

Materials Data Book

2003 Edition

Cambridge University Engineering Department

PHYSICAL CONSTANTS IN SI UNITS

Absolute zero of temperature	– 273.15 °C
Acceleration due to gravity, g	9.807 m/s ²
Avogadro's number, N_A	6.022x10 ²⁶ /kmol
Base of natural logarithms, e	2.718
Boltzmann's constant, k	1.381 x 10 ⁻²⁶ kJ/K
Faraday's constant, F	9.648 x 10 ⁷ C/kmol
Universal Gas constant, $\bar{R}$	8.3143 kJ/kmol K
Permeability of vacuum, μ_0	1.257 x 10 ⁻⁶ H/m
Permittivity of vacuum, ϵ_0	8.854 x 10 ⁻¹² F/m
Planck's constant, h	6.626 x 10 ⁻³⁷ kJ/s
Velocity of light in vacuum, c	2.998 x 10 ⁸ m/s
Volume of perfect gas at STP	22.41 m ³ /kmol

CONVERSION OF UNITS

II. PHYSICAL AND MECHANICAL PROPERTIES OF MATERIALS	
Melting temperature	9
Density	10
Young's modulus	11
Yield stress and tensile strength	12
Fracture toughness	13
Environmental resistance	14
Uniaxial tensile response of selected metals and polymers	15
III. MATERIAL PROPERTY CHARTS	
Young's modulus versus density	16
Strength versus density	17
Young's modulus versus strength	18
Fracture toughness versus strength	19
Maximum service temperature	20
Material price (per kg)	21
IV. PROCESS ATTRIBUTE CHARTS	
Material-process compatibility matrix (shaping)	22
Mass	23
Section thickness	23
Surface roughness	24
Dimensional tolerance	24
Economic batch size	25

V. CLASSIFICATION AND APPLICATIONS OF ENGINEERING MATERIALS

Metals: ferrous alloys, non-ferrous alloys	26
Polymers and foams	27
Composites, ceramics, glasses and natural materials	28

VI. EQUILIBRIUM (PHASE) DIAGRAMS

Copper – Nickel	29
Lead – Tin	29
Iron – Carbon	30
Aluminium – Copper	30
Aluminium – Silicon	31
Copper – Zinc	31
Copper – Tin	32
Titanium-Aluminium	32
Silica – Alumina	33

VII. HEAT TREATMENT OF STEELS

TTT diagrams and Jominy end-quench hardenability curves for steels	34
--	----

VIII. PHYSICAL PROPERTIES OF SELECTED ELEMENTS

Atomic properties of selected elements	36
Oxidation properties of selected elements	37

INTRODUCTION

The data and information in this booklet have been collected for use in the Materials Courses in Part I of the Engineering Tripos (as well as in Part II, and the Manufacturing Engineering Tripos). Numerical data are presented in tabulated and graphical form, and a summary of useful formulae is included. A list of sources from which the data have been prepared is given below. Tabulated material and process data or information are from the Cambridge Engineering Selector (CES) software (Educational database Level 2), copyright of Granta Design Ltd, and are reproduced by permission; the same data source was used for the material property and process attribute charts.

It must be realised that many material properties (such as toughness) vary between wide limits depending on composition and previous treatment. Any final design should be based on manufacturers' or suppliers' data for the material in question, and not on the data given here.

I. FORMULAE AND DEFINITIONS

STRESS AND STRAIN

$$\sigma_t = \frac{F}{A} \quad \sigma_n = \frac{F}{A_o} \quad \varepsilon_t = \ln\left(\frac{\ell}{\ell_o}\right) \quad \varepsilon_n = \frac{\ell - \ell_o}{\ell_o}$$

F = normal component of force

A_o = initial area

A = current area

ℓ_o = initial length

ℓ = current length

σ_t = true stress

σ_n = nominal stress

ε_t = true strain

ε_n = nominal strain

Poisson's ratio, $\nu = - \frac{\text{lateral strain}}{\text{longitudinal strain}}$

Young's modulus E = initial slope of $\sigma_t - \varepsilon_t$ curve = initial slope of $\sigma_n - \varepsilon_n$ curve.

Yield stress σ_y is the nominal stress at the limit of elasticity in a tensile test.

Tensile strength σ_{ts} is the nominal stress at maximum load in a tensile test.

Tensile ductility ε_f is the nominal plastic strain at failure in a tensile test. The gauge length of the specimen should also be quoted.

ELASTIC MODULI

$$G = \frac{E}{2(1 + \nu)} \quad K = \frac{E}{3(1 - 2\nu)}$$

For polycrystalline solids, as a rough guide,

$$\text{Poisson's Ratio} \quad \nu \approx \frac{1}{3}$$

$$\text{Shear Modulus} \quad G \approx \frac{3}{8} E$$

$$\text{Bulk Modulus} \quad K \approx E$$

These approximations break down for rubber and porous solids.

STIFFNESS AND STRENGTH OF UNIDIRECTIONAL COMPOSITES

$$E_{II} = V_f E_f + (1 - V_f) E_m$$

$$E_{\perp} = \left(\frac{V_f}{E_f} + \frac{1 - V_f}{E_m} \right)^{-1}$$

$$\sigma_{ts} = V_f \sigma_f^f + (1 - V_f) \sigma_y^m$$

E_{II} = composite modulus parallel to fibres (upper bound)

$E_{\perp}$ = composite modulus transverse to fibres (lower bound)

V_f = volume fraction of fibres

E_f = Young's modulus of fibres

E_m = Young's modulus of matrix

σ_{ts} = tensile strength of composite parallel to fibres

σ_f^f = fracture strength of fibres

σ_y^m = yield stress of matrix

DISLOCATIONS AND PLASTIC FLOW

The force per unit length F on a dislocation, of Burger's vector b , due to a remote shear stress τ , is $F = \tau b$. The shear stress τ_y required to move a dislocation on a single slip plane is

$$\tau_y = \frac{cT}{bL} \quad \text{where } T = \text{line tension (about } \frac{1}{2} G b^2, \text{ where } G \text{ is the shear modulus)}$$

L = inter-obstacle distance

c = constant ($c \approx 2$ for strong obstacles, $c < 2$ for weak obstacles)

The **shear yield stress** k of a **polycrystalline solid** is related to the shear stress τ_y required to move a dislocation on a single slip plane: $k \approx \frac{3}{2} \tau_y$.

The **uniaxial yield stress** σ_y of a **polycrystalline solid** is approximately $\sigma_y = 2k$, where k is the shear yield stress.

Hardness H (in MPa) is given approximately by: $H \approx 3\sigma_y$.

Vickers Hardness HV is given in kgf/mm², i.e. $HV = H / g$, where g is the acceleration due to gravity.

FAST FRACTURE

The stress intensity factor, K : $K = Y \sigma \sqrt{\pi a}$

Fast fracture occurs when $K = K_{IC}$

In plane strain, the relationship between stress intensity factor K and strain energy release rate G is:

$$K = \sqrt{\frac{EG}{1-\nu^2}} \approx \sqrt{EG} \quad (\text{as } \nu^2 \approx 0.1)$$

Plane strain fracture toughness and toughness are thus related by: $K_{IC} = \sqrt{\frac{E G_{IC}}{1-\nu^2}} \approx \sqrt{E G_{IC}}$

“Process zone size” at crack tip given approximately by: $r_p = \frac{K_{IC}^2}{\pi \sigma_f^2}$

Note that K_{IC} (and G_{IC}) are only valid when conditions for linear elastic fracture mechanics apply (typically the crack length and specimen dimensions must be at least 50 times the process zone size).

In the above:

σ = remote tensile stress

a = crack length

Y = dimensionless constant dependent on geometry; typically $Y \approx 1$

K_{IC} = plane strain fracture toughness;

G_{IC} = critical strain energy release rate, or toughness;

E = Young's modulus

ν = Poisson's ratio

σ_f = failure strength

STATISTICS OF FRACTURE

Weibull distribution, $P_s(V) = \exp \left\{ \int_V - \left(\frac{\sigma}{\sigma_o} \right)^m \frac{dV}{V_o} \right\}$

For constant stress: $P_s(V) = \exp \left\{ - \left(\frac{\sigma}{\sigma_o} \right)^m \frac{V}{V_o} \right\}$

P_s = survival probability of component

V = volume of component

σ = tensile stress on component

V_o = volume of test sample

σ_o = reference failure stress for volume V_o , which gives $P_s = \frac{1}{e} = 0.37$

m = Weibull modulus

FATIGUE

Basquin's Law (high cycle fatigue):

$$\Delta\sigma N_f^\alpha = C_1$$

Coffin-Manson Law (low cycle fatigue):

$$\Delta\varepsilon^{pl} N_f^\beta = C_2$$

Goodman's Rule. For the same fatigue life, a stress range $\Delta\sigma$ operating with a mean stress σ_m , is equivalent to a stress range $\Delta\sigma_o$ and zero mean stress, according to the relationship:

$$\Delta\sigma = \Delta\sigma_o \left(1 - \frac{\sigma_m}{\sigma_{ts}} \right)$$

Miner's Rule for cumulative damage (for i loading blocks, each of constant stress amplitude and duration N_i cycles):

$$\sum_i \frac{N_i}{N_{fi}} = 1$$

Paris' crack growth law:

$$\frac{da}{dN} = A \Delta K^n$$

In the above:

- $\Delta\sigma$ = stress range;
- $\Delta\varepsilon^{pl}$ = plastic strain range;
- ΔK = tensile stress intensity range;
- N = cycles;
- N_f = cycles to failure;
- $\alpha, \beta, C_1, C_2, A, n$ = constants;
- a = crack length;
- σ_{ts} = tensile strength.

CREEP

Power law creep: $\dot{\varepsilon}_{ss} = A \sigma^n \exp(-Q/RT)$

- $\dot{\varepsilon}_{ss}$ = steady-state strain-rate
- Q = activation energy (kJ/kmol)
- R = universal gas constant
- T = absolute temperature
- A, n = constants

DIFFUSION

Diffusion coefficient: $D = D_o \exp(-Q / RT)$

Fick's diffusion equations: $J = -D \frac{dC}{dx}$ and $\frac{\partial C}{\partial t} = D \frac{\partial^2 C}{\partial x^2}$

C = concentration

x = distance

t = time

J = diffusive flux

D = diffusion coefficient (m²/s)

D_o = pre-exponential factor (m²/s)

Q = activation energy (kJ/kmol)

HEAT FLOW

Steady-state 1D heat flow (Fourier's Law): $q = -\lambda \frac{dT}{dx}$

Transient 1D heat flow: $\frac{\partial T}{\partial t} = a \frac{\partial^2 T}{\partial x^2}$

T = temperature (K)

q = heat flux per second, per unit area (W/m².s)

λ = thermal conductivity (W/m.K)

a = thermal diffusivity (m²/s)

For many 1D problems of diffusion and heat flow, the solution for concentration or temperature depends on the error function, erf :

$$C(x,t) = f \left[\operatorname{erf} \left(\frac{x}{2\sqrt{Dt}} \right) \right] \quad \text{or} \quad T(x,t) = f \left[\operatorname{erf} \left(\frac{x}{2\sqrt{at}} \right) \right]$$

A characteristic diffusion distance in all problems is given by $x \approx \sqrt{Dt}$, with the corresponding characteristic heat flow distance in thermal problems being $x \approx \sqrt{at}$.

The error function, and its first derivative, are:

$$\operatorname{erf}(X) = \frac{2}{\sqrt{\pi}} \int_0^X \exp(-y^2) dy \quad \text{and} \quad \frac{d}{dX} [\operatorname{erf}(X)] = \frac{2}{\sqrt{\pi}} \exp(-X^2)$$

The error function integral has no closed form solution – values are given in the Table below.

X	0	0.1	0.2	0.3	0.4	0.5	0.6	0.7	0.8
$\operatorname{erf}(X)$	0	0.11	0.22	0.33	0.43	0.52	0.60	0.68	0.74

X	0.9	1.0	1.1	1.2	1.3	1.4	1.5	∞
$\operatorname{erf}(X)$	0.80	0.84	0.88	0.91	0.93	0.95	0.97	1.0

II. PHYSICAL AND MECHANICAL PROPERTIES OF MATERIALS

II.1 MELTING (or SOFTENING) TEMPERATURE, T_m

All data are for melting points at atmospheric pressure. For polymers (and glasses) the data indicate the glass transition (softening) temperature, above which the mechanical properties rapidly fall. Melting temperatures of selected elements are given in section VIII.

Metals		T_m (°C)
Ferrous	Cast Irons	1130 - 1250
	High Carbon Steels	1289 - 1478
Non-ferrous	Medium Carbon Steels	1380 - 1514
	Low Carbon Steels	1480 - 1526
	Low Alloy Steels	1382 - 1529
	Stainless Steels	1375 - 1450

	Rigid Polymer Foam (HD)	0.024 - 0.091

¹ For full names and acronyms of polymers – see Section V.

Note: K_{IC} only valid for conditions of linear elastic fracture mechanics (see I. Formulae & Definitions). Plane Strain Toughness, G_{IC} , may be estimated from $K_{IC}^2 = EG_{IC} / (1 - \nu^2) \approx EG_{IC}$ (as $\nu^2 \approx 0.1$).

II.7 UNIAXIAL TENSILE RESPONSE OF SELECTED METALS & POLYMERS

Figure 2.1 Tensile response of some common metals

Figure 2.2 Tensile response of some common polymers

III. MATERIAL PROPERTY CHARTS

III.1 YOUNG'S MODULUS – DENSITY

Figure 3.1: Young's modulus, E , against density, ρ . The design guide-lines assist in selection of materials for minimum weight, stiffness-limited design. (Data courtesy of Granta Design Ltd)

III.2 STRENGTH – DENSITY

Figure 3.2: Failure strength, σ_f , against density, ρ . Failure strength is defined as the *tensile elastic limit* (usually yield stress) for all materials other than ceramics, for which it is the *compressive strength*. The design guide-lines assist in selection of materials for minimum weight, strength-limited design. (Data courtesy of Granta Design Ltd)

III.3 YOUNG'S MODULUS – STRENGTH

Figure 3.3: Young's modulus, E , against failure strength, σ_f . Failure strength is defined as the *tensile elastic limit* (usually yield stress) for all materials other than ceramics, for which it is the *compressive strength*. The design guide-lines assist in the selection of materials for maximum stored energy, volume-limited design. (Data courtesy of Granta Design Ltd)

III.4 FRACTURE TOUGHNESS – STRENGTH

Figure 3.4: Fracture toughness (plane strain), K_{IC} , against failure strength, σ_f . Failure strength is defined as the *tensile elastic limit* (usually yield stress) for all materials other than ceramics, for which it is the *compressive strength*. The contours show $K_{IC}^2 / \pi \sigma_f^2$, which is approximately the diameter of the process zone at a crack tip. Valid application of linear elastic fracture mechanics using K requires that the specimen and crack dimensions are large compared to this process zone. The design guide-lines are used in selecting materials for damage tolerant design. (Data courtesy of Granta Design Ltd)

III.5 MAXIMUM SERVICE TEMPERATURE

Figure 3.5: Maximum service temperature. The shaded bars extend to the maximum service temperature – materials may be used safely for all temperatures up to this value, without significant property degradation. (Note: there is a modest range of maximum service temperature in a given material class – not all variants within a class may be used up to the temperature shown, so caution should be exercised if a material appears close to its limit).

NB: For full names and acronyms of polymers – see Section V. (Data courtesy of Granta Design Ltd)

III.6 MATERIAL PRICE (PER KG)

Figure 3.6: Material price (per kg), C_m (2003 data). C_m represents raw material price/kg, and does not include manufacturing or end-of-life costs.

NB: For full names and acronyms of polymers – see Section V. (Data courtesy of Granta Design Ltd)

IV. PROCESS ATTRIBUTE CHARTS

IV.1 MATERIAL – PROCESS COMPATIBILITY MATRIX (SHAPING)

Figure 4.1a: Metals

Thermosets				•	•		•
Polymer Foams	•	•			•		

Notes on other materials:

Ceramics are all processed by powder methods, and Glasses are also moulded. Both are difficult to machine.

Polymer Composites are shaped by dedicated forming techniques, and are difficult to machine.

Natural Materials can only be machined, though some woods are also hot formed.

V. CLASSIFICATION AND APPLICATIONS OF ENGINEERING MATERIALS

V.1 METALS: FERROUS ALLOYS, NON-FERROUS ALLOYS

Metals		Applications
Ferrous	Cast Irons	Automotive parts, engine blocks, machine tool structural parts, lathe beds
	High Carbon Steels	Cutting tools, springs, bearings, cranks, shafts, railway track
	Medium Carbon Steels	General mechanical engineering (tools, bearings, gears, shafts, bearings)
	Low Carbon Steels	Steel structures ("mild steel") – bridges, oil rigs, ships; reinforcement for concrete; automotive parts, car body panels; galvanised sheet; packaging (cans, drums)
	Low Alloy Steels	Springs, tools, ball bearings, automotive parts (gears connecting rods etc)
Non-ferrous	Stainless Steels	Transport, chemical and food processing plant, nuclear plant, domestic ware (cutlery, washing machines, stoves), surgical implements, pipes, pressure vessels, liquid gas containers
	Aluminium Alloys	Automotive parts (cylinder blocks), domestic appliances (irons)
	Casting Alloys	Electrical conductors, heat exchangers, foil, tubes, saucepans, beverage cans, lightweight ships, architectural panels
	Non-heat-treatable Alloys	Aerospace engineering, automotive bodies and panels, lightweight structures and ships
	Heat-treatable Alloys	Electrical conductors and wire, electronic circuit boards, heat exchangers, boilers, cookware, coinage, sculptures
	Copper Alloys	Roof and wall cladding, solder, X-ray shielding, battery electrodes
	Lead Alloys	Automotive castings, wheels, general lightweight castings for transport, nuclear fuel containers; principal alloying addition to Aluminium Alloys
	Magnesium Alloys	Gas turbines and jet engines, thermocouples, coinage; alloying addition to austenitic stainless steels
	Nickel Alloys	Aircraft turbine blades; general structural aerospace applications; biomedical implants.
	Titanium Alloys	Die castings (automotive, domestic appliances, toys, handles); coating on galvanised steel
	Zinc Alloys	

V.2 POLYMERS AND FOAMS

Polymers		Abbreviation	Applications
Elastomer	Butyl Rubber	EVA	Tyres, seals, anti-vibration mountings, electrical insulation, tubing
	Ethylene-vinyl-acetate	IR	Bags, films, packaging, gloves, insulation, running shoes
	Isoprene	NR	Tyres, inner tubes, insulation, tubing, shoes
	Natural Rubber	CR	Gloves, tyres, electrical insulation, tubing
	Polychloroprene (Neoprene)	el-PU	Wetsuits, O-rings and seals, footwear
	Polyurethane Elastomers		Packaging, hoses, adhesives, fabric coating
	Silicone Elastomers		Electrical insulation, electronic encapsulation, medical implants
Thermoplastic	Acrylonitrile butadiene styrene	ABS	Communication appliances, automotive interiors, luggage, toys, boats
	Cellulose Polymers	CA	Tool and cutlery handles, decorative trim, pens
	Ionomer	I	Packaging, golf balls, blister packs, bottles
	Polyamides (Nylons)	PA	Gears, bearings; plumbing, packaging, bottles, fabrics, textiles, ropes
	Polycarbonate	PC	Safety goggles, shields, helmets; light fittings, medical components
	Polyetheretherketone	PEEK	Electrical connectors, racing car parts, fibre composites
	Polyethylene	PE	Packaging, bags, squeeze tubes, toys, artificial joints
	Polyethylene terephthalate	PET	Blow moulded bottles, film, audio/video tape, sails
	Polymethyl methacrylate (Acrylic)	PMMA	Aircraft windows, lenses, reflectors, lights, compact discs
	Polyoxymethylene (Acetal)	POM	Zips, domestic and appliance parts, handles
	Polypropylene	PP	Ropes, garden furniture, pipes, kettles, electrical insulation, astroturf
	Polystyrene	PS	Toys, packaging, cutlery, audio cassette/CD cases
	Polyurethane Thermoplastics	tp-PU	Cushioning, seating, shoe soles, hoses, car bumpers, insulation
	Polyvinylchloride	PVC	Pipes, gutters, window frames, packaging
	Polytetrafluoroethylene (Teflon)	PTFE	Non-stick coatings, bearings, skis, electrical insulation, tape
Thermoset	Epoxies		Adhesives, fibre composites, electronic encapsulation
	Phenolics		Electrical plugs, sockets, cookware, handles, adhesives
	Polyester		Furniture, boats, sports goods
Polymer Foams	Flexible Polymer Foam		Packaging, buoyancy, cushioning, sponges, sleeping mats
	Rigid Polymer Foam		Thermal insulation, sandwich panels, packaging, buoyancy

V.3 COMPOSITES, CERAMICS, GLASSES AND NATURAL MATERIALS

Composites		Applications
Metal Polymer	Aluminium/Silicon Carbide	Automotive parts, sports goods
	CFRP GFRP	Lightweight structural parts (aerospace, bike frames, sports goods, boat hulls and oars, springs) Boat hulls, automotive parts, chemical plant
Ceramics		
Glasses	Borosilicate Glass	Ovenware, laboratory ware, headlights
	Glass Ceramic	Cookware, lasers, telescope mirrors
	Silica Glass	High performance windows, crucibles, high temperature applications
	Soda-Lime Glass	Windows, bottles, tubing, light bulbs, pottery glazes
Porous	Brick	Buildings
	Concrete	General civil engineering construction
	Stone	Buildings, architecture, sculpture
Technical	Alumina	Cutting tools, spark plugs, microcircuit substrates, valves
	Aluminium Nitride	Microcircuit substrates and heatsinks
	Boron Carbide	Lightweight armour, nozzles, dies, precision tool parts
	Silicon	Microcircuits, semiconductors, precision instruments, IR windows, MEMS
	Silicon Carbide	High temperature equipment, abrasive polishing grits, bearings, armour
	Silicon Nitride	Bearings, cutting tools, dies, engine parts
	Tungsten Carbide	Cutting tools, drills, abrasives
Natural		
	Bamboo	Building, scaffolding, paper, ropes, baskets, furniture
	Cork	Corks and bungs, seals, floats, packaging, flooring
	Leather	Shoes, clothing, bags, drive-belts
	Wood	Construction, flooring, doors, furniture, packaging, sports goods

VIII. PHYSICAL PROPERTIES OF SELECTED ELEMENTS

ATOMIC PROPERTIES OF SELECTED ELEMENTS

Element	Symbol	Atomic Number	Relative Atomic Weight ¹	Melting Point (°C)	Crystal structure ² (at 20°C)	Lattice constants ³ (at 20°C)	
						a, (b) (Å)	c (Å)
Aluminium	Al	13	26.982	660	f.c.c.	4.0496	
Beryllium	Be	4	9.012	1280	h.c.p.	2.2856	3.5843
Boron	B	5	10.811	2300	t.	8.73	5.03
Carbon	C	6	12.011	3500	hex.	2.4612	6.7079
Chlorine	Cl	17	35.453	– 101	–	–	
Chromium	Cr	24	51.996	1900	b.c.c.	2.8850	
Copper	Cu	29	63.54	1083	f.c.c.	2.5053	
Germanium	Ge	32	72.59	958	d.	5.6575	
Gold	Au	79	196.967	1063	f.c.c.	4.0786	
Hydrogen	H	1	1.008	– 259	–	–	
Iron	Fe	26	55.847	1534	b.c.c.	2.8663	
Lead	Pb	82	207.19	327	f.c.c.	4.9505	
Magnesium	Mg	12	24.312	650	h.c.p.	3.2094	5.2103
Manganese	Mn	25	54.938	1250	cub.	8.912	
Molybdenum	Mo	42	95.94	2620	b.c.c.	3.1468	
Nickel	Ni	28	58.71	1453	f.c.c.	3.5241	
Niobium	Nb	41	92.906	2420	b.c.c.	3.3007	
Nitrogen	N	7	14.007	– 210	–	–	
Oxygen	O	8	15.999	– 219	–	–	
Phosphorus	P	15	30.974	44	cub.	7.17 (at – 35°C)	
Silicon	Si	14	28.086	1414	d.	5.4305	
Silver	Ag	47	107.870	961	f.c.c.	4.0862	
Sulphur	S	16	32.064	119	f.c.orth.	10.437, (12.845)	24.369
Tin	Sn	50	118.69	232	b.c.t.	5.8313	3.1812
Titanium	Ti	22	47.90	1670	h.c.p.	2.9504	4.6833
Tungsten	W	74	183.85	3380	b.c.c.	3.1652	
Vanadium	V	23	50.942	1920	b.c.c.	3.0282	
Zinc	Zn	30	65.37	419	h.c.p.	2.6649	4.9468
Zirconium	Zr	40	91.22	1850	h.c.p.	3.2312	5.1476

¹ The values of atomic weight are those in the Report of the International Commission on Atomic Weights (1961). The unit is 1/12th of the mass of an atom of C¹².

² f.c.c. = face-centred cubic; h.c.p. = hexagonal close-packed; b.c.c. = body-centred cubic; t. = tetragonal; hex. = hexagonal; d. = diamond structure; cub. = cubic; f.c.orth. = face-centred orthorhombic; b.c.t. = body-centred tetragonal.

³ Lattice constants are in Ångström units (1 Å = 10^{–10} m)

OXIDATION PROPERTIES OF SELECTED ELEMENTS

Standard electrode potentials (300K, molar solutions)

Oxidation reaction for solution of the metal	Normal hydrogen scale (volts)
Mg → Mg ²⁺ + 2e ⁻	- 2.36
Al → Al ³⁺ + 3e ⁻	- 1.66
Zn → Zn ²⁺ + 2e ⁻	- 0.76
Cr → Cr ³⁺ + 3e ⁻	- 0.74
Fe → Fe ²⁺ + 2e ⁻	- 0.44
Ni → Ni ²⁺ + 2e ⁻	- 0.25
Sn → Sn ²⁺ + 2e ⁻	- 0.14
Pb → Pb ²⁺ + 2e ⁻	- 0.13
H ₂ → 2H ⁺ + 2e ⁻	0.00
Sn ²⁺ → Sn ⁴⁺ + 2e ⁻	+ 0.15
Cu → Cu ²⁺ + 2e ⁻	+ 0.34
O ₂ + 2H ₂ O + 4e ⁻ → 4(OH) ⁻	+ 0.40
Fe ²⁺ → Fe ³⁺ + e ⁻	+ 0.77
Ag → Ag ⁺ + e ⁻	+ 0.80
2H ₂ O → O ₂ + 4H ⁺ + 4e ⁻	+ 1.23
Au → Au ³⁺ + 3e ⁻	+ 1.42

Free energy of oxidation (at 273K)

Material	Oxide	Free energy (kJ/mol O ₂)
Beryllium	BeO	- 1182
Magnesium	MgO	- 1162
Aluminium	Al ₂ O ₃	- 1045
Zirconium	ZrO ₂	-1028

Iron	Fe ₃ O ₄	- 508
Nickel	NiO	- 439
Most polymers	-	- 400
Diamond, graphite	CO ₂	- 389
Lead	Pb ₃ O ₄	- 309
Copper	CuO	- 254
GFRP	-	- 200
Silver	Ag ₂ O	- 5
Gold	Au ₂ O ₃	+ 80

CONVERSION OF UNITS – STRESS, PRESSURE AND ELASTIC MODULUS *

	MN/m ² (or MPa)	lb/in ²	kgf/mm ²	bar
MN/m ² (or MPa)	1	1.45 x 10 ²	0.102	10
lb/in ²	6.89 x 10 ⁻³	1	7.03 x 10 ⁻⁴	6.89 x 10 ⁻²
kgf/mm ²	9.81	1.42 x 10 ³	1	98.1
bar	0.10	14.48	1.02 x 10 ⁻²	1

CONVERSION OF UNITS – ENERGY *

	J	cal	eV	ft lbf
J	1	0.239	6.24 x 10 ¹⁸	0.738
cal	4.19	1	2.61 x 10 ¹⁹	3.09
eV	1.60 x 10 ⁻¹⁹	3.83 x 10 ⁻²⁰	1	1.18 x 10 ⁻¹⁹
ft lbf	1.36	0.324	8.46 x 10 ¹⁸	1

CONVERSION OF UNITS – POWER *

	kW (kJ/s)	hp	ft lbf/s
kW (kJ/s)	1	1.34	7.38 x 10 ²
hp	0.746	1	5.50 x 10 ²
ft lbf/s	1.36 x 10 ⁻³	1.82 x 10 ⁻³	1

* To convert row unit to column unit, multiply by the number at the column-row intersection, thus
1 MN/m² = 10 bar
