Specification

1. Title of the invention

Auxiliary device for hearing aids

2. Scope of Claims

An auxiliary device for hearing aids comprising multiple arc-shaped segments that cover the ears, rotatably attached to an eyeglass frame.

3. Detailed description of invention

The present invention relates to an auxiliary device for hearing aids, particularly effective when hearing-impaired individuals use hearing aids, earphones, etc., and aims to provide an auxiliary device for hearing aids that blocks external noise when using hearing aids, earphones, etc., and makes it easier to hear sounds from the hearing aids, earphones, etc.

An embodiment of the present invention will be described below with reference to the accompanying drawings. In the figure, 1 is the eyeglass frame, and 2 is an arc-shaped segment that is rotatably mounted around pivot points 3 and 4 located near the earpieces of the eyeglass frame 1. Several segments 2 are combined to form a hood 5 that covers the ears.

In the above configuration, when hearing aids, earphones, etc. are not in use, segment 2 is folded as shown in FIG. 2 to prevent it from getting in the way. When hearing aids, earphones, etc. are in use, segment 2 is opened as shown in FIG. 3 to cover the ear and block out external noise.

As is clear from the above explanation, this invention offers excellent advantages, such as blocking out external noise when using hearing aids, earphones, etc., making it easier to hear the sound from the hearing aids, earphones, etc., and being able to be folded when not needed so as not to get in the way.

4. Brief description of drawings

FIG. 1 is a perspective view showing an embodiment of the present invention; FIG. 2 is a front view of the hearing aid auxiliary device of the present invention when not in use; FIG. 3 is a cross-sectional view of the same when in use; and FIG. 4 is a perspective view of the segments constituting the hearing aid auxiliary device.

1 Eyeglass frame, 2 Segment.
