For everyone asking, the power button on the new M4 Mac mini is on the bottom

Yes, the bottom. Everybody chill, even when you power down your Mac, you should be doing it via software anyway. The physical power button is more of a reset button than anything. I think it's a fine compromise for the smallest desktop Mac ever made.

And you can probably reach that button without a problem.

The designer of the Magic Mouse was involved in this, weren't they? 😏

Kidding aside, I'm not happy about that. I know a lot of people don't shut down their computers very often these days, but I'm old fashioned. I still shut down at the end of every day, at least with my Mac Studio.

Someone will make a hub that sits under it and include a power button pass thru... I hope... please someone make a hub that does this.

You say power bottom like it's a bad thing.

I can power my MacBook Air M2 through the Studio Display. I want to know if I can do the same for the Mac mini. It seems unlikely, but it shouldn't be much different power wise, right?

No, unfortunately not (as it looks). I am in the same situation, but it would not such a huge problem.
