scFv-CH1/CL

Two scFv fragments against different antigens or epitopes are fused to the CH1/CL domain separately. Due to the natural dimerization between CH1 and CL, by a disulfide bond, the two chains, scFvA-CH1 and scFvB-CL, could form a heterodimer. This type of BsAbs can bind two epitopes simultaneously with 1+1 antigen-binding valency; the molecular weight is about 75 kDa. The small size facilitates the rapid clearance of the molecule from circulation.
