least one cover removably mounted on said at least one support member, said at least one cover having a horizontal section and a vertical section extending downwardly from said horizontal section, said horizontal section being supported on a first side by said vertical section and being supported on a second side by said at least one support member,

said at least one cover and at least one support member cooperatively defining at least one receiving space for receiving said at least one tray.

2. The food warming apparatus of claim 1, wherein said at least one cover is movable between a first position, in which said horizontal section rests on said at least one support member, and a second position, in which said horizontal section rests on said lip of said at least one tray.

3. The food warming apparatus of claim 2, wherein in said second position, said horizontal section of said at least one cover at least partially blocks said tray opening so as to restrict evaporation of liquid from said previously cooked food portions contained in said at least one tray.

4. The food warming apparatus of claim 3, wherein said at least one cover is configured to move from said first position to said second position when said at least one tray is inserted into said at least one receiving space, and wherein said at least one cover is configured to move from said second position to said first position when said at least one tray is removed.

5. The food warming apparatus of claim 4, further comprising:

at least one stop that retains said at least one cover in said at least one heating compartment when said at least one tray is removed.

6. The food warming apparatus of claim 5, further comprising:

a plurality of channel members defining a channel in which said vertical section is disposed, said channel having a front end and a back end.

7. The food warming apparatus of claim 6, wherein said at least one stop blocks at least said front end of said channel.

8. The food warming apparatus of claim 7, further comprising:

a frame disposed in said at least one heating compartment, said at least one support member extending upwardly from said frame.

9. The food warming apparatus of claim 8, wherein said at least one support member comprises a bracket extending between a front of said frame and a back of said frame.

10. The food warming apparatus of claim **1**, wherein said at least one cover comprises a first cover and a second cover, and wherein said at least support member comprises a first support member supporting a first horizontal section of said first cover and a second support member supporting a second horizontal section of said second cover.

11. The food warming apparatus of claim **10**, further comprising:

a plurality of channel members defining a first channel and a second channel between said first and second support members, a first vertical section of said first cover being disposed in said first channel and a second vertical section of said second cover being disposed in said second channel.

12. The food warming apparatus of claim **1**, wherein said at least one cover is metal.

13. The food warming apparatus of claim **1**, further comprising at least one heater plate for heating said at least one heating compartment.

14. A method for covering a tray in a food warming apparatus, said food warming apparatus including a heating compartment, said tray having a lip defining a tray opening, said method comprising:

providing a support that fits into said heating compartment, said support including a support member;

providing a cover for said tray, said cover having a horizontal section and a vertical section extending downwardly from said horizontal section;

mounting said cover on said support such that said horizontal section is supported on a first side said by said vertical section and is supported on a second side by said support member;

inserting said support with said cover mounted thereon into said heating compartment; and

inserting said tray into a receiving space cooperatively defined by said cover and said support until said horizontal section of said cover rests on said lip of said tray and at least partially blocks said tray opening.

15. The method of claim **14**, wherein said support includes a frame, and wherein inserting said support with said cover mounted thereon into said heating compartment comprises: mounting said frame in said heating compartment so that said support member extends upwardly from said frame.

16. The method of claim **14**, wherein said support defines a channel for receiving said vertical section of said cover, and wherein mounting said cover on said support comprises: fitting said vertical section into said channel.

17. The method of claim **16**, wherein said support includes a stop that blocks at least one end of said channel, and wherein fitting said vertical section into said channel comprises: positioning said vertical section behind said stop.

18. The method of claim **17**, further comprising withdrawing said tray from said heating compartment such that said stop prevents said cover from being withdrawn from said heating compartment as said tray is being withdrawn.

19. The method of claim **18**, wherein withdrawing said tray from said heating compartment comprises lowering said horizontal section of said cover onto said support member.

20. The method of claim **14**, wherein inserting said tray into a receiving space cooperatively defined by said cover and said support comprises:

lifting said horizontal section of said cover off of said support member.

* * * * *
