HANGER FOR FIRE SEPARATION WALL**FIELD OF THE INVENTION**

The present invention generally relates to connections for structures, and more specifically, a truss hanger for connecting a truss to a wall including fire retardant sheathing.

BACKGROUND

The use of fire separation walls in structures, such as in multifamily housing, is commonplace. Often, fire separation is required to be continuous along the walls between adjoining units to prevent fire from spreading between the adjoining units in a multifamily structure. For some types of construction, the building codes also require exterior walls to be fire rated. Typically, gypsum board is used as a fire retardant sheathing along these walls. Floor trusses or joists are attached to or hung from the walls including the gypsum board, but cannot be hung from the gypsum board itself. The trusses or joists must therefore be attached to the wall framing. A cutout for the entire cross section of the truss leaves a large discontinuity in the fire retardant sheathing. However, building codes require that the fire separation wall maintain a certain fire resistant rating. Thus, the integrity of the fire retardant sheathing should be maintained and interruptions of the sheathing kept to a minimum.

SUMMARY

In one aspect of the present invention, a hanger for connecting a structural component to a wall having sheathing mounted thereon includes a channel-shaped portion configured to receive the structural component. An extension portion extends from the channel-shaped portion and is configured to extend through the sheathing to engage the wall at a first location. A connection portion is configured for attachment to the wall at a second location spaced from the first location.

In another aspect of the present invention, a truss hanger for connecting a truss to a wall having fire resistant sheathing mounted thereon includes a channel-shaped portion configured to receive the truss. The channel-shaped portion includes a base sized and shaped for receiving a truss chord of the truss thereon, side panels extending upward from the base, and back panels. Each back panel extends from a respective one of the side panels. An extension portion extends from the channel-shaped portion and is configured to extend through the fire resistant sheathing. The extension portion includes extension flanges and back flanges. Each of the extension flanges extends from a respective one of the back panels. Each of the back flanges extends from a respective one of the extension flanges. The truss hanger also includes a connection portion configured for attachment to the wall.

A hanger for connecting a structural component to a wall having sheathing mounted thereon generally comprises a channel-shaped portion configured to receive the structural component. An extension portion is configured to be disposed at least partially in the sheathing. A connection portion is configured for attachment to the wall.

Other objects and features will be in part apparent and in part pointed out hereinafter.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a fragmentary perspective of adjacent floor trusses connected to a wall having fire retardant sheathing by truss hangers that extend through the sheathing;

2

FIG. 2 is a perspective of a truss hanger according to a first embodiment of the present invention;

FIG. 2A is a rear perspective of the truss hanger;

FIG. 3 is a front elevation thereof;

FIG. 4 is a right side elevation thereof;

FIG. 5 is a left side elevation thereof;

FIG. 6 is a rear elevation thereof;

FIG. 7 is a top plan thereof;

FIG. 8 is a bottom plan thereof;

FIG. 9 is a perspective of a wall having fire retardant sheathing with a slot cut in the sheathing to receive the truss hanger;

FIG. 10 is the perspective of FIG. 9, but showing two of the truss hangers mounted thereon;

FIG. 10A is an enlarged fragmentary perspective of FIG. 10;

FIG. 11 is a top plan of FIG. 10, illustrating the truss hanger extending through the fire retardant sheathing;

FIG. 12 is a perspective similar to FIG. 10, but showing a floor truss positioned for mounting in the truss hanger;

FIG. 13 is a side elevation of FIG. 12;

FIG. 13A is an enlarged fragmentary perspective of FIG. 13 with a portion of the fire retardant sheathing broken away;

FIG. 14 is the perspective of FIG. 10, but showing floor trusses mounted in the truss hangers;

FIG. 14A is an enlarged fragmentary perspective of FIG. 14;

FIG. 15 is a top view of a stamped metal blank for forming a truss hanger according to the present invention;

FIG. 16 is a perspective of a slot template for use in cutting the slot in the sheathing to receive the truss hanger;

FIG. 17 is a rear perspective of the slot template;

FIG. 18 is a front elevation thereof;

FIG. 19 is a right side elevation thereof;

FIG. 20 is a left side elevation thereof;

FIG. 21 is a rear elevation thereof;

FIG. 22 is a top plan thereof;

FIG. 23 is a bottom plan thereof;

FIG. 24 is a front view of a stamped metal blank for forming the slot template;

FIG. 25 is a fragmentary perspective of adjacent floor trusses connected at an angle to a wall having fire retardant sheathing by truss hangers of a second embodiment that extend through the sheathing;

FIG. 26 is a perspective of one of the truss hangers of FIG. 25;

FIG. 27 is a rear perspective thereof;

FIG. 28 is a front elevation thereof;

FIG. 29 is a right side elevation thereof;

FIG. 30 is a left side elevation thereof;

FIG. 31 is a rear elevation thereof;

FIG. 32 is a top plan thereof;

FIG. 33 is a bottom plan thereof;

FIG. 34 is a perspective of a wall and the two truss hangers mounted thereon with parts broken away;

FIG. 35 is an enlarged fragmentary perspective of FIG. 34;

FIG. 36 is a top plan of FIG. 34, illustrating the truss hangers extending through the fire retardant sheathing;

FIG. 37 is a side elevation of FIG. 34;

FIG. 38 is an enlarged fragment of FIG. 37;

FIG. 39 is a top plan similar to FIG. 36, but showing a floor truss mounted in each truss hanger; and

FIG. 40 is a front view of a stamped metal blank for forming a truss hanger according to the present invention.

3

Corresponding reference characters indicate corresponding parts throughout the drawings.

DETAILED DESCRIPTION

Referring to FIG. 1, a first embodiment of a connection system for a fire separation wall is shown generally at 10. Floor trusses generally indicated at 12 each include truss members (broadly, “wooden structural members”) including a top chord 14, a bottom chord 16, and web members 18 joining the top and bottom chords. Each floor truss also includes end members 20 at each end joining the top and bottom chords 14, 16 (only one end of each truss is shown). The truss members can be joined by nail plates 22 or by any other suitable fastening structure. The number and orientations of the web members 18 and chords 14, 16 may vary from the illustrated embodiment without departing from the scope of the invention, as a truss hanger 26 according to the present invention is readily applicable to other truss configurations (e.g. a roof truss). Moreover, the hanger 26 may be used to connect structural components other than trusses to a wall or other part of a structure. The hanger can be used to support other wood framing members such as solid sawn or structural composite lumber.

As seen in FIG. 1, a wall 28 includes a top member or plate 30 and support members or studs 32 (only one stud may be seen in FIG. 1). As illustrated, the top plate 30 is formed by two 2x4's in stacked relation. Fire retardant sheathing 34 is mounted on both sides of the wall 28, as illustrated. In one embodiment, the fire retardant sheathing is gypsum board, such as two layers of 5/8" gypsum board mounted on each side of the wall 28 as illustrated, although other configurations of fire retardant sheathing are within the scope of the present invention. Other wall configurations, including different wall constructions and materials, are within the scope of the present invention. For example, the truss hangers 26 can be used with any wall assembly or fire-rated wall assembly, such as a 2-hour fire-resistive wall assembly. The floor trusses 12 are mounted on the wall 28 adjacent the fire retardant sheathing 34 by the truss hangers 26. The truss hangers 26 extend through a narrow slot in the fire retardant sheathing 34 to maintain the integrity and fire retardant characteristics of the fire separation wall.

Referring to FIGS. 2-8, the truss hanger 26 includes a channel-shaped portion 38, an extension portion 40, and a connection portion 42. The channel-shaped portion 38 is configured to receive the floor truss 12. The channel-shaped portion 38 includes a seat or base 44 and a pair of side panels 46 extending upward from the base. When installed, the base 44 is generally horizontal, and the side panels 46 extend generally vertical from the base. A back panel 48 extends from each of the side panels 46. Each back panel 48 is generally perpendicular to both the side panels 46 and the base 44. When installed, each back panel 48 extends generally parallel to an interior face 50 of the fire retardant sheathing 34. The base 44, side panels 46, and back panels 48 form a channel 52 configured to receive the floor truss 12.

As seen in FIGS. 1 and 12-14A, the floor truss 12 is received in the channel 52 to attach the floor truss to the wall 28. The bottom chord 16 of the floor truss 12 engages and rests upon (i.e., is supported by) the base 44. The end member 20 of the floor truss 12 is positioned against the back panels 48 between the side panels 46. The truss hanger 26 includes fastening structure for attaching the floor truss 12 to the truss hanger. Fastening structure can be of any type known in the art for attaching a connector to a wooden structural member, such as nailing teeth (not shown) struck

4

from the material of the hanger. In the illustrated embodiment, the fastening structure comprises a hole to allow for insertion of a fastening member. More specifically, in one embodiment the fastening structure comprises nail holes 54 in the side panels 46 of the truss hanger 26, and the fastening member comprises a nail 56 (see FIG. 12). In the illustrated embodiment, nail holes 54 are positioned on each of the side panels 46 so that nails 56 can be inserted into both the bottom chord 16 and the end member 20 of the floor truss 12 to attach the hanger 26 to the floor truss 12.

Referring again to FIGS. 2-8, the extension portion 40 includes two extension flanges 60 configured to extend through the fire retardant sheathing 34. Each flange 60 extends from one of the back panels 48. The flanges 60 are positioned in opposed, face-to-face relation, and preferably engage each other along a juncture. Each flange 60 extends generally perpendicular from the corresponding back panel 48 and generally parallel to the side panels 46. At a bottom edge, each flange 60 includes a driving point 62. Each of the driving points 62 is generally triangular and includes a pointed tip 64. As seen in FIGS. 3 and 6, the tips 64 of the driving points 62 are vertically offset from each other. As illustrated, the tip 64a of one flange 60a extends vertically below the tip 64b of the other flange 60b. In one embodiment, the tips 64 are vertically offset from each other about 1/8", although other configurations are within the scope of the present invention, such as tips that are aligned or tips that are offset a smaller or larger amount.

A back flange 66 extends from each of the extension flanges 60. Each back flange 66 extends generally perpendicular from the extension flange 60 and is oriented generally parallel to the back panels 48. Referring to FIG. 13A, the back flanges 66 engage the wall 28 at a first location L₁, which in the illustrated embodiment is a vertical face of the top plate 30 of the wall. The back panels 48, extension flanges 60, and back flanges 66 form a pair of sheathing channels 68. Each sheathing channel 68 is configured to receive a portion of the fire retardant sheathing 34 to secure the sheathing between the hanger 26 and the wall 28. As seen in FIG. 7, the sheathing channels 68 extend generally perpendicular to the truss-receiving channel 52.

As seen in FIGS. 10A and 11, the extension flanges 60 extend through a slot 72 in the fire retardant sheathing 34. Preferably, the slot has an area less than or equal to 6 square inches, and the gap between the extension flanges 60 and the edge of the slot 72 is less than or equal to 1/8". The driving points 62 extend down into the sheathing 34 to further secure the sheathing between the hanger 26 and the wall 28. A portion of the fire retardant sheathing 34 extends into each sheathing channel 68 and is secured between the back panels 48 and the back flanges 66.

In one embodiment, the slot 72 in the fire retardant sheathing 34 can be made using a slot template 82 (FIGS. 16-24). The slot template 82 includes a vertical panel 84 having a rear face 86 configured to engage the interior face 50 of the fire retardant sheathing 34 and a horizontal panel 88 having a bottom face 90 configured to engage a top face of the sheathing. The horizontal panel 88 extends generally perpendicular from the vertical panel 84. The slot template 82 is configured to be quickly fixed in position on the sheathing 34 for use in cutting the slot 72 to receive the truss hanger 26. Portions of the slot template 82 are configured to be pressed into the sheathing 34 to locate the template on the sheathing and retain the template in position for cutting the slot 72. In the illustrated embodiment, the horizontal panel includes prongs 92 that are bent downward for insertion into the top face of the sheathing 34. Bottom corners 94 of the

5

vertical panel **84** are bent rearward for insertion into the interior face **50** of the sheathing **34**. The prongs **92** and the corners **94** are inserted into the sheathing **34** to retain the template **82** in position for cutting the slot **72**. In addition, the vertical panel **84** optionally includes dimples **96** extending toward the rear face **86** of the vertical panel **84**. The dimples **96** ensure the vertical panel **84** remains slightly spaced from the interior face **50** of the sheathing **34** so the template **82** can be easily removed from the sheathing after the slot **72** is cut.

The template **82** includes a guide slot **98** to guide a cutting tool in cutting the slot **72** in the sheathing **34**. The guide slot **98** extends from a top edge of the vertical panel **84** to a location spaced from a bottom edge of the vertical panel. As illustrated, the guide slot **98** includes a wide, rectangular portion **98a** in the horizontal panel **88** to ease insertion of a cutting tool into the guide slot. A converging portion **98b** of the slot **98** in the vertical panel **84** transitions from the wide portion **98a** to a narrow lower portion **98c** of the slot. This facilitates entry of the cutting tool into the narrow portion **98c**. The narrow portion **98c** of the guide slot **98** is dimensioned to facilitate cutting the slot **72** in the sheathing **34** to a size configured to receive the extension flanges **60** of the truss hanger **26**.

As seen in FIG. **24**, the template **82** described above can be formed as one piece from a metal blank **100** that is stamped from a sheet metal roll and bent into shape. In one embodiment, the template **82** is stamped from 16 gauge steel, although other thicknesses (e.g., 12-18 gauge) and other suitable materials are within the scope of the present invention.

In use, the template **82** is placed on the sheathing **34** in a selected location for a slot **72**. The template can be used to cut the slot **72** in the sheathing **34** either before or after the sheathing is mounted on the wall **28**. The prongs **92** and corners **94** are inserted into the sheathing **34** by tapping with a hand or striking with a hammer or other blunt instrument. Once the template **82** is secured in position on the sheathing **34**, a cutting tool (e.g., a drywall cutout tool) is inserted into the guide slot **98** to cut a slot **72** in the sheathing at the location of the guide slot. In one embodiment, a drywall cutout tool with a $\frac{1}{8}$ " or $\frac{1}{4}$ " spiral bit is used to cut the slot **72**, although other cutting tools are within the scope of the present invention. After the slot **72** is cut in the sheathing **34**, the template **82** is removed from the sheathing. The sheathing **34** is then configured to receive the truss hanger **26**.

Referring again to FIGS. **2-8**, the connection portion of the hanger includes a pair of connector tabs **74** extending from the back flanges **66**. Each connector tab **74** extends generally perpendicular from one of the back flanges **66**. The connector tabs **74** are generally horizontal when the hanger **26** is installed. The connector tabs **74** are configured to engage an upper surface of the top plate **30** of the wall **28** at a second location L_2 spaced from the first location L_1 . The connector tabs **74** can be used to attach the truss hanger **26** to the wall, thereby hanging the floor trusses **12** from the wall. As seen in FIG. **1**, the connector tabs **74** extend over a portion of the top plate **30** of the wall **28**. Each connector tab **74** includes fastening structure, such as nail holes **76**, for insertion of a fastening member, such as nails **78** (see FIGS. **10** and **10A**), to attach the hanger **26** to the wall **28**. In the illustrated embodiment, each connector tab **74** includes three nail holes **76**. Other configurations are within the scope of the present invention, such as a different number of nail holes, or alternate fastening structure such as nailing teeth or other appropriate structure for fastening the hanger to the wall.

6

The base **44** and back flanges **66** of the truss hanger **26** cooperate to stabilize the truss hanger **26** and protect the fire retardant sheathing **34** under the loads transferred from the truss **12** to the wall **28** by way of the hanger. The channel **52** that receives an end portion of the truss **12** is spaced to the interior of the wall **28** and more particularly to the interior of the second location L_2 where the connector tabs **74** are attached to an upper surface of the top plate **30**. The vertically downward load of the truss **12** applied to the base **44** of the truss hanger **26** urges the truss hanger **26** to pivot so that the base would move toward the wall **28**, which could damage the fire retardant sheathing **34** and pry out the nails **78** connecting the connector tabs **74** to the upper surface of the top plate **30**. However, this motion is resisted by the engagement of the back flanges **66** with the interior vertical face of the top plate **30** at the first location L_1 . Thus, there is a force couple between the base **44** of the hanger **26** carrying the vertical load of the truss **12** and the back panels **48** of the hanger (via engagement of the back flanges **66** with the top plate **30**) engaging the end face of the truss. Accordingly, the truss hanger **26** and truss **12** are stable with minimal disruption of the fire retardant sheathing **34**, even though the truss is held at a distance from the wall **28** by the truss hanger.

As seen in FIG. **15**, a truss hanger **26** as described above can be formed as one piece from a metal blank **80** that is stamped from a sheet metal roll and bent into shape. In one embodiment, the truss hanger **26** is stamped from 12-14 gauge steel, although other suitable materials are within the scope of the present invention. The configuration of the truss hanger **26** of the present invention allows a lighter gauge metal to be used.

In use, the truss hanger **26** is positioned in the slot **72** of the fire retardant sheathing **34** mounted on the wall **28**. As seen in FIGS. **9-14A**, one method of using the truss hanger **26** includes cutting the slot **72** in the fire retardant sheathing **34** (either before or after the sheathing is mounted on the wall). In one embodiment, the slot **72** can be cut using the slot template **82** (either before or after the sheathing **34** is mounted to the wall **28**). The slot can be any suitable length, and in one embodiment is about 10 inches long. The truss hanger **26** is then positioned against the fire retardant sheathing **34** so that the extension flanges **60** extend through the slot **72**. In one embodiment, the hanger **26** is slid downward into place so that the extension flanges **60** extend through the slot **72**, the back flanges **66** are positioned adjacent the wall **28**, and the fire retardant sheathing **34** is positioned in the sheathing channels **68** between the back flanges and the back panels **48**. The hanger connector tabs **74** are fastened to the top plate **30** of the wall **28** by any suitable means, such as by inserting nail **78** through the nail holes **76**. Then, a truss member, e.g. truss bottom chord **16**, is positioned in the truss channel **52** of the hanger **26** (see FIG. **1**), thereby securing the floor truss **12** to the wall **28**. The truss hanger **26** is then fastened to the truss **12** by any suitable means, such as by inserting nails **56** through the nail holes **54** in each side panel **46** of the hanger. The hanger **26** is thus secured to both the truss **12** and the wall **28**, with the fire retardant sheathing **34** secured between the hanger and the wall.

In another embodiment, the truss hangers **26** can be installed without pre-forming the slot **72** in the fire retardant sheathing **34**. More particularly, each hanger **26** can be driven into the sheathing **34**. The driving point **62** of the hanger **26** is positioned against a top edge of the fire retardant sheathing. The hanger **26** is then driven downward into the sheathing **34**, led by the pointed tip **64**. The hanger

26 continues to be driven into the gypsum boards until the connector tabs 74 engage the upper surface of the top plate 30. In this way, the hanger 26 forms the slot in the sheathing 34.

In still another embodiment, the truss hangers 26 can be installed on the wall 28 before the sheathing 34 is mounted on the wall. This simplifies construction by allowing the building to be completely framed and roofed before requiring the sheathing 34 to be installed. Trade workers (e.g., mechanical, electrical) therefore have complete access to the wall cavity to install components without interference from the sheathing 34. The truss hanger 26 is positioned against the wall 28 such that the back flanges 66 engage the wall and the connector tabs 74 engage the top plate 30. The connector tabs 74 are fastened to the top plate 30 of the wall by any suitable means, such as by inserting nails 78 through nail holes 76. Then, a truss 12 is positioned in the truss channel 52 of the hanger 26. The truss hanger is fastened to the truss 12 by any suitable means, such as by inserting nails 56 through the nail holes 54 in each side panel 46 of the hanger 26. The floor truss 12 is thereby secured to the hanger 26 and the wall 28, and access to the wall cavity remains unhindered by sheathing. Subsequently, the sheathing 34 can be mounted on the wall 28 by moving the sheathing upward into place so that the extension flanges 60 of the hanger 26 extend through the slot 72 of the sheathing and the sheathing is positioned in the sheathing channels 68 between the back flanges 66 and the back panels 48.

Referring to FIGS. 25-40, a second embodiment of a truss hanger 126 for use in mounting the floor truss 12 to the wall 28 is illustrated. The truss hanger 126 is similar to the truss hanger 26 described above, with differences as pointed out herein. Where the truss hanger 26 is configured for mounting the floor truss 12 generally orthogonal to the wall 28, the truss hanger 126 is configured for mounting the floor truss 12 in a skewed position relative to the wall.

Referring to FIGS. 26-33, the truss hanger 126 includes a channel-shaped portion 138, an extension portion 140, and a connection portion 142. The channel-shaped portion 138 is configured to receive the floor truss 12. The channel-shaped portion 138 is configured to support the floor truss 12 at a non-orthogonal angle relative to the wall 28. In this skewed embodiment, the channel-shaped portion 138 is offset from the extension portion 140. The channel-shaped portion 138 includes a seat or base 144 and a pair of side panels 146 extending upward from the base. When installed, the base 144 is generally horizontal, and the side panels 146 extend generally vertical from the base. A back panel 148 extends from one of the side panels 146a toward the opposing side panel 146b. The back panel 148 is generally perpendicular to both the side panels 146 and the base 144. When installed, the back panel 148 extends at a non-orthogonal angle (e.g., about 45°) to the interior face 50 of the fire retardant sheathing 34. The base 144, side panels 146, and back panel 148 form a channel 152 configured to receive the floor truss 12. Other configurations are within the scope of the present invention. For example, the truss hanger 126 can be configured to support the floor truss 12 at a range of different angles with respect to the wall 28.

As seen in FIGS. 25 and 39, the floor truss 12 is received in the channel 152 to attach the floor truss to the wall 28 at a skewed angle. The bottom chord 16 of the floor truss 12 engages and rests upon (i.e., is supported by) the base 144. The end member 20 of the floor truss 12 is positioned against the back panel 148 between the side panels 146. The truss hanger 126 includes fastening structure for attaching the floor truss 12 to the truss hanger. Fastening structure can be

of any type known in the art for attaching a connector to a wooden structural member, such as nailing teeth (not shown) struck from the material of the hanger. In the illustrated embodiment, the fastening structure comprises a hole to allow for insertion of a fastening member. More specifically, in one embodiment the fastening structure comprises nail holes 154 in the side panels 146 of the truss hanger 126 (see, FIG. 26), and the fastening member comprises a nail 156 (see, FIG. 25). In the illustrated embodiment, nail holes 154 are positioned on each of the side panels 146 so that nails 156 can be inserted into both the bottom chord 16 and the end member 20 of the floor truss 12 to attach the hanger 126 to the floor truss.

Referring again to FIGS. 26-33, the extension portion 140 includes two extension flanges 160 configured to extend through the fire retardant sheathing 34. One of the flanges 160a extends from the back panel 148. The other flange 160b extends from the side panel 146b. The flanges 160 are positioned in opposed, face-to-face relation, and preferably engage each other along a juncture. At a bottom edge, each flange 160 includes a driving point 162. Each of the driving points 162 is generally triangular and includes a pointed tip 164. As seen in FIG. 28, the tips 164 of the driving points 162 are vertically offset from each other. As illustrated, the tip 164a of one flange 160a extends vertically below the tip 164b of the other flange 160b. In one embodiment, the tips 164 are vertically offset from each other about 1/8", although other configurations are within the scope of the present invention, such as tips that are aligned or tips that are offset a smaller or larger amount.

A back flange 166 extends from the extension flange 160 generally perpendicular from the extension flange. Referring to FIG. 38, the back flange 166 engages the wall 28 at a first location L₁₀, which in the illustrated embodiment is a vertical face of the top plate 30 of the wall behind the fire retardant sheathing 34. The back flange 166 comprises a back flange portion 166a bent from the extension flange 160a and a back flange portion 166b bent from the extension flange 160b. The back panel 148, side panel 146b, extension flanges 160, and back flange 166 form a pair of sheathing channels 168 (see, FIG. 32). Each sheathing channel 168 is configured to receive a portion of the fire retardant sheathing 34.

As seen in FIGS. 34-36, the extension flanges 160 extend through the slot 72 in the fire retardant sheathing 34. Preferably, the slot has an area less than or equal to 6 square inches, and the gap between the extension flanges 60 and the edge of the slot 72 is less than or equal to 1/8". The driving points 162 extend down into the sheathing 34 to engage the sheathing and further secure the sheathing between the hanger 126 and the wall 28. A portion of the fire retardant sheathing 34 extends into each sheathing channel 168 and is secured against the back flange 166.

Referring again to FIGS. 26-33, the connection portion 142 of the hanger 126 includes a pair of connector tabs 174 extending from the back flange portions 166a, 166b. Each connector tab 174 extends generally perpendicular from a respective one of the back flanges 166a, 166b. The connector tabs 174 are generally horizontal when the hanger 126 is installed. The connector tabs 174 are configured to overlie and engage an upper surface of the top plate 30 of the wall 28 at a second location L₂₀ spaced from the first location L₁₀ (see, FIGS. 37 and 38). The connector tabs 174 can be used to attach the truss hanger 126 to the wall 28, thereby hanging the floor trusses 12 from the wall. As seen in FIG. 25, the connector tabs 174 extend over a portion of the top plate 30 of the wall 28. Each connector tab 174 includes fastening

structure, such as nail holes 176, for insertion of a fastening member, such as nails 178 (see FIGS. 34 and 35), to attach the hanger 126 to the wall 28. In the illustrated embodiment, each connector tab 174 includes three nail holes 176. Other configurations are within the scope of the present invention, such as a different number of nail holes, or alternate fastening structure such as nailing teeth or other appropriate structure for fastening the hanger to the wall.

The base 144 and back flanges 166 cooperate to stabilize the truss hanger 126 and protect the fire retardant sheathing 34 from exposure to the loads transferred from the truss 12 to the wall 28 by way of the truss hanger 126. The channel 152 that receives an end portion of the truss 12 is spaced to the interior of the wall 28 and more particularly to the interior of the second location L_{20} where the connector tabs 174 are attached to an upper surface of the top plate 30 (see FIG. 38). The vertically downward load of the truss 126 applied to the base 144 of the truss hanger 126 urges the truss hanger to pivot so that the base would move toward the wall 28, which could damage the fire retardant sheathing 34 and pry out the nails 178 connecting the connector tabs 174 to the upper surface of the top plate 30. However, this motion is resisted by the engagement of the back flanges 166 with the interior vertical face of the top plate 30 at the first location L_{10} . Thus, there is a force couple between the base 144 and back panel 148 of the hanger 126 (via engagement of the back flanges 166 with the top plate 30) engaging the end fact of the truss. Accordingly, the truss hanger 126 and truss 12 are stable with minimal disruption of the fire retardant sheathing 34, even though the truss is held at a distance from the wall 28.

As seen in FIG. 40, a truss hanger 126 as described above can be formed as one piece from a metal blank 180 that is stamped from a sheet metal roll and bent into shape. Parts of the blank 180 are labelled with reference numerals corresponding to the various parts of the formed truss hanger 126. In one embodiment, the truss hanger 126 is stamped from 12-14 gauge steel, although other suitable materials are within the scope of the present invention. The configuration of the truss hanger 126 of the present invention allows a lighter gauge metal to be used.

The truss hanger 126 is used as described above with reference to the truss hanger 26. In use, the truss hanger 126 is positioned in the slot 72 of the fire retardant sheathing 34 mounted to the wall 28. One method of using the truss hanger 126 includes cutting the slot 72 in the fire retardant sheathing (either before or after the sheathing is mounted on the wall). In one embodiment, the slot 72 can be cut using the slot template 82 (either before or after the sheathing 34 is mounted to the wall 28). The slot 72 can be any suitable length, and in one embodiment is about 10 inches long. The truss hanger 126 is then positioned against the fire retardant sheathing 34 so that the extension flanges 160 extend through the slot 72. In one embodiment, the hanger 126 is slid downward into place so that the extension flanges 160 extend through the slot 72, the driving point 162 engages the fire retardant sheathing 34, the back flange 166 is positioned adjacent the wall 28, and the fire retardant sheathing is positioned in the sheathing channels 168 of the hanger. The hanger connector tabs 174 are fastened to the top plate 30 of the wall 28 by driving nails 178 through the nail holes 176 into the top plate 30. Then, a truss member, e.g. truss bottom chord 16 is positioned in the truss channel 152 of the hanger 126. Nails 156 are driven through holes 154 in the side panels 146 to secure the floor truss 12 to the wall 28. The

hanger 126 is thus secured to both the truss 12 and the wall 28, with the fire retardant sheathing 34 between the hanger and the wall.

In another embodiment, the truss hangers 126 can be installed without pre-forming the slot 72 in the fire retardant sheathing 34. More particularly, each hanger 126 can be driven into the sheathing 34. The pointed tip 164 of the driving point 162 of the hanger 126 is positioned against a top edge of the fire retardant sheathing 34. The hanger 126 is then driven downward into the sheathing 34, led by the pointed tip 164. The hanger 126 continues to be driven into the gypsum boards until the connector tabs 174 engage the upper surface of the top plate 30. In this way, the hanger 126 forms the slot in the sheathing 34.

In another embodiment, the truss hangers 126 can be installed on the wall 28 before the sheathing 34 is mounted on the wall. This simplifies construction by allowing the building to be completely framed and roofed before requiring the sheathing 34 to be installed. Trade workers (e.g., mechanical, electrical) therefore have complete access to the wall cavity to install components without interference from the sheathing 34. The truss hanger 126 is positioned against the wall 28 such that the back flange 166 engages the wall and the connector tabs 174 engage the top plate 30. The connector tabs 174 are fastened to the top plate 30 of the wall by any suitable means, such as by inserting nails 178 through nail holes 176. Then, a truss 12 is positioned in the truss channel 152 of the hanger 126. The truss hanger 126 is fastened to the truss 12 by any suitable means, such as by inserting nails 156 through the nail holes 154 in each side panel 146 of the hanger. The floor truss 12 is thereby secured to the hanger 126 and the wall 28, and access to the wall cavity remains unhindered by sheathing. Subsequently, the sheathing 34 can be mounted on the wall 28 by moving the sheathing upward into place so that the extension flanges 160 of the hanger 126 extend through the slot 72 of the sheathing and the sheathing is positioned in the sheathing channels 168 of the hanger.

The truss hanger 26, 126 permits a floor truss 12 to be secured to a wall 28 through fire retardant sheathing 34 with minimal interruption to the sheathing. Installation of the truss hanger minimally disrupts the continuity of the sheathing and therefore does not reduce the fire resistive rating of a fire rated assembly. The extension flanges 60, 160 extend through the fire retardant sheathing 34 so that the sheathing is interrupted only by the slot 72 required to receive the flanges. The back flanges 66, 166 engage the wall 28 behind the sheathing 34 to stabilize the hanger 26, 126 and protect the sheathing. The truss hanger 26, 126 can be mounted on a wall already having sheathing mounted thereon, or can be mounted on a wall before the sheathing (i.e., the sheathing does not have to be mounted on the wall before the truss hanger), thereby simplifying construction. The truss hanger 26, 126 can be formed from a metal blank 80, 180, which reduces the number of parts required to hang the floor truss 12 and simplifies the manufacturing process.

In an independent test performed by an outside firm, the truss hanger was installed as part of a wall assembly including 2x6 wood studs, 24" on center, with two layers of 5/8" Type X gypsum attached to each side. The gypsum board included a slot to accommodate the hanger. The hanger was fixed to the top plate of the wall with six 10d common nails in the connector tabs. The cavities in the wall were filled with mineral wool insulation. The testing was performed per ASTM E814 which subjected the specimen to the time/temperature curve prescribed in ASTM E119 for a period of two hours, followed by a hose stream test. As a result of this

11

testing, the outside firm reported that when installed on one side of a maximum 2 hour fire-rated wall assembly, the penetration of the truss hanger through the gypsum board will not reduce the fire resistive rating of the 2 hour fire resistive assembly.

Having described the invention in detail, it will be apparent that modifications and variations are possible without departing from the scope of the invention defined in the appended claims.

When introducing elements of the present invention or the preferred embodiments(s) thereof, the articles “a”, “an”, “the” and “said” are intended to mean that there are one or more of the elements. The terms “comprising”, “including” and “having” are intended to be inclusive and mean that there may be additional elements other than the listed elements.

In view of the above, it will be seen that the several objects of the invention are achieved and other advantageous results attained.

As various changes could be made in the above products without departing from the scope of the invention, it is intended that all matter contained in the above description and shown in the accompanying drawings shall be interpreted as illustrative and not in a limiting sense.

What is claimed is:

1. A hanger for connecting a structural component to a wall adapted to have sheathing mounted thereon, the hanger comprising:

- a channel-shaped portion configured to receive the structural component;
 - an extension portion extending from the channel-shaped portion and configured to extend through the sheathing to engage the wall at a first location, the extension portion including extension flanges extending from the channel-shaped portion, each of the extension flanges being configured to extend through the sheathing; and
 - a connection portion configured for attachment to the wall at a second location spaced from the first location;
- wherein the extension flanges include edges, each of the edges having an edge surface area, and major surfaces, each of the major surfaces having a major surface area, the major surface area being greater than the edge surface area, the major surfaces of the extension flanges being in opposed face-to-face relation and directly engaging each other along a juncture between the connection portion and the channel-shaped portion, the edges of the extension flanges being free of engagement with each other.

12

2. A hanger as set forth in claim 1, wherein the channel-shaped portion is disposed with respect to the extension portion to mount the structural component generally orthogonal to the wall.

3. A hanger as set forth in claim 1, wherein the channel-shaped portion is disposed with respect to the extension portion to mount the structural component at a non-orthogonal angle relative to the wall.

4. A hanger as set forth in claim 1, wherein the major surfaces of the extension flanges are configured to engage each other along a juncture positioned within the sheathing.

5. A hanger as set forth in claim 1, wherein each of the extension flanges includes a driving point configured to be inserted into the sheathing, the driving point extending vertically when the hanger is attached to the wall.

6. A hanger as set forth in claim 1, wherein the connection portion includes connector tabs configured to overlie and engage a top plate of the wall.

7. A hanger as set forth in claim 1, wherein the extension portion includes back flanges configured to engage the wall at said first location.

8. A hanger as set forth in claim 1, wherein the channel-shaped portion includes a base sized and shaped for receiving the structural component thereon and side panels extending upward from the base, each of the side panels including fastening structure for use in attaching the hanger to the structural component.

9. A hanger as set forth in claim 8, wherein the channel-shaped portion further includes back panels, each of the back panels extending from a respective one of the side panels.

10. A hanger as set forth in claim 1 in combination with a slot template for cutting a slot in the sheathing configured to receive the extension portion of the hanger.

11. A hanger as set forth in claim 1, wherein the channel-shaped portion, extension portion, and connection portion are formed as a one-piece construction such that the channel-shaped portion is fixed in position relative to the connection portion.

12. A hanger as set forth in claim 1 wherein the channel-shaped portion includes a base sized and shaped for receiving the structural component thereon and side panels extending upward from the base, the extension flanges being substantially perpendicular to the base.

13. A hanger as set forth in claim 12 wherein the connection portion includes connector tabs configured to overlie and engage a top plate of the wall, the connector tabs being parallel to the base, and perpendicular to the side panels and the extension flanges.
